COTSWOLD DISTRICT COUNCIL – INFRASTRUCUTRE COSTS ADDENDUM TO FINANCIAL VIABILITY ASSESSMENT

1. Introduction

1.1. This note considers the ability of strategic sites allocated in Cotswold District Council's ('the Council') emerging Local Plan to absorb the requirements identified in the Infrastructure Delivery Plan ('IDP'). It should be read in conjunction with the Local Plan Viability Study (July 2026), which details the typologies and assumptions that we used to test policies in the Council's emerging Local Plan, as summarised in Table 1.1.

Table 1.1.1: Strategic sites and typologies used for testing purposes

Strategic Sites	No of units	Closest typology	Units in typology
Cirencester: Steadings southern extension	1,364	CDC-RES-34	1,300
Cirencester: Land south east of Cirencester and south of Preston	1,368	CDC-RES-34	1,300
Cirencester: Land east of Kingshill Lane	613	CDC-RES-28	500
Siddington: Land south west of Siddington	372	CDC-RES-26	400
Down Ampney: Land surrounding Down Ampney	1,658	CDC-RES-35	2,000
Driffield: Land south of Driffield	2,222	CDC-RES-35	2,000
Fairford: Land north-east of Fairford	1,141	CDC-RES-32	1,000
Kemble: Land south-west of Kemble	1,020	CDC-RES-32	1,000
Mickleton - Strategic - Land North and west of Mickleton	1,238	CDC-RES-34	1,300
Moreton-in-Marsh: Land north, east and south of Moreton-in-Marsh	2,217	CDC-RES-35	2,000
Total units	**13,211**		12,800

2. Infrastructure requirements identified by the IDP

2.1. The IDP identifies a range of infrastructure requirements in a number of categories. The first is site-specific infrastructure (such as schools); the second is infrastructure that supports a group of sites, such as boosting utilities capacity or putting flood mitigation in place; and the third is highways interventions which are associated with more than one site.

2.2. The total requirements falling to strategic sites in the three categories above are as follows:

- On-site infrastructure: £273.69 million
- Sub-area infrastructure: £4.40 million
- Sub-area highways interventions: £37.84 million

When considered in aggregate, the infrastructure requirements range from £18,453 to £40,929 per dwelling.

3. Potential funding generated by the typologies

3.1. As noted in the Local Plan Viability Study, the appraisals incorporate CIL and Section 106 obligations, both of which could be used (in principle) to fund infrastructure costs identified by the IDP. The Council expects to review its CIL Charging Schedule prior to the adoption of the emerging Local Plan and it expects to set nil rates for strategic sites, as they are providing infrastructure on site. In our calculations, the column headed CIL will simply be additional surplus residual land value.

3.2. We have identified the residual land value generated by each typology and deducted the relevant benchmark land value to identify any 'surplus' residual value that could be used to fund infrastructure.

3.3. The total funding that each typology would be able to make available for infrastructure is therefore the total of (a) surplus residual land value, (b) CIL included in the appraisals and (c) Section 106 financial contributions included in the appraisals.

3.4. These outputs are summarised in Table 3.4.1 and Table 3.4.2 (which shows the data in Table 3.4.1 on a per unit basis).

Table 3.4.1: Funding available for infrastructure

Site	Residential units	Closest typology	Units in typology	RLV	BLV	Surplus RLV	CIL (see para 3.1)	S106	Total resources generated
Cirencester: Steadings southern extension	1,364	CDC-RES-34	1,300	£31,154,605	£15,289,300	£15,865,305	£6,624,517	£9,880,000	£32,369,822

4. Conclusions

4.1. Table 4.1.1 below draws together the total resources generated by the typologies on a per unit basis and compares this to the total infrastructure requirement, again per unit. As can be noted, there is an even split between the sites that can fund all the infrastructure requirement at the present time and those that cannot fund 100% of the requirement. It is likely that these funding gaps could be closed relatively easily by increasing values over the course of the development or by re-profiling of the timing of infrastructure payments or timing of provision.

Table 4.1.1: Summary of capacity and infrastructure requirements per unit

Site	Residential units	Units in typology	Closest typology	Infra requirement per unit	Total resources generated
Cirencester: Steadings southern extension	1,364	1,300	CDC-RES-34	£20,039	£24,900
Cirencester: Land south east of Cirencester and south of Preston	1,368	1,300	CDC-RES-34	£25,746	£24,900
Cirencester: Land east of Kingshill Lane	613	500	CDC-RES-28	£22,190	£36,371
Siddington: Land south west of Siddington	372	400	CDC-RES-26	£18,453	£37,043
Down Ampney: Land surrounding Down Ampney	1,658	2,000	CDC-RES-35	£29,020	£18,146
Driffield: Land south of Driffield	2,222	2,000	CDC-RES-35	£27,520	£18,146
Fairford: Land north-east of Fairford	1,141	1,000	CDC-RES-32	£27,639	£20,258
Kemble: Land south-west of Kemble	1,020	1,000	CDC-RES-32	£24,395	£27,086
Mickleton - Strategic - Land North and west of Mickleton	1,238	1,300	CDC-RES-34	£22,385	£31,129

Site	Residential units	Units in typology	Closest typology	Infra requirement per unit	Total resources generated
Moreton-in-Marsh: Land north, east and south of Moreton-in-Marsh	2,217	2,000	CDC-RES-35	£40,929	£24,514
	13,211	**£27,789**			**£23,997**

4.2. It should also be borne in mind that our appraisals do not include any affordable housing grant funding which may be made available, nor have we included any funding from other sources that may be made available to developments. Section 5 of the IDP points to other sources of funding that may be deployed, including funding streams from private sector organisations including UKPN, Thames Water and digital service providers, as well as public sector organisations including the NHS. It is unusual for all sites in a Local Plan to be able to absorb the entire identified infrastructure requirement at the outset, so our findings for CDC are consistent with other areas.

01
Introduction

This section will outline the purpose, and context of this Infrastructure Delivery Plan (IDP) and how local and national planning policy context has informed the scope and requirements.

01.1

Background and scope

01.1.1

Context

Prior + Partners (P+P) have been instructed by Cotswold District Council (CDC) to produce an Infrastructure Delivery plan (hereafter IDP) to support the emerging Local Plan 2026-2043 (hereafter referred to as the emerging Local Plan).

The IDP process has been iteratively developed in parallel to consultation on the emerging Local Plan, informing and being informed by the proposed allocations and wider approach to the housing and employment requirement identified in the emerging Local Plan. This report has been collated by P+P but relies upon significant engagement with key providers, stakeholders and the evidence base for the emerging Local Plan examination.

This version is shared alongside the Regulation 19 consultation although this may be updated to respond to issues raised ahead of the Examination in Public.

Role of the IDP

IDP reports function to identify existing infrastructure and capacity across the district, including deficiencies and potential capacity to accommodate new local plan growth where applicable, and setting out future infrastructure requirements in line with local plan housing growth over the plan period.

IDPs are strategic documents which identify, coordinate, and schedule necessary infrastructure as the starting point for future delivery.

In line with the National Planing Policy Framework (December 2024, given the emerging plan it supports will be issued under the transition arrangements), the supporting PPG[1] and broader Planning Advisory Service guidance plans should set out the contributions expected from development, including setting out the types of infrastructure required. This infrastructure should be proportional to the plan making stage and subject to refinement at the application stage, however it must also demonstrate that there is a realistic prospect of its delivery and help support the examination of the plan such that the cumulative policies and requirements should not undermine the deliverability of the plan.

This IDP is a ‘live’ document, which means that each iteration provides an opportunity to revisit and re-establish communications and discussions with key stakeholders. Each iteration also provides an opportunity to re-visit the Infrastructure Delivery Schedule to ensure that it contains the most up-to-date information relating to infrastructure requirements, including costs and delivery timescales for each project.

1 See here: https://www.gov.uk/government/collections/planning-practice-guidance

Relationship to other documents

This IDP forms a core evidence base document for the CDC emerging Local Plan by providing an overview of identified infrastructure requirements. Whilst some of the requirements are bespoke to the IDP, such as calculations of education requirements, the IDP relies on a number of additional evidence base documents produced to the support the plan's development and examination. These are referenced throughout this document but notably and non exhaustively include: the CDC Green Infrastructure Strategy, the City Science Transport Strategy, the LUC SANG Strategy/Recreation and Mitigation strategy, the JBA Water Cycle study (covering utilities upgrades) and a series of evidence base documents prepared by ONH, KKP and AECOM covering indoor and outdoor sport requirements.

In addition, the IDP has been prepared following extensive engagement with a number of stakeholders who have produced substantial guidance which has informed the recommendations of the IDP.

Although the engagement undertaken is set out thematically within this document, Gloucestershire County Council (GCC) have been a key stakeholder in the production of this IDP, given their responsibility for education and learning, libraries, and is the local highway authority within the county omitting the strategic road network managed by National Highways.

Relationship to CIL

The Infrastructure Funding Statement (IFS) is an annual report which provides a summary of all financial and non-financial developer contributions relating to S106 and the CIL collected and spent by CDC. The latest report runs from 1 April 2024 to 31 March 2025 and was approved in November 2025. The 2025-2026 report is in progress.

For the purposes of this IDP, it is currently assumed that the strategic sites will be 'zero rated' and not liable for payment of CIL (with planning obligations secured by alternative measures).

As a result, this IDP retains reference to CIL as this will be collected under the non-strategic site allocations and windfall development, and the supporting work will be a helpful resource for future CIL applications.

01.1.2

Scope of this IDP

Infrastructure sub-themes

The types of infrastructure covered in this report respond to both national policy and best practice guidance, and have been agreed with CDC in advance. The topics covered therefore include:

- Education
  - Early years
  - Primary education
  - Secondary education and Post 16
- Community and culture
  - Community spaces
  - Libraries
  - Burial grounds
- Primary Healthcare
- Emergency services
- Open space and Sports
  - Open space
  - SANG
  - Sports and Recreation
- Emergency services
- Transport
  - Rail
  - Bus
  - Active mode
  - Highways
  - Behaviour change
- Flood management
- Utilities
  - Electricity
  - Water and waste
  - Digital infrastructure

Given the role of GCC as Minerals and Waste Planning Authority (MWPA), for avoidance of doubt, these themes are not included in the infrastructure requirements identified within this IDP and instead have been scoped to be considered outside of the CDC local Plan 2043 as part of the Statutory review of the Minerals Local Plan and part of the (currently emerging) Waste Local Plan.

Furthermore, as set out in the Gloucestershire Local Development Guide (2025) it is GCC's policy to require SEND funding for applications over 4,000 homes. As there is not a site at this scale proposed in the emerging Local Plan, this is not included with this IDP.

01.1.3

Approach

Structure

This report includes the following chapters:

1. Introduction; will set out the context, scope, and methodology for the following work.

2. Infrastructure baseline; provides the underpinning data alongside cross reference to other Local Plan evidence base documents, county guidance and online sources to produce the infrastructure baseline. This section will include the appropriate consideration of pipeline and currently committed projects across the sub themes (outlined in 01.1.4) and this section forms the basis upon which future infrastructure requirements are estimated.

3. Proposed growth scenario and resulting population modelling; this section of the IDP takes the local plan growth scenario to produce a housing and population projection using the draft site allocations and predicted windfall development. This will be used to estimate requirements across sub-areas of the District and strategic sites in IDP.

4. Modelled infrastructure requirements per theme; using the population projections and applying benchmark standards and considering against the baseline infrastructure to determine or otherwise quantify future infrastructure needs

5. Infrastructure requirements and funding mechanisms; as an overview of the appended Infrastructure Delivery Schedule; this is effectively the summary of infrastructure requirements at the heart of the IDP, summarised into a set of key projects and recommendations to inform future delivery, funding applications and the review of submitted planning applications.

01.1.4

Overview of methodology

Study area

The study area is primarily focused on Cotswold District Council's Local Planning Area, although cross boundary considerations are relevant for adjacent authorities, notably with a proposed spatial strategy focused on areas outside of the National Landscape in the south of the district.

An overview of the existing settlement pattern and a list of principal settlements (set out in the CDC settlement hierarchy) is provided overleaf in figure 1.

Baseline information and engagement

As far as possible the baseline data has been aligned with an April 2025 as the baseline date for the IDP unless otherwise specified. Although the CDC housing trajectory has been updated since this point, where relevant within the sub themes, this IDP has reviewed any reliance on baseline capacities.

Significant engagement with statutory providers, including multiple workshops and discipline specific engagement has been undertaken to inform this IDP. This will be captured in Statement of Common Ground where relevant.

Local standard benchmarking

Local standards have been used to establish projected demand against the growth scenario in the emerging Local Plan. Where directly proportional to future population (namely a relevant provision per person) these are quantified as far as possible, but some requirements are also related to wider needs and evidence base established by key stakeholders providers. Sources for this are provided throughout the IDP per theme

'Pipeline' projects

Pipeline projects within this IDP are commitments that are sufficiently committed and considered to reasonably influence capacity have been incorporated or referenced in the baseline. This is specific for each theme and justified appropriately.

Cross boundary considerations

Where relevant, cross boundary considerations such as provision outside of the district, have been considered as far as is appropriate. This varies depending on the theme and other considerations but is set out within.

For the avoidance of doubt, this IDP is not reliant upon regionally significant infrastructure or mitigation being provided to support local plan growth.

It is noted that a number of themes, such as the use of existing sports facilities, have considered usage by those outside of CDC as the practical reality of usage is blind to authority boundaries. Where relevant, such as the Water Cycle Study, appropriate consideration of cumulative growth has been considered through engagement with neighbouring authorities, and where items are required to be delivered outside of CDC and GCC's control, such as on offsite transport mitigation, these are explicitly flagged.

02 Infrastructure baseline

This chapter provides an overview of existing infrastructure provision within the district, as well as noting existing commitments at the time of writing, relevant for consideration in the future growth scenario.

02.1
Education

02.1.1
Early years

Policy context

Local authorities have specific powers and duties, alongside other regulatory bodies, in relation to the well-being of young children, specifically in regards to the provision of childcare and the provision of information to parents and other persons; to make provision about the regulation and inspection of childcare provision. In summary, the Childcare Act (2006) states that:

(1) An English local authority must—

(a) improve the well-being of young children in their area, and

(b) reduce inequalities between young children in their area in relation to the matters mentioned in subsection (2).

(1) The meaning of "early childhood services for the purposes of section 3 is as follows:

(a) early years provision;

(b) the social services functions of the local authority, so far as relating to young children, parents or prospective parents;

(c) health services relating to young children, parents or prospective parents;

(d) the provision, under arrangements made under section 2 of the Employment and Training Act 1973 (c. 50), of assistance to parents or prospective parents;

(3) Specific duties of a local authority in relation to early childhood services:

(2)The authority must make arrangements to secure that early childhood services in their area are provided in an integrated manner which is calculated to—

(a)facilitate access to those services, and

(b)maximise the benefit of those services to parents, prospective parents and young children.

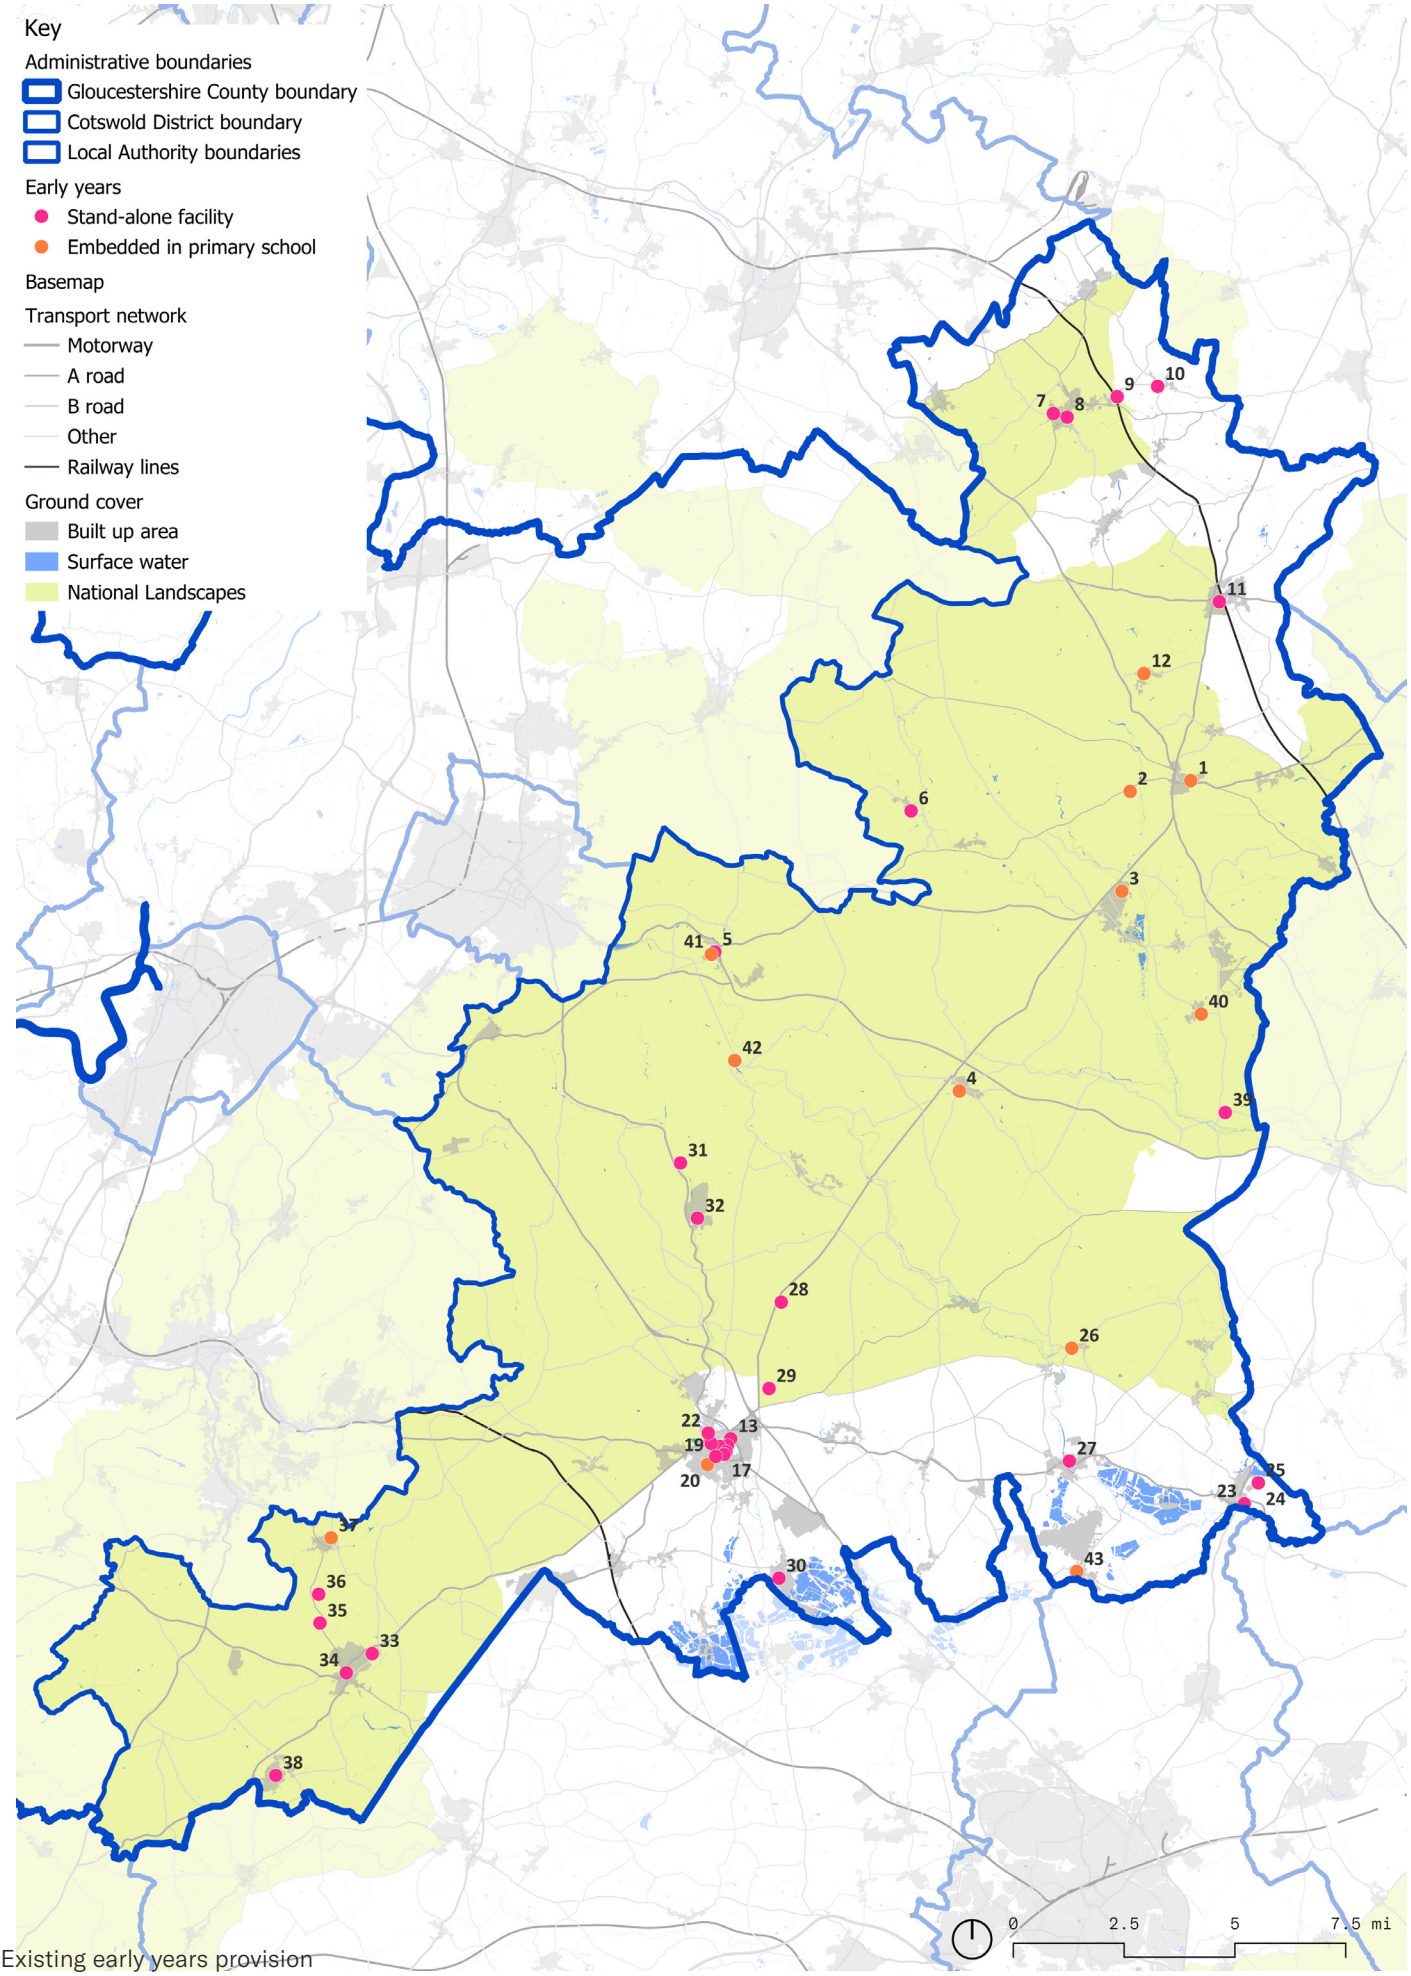
This is relevant because it sets out that should a deficit by identified in the provision of early years education and childcare, the local authority (GCC) must take steps to address this and to satisfy the above regulations.

GCC is responsible ensuring that funding entitlement for early years childcare is provided and works in collaboration with private providers who operate in response to commercial demand. As a result, early year childcare is provided both by GCC and also private companies.

Data used & evidence

This assessment was produced with reference to a bespoke GIS database created for the project which used a combination of data received from Cotswold District Council, and publicly available national datasets released on the Open Geography Portal by the Office for National Statistics, and by private providers on their websites. For private nurseries, GIS data was extracted from daynurseries.co.uk; public nurseries, data extracted from https://get-information-schools.service.gov.uk/. Information was then manually checked for accuracy by searching online using postcode then adjusted using OpenStreetMaps. All GIS data dates from April 2025 but has been reviewed as of June 2026 for accuracy.

Commentary



The baseline identifies 43 total early years childcare and education providers which varied from nurseries, Montessori, and playgroups. Most facilities were stand-alone, but 12 facilities functioned as nursery classes embedded into primary schools. Facilities are predominantly privately provided, many premises accept payment via the Free Childcare for Working Parents scheme which offers 30 hours of free childcare per week.

1,230 total spaces of capacity were identified across the 26 providers who publicly publish their data publicly online[1].

The geographical spread of facilities is aligned to population distribution across the district, with the highest proportion of facilities concentrated in Cirencester. However, there is a good physical distribution of nurseries and other childcare across the district, with slightly limited services in more sparsely populated localities within the National Landscape. In these locations, the majority of facilities are embedded within existing primary schools, as shown in the figure overleaf.

It should be noted that significant additional providers, particularly at smaller scale such as child minders, play an important role in provision and will not be captured by the below mapping.

02.1.3

Primary education

Data used & evidence

Educational facilities data was obtained from the Department for Education (DfE)'s public dataset, updated April 2025 and cross referenced with CDC held data. GCC's School Places Strategy for Primary and Secondary Schools (2025-2030) was also reviewed to understand the local capacity, pipeline investments, challenges and other influencing factors in pupil place planning. Although the baseline data (particularly the detailed number of pupils on roll) the projections for 2027 remains robust for the purposes of assessing potential future impact at the local plan stage.

Whilst they are recognised as an important part of the overall provision of education in the study area, Independent schools have not been incorporated into the scope of the study. This is because allowances made under the pupil modelling undertaken in Chapter 4 consider a percentage of pupils attending private institutions.

As part of early engagement with GCC, relevant School Place Plan areas were identified for any cross boundary issues. In combination with the recommendations (set out in Section 4) there was not considered to be an impact on adjacent authorities outside of GCC, who are also responsible for some of the adjacent LPAs.

Commentary

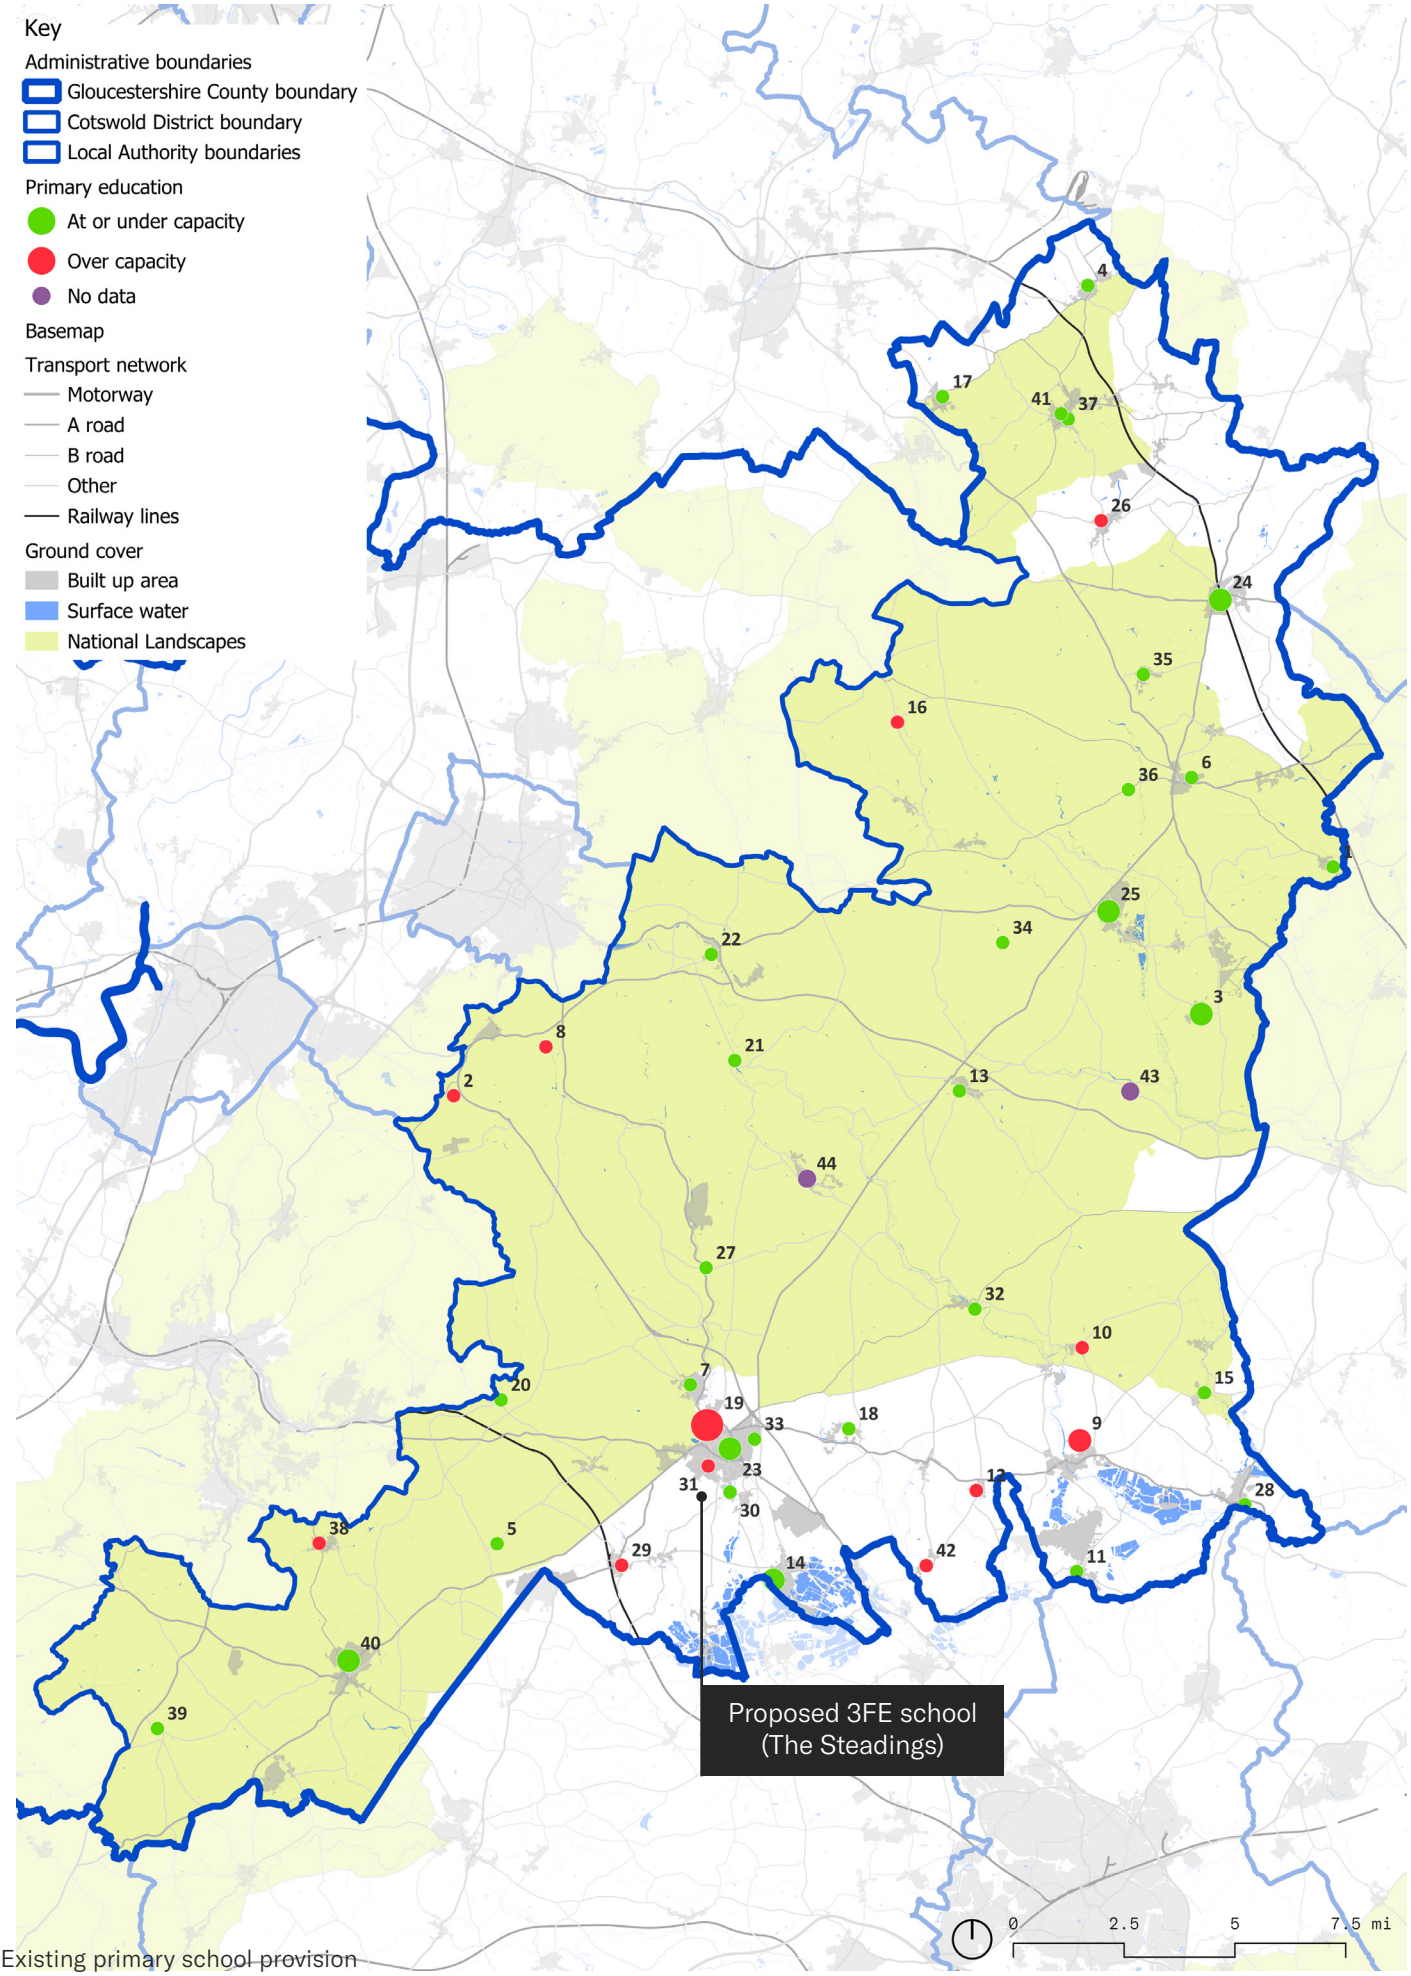
For the purposes of the study, schools were considered at full capacity at 95% full to allow for a 5% allowance for parental preference, windfall growth and in migration during school year. This is in line with the Gloucestershire County Council Local Development Guide[1].

This report identifies 44 total primary schools in the district, with 32 either at or under capacity, i.e., that the Published Admission Number (PAN) is up to 95% of the total capacity. The remaining nine schools were identified as over target capacity. The majority of schools are 2 forms of entry (FE), eight schools had one FE, and one school had 3FE.

Local authorities supply the DfE with their own low-level planning area forecasts using their own methodologies that are based on a variety of local factors including ONS data on live births, local migration patterns, pupil yield from housing developments and data provided by local health bodies. These have incorporated the 2027/2028 projected demand (place planning) which was developed using the average birth rate for 2021-2025. This was included as it should capture the future baseline for the new Local Plan by aligning with the delivery of existing commitments as part of the extant Local Plan.

The highest proportion of primary schools is concentrated in Cirencester which has six operational schools, the largest of which is operating over capacity but the remaining five schools are either at or under capacity.

As per the S106 agreement for The Steadings (an existing commitment), a new 3FE primary school will be developed on the site and is scheduled to open in September 2029 according to the Corinium Education Trust who will operate the school. This new school was incepted in response to an established need for a 3FE school with early years facilities following the outline approval of 2,300 homes in Chesterton, Cirencester and will be delivered in phases.



As a result, this potential provision is relevant to the recommendations for The Steadings southern extension.

02.1.6

Secondary and Post 16 education

Approach

Educational facilities data was obtained from the Department for Education (DfE)'s public dataset, updated April 2025 and cross referenced with CDC held data. GCC's School Places Strategy for Primary and Secondary Schools (2025-2030) was also reviewed to understand the local capacity, pipeline investments, challenges and other influencing factors in pupil place planning. Although the baseline data (particularly the detailed number of pupils on roll) the projections for 2027 remains robust for the purposes of assessing potential future impact at the local plan stage.

Independent schools have also been omitted from the quantitative assessment due to their lack of impact on local educational needs, however, two have been identified within the district.

Policy context

GCC has a statutory duty to plan the provision of school places and to ensure there are sufficient appropriately located places for all 4 to 16-year-old young people in the county. The council manages the impact of rising and declining pupil numbers and helps to create a diverse community of schools.

The Education Planning and Infrastructure Team receive new pupil forecasts in February each year, when the data is examined to identify action that may be required to meet the need for September of the following year. Priority projects are included in the SPS Implementation Plan and officer engage with schools to discuss findings and explore how additional capacity might be realised.

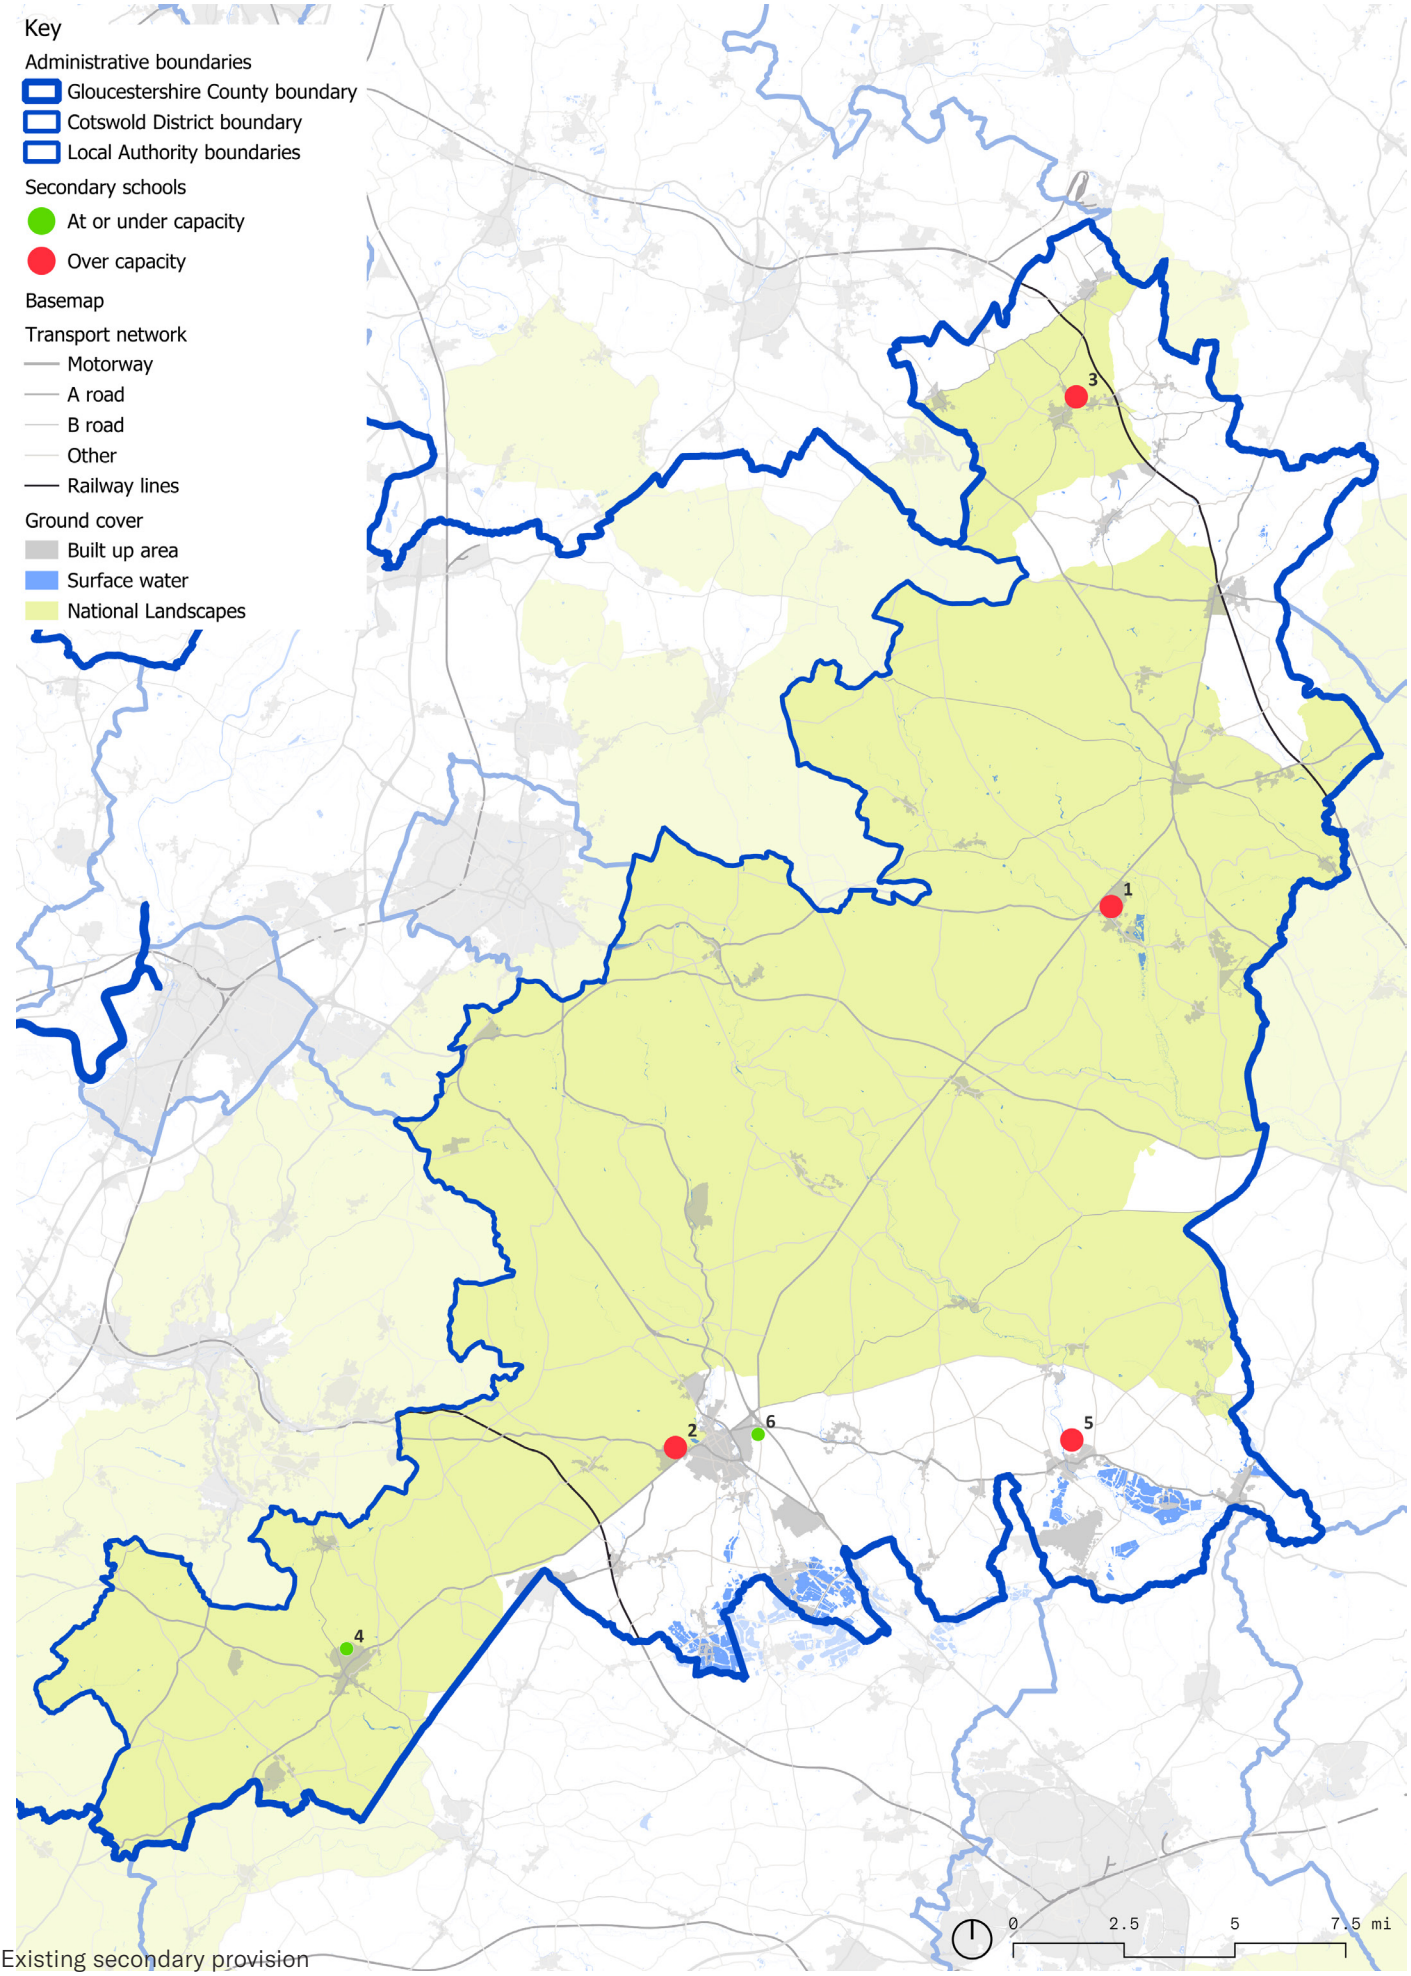
According to the Gloucestershire School Place Strategy, the optimum size for an 11 to 16 secondary school is 900 (6FE) to 1,200 (9FE) pupils. GCC however recognises that provision in some communities may fall outside the ideal size of secondary school and demand for additional places could be met either by expanding existing schools, if there is sufficient capacity on the site, or by new provision located within a new housing community. Gloucestershire secondary school provision includes grammar or selective and two faith schools as an option for students transferring to Y7. In the autumn term, Y6 pupils are invited to sit an entry test for grammar schools. There are five selective single sex grammar schools and two selective co-educational grammar schools in Gloucestershire places are open to all students both in county and across county borders, subject to meeting the criteria. All of the grammar schools (as of the 2025-2030 strategy) have recently increased in capacity and there are now a total of 1,050 selective places in Year 7.

Commentary

Both school place planning areas are projected to have a reasonable operating surplus, approximately 5% each, to facilitate parental choice and windfall. However at the facility level, four schools are at or over capacity and two, located in Tetbury and Cirencester are under capacity.

At this stage, there are no committed or planned school development identified for secondary provision, although this is reported regularly by CDC[1].

Cirencester College is a specialist sixth form provider catering for ages 16-19, and is also the only institution offering adult education in the district. There re six courses available for adult education as per November 2025, as follows:



- English as a second language (ESOL)
- Level 5 Diploma in Teaching
- Adult GCSE Maths and English
- Level 2 Award in Support Work in Schools and Colleges
- Functional Skills Maths and English
- 1 Day Introduction to Holistic and Sports Massage

02.2

Community and culture

Approach

The following facilities will be considered under cultural and community infrastructure in the IDP due to their condition as fixed physical assets which are suitable for a range of activities and public uses:

— Community facilities, including community centres, church/parish/village halls
— Libraries
— Burial grounds

This is not to exclude a multitude of other services which provide a community and cultural function. Please note, indoor sports facilities are covered later in the IDP under the Sports and Recreation section.

GIS data was assessed alongside various internet sources and formal strategy documents to produce a quantitative account of community infrastructure across the district and their geographic distribution. Data is compiled using a combination of CDC held data based on survey work, P+P data base and supplemented manually using OpenStreetMap. Unlike schools, there is not as strong correlation with capacity with the majority of facilities within this section given their nature.

Libraries data was extracted from the Gloucestershire County website and then geolocalised using postcodes and OpenStreetMaps. Other community spaces such as community centres, village halls and parish halls were identified using online resources which were cross checked against OpenStreetMaps.

Community facilities

CDC are not duty bound to adopt a Cultural Strategy, however, following an ambition set out in the 2024 Corporate Plan, a cultural strategy was commissioned by the district council in July 2025[1], and is currently live with recommendations still emerging.

According to the ONS 2024 (counts and per capita counts of Community Facilities in Local Authority Districts (LAD) in England and Wales), there are 143 identified facilities in Cotswold (as of July 2024) with 156.30 facilities per 100,000 people.

This is equivalent to 0.48ha (or 48,031 sqm) per 100,000 people and a mean facility size of 308sqm per facility. This is above the provision for a comparable region.

Parish Halls, Village Halls, Reading Rooms and other small community venues are not owned or managed by CDC but by local organisations such as voluntary trusts or committees, typically in associated with the local Parish Council and there is no district wide strategy for their management.

The CDC Settlement role and function Study (July 2026) provides additional information on the current distribution of community facilities and assets across the district.

When combining a number of local facilities and services across settlements (including: Library, Primary School Pre-school / Nursery, GP Surgery, Dentist, Pharmacy, Pub, Community Hall, Sports Field, Allotments, Play areas) it concluded that “none of the local facilities and services assessed are available across the board, although more than half of the settlements has a primary school, pub, village hall and/or play area. Only the larger settlements have access to a library, GP, dentist and/or pharmacy. The lack of local facilities does not only occur in small settlement such as Coates and Shipton, but also medium sized settlements such as Willersey”.

Libraries

Seven out of eight of the libraries in CDC are owned and managed by the GCC libraries team, the one additional library at Lechlade is a community library and is operated independently. GCC operated libraries are managed in accordance with the Gloucestershire Libraries Strategy 2023-2028[2] which sets out the ambitions for the service over a five year period. Gloucestershire Libraries also publishes an annual report on progress against the Library Strategy, the

Fairford	10,992	329.76	257.28	25269
Lechlade	*community library, no data held by GCC			

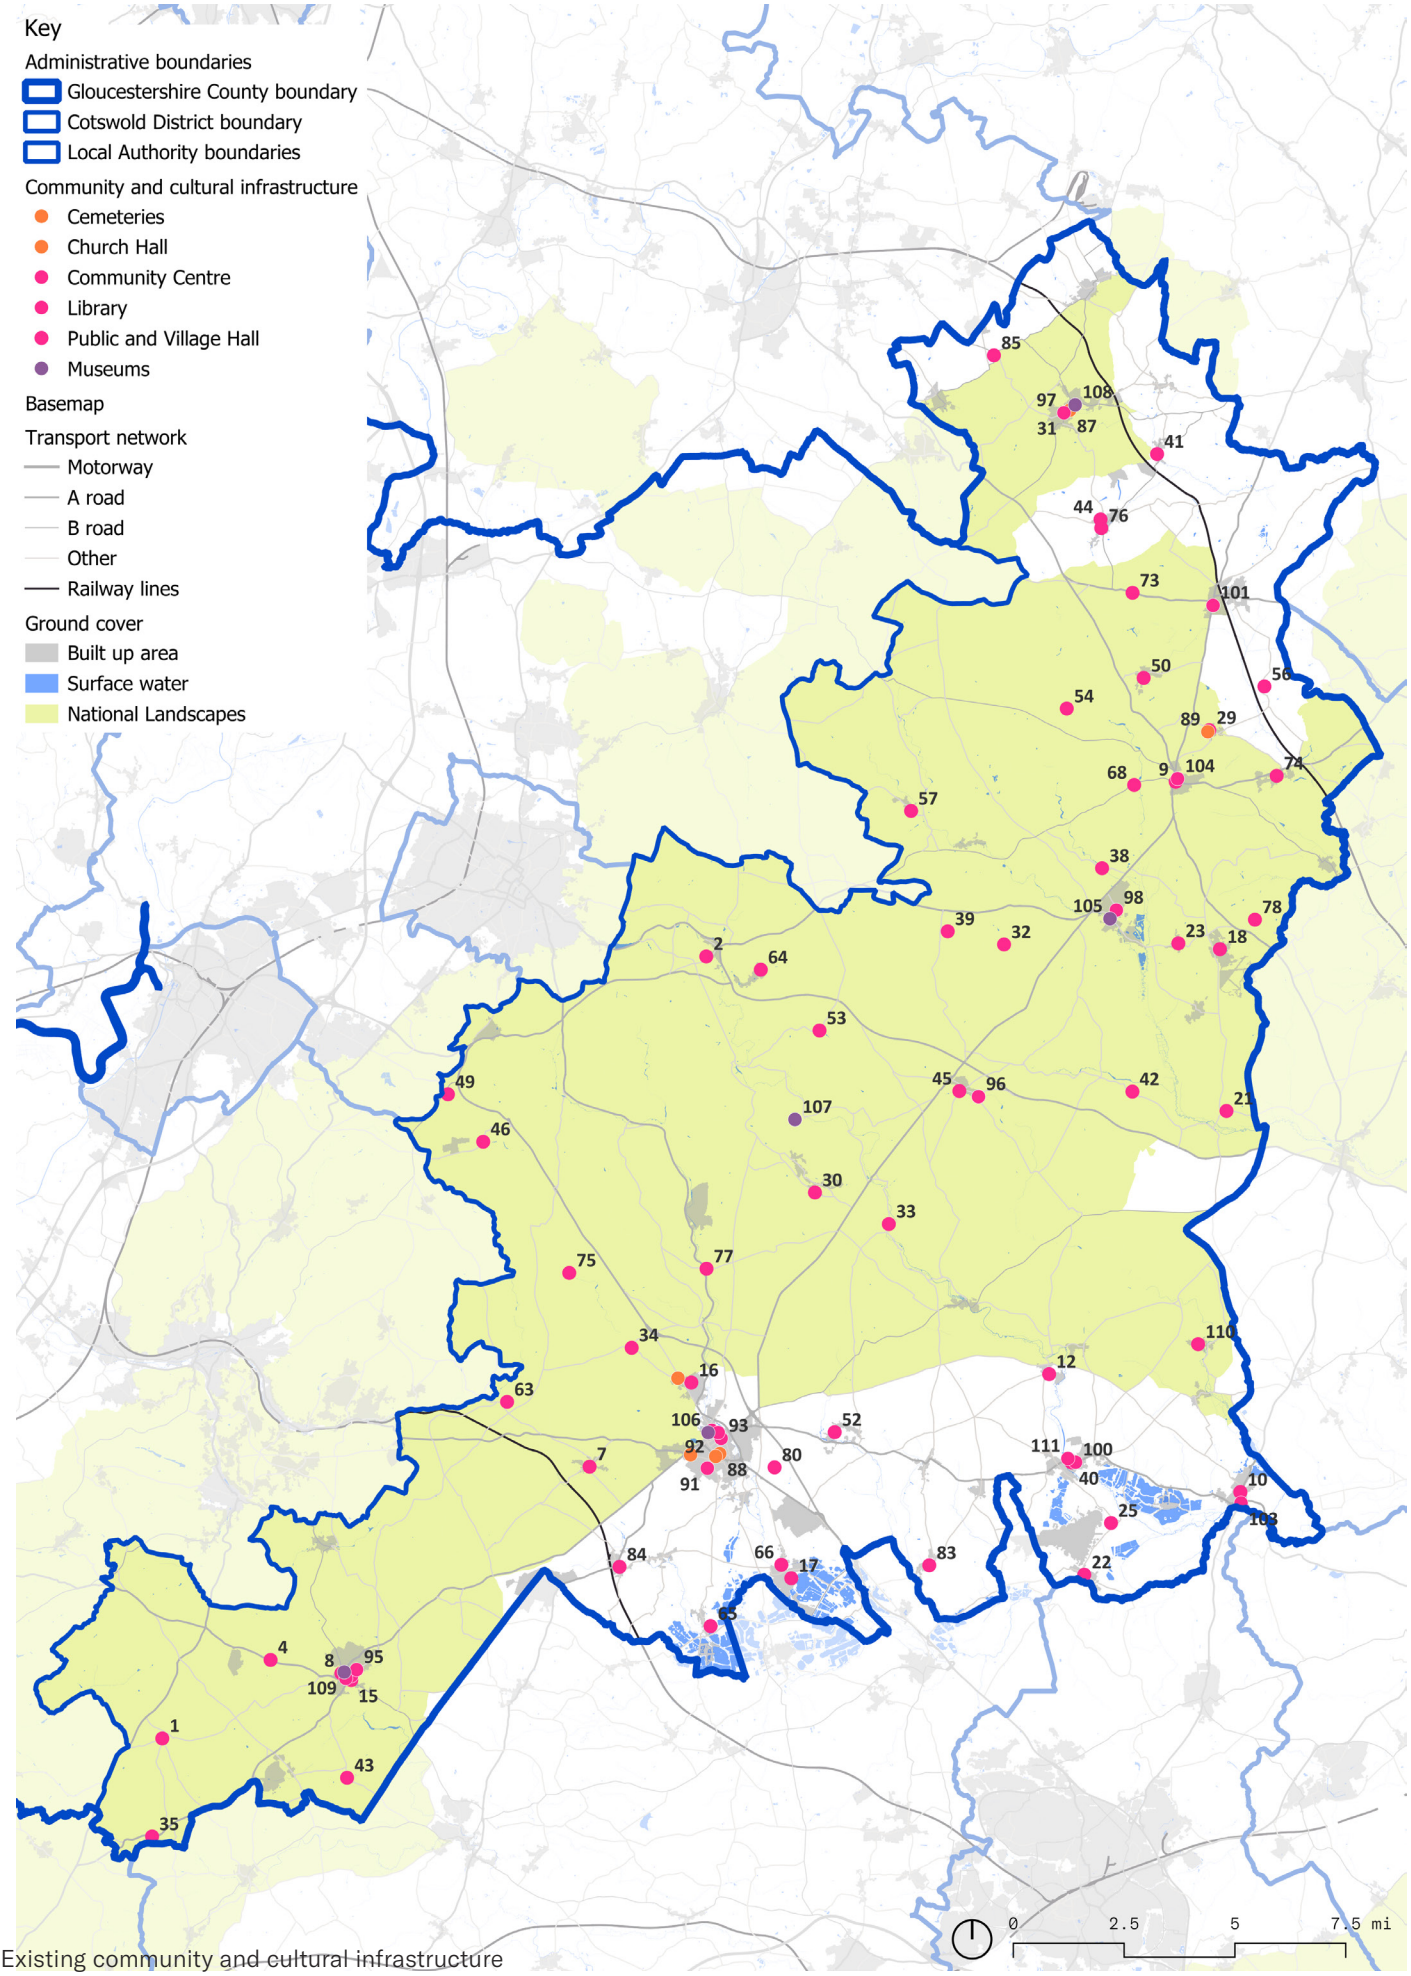
latest available at the time of writing is from the period April 2023 - March 2024[3].

Internal space data was shared directly by the GCC libraries team, table included overleaf. Museums, Libraries and Archives (MLA) advise a service requirement of 30m2 of public library space per 1,000 population which are shown in column 3. This shows that, compared to this recommended target, current library provision is lower than that suggested as required to serve the catchment population (derived from user postcode data). However, as set out in the libraries strategy above, GCC are looking at rationalising the existing assets to improve service offer and this is considered in Section 4 of this IDP.

Burial grounds and cemeteries

There are approximately 167 churchyard cemeteries within the district which are largely closed to new burials. There are two functional cemeteries in Cotswold District, both operated by CDC. The information provided in this IDP has been derived through engagement with the CDC Bereavement team and not part of a published strategy.

Chesterton Cemetery is the larger with 14,404 burials (April 2026) through a mixture of cremation remains, single double and treble depth graves. The operation is currently working on burials in Plot 29 which is the last available ground to be used for this purpose and will provide approx. 395 grave spaces remaining for single double or treble depth graves. Cremated remains are currently undertaken on Plot 36. This remains ongoing and no current capacity issues have been highlighted to date for this type. As an estimate of uptake, there have been 15 reservations at Chesterton cemetery over the past year (April 2025 to April 2026).



Stratton Cemetery totals 2,243 burials (April 2026), through a mixture of cremation remains, single double and treble depth graves. The operation is currently working on burials in Plot 12 which is the last available space at Stratton for full burials. As of April 2026, of the 113 spaces created, 97 remain and are available for single depth only.

Cremated remains are currently undertaken on Plot 11. This remains ongoing and no current capacity issues have been highlighted to date for this type.

As an estimate of uptake, there have been 23 reservations at Stratton cemetery over the past year (April 2025 to April 2026).

On this basis, Stratton Cemetery is considered to be most likely to have insufficient capacity over the plan period.

02.3

Primary healthcare

Approach

The Gloucestershire Integrated Care Board (ICB) is the NHS statutory organisation responsible for planning and funding and improving health services in Gloucestershire including emergency and elective hospital care, specialist medical care and surgical services, outpatient and diagnostic services, and maternity and paediatric care. They oversee and work closely with individual practices providing primary health care services. As part of the engagement on the IDP, the ICB were also supported by the NHS Property Services.

The Gloucestershire ICB produces public reports to monitor services and to manage its estate. The ICB sets out ambitions and a joint forward plan, as well as an estate overview, and risks and mitigations in the Gloucestershire Infrastructure Strategy and Summary (2024-2034)[1]. The ICB also produces an update from the commissioner (July 2025) for 2025/2026.

GIS data for hospitals and GPs was sourced from the NHS Patient-Led Assessments of the Care Environment (PLACE), dated February 2026.

As of 1 April 2026 and during the preparation of this IDP, NHS Gloucestershire Integrated Care Board has clustered with NHS Bristol, North Somerset and South Gloucestershire (BNSSG) ICB. While remaining separate statutory legal entities, they share a joint Chair, Chief Executive, and executive team, and are operating under a formal Joint Cluster Board. the Glocustershire ICB maintains its own Board, which holds responsibility for the governance and decision making of the organisation.

Commentary

According to public NHS data from March 2026, within the Gloucestershire ICB there are 698,253 patients registered with a GP practice and 64 practices across the County.

Two Primary Care Networks (PCNs) operate in the district, a PCN is a made up of a group of neighbouring GP practices that join together to serve a combined population, potentially share staff, services and resources, and deliver NHS services locally. Two PCNs operate in the district, North Cotswolds, which has circa 33,070 registered patients as of March 2026, and South Cotswolds, which has 61,661.

In Cotswold total of 16 facilities, estimated to be circa 7,560 sqm of practicing space (a mean size of 467.5sqm), with combined FTE of circa 60 workforce (May 2026) and serving 93,731 patients in total, with approximately two thirds of those in the South Cotswold PCN. This is equivalent to circa 80.7 sqm per 1,000 patients in Cotswold LPA.

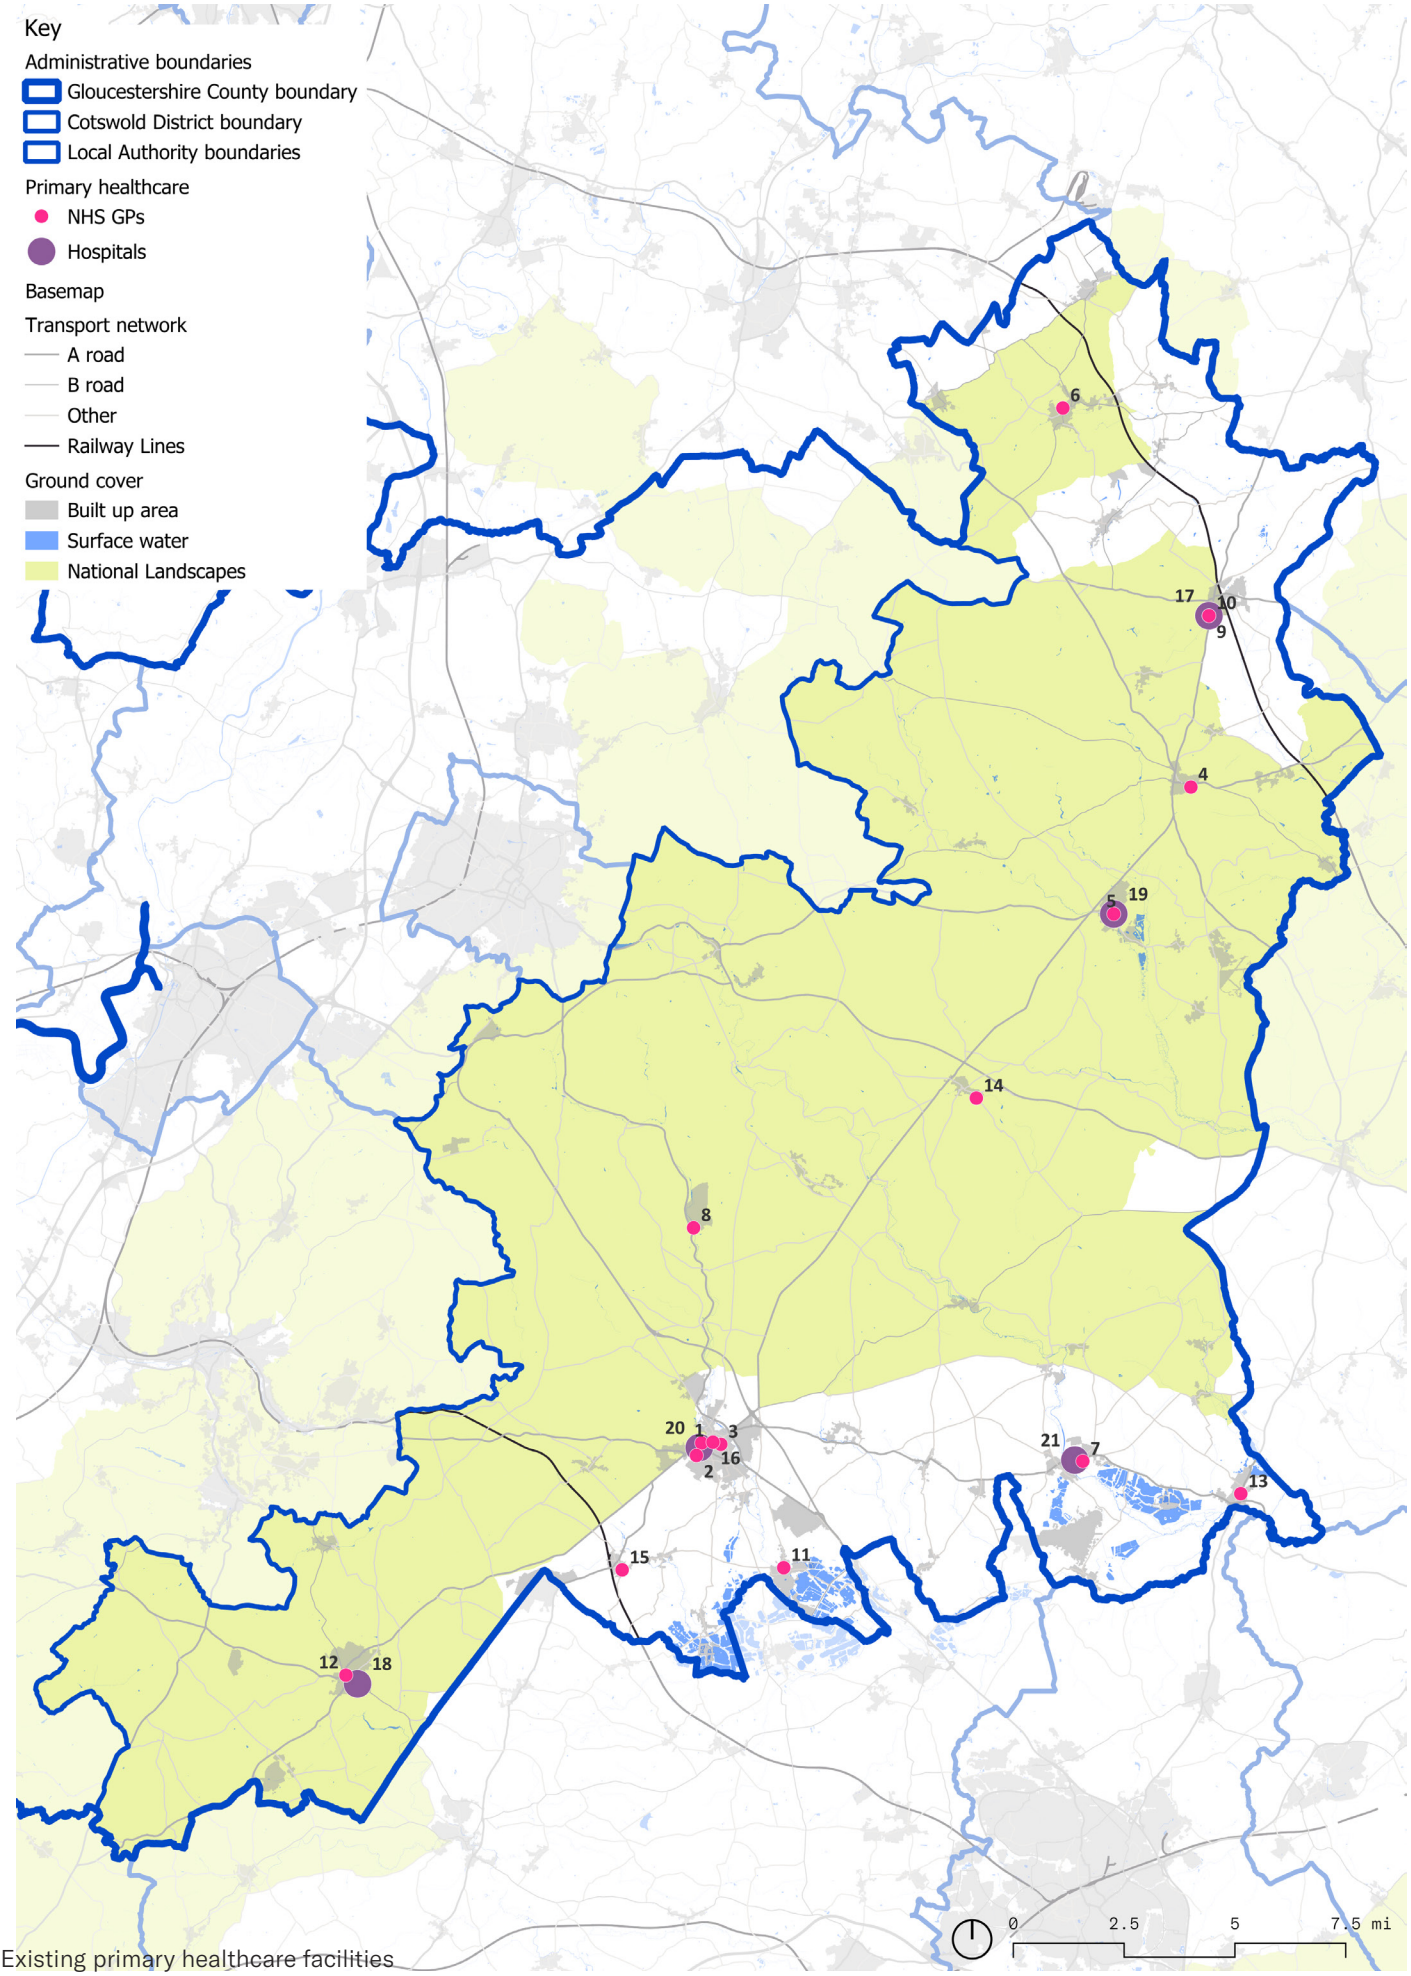
Several pipeline projects have been identified through evidence monitoring and engagement with Gloucestershire ICB. This includes a number of existing Future Funding Commitments and identified potential projects to provide additional capacity for an additional circa 18,000 patients over the next ten years. These are specifically relevant to the recommendations, covered in the subsequent section of this IDP, as there is an opportunity to help implement the current project size to provide for the additional capacity created by the proposed Local Plan growth. This includes the consolidation of existing GP surgeries in Cirencester and the creation of two new, larger and more efficient surgeries capable of handing a larger patient list.

The NHS has made a future funding commitment for the Park Surgery in Cirencester Town which would create capacity for 3,000 additional patients.

Another new facility will replace The Phoenix Surgery

1 See here: https://www.nhsglos.nhs.uk/wp-content/uploads/2025/06/Gloucs-ICS-Infrastructure-Strategy-Summary-Version-May-2025-Final-.pdf

Cirencester and will be located within The Steadings development, also to provide additional capacity for 3,000 patients. Chipping Campden's new site is a priority for the NHS and will provide for an additional 1,500 patients. This practice is likely to be provided on GCC owned land.



The Tetbury facility at Worwell Farm is currently under construction and will provide for 2,500 additional patients. Stowe Surgery still has capacity for up to 2,00 patients, and while Moreton-in-Marsh's two facilities are adequate for the current population, new provision will likely be required by growth.

There are existing commitments in existing section 106 agreements, such as The Steadings, to support the relocation although detailed sites are not yet identified for all projects.

Separately, a future funding commitment made to support the new Cirencester Neighbourhood Health hub, although land is required to support its implementation. Potential site although subject to further work, and therefore alternatives sought.

The Spending Review 2025[2] and the government's 10 Year Health Plan for England together set out some of the most significant reforms of NHS capital in recent history. The NHS has a 4-year capital settlement, extending to 2029/30, and a further 5 years of certainty for estates maintenance. This report continues to state that "Capital allocations do not cover additional facilities required due to housing developments. NHS organisations should work with local authorities to secure developer contributions for extra capacity. These contributions are additional funding recorded as a "credit" to capital departmental expenditure limit (CDEL), increasing spending power without reducing regular NHS allocations".

Emergency Services

Approach

A list of assets was created after identifying primary providers, then georeferenced on OpenStreetMap and added to the GIS workspace. This includes consideration of the South Western Ambulance Service, Gloucestershire Constabulary and Gloucestershire Fire and Rescue.

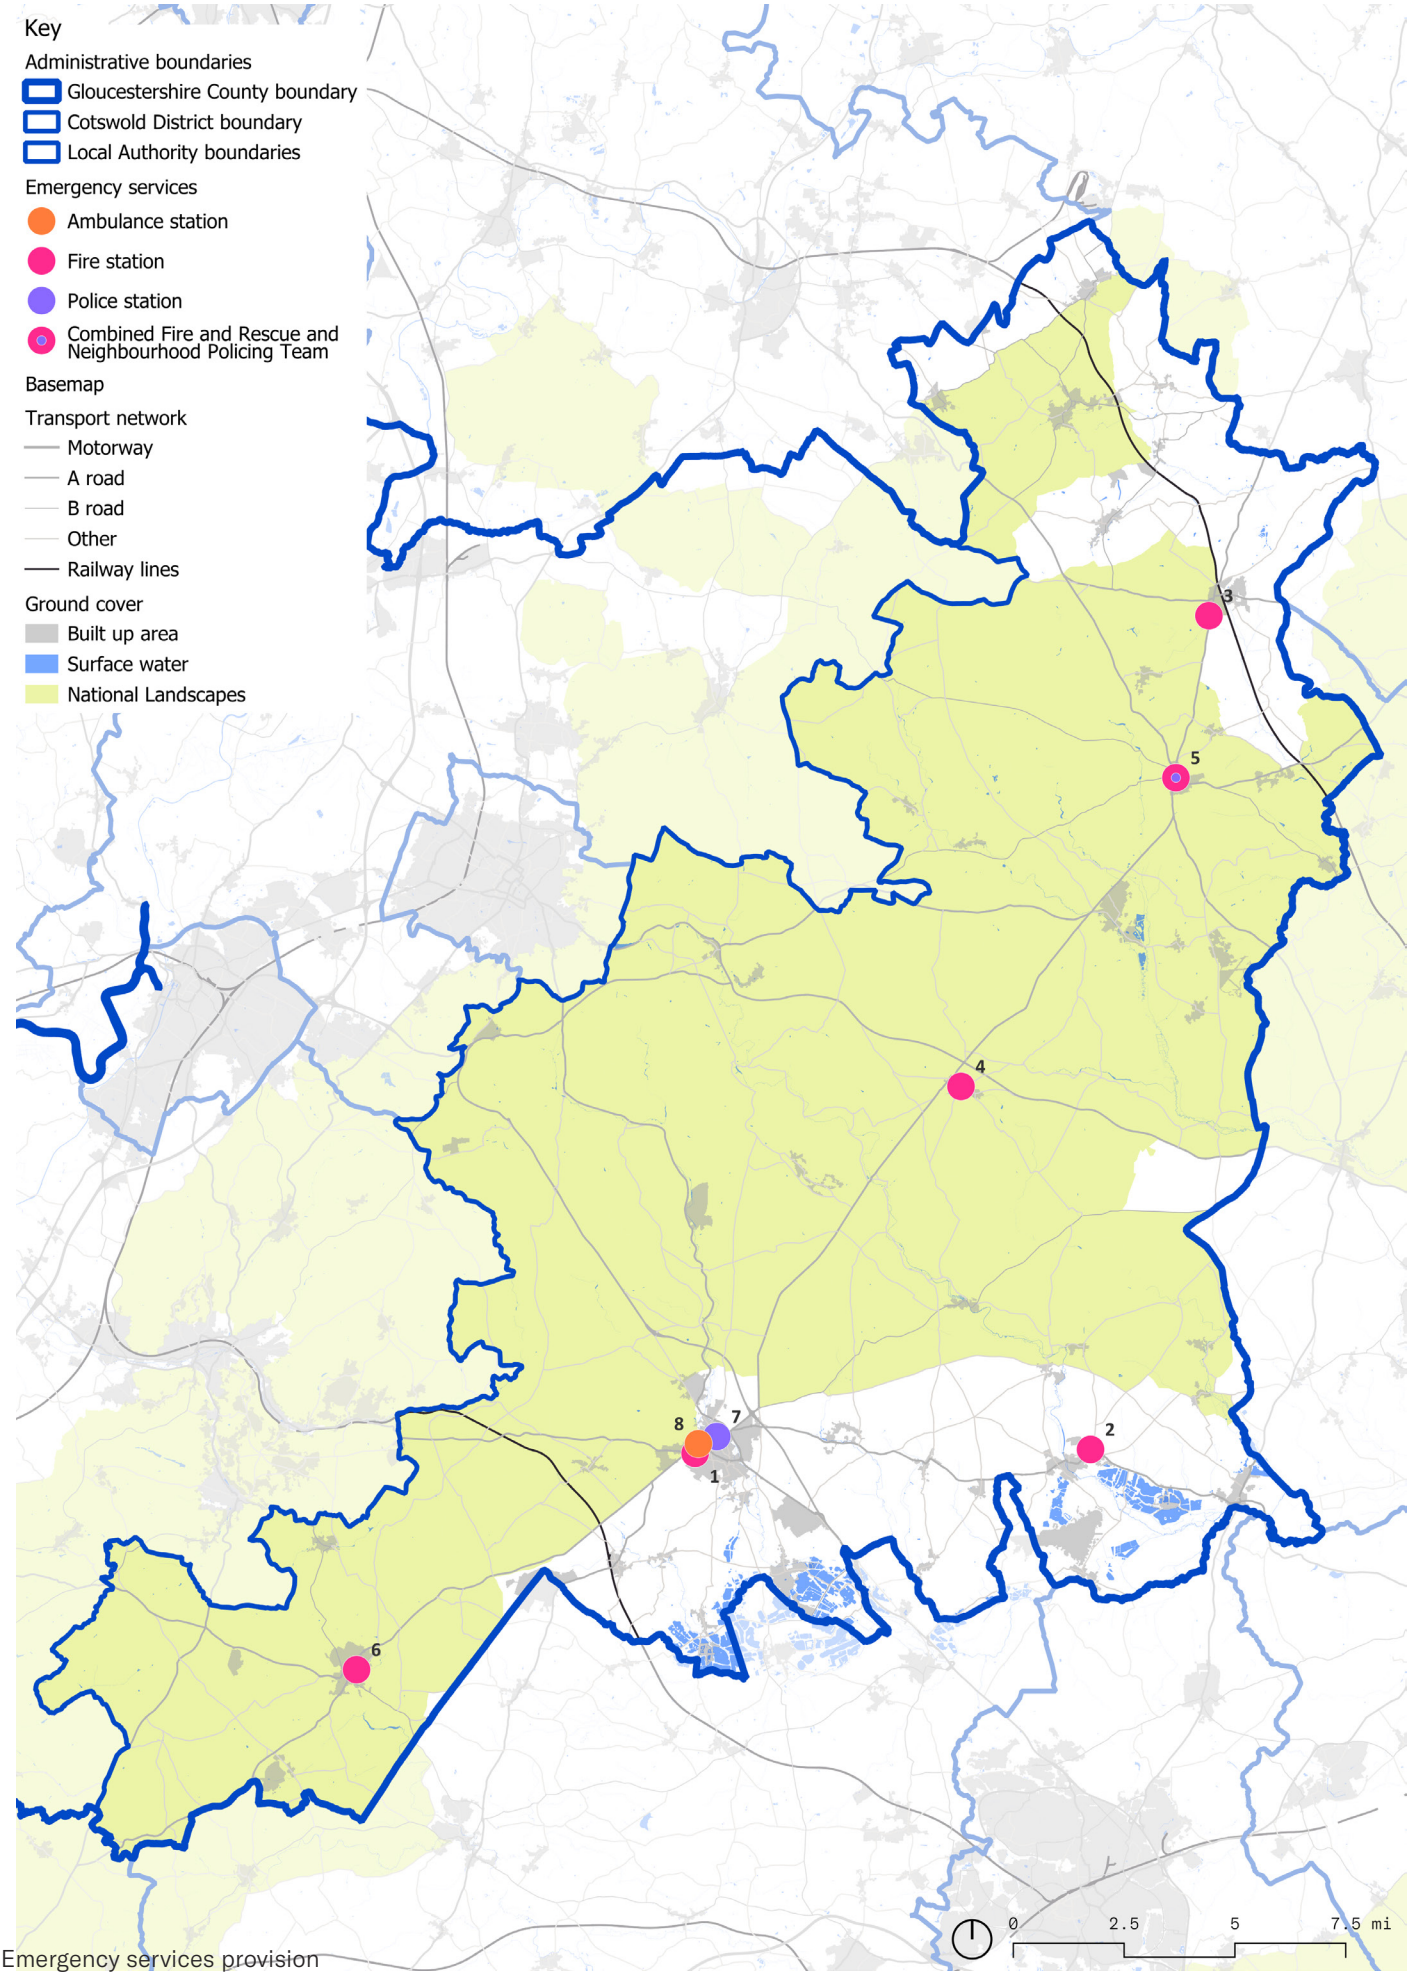
Ambulance

South Western Ambulance Service (SWAS) NHS Foundation Trust provides accident and emergency services throughout the South West region including Gloucestershire. The Great Western Air Ambulance Charity also serves Gloucestershire and surrounding areas. They staff the Cirencester Ambulance Station and have a number of community response posts across the district.

Fire

Gloucestershire Fire and Rescue Service fulfils the role of the Fire Authority in the county as prescribed under the Fire and Rescue Services Act 2004[1]. The fire authority is responsible for: Setting the overarching Corporate Strategy[2], making strategic decisions on expenditure and service, overseeing business activities, internal audits, and provision of an Annual Governance Statement as set out in the Accounts and Audit Regulations 2015[3].

Police



Gloucestershire Constabulary is the local police service in CDC, covering a total area of around 1000 square miles and a population of around 600,000 people. Day-to-day policing is delivered through six areas including Cheltenham, Gloucester, Tewkesbury, Stroud, Cotswold and Forest of Dean.

Stroud Police Station is located just to the west of the boundary, Cheltenham to the northwest, and Tewkesbury to the north, all of which provide custody and front-counter services for neighbouring districts.

Cotswold Community Safety Partnership (CCSP) brings together local organisations, including police and fire and rescue, to share knowledge and skills to prevent and reduce crime. There is one police station in the district at Cirencester. The police force is also enacting the Gloucestershire Rapid Improvement Plan 2025/26 to transform the operational service to make £12.3 in savings over the coming year. This will make 60 police posts redundant during that time. However, new dedicated Policy Community Support Officers (PCOS) will be taken on to ensure one for every neighbourhood.

Emergency services provision

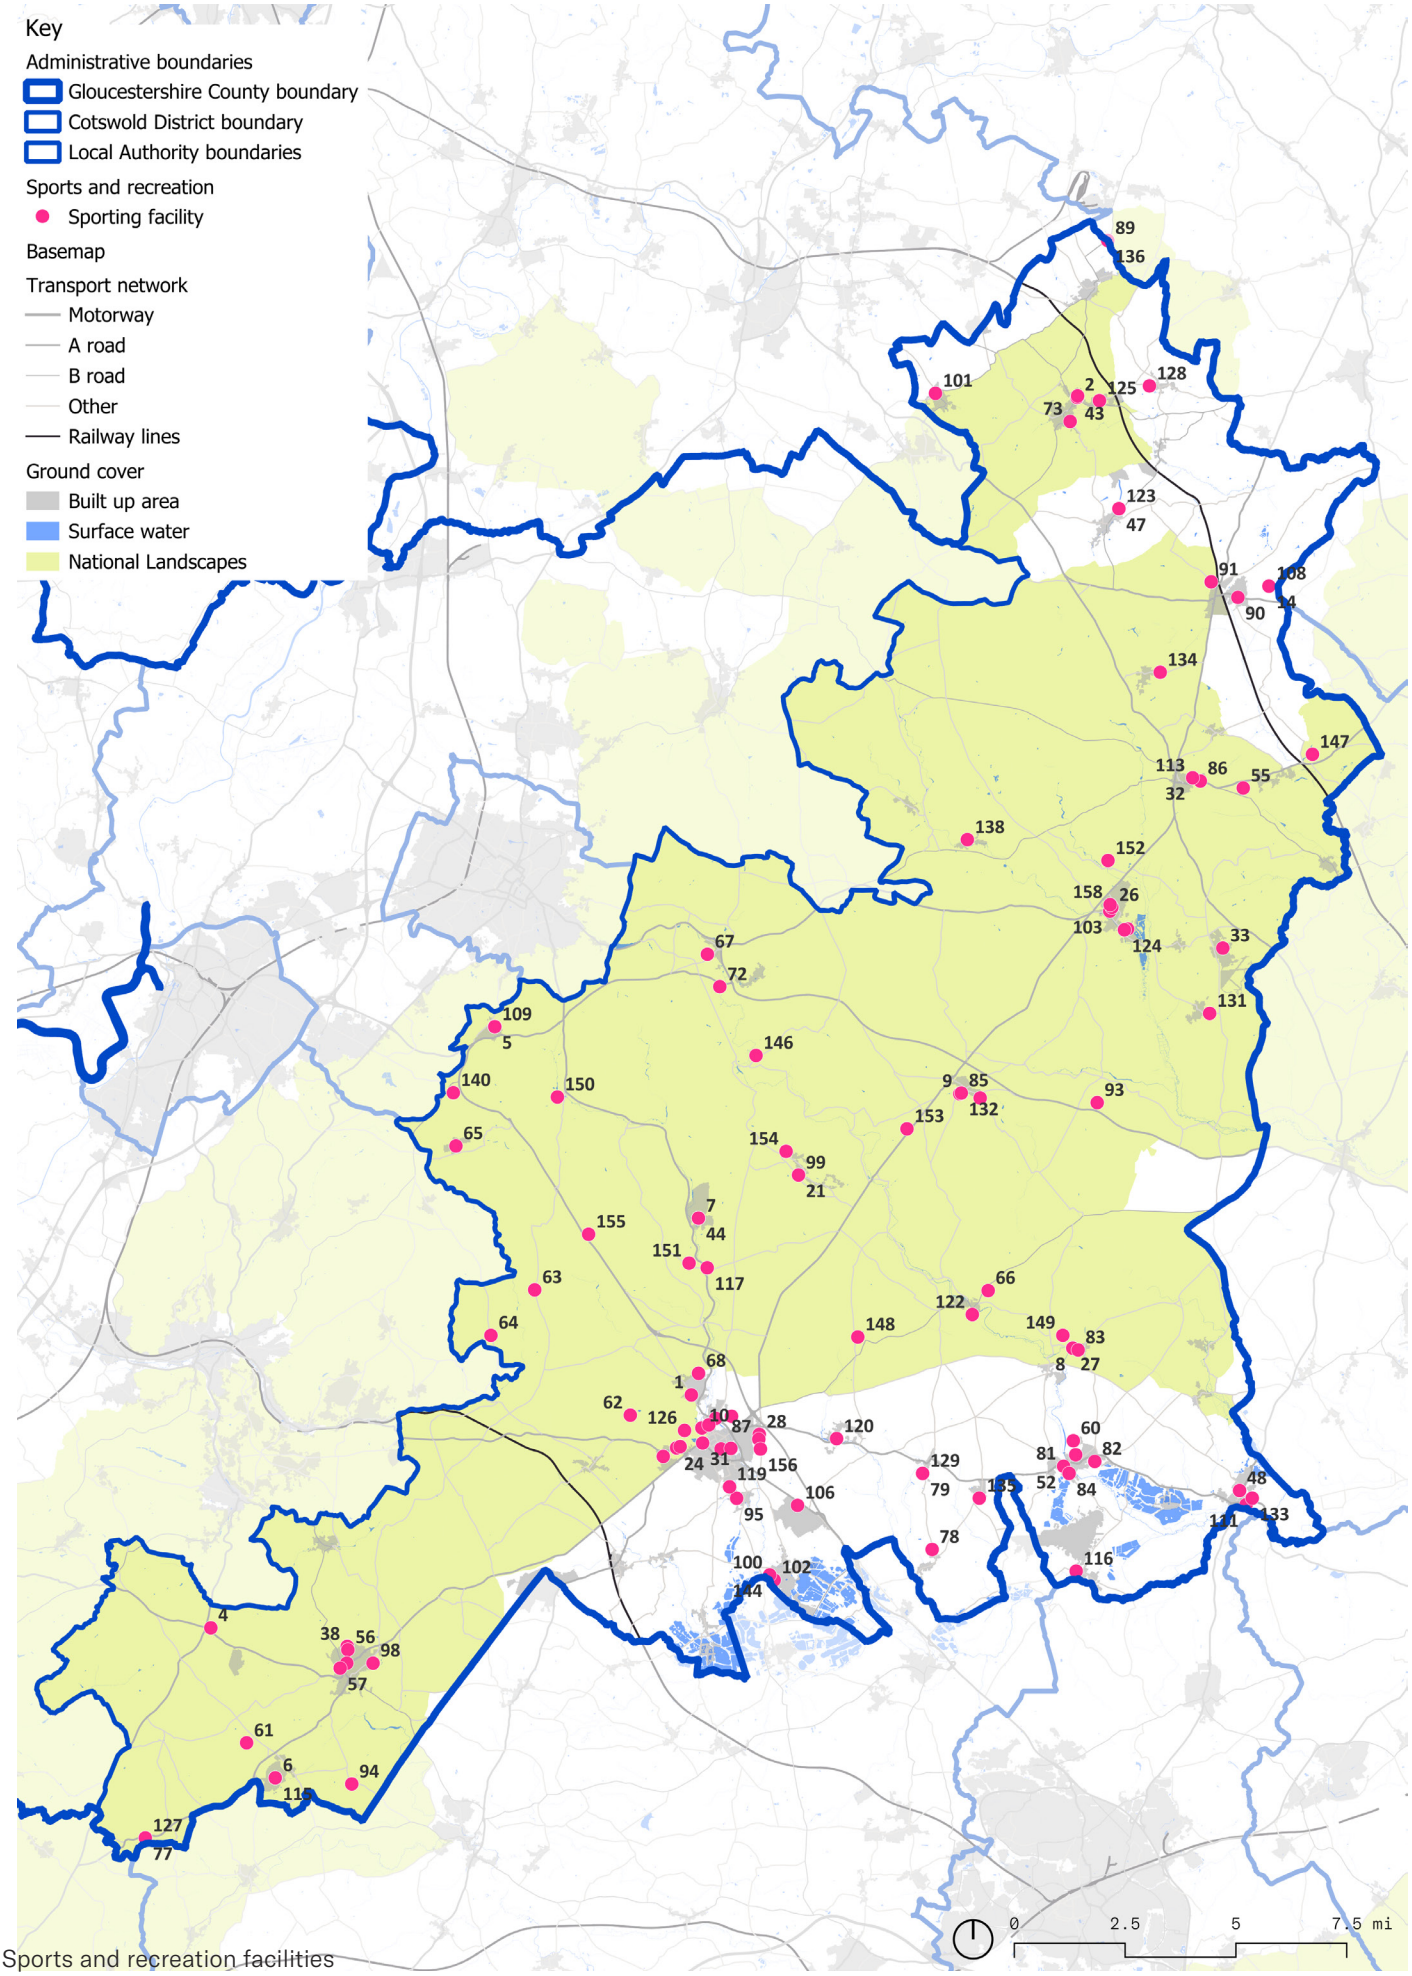
02.5

Sports and recreation

Approach

The IDP is supported by sport provision assessments being undertaken by ORH on behalf of Sport England (Facilities Planning Model Assessment of Sports Hall Provision for Cotswold District Council, and Facilities Planning Model Assessment for Swimming Pool Provision for Cotswold District Council). The Cotswold District Council Playing Pitch & Outdoor Sport Strategy & Action Plan (June, 2023) by KKP also provides a strategic framework for the maintenance and improvement of existing playing pitches as well as an assessment of provision as of 2023 and a maintenance plan up to 2031.

As a result, this IDP baseline has sought to integrate the baseline position into a single map, but otherwise relies upon the data provided by the supporting evidence base. Sport facilities demand includes the consideration of generated use beyond the district boundary as in reality as there are users outside of the LPA. This will be considered in the final recommendations in section 4.



Sport England Active Places Data was used for map points, dated February 2026, cross checked against the above studies. The map provides demonstrates the following distribution of sports facilities by type:

- PPS database points: 105
- Football pitches (outdoor): 54
- Cricket pitches: 36
- Sports halls: 26
- Swimming pools: 15
- Rugby Union pitches: 12
- 3G pitches: 11
- Hockey pitches: 7
- Polo pitches: 5
- Leisure centres: 3

Commentary

Capacity, condition and geographical spread of outdoor sports facilities can be found in the summary sections of the Playing Pitch and Outdoor Sport Strategy[1]. The report found that unlike some authorities nationally, there is not too much an over reliance for on the education sector to provide for most of the demand for playing pitch and outdoor sport facilities. However, where this is the case, particularly for the likes of hockey, it is imperative that future opportunities to secure tenure for clubs is explored and progressed where possible.

1 See here: https://www.cotswold.gov.uk/media/v0ulu014/a5-4-5-playing-pitch-strategy-and-action-plan-jun-2023.pdf

Sports and recreation facilities

02.6

Open space

Approach

The Cotswold Green Infrastructure Strategy (2023)[1] includes a comprehensive overview of both green and blue (i.e. water-related features) infrastructure and protected ecological sites within Cotswold. As a result, additional baseline mapping has not been produced to support this IDP, which instead cross refers to this more comprehensive evidence base which cross refers to a number of guidance and legislative requirements, such as the Gloucestershire Local Nature Recovery Strategy[2] and the Cotswold Nature Recovery Plan (2021)[3].

The Green Infrastructure strategy states that circa 80% of the district covered by the National Landscape and circa 11% of the district if covered by priority habitats and wildlife sites (Page 15).

The Green Infrastructure Study was prepared to direct the design and delivery of Green Infrastructure in the district to maximise its environmental, community and economic benefits. This culminates in an implementation plan for Cotswold District Council which will be brought forward by the emerging Local Plan. It is explicitly framed as both a strategic framework and a practical guide — for developers, statutory consultees, parish and town councils, landowners, and the public.

The Cotswold District has a large number of strategic scale open spaces, ranging from 20ha to over 500ha mapped. However, when mapped against the ANGsT (Accessible Natural Greenspace Standards) there are a number of deficits identified, particularly related to accessibility to open spaces.

As a result, there is considered to be a deficit of accessible and door step based access to green infrastructure.

The context and recommendations captured in the policy recommendations and Green Infrastructure potential in the Principal Settlements has been integrated into the later Sections of this IDP.

As set out in the LUC Recreation Mitigation Study (2026) many protected habitats and species can be damaged or disturbed by high visitor numbers. Activities like dog walking, cycling or even repeated footfall can disturb wildlife, reduce breeding success and lead to the erosion of fragile ecosystems. National planning policy and environmental legislation (the Conservation of Habitats and Species Regulations 2017 (as amended), or 'Habitats Regulations') include provisions that seek to ensure that plans and projects (including applications for planning permission) are not approved where they could harm the integrity of certain designated sites. Within Cotswolds, this includes Special Areas of Conservation (SACs) in particular the Cotswold Beechwoods SAC and North Meadow and Clattinger Farm SAC.

A Zone of Influence (ZoI) is a designated buffer radius around a protected ecological site (such as a Special Protection Area or Special Area of Conservation), relevant to the mitigation identified in Section 4. Identifying alternative green spaces forms a key part of the mitigation strategy for residential site allocations located near sensitive ecological sites and they will need to be delivered alongside new housing development.

02.7
Transport

Approach

Transport planning is the primary responsibility of GCC, which acts as the Highway Authority for the County and has closely supported the development of the emerging Local Plan evidence base. Transport infrastructure is planned for through the Local Transport Plan, which was most recently updated in March 2021, for the period 2020-2041. GCC are currently undertaking a review of the transport plan which will capture the emerging local plan growth in CDC.

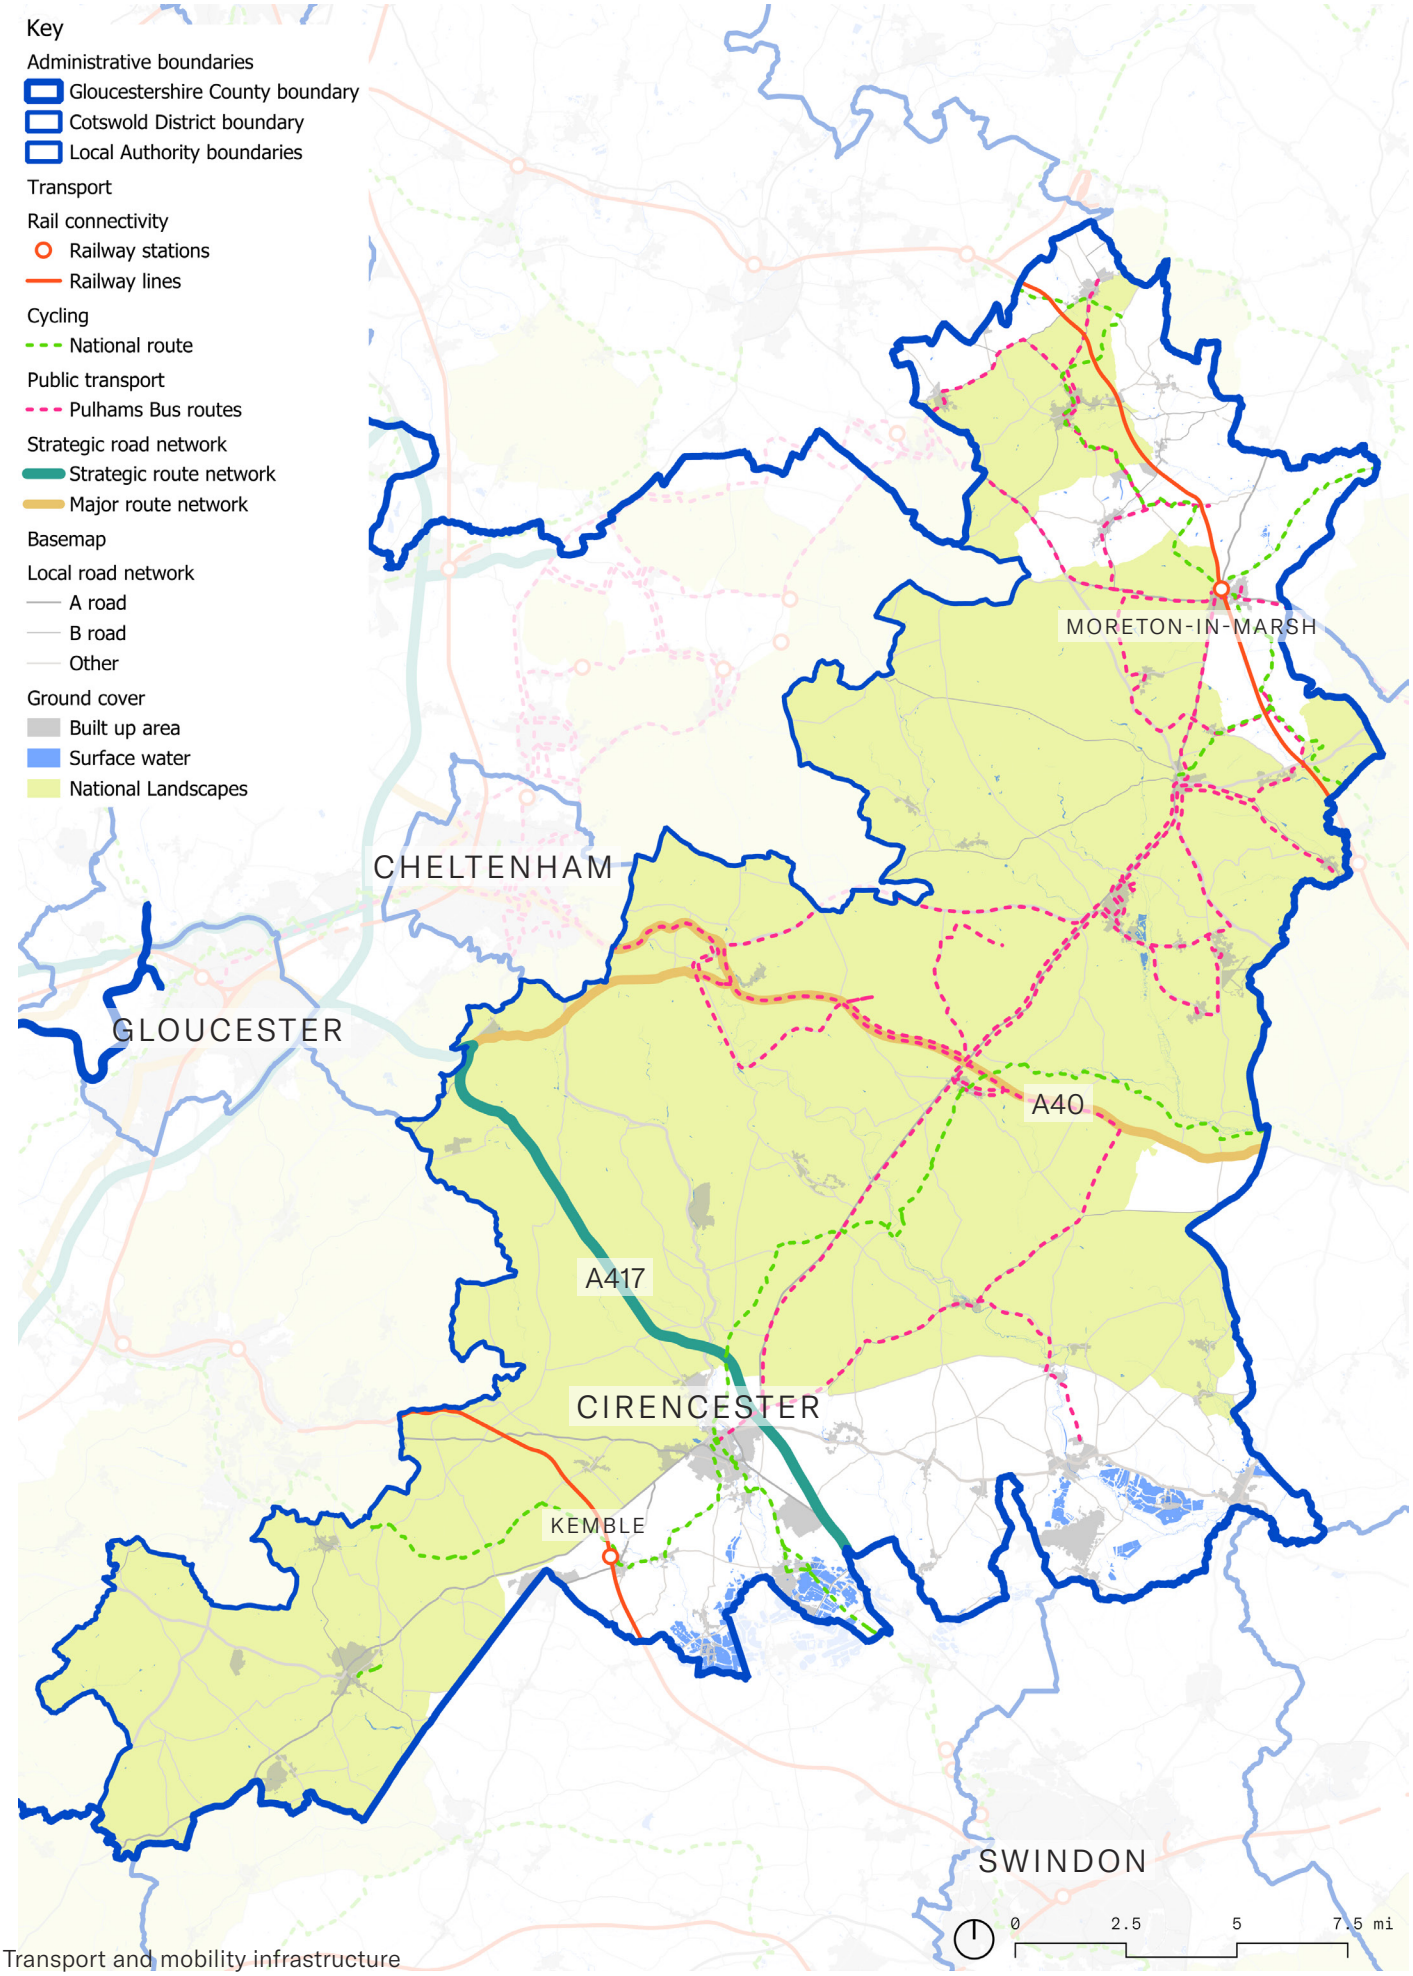
Detailed transport assessment and modelling has been produced by City Science consultants and key outputs of this study are integrated into this IDP.

A series of transport workshops was planned to feed information between City Science, the district and county transport teams and P+P to ensure the requirements of the transport workstream are adequately captured in the IDS.

Commentary

Given the combination of transport interventions being delivered at both the strategic scale and at the application level, the identification of pipeline projects assumed to be in place ahead of the growth planned within the emerging Local Plan is developing in parallel is less defined compared to other topics in this IDP.

However, there a number of committed projects already secured which are assumed to be implemented. This is particularly important where they are adjacent to existing developments which are still completing.



For example, improvements to the junction of A429/ A433 to mitigate congestion and provide better connectivity between Kemble and Cirencester in the current situation has been secured by the Steadings development.

For additional detail, on the approach to the modelling undertaken to support the emerging Local Plan please review the supporting transport strategy.

The Strategic Transport Assessment (July, 2026) identified that travel demand and movement patterns in the district are strongly shaped by its rural settlement pattern, ageing population, and dispersed provision of key services. The district has a population of 91,360 (GCC, 2023), with most residents concentrated in Cirencester, as well as the smaller towns of Tetbury, Moreton-in-Marsh, Stow-on-the-Wold and Chipping Camden. These act as the main origins and destinations for most trips in the district. Outside of these towns, low density rural settlements with longer distances to key services increase reliance on the highway network.

The population is older that the national average, with a median age of around 49 years and approximately 28% of residents aged over 65 years old (GCC, 2023). This age profile, which is also associated with higher levels of long term conditions, can increase dependence on accessible and reliable transport, particularly for essential journeys such as healthcare, education and shopping.

Overall, the combination of rurality and an ageing population means that travel demand is unevenly distributed and strongly car-reliant, with towns concentrating most activity and rural areas facing more limited accessibility.

Transport and mobility infrastructure

02.7.1

Pipeline investment

	CIL FUNDING ALLOCATIONS	DETAIL
1	Cirencester to Kemble Cycle Link – Cirencester End - The Cycle link connecting Cirencester to Kemble railway station is recognised in Gloucestershire's adopted Local Transport Plan (LTP). This bid is for the Preliminary design work, which will give the detail required for Gloucestershire CC to seek and secure funding to deliver the corridor – it focusses on the Cirencester end of the link connecting the town centre to the Steadings development.	— £100,000 in 2024/2025
2	Bourton-on-the-Water Interchange Hub - Local Corridor Transport Link Hubs provide an interchange facility that links a local catchment area into the core transport network. This facility would include: a bus boarding area compliant with the Equalities Act 2010	— £185,700 in 2024/2025
3	Footpath in Moreton-in-Marsh - footway and a pedestrian crossing across the A429 Fosse Way in Moreton-in-Marsh. This initiative seeks to provide a safe passage for pedestrians, connecting the Fosse Way Garden Centre with existing facilities and fostering a more pedestrian-friendly environment within the community.	— £146,040 in 2024/2025
4	The Forum Interchange Hub - The scheme proposes replacing the two existing bus stops on the western side of South Way with an 8-bay bus shelter to accommodate the high number of services and demand in this area.	— £66,300 in 2024/2025

	ROADS AND HIGHWAYS	DETAILS
11	Junction improvements at A429 / A433, between Cirencester and Kemble (CDC IFS 2022-2023)	— Identified by extant Local Plan Policy SA1
12	Improvements to the A429 at Fosse Way (CDC IFS 2022-2023)	— Identified by extant Local Plan Policy SA1
13	Junction improvements at A429 (High Street)/A44 (Oxford Street), Moreton-in-Marsh (CDC IFS 2022-2023)	— Identified by extant Local Plan Policy SA3
14	Junction improvements at A29 (High Street/ A44 (Bourton Road), Moreton-in-Marsh (CDC IFS 2022-2023)	— Identified by extant Local Plan Policy SA3
15	Improvement of Unicorn junction (A436/B4068), Stow-on-the-Wold (CDC IFS 2022-2023)	— Identified by extant Local Plan Policy SA1
16	Junction improvements at A433 (London Road / Long Street) Hampton Street / New Church Street, Tetbury (CDC IFS 2022-2023)	— Identified by extant Local Plan Policy SA1

02.8
Utilities

02.8.1
Water supply and waste water

Approach

Water companies serving the area have a statutory duty to serve new development both in water supply and treatment of wastewater.

Under the Water Industry Act 1991, providers are required to plan for and enable growth by providing new connections and maintain the system of water supply such that it can make supplies available to persons demanding them[1].

Capacity is not considered a constraint, given adequate time and planning certainty, which are both required in order to provide investment in additional capacity when and where it is needed. Strategic infrastructure such as extensions to wastewater treatment works can be planned and funded through the price review process, and coordinated with new development as part of wider Asset Management Planning.

In a number of areas throughout the district, the local sewerage system currently has limited capacity to accommodate additional development. The water industry's investment in new infrastructure requires a degree of certainty that sites will proceed to development. This involves a site either being allocated in an adopted local plan, or having a valid planning permission. The emerging Local plan is therefore a key step in future expansion in capacity.

Water and sewerage infrastructure is constructed and maintained by private providers who are regulated by Ofwat to ensure standards under the Water Environment Regulations policy 2017.

There are a number of organisations responsible for water supply and waste water in Cotswold District and they are summarised in the table overleaf.

Given the coverages within the supporting Water cycle Study (JBA, 2026) the baseline mapping of existing assets and provider coverage is not replicated here.

In addition, a number Regulation 18 consultation responses reference a lack of capacity (both for potable and sewage treatment capacity).

Cotswold District is classified by the Environment Agency as an area of serious water stress. The district's geology (Jurassic limestone and chalk) means rivers have low flows and groundwater is sensitive to abstraction. Water Industry National Environment Programme (WINEP) investigations are underway at several abstraction sources where there are concerns about the Water Framework Directive's (WFD) no-deterioration obligations.

The WCS, in line with Defra guidance, recommends a new Building Regulations target of 100 litres per day (l/p/d), reducing to 90 l/p/d in 2030, using a fittings-based approach, subject to viability testing by the LPA.

In terms of pipeline projects, there is a scheme planned for Blockley Wastewater Treatment Works 2020-2025 to increase the amount of flow to be treated to improve water quality of the receiving watercourse. The scheme is funded by Severn Trent and due for completion by 2025.

As part of early correspondence, Severn Trent flagged that there is an improvement scheme planned for Honeybourne WwTW to meet a new phosphate permit to improve water quality of the receiving watercourse by 2025. An element of this scheme will increase flows to treatment in line with the permit.

Severn Trent also confirmed there are plans for a sewerage network scheme to address current planned growth in the catchment (identified in existing adopted local plan and with existing planning permissions), this will look at providing capacity at Willersey – Badsey Lane Sewage Pumping Station (SPS) and Saintbury – The Cross SPS which is impacted downstream.

1 See here: https://www.ofwat.gov.uk/regulated-companies/markets/connections-market/new-connections/#:~:text=assurance%20terms').-,Planning%20for%20and%20enabling%20growth,sufficient%20evidence%20%E2%80%92%20for%20them%20to:

NAME	KEY RESPONSIBILITIES
Environment Agency (EA)	The EA are the environmental regulators in the UK. Their responsibilities are within water quality, flood risk and administrating water abstraction licences. They are a statutory consultee for many development plan documents and for some planning applications. They advise on environmental and infrastructure capacity issues across the water cycle.
Natural England (NE)	Natural England are the Government's advisors on the natural environment, which they have a responsibility to protect and enhance. In a WCS they may provide information on the conservation objectives, and guidance on, the protection of designated sites.
Bristol Water, Severn Trent Water, Wessex Water and Thames Water.	Bristol Water, Severn Trent Water and Thames Water are the water suppliers for the Cotswold district; therefore, they have a statutory duty under the Water Industry Act to maintain an efficient and economical system of water supply within their areas and supply households with a reliable and sufficient water supply.
Severn Trent Water, Thames Water and Wessex Water	Severn Trent Water, Thames Water and Wessex Water are the sewerage undertakers for the district. This means they have a duty under the Water Industry Act to provide, improve and extend a system of public sewers (for both domestic and trade flows) so as to cleanse and maintain those sewers (and any lateral drain), to ensure that the area that they serve is effectually drained. There is also a duty to make provision for the emptying of those sewers, normally through sewage treatment works or where appropriate through discharges direct to watercourses.

As the proposed growth in the emerging Local Plan is largely in addition to existing planned growth, it is possible that the scope of this existing scheme will need to broaden or an additional scheme may be required. This is covered in section 4.

Wessex Water, responsible for a small element of the District, have a proposed AMP8 scheme at Tetbury WRC for Phosphorous Removal and chemical permit. The scheme is now in design and construction is due to commence in 2027.

02.8.2

Digital infrastructure (telecoms)

Telecoms infrastructure is constructed and maintained by private providers who are regulated by the Office of Communications (Ofcom[1]) to ensure standards under the Communications Act 2003. The following telecoms providers operate within the district:

— Cotswold Telecoms Services (offers high-speed fibre)
— Wurzel (focuses on superfast broadband)

As part of the GCC Digital infrastructure Inclusion and Innovation strategy, they have set out a 2026-203 action plan[2]. A primary action within this is to extend gigabit-capable digital infrastructure across Gloucestershire, working in collaboration with the national Project Gigabit programme and broadband providers to accelerate rollout in urban and hard-to-reach rural areas.

As part of that strategy GCC highlight that fixed line broadband continues to be the primary digital infrastructure in the UK, providing most households and businesses with access to the internet. This infrastructure also supports and enables much of the UK's mobile 4G and 5G mast cells. In 2025, 98.8% of properties in Gloucestershire have access to a superfast (>30Mbps) connection, continuing the deployment of faster more reliable gigabit-capable full fibre broadband across the county is essential for delivering long-term economic growth.

The IDP does not produce a detailed assessment of digital infrastructure capacity however, assumed that against local plan growth, further investment and expansion of the network will be required. Developers of strategic housing sites must identify an appropriate provider under The Internet Services Providers' Association UK to ensure a 'connectivity plan' is produced at an early stage.

02.8.3

Electricity

Approach

The provision of electricity in England is primarily managed by the National Grid who operate the distribution and transmission network. The Office of Gas and Electricity Markets (Ofgem) serves as the regulator overseeing the markets, ensuring consumer protection. Individual energy operators are then responsible for the actual construction and maintenance of energy infrastructure. Scottish and Southern Electricity Networks (SSEN) is the largest operator in Cotswold District. Other parts of the district are covered by Western Power Distribution including in the vicinity of Moreton-in-Marsh and Mickleton, and in the South east (excluding Cirencester but including some areas of Kemble).

SSEN's Distribution System Operator (DSO) 'Whole System' approach - May 2026 and the publication of the Distributions Network Development Plan[1] (May 2026, NDP) is well timed to understand current projected capacity, overview of planned works and to underpin estimated new connection and reinforcement works which may be required. The reporting gives users access to information pertaining to SSEN's network plans for the next ten years in relation to 11kV networks and the Minety Strategic Development Plan[2] (Feb 2026) provide additional detail of currently planned reinforcement works.

Forecast generation and headroom capacity estimates are publicly available via the Network Scenario Headroom Report[3] (NSHR). This report is published to enable customers, developers, generators, local authorities and other interested third parties to view the possible headroom capacity at their Primary Substations and Bulk Supply Points (BSP) up to 2050, set out to four scenarios of demand and generation forecasts associated with a transition to net zero. Estimate requirements for domestic gas is not estimated within this IDP given the emerging Local plan requirements and we have therefore focused on the minimum headroom scenario.

As a result, whilst the NSHR provides a view of the future in terms of potential available capacity and constraints on the network, SSEN encourage any party using this information in their decision-making process to engage with them at the earliest instance.

For the electricity distribution network, from substations to the supply of homes, SSEN have indicated that electrical reinforcement may be required in a number of locations across the district to cater for new development at the strategic scale, towards the end of the plan period. An overview of the SSEN infrastructure relevant to the Cotswold and a summary of capacity/ generation headroom assessment is summarised in Table 1 overleaf. This is current as of May 2026, but reflecting some data from November 2025. Although dependent on electricity consumption (particularly in relation to EV charging, removal of gas and increased uses of heat pumps) National Grid Electricity Distribution annual report for 24/25 estimates that baseline consumption per home is approximately of 3,100 kWh and this is helpful context for the scale of development which can currently be served on top of planned growth within the existing infrastructure.

However it is noted that energy planning is based on peak demand and this has the potential to increase over the plan period and should be monitored[4].

Further information is not forthcoming without electrical loading data only available at the application stage, but it is not foreseen that electrical infrastructure would be a constraint to development if suitable planning in advance, but may impact timing of connection (and therefore occupation.

Requirements in this regard would be agreed in discussion with developers with the local connection infrastructure funded by developers and could impact delivery rates if not considered at the outset.

02.8.4

Flood management

Flood risk management sits at the intersection of infrastructure planning, development management, and environmental policy requirements. This IDP does not cover aspect within the Strategic Flood Risk Assessment (SFRA) Levels 1 and 2, or consider evidence on Flood Zones or SuDS requirements. However, best practice IDPs consider flood management as an infrastructure theme to identify if any strategic scale projects are required to serve the emerging Local Plan growth beyond that which is capable of being delivered at the site level and to consider the shared responsibility to not increase flood risk as part of new development.

GCC is the Lead Local Flood Authority for Cotswold, but they work in tandem with CDC development management officers and the Environment Agency in the application of relevant standards, requirements and guidance at the application level.

The Flood and Water Management Act 2010 places a statutory duty on the Environment Agency to develop a National Flood and Coastal Erosion Risk Management Strategy for England. This strategy[1] describes what needs to be done by all risk management authorities (RMAs) involved in flood and coastal erosion risk management for the benefit of people and places. This includes: the Environment Agency; lead local flood authorities; district councils; internal drainage boards; highways authorities water and sewerage companies.

At the more local level, GCC have prepared a Local Flood risk Management Strategy and provided a 25-27 Progress and Implementation plan[2].

The Strategy focusses on GCC's responsibilities to manage risk of flooding from ordinary watercourses, surface water and groundwater and is clear that other Risk Management Authorities are responsible for other sources of flooding, for example main river flooding lying with the EA. GCC has committed to allocate at least £2.1m a year to flood prevention across the county.

GCC is leading on approximately 23 flood alleviation schemes, funded through GCC resources (capital and revenue) and a variety of external sources, primarily Flood Defence Grant-in-Aid and Local Levy.

Although GCC are moving away from a parish to a catchment based prioritisation programme, a number of Cotswold Parishes have received support and completed works (such as Andoversford, Blockley, Bourton-on-the-Water, Chipping Camden, Northleach with Eastington), some are in progress (such as Cirencester, Fairford, Kempsford and Moreton-in-Marsh) and others are flagged as area for potential intervention at the local scale.

Beyond this, no other strategic scale flood defence work has been identified to be relevant to the Cotswold baseline.

03
Site allocations and population modelling

This section of the IDP sets out the proposed emerging local plan growth scenario and introduces the proposed sub areas used throughout the remainder of the IDP.

03.1

Site allocations and population projections

03.8.1

Indicative housing and population projections

This IDP is based on the proposed spatial strategy within the Regulation 19 consultation version of the plan and has been developed in parallel to site selection and policy drafting.

As the IDP concerns both the impact of proposed sites individually and the potential impact of cumulative growth, the estimated housing growth is attributed to sub areas, set out overleaf. For each sub area, this will combined the proposed Strategic and non-strategic site allocations, as well as estimated windfall growth per parish set out in the emerging Local Plan.

The sub areas are proposed based on alignment with existing policy approaches (notably to North and South Cotswold, used for Secondary school planning and in the Gloucestershire Local transport Plan). To align with the apportionment of CIL and the existing and emerging neighbourhood plans, parish boundaries are used to delineate sub areas and are centred on the areas of largest potential growth and which share a functional relationship.

This is not to suggest that any impact of proposed development would be limited to these sub areas but they are used to help identify where mitigation is required and apportioned to development sites based on their estimated and evidenced impact. At the application stage, the potential impact of individual applications will be reviewed by officers and may differ from the sub areas proposed in this IDP.

Typically, strategic sites fall within their own sub areas, although the those sites which share a key functional relationship to Cirencester and its town centre are considered collectively. The remaining parishes outside of these sub areas have been combined into “North Cotswold” and “South Cotswold” to recognise that there are infrastructure needs arising from windfall based growth.

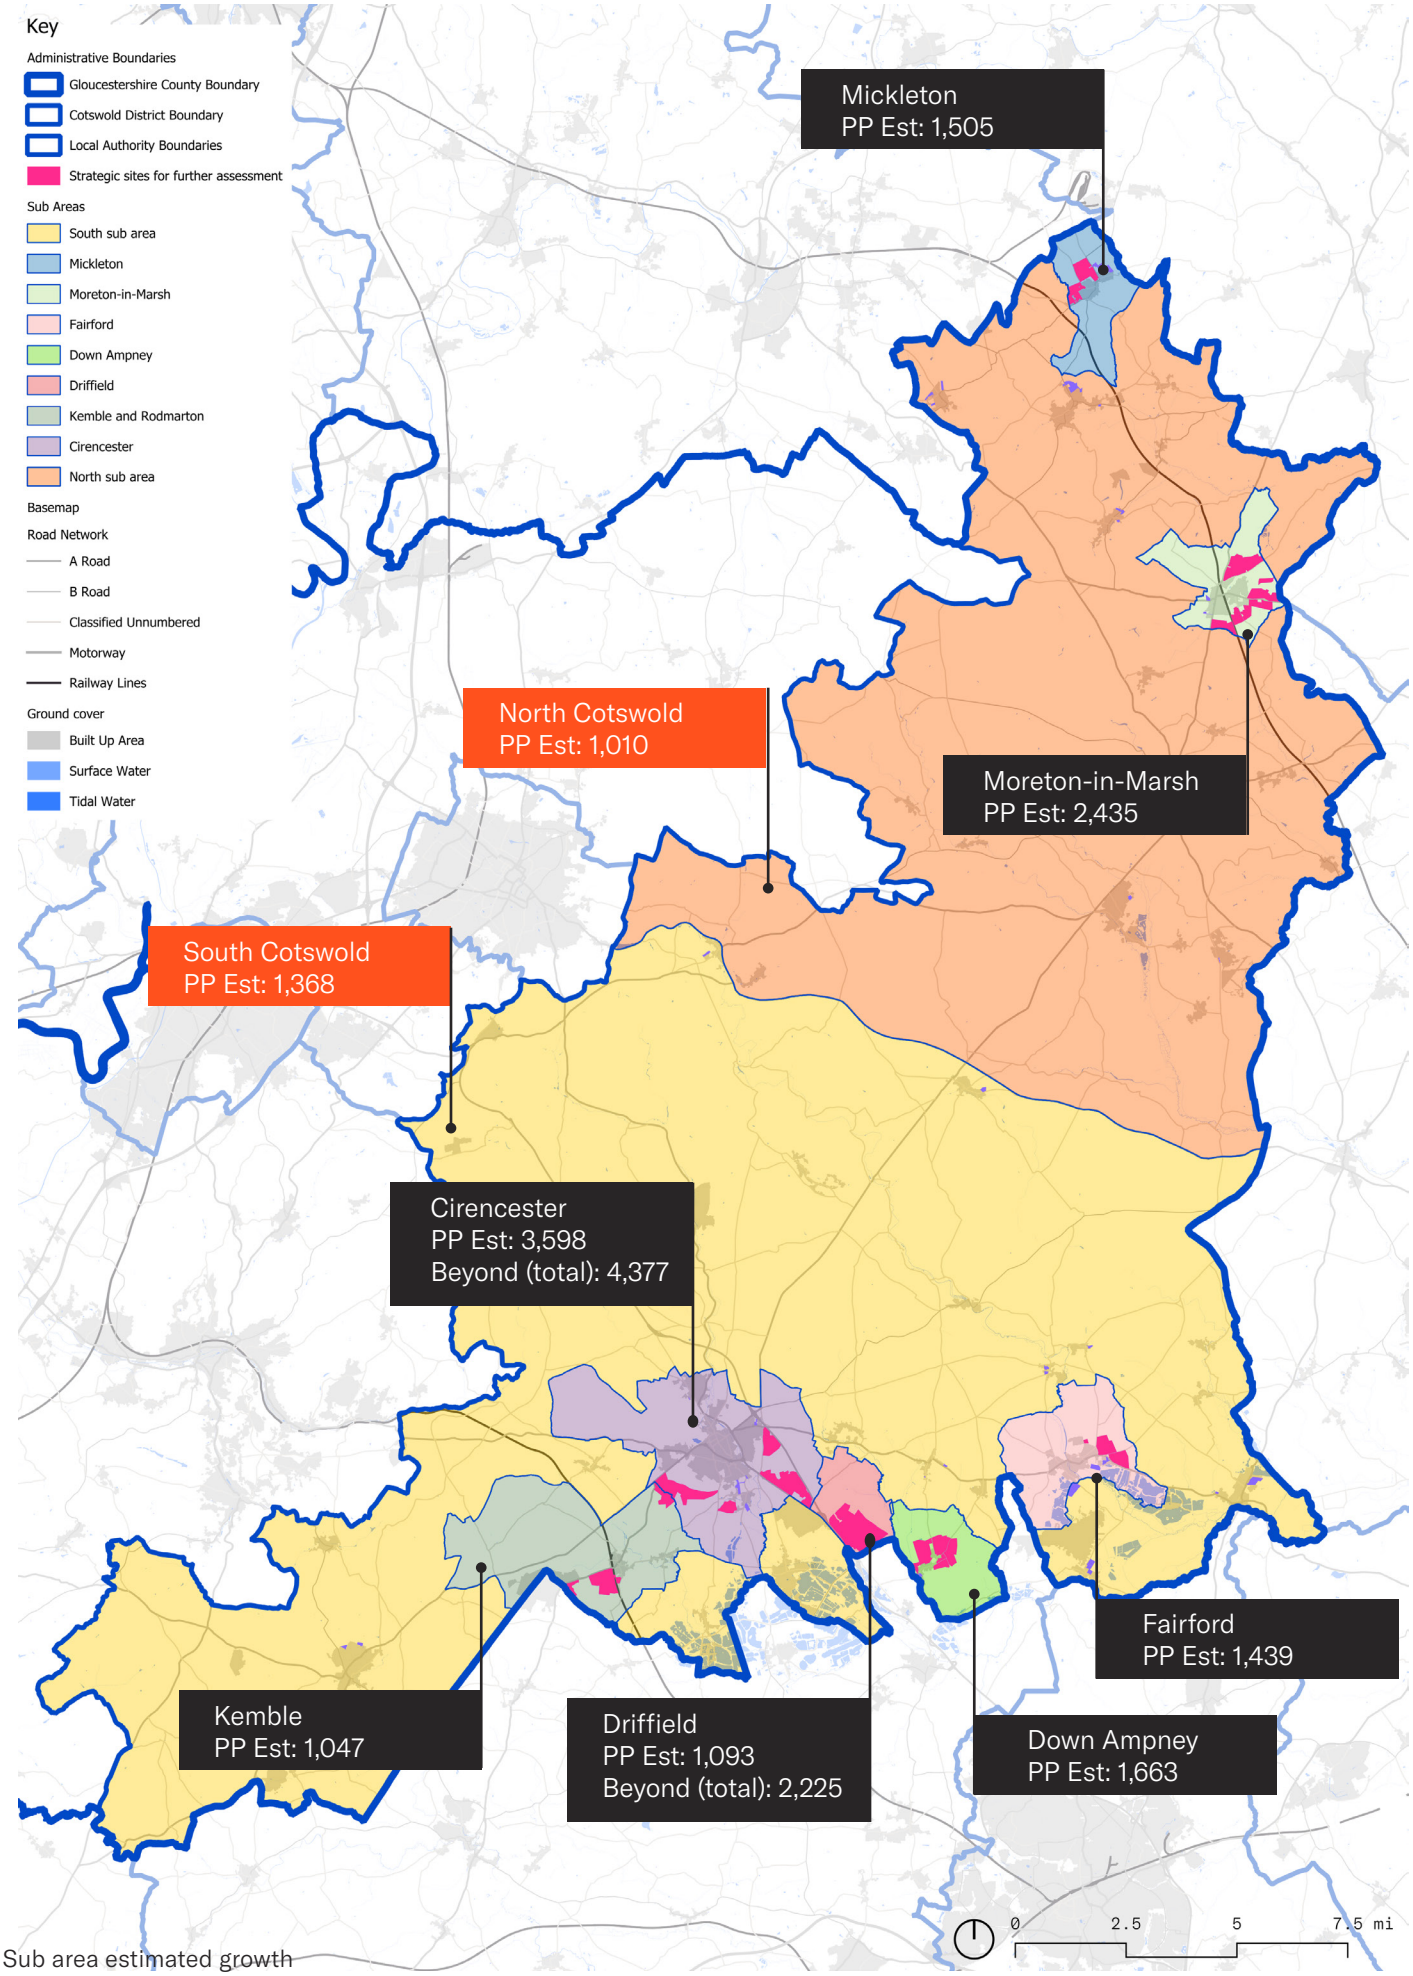
There are a small number of parishes where the proposed boundary between North and South Cotswold (namely the A40) does not align as the parish boundary and therefore, some parishes straddle the North and South sub areas. The total estimated windfall for these is comparatively low and, by its nature, difficult to predict. For the purposes of this IDP they have been designated for windfall in the below sub areas below:

South Cotswold:

- Andoversford (Village is to the South of the road);
- Barrington (area outside of National Landscape is to the south of the road);
- Hampnett (the majority of land within parish is to the South of the road);
- Northleach (the alluvial and the majority of land within parish is to the South of the road); and
- Windrush (area outside of National Landscape is to the south of the road).

North Cotswold:

- Farmington (the majority of land within parish is to the North of the road);
- Sherborne (the majority of land within parish is to the North of the road);
- Shipton (Village is to the North of the road); and
- Whittington (the majority of land within parish is to the North of the road).



The figures within the plan period are based on the Iceni Housing Delivery Trajectory work. It is important to note that some sites, notably the Steadings southern extension and the Strategic Site at Driffiled are proposed to be allocated at their full potential capacity although they are not currently anticipated to be built out to completion within the plan period. As a result, mitigation for these sites are calculated on their full capacity, whilst the assessment to emerging Local Plan need does not include their full build out. However, for the majority of the allocations proposed, including all windfall and non strategic sites, these are considered deliverable within the plan period.

To aid in understanding, the proposed growth scenario at the heart of this IDP is set out overleaf.

Within the remainder of the sections of this IDP the estimated population which requires mitigation is set out, with some infrastructure themes taking a different approach. For example, open space requirements are based on total population, whilst education requirements are based on forecast pupils and primary healthcare on increase in patients. However, for the majority of items the estimated household occupancy rate has been assumed to be 2.2, aligning with projected demographic work for Cotswold.

On the basis of an estimate Local Plan growth scenario of 15,158, this is an estimated population considered in this IDP of 33,347.

This figure is considered to potentially be higher than could be experienced over the plan period, as there will be a number of existing households within the proposed affordable housing already resident in Cotswold, but is considered to be robust for estimating infrastructure requirements at the plan making stage.

Sub area estimated growth

RESIDENTIAL GROWTH

CATEGORY	WITHIN PLAN PERIOD	BEYOND PLAN PERIOD
Strategic sites	11,30	13,212
Non-strategic sites	1,568	1,568
Parish windfall	2,289	2,289
Total additional growth	15,158	17,069

EMPLOYMENT GROWTH

SITE NAME	TYPE / USE CLASS	AVAILABLE DEVELOPMENT LAND
Cirencester and surrounding villages		
Steadings southern extension	B2, B8 and E(g)	2.5 ha
Land south east of Cirencester and south of Preston	B2, B8 and E(g)	5.6 ha
South Cotswold Area		
Strategic extension to the north-east of Fairford	B2, B8 and E(g)	4.2 ha
Strategic extension to the south-west of Kemble	B2, B8 and E(g)	8.6 ha
New settlement to the south of Driffield	B2, B8 and E(g)	10.9 ha
Total additional growth		31.8 ha

SUB AREA	SITE ALLOCATION/ WINDFALL ASSUMPTION	LOCAL PLAN PERIOD GROWTH (2026-2043)	(TOTAL) CONSIDERATION OF BEYOND PLAN PERIOD GROWTH

04 Growth requirements per theme

This section of the IDP sets out the estimated infrastructure requirements per theme to inform policy development, the approach to assessing future planning applications for potential obligations, CIL spending and other wider business case and grant funding applications.

04.1
Education

04.1.1
Infrastructure requirements from Local Plan growth

Infrastructure standards

GCC will assess the impact of new development in terms of the ability of local primary and secondary schools to offer places to children arising from the development.

For large-scale schemes where a new school is required, in accordance with the DfE Guidance, the expectation will usually be that land, financial contributions and potential direct delivery (subject to adherence with GCC requirements) to meet the needs will be provided on-site.

Where there are multiple new developments that together require a new school, GCC splits the full cost of education infrastructure between developers based on estimated pupil yields arising from development. All new schools provided in this way will need to meet applicable GCC design standards at the time the development is built. These design standards are based on DfE's "Building Bulletin 103: Area Guidelines for Mainstream Schools" along with local modifications.

Estimated demand

As set our in Section 2, GCC publishes a School Places Strategy including the approach to planning and delivering education in Cotswold District, which is also summarised in the GCC Local Developer Guide. Appendix B of that document sets out the Pupil Product Ratios, Cost Multipliers & School Site Sizes used within this IDP. These are summarised below and in the table overleaf.

Please note that the costs and multipliers are reviewed annually, and are consistent with the DfE's pupil yield dashboard published in September 2025. The following standards included in the table overleaf have been identified via the DfE's latest scorecard and benchmarking, noting that costs within are subject to change and indexation over the plan period.

To note for Early Years demand that the GCC IDG is being reviewed at the time of writing (July 2026) and the latest scorecard is 7.4.

These standards are applied to the growth scenario in Section 3. It should be noted that this assumes that all dwellings proposed are 'qualifying units' and are otherwise not restricted in such a way they would not be liable to contribute to education provision, such as age restricted accommodation. As such, the estimated requirements will be refined at the application stage based on more detailed proposals on the number of homes to be provided.

Commentary

Early years
On the basis of the above standards and assumptions, plan wide need is set out in the following table.

Approach taken for majority of sites and identified need is that early years provision envisaged to be included on site as part of primary schools (covered below). This is included in the space requirements set out in the masterplan frameworks and meets GCC's duty whilst providing benefits for shared and linked trips.

The private provision of early years is also something encouraged within new local centres and although not a requirement (where need is met through primary schools), this is included on the IDS as a potential use in future local centres.

Primary
GCC's preference (in line with DfE advice) is to seek a 2FE minimum to support ongoing viability and vitality of schools. GCC will seek the provision of serviced land within strategic sites, as well as proportional

	SECTOR	ESTIMATED DEMAND	BENCHMARK COST	PLAN WIDE NEED
01	Early years education	7 per 100 dwellings	£24,660 per place	1,061 places
02	Primary education	30 per 100 dwellings	£24,660 per place	4,547 places - equivalent to c. 21.7FE
03	Secondary education	14.7 per 100 dwellings	£29,875 per place	2,228 - equivalent to c.14.9FE
04	Post 16	5 per 100 dwellings	£29,200 per place	758 places

contributions towards their delivery. This will be pooled and aligned with wider funding from the DfE to delivery primary schools. Based on the current scorecard and benchmarking from the DfE, financial contributions sought are currently £24,660 per place, or the equivalent of:

- 1FE - £5.2m (site area of 1.5ha)
- 2FE - £10.4m (site area of 2.0ha)
- 3FE - £15.6m (site area of 2.8ha)

As the plan wide mitigation is proposed to be met through delivery on strategic sites, the costs assumed in the IDS are for the establishment of a new school, although it is noted that the School Place scorecard produces a slightly lower figure where an existing school is proposed to be expanded. At this stage, the higher cost is allowed for.

Site specific commentary
There is insufficient capacity to support the scale of growth proposed. Strategic scale sites are generally of a sufficient size that they generate a need for on site primary school. This varies in size dependent on the scale of development proposed to be allocated and this is captured in the IDS.

For avoidance of doubt, existing project primary school capacity in the sub areas in Fairford, Cirencester and Kemble have been considered in the recommendations for on-site provision.

There is potential for some initial capacity to be served in existing primary schools and this is especially true for the North and South Cotswold sub area, which may benefit from capacity in the Chipping Campden, Bourton-on-the-Water and Northleach pupil place areas.

Recommendations are based on the strategic sites also providing sufficient space for the residual need generated by non-strategic sites and assumed parish based windfall for the sub areas, but with each dwelling in the sub area proportionally contributing financially to its delivery.

Total provision allowed for across strategic sites equates to total need. As flagged, there are some strategic sites identified as liable to provide a 1FE school / equivalent contribution on site but to be expanded to accommodate attendance from pupils in wider growth, notably the South Cotswold sub area.

The Siddington allocation does not generate the need for on-site primary, but there is not sufficient capacity to serve it in isolation. Depending on the coordination with other strategic sites, the build out of the 3FE in The Steadings (secured via the section 106 as set out in Section 2) and creation of a new primary school to serve the Steadings extension, would likely create capacity at Siddlington Primary (who currently attend here in general) to serve the new development. Although covered under the transport section, an active mode link is proposed which would provide safe access to this school.

As part of this strategy, there are also wider possibilities for the committed 3FE primary at The Steadings to accommodate some of the additional need generated by the southern extension. At this stage however, this requirement should be held at The Steadings extension (as sufficient capacity cannot be identified at this stage) but subject to further engagement with GCC at the application stage.

Some sites shown as being built out after the emerging local plan period, such as Driffield. Cognisant of this, a 3FE primary can be provided more efficiently on a single

site compared to two separate schools. However, based on the housing trajectory work the Local Plan plan build out would only generate a need for a new 2FE school on site but a 3FE is required for the site's full capacity.

At Moreton-in-Marsh sub area (including growth in the sub area) the detailed modelling has suggested that the proposed 3FE school would be marginally smaller than total identified need. As stated above, there is a potential for the North Cotswold sub area contributions to be used to expand an existing school to provide for this which is considered more proportional than expanding the requirement at Moreton-in-Marsh. Furthermore, Moreton-in-Marsh has been identified as a potential location for growth in a future plan period, where the needs of the settlement would be revisited.

The mitigation approach for the windfall development is based on a per home mitigation cost sought to provide reinforcement of existing schools or the expansion of new, smaller schools on the strategic sites. The scale of windfall development, by its nature, is difficult to predict and therefore a number of schools, subject to feasibility work and school performance, could be suitable for expansion to support local plan growth. This is included as a separate line item in the IDS to clearly show this. As a result, the cumulative requirements set out in this IDS for the provision of 20FE and a 1 FE expansion (At this stage, the potential expansion from 1FE to 2FE at the Kingshill site would provide an options for this) in combination with existing projected capacity is sufficient to mitigate the plan wider need of 21.7FE equivalent.

Secondary
Existing secondary schools in the district have insufficient capacity to serve local plan growth.

GCC will seek the provision of serviced land within strategic sites, as well as proportional contributions towards their delivery. This will be pooled and aligned with wider funding from the DfE to deliver secondary schools in a timely manner.

Based on the current scorecard and benchmarking from the DfE, these are currently £29,875 per place, or the equivalent of:

- 6FE - £26.9m (site area of 6.8ha)
- 8FE - £35.9m (site area of 8.7ha)

Geographic access is also important, with the district split into north and south pupil plan areas. GCC's preference is that a secondary school would need to be a minimum of 6FE to support its ongoing viability.

Whilst the majority of provision and available capacity, centred on Cirencester, is currently located to the south it is also the location of the majority of strategic sites. The strategic sites generate an estimated 11FE need, subject to assumptions regarding windfall growth.

For the south plan area, a new standalone 6FE secondary would be required on a site area of 6.8ha. This should have suitable access to support the majority of growth in this location.

This is currently proposed to be located south east of Cirencester on- Land south east of Cirencester and south of Preston site. From a spatial perspective, the transport strategy support safe access to this site by walking and cycling and public transport and is based on existing connections and links to existing schools in the vicinity. The illustrative concept framework work completed to support the also demonstrates that suitable land is available to achieve the allocation as a whole. For the avoidance of doubt, land will be required at this site in an accessible location, but the full delivery of this school will be supported by proportional contributions from other development.

In the north, the developments at Moreton-in-Marsh, Mickleton and the north sub area are proposed to be met by a new secondary school at the Moreton-in-Marsh strategic site. To support the viable functioning of the school this is required to provide the land for 6FE, noting that new development on this site only would generate less than this demand, with the additional funding provided by proportional contributions from other new development.

There is currently estimated to be circa 2FE of secondary school pupils in this area currently 'commuting' to Chipping Camden school from this area of the Cotswold and wider School plan area for schools could be adjusted to reduce the average journey to school times.

It is noted that for the smaller scale sites and windfall growth these could be accommodated through existing potential capacity where available, although this is subject to suitable evidence at the application stage and

is envisaged to be relevant for the early phases of the Local Plan period only.

The IDS captures this by identifying the estimated proportional contribution for each strategic site, based on their estimated secondary school pupil yields totalling approximately £66m. For avoidance of doubt, this is considered sufficient to provide the two secondary school sites proposed, subject to additional details being refined at the application stage.

Post 16
Based on benchmark costs of £29,200 per place, a demand of 758 places would result in a cost of an estimated plan wide cost of £22.6m. This contribution would be to a strategic pot to support delivery of post 16 education within the district, in combination with national funding.

Delivery

GCC will be an important partner in the delivery of education in CDC and, via the Comprehensive Masterplan process, it is expected that strategic allocations will identify a suitable and serviced plot to transfer to GCC, alongside proportional financial contributions. The Comprehensive Masterplan process will also need to ensure that the site proposed is unfettered by constraints and has appropriate consideration of adjacent development, including provision of safe access and alignment with GCC published school design requirements.

04.2

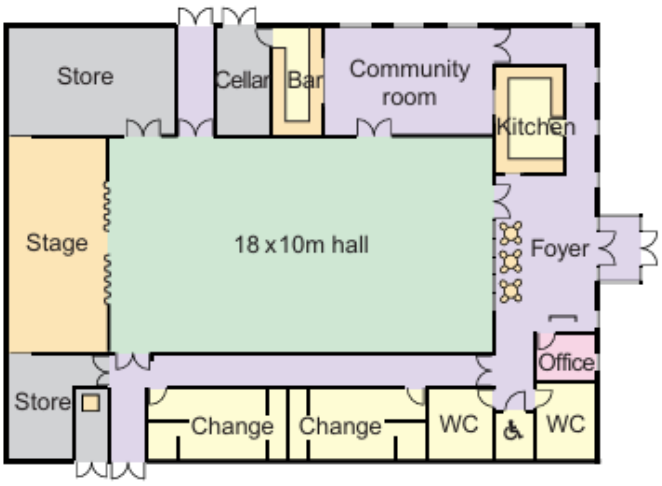
Community and culture

04.2.1

Infrastructure requirements from Local Plan growth

Community centres
As sect out in Section 2, the community spaces are wide ranging and can consider things such as cultural and museum space, library space and even indoor sports provision. As a result, the requirements for a provision of a specific requirement per person are less defined, with the focus being on ensure provision to serve new communities as they grow without placing undue pressure on existing facilities.

As part of the previous IDP work to support the Cotswold current local plan, a community centre of 645sqm was sought per 4,000 population, which equates to a community centre per 1,860 dwellings (then based on an average household size of 2.15). Translating that requirement to the proposed local plan growth scenario, this would work out to 161sqm per 1,000 people.



It should be reiterated that the requirement for strategic sites to provide community facilities is reinforced by the transport modelling work which has included the need for onsite facilities to reduce demand on the wider network by providing for day to day uses. Given the scale of sites, it is more appropriate therefore to seek to include the provision of new community uses within strategic sites, and the wider reinforcement of existing facilities for the non-strategic or windfall development.

Engagement as part of this IDP confirmed a trend towards a preferences for consolidated multifunctional facilities to help reduce staffing and other operational costs. Although a number of successful community facilities within CDC may be smaller than this, (as flagged in Section 2) to improve the financial viability and programming options available emerging guidance suggests that 400sqm provides the minimum space to provide ongoing revenue generating opportunities to support delivery. For reference, see below extract from the Sport England Village and Community Hall Design guidance showing a potential multifunctional use building. This is however dependent on planned uses within the building and subject to additional work at the application stage.

The larger strategic sites would generate a need above the 400sqm minimum threshold and this is captured in the IDS. The costs associated with this infrastructure requirement set out in the IDS is based on a proposed BCIS costs as an estimate, proportional to the scale of development required. As a result, it identifies the requirement but this is likely subject to refinement at the application stage. At this stage, the IDP is based on an estimated facility size using the above standards but balanced against the minimum site size requirements to ensure there is a reasonable prospect of its delivery.

Please note, this section should also be read alongside the conclusions on emergency service infrastructure requirements.

Reinforcement of existing facilities is also welcomed for smaller sites and will be reviewed on an application basis. This could include improvement of service offer to accommodate local growth and also support the installation of Community Public Access Defibrillators (CPADs).

Symmetrical support accommodation around a hall with a separate stage.

Libraries
Planning applications for 25 dwellings or more are assessed by GCC to determine their likely impact on existing local library services and the scope of resultant mitigation works required. As part of this assessment, qualitative factors are considered, together with the existing physical capacity of the local library which is currently calculated having regard to the national recommended floorspace benchmark of 30sqm per 1,000 population (as stated in Arts Council England's "Guidance on seeking and securing developer contributions for library and archive provision in England" published in September 2023.

Where large-scale developments are proposed and the associated Section 106 (S106) funding allocated to library services is significant, GCC are exploring additional or alternative options including a satellite site or collection points utilising digital technology.

While S106 funding can support the capital costs of delivering library infrastructure, such as design, fit-out, and equipment, it cannot be used to fund ongoing staffing costs, which must be met from existing revenue budgets. This presents a constraint for the delivery of additional traditional staffed library models within new developments.

The alternatives GCC are exploring provides a pragmatic and sustainable alternatives, enabling access to core library services without the requirement for dedicated on-site staff at all times. Such integrated facilities can deliver a meaningful library presence within new communities, supporting access to resources, digital inclusion, and reading engagement. Options could offer a range of services, including (but not limited to):

- A curated lending stock
- Self-service kiosks for issuing and returning items
- Book reservation and collection services
- Public access computers
- Printing and associated digital services

These models offer flexibility in terms of location and design. Provision could be situated within a dedicated room or integrated into a shared community space, such as a hub, leisure facility, or café area. Access arrangements could also vary, with the facility operating either during specific hours or aligned with the wider opening times of the host building. The final configuration, scale, and service offer of any satellite library would be determined by the nature of the development, the level of available S106 funding, and the range of complementary services provided on-site.

Expansion or improvements to funded by proportional contributions from across the district. The IDP is based on a continuation of a per unit contribution set out in the GCC Developer Guide (£196 per home across 15,158 homes), used to fund reinforcement and potential expansion or relocation of an existing library. New facilities will not be pursued due to staffing constraints and ongoing pressure on budgets.

At this stage, the preferred location for this would be the Moreton-in-Marsh strategic site, as this could be aligned with the expansion and relocation of the existing facility. There are benefits to anchor uses on the strategic sites in terms of overall modal share.

Burial grounds
There is no statutory requirement for CDC to provide burial spaces, however, this is a key concern for the district and something CDC would support through the use of CIL.

A specific scheme has been identified in consultation with the CDC Bereavement team which is to support the expansion of Stratton Cemetery, potentially though the provision of land in kind of CIL contributions or otherwise purchase and facilitation through CIL.

Establishment costs are proportional to build out with largest barrier being the land transfer costs associated with adjacent land owner (Bathurst Development Limited). CDC will support the delivery of this expansion through the use of CIL or an in kind contribution equivalent.

04.3
Healthcare

04.3.1
Infrastructure requirements from Local Plan growth

Infrastructure standards

Primary healthcare
Engagement with Gloucestershire ICB was carried out in the development of this IDP and input was also received from NHS Property Services team during transitional arrangements and from July 2026.

Traditionally, S106 requests made by health to support new developments have been centred around the capacity and development needs of a single GP Practice. However, over the last few years there has been a move towards new healthcare models on a larger scale at neighbourhood level involving multiple organisations including primary care. This approach is set out in the NHS Ten Year Plan published in July 2025.

The GCC ICB has produced the GP Premises Development & Delivery Plan April 2024 to March 2031 (July 2024). This outlines, in line with national guidelines[1] a requirement for 83.33m2 gross internal area (GIA) per 1,000 patients up to 10,000 patients then 41.66m2 GIA per 1,000 patients.

As set out in the baseline section for reference Cotswold is currently served by the estimated equivalent to 69.8 m2 per 1,000 patients in Cotswold LPA, although this is not a measured figure for existing provision.

However, The ICB has recently adopted an updated approach to establishing primary care infrastructure requirements. The approach is set out below.

Step 1: Assess level of primary care infrastructure need proposal generates

- Average household size applied to total number of residential units (for Cotswold this is 2.2 patients per dwelling)
- Integrated Care Strategy (ICS) floorspace requirement for growth are then set at 150sqm GIA per 1,750 patients

Step 2: Review capacity of existing primary care infrastructure

- Identify existing practices likely to be impacted identified by ICS. ICS benchmark for existing capacity 120sqm NIA per 1,750 patients

Step 3: Consider appropriate additional capacity solutions and approaches

- Potential for expansion of existing facilities or new provision (either with or in addition to existing practices.

Step 4: Identify appropriate form of developer contributions

- ICS 2024 build cost benchmarks (will be updated annually) which differentiate for mitigation in the form of refurbishment/extension or new build will be applied.

At this stage therefore, the IDS is based on the upper end estimated requirement. For 15,158 homes and 2.2 patients per home, a new build requirement to serve the local growth would equate to a Local plan wide need for 2,858sqm, ranging from a total new build cost of between £15.3 million (based on expansion rates) to £20.26 million for stand alone new build provision. This would be on the basis of available capacity being refined at the application stage.

There is no individual sub area of a sufficient size for the minimum commissioning threshold (to serve 10,000 patients) but there is not sufficient capacity for the new patients within existing facilities. However, as set out above the likely reality is that a significant element of

1 See here: https://www.england.nhs.uk/wp-content/uploads/2021/05/HBN_11-01_Final.pdf

the mitigation proposed would be based on the lower figure (sometimes call the marginal rate) as they would be expansions to existing (or otherwise committed but not yet built) facilities.

It is noted that recent new facilities commissioned have been larger and the per home requirement would be reduced (as other core/ancillary space remains constant), with the reduction focused on additional clinical and practicing space, providing a significant build cost efficiency and one which would assist ongoing running costs.

As set out in the baseline section, the focus of the emerging Local Plan is on identifying land and contributions within strategic sites to allow for the implementation of approved business cases (funded outside of the new development in the emerging local plan) to enable the expansion in provision required to serve existing growth (as covered in the 2024-2031 plan) but cognisant of the additional growth identified in the emerging local plan up to 2043.

As set out in the baseline, existing funding commitments are in place for a number of pipeline projects. As identified through discussions with the ICB, a key barrier for expansion of existing premises is land and supporting contributions to facilitate the initial capital expenditure, either on current sites or alternatives allocated in the emerging local plan.

Identified schemes include:

- Land to support new GP surgery/ existing Business Case for Chipping Campden surgery (expanded);
- Land to support new GP surgery/ existing Business Case for the replacement Phoenix Health surgery (currently envisaged to be delivered on existing Steadings site and in tandem with the proposed extension);
- Identify land to support new GP surgery/ existing Business Case for the expansion of Cirencester Neighbourhood Health Centre (site preliminarily identified on land at Kingshill); and

Cumulatively, the identified projects when implemented would provide a significant element of the total local plan need, with a residual need to mitigate patient 358sqm, or the equivalent for 3,347 patients. Although subject to further feasibility a potential location for this additional provision in the latter stages of the plan period could be at the Moreton-In-Marsh existing facility to provide additional capacity in the North Cotswolds PCN.

As set out in the IDS, it is important to also include a ‘fallback’ mitigation line item should this provision not be delivered or the business cases are impacted by cost increases or loss of available funding. This would require offsite financial contributions (in lieu of contributions towards the identified schemes) for alternative mitigation within the plan period.

The Driffield allocation has potential to expand in future plan periods, as a result, the requirement for additional primary healthcare facilities will be monitored as part of subsequent update to this IDP but would be a logical space to support the expansion of primary health care with ready access to existing populations should the current sites not be feasible.

As a result and although to be refined at the application stage, the request for land and contributions towards primary care is considered to meet the wider requirement of the CIL regulations.

Although covered further in the transport section, the provision of on-site facilities which meet the day to day needs of current and future residents has the significant additional benefits of helping to reduce modal share.

04.4

Emergency services

04.4.1

Infrastructure requirements from Local Plan growth

Combined blue light facilities
Through precedent research and stakeholder engagement, it was agreed that there is a general preference for integration of blue light services on singular campuses for efficiency, and provision to be incorporated within new community infrastructure, supported (where justified) by proportional contributions. Consolidation must align with existing review of staffing arrangements and ongoing changes to national funding.

The IDS advocates for the integration of 'blue light facilities' to help improved both operation efficiency and collaboration as well as support ongoing estate renewal. The IDS also references inclusion of blue light facilities and associated parking at community hubs.

Police
Policing is a population based service and therefore this proposed uplift in population would inevitably place demands on existing policing services. Provision of new infrastructure to meet the additional demands placed upon policing services generated as a direct result of this projected increase in population and associated planned developments will be required in order to maintain effective and efficient policing services.

Whilst additional staff posts would not be sought to be funded through the planning system, there will likely be capital projects associated with accommodating this staff growth. There is a need to provide adequate space for staff and equipment, resulting from this growth.

Regarding policing, equipment provision is considered to be better considered as part of future funding requests at the CIL stage, or requests at the application stage.

Ambulance
The Trust operates a network of Ambulance Community Response Posts (ACRPs) across its area - a facility which provides rest facilities for staff between emergencies, normally accommodating one crew at any one time. The locations for the response posts have been strategically matched with potential demand and expansions to the urban area to ensure as many people as quickly as possible can be reached quickly. These facilities are supplemented by Community First Responders (CFRs) who are trained to attend emergency calls received by the ambulance service and provide care until the ambulance arrives.

Regarding ambulance services, additional provision for parking within strategic sites, particularly next to community facilities where blue light service access may be arranged, would assist in coverage. These have been identified in new strategic sites without an existing response post nearby or where the most significant growth is proposed. This is not considered to be a significant additional costs to the development costs set out in the viability assessment and therefore a specific cost is not identified for this intervention.

Fire service
Gloucestershire Fire and Rescue Service's 'Productivity and Efficiency Plan 2025-2026' notes a preference at planning to mitigate impact through reduction in incidents. These are, compared to existing building stock, comparatively lower risk for new build (subject to integration of necessary safety features).

The IDS is therefore based on estimated increases in incidents to be mitigated through onsite provision of hydrants. The requirement for on site hydrant provision for schemes over 50 homes and on selected commercial developments is set out in the GCC developer guide. Where local fire risk could be demonstrably heightened, the provision for modern suppression in appropriate homes to reduce call outs will be sought.

This page is intentionally left blank.

04.5
Transport

04.5.1
Infrastructure requirements from Local Plan growth

Introduction and structure of chapter

This chapter will differ from the structure of previous chapters as the infrastructure requirements are identified in the Strategic Transport Assessment prepared by City Science.

This IDP therefore reflects a summary of the work undertaken by City Science which had a focus on achieving modal shift to sustainable transport methods and a vision-led direction from CDC and is summarised in the IDS. Significant engagement has been undertaken with CDC's transport team, GCC and City Science throughout the emerging Local Plan development and the development of the IDP. This includes multiple workshops, regular check-ins and an membership of a working group with engagement on transport matters.

This IDP provides a high level summary of requirements across key themes (covering Rail, Bus, Active Mode, Highways and Behaviour Change), before covering specific items relevant to strategic sites and coordination within and between them.

The identified schemes have been mapped graphically by City Science in Appendix D of the Strategic Transport Assessment and reproduced over the next few pages.

Rail

To achieve a plan wide mode share targets for public transport, development has been allocated near to existing stations and improvements sought at Kemble and at Moreton-in-Marsh station. These are based on the improvements to the accessibility and other improvements to facilities to increase and accommodate projected increases in their use. A more detailed specification has been preliminarily identified in the IDS but details are subject to additional feasibility work.

Bus

To prioritise the use of public transport, a number of interventions are identified to support the expansion and diversion of existing and new bus routes to serve the proposed allocations. This includes a range of scales as set out in the IDS but include, amongst others:

- A Cirencester Park and Ride, providing bus access to Cirencester;
- The establishment of a Cirencester-Swindon Bus Rapid Transit (BRT) to serve the South of Preston, Driffield and Down Ampney sites, and a (separate) Moreton-in-Marsh to Cheltenham BRT;
- More localised improvements to support specific sites, such as enhancements to the 76 bus route and establishment and viability of new routes; and
- Enhancements to the existing North Cotswolds Robin Community Bus to support increased projected patronage.

Active mode

The most significant number of projects identified on the IDS is for active travel improvements to improve the sustainability of existing sites and reduce the need to travel by private car. These are shown on the Masterplan frameworks to show broad extent and length, although more detailed work will be required at the application stage.

Behaviour change and supporting sustainable transport integration

As part of the vision led approach, the transport work has also identified the need and benefits of sustainable transport integration. This ranges from a requirement for onsite services within local centres at new strategic sites, to the specific integration of local transport corridor interchanges to reduce barriers to public transport access .

In addition, this category includes a requirement to expand GCC s current 20mph speed work, increase

the installation of public EV charging where possible and to support localised improvements to safety and car parking rationalisation, where compliant with the CIL tests and identified as necessary in supporting Transport Assessments.

Highways

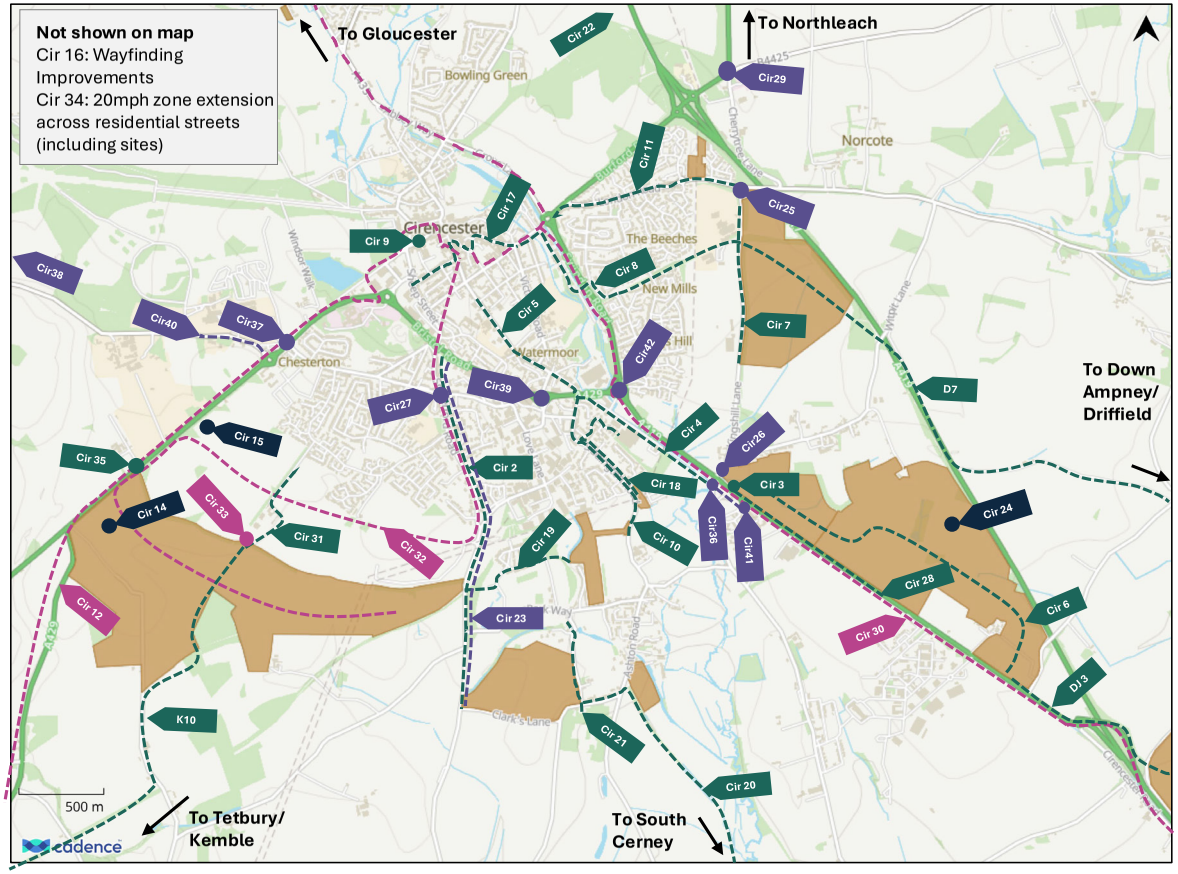
As a result of the modelling referenced above, there is a need for a number of highways schemes to look at improvements to existing junctions and roads, ranging from optimised signalisation, new approaches and arm flares, as well as new roundabouts to improve traffic flow.

The most significant highway intervention (although active mode links are embedded within) is focused on the new road to serve the Moreton-in-Marsh strategic site, as set out in the Moreton-in-Marsh feasibility study.

For each site, smaller scale interventions must be monitored and managed to improve safety and implement TROs, improvements to safety at school access (where relied upon for smaller sites) such as additional bus stop infrastructure identified where specified but to be derived by Transport Assessments. A number of smaller scale highway interventions could also be funded by CIL including safety concerns, expansion of Electric Vehicle charging in public realm to encourage uptake.

Support for regionally significant schemes and relationship with CIL

Although local plan growth is not predicated upon it, CDC support the wider potential of the North Cotswold Line transformation. This is a series of improvements including doubling of the line leading to the a doubling of the frequency (to two trains per hour) and improved speed which would further make routes along this line such as Oxford-Worcester and London (and onto further connections) more time competitive with private modes. As part of the City Science work, it set out that the SOBC estimated the whole cost of this improvement to be £199 million but includes enabling of more housing in Oxfordshire.



As a result, this scheme is identified on the IDS as a potential use for CIL in the future, notably as part of any early feasibility work required to support its refinement, although contributions are not sought from current development. Should this project gain significant momentum, it would likely trigger the need to review the transport strategy at the heart of this IDP.

Coordination between strategic sites

The majority of schemes identified are for a specific strategic sites and are the responsibility (in tandem with partners) to subsequent applications to ensure their delivery. However, some are attributed to a wider sub area (for example for interventions in Cirencester town centre based on cumulative development).

There is also a linkage for the three south east of Cirencester sites in Land South east of Cirencester and South of Preston, Driffield and Down Ampney which share a functional relationship with Cirencester. Key to this is a change in character of Cirencester road for the existing condition, improving active mode connection and improved bus services. As a result, this forms a potential combined ‘scheme’ of interventions which collectively provide sustainable transport modes across all three sites, to be delivered by the sites in tandem. These costs are apportioned based on a proportional contribution approach in that each strategic site will deliver elements of the intervention but each is reliant upon its implementation in the long term. As a result, there is a need for coordination between these three strategic sites in their delivery trajectories and this is flagged in the IDS. In the absence of this, a potentially longer connection may be required for the earlier applications and may increase the cost per home current assumed in the IDP. This is because the delivery of only part of this mitigation is unlikely to support the required mode share and wider sustainability of the individual site.

Cirencester

Active Travel Interventions

04.6

Open space, SANG, Sport and recreation

04.6.1

Infrastructure requirements from Local Plan growth

Accessible Greenspace
Accessible Greenspaces are available for the general public to use free of charge and without time restrictions (although some sites may be closed to the public overnight and there may be fees for parking a vehicle). Accessible greenspaces are available to all, meaning that every reasonable effort is made to comply with the requirements of the Equality Act 2020. Accessible Greenspaces are areas of vegetation set within a landscape or townscape, often include blue space (i.e. lakes, rivers and wetlands). There are a range of types of greenspaces included within the definition of publicly accessible greenspace and will be refined at application stage.

The Green Infrastructure Strategy sets a requirement for 3ha of accessible greenspace per 1,000 people. At the estimated population generation in this IDP this would result in the provision of circa 100ha of additional open space to be secured as part of new sites, with a particular focus on the strategic sites providing 75% of this.

As part of the illustrative concept framework workstream, it has been demonstrated that sites can meet this standard alongside other allocation requirements.

The Green Infrastructure Strategy includes addition guidance, particularly covering provision of Play space. More detailed open space categories not defined on the framework plans to avoid prejudicing more detailed masterplanning and survey information.

Although expected to be direct delivered and included within typical development costs, policy compliant open space is included in the IDS for clarity.

The National Allotment Society[1] states that 'An allotment is traditionally measured in rods (perches or poles), an old measurement dating back to Anglo-Saxon times. 10 poles is the accepted size of an allotment, the equivalent of 250 square metres or about the size of a doubles tennis court. There should be 15 allotment plots per 1000 households'.

Using the estimated population across the plan period and adjusted to 3,750 sqm per 1000 population would equate to a plan wide provision of circa 5.7ha of allotments.

Sport and recreation
As set out in the baseline Sports provision, is also identified in the KKP work at the plan level. This considers in detail the available capacity, projected demand and identified potential shortfalls. The report uses the Sport England's Playing Pitch Calculator as a tool for helping to determine the additional demand for pitches and to estimate the likely developer contribution required linking to sites within the locality.

The calculator uses the current number of teams by sports pitch type contained within the Assessment Report and calculates the percentage within each age group that play that sport. That percentage is then applied to the population growth. The additional teams likely to be generated are then converted into match equivalent sessions and associated pitch requirements in the peak period, with the associated costs (both for providing the pitch/facility and for its life cycle) then given. The calculator splits the requirement into peak time demand for natural turf pitches, training demand for artificial grass pitches, and the number of new changing rooms required.

This estimates that for a 500 dwelling allocation, additional demand for a combined total of 0.65 pitches

1 https://thenas.org.uk/uploads/NAS%20Development%20Brochure%202023%20LR.pdf

Table 7.4: Estimated demand and costs for new pitch provision

Pitch type	Estimated demand and costs for new pitches				Changing rooms	
	Number of pitches to meet demand	Capital cost[33]	Lifecycle Cost (per annum)[34]		Number	Capital cost
Adult football	0.09	£10,097	£2,130		0.18	£36,300
Youth football	0.19	£17,031	£3,577		0.24	£47,679
Mini soccer	0.13	£4,038	£848		0.00	£0
Rugby union	0.08	£13,291	£2,844		0.16	£31,358
Rugby league	0.00	£0	£0		0.00	£0
Cricket	0.12	£40,467	£8,174		0.24	£46,291
Sand based AGPs	0.01	£11,086	£344		0.02	£4,866
3G	0.02	£24,393	£868		0.04	£8,566
Total	**0.65**	**£120,403**	**£18,785**		**0.89**	**£175,061**

is required. On the basis of 15,238 homes within the plan period, this is equivalent to a plan wide need for approximately 20 pitches, 15 of which are generated by the new strategic sites.

Contributions to increase carrying capacity of existing facilities Local Plan wide need for 20 playing pitches, typologies to be identified at the application stage. The costs within are identified as per pitch but as shown in the extracted table, above, will depend on the type of pitch provided. The costs assumed at this stage will be refined and will dependent on the detailed specification of new pitches and the sports they provide for at the application stage, however are considered robust to support the plan making stage.

Sport England recommend that contributions should also be secured towards the first ten years of maintenance on new pitches (lifecycle costs), the cost of which is indicated by the Sport England Playing Pitch Calculator.

External funding should also be sought/secured to achieve maximum benefit from the investment into appropriate facility enhancement, alongside other open space provision, and its subsequent maintenance.

Indicative locations are identified on the concept frameworks considered capable of providing for local plan need, subject to more detailed design and engagement at the application stage.

However, to determine what supply of provision is provided, it is imperative that the PPS findings are taken into consideration and that for particularly large developments consultation takes place with the relevant NGBs and Sport England. This is due to the importance of ensuring that the stock of facilities provided is correct to avoid provision becoming unsustainable and unused. The preference is for multi-pitch and potentially multi-sport sites to be developed, supported by a clubhouse and adequate parking facilities which consider the potential for future AGP development. This is because single-pitch facilities are more likely to become under-used (or unused), non-viable and unsustainable.

This is subject to additional details and investigation of need at the time of application and to ensure that a local partner is identified to manage and maintain the sports pitches throughout their lifetime.

As part of the Action plan element of the KKP work, it is recommended that such discussions take place within PPS Steering Group meetings, which should take place regularly following adoption of the study as part of the ongoing monitoring and evaluation process.

As part of the Local Plan evidence base, CDC have procured two separate reports by ORH on behalf of Sports England to assess the current provision of swimming pools and sports hall and to assess the project need in relation to local plan growth, as follows:

- Facilities Planning Model Assessment of Swimming Pool Provision for Cotswold District Council (May 2026)

- Facilities Planning Model Assessment for Sports Halls Provision for Cotswold District Council (May 2026)

Since the preparation of these reports, the spatial strategy for the Cotswold Local Plan has increased the number of homes being delivered across the plan period. Whilst the majority of the key findings in relation to the total supply, available supply and the distribution of provision are still relevant for the purpose of the Local Plan, the outcomes in relation to the identified need up to 2043 for swimming pool and sports hall provision are based on a level of housing delivery that has been superseded.

A Swimming Pool and Sports Hall Provision - Addendum (July 2026), was then produced by AECOM to assess both Swimming Pool provision and Indoor Sport provision using The Sports Facility Calculator (SFC).

This addendum outline the new requirement for swimming pools and sports halls, as follows:

- 1.7 new swimming pools (358.16 sqm and 6 lanes) with an estimated cost of £7,736,226.
- Two new Sports Centres (to provide 8 new courts) with an estimated cost of £5,865,436.

This is on the basis of continued CUAs however, and therefore included as a requirement in the IDS.

In addition, it is noted that the identified multifunctional community may have an element of indoor sports available for rent (notably for items such as Badminton or fitness classes) and therefore to support with viable operation of the community spaces.

SANG

LUC have prepared a detailed Recreation Mitigation Study (2026) based on the proposed growth scenario. This work has been completed in consultation with Natural England.

Within Cotswold District Council this mitigation comprises three main measures:

- Suitable Accessible Natural Greenspace (SANG): new or enhanced greenspace, designed to divert recreation trips away from designated sites.
- Alternative Natural Recreational Greenspaces (ANRG): new or enhanced greenspace, public right of way enhancements, and high quality green infrastructure, designed to divert recreation trips away from designated sites.
- Strategic Access Management and Monitoring (SAMM): measures to manage the residual impact at the designated sites.

The objective of SANG delivery is to offer a naturalistic green space that is appealing and more conveniently located than the protected areas they relieve pressure from. They do not need to exactly replicate the sites they are diverting trips from but must be attractive and local enough to result in people choosing the SANG (for example for dog walking) over the more sensitive site.

ANRG is an approach to recreation mitigation where is has not been deemed necessary to apply the stricter SANG design requirements. ANRG can be of a more flexible design, resembling enhanced green infrastructure and open spaces as opposed to the key requirements for naturalness and a variety of habitats in SANG.

SANG requirements are 8ha per 1000 people for those within the identified Zone of Influence (ZoI), with a requirement for on site Alternative Natural Recreational Greenspace (ANRG) for those strategic sites outside of the immediate ZoI.

Broadly, the proposed mitigation is that the strategic sites in the ZoI (namely The Steadings Extension and Kemble) will mitigate their own need through onsite SANG.

Large Development sites typically provide their own new bespoke SANGs via S106 Agreements which are then normally transferred to Council ownership with a commuted maintenance payment for their ongoing upkeep. All SANGs have to be laid out in accordance with a SANG Management Plan which is agreed with the Council and Natural England.

Onsite mitigation at Strategic Allocations will be able to meet the SANG and ANRG requirements for the Strategic Allocations, and the wider ANRG requirements for non-strategic and windfall development. There is, therefore, a need to secure an additional 18.84 ha of SANG for the 1,070 dwellings delivered by non-strategic residential and windfall development within the Cotswold Beechwoods ZoI.

Not all development proposals will be capable of delivering bespoke onsite mitigation given a need to ensure a minimum SANG size. In particular, smaller schemes and windfall developments may find opportunities to provide new SANG within the site boundary to be limited. To maintain flexibility and support sustainable growth, financial contributions may therefore be secured in lieu of on-site provision and used to purchase units or capacity at a Strategic SANG or capacity at other mitigation sites.

The delivery of this mitigation could be a private opportunity (making land available for this form in exchange for contributions from smaller scale development).

A site to the south of the Kemble Strategic site allocation has been identified to be available, capable of providing sufficient SANG capacity, is located within the vicinity of the majority of the proposed development within the district, and has a reasonable prospect of being delivered to meet the SANG needs.

Currently, the proposed Strategic SANG site has been drawn as have a capacity of approximately 30ha which would give it a SANG mitigation capacity of 3,750 dwellings, a surplus of 11.16ha which would be able to provide mitigation for an additional 635 dwellings (in addition to those within the emerging Local Plan). Developments using the new strategic SANG as mitigation will be required to make financial contributions towards the enhancement and in-perpetuity management and maintenance through a combination of s106 agreements and the Community Infrastructure Levy (CIL). Each development using the Strategic SANG cannot be occupied until the relevant enhancement works are provided at the SANG. This can be delivered via a s106 obligation to restrict occupation is required to be entered into by the developer.

04.7

Flood management requirements

04.7.1

Infrastructure requirements from Local Plan growth

Infrastructure standards

Based on the Strategic Flood Risk Assessment (SFRA) and individual detailed site assessments by JBA, relevant recommendations included within this IDP. As part of this work, no significant flood mitigation measures to support flood management has been identified as required to enable the allocations proposed beyond reasonable on site measures.

Natural Flood Management (NFM) describes the process of restoring the natural function of our river catchments, with the aim of increasing communities' resilience to flooding. Some NFM measures are taken in or next to the river itself, such as leaky dams, reconnecting rivers with their floodplains or even beaver reintroductions. Others operate in the wider river catchment like sustainable soil management or tree planting. Taken together they can reduce and delay flood peaks in communities downstream whilst contributing multiple other benefits including carbon sequestration, biodiversity improvements and cleaner water. Crucially, this makes NFM very good value for money when used in conjunction with traditional engineered flood schemes.

The Gloucestershire NFM Partnership aims to expand the scale, scope and impact of Natural Flood Management in Gloucestershire and is building a pipeline of NFM projects across the county in priority catchments and by providing funding through the Gloucestershire NFM Grant Scheme.

GCC is leading on approximately 23 flood alleviation schemes, funded through GCC resources (capital and revenue) and a variety of external sources, primarily Flood Defence Grant-in-Aid and Local Levy.

The government's new approach to flood funding has earmarked £300m for Natural Flood Management over 10 years and became live in April 2026.

Commentary and initial conclusions

Given the findings of the SFRA, there is a residual need only to include a requirement to comply with CDC policy and national policy regarding integration of SuDS, although the detail of this will be refined at the application stage.

In addition, CDC support (as outlined in the extant IDP) wider approaches to natural flood mitigation in upstream catchments to reduce downstream risk to the town. Although this is not identified as required mitigation to serve the local plan growth, CDC and GCC will explore opportunities for funding to seek its delivery.

It is therefore added to the IDS as a potential use of CIL in the future.

04.8
Utilities

04.8.1
Infrastructure requirements from Local Plan growth

Introduction
The responsibility for the delivery of utilities infrastructure is split between various bodies, with networks delivered, operated and maintained by regulated utilities companies. Individual sector regulators (Ofgem, Ofwat, Ofcom) are responsible for the overseeing of and adherence to regulations and standards.

Digital infrastructure (telecoms)
There is an expectation for Fibre to the Premises (FTTP) for all schemes over ten homes. All development allocation will likely be funded by Universal Service Obligation, a system whereby connections are provided to sites during development free of charge, such that future ISPs regain this investment through new customer.

Electricity
Connection costs for new homes to the electricity network is paid for by the developer and not considered relevant to the IDP. However, it is less clear cut regarding reinforcement costs (essentially the improvement of the strategic scale, offsite infrastructure required) outside of planned growth.

As part of large scale applications there may be a need to work with SSEN and National Grid on a bespoke assessment of capacity, tied to detailed build out and scheme design to ensure available capacity. This is largely to prevent any delays in accessing power but also to ensure that any costs associated with reinforcement are included within broader price controls. In some instances, there may be a need for more detailed discussion regarding connection timing and associated costs. This is because, as set out in this IDP there will need to be reinforcement of the existing network to serve large scale development in some areas.

However, at this stage there are no identified systemic issues with accessing power across the plan period There has been a significant increase in public data regarding connection points. Although there are not envisaged to be any section 106 costs associated with this (and instead included within the overall development costs) these are included in the IDS for completeness.

Water and Wastewater
Based on the comparatively small scale of growth likely within the catchment for the Tetbury STW, Wessex Water have confirmed that no additional upgrades beyond that already identified in the baseline section of this IDP are required to support the Local Plan growth, although this will be monitored over the plan period. This position is also echoed by Bristol Water who do not foresee any major infrastructure requirements as a result of the forecast growth in the Bristol Water area of supply.

Thames Water undertook a RAG assessment of water supply infrastructure at 55 potential local plan allocations in the SWOX WRZ. Of these, 15 sites received a red rating (extensive upgrades to local and strategic supply network anticipated), 20 received amber (hydraulic modelling likely required, upgrades possible), and 12 received green.

Thames Water also undertook a RAG assessment of waste water collection capacity at emerging allocations and found 12 sites rated red (network upgrades necessary) and 23 rated green; four sites were not assessed. Two Wessex Water sites (near Tetbury) have incomplete sewer records and require pre-planning enquiry before connection points can be confirmed.

Feedback from Thames Water suggests: “The time to deliver water/wastewater infrastructure should not be underestimated. It can take 18 months – 3 years for

WASTEWATER TREATMENT WORKS CATCHMENT	POTENTIAL HOUSING	EMPLOYMENT SPACE (SQM)
Ampney St Peter STW	5,062	109,000
Andoversford STW	109	0
Blockley (WRW)	65	0
Bourton-on-the-Water STW	934	0
Broadwell STW	198	0
Chipping Campden (WRW)	198	0
Cirencester STW	11,600	252,912

Honeybourne (WRW)	1,412	0
Lechlade STW	220	0
Moreton-in-Marsh STW	4,302	51,000
Tetbury STW	336	0
No public sewerage in the vicinity	153	0
Total	26,607	454,912

local upgrades and 3 – 5 years plus for more strategic solutions to be delivered. It is therefore vital that the Council and Developers work alongside Thames Water so that we can build up a detailed picture what is being built where, get confidence of when that development is going to start and what the phasing of that development will be."

The understood cumulative growth, including cross boundary considerations, is captured in the WCS (Table 3.1) and replicated above. The WCS also concluded, following a site-by-site assessment of potential allocations in their supply area, that there are 15 sites where further modelling by Thames Water is definitely required, and a further 20 where modelling may be required. In both cases, upgrades to the water supply network may be needed to accommodate development.

Upgrades to the local supply network would be funded as part of the developer Infrastructure Charge. Early engagement between developers, CDC and the water companies is recommended to ensure upgrades are in place prior to occupation.

A RAG assessment for wastewater capacity and wastewater treatment works (WwTW) was also provided, also replicated overleaf.

THAMES WATER RAG ASSESSMENT FOR WASTEWATER CAPACITY

WwTW	Predicted housing during LP period (no. dwellings)	Predicted employment during LP period (sqm)	JBA Assessment	Estimated spare hydraulic capacity following planned development (number of dwellings)
AMPNEY ST PETER STW	5,062	109,000	AMBER - Likely to be close to or exceed permit during plan period. Upgrades and / or a change to permit limit may be required. No significant constraints have been identified.	-5,062

This page is intentionally left blank.

05 Infrastructure requirements

A summary of infrastructure requirements outlined in the previous chapter and as per the accompanying Infrastructure Delivery Schedule.

05.1
Funding and delivery

05.1.1
Potential funding mechanisms

The IDP is a living document and intended to be updated during the Local Plan's lifecycle. Infrastructure planning is inherently dynamic, drawing information from a wide range of sources and strategies at different stages of development. This current iteration of the IDP is a proportional response to the available information at this stage and will be periodically reviewed.

The NPPF paragraph 35 sets the policy framework for funding infrastructure. It states:

"Plans should set out the contributions expected from development. This should include setting out the levels and types of affordable housing provision required, along with other infrastructure (such as that needed for education, health, transport, flood and water management, green and digital infrastructure). Such policies should not undermine the deliverability of the plan."

The two principal mechanisms available to fund infrastructure are s106 legal agreements entered into with developers on individual sites and CIL. Both of these methods of raising funds from private developers are well-trodden paths which have contributed to the successful delivery of infrastructure such as schools and community spaces. These charges are levied on detailed proposals advanced by developers on specific sites and as such, it is challenging to predict with anything other than a broad degree of accuracy, the potential quantum of funding these sources could raise during the life of the plan.

The Local Plan CIL Viability Study explores the potential of strategic sites and other sites on a typology basis to estimate the potential receipts both charges could raise to be deployed against infrastructure needs, without compromising the financial viability and deliverability of those same sites. It also considers the applicability of zero-rated CIL in accordance with the requirements of the NPPF and so should be read in conjunction with this document.

Facilitated by the English Devolution and Community Empowerment Act 2026, Local Government reorganisation will create new relationships between the current different tiers of local government, with shifting responsibilities likely to have an impact on service delivery. This IDP has been prepared to reflect the current legislative and funding requirement. Future iterations will need to respond to any significant changes that influence the infrastructure planning process.

CIL

The Council's Infrastructure Funding Statement (1 April 2023 to 31 March 2024) contains the most up to date record of CIL receipts and s106 contributions held by the Council. The total value of demand notices issued in 2023/24 was £3,397,266.72. After the deduction of administrative expenses in accordance with CIL Regulation 61, the amount retained by the Council is **£3,325,758.01**.

An estimate of the potential CIL receipts that could be realised during the plan has been calculated overleaf. This is based on notional development mixes per site calculated in the mid-range of the Council's emerging housing mix requirement as set out in the below table and typical dwelling sizes set out, although this is subject to detailed proposals at the application stage.

This estimate has been calculated assuming that 40% affordable housing is delivered as advised by the Council. The mix between shared ownership and affordable rent is 40%:60% in favour of affordable rent.

As such 40% mandatory affordable housing relief is applied in our calculations.

It is not possible to estimate the potential additional relief that could be granted (such as self-build/ custom build relief) and demolition/in-use credits at this strategic level. In addition, there is no allowance for indexation as it is not possible to estimate the timescales of delivery of individual sites. Until demand notices are issued, this figure should only be regarded as a reasonable estimate.

For the purposes of this modelling, the current indexed rate of £100.63m/2 for residential floorspace has been applied. There is no clear estimate of the quantum of retail space that could come forward for the purposes of this modelling and so no calculation of CIL that could be gained from retail development is included in the estimate.

As such, the projected CIL estimate using the above assumptions as the basis for the calculation is **£20,440,972**.

Adopted Housing Mix - CIL Estimate

MIX	1B	2B	3B	4B	TOTAL
Market	5%	35%	40%	20%	100%
Shared ownership	20%	40%	30%	10%	100%
Affordable rent	30%	35%	25%	10%	100%
Adopted typical dwelling size (square metres)	50 1B2P (APARTMENT)	79 2B4P (2-STOREY HOUSE)	93 3B5P (2-STOREY HOUSE)	115 4B7P (2-STOREY HOUSE)	

S106 contributions

The total s106 contributions held by the Council as per the above Infrastructure statement that have not been allocated is **£1,689,311.92**.

Further obligations amounting to **£143,760** were secured via agreement in the 2023/24 year.

The Council has allocated **£750,965.24** to stated projects.

Contributions can be secured from developers by (but not limited to) the following mechanisms:

- The provision of a turnkey, fully-fitted out facility for the local authority/operator provided at nil cost (such as a health facility).
- The provision of a serviced plot of land and/or capital contributions equivalent in scale to the required facility (such as a school).
- Capital contributions towards modernisation, facilitation or expansion of existing or new facilities (such as a community project).

The Highways Authority will generally prefer to secure contributions via sections 38 and 278 of the Highways Act 1980.

Strategic projects and capital grants

The coordination and delivery of strategic infrastructure is more complex. Delivery of major infrastructure requirements necessary for the delivery of development can require pooling of land and development contributions alongside the deployment of the Council's statutory powers to enable delivery. Depending on the criticality of infrastructure and the nature of the barriers to effective delivery, the use of the Council's compulsory purchase powers may be used as a last resort.

For these more complex schemes, there is often a need for grant funding to either offset delivery cost, cash flow delivery costs in advance of recouping those costs via planned/consented developments or to pay for delivery costs in their entirety. Periodic capital grant funding programmes are released by central government to fund such requirements which are usually distributed to local authorities via a competitive bidding process. Specific projects may be funded via specific requests made to the Department of Transport or in partnership with other public sector organisations such as Homes England. Historic and current examples include:

- Housing Infrastructure Funding (HIF)
- Brownfield release fund
- One Public Estate
- DFT Structures Fund

More innovative approaches for strategic sites may include:

- Land equalisation agreements
- Roof taxes

The provision of critical infrastructure via these routes is best secured through more in-depth feasibility studies and design work so that more accurate scheme costs can be compiled with the appropriate funding sources identified. The strategic road connection to the proposed strategic site at Moreton-in-Marsh is a good example of this. Future development of the North Cotswold Line transformation would require this. These approaches could potentially be utilised as part of the Comprehensive Masterplan process and the underpinning infrastructure phasing work.

Other sources of funding

Not all infrastructure is funded and delivered by the Council, however it does play a critical role in convening the necessary stakeholders from other affected parties to coordinate the delivery of infrastructure where possible.

This is particularly true for utility providers such as UKPN, Thames Water and digital service providers but also community representatives and technical experts. Each party brings their own unique perspective to shaping infrastructure that responds to the evolving needs of the changing population and is resilient to economic and climate change shocks.

Private enterprise responsible for delivering utilities and other services will deliver business plans that respond to user demand. At a point in time where the public ownership of utilities is being discussed at a national level, this plan should be updated should significant changes occur that will affect the coordination and delivery of utility infrastructure.

The NHS has received funding via the 10 Year Health Plan for England, with a funding settlement extending to 2029/30 with a further 5 years of certainty for estates maintenance. This is distributed via the ICB allocations which are referred to earlier in this report. Availability of land via safeguarded, serviced plots remains the primary limitation for delivering additional health infrastructure. The provision of this attracts private and institutional capital into revenue-based models of funding health infrastructure which should be explored during the plan as a way of accelerating delivery.

05.2

Infrastructure Delivery schedule (2043)

05.2.1

Structure

The Infrastructure Delivery Schedule is set out to the following column headings:

- **Relevant Sub area**: To aid with orientation, this column flags which sub area of Cotswold is relevant for the individual infrastructure item. Some items are relevant to all sites and the full list of sub areas is set out in Section 3.
- **Site/Sub area attribution:** This column identifies the allocation, set of allocation or wider sub area considered related to the infrastructure proposed.
- **Ref**: Each scheme has been given a unique reference number. For Transport items, this reference is consistent with the Strategic Modelling Assessment.
- **Scheme name**: A scheme name
- **Scheme description:** Details provided on the scope of infrastructure required and additional details relevant to understanding the item required
- **Infrastructure category**: The Infrastructure Delivery Schedule is set out in the same order as the headings within this IDP
- **Infrastructure sub-category**: To assist with project categorisation, additional sub themes are added
- **Source:** A reference to the evidence base/ stakeholder or policy document where the infrastructure has been raised
- **Prioritisation:** The relative level of prioritisation used to help structure the IDS (expanded below)
- **Cost (£):** The current best estimate of cost for each scheme, based upon the most recent published costs where available (please reference to Source of Cost)
- **Source of cost:** The origin or other contextual information to understand the project estimated cost. The costs included are proportional to the plan making stage and are generally subject to indexation (to adjust for inflation and other influences) over time. Actual costs should therefore be treated as a starting point, with more detailed re-calculation being necessary at the time development comes forward
- **Confirmed funding:** Existing funding already confirmed as in place for schemes, where relevant. This will become more relevant as the IDS is updated over the delivery of the plan period.
- **Potential funding mechanism**: The mechanism through which the infrastructure is expected to be funded. This is largely related to S106 and CIL (defined in the following section) but can also include committed funding, grant sources or other natural or provider specific funding.
- **Initial phasing:** This phasing estimate the key phase across the plan period where the infrastructure is envisaged or otherwise required to be in place, based on the need for infrastructure and the projected phasing of development. This also includes consideration of the potential lead in time for delivery of the scheme and early contributions (such as towards more detailed feasibility or initial financial obligations) may be required, as defined at the application stage.
- **Potential Delivery partners**: The infrastructure provider, public body and/or partners with responsibility for the delivery of the scheme. Responsibility may be shared between several delivery bodies, with this indicated where appropriate.
- **Commentary**: Any additional commentary relevant to understanding the infrastructure item required.

Prioritisation

To support future investment and funding decisions, each scheme has been assigned a relative priority level based on an assessment of its relative significance. These priorities reflect a practical and pragmatic basis for decision-making when balancing competing demands, and do not necessarily represent the views of all stakeholders.

It is important to note that a lower priority rating does not mean a scheme is optional or less critical to making development acceptable in planning terms. Schemes

requiring mitigation will still be required to deliver identified infrastructure, regardless of its assigned priority level.

Categories used include:

- **Critical**: Infrastructure that must be provided for development to proceed. This generally includes connections to infrastructure networks and items crucial to the acceptability of proposed sites (in planning terms) and will often be triggered by the commencement of development or early occupation.
- **Essential**: Infrastructure that will mitigate impacts arising from development. It often addresses demand generated by occupiers of new development (whether residential or commercial) and is usually triggered in line with occupation.
- **Important**: Infrastructure that is required to achieve sustainable growth and deliver high-quality places in line with the CDC policy requirements. It will generally improve operational infrastructure capacity, and/or deliver wider benefits to society
- **Regionally Significant**: These schemes are identified. They are usually so significant that they have cross boundary implications or otherwise require coordination of funding and benefits beyond the LPA boundary.

Sources of costs

This IDP was primarily completed in 2025 and 2026 and refers to and collates cost estimates from a range of evidence bases. Whilst the IDS is clear on the origin of these costs and they are considered robust for the plan making stage, these are a best estimate which will require monitoring for potential updates as the Local Plan period progresses. These costs have been supported by viability testing but are not intended to prevent refinement at the application stage as more detail becomes available.

All costs within are subject to indexation and wider review at the application stage. At the time of publishing, the Minister of State for Housing and Planning has written to the Planning Inspectorate (July 2026) to state "In light of the December 2026 submission deadline for legacy system local plans, you will be acutely aware that we are approaching a period of higher demand for local plan examination services. That forthcoming rise in demand obviously takes place against a backdrop of volatile economic conditions, largely owing to current geopolitical tensions, which is likely to impact on local plan preparation...

While deliverability and viability must remain important considerations in plan making, substantial economic volatility can generate uncertainty which may not reflect the longer-term prospects for delivery over the life of plan. With the benefits of up-to-date local plans firmly in mind, it is important that local plan deliverability and viability challenges be considered in a broad context, especially when economic conditions are volatile and are causing fluctuations to market conditions and heightening development risk and associated costs. As such, allocations should generally be assessed against their prospects of delivery over the plan period as a whole, rather than solely against current market conditions.

For these reasons, where a robust evidence base exists and there is a reasonable basis for concluding that allocations are capable of delivery over the plan period as a whole, I expect concerns regarding deliverability and viability to be approached pragmatically".

Conclusions and Next steps

This report is provided to support the Reg 19 consultation of the emerging CDC Local Plan.

The supporting IDS forms a key summary to this IDP and, in combination with the wider Local Plan evidence base, demonstrates that there is a reasonable prospect required infrastructure to support the proposed allocations and provides clarity in potential obligations due at application stage, although is not intended to prevent or otherwise restrict the use of CIL or other financial obligations for additional requests which meet the CIL tests and other national policy.

The IDP recognises that specific requirements will be refined at the application stage and it is important that this document otherwise be kept as a 'live' document and updated to monitor delivery and progress across the plan period.

Driffield	Driffield - Strategic - Land south of Driffield (2x landowners)	2.117	New onsite multifunctional community hub	A combined facility (covering community, culture, blue light and potential indoor sport requirement) of approximately 600sqm to cover both the current Local Plan and the broad location for growth.	02_Community and social infrastructure	02_Multifunction community spac
Fairford	Fairford - Strategic - Land north-east of Fairford (1x landowner)	2.118	New onsite multifunctional community hub	A combined facility (covering community, culture, blue light and potential indoor sport requirement) of approximately 400sqm.	02_Community and social infrastructure	02_Multifunction community spac
Kemble	Kemble - Strategic - Land south-west of Kemble (1X landowner / promoter)	2.119	New onsite multifunctional community hub	A combined facility (covering community, culture, blue light and potential indoor sport requirement) of approximately 400sqm. At this stage this is considered to be the smallest viable community facility but subject to refinement at application stage	02_Community and social infrastructure	02_Multifunction community spac
Mickleton	Mickleton - Strategic - Land North and west of Mickleton (8 landowners / promoters)	2.12	New onsite multifunctional community hub	A combined facility (covering community, culture, blue light and potential indoor sport requirement) of approximately 400sqm.	02_Community and social infrastructure	02_Multifunction community spac
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	2.121	New onsite multifunctional community hub	A combined facility (covering community, culture, blue light and potential indoor sport requirement) of approximately 600sqm.	02_Community and social infrastructure	02_Multifunction community spac
District-wide	All sites	2.21	Reinforcement of existing Library provision to support current Local Plan growth	Current preferred option is the expansion/relocation of the Moreton-in- Marsh Library. The alternatives (a satellite site of collection point in a multifunctional community building) provides a pragmatic and sustainable alternatives, enabling access to core library services without the requirement for dedicated on-site staff at all times. Such facilities can deliver a meaningful library presence within new communities, supporting access to resources, digital inclusion, and reading engagement. Both options could offer a range of services, including (but not limited to): •A curated lending stock •Self-service kiosks for issuing and returning items •Book reservation and collection services •Public access computers •Printing and associated digital services These models offer flexibility in terms of location and design. Provision could be situated within a dedicated room or integrated into a shared community space, such as a hub, leisure facility, or café area	02_Community and social infrastructure	02_Library
Cirencester	All sites	2.31	Expansion of Stratton Cemetery	Potential expansion of Stratton Cemetery - provision of land in kind of CIL	02_Community and social infrastructure	02_Burial ground/cemeteri

risation			Cost and delivery						
e sub-	Source	Prioritisation	Cost (£)	Source of cost	Confirmed funding	Potential funding mechanism	Initial phasing	Potential Delivery partners/ providers	Commentary
	IDP modelling	Essential	Planning obligation/ covered by separate line item	N/A	Business case approved covering operational costs	S106/CIL	01: 2027-2032 (inclusive)	GCC ICB; NHS	Cost assumed to be based on provision of land to support current business case approval and related to potential fallback mechanism contained in item 3.14
	IDP modelling	Essential	Planning obligation/ covered by separate line item	N/A	Business case approved covering operational costs	S106/CIL	01: 2027-2032 (inclusive)	GCC ICB; NHS	Cost assumed to be based on provision of land to support current business case approval and related to potential fallback mechanism contained in item 3.14
	IDP modelling	Essential	Planning obligation/ covered by separate line item	N/A	Business case approved covering operational costs	S106/CIL	01: 2027-2032 (inclusive)	GCC ICB; NHS	Cost assumed to be based on provision of land to support current business case approval and related to potential fallback mechanism contained in item 3.14. Alternative locations would also be considered on their merits but Kingshill benefits from the need for onsite facilities to support modal share and access to existing patient lists in Cirencester
	IDP modelling	Important	£ 2,034,256	Cost based on a plan wide need for 2,854sqm at a total costs of £20.26 million based on delivered and fitted out space, with provision for ceca 30,000 patients delivered by existing programme (at an equivalent new build cost of £18.24 million). The residual demand (3,347 patient or 287sqm) at the same fit out (£7,088 per sqm) is therefore included	See committed schemes	S106/CIL	03: 2033-2037 (inclusive)	GCC ICB; NHS	As set out in the body of the IDP, whilst there is an element of funding committed as part of the business case under schemes 3.11,3.12 and 3.13, these are yet to be implemented. In this event, the same methodology would apply to the wider housing growth figures and therefore be increased significantly. As set out in the body of the IDP this would equate to an estimated range of £15.63 to £20.26 million. As a result if the on-site provision is not provided, off-site financial contribution towards refurb and/or extensions of impacted PCN(s). Any on-site provision should meet the NHS's minimum requirements regarding commercial terms, scale and design of the primary care facility
	IDP modelling	Important	Included in CIL	N/A	N/A	CIL	07: Phased in line with delivery	GCC ICB; NHS

Relevant Sub area	**Site/Sub area attribution**	**Ref**	**Scheme name**	**Scheme description**	Infrastructure category	Infrastructure category
Fairford	Fairford - Strategic - Land north-east of Fairford (1x landowner)	Fa14	Fairford-Circencester AT Route	An active travel route including cycling and walking to join onto intervention D7 to provide a route between all the major sites and Cirencester. This route is 10.7km long and would be formed through 3.4km predominantly upgraded bridleways, footpaths and tracks followed by 1.3km of quiet lane treatment followed by 1.6km of on road segregation followed by 3.2km of quiet lane treatment on Welsh Way followed by small bit of shared pathway on the A417 between Village Street and Waterton Farm (BAC25 footpath) 0.4km followed by 1.7km of upgraded footpath to shared space.	05_Transport	05_Active travel public realm
Cirencester	Siddington -Strategic- Land south west of Siddington (1x landowner / promoter)	Cir10	Siddington Road Cycleway	Provision of an on-road cycleway connecting Sites SD23 and SD17 to town centre via Siddington Road. Cycleway would follow Siddington Road then turn onto Kingsmead Road to connect to existing cycleway underpass under Bristol Road. To be delivered along with Cir5 to provide onwards cycle access to town centre.	05_Transport	05_Active travel public realm
Cirencester	Cirencester - Strategic - Land east of Kingshill Lane (1x landowner / promoter)	Cir11	Extend London Road cycleway	Extend London Road cycleway next to Site C81B toward town centre with on-road cycle lane. Connect to existing active travel bridge over Swindon Road, creating a shared use path for pedestrians and cyclists. Rejoin cycleway to London Road and towards town centre with	05_Transport	05_Active travel public realm
Cirencester	Kemble Sub area	Cir12	Enhancement to 882 bus service	Increase the frequency of the Stagecoach West 882 bus service to run once an hour to provide better public transport connectivity to Cirencester.	05_Transport	05_Public transp Bus
Cirencester	Circencester Sub area	Cir14	Cirencester mobility hub	Development of a new or enhanced mobility hub integrating public transport, micromobility, cycle facilities, and shared mobility options	05_Transport	05_Supporting Sustainable tran integration
Cirencester	All sites	Cir15	Cirencester Park and Ride	Park and ride/stride provision to intercept car trips at the edge of town, with potential for targeted bus priority measures to improve reliability and attractiveness of services into Cirencester. Park and Rides tend to target cars coming from out of town. Given the placement of this it is unlikely to be used by sites within the local plan. It is will be important for reducing overall traffic levels which may help local plan traffic however at present the modelling does not suggest it is critical for the functioning of the network	05_Transport	05_Public transp Bus
Cirencester	Circencester Sub area	Cir16	Wayfinding improvements	Introduction of a coherent, high-quality wayfinding strategy to improve navigation, reinforce key destinations, and enhance the legibility of walking and cycling networks across the town.	05_Transport	05_Active travel public realm
Cirencester	Circencester Sub area	Cir17	East-West Pedestrian / Cycle route improvements	Strengthening east–west pedestrian and cycle connectivity across Cirencester, improving continuity, safety, and accessibility.	05_Transport	05_Active travel public realm
Cirencester	Siddington -Strategic- Land south west of Siddington (1x landowner / promoter)	Cir18	Tesco–Siddington Road Active Travel Link	Creation of a direct, safe walking and cycling route connecting Tesco to Siddington Road, improving local accessibility and reducing short car trips.	05_Transport	05_Active travel public realm
Cirencester	Cirencester - Strategic - Steadings southern extension (1x landowner)	Cir19	Orchard Fields–Steadings Active Link	Establishment of a walking and cycling route through Orchard Fields connecting Siddington to The Steadings.	05_Transport	05_Active travel public realm
Cirencester	Cirencester - Strategic - Steadings southern extension (1x landowner)	Cir2	Spratsgate Lane/Somerfield Road active travel links	Package of active travel measure could include providing pedestrian footpaths for residents willing to walk into Cirencester, as well as a on-road segregated cycleway. Require active travel access points along Spratsgate Lane for Sites SD20 and C190	05_Transport	05_Active travel public realm
Cirencester	Siddington -Strategic- Land south west of Siddington (1x landowner / promoter)	Cir20	Siddington–South Cerney active travel link	Development of a strategic active travel corridor utilising the disused railway line to provide a direct, segregated walking and cycling link between Siddington and South Cerney.	05_Transport	05_Active travel public realm
Cirencester	Siddington -Strategic- Land south west of Siddington (1x landowner / promoter)	Cir21	Green Lane Quiet Road	Reclassification of Green Lane (off Clark's Lane) from highway use to a quiet lane with lower speed limits and appropriate signage to enable shared use road for walking and cycling.	05_Transport	05_Active travel public realm
Cirencester	Circencester Sub area	Cir22	A417 Underpass Roundabouts Active Travel Mitigation	Model suggests that cycling along the Dower's Lane becomes unsuitable for most people from suitable for some people due to increased traffic volumes. Many surrounding roads are currently assessed to have low suitability for cycling however there are a few off-road routes nearby meaning some cycle routing may be happening. Mitigation is likely to involve speed limit treatment on Dower's Lane and a shared pathway/cyclops upgrade to the two roundabouts. There is limited suitability in the wider area for cycling so this is unlikely to be a critical mitigation	05_Transport	05_Active travel public realm
Cirencester	Siddington -Strategic- Land south west of Siddington (1x landowner / promoter)	Cir23	Spratsgate Lane AT Mitigation	At present the road has minimal segregated infrastructure (with the exception of the new roundabout that feeds into the development near the Wilkinson Road Junction). The change is traffic is significant enough that even with minimal interventions such as 20mph zones and traffic calming or non-segregated cycle lanes are unlikely to be sufficient to leave the road suitable for most people. At present this route lies on the National Route 45. Multiple options should be explored including providing segregated provision or through alternative routing for the key routes that may use this route. For example K10 intervention may open up a route through Chesterton Farm and into the town centre and to east provision could be improved for a route along love lane. These interventions would be in addition to that proposed as part of the committed steadings site.	05_Transport	05_Active travel public realm
Cirencester	Cirencester - Strategic - Land east of Kingshill Lane (1x landowner / promoter)	Cir24	On site provision of services	Site further from Cirencester Town centre require on site provision of essential services to reduce travel in to the town centre. This should include at a minimum a primary school, a community space, a retail offering (ideally a small convenience store and service for last mile delivery such a RM parcel box and parcel collection (either within a retail offering or through an external parcel collection service).	05_Transport	05_Behaviour ch
Cirencester	Cirencester - Strategic - Land east of Kingshill Lane (1x landowner / promoter)	Cir25	Kingshill Road/London Road mitigation	Upgrade Junction to a signalised Junction	05_Transport	05_Highways
Cirencester	Cirencester - Strategic - Land east of Kingshill Lane (1x landowner / promoter)	Cir26	Kingshill Road/Cirencester Road mitigation	Upgrade Junction to a signalised Junction	05_Transport	05_Highways
Cirencester	Siddington -Strategic- Land south west of Siddington (1x landowner / promoter)	Cir27	Somerford Road/Chesterton Lane HW Mitigation	Upgrade intersection between Somerford road and Chesterton lane to be signalised. The modelling suggests that increased traffic on Chesterton road will lead to severe queueing on the Somerford road due to them being unable to merge	05_Transport	05_Highways
Cirencester	Multiple: SE Cirencester Strategic sites (South of Preston, Down Ampney and Driffield)	Cir28	Cirencester Road AT Flag	Limit issues for active travel using speed limits (20mph) and soft segregation	05_Transport	05_Active travel public realm
Cirencester	Circencester Sub area	Cir29	B4425/A429 Stow Road mitigation	Signal Optimisation/ Increase cycle time (reduce amount of loss time for Cherrytree Ln and increase green time B4425 and Stow Rd) Required to deal with harm to network	05_Transport	05_Highways
Cirencester	Multiple: SE Cirencester Strategic sites (South of Preston, Down Ampney and Driffield)	Cir3	Active travel access Swindon Road	Active travel access onto Swindon Road at the northeastern corner of Site R519 to give access to existing cycleway crossing the A419 and along Cricklade Road to town centre.	05_Transport	05_Active travel public realm
Cirencester	Multiple: SE Cirencester Strategic sites (South of Preston, Down Ampney and Driffield)	Cir30	Cirencester-Swindon BRT	Implementation of BRT route prosed between Cirencester and Swindon. This is assumed to contain enough bus priority interventions to keep the journey times down and a service that is frequent a minimum of every fifteen minutes. In order to maximise the utility of these route for the local plan it is assumed that this will be an express stopping service that would call at Swindon-Down Ampney-Driffield Junction- Preston-Kingshill Lane-Cirencester. This captures around 2300 dwellings in the local plan. Journey time between Swindon and Cirencester should be no longer than 50-60 minutes to provide a competitive journey time to driving.	05_Transport	05_Public transp Bus
Cirencester	Cirencester - Strategic - Steadings southern extension (1x landowner)	Cir32	Enhanced or extended bus service between Site C187 via the Steadings to Cirencester	Increase the frequency of existing bus routes or implementation of a new bus route to connect the new site south of the Steadings via The Steadings to Cirencester. Could include a bus gate to permit bus movements between the Steadings and site C187.	05_Transport	05_Public transp Bus
Cirencester	Cirencester - Strategic - Steadings southern extension (1x landowner)	Cir33	Local transport corridor interchange hub in The Steadings	Implement a Local Transport Corridor Interchange Hub within The Steadings where bus service between The Steading and Cirencester will stop on site.	05_Transport	05_Supporting Sustainable tran integration
Cirencester	Circencester Sub area	Cir34	20mph zones	Extended the 20mph zones to cover residential street and development sites. This follows the consultation currently out	05_Transport	05_Behaviour ch
Cirencester	Cirencester - Strategic - Steadings southern extension (1x landowner)	Cir35	Active Travel Route from South Steadings to Tetbury Road Entrance of Agricultural College	Route following the existing planned interconnection between the Steadings and South Steadings extension. Exiting on the southern access from the Steadings (assuming the roundabout has been designed with adequate segregation. Then 0.2km of shared pathway on the north bound side of the road. Given the likely low volumes of both pedestrians and cyclists a 3m shared pathway would be sufficient and can be delivered within the HW boundary	05_Transport	05_Active travel public realm
Cirencester	Cirencester - Strategic - Steadings southern extension (1x landowner)	Cir36	A419 Swindon Road/Silver Street	Upgrade the junction to a signalised junction and add approach flares.	05_Transport	05_Highways
Cirencester	Cirencester - Strategic - Steadings southern extension (1x landowner)	Cir37	A429/Chesterton Ln Junction	Change the stages and phases (having an all A429 stage followed by a Chesterton ln stage, and more green time for Stroud lane approach)	05_Transport	05_Highways
Cirencester	Cirencester - Strategic - Land south east of Cirencester and south of Preston (2x landowners / promoter)	Cir38	A419 Stroud Road/Trewsbury Road	Upgrade the junction to a signalised junction and add approach flares.	05_Transport	05_Highways
Cirencester	Multiple: SE Cirencester Strategic sites (South of Preston, Down Ampney and Driffield)	Cir39	A429 Watermoor Roundabout	Add approach arm flares to the roundabout and widen the eastbound approach arm.	05_Transport	05_Highways
Cirencester	Multiple: SE Cirencester Strategic sites (South of Preston, Down Ampney and Driffield)	Cir4	Cricklade Road Cycleway Enhancement	Upgrade the cycleway from Preston Toll Bar along Cricklade Road by installing high-quality road surface throughout, introducing a designated on-road cycle lane, and implementing clear signage. Extend this cycleway improvements to the town centre, passing under the foot tunnel under the Bristol Road and joining Watermoor Way	05_Transport	05_Active travel public realm

Cirencester	Cirencester - Strategic - Steadings southern extension (1x landowner)	Cir40	Stroud Road north of Tetbury Roundabout	Widen the road to two lanes to accommodate development access.	05_Transport	05_Highways
Cirencester	Multiple: SE Cirencester Strategic sites (South of Preston, Down Ampney and Driffield)	Cir41	A419 Swindon Road\Cirencester Road	Widen the roundabout to provide two lanes between the roundabout and the Kingsmill Lane signalised junction.	05_Transport	05_Highways
Cirencester	Multiple: SE Cirencester Strategic sites (South of Preston, Down Ampney and Driffield)	Cir42	A29 Swindon Road/Bristol Road Roundabout	Widen the roundabout.	05_Transport	05_Highways
Cirencester	Circencester Sub area	Cir43	Chesterton Road Active Travel Mitigation	Segregated cycle route from Chesterton Farm Lodge to join into A429/A419 underpass. This is to account for the decreased suitability for mixed traffic cycling due to the increase in traffic.	05_Transport	05_Active travel / public realm
Cirencester	Multiple: SE Cirencester Strategic sites (South of Preston, Down Ampney and Driffield)	Cir5	Watermoor Road space reallocation	Reallocate road space along Watermoor Road to create a serrated cycleway, joining with Cycleway improvements in Cir4 to provide active travel links for southern development sites into Cirencester.	05_Transport	05_Active travel / public realm
Cirencester	Cirencester - Strategic - Land east of Kingshill Lane (1x landowner / promoter)	Cir7	Active travel access on Kingshill Lane	Active travel access on western boundary of site directly opposite off road leading to Cirencester skate park.	05_Transport	05_Active travel / public realm
Cirencester	Cirencester - Strategic - Land east of Kingshill Lane (1x landowner / promoter)	Cir8	Queen Elizabeth Road/Beeches Road cycleway	On road cycleway connecting to existing east-west cycle route to link Sites R650 and R519 to town centre. Include on road cycleways along Queen Elizabeth Road and Beeches Road. Then a segregated cycle lane along London Road/Lewis Lane to access town centre.	05_Transport	05_Active travel / public realm
Cirencester	Circencester Sub area	Cir9	Pedestrianise Castle Street	Extend current pedestrian zone restrictions to on Crickade Road to cover Castle Street for more attractive placemaking in town centre. Reallocate road space to active travel infrastructure and green space. Divert East West traffic along Park Lane, Black Jack Street, Market Place and The Waterloo to reach London Road	05_Transport	05_Active travel / public realm
Down Ampney	Down Ampney - Strategic - Land surrounding Down Ampney (2x landowners/ promoters)	D1	On site provision of services	Site requires on-Site provision of key services such as retail and healthcare as there is currently only one small village shop in Down Ampney, with other retail and healthcare services located over 3km away.	05_Transport	05_Behaviour cha
Down Ampney	Down Ampney - Strategic - Land surrounding Down Ampney (2x landowners/ promoters)	D2	Cricklade cycle route	Cycleway connecting Down Ampney and Cricklade to give sustainable access to retail services in Crickade. Route would follow Down Ampney Road and head south on Cirencester road, cross the A419 and continue down into Crickade.	05_Transport	05_Active travel / public realm
Down Ampney	Down Ampney - Strategic - Land surrounding Down Ampney (2x landowners/ promoters)	D3	South Cerney cycle route	Cycleway connecting Down Ampney and Cricklade to give sustainable access to retail services in South Cerney. Route would follow Down Ampney Road west and cross the A419, before turning north onto Cerney Wick Lane and following north on to Station Road into the centre of South Cerney.	05_Transport	05_Active travel / public realm
Down Ampney	Down Ampney - Strategic - Land surrounding Down Ampney (2x landowners/ promoters)	D6	Enhancements of 76 bus route	Increase the frequency of the Stagecoach West 76 bus service to run once an hour to provide better public transport connectivity to Cirencester.	05_Transport	05_Public transpo Bus
Down Ampney	Down Ampney - Strategic - Land surrounding Down Ampney (2x landowners/ promoters)	D7	Down Ampney -Cirencester Greenway	Extended greenway linking Sites in Down Ampney to Cirencester. Route would extend up through the sites in Down Ampney, north along the PROW route (BDA1) and the west towards Driffield (Route BDD16). It would then connect with the sites at Driffield Junction Development, running directly through these sites and onwards to the existing bridleway running northeast from Harnhill and adjacent to the A419. It would cross the A417 at Witpit Lane and connect to the sites along Kingshill Lane. For there it would follow Cir8 into town centre.	05_Transport	05_Active travel / public realm
Down Ampney	Down Ampney - Strategic - Land surrounding Down Ampney (2x landowners/ promoters)	D9	20mph zones	Introducing 20mph zones across Down Ampney including within development sites	05_Transport	05_Behaviour cha
Down Ampney	Down Ampney - Strategic - Land surrounding Down Ampney (2x landowners/ promoters)	D10	Quiet Lane Treatment on Unnamed Road between Oak Road and Fairford Road	In order to limit the use of this not suitable single track road several measures are pursued: Speed limit Change from National Speed limit to 30mph - this change will ensure that subtility level for active travel is improved as well as limit the perceived advantage of the route. Traffic calming measures including road marking and bumps. In addition formally designating this as a rural quiet lane with measures to ensure that traffic is kept beneath 1000 pcu a day. Finally in order to facilitated passing more passing places to be implemented with	05_Transport	05_Highways
Driffield	Driffield - Strategic - Land south of Driffield (2x landowners)	DJ1	On site provision of services	Site requires on-Site provision of key services such as retail, education and healthcare as closest services are 2 miles away in South Cerney or Down Ampney.	05_Transport	05_Behaviour cha
Driffield	Driffield - Strategic - Land south of Driffield (2x landowners)	DJ10	B4696 Spine Rd Approach to Station Rd/Cerney Wick Ln Intersection	Upgrade Junction to a signalised Junction	05_Transport	05_Highways
Driffield	Driffield - Strategic - Land south of Driffield (2x landowners)	DJ2	South Cerney active travel route	Provision of a segregated cycleway linking the western boundary of the Site to services in South Cerney for those who are able to cycle the distance. This could include active travel priority at A419/B4696 junction, then an onwards active travel route along the B4696 and Station Road into South Cerney. Alternatively could explore an active travel bridge over A419 connecting to and active trave route along Bow Wow Road directly into South Cerney. This assumed D3 is delivered	05_Transport	05_Active travel / public realm
Driffield	Driffield - Strategic - Land south of Driffield (2x landowners)	DJ3	Cirencester active travel route	Provision of a segregated cycleway connecting the Site to Cirencester via Cirencester Road for those able to cycle the distance. It is assumed that this should be delivered using a crossing of Cirencester Road which requires a change in the character of that road. GCC expressed support for this.	05_Transport	05_Active travel / public realm
Driffield	Driffield - Strategic - Land south of Driffield (2x landowners)	DJ5	Driffield Junction Development Village Mobility Hub	A smaller mobility hub providing bus services, EV charging and parcel drop off points.	05_Transport	05_Supporting Sustainable transp integration
Driffield	Driffield - Strategic - Land south of Driffield (2x landowners)	DJ8	Bridleway enhancement to Down Ampney (Wiltshire)	Enhancement of Bridleways through Wiltshire to high quality cycleway and walking route to Down Ampney	05_Transport	05_Active travel / public realm
Fairford	Fairford - Strategic - Land north-east of Fairford (1x landowner)	Fa1	On site provision of services	On-Site provision of key services such as retail and healthcare.	05_Transport	05_Behaviour cha
Fairford	Fairford - Strategic - Land north-east of Fairford (1x landowner)	Fa10	Enhancement to 76 bus service	Increase the frequency of the Stagecoach West 76 bus service to run once an hour to provide better public transport connectivity to Cirencester.	05_Transport	05_Public transpo Bus
Fairford	Fairford Sub area	Fa11	Fairford High Street Placemaking and AT	Increased traffic from Local Plan developments lead the high street to become "unsuitable" for most people. At present the high street has dedicated a lot of space to private vehicle use including parking and minimal space to active travel. Possible solutions include limiting or removing through traffic from the high street, full pedestrianisation, a one way system in additional to the removal of parking to allow for more segregated routes.	05_Transport	05_Active travel / public realm
Fairford	Fairford - Strategic - Land north-east of Fairford (1x landowner)	Fa12	20mph zones	Introducing 20mph zones across Down Ampney including within development sites	05_Transport	05_Behaviour cha
Fairford	Fairford - Strategic - Land north-east of Fairford (1x landowner)	Fa13	Fairford-Lechlade AT Route	Segregated Cycleway on Park Street (0.3km) followed by quiet lane treatment (with physical calming measures) on Leafield Road (0.5km) followed by footway upgrade to shared space (0.4km), segregated route along Hatherop Lane (0.3km) and then again (shared) along to Slothop Road (2.2km) followed by enhanced of a bridleway (1.6km) finally quiet lane treatment on Hambidge Lane (2.7km). Cost is additional to Fa3. This scheme is dependent on Fa2 being delivered	05_Transport	05_Active travel / public realm
Fairford	Fairford - Strategic - Land north-east of Fairford (1x landowner)	Fa2	Southrop Road/London Road active travel route	Provision of a segregated active route linking Site F57C to the town centre via Southrop Road and London Road. Package of measures include ensuring filling in gaps in pedestrian infrastructure and ensuring continuous footpaths and adequate crossing facilities, as well as enabling a shared used road with a cycleway. Requires active travel access of the southern boundary of the large Site along Hatherop Road and active travel access of the northern boundary of the large Site south of Southrop road.	05_Transport	05_Active travel / public realm
Fairford	Fairford - Strategic - Land north-east of Fairford (1x landowner)	Fa3	Hatherop Road active travel route	Provision of an active route connecting Site F57B to the town centre via Hatherop Road. Measures could include widening existing footpaths in some areas and, ensuing adequate crossing facilities and implementing shared used road with a cycleway. Requires active travel access to Site along northwestern boundary along Hatherop Road.	05_Transport	05_Active travel / public realm
Fairford	Fairford - Strategic - Land north-east of Fairford (1x landowner)	Fa5	Cinder Lane quiet road	Designation of Cinder Lane as a quiet road, to encourage active travel from Site F20A to the Town centre. Requires active travel access to Cinder Lane on northern boundary of Site. Includes surfacing upgrade.	05_Transport	05_Active travel / public realm
Fairford	Fairford - Strategic - Land north-east of Fairford (1x landowner)	Fa6	Horcott Road active travel route	Improve active travel links along Horcott Road to encourage sustainable access from Site F53A to the town centre. This includes by widen footpaths and improving crossing over wide-mouth junctions heading to town centre, as well as introducing a cycleway. This could connect to existing the cycleway crossing Dilly's Bridge and connecting to Gas Lane, providing a more direct route to High Street.	05_Transport	05_Active travel / public realm
Fairford	Fairford - Strategic - Land north-east of Fairford (1x landowner)	Fa8	Leafield Road Crossing	Provision of pedestrian crossing connecting Site to the east of Leafield Road to the Primary School opposite.	05_Transport	05_Active travel / public realm
Fairford	Fairford - Strategic - Land north-east of Fairford (1x landowner)	Fa9	Leafield Road active travel route	Providing footpaths along Leafield road and a cycleway to enable active travel into town centre from Site F57A.	05_Transport	05_Active travel / public realm
Kemble	Kemble - Strategic - Land south-west of Kemble (1X landowner / promoter)	K10	Kemble -Cirencester cycleway	Reuse of former rail route as a cycleway connecting Kemble and Cirencester for access to employment and education.	05_Transport	05_Active travel / public realm
Kemble	Kemble - Strategic - Land south-west of Kemble (1X landowner / promoter)	K12	Kemble to Tetbury Service bus service	New bus service connecting town centre of Kemble, developments Sites and Tetbury, along A439, Oxleaze Road and A433. Modelling suggests 100-200 passengers a day	05_Transport	05_Public transpo Bus
Kemble	Kemble - Strategic - Land south-west of Kemble (1X landowner / promoter)	K13	On site provision of services	Sites require on-site provision of key services such as retail and healthcare as there are minimal key services available in Kemble.	05_Transport	05_Behaviour cha

Kemble	Kemble - Strategic - Land south-west of Kemble (1X landowner / promoter)	K14	Windmill Road AT Mitigation	Flag identifies cycling may become unsuitable for most people as a result of increased traffic flow. At present the road is functionally not a full two-way street due to parking on the street. Mitigation could involve removing on street parking given most houses have drives to accommodate segregation	05_Transport	05_Active travel / public realm
Kemble	Kemble - Strategic - Land south-west of Kemble (1X landowner / promoter)	K15	Kemble to Ewen Cycle Mitigation	Model suggests that local plan traffic will make Windmill Road, School Road to Ewen no longer 'suitable for most people'. Mitigation involves shared pathway and reduction to 40mph	05_Transport	05_Active travel / public realm
Kemble	Kemble - Strategic - Land south-west of Kemble (1X landowner / promoter)	K20	20mph zones	Introducing 20mph zones across all streets in Kemble, including within the development sites.	05_Transport	05_Behaviour cha
Kemble	Kemble - Strategic - Land south-west of Kemble (1X landowner / promoter)	K3	Church Road active travel	Improvements to active travel along Church Road for Site K12. This includes active travel access to site boundary on Church road, continuous footways and possible exploration of a quiet lane on Church Road with lower speed limits and signage to improve mixed use of road for cycling.	05_Transport	05_Active travel / public realm
Kemble	Kemble - Strategic - Land south-west of Kemble (1X landowner / promoter)	K5	Improved A429 crossing facilities	Improved active travel crossing facilities to allow active travel access from Site K12 to access Station Road, for onwards access to Kemble Station.	05_Transport	05_Active travel / public realm
Kemble	Kemble - Strategic - Land south-west of Kemble (1X landowner / promoter)	K6	Station Road active travel	Improved pedestrian footways and cycleways along Station Road to promote active travel access from Sites K12 to Kemble Station	05_Transport	05_Active travel / public realm
Kemble	Kemble - Strategic - Land south-west of Kemble (1X landowner / promoter)	K8	Kemble station improvements	Package of improvements including improving accessibility at the station with step free bridge, cycle parking etc.	05_Transport	05_Public transpo Rail
Kemble	Kemble Sub area	K21	Anti-Ratrunning Measures on Unnamed Road between A429 and A433	Minor alterations including speed interventions and no left turn into it from A429 and no right turn into it from A433 in order to stop traffic using to avoid A429/A433 junction	05_Transport	05_Highways
Down Ampney	Down Ampney - Strategic - Land surrounding Down Ampney (2x landowners/ promoters)	LP10	B4040/B4696	Signal Optimisation	05_Transport	05_Highways
Kemble	North Cotswold Sub area	LP7	Stow-on-the-Wold Sheep Street/A429/High Street Mitigation	Change signal stages with indicative arrows at high street/Roman Rd Junctions. Signal optimisation at A429/B4068.	05_Transport	05_Highways
Kemble	Kemble - Strategic - Land south-west of Kemble (1X landowner / promoter)	LP8	Avening High Street AT Mitigation	Model suggests that Avening High Street becomes unsuitable to most people to cycle on after the local plan. Mixed traffic suitability could be restored if the speed limit is reduced to 20mph with a corresponding amount of traffic calming to ensure the design speed matches the new speed limit. The remainder of links surrounding this one are deemed unsuitable according to LTN1/20 before and after the local plan which means this stretch is unlikely to currently form part of a whole route however there are some non-road routes near by which this may cut off.	05_Transport	05_Active travel / public realm
Kemble	Kemble - Strategic - Land south-west of Kemble (1X landowner / promoter)	LP9	Coates AT Mitigation	Model suggests that cycling on the Trewsbury Road becomes unsuitable for most people due to increased traffic volumes. Caveat: At present all the surrounding rounds into Coates are current deemed to be unsuitable for most cyclists and this is unlikely to block a route. Solutions include implementing a one way system around coates to allow for cycle lanes and/or speed reductions.	05_Transport	05_Active travel / public realm
Kemble	North Cotswold Sub area	LP16	Willersey AT Flag	Willersey Leamington Road and Main Street because unsuitable for cycling due to increased traffic. 20mph speed limit would resolve this.	05_Transport	05_Highways
Mickleton	Mickleton - Strategic - Land North and west of Mickleton (8 landowners / promoters)	Mic11	20mph zones	Introducing 20mph zones across all streets in Mickleton, including within the development sites.	05_Transport	05_Behaviour cha
Mickleton	Mickleton - Strategic - Land North and west of Mickleton (8 landowners / promoters)	Mic2	Site Active Travel Connections and wider offsite improvements to car-free routes	Active Travel only connections to the public park to provide attractive active travel routes within Mickleton. At present the paths within the park are not sufficient for cycling and so upgrade of widths for a shared pathway or separate cycling routes would be required. Includes at least 2.6km of pathways to upgrade	05_Transport	05_Active travel / public realm
Mickleton	Mickleton - Strategic - Land North and west of Mickleton (8 landowners / promoters)	Mic3	Long Marsdon Road Active Travel Connection	Cycleway and/or Shared Pathways along Long Marsdon Road to facilitate segregated access to National Cycleway 5 route featuring a fully car-free travel route to Stratford-Upon-Avon the distance being approximated 12-14km/ 7.5-8.5 mi within the distance that some may commute especially if coupled with targeted e-micromobility interventions.	05_Transport	05_Active travel / public realm
Mickleton	Mickleton - Strategic - Land North and west of Mickleton (8 landowners / promoters)	Mic5	On site provision of services	At present that are limited services within Mickleton itself. Providing a local hub including some GP services, Schools and Retail offerings and mobility hub	05_Transport	05_Behaviour cha
Mickleton	Mickleton - Strategic - Land North and west of Mickleton (8 landowners / promoters)	Mic6	Improved Bus Services Mickleton to Moreton-in-Marsh	Current services offer routes to Stratford-Upon-Avon, Chipping Campden and Moreton-In-Marsh. Frequency is approximately every one to two hours with early and late travel options available. No services exist to nearby Evesham. This intervention would look at improving frequency of the current offering whilst also adding connections to Evesham in line with new population. Nearby Warwickshire also has some sites nearby in REG18 so there is potential for collaboration.	05_Transport	05_Public transpo Bus
Mickleton	Mickleton - Strategic - Land North and west of Mickleton (8 landowners / promoters)	Mic8	Mickleton to Ebrington Primary School AT Flag	Baker's Hill, Hidcote Road are expected to become unsuitable to cycle. Part of the route sits on the existing national 42 cycle route. Mitigations that could be effective at retaining the cycle routes suitability include: 20mph along the stretch with included enforcement however this is unlikely to be viable across such a long stretch of rural road therefore share pathway segregation utilising bridleway for some of it.	05_Transport	05_Active travel / public realm
Mickleton	Mickleton - Strategic - Land North and west of Mickleton (8 landowners / promoters)	Mic9	Mickleton to Willersey speed route treatment	Reduction of Willersey Speed Limit to 20mph and "route treatment" to Mickleton. Could be potentially extended into Mickleton.	05_Transport	05_Behaviour cha
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo1	Moreton-in-Marsh to Bourton-on-the-Water via Stow-on-the-Wold active travel link	An LTN1/20 compliant route from Moreton-In-Marsh to Bourton-on-the-Water via Stow-in-the-Wold. This route can either be in the form of a segregated addition to the Fosse Road or along the routes identified in the GCC countywide LCWIP (Evenload Road-Chapel Street-Ex railway alignment). The latter was estimated to need ~1-2million to deliver and the latter is assumed	05_Transport	05_Active travel / public realm
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo10	Moreton-in-Marsh New Road	South eastern portion of the link road around Moreton-in-Marsh to the East in an attempt to move through traffic and some development traffic away from currently constrained double roundabout. In order to remain inline with the vision to not induce increased car use this should include a wider array of measures including the potential to be car capacity neutral by e.g. pedestrianising or semi-pedestrianising the high street.	05_Transport	05_Highways
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo12	Moreton-In-Marsh to Chipping Campden Greenway	A quiet street and infrastructure approach to delivering a car-lite route from Moreton-In-Marsh to Chipping Campden. This largely would be upgrades the current 442 national cycle route and could include closure/one-way/speed treatments on one leg of the triangle near Batsford, work on the crossing at station road and lanes or shared pathways along areas of the road that can facilitate it. Alternatively a route could be pursued through upgrading of Rights of Way footpaths along the railway line via Paxford this route is flatter but may be harder to deliver. Also to note that it opens up railway access for Chipping Campden including sites being delivered there	05_Transport	05_Active travel / public realm
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo13	Moreton-In-Marsh to Shipston-on-Stour Cycleway	Greenway from Moreton-in-Marsh to Shipstone-on-the-Stour. This could utilise the verge to make a shared pathway along Todenham Street and joining to an upgraded Bridleway to Shipston-on-Stour. It should be noted that there may be grounds for cross-collaboration over the border with development along this route	05_Transport	05_Active travel / public realm
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo16	Evenlode Improvements	Currently part of the National 48 and the 442 cycle routes and all cyclists are expected to mix with general traffic. The high amount of additional traffic from developments along the route means that cycling is likely to become unsuitable for most people. It is likely that to remain suitable some form of segregation is likely to be required. There is a marginal possibility that limiting speed along the road to 20mph as well with measures to decrease or reroute traffic may retain the route as suitable for some people	05_Transport	05_Active travel / public realm
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo17	Moreton-in-Marsh Station Improvements	Upgrades to the facilities of the station in line with high patronage including better active travel connections.	05_Transport	05_Public transpo Rail
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo18	20mph zones	Introducing 20mph zones across Moreton-in-Marsh (excluding A44 and A429)	05_Transport	05_Behaviour cha
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo2	Blenheim Meadow AT routes upgrade	Upgrading the traffic-free paths through Blenheim Meadow to be suitable for cycling. Current paths cycling is not allowed and there are key barriers along the route. Upgrading these including widening and removal of barriers/gates will allow the developments further away from the centre to use cycling to access the town centre and railway station.	05_Transport	05_Active travel / public realm
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo3	A44 Corridor Active Transport Route	From edge of Fire Service College Site to High Street roundabout on A44. A combination of measures including a shared pathway or pathway and cycleway up to the junction with Evenload Road where geometric constraint may need a different approach e.g. speed limit reductions or alternative routing.	05_Transport	05_Active travel / public realm
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo4	Southern Moreton greenway	Footpaths HMM8 and HMM18 to be upgraded to shared green way and options explored to facilitate onwards routing in a low traffic environment, possibly through allotments and through quiet East Street. Facilitating traffic free travel from southern sites to town services.	05_Transport	05_Active travel / public realm
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo5	BRT Route C09/C08 Moreton-in-Marsh to Cheltenham	BRT Route C09/C08 Moreton-in-Marsh to Cheltenham	05_Transport	05_Public transpo Bus

Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	2.121	New onsite multifunctional community hub	A combined facility (covering community, culture, blue light and potential indoor sport requirement) of approximately 600sqm.	02_Community and social infrastructure	02_Multifunctional community space	IDP modelling	Important	£ 1,800,000	BCIS estimate of £2,640/m^2 + fees (£3,000) for outside London combined facility applied to facility size, including fit out but excluding land cost	£ -	S106; direct delivery	02: 2027-2037 (inclusive)	Parish and Town Councils			No	Draft for comment
District-wide	All sites	2.21	Reinforcement of existing Library provision to support current Local Plan growth	Current preferred option is the expansion/relocation of the Moreton-in- Marsh Library. The alternatives (a satellite site of collection point in a multifunctional community building) provides a pragmatic and sustainable alternatives, enabling access to core library services without the requirement for dedicated on-site staff at all times. Such facilities can deliver a meaningful library presence within new communities, supporting access to resources, digital inclusion, and reading engagement. Both options could offer a range of services, including (but not limited to): •A curated lending stock •Self-service kiosks for issuing and returning items •Book reservation and collection services •Public access computers •Printing and associated digital services These models offer flexibility in terms of location and design. Provision could be situated within a dedicated room or integrated into a shared community space, such as a hub, leisure facility, or café area	02_Community and social infrastructure	02_Library	IDP modelling	Important	£ 2,970,968	GCC Developer Guide rate of £196 per homes x 15,158 homes	£ -	S106	07: Phased in line with delivery	GCC Libraries	Alternative sites for new sites will also be supported but subject to retention of existing staffing levels		Yes	Agreed in principle
Cirencester	All sites	2.31	Expansion of Stratton Cemetery	Potential expansion of Stratton Cemetery - provision of land in kind of CIL	02_Community and social infrastructure	02_Burial ground/cemeteries	CDC Bereavement team	Important	Included in CIL	Establishment costs are proportional to build out with largest barrier being the land transfer costs associated with adjacent land owner (BDL)	£ -	CIL	05: 2033-2043 (inclusive)	CDC Bereavement team			No	Draft for comment
North Cotswold	North Cotswold Sub area	3.11	Land / contributions to support new GP surgery/ existing Business Case	Support Chipping Camden Surgery to be expanded to align with the current future funding commitment. In combination with schemes 3.11,3.12 and 3.13 these collectively provide circa 2,500sqm of practicing space capable of provide services to circa 30,000 patients though collective funding of approximately £19.24m).	03_Primary Healthcare	03_GP space	IDP modelling	Essential	Planning obligation/ covered by separate line item	N/A	Business case approved covering operational costs	S106/CIL	01: 2027-2032 (inclusive)	GCC ICB; NHS	Cost assumed to be based on provision of land to support current business case approval and related to potential fallback mechanism contained in item 3.14		Yes	Agreed in principle

Cirencester	Cirencester Sub area	3.12	Land to support new GP surgery/ existing Business Cass	Support replacement of Pheonix Health surgery (moving from Chesterton Lane). In combination with schemes 3.11,3.12 and 3.13 these collectively provide circa 2,500sqm of practicing space capable of provide services to circa 30,000 patients though collective funding of approximately £18.24m). Currently envisaged to be delivered on existing Steadings site or as part of Southern Expansion through new build	03_Primary Healthcare	03_GP space	IDP modelling	Essential	Planning obligation/ covered by separate line item	N/A	Business case approved covering operational costs	S106/CIL	01: 2027-2032 (inclusive)	GCC ICB; NHS	Cost assumed to be based on provision of land to support current business case approval and related to potential fallback mechanism contained in item 3.14		Yes	Agreed in principle
Cirencester	Cirencester Sub area	3.13	Identify land to support new GP surgery/ existing Business Cass	Support expansion of Cirencester Neighbourhood health centre in combination with schemes 3.11,3.12 and 3.13 these collectively provide circa 2,500sqm of practicing space capable of provide services to circa 30,000 patients though collective funding of approximately £18.24m). Specific site to be identified in Cirencester sub area, preliminarily identified as Land at Kingshill	03_Primary Healthcare	03_GP space	IDP modelling	Essential	Planning obligation/ covered by separate line item	N/A	Business case approved covering operational costs	S106/CIL	01: 2027-2032 (inclusive)	GCC ICB; NHS	Cost assumed to be based on provision of land to support current business case approval and related to potential fallback mechanism contained in item 3.14. Alternative locations would also be considered on their merits but Kingshill benefits from the need for onsite facilities to support modal share and access to existing patient lists in Cirencester		Yes	Agreed in principle
District-wide	All sites	3.14	Residual need for primary healthcare (and consideration of tall back measures)	This scheme includes the residual cost estimate for additional planned projects towards the end of the Local Plan period, on the basis the identified schemes within this IDS collectively provide approximately 2,500sqm of practicing space. This cost would therefore mitigate the need for approximately 3,347 additional patients at the latter end of the plan period. This is currently understood to be reviewed at the Moreton-in-Marsh, subject to feasibility.	03_Primary Healthcare	03_GP space	IDP modelling	Important	£ 2,034,256	Cost based on a plan wide need for 2,854sqm at a total costs of £20.26 million based on delivered and fitted out space, with provision for circa 30,000 patients delivered by existing programme (at an equivalent new build cost of £18.24 million). The residual demand (3,347 patient or 287sqm) at the same fit out (£7,088 per sqm) is therefore included	See committed schemes	S106/CIL	03: 2033-2037 (inclusive)	GCC ICB; NHS	As set out in the body of the IDP, whilst there is an element of funding committed as part of the business case under schemes 3.11,3.12 and 3.13, these are yet to be implemented. In this event, the same methodology would apply to the wider housing growth figures and therefore be increased significantly. As set out in the body of the IDP this would equate to an estimated range of £15.63 to £20.26 million. As a result if the on-site provision is not provided, off-site financial contribution towards refurb and/or extensions of impacted PCN(s). Any on-site provision should meet the NHS's minimum requirements regarding commercial terms, scale and design of the primary care facility		Yes

Cirencester	Siddington -Strategic- Land south west of Siddington (1x landowner / promoter)	Cir21	Green Lane Quiet Road	Reclassification of Green Lane (off Clark's Lane) from highway use to a quiet lane with lower speed limits and appropriate signage to enable shared use road for walking and cycling.	05_Transport	05_Active travel / public realm	Cotswold DC	Essential	£ 100,000	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment.	£ -	S106; S278	04: 2038-2043 (inclusive)	GCC			No	Draft for comment
Cirencester	Cirencester Sub area	Cir22	A417 Underpass Roundabouts Active Travel Mitigation	Model suggests that cycling along the Dower's Lane becomes unsuitable for most people from suitable for some people due to increased traffic volumes. Many surrounding roads are currently assessed to have low suitability for cycling however there are a few off-road routes nearby meaning some cycle routing may be happening. Mitigation is likely to involve speed limit treatment on Dower's Lane and a shared pathway/cyclops upgrade to the two roundabouts. There is limited suitability in the wider area for cycling so this is unlikely to be a critical mitigation	05_Transport	05_Active travel / public realm	City Science modelling	Important	£ 250,000	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment.	£ -	S106; S278	01: 2027-2032 (inclusive)	GCC			No	Draft for comment
Cirencester	Siddington -Strategic- Land south west of Siddington (1x landowner / promoter)	Cir23	Spratsgate Lane AT Mitigation	At present the road has minimal segregated infrastructure (with the exception of the new roundabout that feeds into the development near the Wilkinson Road Junction). The change is traffic is significant enough that even with minimal interventions such as 20mph zones and traffic calming or non-segregated cycle lanes are unlikely to be sufficient to leave the road suitable for most people. At present this route lies on the National Route 45. Multiple options should be explored including providing segregated provision or through alternative routing for the key routes that may use this route. For example K10 intervention may open up a route through Chesterton Farm and into the town centre and to east provision could be improved for a route along love lane. These interventions would be in addition to that proposed as part of the committed steadings site.	05_Transport	05_Active travel / public realm	City Science modelling	Critical	£ 1,400,000	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment.	£ -	S106; S278	01: 2027-2032 (inclusive)	GCC			No	Draft for comment
Cirencester	Cirencester - Strategic - Land east of Kingshill Lane (1x landowner / promoter)	Cir24	On site provision of services	Site further from Cirencester Town centre require on site provision of essential services to reduce travel in to the town centre. This should include at a minimum a primary school, a community space, a retail offering (ideally a small convenience store and service for last mile delivery such a RM parcel box and parcel collection (either within a retail offering or through an external parcel collection service).	05_Transport	05_Behaviour change	City Science modelling	Critical	£ -	City Science estimate based on scheme typology and length of intervention. Mickleton	Mickleton - Strategic - Land North and west of Mickleton (8 landowners / promoters)	Mic5	On site provision of services	At present that are limited services within Mickleton itself. Providing a local hub including some GP services, Schools and Retail offerings and mobility hub	05_Transport	05_Behaviour change	City Science modelling	Critical	£ -	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment.	£ -	Direct delivery	02: 2027-2037 (inclusive)	Strategic site promoter			No	Draft for comment
Mickleton	Mickleton - Strategic - Land North and west of Mickleton (8 landowners / promoters)	Mic6	Improved Bus Services Mickleton to Moreton-in-Marsh	Current services offer routes to Stratford-Upon-Avon, Chipping Campden and Moreton-In-Marsh. Frequency is approximately every one to two hours with early and late travel options available. No services exist to nearby Evesham. This intervention would look at improving frequency of the current offering whilst also adding connections to Evesham in line with new population. Nearby Warwickshire also has some sites nearby in REG18 so there is potential for collaboration.	05_Transport	05_Public transport - Bus	City Science modelling	Critical	£ 400,000	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment.	£ -	S106	02: 2027-2037 (inclusive)	Bus provider, GCC			No	Draft for comment
Mickleton	Mickleton - Strategic - Land North and west of Mickleton (8 landowners / promoters)	Mic8	Mickleton to Ebrington Primary School AT Flag	Baker's Hill, Hidcote Road are expected to become unsuitable to cycle. Part of the route sits on the existing national 42 cycle route. Mitigations that could be effective at retaining the cycle routes suitability include: 20mph along the stretch with included enforcement however this is unlikely to be viable across such a long stretch of rural road therefore share pathway segregation utilising bridleway for some of it.	05_Transport	05_Active travel / public realm	City Science modelling	Essential	£ 2,000,000	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment.	£ -	S106; S278	01: 2027-2032 (inclusive)	Multi-academy trust; GCC			No	Draft for comment
Mickleton	Mickleton - Strategic - Land North and west of Mickleton (8 landowners / promoters)	Mic9	Mickleton to Willersey speed route treatment	Reduction of Willersey Speed Limit to 20mph and "route treatment" to Mickleton. Could be potentially extended into Mickleton.	05_Transport	05_Behaviour change	GCC (20mph Speed Work)	Important	£ 75,000	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment.	£ 75,000	S106; S278	01: 2027-2032 (inclusive)	GCC			No	Draft for comment
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo1	Moreton-in-Marsh to Bourton-on-the-Water via Stow-on-the-Wold active travel link	An LTN1/20 compliant route from Moreton-In-Marsh to Bourton-on-the-Water via Stow-in-the-Wold. This route can either be in the form of a segregated addition to the Fosse Road or along the routes identified in the GCC countywide LCWIP (Evenload Road-Chapel Street-Ex railway alignment). The latter was estimated to need ~1-2million to deliver and the latter is assumed	05_Transport	05_Active travel / public realm	City Science/GCC LCWIP	Essential	£ 2,000,000	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment.	£ -	S106; S278	01: 2027-2032 (inclusive)	GCC			No	Draft for comment
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo10	Moreton-in-Marsh New Road	South eastern portion of the link road around Moreton-in-Marsh to the East in an attempt to move through traffic and some development traffic away from currently constrained double roundabout. In order to remain inline with the vision to not induce increased car use this should include a wider array of measures including the potential to be car capacity neutral by e.g. pedestrianising or semi-pedestrianising the high street.	05_Transport	05_Highways	GCC/CDC/WSP	Critical	£ 37,450,252	Bentley V2 costing report, subject to confirmation on length of road and specification, as set out in the Moreton-in-Marsh feasibility study	£ -	S106; S278; Homes England forward funding	02: 2027-2037 (inclusive)	GCC Highways; Strategic Site landowners	Delivery approach and cost based on the phased implementation of the access road across applications and aligned to the agreed masterplan, rather than pooled funding and delivery by GCC	Cost to be refined on revised length	No	Draft for comment
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo12	Moreton-In-Marsh to Chipping Campden Greenway	A quiet street and infrastructure approach to delivering a car-lite route from Moreton-In-Marsh to Chipping Campden. This largely would be upgrades the current 442 national cycle route and could include closure/one-way/speed treatments on one leg of the triangle near Batsford, work on the crossing at station road and lanes or shared pathways along areas of the road that can facilitate it. Alternatively a route could be pursued through upgrading of Rights of Way footpaths along the railway line via Paxford - this route is flatter but may be harder to deliver. Also to note that it opens up railway access for Chipping Campden including sites being delivered there	05_Transport	05_Active travel / public realm	City Science modelling	Essential	£ 1,000,000	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment.	£ -	S106; S278	04: 2038-2043 (inclusive)	GCC			No	Draft for comment
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo13	Moreton-In-Marsh to Shipston-on-Stour Cycleway	Greenway from Moreton-in-Marsh to Shipstone-on-the-Stour. This could utilise the verge to make a shared pathway along Todenham Street and joining to an upgraded Bridleway to Shipston-on-Stour. It should be noted that there may be grounds for cross-collaboration over the border with development along this route	05_Transport	05_Active travel / public realm	City Science modelling	Essential	£ 1,500,000	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment.	£ -	S106; S278	04: 2038-2043 (inclusive)	GCC			No	Draft for comment
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo16	Evenlode Improvements	Currently part of the National 48 and the 442 cycle routes and all cyclists are expected to mix with general traffic. The high amount of additional traffic from developments along the route means that cycling is likely to become unsuitable for most people. It is likely that to remain suitable some form of segregation is likely to be required. There is a marginal possibility that limiting speed along the road to 20mph as well with measures to decrease or reroute traffic may retain the route as suitable for some people	05_Transport	05_Active travel / public realm	City Science modelling	Critical	£ 350,000	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment.	£ -	S106; S278	02: 2027-2037 (inclusive)	GCC			No	Draft for comment
Moreton-in-Marsh	Moreton-in-Marsh - Strategic - Land north, east and south of Moreton-in-Marsh (c. 14x landowners / promoters)	Mo17	Moreton-in-Marsh Station Improvements	Upgrades to the facilities of the station in line with high patronage including better active travel connections.	05_Transport	05_Public transport - Rail	City Science modelling	Critical	£ 3,500,000	City Science estimate based on scheme typology and length of intervention. Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
XXMO1+	Kingham Station-Stow-on-the-Wold-Bourton-On-The-Water Greenway	AK CDC	Active Travel route	£2,000,000.00	Important	Proposed	All
Ac1	On-site services	City Science	This site represents a singificant expansion of an existing village to the north. At present there is extremely limited services around the village including a small village hall, a small primary school (~100 pupils), a small play park and green space and a small church. The level development (660 dwellings) combined with the more isolated nature of the site (~5miles from Cirencester which is likely to be where most services are for the housing). It is approximately 2-2.5 miles from the Driffield Site. The scale of the development suggests that it would require at least an additional primary school, a retail offering ideally with a sizable convience	£0	Critical	LP: On-site	Cotswold: Ampney Cruicis
Ac2	Enhancements to 50 Bus	City Science	Currently the 50 bus provides a circularly route between Cirencester and Amney Cruicis Monday to Friday between 8:50 13:50. This intervention will increase the frequency of the bus from hourly to half-hourly and extend the times to 0730 to 1830 (to allow for work time commuting). In addition services would run a more limited service on saturday and sunday (at present there is no services. Given the level of current provision an additional vehicle would likely be needed.	£500,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Ac3	Active Travel route to join D7 (access to Down Ampney, Driffield Site and	City Science	An active travel route including cycling and walking to join onto intervention D7 to provide a route between all the major sites and Cirencester. This route is 2.1km long and would be formed through small bit of shared pathway on the A417 between Village Street and Waterton Farm (BAC25 footpath) 0.4km followed by 1.7km of upgraded footpath to shared space.	£1,000,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Ac4	Ampney Cruicis-Poulton-Fairford Active Travel Route	City Science	An active travel route providing a route to Poulton including Ampney St Peter. 3.4km predominantly upgraded bridleways, footpaths and tracks followed by 1.3km of quiet lane treatment, 1.6km of on road segregation followed by 3.2km of quiet lane treatment on Welsh Way. The whole route is 8.6km.	£4,000,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Ac5	Amney Cruicis 20mph zone	City Science	20mph within Ampney Cruicis including new residential streets, village street, school lane, butchers arm lane, allotment lane, and riding lane (from the northern edge of the site to ashbrook lane junction)	£100,000	Critical	LP: Local access	Cotswold: Ampney Cruicis
Ac6	Diversion of 77 through Village Street	City Science	Diversion of the 76/77 bus route through Ampney Crucis. This will provide bus services to fairford and additional services to circencester	£100,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Ac7	Segregated Active Travel Route on Access Road and B4425	City Science	Route along new access road and then extend and enhance segregated cycleway within road boundary,	£2,500,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Cir2	Spratsgate Lane/Somerfield Road active travel links	City Science	Package of active travel measure could include providing pedestrian footpaths for residents willing to walk into Cirencester, as well as a on-road segregated cycleway. Require active travel access points along Spratsgate Lane for Sites SD20 and C190	£1,400,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester
Cir3	Active travel access Swindon Road	City Science	Active travel access onto Swindon Road at the northeastern corner of Site R519 to give access to existing cycleway crossing the A419 and along Cricklade Road to town centre.	£200,000	Critical	LP: Local access	Cotswold: Cirencester

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Cir4	Cricklade Road Cycleway Enhancement	City Science	Upgrade the cycleway from Preston Toll Bar along Cricklade Road by installing high-quality road surface throughout, introducing a designated on-road cycle lane, and implementing clear signage. Extend this cycleway improvements to the town centre, passing under the foot tunnel under the Bristol Road and joining Watermoor Way	£2,000,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester
Cir5	Watermoor Road road space reallocation	City Science	Reallocate road space along Watermoor Road to create a serrated cycleway, joining with Cycleway improvements in Cir4 to provide active travel links for southern development sites into Cirencester.	£250,000	Critical	LP: Local access	Cotswold: Cirencester
Cir6	Internal active travel links for Site R650	City Science	Internal active links connecting Site R650 to Site R519 to benefit from active travel access towards town centre suggested in Cir4 and Cir5.	£0	Critical	LP: Local access	Cotswold: Cirencester
Cir7	Active travel access on Kingshill Lane	City Science	Active travel access on western boundary of site directly opposite off road leading to Cirencester skate park.	£150,000	Critical	LP: Local access	Cotswold: Cirencester
Cir8	Queen Elizabeth Road/Beeches Road cycleway	City Science	On road cycleway connecting to existing east-west cycle route to link Sites R650 and R519 to town centre. Include on road cycleways along Queen Elizabeth Road and Beeches Road. Then a segregated cycle lane along London Road/Lewis Lane to access town centre.	£1,000,000	Critical	LP: Local access	Cotswold: Cirencester
Cir9	Pedestrianise Castle Street	City Science	Extend current pedestrian zone restrictions to on Crickade Road to cover Castle Street for more attractive placemaking in town centre. Reallocate road space to active travel infrastructure and green space. Divert East West traffic along Park Lane, Black Jack Street, Market Place and The Waterloo to reach London Road	£100,000	Important	LP: Strategic (off-site)	Cotswold: Cirencester
Cir10	Siddington Road Cycleway	City Science	Provision of an on-road cycleway connecting Sites SD23 and SD17 to town centre via Siddington Road. Cycleway would follow Siddington Road then turn onto Kingsmead Road to connect to existing cycleway underpass under Bristol Road. To be delivered along with Cir5 to provide onwards cycle access to town centre.	£300,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir11	Extend London Road cycleway	City Science	Extend London Road cycleway next to Site C81B toward town centre with on-road cycle lane. Connect to existing active travel bridge over Swindon Road, creating a shared use path for pedestrians and cyclists. Rejoin cycleway to London Road and towards town centre with	£500,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester
Cir12	Enhancement to 882 bus service	City Science	Increase the frequency of the Stagecoach West 882 bus service to run once an hour to provide better public transport connectivity to Cirencester.	£400,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester
Cir14	Cirencester mobility hub	Cotswold DC	Development of a new or enhanced mobility hub integrating public transport, micromobility, cycle facilities, and shared mobility options	£1,000,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Cir15	Cirencester Park and Ride	Cotswold DC	Park and ride/stride provision to intercept car trips at the edge of town, with potential for targeted bus priority measures to improve reliability and attractiveness of services into Cirencester. Park and Rides tend to target cars coming from out of town. Given the placement of this it is unlikely to be used by sites within the local plan. It is will be important for reducing overal traffic levels which may help local plan traffic however at present the modelling does not suggest it is critical for the functioning of the network	£10,000,000	Important	LP: Strategic (off-site)	Cotswold: Cirencester
Cir16	Wayfinding improvements	Cotswold DC	Introduction of a coherent, high-quality wayfinding strategy to improve navigation, reinforce key destinations, and enhance the legibility of walking and cycling networks across the town.	£500,000	Important	LP: Strategic (off-site)	Cotswold: Cirencester
Cir17	East-West Pedestrian / Cycle route improvements	Cotswold DC	Strengthening east–west pedestrian and cycle connectivity across Cirencester, improving continuity, safety, and accessibility.	£500,000	Important	LP: Strategic (off-site)	Cotswold: Cirencester
Cir18	Tesco–Siddington Road Active Travel Link	Cotswold DC	Creation of a direct, safe walking and cycling route connecting Tesco to Siddington Road, improving local accessibility and reducing short car trips.	£250,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir19	Orchard Fields–Steadings Active Link	Cotswold DC	Establishment of a walking and cycling route through Orchard Fields connecting Siddington to The Steadings.	£375,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir20	Siddington–South Cerney active travel link	Cotswold DC	Development of a strategic active travel corridor utilising the disused railway line to provide a direct, segregated walking and cycling link between Siddington and South Cerney.	£1,100,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir21	Green Lane Quiet Road	Cotswold DC	Reclassification of Green Lane (off Clark's Lane) from highway use to a quiet lane with lower speed limits and appropriate signage to enable shared use road for walking and cycling.	£100,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir22	Dower's Lane and A417 Underpass Roundabouts Active Travel	City Science	Model suggests that cycling along the Dower's Lane becomes unsuitable for most people from suitable for some people due to increased traffic volumes. Many surrounding roads are currently assessed to have low suitability for cycling however there are a few off-road routes nearby meaning some cycle routing may be happening. Mitigation is likely to involve speed limit treatment on Dower's Lane and a shared pathway/cyclops upgrade to the two roundabouts. There is limited suitability in the wider area for cycling so this is unlikely to be a critical mitigation	£250,000	Not Important	Proposed	Cotswold: Cirencester
Cir23	Spratsgate Lane AT Mitigation	City Science	At present the road has minimal segregated infrastructure (with the exception of the new roundabout that feeds into the development near the Wilkinson Road Junction). The change is traffic is significant enough that even with minimal interventions such as 20mph zones and traffic calming or non-segregated cycle lanes are unlikely to be sufficient to leave the road suitable for most people. At present this route lies on the National Route 45. Multiple options should be explored including providing segregated provision or through alternative routing for the key routes that may use this route. For example K10 intervention may	£1,400,000	Critical	Proposed	Cotswold: Cirencester
Cir24	On site provision of services	City Science	Site further from Cirencester Town centre require on site provision of essential services to reduce travel in to the town centre. This should include at a minimum a primary school, a community space, a retail offering (ideally a small convience store and service for last mile delivery such a RM parcel box and parcel collection (either within a retail offering or through an external parcel collection service).	£0	Critical	LP: On-site	Cotswold: Cirencester

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Cir25	Kingshill Road/London Road mitigation	City Science	Upgrade Junction to a signalised Junction	£250,000	Critical	Proposed	Cotswold: Cirencester
Cir26	Kingshill Road/Cirencester Road mitigation	City Science	Upgrade Junction to a signalised Junction	£250,000	Critical	Proposed	Cotswold: Cirencester
Cir27	Somerford Road/Chesterton Lane HW Mitigation	City Science	Upgrade intersection between somerford road and chesterton lane to be signalised. The modelling suggests that increased traffic on Chesterton road will lead to severe queueing on the Somerford road due to them being unable to merge	£250,000	Essential	Proposed	Cotswold: Cirencester
Cir28	Cirencester Road AT Flag	Ciry Science	Limit issues for active travel using speed limits (20mph) and soft segregation	£400,000	Critical	0	Cotswold: Cirencester
Cir29	B4425/A429 Stow Road mitigation	City Science	Signal Optimisation/ Increase cycle time (reduce amount of loss time for Cherytree Ln and increase green time B4425 and Stow Rd) Required to deal with harm to network	£10-50k	Critical	Proposed	Cotswold: Cirencester
Cir30	Cirencester-Swindon BRT	City Science	Implementation of BRT route prosed between Cirencester and Swindon. This is assumed to contain enough bus priority interventions to keep the journey times down and a service that is frequent a minimum of every fifteen minutes. In order to maximise the utility of thise route for the local plan it is assumed that this will be an express stopping service that would call at Swindon-Down Ampney-Driffield Junction- Preston-Kingshill Lane-Cirencester. This captures around 2300 dwellings in the local plan. Journey time between Swindon and Cirencester should be no longer than 50-60 minutes to provide a competitive journey	£5,000,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester
Cir31	Active travel connections with and through The Steadings	City Science	Connection of Cirencester to Kemble active travel route to the south side of The Steading site, with active connections through the site to allow onwards active travel to Cirencester.	£0	Critical	LP: Local access	Cotswold: Cirencester
Cir32	Enhanced or extended bus service between Site C187 via the Steadings to	City Science	Increase the frequency of existing bus routes or implementation of a new bus route to connect the new site south of the Steadings via The Steadings to Cirencester. Could include a bus gate to permit bus movements between the Steadings and site C187.	£150,000	Critical	BAU+	Cotswold: Cirencester
Cir33	Local transport corridor interchange hub in The Steadings	City Science	Implement a Local Transport Corridor Interchange Hub within The Steadings where bus service between The Steading and Cirencester will stop on site.	£0	Critical	LP: Strategic (off-site)	Cotswold: Cirencester
Cir34	20mph zones	City Science	Extended the 20mph zones to cover residential street and development sites. This follows the consultation currently out	£150,000	Essential	LP: On-site	Cotswold: Cirencester

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Cir35	Active Travel Route from South Steadings to Tetbury Road Entrance of	City Science/ GCC	Route following the existing planned interconnection between the Steadings and South Steadings extension. Exiting on the southern access from the Steadings (assuming the roundabout has been designed with adequate segregation. Then 0.2km of shared pathway on the north bound side of the road. Given the likely low volumes of both pedestrians and cyclists a 3m shared pathway would be sufficient and can be delivered within the HW boundary	£100,000	Critical	LP: Local access	Cotswold: Cirencester
Cir36	A419 Swindon Road/Silver Street	City Science	Upgrade the junction to a signalised junction and add approach flares.	~0.5-1million	Critical	Proposed	Cotswold: Cirencester
Cir37	A429/Chesterton Ln Junction	City Science	Change the stages and phases (having an all A429 stage followed by a Chesterton ln stage, and more green time for Stroud lane approach)	£10-50k	Critical	Proposed	Cotswold: Cirencester
Cir38	A419 Stroud Road/Trewsbury Road	City Science	Upgrade the junction to a signalised junction and add approach flares.	~0.5-1million	Critical	Proposed	East of Cirencester
Cir39	A429 Watermoor Roundabout	City Science	Add approach arm flares to the roundabout and widen the eastbound approach arm.	£1-10million	Critical	Proposed	Cotswold: Cirencester
Cir40	Stroud Road north of Tetbury Roundabout	City Science	Widen the road to two lanes to accommodate development access.	£1-10million	Critical	Proposed	Cotswold: Cirencester
Cir41	A419 Swindon Road\Cirencester Road	City Science	Widen the roundabout to provide two lanes between the roundabout and the Kingsmill Lane signalised junction.	£1-10million	Critical	Proposed	Cotswold: Cirencester
Cir42	A29 Swindon Road/Bristol Road Roundabout	City Science	Widen the roundabout.	£1-10million	Critical	Proposed	Cotswold: Cirencester
D1	On site provision of services	City Science	Site requires on-Site provision of key services such as retail and healthcare as there is currently only one small village shop in Down Ampney, with other retail and healthcare services located over 3km away.	£0	Critical	LP: On-site	Cotswold: Down Ampney
D2	Cricklade cycle route	City Science	Cycleway connecting Down Ampney and Cricklade to give sustainable access to retail services in Crickade. Route would follow Down Ampney Road and head south on Cirencester road, cross the A419 and continue down into Crickade.	£900,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney
D3	South Cerney cycle route	City Science	Cycleway connecting Down Ampney and Cricklade to give sustainable access to retail services in South Cerney. Route would follow Down Ampney Road west and cross the A419, before turning north onto Cerney Wick Lane and following north on to Station Road into the centre of South Cerney.	£1,750,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney
D4	Driffield Junction Development cycle route	City Science	Cycleway connecting Down Ampney to Driffield Junction Development via existing bridleway to the north of the development Site. Route meets the eastern boundary of the Driffield Junction Development Site, where, in conjunction with Option DJ3 it would benefit from onwards cycle access to Cirencester.	£1,500,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
D6	Enhancements of 76 bus route	City Science	Increase the frequency of the Stagecoach West 76 bus service to run once an hour to provide better public transport connectivity to Cirencester.	£1,000,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney
D7	Down Ampney - Cirencester Greenway	Cotswold DC	Extended greenway linking Sites in Down Ampney to Cirencester. Route would extend up through the sites in Down Ampney, north along the PROW route (BDA1) and the west towards Driffield (Route BDD16). It would then connect with the sites at Driffield Junction Development, running directly through these sites and onwards to the existing bridleway running northeast from Harnhill and adjacent to the A419. It would cross the A417 at Witpit Lane and connect to the sites along Kingshill Lane. For there it would follow Cir8 into town centre	£3,500,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney
D9	20 mph zones	City Science	Introducing 20mph zones across Down Ampney including within development sites	£75,000	Essential	LP: Strategic (off-site)	Cotswold: Down Ampney
DJ1	On site provision of services	City Science	Site requires on-Site provision of key services such as retail, education and healthcare as closest services are 2 miles away in South Cerney or Down Ampney.	£0	Critical	LP: On-site	Cotswold: Driffield Junction Development
DJ2	South Cerney active travel route	City Science	Provision of a segregated cycleway linking the western boundary of the Site to services in South Cerney for those who are able to cycle the distance. This could include active travel priority at A419/B4696 junction, then an onwards active travel route along the B4696 and Station Road into South Cerney. Alternatively could explore an active travel bridge over A419 connecting to and active trave route along Bow Wow Road directly into South Cerney. This assumed D3 is delivered	£200,000	Critical	LP: Strategic (off-site)	Cotswold: Driffield Junction Development
DJ3	Cirencester active travel route	City Science	Provision of a segregated cycleway connecting the Site to Cirencester via Cirencester Road for those able to cycle the distance. It is assumed that this should be delivered using a crossing of Cirencester Road which requires a change in the character of that road. GCC expressed support for this.	£3,000,000	Critical	LP: Strategic (off-site)	Cotswold: Driffield Junction Development
DJ5	Driffield Junction Development Village Mobility Hub	City Science	A smaller mobility hub providing bus services, EV charging and parcel drop off points.	£1,500,000	Critical	LP: Strategic (off-site)	Cotswold: Driffield Junction Development
DJ6	Charlham Lane access	City Science	Active travel access to Charlham Lane to facilitate onward active travel to Primary school and shop. Much of this is covered by D4 but this just ensures the access is secured in the masterplan	£0	Critical	LP: Local access	Cotswold: Driffield Junction Development
DJ8	Bridleway enhancement to Down Ampney (Wiltshire)	City Science	Enhancement of Bridleways through Wiltshire to high quality cycleway and walking route to Down Ampney	£750,000	Critical	LP: Strategic (off-site)	Cotswold: Driffield Junction Development
DJ9	Future Proofing for Post-Local Plan Growth	City Science	Ensuring that internal design accounts for future post-local growth particularly around the prevention of through-traffic	£0	Critical	LP: On-site	Cotswold: Driffield Junction Development

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
DJ10	B4696 Spine Rd Approach to Station Rd/Cerney Wick Ln Intersection	City Science	Upgrade Junction to a signalised Junction	£250,000	Critical	Proposed	Cotswold: Driffield Junction Development
Fa1	On-site provision of services	City Science	On-Site provision of key services such as retail and healthcare.	£0	Critical	LP: On-site	Cotswold: Fairford
Fa2	Southrop Road/London Road active travel route	City Science	Provision of a segregated active route linking Site F57C to the town centre via Southrop Road and London Road. Package of measures include ensuring filling in gaps in pedestrian infrastructure and ensuring continuous footpaths and adequate crossing facilities, as well as enabling a shared used road with a cycleway. Requires active travel access of the southern boundary of the large Site along Hatherop Road and active travel access of the northern boundary of the large Site south of Southrop road.	£0	Critical	LP: Local access	Cotswold: Fairford
Fa3	Hatherop Road active travel route	City Science	Provision of an active route connecting Site F57B to the town centre via Hatherop Road. Measures could include widening existing footpaths in some areas and, ensuing adequate crossing facilities and implementing shared used road with a cycleway. Requires active travel access to Site along northwestern boundary along Hatherop Road.	£2,000,000	Critical	LP: Local access	Cotswold: Fairford
Fa4	Trubshaw Way active travel access	City Science	Active travel access to Trubshaw Way for Site F20A for onward active travel to town centre.	£0	Critical	LP: On-site	Cotswold: Fairford
Fa5	Cinder Lane quiet road	City Science	Designation of Cinder Lane as a quiet road, to encourage active travel from Site F20A to the Town centre. Requires active travel access to Cinder Lane on northern boundary of Site. Includes surfacing upgrade.	£380,000	Critical	LP: Local access	Cotswold: Fairford
Fa6	Horcott Road active travel route	City Science	Improve active travel links along Horcott Road to encourage sustainable access from Site F53A to the town centre. This includes by widen footpaths and improving crossing over wide-mouth junctions heading to town centre, as well as introducing a cycleway. This could connect to existing the cycleway crossing Dilly's Bridge and connecting to Gas Lane, providing a more direct route to High Street.	£620,000	Critical	LP: Local access	Cotswold: Fairford
Fa7	E End active travel access	City Science	Provision of an active travel access from the western boundary of the Site F20A, enhancing the existing footpath the connects to E End	£0	Critical	LP: Local access	Cotswold: Fairford
Fa8	Leafield Road Crossing	City Science	Provision of pedestrian crossing connecting Site to the east of Leafield Road to the Primary School opposite.	£140,000	Critical	LP: Local access	Cotswold: Fairford
Fa9	Leafield Road active travel route	City Science	Providing footpaths along Leafield road and a cycleway to enable active travel into town centre from Site F57A.	£0	Critical	LP: Local access	Cotswold: Fairford

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Fa10	Enhancement to 76 bus service	City Science	Increase the frequency of the Stagecoach West 76 bus service to run once an hour to provide better public transport connectivity to Cirencester.	£350,000	Critical	LP: Strategic (off-site)	Cotswold: Fairford
Fa12	20mph zones	City Science	Introducing 20mph zones across Down Ampney including within development sites	£150,000	Critical	LP: On-site	Cotswold: Fairford
Fa13	Fairford-Lechlade AT Route	City Science	Segregated Cycleway on Park Street (0.3km) followed by quiet lane treatment (with physical calming measures) on Leafield Road (0.5km) followed by footway upgrade to shared space (0.4km), segregated route along Hatherop Lane (0.3km) and then again (shared) along to Slothop Road (2.2km) followed by enhanced of a bridleway (1.6km) finally quiet lane treatment on Hambidge Lane (2.7km). Cost is additional to Fa3	£800,000	Essential	LP: Strategic (off-site)	Cotswold: Fairford
K1	A429 Active travel route	City Science	The A429 is the single route currently connecting the K15 sites to Kemble centre. Provide a segregated cycleway along road to improve active travel access to key services and schools in Kemble centre, along with improved continuous footpaths.	£0	Critical	LP: Strategic (off-site)	Cotswold: Kemble
K2	Access to Old Vicarage Lane	City Science	Active travel access to the south of Old Vicarage Lane of the eastern boundary of Site K12 to allow onwards active travel access to centre of Kemble.	£0	Critical	LP: Local access	Cotswold: Kemble
K3	Church Road active travel	City Science	Improvements to active travel along Church Road for Site K12. This includes active travel access to site boundary on Church road, continuous footways and possible exploration of a quiet lane on Church Road with lower speed limits and signage to improve mixed use of road for cycling.	£250,000	Critical	LP: Local access	Cotswold: Kemble
K5	Improved A429 crossing facilities	City Science	Improved active travel crossing facilities to allow active travel access from Site K12 to access Station Road, for onwards access to Kemble Station.	£100,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
K6	Station Road active travel	City Science	Improved pedestrian footways and cycleways along Station Road to promote active travel access from Sites K12 to Kemble Station	£120,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
K8	Kemble station improvements	GCC (LTP)	Package of improvements including improving accessibility at the station with step free bridge, cycle parking etc.	£2,500,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
LP7	Stow-on-the-Wold Sheep Street/A429/High Street Mitigation	City Science	Change signal stages with indicative arrows at high street/Roman Rd Junctions. Signal optimisation at A429/B4068.	~£90-130k	Critical	Proposed	

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
LP8	Avening High Street AT Mitigation	City Science	Model suggests that Avening High Street becomes unsuitable to most people to cycle on after the local plan. Mixed traffic suitability could be restored if the speed limit is reduced to 20mph with a corresponding amount of traffic calming to ensure the design speed matches the new speed limit. The remainder of links surrounding this one are deemed unsuitable according to LTN1/20 before and after the local plan which means this stretch is unlikely to currently form part of a whole route however there are some non-road routes near by which this may cut off	£150,000	Critical	Proposed	Cotswold: Kemble
LP9	Coates AT Mitigation	City Science	Model suggests that cycling on the Trewsbury Road becomes unsuitable for most people due to increased traffic volumes. Caveat: At present all the surrounding rounds into Coates are current deemed to be unsuitable for most cyclists and this is unlikely to block a route. Solutions include implementing a one way system around coates to allow for cycle lanes and/or speed reductions.	£150,000	Essential	Proposed	Cotswold: Kemble
LP10	B4040/B4696	City Science	Signal Optimisation	£10-50k	Essential	Proposed	In Wiltshire
K10	Kemble - Cirencester cycleway	GCC (LTP)	Reuse of former rail route as a cycleway connecting Kemble and Cirencester for access to employment and education.	£2,000,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
K12	Kemble to Tetbury Service bus service	City Science	New bus service connecting town centre of Kemble, developments Sites and Tetbury, along A439, Oxleaze Road and A433. Modelling suggests 100-200 passengers a day	£400,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
K13	On site provision of services	City Science	Sites require on-site provision of key services such as retail and healthcare as there are minimal key services available in Kemble.	£0	Critical	LP: On-site	Cotswold: Kemble
K14	Windmill Road AT Mitigation	City Science	Flag identifies cycling may become unsuitable for most people as a result of increased traffic flow. At present the road is functionally not a full two-way street due to parking on the street. Mitigation could involve removing on street parking given most houses have drives to accommodate segregation	£160,000	Critical	Proposed	Cotswold: Kemble
K15	Kemble to Ewen Cycle Mitigation	City Science	Model suggests that local plan traffic will make Windmill Road, School Road to Ewen no longer 'suitable for most people'. Mitigation involves shared pathway and reduction to 40mph	£1,100,000	Essential	Proposed	Cotswold: Kemble
K20	20mph zones	City Science	Introducing 20mph zones across all streets in Kemble, including within the development sites.	£150,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
Mic2	Site Active Travel Connections and wider offsite improvements to car-free	City Science	Active Travel only connections to the public park to provide attractive active travel routes within Mickleton. At present the paths within the park are not sufficient for cycling and so upgrade of widths for a shared pathway or separate cycling routes would be required	£50,000	Critical	LP: Local access	Cotswold: Mickleton
Mic3	Long Marsdon Road Active Travel Connection	City Science	Cycleway and/or Shared Pathways along Long Marsdon Road to facilitate segregated access to National Cycleway 5 route featuring a fully car-free travel route to Stratford-Upon-Avon the distance being approximated 12-14km/ 7.5-8.5 mi within the distance that some may commute especially if coupled with targeted e-micromobility interventions.	£3,500,000	Important	LP: Strategic (off-site)	Cotswold: Mickleton

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Mic5	Mickleton Local Centre and Services Hub	City Science	At present that are limited services within Mickleton itself. Providing a local hub including some GP services, Schools and Retail offerings and mobility hub	£0	Critical	LP: On-site	Cotswold: Mickleton
Mic6	Improved Bus Services Mickleton to Moreton-in-Marsh	City Science	Current services offer routes to Stratford-Upon-Avon, Chipping Campden and Moreton-In-Marsh. Frequency is approximately every one to two hours with early and late travel options available. No services exist to nearby Evesham. This intervention would look at improving frequency of the current offering whilst also adding connections to Evesham in line with new population. Nearby Warwickshire also has some sites nearby in REG18 so there is potential for collaboration.	£400,000	Critical	LP: Strategic (off-site)	Cotswold: Mickleton
Mic8	Mickleton to Ebrington Primary School AT Flag	City Science	Baker's Hill, Hidcote Road are expected to become unsuitable to cycle. Part of the route sits on the existing national 42 cycle route. Mitigations that could be effective at retaining the cycle routes suitability include: 20mph along the stretch with included enforcement however this is unlikely to be viable across such a long stretch of rural road therefore share pathway segregation utilising bridleway for some of it.	£2,000,000	Essential	Proposed	Cotswold: Mickleton
Mic9	Mickleton to Willersey speed route treatment	GCC (20mph Speed Work)	Reduction of Willersey Speed Limit to 20mph and "route treatment" to Mickleton. Could be potentially extended into Mickleton.	£0	Important	LP: Strategic (off-site)	Cotswold: Mickleton
Mic11	20mph zones	City Science	Introducing 20mph zones across all streets in Mickleton, including within the development sites.	£150,000	Critical	LP: Strategic (off-site)	Cotswold: Mickleton
Mo1	Moreton-in-Marsh to Bourton-on-the-Water via Stow-on-the-Wold	City Science/GCC LCWIP	An LTN1/20 compliant route from Moreton-In-Marsh to Bourton-on-the-Water via Stow-in-the-Wold. This route can either be in the form of a segregated addition to the Fosse Road or along the routes identified in the GCC countywide LCWIP (Evenload Road-Chapel Street-Ex railway alignment). The latter was estimated to need ~1-2million to deliver and the latter is assumed	£2,000,000	Essential	Proposed	Cotswold: Moreton-In-Marsh
Mo2	Blenheim Meadow AT routes upgrade	City Science	Upgrading the traffic-free paths through Blenheim Meadow to be suitable for cycling. Current paths cycling is not allowed and there are key barriers along the route. Upgrading these including widening and removal of barriers/gates will allow the developments further away from the centre to use cycling to access the town centre and railway station.	£250,000	Critical	LP: Local access	Cotswold: Moreton-In-Marsh
Mo3	A44 Corridor Active Transport Route	City Science	From edge of Fire Service College Site to High Street roundabout on A44. A combination of measures including a shared pathway or pathway and cycleway up to the junction with Evenload Road where geometric constraint may need a different approach e.g. speed limit reductions or alternative routing.	£1,500,000	Critical	LP: Local access	Cotswold: Moreton-In-Marsh
Mo4	Southern Moreton greenway	City Science	Footpaths HMM8 and HMM18 to be upgraded to shared green way and options explored to facilitate onwards routing in a low traffic environment, possibly through allotments and through quiet East Street. Facilitating traffic free travel from southern sites to town services.	£1,000,000	Critical	LP: Local access	Cotswold: Moreton-In-Marsh
Mo5	Moreton-in-Marsh to Cheltenham BRT	WSP/GCC	BRT Route C09/C08 Moreton-in-Marsh to Cheltenham	£3,500,000	Essential	BAU+	Cotswold: Moreton-In-Marsh

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Mo8	Moreton-in-Marsh Transport Hub, parking and road space reallocation	City Science/Moreton-in-Marsh Neighbourhood Plan	Moving the predominant parking away from the High street to free up capacity on the road for other uses including any road adjustments required and a higher focus on placemaking activities and improved Active Travel facilities. It could include utilisation of parking pricing to further dis-incentivise the use of private vehicles. Includes "Park and Stride" facilities.	£1,000,000	Critical	BAU+	Cotswold: Moreton-In-Marsh
Mo9	On-site services	City Science	On-Site provision of key services such as retail and healthcare.	£0	Critical	LP: On-site	Cotswold: Moreton-In-Marsh
Mo10	Moreton-in-Marsh New Road	GCC/CDC/WSP	South easten portion of the link road around Moreton-in-Marsh to the East in an attempt to move through traffic and some development traffic away from currently constrained double roundabout. In order to remain inline with the vision to not induce increased car use this should include a wider array of measures including the potential to be car capacity neutral by e.g. pedestrianising or semi-pedestrianising the high street.	£37,450,252	Critical	Proposed	Cotswold: Moreton-In-Marsh
Mo12	Moreton-In-Marsh to Chipping Campden Greenway	City Science	A quiet street and infrastructure approach to delivering a car-lite route from Moreton-In-Marsh to Chipping Campden. This largely would be upgrades the current 442 national cycle route and could include closure/one-way/speed treatments on one leg of the triangle near Batsford, work on the crossing at station road and lanes or shared pathways along areas of the road that can facilitate it. Alternatively a route could be pursued through upgrading of Rights of Way footpaths along the railway line via Paxford - this route is flatter but may be harder to deliver. Also to note that it opens up railway access for Chipping Campden including sites being	£1,000,000	Essential	LP: Strategic (off-site)	Cotswold: Moreton-In-Marsh
Mo13	Moreton-In-Marsh to Shipston-on-Stour Cycleway	City Science	Greenway from Moreton-in-Marsh to Shipstone-on-the-Stour. This could utilise the verge to make a shared pathway along Todenham Street and joining to an upgraded Bridleway to Shipston-on-Stour. It should be noted that there may be grounds for cross-collaboration over the border with development along this route	£1,500,000	Essential	LP: Strategic (off-site)	Cotswold: Moreton-In-Marsh
Mo16	Evenlode Improvements	City Science	Currently part of the National 48 and the 442 cycle routes and all cyclists are expected to mix with general traffic. The high amount of additional traffic from developments along the route means that cycling is likely to become unsuitable for most people. It is likely that to remain suitable some form of segregation is likely to be required. There is a marginal possibility that limiting speed along the road to 20mph as well with measures to decrease or reroute traffic may retain the route as suitable for some people	£350,000	Critical	LP: Local access	Cotswold: Moreton-In-Marsh
Mo17	Moreton-in-Marsh Station Improvements	City Science	Upgrades to the facilities of the station in line with high patronage including better active travel connections.	£3,500,000	Critical	LP: Strategic (off-site)	Cotswold: Moreton-In-Marsh
Mo18	20 mph zones	City Science	Introducing 20mph zones across Moreton-in-Marsh (excluding A44 and A429)	£150,000	Critical	LP: Strategic (off-site)	Cotswold: Moreton-In-Marsh

Ampney Crucis	Ampney Crucis - Strategic - Ampney Crucis (1x landowner)	Ac1	On site provision of services	This site represents a significant expansion of an existing village to the north. At present there is extremely limited services around the village including a small village hall, a small primary school (~100 pupils), a small play park and green space and a small church. The level development (660 dwellings) combined with the more isolated nature of the site (~5miles from Cirencester which is likely to be where most services are for the housing). It is approximately 2-2.5 miles from the Driffield Site. The scale of the development suggests that it would require at least an additional primary school, a retail offering ideally with a sizable convenience shop and/or postal facilities collection/delivery and a third space such as community centre	05_Transport	05_Behaviour change	City Science modelling	Critical	£ -	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment	N/A	Direct delivery	02: 2027-2037 (inclusive)	Strategic site promoter			No	Draft for comment
Ampney Crucis	Ampney Crucis - Strategic - Ampney Crucis (1x landowner)	Ac2	Enhancements to 50 Bus	Currently the 50 bus provides a circularly route between Cirencester and Ampney Crucis Monday to Friday between 8:50 13:50. This intervention will increase the frequency of the bus from hourly to half-hourly and extend the times to 0730 to 1830 (to allow for work time commuting). In addition services would run a more limited service on Saturday and Sunday (at present there is no services. Given the level of current provision an additional vehicle would likely be needed.	05_Transport	05_Public transport - Bus	City Science modelling	Critical	£ 500,000	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment	£ -	S106	01: 2027-2032 (inclusive)	Bus provider, GCC			No	Draft for comment
Ampney Crucis	Ampney Crucis - Strategic - Ampney Crucis (1x landowner)	Ac3	Active Travel route to join D7 (access to Down Ampney, Driffield Site and Cirencester)	An active travel route including cycling and walking to join onto intervention D7 to provide a route between all the major sites and Cirencester. This route is 2.1km long and would be formed through small bit of shared pathway on the A417 between Village Street and Waterton Farm (BAC25 footpath) 0.4km followed by 1.7km of upgraded footpath to shared space. Explicitly Dependent on D7, Cir4, Cir5, Cir7 and Cir8 being delivered	05_Transport	05_Active travel / public realm	City Science modelling	Critical	£ 1,000,000	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment	£ -	S106; S278	01: 2027-2032 (inclusive)	GCC			No	Draft for comment
Ampney Crucis	Ampney Crucis Sub Area	Ac4	Ampney Cruicis-Poulton-Fairford Active Travel Route	An active travel route providing a route to Poulton including Ampney St Peter. 3.4km predominantly upgraded bridleways, footpaths and tracks followed by 1.3km of quiet lane treatment, 1.6km of on road segregation followed by 3.2km of quiet lane treatment on Welsh Way. The whole route is 8.6km.	05_Transport	05_Active travel / public realm	City Science modelling	Critical	£ 4,000,000	City Science estimate based on scheme typology and length of intervention. Cirencester	Circencester Sub area	Cir22	A417 Underpass Roundabouts Active Travel Mitigation	Model suggests that cycling along the Dower's Lane becomes unsuitable for most people from suitable for some people due to increased traffic volumes. Many surrounding roads are currently assessed to have low suitability for cycling however there are a few off-road routes nearby meaning some cycle routing may be happening. Mitigation is likely to involve speed limit treatment on Dower's Lane and a shared pathway/cyclops upgrade to the two roundabouts. There is limited suitability in the wider area for cycling so this is unlikely to be a critical mitigation	05_Transport	05_Active travel / public realm	City Science modelling	Important	£ 250,000	City Science estimate based on scheme typology and length of intervention. Additional details on methodology in Strategic Transport Assessment	£ -	S106; S278	01: 2027-2032 (inclusive)	GCC		This has been adjusted slightly keeping only the underpass as this is still a problem and acts as the only AT way across the A417. The price remains constant because the section lost was very minor speed limit changes.	No	Draft for comment
Cirencester	Siddington -Strategic- Land south west of Siddington (1x landowner / promoter)	Cir23	Spratsgate Lane AT Mitigation	At present the road has minimal segregated infrastructure (with the exception of the new roundabout that feeds into the development near the Wilkinson Road Junction). The change is traffic is significant enough that even with minimal interventions such as 20mph zones and traffic calming or non-segregated cycle lanes are unlikely to be sufficient to leave the road suitable for most people. At present this route lies on the National Route 45. Multiple options should be explored including providing segregated provision or through alternative routing for the key routes that may use this route. For example K10 intervention may open up a route through Chesterton Farm and into the town centre and to east provision could be improved for a route along love lane. These interventions would be in addition to that proposed as part of the committed steadings site.	05_Transport	05_Active travel / public realm	City Science modelling	Critical	£ 1,400,000	City Science estimate based on scheme typology and length of intervention. XXMO1+	Kingham Station-Stow-on-the-Wold-Bourton-On-The-Water Greenway	AK CDC	Active Travel route	£2,000,000.00	Important	Proposed	All
Ac1	On-site services	City Science	This site represents a singificant expansion of an existing village to the north. At present there is extremely limited services around the village including a small village hall, a small primary school (~100 pupils), a small play park and green space and a small church. The level development (660 dwellings) combined with the more isolated nature of the site (~5miles from Cirencester which is likely to be where most services are for the housing). It is approximately 2-2.5 miles from the Driffield Site. The scale of the development suggests that it would require at least an additional primary school, a retail offering ideally with a sizable convience	£0	Critical	LP: On-site	Cotswold: Ampney Cruicis
Ac2	Enhancements to 50 Bus	City Science	Currently the 50 bus provides a circularly route between Cirencester and Amney Cruicis Monday to Friday between 8:50 13:50. This intervention will increase the frequency of the bus from hourly to half-hourly and extend the times to 0730 to 1830 (to allow for work time commuting). In addition services would run a more limited service on saturday and sunday (at present there is no services. Given the level of current provision an additional vehicle would likely be needed.	£500,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Ac3	Active Travel route to join D7 (access to Down Ampney, Driffield Site and	City Science	An active travel route including cycling and walking to join onto intervention D7 to provide a route between all the major sites and Cirencester. This route is 2.1km long and would be formed through small bit of shared pathway on the A417 between Village Street and Waterton Farm (BAC25 footpath) 0.4km followed by 1.7km of upgraded footpath to shared space.	£1,000,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Ac4	Ampney Cruicis-Poulton-Fairford Active Travel Route	City Science	An active travel route providing a route to Poulton including Ampney St Peter. 3.4km predominantly upgraded bridleways, footpaths and tracks followed by 1.3km of quiet lane treatment, 1.6km of on road segregation followed by 3.2km of quiet lane treatment on Welsh Way. The whole route is 8.6km.	£4,000,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Ac5	Amney Cruicis 20mph zone	City Science	20mph within Ampney Cruicis including new residential streets, village street, school lane, butchers arm lane, allotment lane, and riding lane (from the northern edge of the site to ashbrook lane junction)	£100,000	Critical	LP: Local access	Cotswold: Ampney Cruicis
Ac6	Diversion of 77 through Village Street	City Science	Diversion of the 76/77 bus route through Ampney Crucis. This will provide bus services to fairford and additional services to circencester	£100,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Ac7	Segregated Active Travel Route on Access Road and B4425	City Science	Route along new access road and then extend and enhance segregated cycleway within road boundary,	£2,500,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Cir2	Spratsgate Lane/Somerfield Road active travel links	City Science	Package of active travel measure could include providing pedestrian footpaths for residents willing to walk into Cirencester, as well as a on-road segregated cycleway. Require active travel access points along Spratsgate Lane for Sites SD20 and C190	£1,400,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Cir3	Active travel access Swindon Road	City Science	Active travel access onto Swindon Road at the northeastern corner of Site R519 to give access to existing cycleway crossing the A419 and along Cricklade Road to town centre.	£200,000	Critical	LP: Local access	Cotswold: Cirencester
Cir4	Cricklade Road Cycleway Enhancement	City Science	Upgrade the cycleway from Preston Toll Bar along Cricklade Road by installing high-quality road surface throughout, introducing a designated on-road cycle lane, and implementing clear signage. Extend this cycleway improvements to the town centre, passing under the foot tunnel under the Bristol Road and joining Watermoor Way	£2,000,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester
Cir5	Watermoor Road road space reallocation	City Science	Reallocate road space along Watermoor Road to create a serrated cycleway, joining with Cycleway improvements in **Cir4** to provide active travel links for southern development sites into Cirencester.	£250,000	Critical	LP: Local access	Cotswold: Cirencester
Cir6	Internal active travel links for Site R650	City Science	Internal active links connecting Site R650 to Site R519 to benefit from active travel access towards town centre suggested in **Cir4** and **Cir5**.	£0	Critical	LP: Local access	Cotswold: Cirencester
Cir7	Active travel access on Kingshill Lane	City Science	Active travel access on western boundary of site directly opposite off road leading to Cirencester skate park.	£150,000	Critical	LP: Local access	Cotswold: Cirencester
Cir8	Queen Elizabeth Road/Beeches Road cycleway	City Science	On road cycleway connecting to existing east-west cycle route to link Sites R650 and R519 to town centre. Include on road cycleways along Queen Elizabeth Road and Beeches Road. Then a segregated cycle lane along London Road/Lewis Lane to access town centre.	£1,000,000	Critical	LP: Local access	Cotswold: Cirencester
Cir9	Pedestrianise Castle Street	City Science	Extend current pedestrian zone restrictions to on Crickade Road to cover Castle Street for more attractive placemaking in town centre. Reallocate road space to active travel infrastructure and green space. Divert East West traffic along Park Lane, Black Jack Street, Market Place and The Waterloo to reach London Road	£100,000	Important	LP: Strategic (off-site)	Cotswold: Cirencester
Cir10	Siddington Road Cycleway	City Science	Provision of an on-road cycleway connecting Sites SD23 and SD17 to town centre via Siddington Road. Cycleway would follow Siddington Road then turn onto Kingsmead Road to connect to existing cycleway underpass under Bristol Road. To be delivered along with **Cir5** to provide onwards cycle access to town centre.	£300,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir11	Extend London Road cycleway	City Science	Extend London Road cycleway next to Site C81B toward town centre with on-road cycle lane. Connect to existing active travel bridge over Swindon Road, creating a shared use path for pedestrians and cyclists. Rejoin cycleway to London Road and towards town centre with	£500,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Cir12	Enhancement to 882 bus service	City Science	Increase the frequency of the Stagecoach West 882 bus service to run once an hour to provide better public transport connectivity to Cirencester.	£400,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester
Cir14	Cirencester mobility hub	Cotswold DC	Development of a new or enhanced mobility hub integrating public transport, micromobility, cycle facilities, and shared mobility options	£1,000,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir15	Cirencester Park and Ride	Cotswold DC	Park and ride/stride provision to intercept car trips at the edge of town, with potential for targeted bus priority measures to improve reliability and attractiveness of services into Cirencester. Park and Rides tend to target cars coming from out of town. Given the placement of this it is unlikely to be used by sites within the local plan. It is will be important for reducing overal traffic levels which may help local plan traffic however at present the modelling does not suggest it is critical for the functioning of the network	£10,000,000	Important	LP: Strategic (off-site)	Cotswold: Cirencester
Cir16	Wayfinding improvements	Cotswold DC	Introduction of a coherent, high-quality wayfinding strategy to improve navigation, reinforce key destinations, and enhance the legibility of walking and cycling networks across the town.	£500,000	Important	LP: Strategic (off-site)	Cotswold: Cirencester
Cir17	East-West Pedestrian / Cycle route improvements	Cotswold DC	Strengthening east–west pedestrian and cycle connectivity across Cirencester, improving continuity, safety, and accessibility.	£500,000	Important	LP: Strategic (off-site)	Cotswold: Cirencester
Cir18	Tesco–Siddington Road Active Travel Link	Cotswold DC	Creation of a direct, safe walking and cycling route connecting Tesco to Siddington Road, improving local accessibility and reducing short car trips.	£250,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir19	Orchard Fields–Steadings Active Link	Cotswold DC	Establishment of a walking and cycling route through Orchard Fields connecting Siddington to The Steadings.	£375,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir20	Siddington–South Cerney active travel link	Cotswold DC	Development of a strategic active travel corridor utilising the disused railway line to provide a direct, segregated walking and cycling link between Siddington and South Cerney.	£1,100,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir21	Green Lane Quiet Road	Cotswold DC	Reclassification of Green Lane (off Clark's Lane) from highway use to a quiet lane with lower speed limits and appropriate signage to enable shared use road for walking and cycling.	£100,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Cir22	Dower's Lane and A417 Underpass Roundabouts Active Travel		Model suggests that cycling along the Dower's Lane becomes unsuitable for most people from suitable for some people due to increased traffic volumes. Many surrounding roads are currently assessed to have low suitability for cycling however there are a few off-road routes nearby meaning some cycle routing may be happening. Mitigation is likely to involve speed limit treatment on Dower's Lane and a shared pathway/cyclops upgrade to the two roundabouts. There is limited suitability in the wider area for cycling so this is unlikely to be a critical mitigation	£250,000	Not Important	Proposed	Cotswold: Cirencester
Cir23	Spratsgate Lane AT Mitigation	City Science	At present the road has minimal segregated infrastructure (with the exception of the new roundabout that feeds into the development near the Wilkinson Road Junction). The change is traffic is significant enough that even with minimal interventions such as 20mph zones and traffic calming or non-segregated cycle lanes are unlikely to be sufficient to leave the road suitable for most people. At present this route lies on the National Route 45. Multiple options should be explored including providing segregated provision or through alternative routing for the key routes that may use this route. For example K10 intervention may	£1,400,000	Critical	Proposed	Cotswold: Cirencester
Cir24	On site provision of services	City Science	Site further from Cirencester Town centre require on site provision of essential services to reduce travel in to the town centre. This should include at a minimum a primary school, a community space, a retail offering (ideally a small convience store and service for last mile delivery such a RM parcel box and parcel collection (either within a retail offering or through an external parcel collection service).	£0	Critical	LP: On-site	Cotswold: Cirencester
Cir25	Kingshill Road/London Road mitigation	City Science	Targeted junction improvements to address capacity constraints and improve traffic flow.	£200,000	Critical	Proposed	Cotswold: Cirencester
Cir26	Kingshill Road/Cirencester Road mitigation	City Science	Corridor-based measures to alleviate congestion and improve travel into and Cirencester.	£250,000	Critical	Proposed	Cotswold: Cirencester
Cir27	Somerford Road/Chesterton Lane HW Mitigation	City Science	Upgrade intersection between somerford road and chesterton lane to be signalised. The modelling suggests that increased traffic on Chesterton road will lead to severe queueing on the Somerford road due to them being unable to merge	£250,000	Essential	Proposed	Cotswold: Cirencester
Cir28	Cirencester Road AT Flag	Ciry Science	Limit issues for active travel using speed limits (20mph) and soft segregation	£400,000	Critical	0	Cotswold: Cirencester
Cir29	B4425/A429 Stow Road mitigation	City Science	Signal Optimisation/ Increase cycle time (reduce amount of loss time for Cherytree Ln and increase green time B4425 and Stow Rd) Required to deal with harm to network	£10-50k	Critical	Proposed	Cotswold: Cirencester
Cir30	Cirencester-Swindon BRT	City Science	Implementation of BRT route prosed between Cirencester and Swindon. This is assumed to contain enough bus priority interventions to keep the journey times down and a service that is frequent a minimum of every fifteen minutes. In order to maximise the utility of thise route for the local plan it is assumed that this will be an express stopping service that would call at Swindon-Down Ampney-Driffield Junction- Preston-Kingshill Lane-Cirencester. This captures around 2300 dwellings in the local plan. Journey time between Swindon and Cirencester should be no longer than 50-60 minutes to provide a competitive journey time	£5,000,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Cir31	Active travel connections with and through The Steadings	City Science	Connection of Cirencester to Kemble active travel route to the south side of The Steading site, with active connections through the site to allow onwards active travel to Cirencester.	£0	Critical	LP: Local access	Cotswold: Cirencester
Cir32	Enhanced or extended bus service between Site C187 via the Steadings to	City Science	Increase the frequency of existing bus routes or implementation of a new bus route to connect the new site south of the Steadings via The Steadings to Cirencester. Could include a bus gate to permit bus movements between the Steadings and site C187.	£150,000	Critical	BAU+	Cotswold: Cirencester
Cir33	Local transport corridor interchange hub in The Steadings	City Science	Implement a Local Transport Corridor Interchange Hub within The Steadings where bus service between The Steading and Cirencester will stop on site.	£0	Critical	LP: Strategic (off-site)	Cotswold: Cirencester
Cir34	20mph zones	City Science	Extended the 20mph zones to cover residential street and development sites. This follows the consultation currently out	£150,000	Essential	LP: On-site	Cotswold: Cirencester
Cir35	Active Travel Route from South Steadings to Tetbury Road Entrance of	City Science/ GCC	Route following the existing planned interconnection between the Steadings and South Steadings extension. Exiting on the southern access from the Steadings (assuming the roundabout has been designed with adequate segregation. Then 0.2km of shared pathway on the north bound side of the road. Given the likely low volumes of both pedestrians and cyclists a 3m shared pathway would be sufficient and can be delivered within the HW boundary	£100,000	Critical	LP: Local access	Cotswold: Cirencester
Cir36	A419 Swindon Road/Silver Street	City Science	Upgrade the junction to a signalised junction and add approach flares.	~0.5-1million	Critical	Proposed	Cotswold: Cirencester
Cir37	A429/Chesterton Ln Junction	City Science	Change the stages and phases (having an all A429 stage followed by a Chesterton ln stage, and more green time for Stroud lane approach)	£10-50k	Critical	Proposed	Cotswold: Cirencester
Cir38	A419 Stroud Road/Trewsbury Road	City Science	Upgrade the junction to a signalised junction and add approach flares.	~0.5-1million	Critical	Proposed	East of Cirencester
Cir39	A429 Watermoor Roundabout	City Science	Add approach arm flares to the roundabout and widen the eastbound approach arm.	£1-10million	Critical	Proposed	Cotswold: Cirencester

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Cir40	Stroud Road north of Tetbury Roundabout	City Science	Widen the road to two lanes to accommodate development access.	£1-10million	Critical	Proposed	Cotswold: Cirencester
Cir41	A419 Swindon Road\Cirencester Road	City Science	Widen the roundabout to provide two lanes between the roundabout and the Kingsmill Lane signalised junction.	£1-10million	Critical	Proposed	Cotswold: Cirencester
Cir42	A29 Swindon Road/Bristol Road Roundabout	City Science	Widen the roundabout.	£1-10million	Critical	Proposed	Cotswold: Cirencester
D1	On site provision of services	City Science	Site requires on-Site provision of key services such as retail and healthcare as there is currently only one small village shop in Down Ampney, with other retail and healthcare services located over 3km away.	£0	Critical	LP: On-site	Cotswold: Down Ampney
D2	Cricklade cycle route	City Science	Cycleway connecting Down Ampney and Cricklade to give sustainable access to retail services in Crickade. Route would follow Down Ampney Road and head south on Cirencester road, cross the A419 and continue down into Crickade.	£900,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney
D3	South Cerney cycle route	City Science	Cycleway connecting Down Ampney and Cricklade to give sustainable access to retail services in South Cerney. Route would follow Down Ampney Road west and cross the A419, before turning north onto Cerney Wick Lane and following north on to Station Road into the centre of South Cerney.	£1,750,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney
D4	Driffield Junction Development cycle route	City Science	Cycleway connecting Down Ampney to Driffield Junction Development via existing bridleway to the north of the development Site. Route meets the eastern boundary of the Driffield Junction Development Site, where, in conjunction with Option DJ3 it would benefit from onwards cycle access to Cirencester.	£1,500,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney
D6	Enhancements of 76 bus route	City Science	Increase the frequency of the Stagecoach West 76 bus service to run once an hour to provide better public transport connectivity to Cirencester.	£1,000,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney
D7	Down Ampney - Cirencester Greenway	Cotswold DC	Extended greenway linking Sites in Down Ampney to Cirencester. Route would extend up through the sites in Down Ampney, north along the PROW route (BDA1) and the west towards Driffield (Route BDD16). It would then connect with the sites at Driffield Junction Development, running directly through these sites and onwards to the existing bridleway running northeast from Harnhill and adjacent to the A419. It would cross the A417 at Witpit Lane and connect to the sites along Kingshill Lane. For there it would follow Cir8 into town centre.	£3,500,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
D9	20 mph zones	City Science	Introducing 20mph zones across Down Ampney including within development sites	£75,000	Essential	LP: Strategic (off-site)	Cotswold: Down Ampney
DJ1	On site provision of services	City Science	Site requires on-Site provision of key services such as retail, education and healthcare as closest services are 2 miles away in South Cerney or Down Ampney.	£0	Critical	LP: On-site	Cotswold: Driffield Junction Development
DJ2	South Cerney active travel route	City Science	Provision of a segregated cycleway linking the western boundary of the Site to services in South Cerney for those who are able to cycle the distance. This could include active travel priority at A419/B4696 junction, then an onwards active travel route along the B4696 and Station Road into South Cerney. Alternatively could explore an active travel bridge over A419 connecting to and active trave route along Bow Wow Road directly into South Cerney. This assumed D3 is delivered	£200,000	Critical	LP: Strategic (off-site)	Cotswold: Driffield Junction Development
DJ3	Cirencester active travel route	City Science	Provision of a segregated cycleway connecting the Site to Cirencester via Cirencester Road for those able to cycle the distance. It is assumed that this should be delivered using a crossing of Cirencester Road which requires a change in the character of that road. GCC expressed support for this.	£3,000,000	Critical	LP: Strategic (off-site)	Cotswold: Driffield Junction Development
DJ5	Driffield Junction Development Village Mobility Hub	City Science	A smaller mobility hub providing bus services, EV charging and parcel drop off points.	£1,500,000	Critical	LP: Strategic (off-site)	Cotswold: Driffield Junction Development
DJ6	Charlham Lane access	City Science	Active travel access to Charlham Lane to facilitate onward active travel to Primary school and shop. Much of this is covered by D4 but this just ensures the access is secured in the masterplan	£0	Critical	LP: Local access	Cotswold: Driffield Junction Development
DJ8	Bridleway enhancement to Down Ampney (Wiltshire)	City Science	Enhancement of Bridleways through Wiltshire to high quality cycleway and walking route to Down Ampney	£750,000	Critical	LP: Strategic (off-site)	Cotswold: Driffield Junction Development
DJ9	Future Proofing for Post-Local Plan Growth	City Science	Ensuring that internal design accounts for future post-local growth particularly around the prevention of through-traffic	£0	Critical	LP: On-site	Cotswold: Driffield Junction Development
DJ10	B4696 Spine Rd Approach to Station Rd/Cerney Wick Ln Intersection	City Science	Upgrade Junction to a signalised Junction	£250,000	Critical	Proposed	Cotswold: Driffield Junction Development

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Fa1	On-site provision of services	City Science	On-Site provision of key services such as retail and healthcare.	£0	Critical	LP: On-site	Cotswold: Fairford
Fa2	Southrop Road/London Road active travel route	City Science	Provision of a segregated active route linking Site F57C to the town centre via Southrop Road and London Road. Package of measures include ensuring filling in gaps in pedestrian infrastructure and ensuring continuous footpaths and adequate crossing facilities, as well as enabling a shared used road with a cycleway. Requires active travel access of the southern boundary of the large Site along Hatherop Road and active travel access of the northern boundary of the large Site south of Southrop road.	£0	Critical	LP: Local access	Cotswold: Fairford
Fa3	Hatherop Road active travel route	City Science	Provision of an active route connecting Site F57B to the town centre via Hatherop Road. Measures could include widening existing footpaths in some areas and, ensuing adequate crossing facilities and implementing shared used road with a cycleway. Requires active travel access to Site along northwestern boundary along Hatherop Road.	£2,000,000	Critical	LP: Local access	Cotswold: Fairford
Fa4	Trubshaw Way active travel access	City Science	Active travel access to Trubshaw Way for Site F20A for onward active travel to town centre.	£0	Critical	LP: On-site	Cotswold: Fairford
Fa5	Cinder Lane quiet road	City Science	Designation of Cinder Lane as a quiet road, to encourage active travel from Site F20A to the Town centre. Requires active travel access to Cinder Lane on northern boundary of Site. Includes surfacing upgrade.	£380,000	Critical	LP: Local access	Cotswold: Fairford
Fa6	Horcott Road active travel route	City Science	Improve active travel links along Horcott Road to encourage sustainable access from Site F53A to the town centre. This includes by widen footpaths and improving crossing over wide-mouth junctions heading to town centre, as well as introducing a cycleway. This could connect to existing the cycleway crossing Dilly's Bridge and connecting to Gas Lane, providing a more direct route to High Street.	£620,000	Critical	LP: Local access	Cotswold: Fairford
Fa7	E End active travel access	City Science	Provision of an active travel access from the western boundary of the Site F20A, enhancing the existing footpath the connects to E End	£0	Critical	LP: Local access	Cotswold: Fairford
Fa8	Leafield Road Crossing	City Science	Provision of pedestrian crossing connecting Site to the east of Leafield Road to the Primary School opposite.	£140,000	Critical	LP: Local access	Cotswold: Fairford
Fa9	Leafield Road active travel route	City Science	Providing footpaths along Leafield road and a cycleway to enable active travel into town centre from Site F57A.	£0	Critical	LP: Local access	Cotswold: Fairford

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Fa10	Enhancement to 76 bus service	City Science	Increase the frequency of the Stagecoach West 76 bus service to run once an hour to provide better public transport connectivity to Cirencester.	£350,000	Critical	LP: Strategic (off-site)	Cotswold: Fairford
Fa12	20mph zones	City Science	Introducing 20mph zones across Down Ampney including within development sites	£150,000	Critical	LP: On-site	Cotswold: Fairford
Fa13	Fairford-Lechlade AT Route	City Science	Segregated Cycleway on Park Street (0.3km) followed by quiet lane treatment (with physical calming measures) on Leafield Road (0.5km) followed by footway upgrade to shared space (0.4km), segregated route along Hatherop Lane (0.3km) and then again (shared) along to Slothop Road (2.2km) followed by enhanced of a bridleway (1.6km) finally quiet lane treatment on Hambidge Lane (2.7km). Cost is additional to Fa3	£800,000	Essential	LP: Strategic (off-site)	Cotswold: Fairford
K1	A429 Active travel route	City Science	The A429 is the single route currently connecting the K15 sites to Kemble centre. Provide a segregated cycleway along road to improve active travel access to key services and schools in Kemble centre, along with improved continuous footpaths.	£0	Critical	LP: Strategic (off-site)	Cotswold: Kemble
K2	Access to Old Vicarage Lane	City Science	Active travel access to the south of Old Vicarage Lane of the eastern boundary of Site K12 to allow onwards active travel access to centre of Kemble.	£0	Critical	LP: Local access	Cotswold: Kemble
K3	Church Road active travel	City Science	Improvements to active travel along Church Road for Site K12. This includes active travel access to site boundary on Church road, continuous footways and possible exploration of a quiet lane on Church Road with lower speed limits and signage to improve mixed use of road for cycling.	£250,000	Critical	LP: Local access	Cotswold: Kemble
K5	Improved A429 crossing facilities	City Science	Improved active travel crossing facilities to allow active travel access from Site K12 to access Station Road, for onwards access to Kemble Station.	£100,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
K6	Station Road active travel	City Science	Improved pedestrian footways and cycleways along Station Road to promote active travel access from Sites K12 to Kemble Station	£120,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
K8	Kemble station improvements	GCC (LTP)	Package of improvements including improving accessibility at the station with step free bridge, cycle parking etc.	£2,500,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
K21	Anti-Ratrunning Measures on Unnamed Road between A429 and A433	City Science	Minor alterations including speed interventions and no left turn into it from A429 and no right turn into it from A433 in order to stop traffic using to avoid A429/A433 junction	£10,000	Critical		Cotswold: Kemble
LP7	Stow-on-the-Wold Sheep Street/A429/High Street Mitigation	City Science	Change signal stages with indicative arrows at high street/Roman Rd Junctions. Signal optimisation at A429/B4068.	~£90-130k	Critical	Proposed	
LP8	Avening High Street AT Mitigation	City Science	Model suggests that Avening High Street becomes unsuitable to most people to cycle on after the local plan. Mixed traffic suitability could be restored if the speed limit is reduced to 20mph with a corresponding amount of traffic calming to ensure the design speed matches the new speed limit. The remainder of links surrounding this one are deemed unsuitable according to LTN1/20 before and after the local plan which means this stretch is unlikely to currently form part of a whole route however there are some non-road routes near by which this may cut off	£150,000	Critical	Proposed	Cotswold: Kemble
LP9	Coates AT Mitigation	City Science	Model suggests that cycling on the Trewsbury Road becomes unsuitable for most people due to increased traffic volumes. Caveat: At present all the surrounding rounds into Coates are current deemed to be unsuitable for most cyclists and this is unlikely to block a route. Solutions include implementing a one way system around coates to allow for cycle lanes and/or speed reductions.	£150,000	Essential	Proposed	Cotswold: Kemble
LP10	B4040/B4696	City Science	Signal Optimisation	£10-50k	Essential	Proposed	In Wiltshire
LP16	Willersey AT Flag	City Science	Willersey Leamington Road and Main Street because unsuitable for cycling due to increased traffic. 20mph speed limit would resolve this.	£10,000	Critical		North Cotswold
K10	Kemble - Cirencester cycleway	GCC (LTP)	Reuse of former rail route as a cycleway connecting Kemble and Cirencester for access to employment and education.	£2,000,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
K12	Kemble to Tetbury Service bus service	City Science	New bus service connecting town centre of Kemble, developments Sites and Tetbury, along A439, Oxleaze Road and A433. Modelling suggests 100-200 passengers a day	£400,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
K13	On site provision of services	City Science	Sites require on-site provision of key services such as retail and healthcare as there are minimal key services available in Kemble.	£0	Critical	LP: On-site	Cotswold: Kemble

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
K14	Windmill Road AT Mitigation	City Science	Flag identifies cycling may become unsuitable for most people as a result of increased traffic flow. At present the road is functionally not a full two-way street due to parking on the street. Mitigation could involve removing on street parking given most houses have drives to accommodate segregation	£160,000	Critical	Proposed	Cotswold: Kemble
K15	Kemble to Ewen Cycle Mitigation	City Science	Model suggests that local plan traffic will make Windmill Road, School Road to Ewen no longer 'suitable for most people'. Mitigation involves shared pathway and reduction to 40mph	£1,100,000	Essential	Proposed	Cotswold: Kemble
K20	20mph zones	City Science	Introducing 20mph zones across all streets in Kemble, including within the development sites.	£150,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
Mic2	Site Active Travel Connections and wider offsite improvements to car-free routes	City Science	Active Travel only connections to the public park to provide attractive active travel routes within Mickleton. At present the paths within the park are not sufficient for cycling and so upgrade of widths for a shared pathway or separate cycling routes would be required	£50,000	Critical	LP: Local access	Cotswold: Mickleton
Mic3	Long Marsdon Road Active Travel Connection	City Science	Cycleway and/or Shared Pathways along Long Marsdon Road to facilitate segregated access to National Cycleway 5 route featuring a fully car-free travel route to Stratford-Upon-Avon the distance being approximated 12-14km/ 7.5-8.5 mi within the distance that some may commute especially if coupled with targeted e-micromobility interventions.	£3,500,000	Important	LP: Strategic (off-site)	Cotswold: Mickleton
Mic5	Mickleton Local Centre and Services Hub	City Science	At present that are limited services within Mickleton itself. Providing a local hub including some GP services, Schools and Retail offerings and mobility hub	£0	Critical	LP: On-site	Cotswold: Mickleton
Mic6	Improved Bus Services Mickleton to Moreton-in-Marsh	City Science	Current services offer routes to Stratford-Upon-Avon, Chipping Campden and Moreton-In-Marsh. Frequency is approximately every one to two hours with early and late travel options available. No services exist to nearby Evesham. This intervention would look at improving frequency of the current offering whilst also adding connections to Evesham in line with new population. Nearby Warwickshire also has some sites nearby in REG18 so there is potential for collaboration.	£400,000	Critical	LP: Strategic (off-site)	Cotswold: Mickleton
Mic8	Mickleton to Ebrington Primary School AT Flag	City Science	Baker's Hill, Hidcote Road are expected to become unsuitable to cycle. Part of the route sits on the existing national 42 cycle route. Mitigations that could be effective at retaining the cycle routes suitability include: 20mph along the stretch with included enforcement however this is unlikely to be viable across such a long stretch of rural road therefore share pathway segregation utilising bridleway for some of it.	£2,000,000	Essential	Proposed	Cotswold: Mickleton
Mic9	Mickleton to Willersey speed route treatment	GCC (20mph Speed Work)	Reduction of Willersey Speed Limit to 20mph and "route treatment" to Mickleton. Could be potentially extended into Mickleton.	£0	Important	LP: Strategic (off-site)	Cotswold: Mickleton

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Mic11	20mph zones	City Science	Introducing 20mph zones across all streets in Mickleton, including within the development sites.	£150,000	Critical	LP: Strategic (off-site)	Cotswold: Mickleton
Mo1	Moreton-in-Marsh to Bourton-on-the-Water via Stow-on-the-Wold	City Science/GCC LCWIP	An LTN1/20 compliant route from Moreton-In-Marsh to Bourton-on-the-Water via Stow-in-the-Wold. This route can either be in the form of a segregated addition to the Fosse Road or along the routes identified in the GCC countywide LCWIP (Evenload Road-Chapel Street-Ex railway alignment). The latter was estimated to need ~1-2million to deliver and the latter is assumed	£2,000,000	Essential	Proposed	Cotswold: Moreton-In-Marsh
Mo2	Blenheim Meadow AT routes upgrade	City Science	Upgrading the traffic-free paths through Blenheim Meadow to be suitable for cycling. Current paths cycling is not allowed and there are key barriers along the route. Upgrading these including widening and removal of barriers/gates will allow the developments further away from the centre to use cycling to access the town centre and railway station.	£250,000	Critical	LP: Local access	Cotswold: Moreton-In-Marsh
Mo3	A44 Corridor Active Transport Route	City Science	From edge of Fire Service College Site to High Street roundabout on A44. A combination of measures including a shared pathway or pathway and cycleway up to the junction with Evenload Road where geometric constraint may need a different approach e.g. speed limit reductions or alternative routing.	£1,500,000	Critical	LP: Local access	Cotswold: Moreton-In-Marsh
Mo4	Southern Moreton greenway	City Science	Footpaths HMM8 and HMM18 to be upgraded to shared green way and options explored to facilitate onwards routing in a low traffic environment, possibly through allotments and through quiet East Street. Facilitating traffic free travel from southern sites to town services.	£1,000,000	Critical	LP: Local access	Cotswold: Moreton-In-Marsh
Mo5	Moreton-in-Marsh to Cheltenham BRT	WSP/GCC	BRT Route C09/C08 Moreton-in-Marsh to Cheltenham	£3,500,000	Essential	BAU+	Cotswold: Moreton-In-Marsh
Mo8	Moreton-in-Marsh Transport Hub, parking and road space reallocation	City Science/Moreton-in-Marsh Neighbourhood Plan	Moving the predominant parking away from the High street to free up capacity on the road for other uses including any road adjustments required and a higher focus on placemaking activities and improved Active Travel facilities. It could include utilisation of parking pricing to further dis-incentivise the use of private vehicles. Includes "Park and Stride" facilities.	£2,000,000	Critical	BAU+	Cotswold: Moreton-In-Marsh
Mo9	On-site services	City Science	On-Site provision of key services such as retail and healthcare.	£0	Critical	LP: On-site	Cotswold: Moreton-In-Marsh
Mo10	Moreton-in-Marsh New Road	GCC/CDC/WSP	South easten portion of the link road around Moreton-in-Marsh to the East in an attempt to move through traffic and some development traffic away from currently constrained double roundabout. In order to remain inline with the vision to not induce increased car use this should include a wider array of measures including the potential to be car capacity neutral by e.g. pedestrianising or semi-pedestrianising the high street.	???	Critical	Proposed	Cotswold: Moreton-In-Marsh

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Mo12	Moreton-In-Marsh to Chipping Campden Greenway	City Science	A quiet street and infrastructure approach to delivering a car-lite route from Moreton-In-Marsh to Chipping Campden. This largely would be upgrades the current 442 national cycle route and could include closure/one-way/speed treatments on one leg of the triangle near Batsford, work on the crossing at station road and lanes or shared pathways along areas of the road that can facilitate it. Alternatively a route could be pursued through upgrading of Rights of Way footpaths along the railway line via Paxford - this route is flatter but may be harder to deliver. Also to note that it opens up railway access for Chipping Campden including sites being	£1,000,000	Essential	LP: Strategic (off-site)	Cotswold: Moreton-In-Marsh
Mo13	Moreton-In-Marsh to Shipston-on-Stour Cycleway	City Science	Greenway from Moreton-in-Marsh to Shipstone-on-the-Stour. This could utilise the verge to make a shared pathway along Todenham Street and joining to an upgraded Bridleway to Shipston-on-Stour. It should be noted that there may be grounds for cross-collaboration over the border with development along this route	£1,500,000	Essential	LP: Strategic (off-site)	Cotswold: Moreton-In-Marsh
Mo16	Evenlode Improvements	City Science	Currently part of the National 48 and the 442 cycle routes and all cyclists are expected to mix with general traffic. The high amount of additional traffic from developments along the route means that cycling is likely to become unsuitable for most people. It is likely that to remain suitable some form of segregation is likely to be required. There is a marginal possibility that limiting speed along the road to 20mph as well with measures to decrease or reroute traffic may retain the route as suitable for some people	£350,000	Critical	LP: Local access	Cotswold: Moreton-In-Marsh
Mo17	Moreton-in-Marsh Station Improvements	City Science	Upgrades to the facilities of the station in line with high patronage including better active travel connections.	£3,500,000	Critical	LP: Strategic (off-site)	Cotswold: Moreton-In-Marsh
Mo18	20 mph zones	City Science	Introducing 20mph zones across Moreton-in-Marsh (excluding A44 and A429)	£150,000	Critical	LP: Strategic (off-site)	Cotswold: Moreton-In-Marsh

Hi Matt,

Based on our call with Tom the SANG deficit is now 14.9 hectares as below with the Strategic Sites primarily mitigating against their own development with some capacity to provide for other types of development:

Development type	Sum of Area (ha) of SANG required	Sum of Masterplan SANG drawn (ha)	Sum of Area of ANRG required (ha)	Sum of Masterplan ANRG drawn (ha)
Non-strategic; non-principal settlements				
Non-strategic; principal settlements	1.61			
Saved allocations from 2011-31 LP; no planning permission	1.69			
Strategic Site	41.96	45.90	68.29	83.70
Windfall	15.54		1.80	
Total	**60.80**	**45.90**	**70.08**	**83.70**
Deficit / Surplus	-14.90		+13.62	

If the southern Kemble site were to be used solely for mitigating the non-Strategic Sites (i.e., other site allocations and windfall) then the requirement would be for 18.84 hectares of SANG. Looking at it from a purely operational perspective, this may be the simplest way of organising the SANG capacity as there would be only one management company/developer to allocate all of the SANG monies to.

If you need another call to discuss how we proceed with this let me know. I will begin to update the report to reflect these figures, and to include reference to the availability of the southern parcel of land at Kemble that can accommodate this c15ha requirement. I have set aside tomorrow to focus on this so can have as many calls as we need to get it sorted.

Hi Tom,

SAMM contributions for Strategic Sites are as in Table 1 below. SAMM contribution estimates for all development in Table 2. Please note that these have been calculated using the most recent SAMM tariffs given on the CDC website and not the sums from the specific recreation mitigation strategies. These figures also do not include the Council's a
fee.

We are currently putting together the suggested policy wording for the strategic SANG south of the Kemble allocation as discussed with Matt and will share ASAP.

Table 1 – Strategic Sites SAMM

Strategic Allocation	**Dwellings**	**Total Beechwoods SAMM contribution (£221.33 per dwelling)**	**Total North Meadow SAMM contribution (£356.21 per dwelling)**
Land east of Kingshill Lane	613		£218,356.73
Land north-east of Fairford	1,141		£406,435.61
Land south east of Cirencester and south of Preston	1,368		£487,295.28
Land south of Driffield	2,222		£791,498.62
Land south west of Siddington	372		£132,510.12
Land south-west of Kemble	1,020	£225,756.60	
Land surrounding Down Ampney	1,658		£590,596.18
Steadings southern extension	1,364	£301,894.12	£485,870.44
Grand Total	**9,758**	**£527,650.72**	**£3,112,562.98**

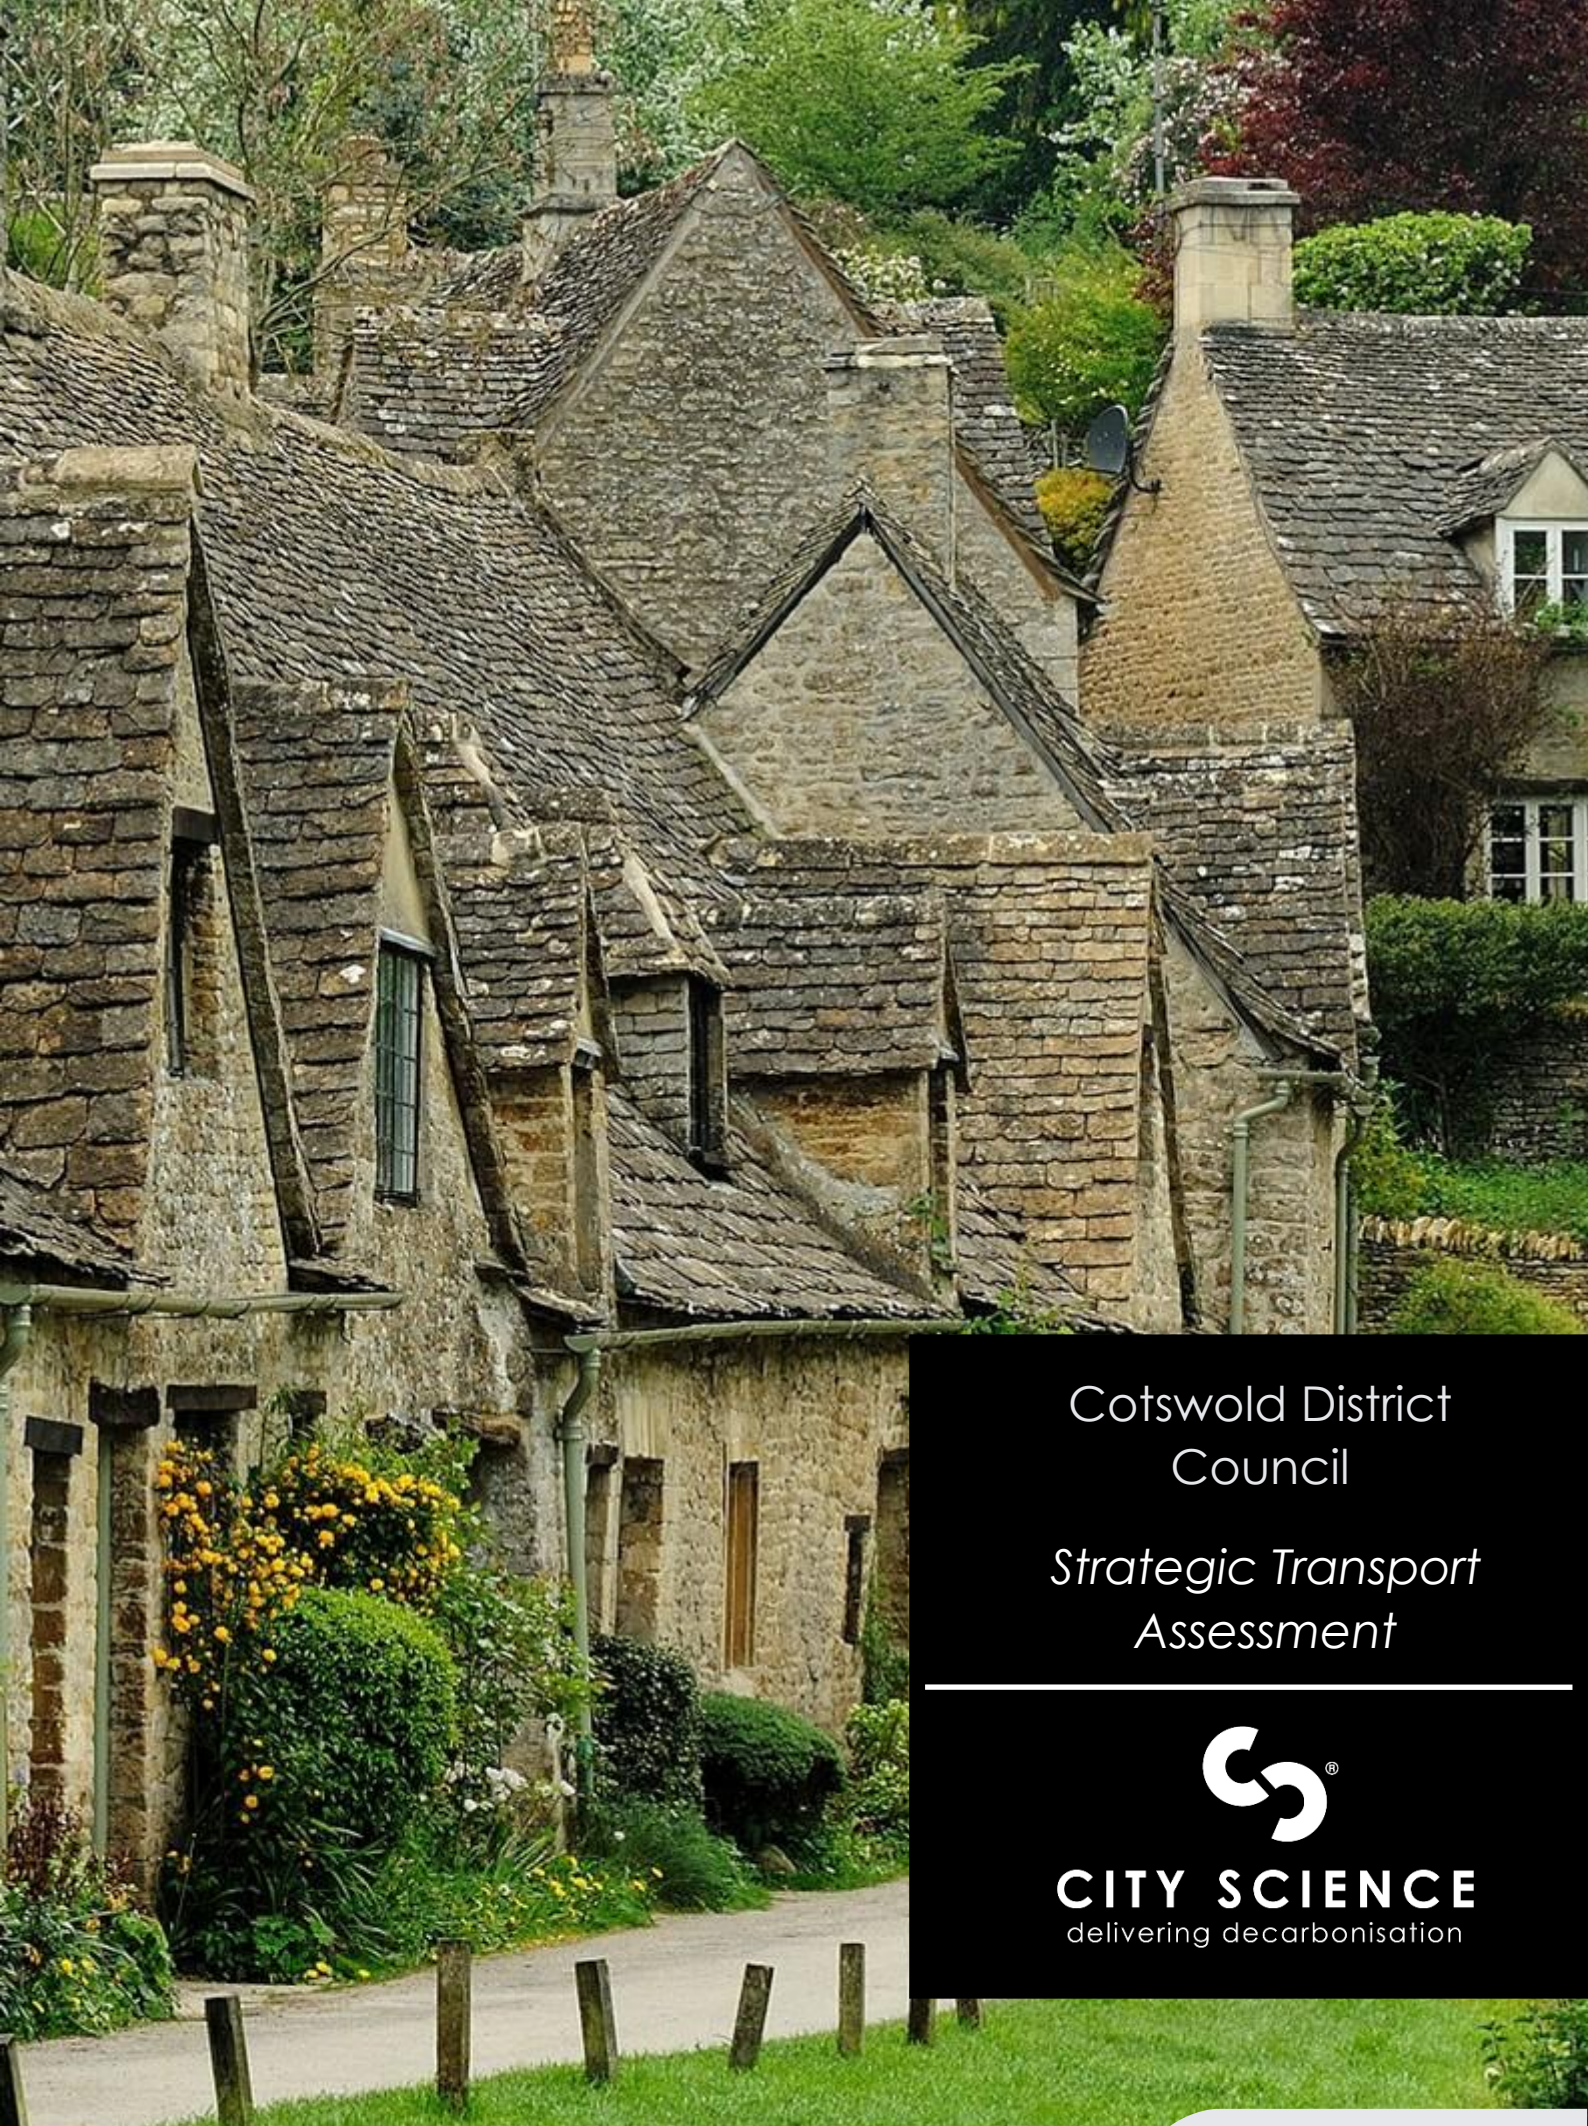

Table 2 – All residential development SAMM

Development Type	**Dwellings**	**Total Beechwoods SAMM contribution (£221.33 per dwelling)**	**Total North Meadow SAMM contribution (£356.21 per dwelling)**
Non-strategic; non-principal settlements	169		£60,199.49

Non-strategic; principal settlements	388	£20,141.03	£138,209.48
ved allocations from 2011-31 LP; no planning rmission	96	£21,247.68	
rategic Site	9,758	£527,650.72	£3,112,562.98
ndfall	1,264	£195,434.39	£135,716.01

Executive Summary

City Science has worked with Cotswold District Council to provide a transport evidence base as part of its draft local plan. This Strategic Transport Assessment forms a central part of the transport evidence base designed to fulfil its legal and procedural requirements..

Vision and Validate Approach

Under the new NPPF framework this work has adopted a vision and validate approach. This is designed to set a direction for the Local Plan and then work to deliver the necessary change to deliver it. This sits in contrast with previous approaches which have tended to focus on managing and mitigating any impacts.

Our approach has been designed to prioritise sustainable travel measures in line with the vision at every stage. Initial interventions and measures were designed wholly to meet and further the objectives and where residual mitigations have been required it is expected that they still deliver improvement for the vision.

The measures identified in this document provide for a substantive improvement to active and public transport networks for new developments that will also have positive impacts for all residents of the district. They have been robustly studied and tested to ensure that, cumulatively, they provide a comprehensive and viable route to achieving the vision and objectives alongside ensuring no adverse severe harms.

Local Plan Impacts

The Local Plan sets out to deliver 18,859 new homes and 79.68 new hectares of employment. This leads to an additional 157,600 trips within the district. The evidence suggests that sites with the sustainable measures are able to deliver key outcomes that outperform equivalent areas (e.g. on sustainable mode share) whilst also avoiding adverse harm to the network through key necessary changes to the network.

Conclusions

This STA provides a robust, comprehensive, and legally compliant evidence base. It confirms that the transport implications of the spatial strategy have been fully evaluated and appropriately mitigated and integrated whilst ensuring that the direction of travel is to fulfil the vision and objectives.

1. Introduction & Background

1.1 Purpose of this document

This Strategic Transport Assessment is one of several documents which provide evidence that the draft Cotswold District Local Plan has been prepared in accordance with legal and procedural requirements and is sound with regard to transport matters[1].

Specifically, this document demonstrates that the transport policies and measures set out in the Local Plan:

- meet Cotswold District's objectively assessed housing needs;
- were prepared in cooperation and liaison with neighbouring planning and transport authorities, and with Gloucestershire County Council and National Highways as highway authorities;
- represent a strategy which is appropriate and based on consideration of reasonable alternatives;
- are deliverable either directly by Cotswold District Council (CDC) or through joint working with neighbouring authorities, the highway authorities and/or other stakeholders;
- are consistent with national policy, particularly the principles of the National Planning Policy Framework (NPPF), including adopting a 'vision-led' approach intended to maximise the sustainability of new developments; and
- are aligned with strategic policies in the area including the emerging Gloucestershire Local Transport Plan 5.

This document has been prepared prior to the Regulation 19 public consultation on the draft Local Plan prior to planned submission for independent public examination in December 2026.

1.2 Background

CDC commenced a review of its adopted Local Plan (2011-2031) in 2020, with an initial Regulation 18 Issues and Options consultation in 2022. The purpose of this review was to ensure the plan remained up to date and responsive to national planning policy changes, while also strengthening its approach to environmental sustainability through a "green to the core" agenda. This initial stage sought views on the key issues that the emerging plan needed to address, including climate change, biodiversity, sustainable development and the overall effectiveness of existing policies. A further Regulation 18 consultation followed in 2024. This included both draft policy updates for the partial Local Plan review and an Issues and Options consultation for a separate Development Strategy and Site Allocations Plan. This considered how growth beyond 2031 might be accommodated across the district.

In December 2024, the Government published a revised National Planning Policy Framework consultation, which introduced a new Standard Method for assessing local housing need. This resulted in a substantial increase in Cotswold District's housing

[1] As set out in Paragraph 36 of the National Planning Policy Guidance (December 2024)

requirement to approximately 1,036 dwellings per year. In response, the Council committed to a full review of the Local Plan.

In July 2025, the Council resolved to consolidate the two ongoing Local Plan projects:

- the partial update of the adopted Cotswold District Local Plan (2011-2031);
- and the Development Strategy and Site Allocations Plan,

into a single comprehensive Full Local Plan Update, with a view to submission in 2026 and adoption in 2027.

Following this decision, the Council progressed a further Regulation 18 consultation on Preferred Spatial Options, informed by an evidence base including a Broad Locations Study and a Settlement Role and Function Study, alongside a further Call for Sites exercise. These studies assess environmental constraints, infrastructure capacity, settlement sustainability and potential growth locations. The Council has now refined its preferred spatial strategy and preparing for the next stage for the plan process; a Regulation 19 Draft Local Plan and subsequent submission for examination.

1.3 The transport evidence base

This transport evidence base forms a key component of the supporting evidence underpinning the Local Plan. It tests the deliverability of the proposed strategy, assesses the impact of planned growth on the highway network and sustainable transport systems, and identifies any necessary mitigation and infrastructure improvements.

The December 2024 NPPF update put an increased focus on Local Plans being developed using a 'Vision & Validate' approach, as opposed to the previous 'Predict & Provide' approach.

As a result, in September 2025 the Council appointed City Science to deliver the transport evidence base required for a compliant and effective Local Plan. This evidence base is intended to meet the tests of soundness and enable Regulation 19 consultation by summer 2026. The evidence is presented in this Strategic Transport Assessment.

1.4 Involvement of stakeholders & Duty to Cooperate

The Duty to Cooperate was established under the Localism Act 2011 and requires local planning authorities to work together in a proactive and constructive way on strategic cross-boundary issues, thereby strengthening the preparation of Local Plans. It ensures that key matters such as transport are considered jointly by neighbouring authorities and relevant statutory bodies. This transport evidence base has been developed in coordination with Gloucestershire County Council, in its role as the highway authority.

Whilst the Duty as a legal test is unlikely to apply when the plan is examined, CDC, through City Science, has regularly engaged with key partners on transport matters. This includes National Highways, Gloucestershire County Council, Gloucester City Council, Cheltenham Borough Council and Tewkesbury Borough Council as Strategic Local Plan (SLP), Worcestershire County Council, Oxfordshire County Council, Warwickshire County Council, Swindon Borough Council, Wiltshire County Council, Network Rail, and the Environment Agency.

2. Our vision-led approach

2.1 Introduction

This chapter firstly describes our 'vision & validate' approach for determining the transport measures required to support the Preferred Spatial Option. The chapter sets out the aspiration (i.e. 'the vision') for travel related to the Preferred Spatial Option, which has a strong focus on sustainability. Objectives and sub-objectives of this vision are also described along with the Key Performance Indicators (KPIs) which can be used to monitor the delivery of the vision going forward. The vision is cross-referenced against the existing policy context to ensure alignment.

2.2 The 'Vision & Validate' approach

2.2.1 Overview: What is Vision & Validate?

The transport evidence base for CDC applies a 'Vision & Validate' methodology to establish a robust, future-focused foundation for planning decisions. This approach is centred around defining the transport outcomes the district seeks to achieve and identifying the policies, infrastructure, and behaviours required to deliver them. This follows a recent shift away from the previous 'Predict & Provide' approach following the December 2024 revision of the National Planning Policy Framework. Where 'Predict & Provide' relied on projecting future travel demand from historic data and providing capacity to accommodate it, 'Vision & Validate' shifts away from reactive forecasting to proactive outcome-led planning. The method involves three key steps:

- **A Long-term, Place-based Vision:** The process begins by establishing a clear vision for the future, grounded in the objectives of the CDC Local Plan and informed by national, regional, and local priorities. This vision reflects the type of places the CDC Local Plan wants to create (e.g. walkable, connected, low-carbon communities) and sets clear ambitions for mode shift, accessibility, and climate mitigation and resilience.
- **Defining Infrastructure, Policies & Behaviours**: Rather than extrapolating past trends, Vision & Validate works back from the desired outcomes by considering the infrastructure, services, and behaviours that need to be in place to realise this vision. This allows planning to focus on the enablers of desired change and ensuring that spatial growth is aligned with transport opportunities.
- **Validated through Scenario Testing & Engagement**: Once the vision is defined, a series of transport scenarios are tested to understand the range of ways in which the outcomes could be delivered. A preferred package of interventions is then selected, informed by these tests and other planning considerations. The preferred approach is then validated against a multi-criteria assessment framework (using KPIs representing the objectives), modelling evidence, stakeholder input, and deliverability criteria, ensuring it is both ambitious and achievable.
- **Avoiding Substantive Harm:** A vision and validate approach must still avoid any substantive residual harm to the highway network. Residual mitigations may be needed in addition to vision-based interventions in order to ensure this.

Importantly, further validation of this vision-led approach can be achieved through planned performance monitoring to measure progress towards the vision (e.g. through the share of

journeys by sustainable modes). Where progress is not as planned, potential risks can be identified, and mitigated, and consideration is given to why this is the case and how progress can be improved.

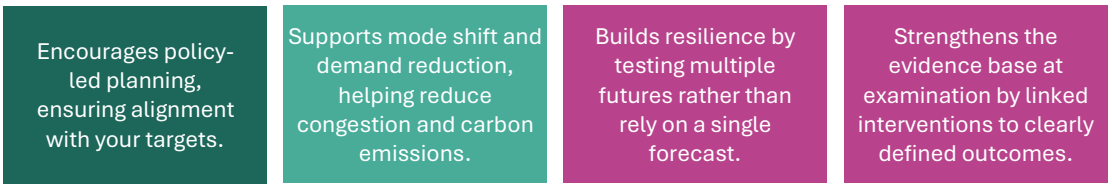
Where progress is better than expected, examination of why this is the case can inform future delivery, by understanding what has worked well, and consideration of a more ambitious vision. In this context, consideration should be given to the potential for reduced car travel resulting from the design of new developments to increase the viability of further investment in active travel and public transport. This 'virtuous circle' of changing travel behaviour and investment has been recognised by organisations such as the CIHT and the Transport Planning Society (Hopkinson L, 2025).

2.2.2 Rationale: Why Vision & Validate?

Traditional transport planning has often relied on a 'Predict and Provide' approach - forecasting future travel demand based on historic trends and planning infrastructure around anticipated volumes. While this can be useful for short-term operational management, it risks encouraging car dependency, underinvesting in sustainable modes, and failing to account for changing behaviours, policy shifts, or new technologies.

By contrast, the Vision & Validate approach has several benefits for plan making, as shown in Figure 2-1.

Figure 2-1: Benefits of the Vision & Validate approach



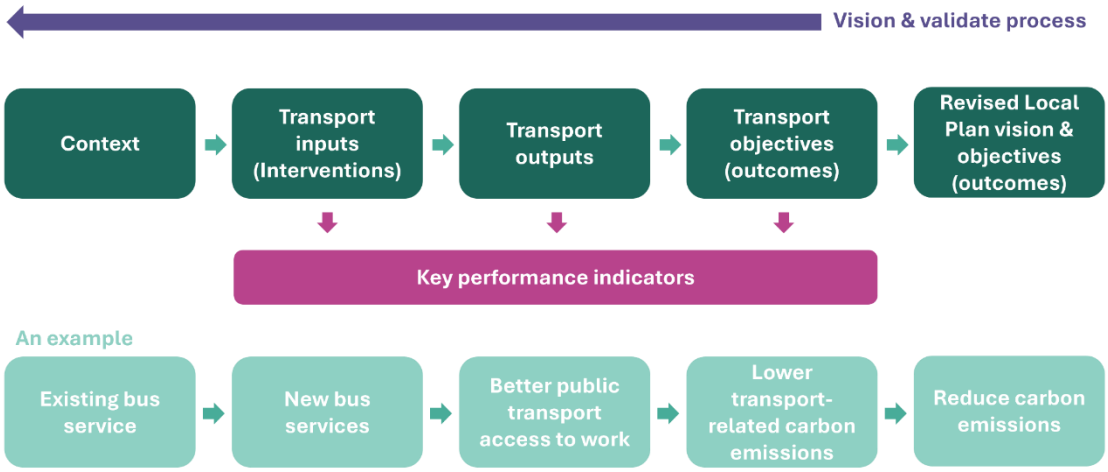


Figure 2-2 demonstrates how logic mapping can clarify these linkages, providing an illustrative example. The 'logic map' is read from left to right but developed from right to left, consistent with the Vision & Validate approach.

Figure 2-2: Tavistock Institute approach to logic mapping

2.2.3 Applying the Vision & Validate Approach

The Vision & Validate approach has been embedded throughout the preparation of the Local Plan and supporting transport evidence. Rather than forecasting future travel demand based solely on past trends, the process has started with the outcomes sought by the Council and its partners, as articulated through the transport vision and objectives. Transport interventions and development strategies have then been tested to determine the extent to which they can support delivery of these outcomes.

A preferred spatial option (PSO) was created with the sites for development that would be taken forward. A two stage approach was designed: Intervention and Mitigation.

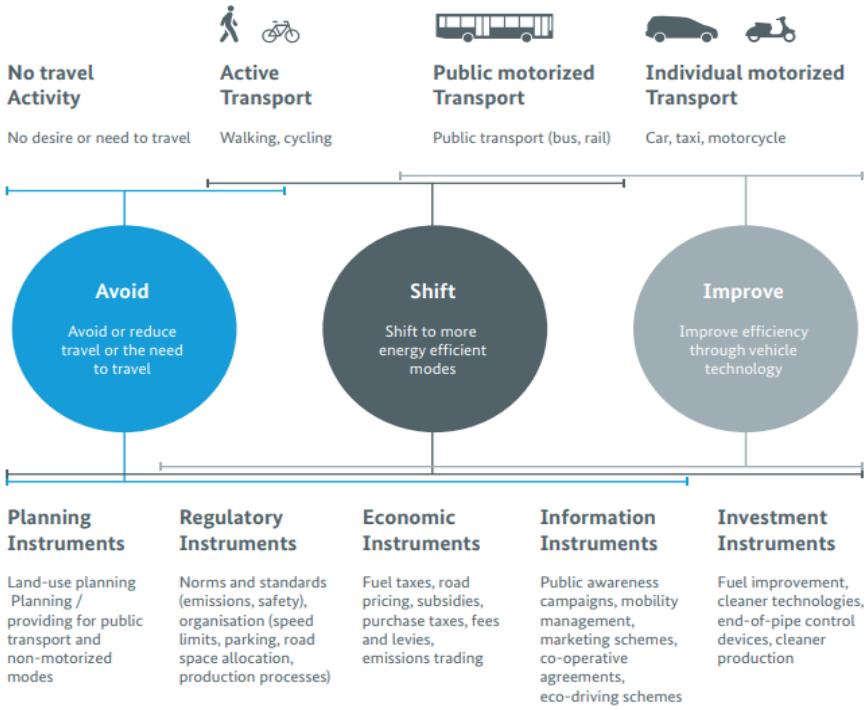
- **Intervention:** Interventions were measures that were designed to deliver the vision and objectives for the local plan. This was informed both from modelling (e.g. on likely demand corridors with the most impact for active travel) and through good practice urban design (e.g. ensuring active travel corridors to key services in line with guidance). This testing process was used to validate whether proposed growth and associated transport measures could contribute to achieving the desired transport vision.
- **Mitigation:** Where potential issues were identified, mitigation measures were then considered and the PSO was re-assessed to determine the extent to which impacts could be reduced or appropriately managed. This iterative process ensured that the spatial strategy was refined in response to evidence, rather than assumptions, and that any harmful effects were addressed where possible. These mitigations are still expected to prioritise the vision as much as possible. For example, junction capacity increases should be designed to also deliver active travel segregation and/or public transport priority.

This Vision & Validate approach has therefore ensured that sustainable measures in line with the vision have been prioritised throughout. By focusing on desired outcomes from the outset and using evidence to test and refine proposals, the approach provides a more robust framework for achieving the Council's long-term transport ambitions.

2.3 Encouraging sustainable travel

Cotswold District Council has demonstrated a strong commitment to sustainable travel and net zero through a series of formal actions and adopted targets. In July 2019, the Council declared a climate emergency and committed to achieving net zero carbon emissions from its own activities as soon as possible, with an 80% reduction against a 1990 baseline by 2030 and full decarbonisation by 2045, alongside achieving 100% clean energy use by 2030. These commitments are supported by the appointment of a Climate Emergency Manager, the establishment of a Climate Change Panel, and the adoption of a Climate Emergency Strategy for 2020–2030, embedding climate considerations across decision-making and reporting.

These commitments are further reflected in the Council’s approach to plan-making, including the review of the Local Plan to ensure it is “green to the core” and the integration of climate and sustainability objectives throughout its policies, including those relating to transport and development.



The NPPF recommends use of the vision-led approach in plan-making to identify "transport solutions that deliver well-designed, sustainable and popular places." The Council is fully committed to delivering these outcomes through the Local Plan process.

In terms of sustainable travel specifically, this has been achieved through adoption of a key principle, informing all stages of decision-making. This is the 'avoid/shift/improve' ('ASI') framework, first applied in Europe in the 1990s but since widely applied in the UK. ASI focuses on the needs of people, rather than car infrastructure, and on the demand for travel rather than the supply of infrastructure. It seeks to create more liveable places, reduce production of greenhouse gases and congestion and improve energy efficiency.

The ASI framework sequentially prioritises:

- Those measures which AVOID the need to travel (either negating the need for some journeys altogether or reducing the length of journeys) through measures such as transit-orientated development and compact multi-use development.
- SHIFT as many of the remaining journeys onto the most sustainable and energy efficient modes of travel: public transport, wheeling and walking.
- Minimising the impact of residual vehicle trips by IMPROVING their sustainability. This includes promotion of electric vehicles and energy efficiency in the provision of public transport.

Figure 2-3: Avoid/Shift/Improve instruments

Source: New Urban Agenda #114[2]

[2] https://www.transformative-mobility.org/wp-content/uploads/2023/03/ASI_TUMI_SUTP_iNUA_No-9_April-2019-Mykme0.pdf

As such, this STA proposes measures and policies which, for example, enable shorter journeys and digital rather than physical accessibility, over those which encourage public transport use and over those which support use of private cars.

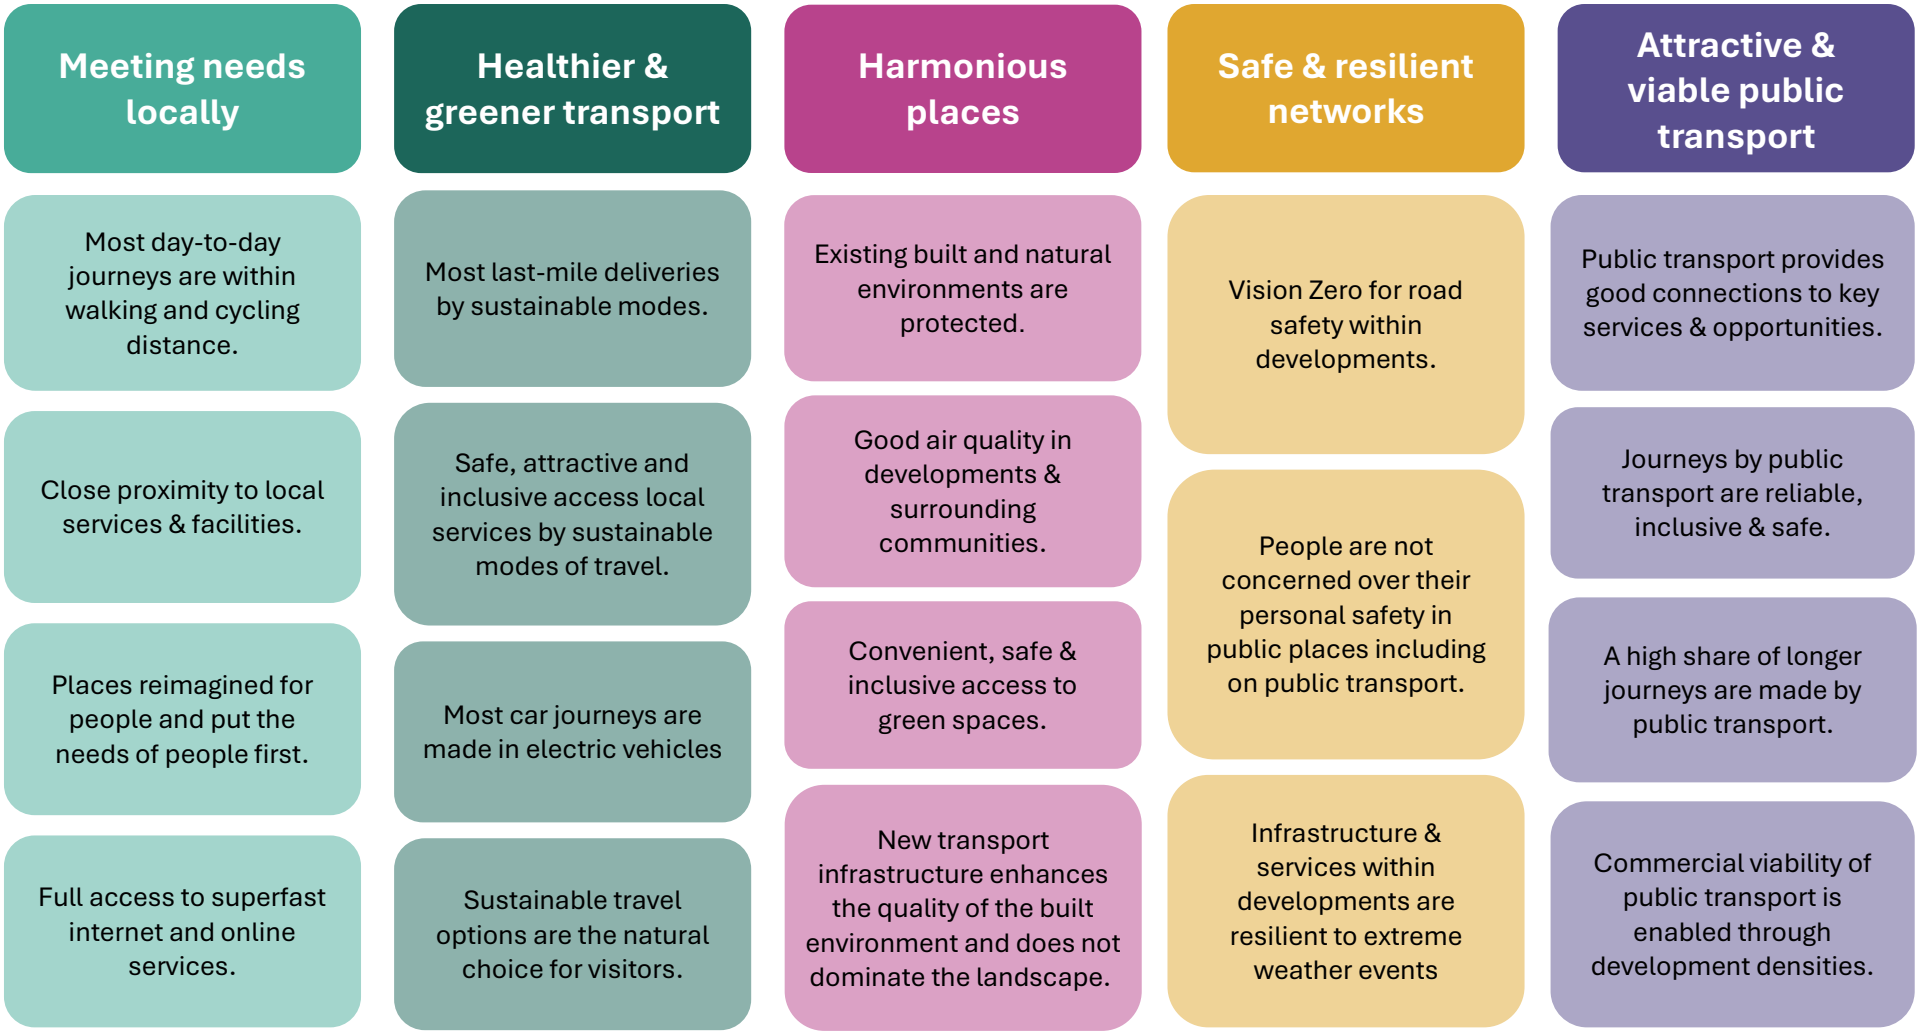
2.4 The transport vision

The transport vision and objectives set the basis for decision-making and ensure that those decisions link back to best practice, adopted policy and emerging priorities. Transport is not an end, but an enabler of wider societal benefits such as health and wellbeing, and placemaking. The transport vision provides a simple statement of what is being sought through the Local Plan and is consistent with the broader vision for the Local Plan as a whole.

The transport vision for the Local Plan is shown in Figure 2-4.

Figure 2-4: Transport vision for the Local Plan

The 'what': Residents in developments within the Cotswold District will have access to high quality sustainable low-carbon transport with low car dependency. Developments will prioritise active travel and public transport as we transition to net zero carbon.



The 'so-what': Residents will be well connected to their everyday needs with options that enable low-carbon travel choices for all to reduce emissions, boost health and wellbeing, supporting local people and the environment to thrive."

2.5 The transport objectives

While the transport vision outlines the Council's long-term aspirations for the transport network, the objectives define the specific ways in which transport will help realise that vision. They draw on the existing Regulation 18 Local Plan objectives, that have shaped the development of policies and interventions in the plan preparation process. The objectives were refined collaboratively with key stakeholders, including Gloucestershire County Council, National Highways, and other partners, through a programme of targeted workshops and stakeholder discussions.

The transport objectives are shown in Figure 2-5. They are intentionally aspirational, providing a more detailed expression of the transport vision and the outcomes it seeks to achieve. However, it is acknowledged that full delivery of every objective may not be achievable within the Plan period, particularly where progress is dependent on external factors or agencies beyond the Council's direct influence. Consequently, any proposals, decisions, or actions that could hinder advancement towards these objectives should be carefully assessed and justified.

Figure 2-5: Transport Objectives and Sub Objectives

2.5.1 Objective 1: Meeting needs locally

Meeting needs locally means ensuring that people can access day-to-day services, such as a local shop, primary education and leisure opportunities within their own communities. Travel demand is largely 'derived', arising from where homes, workplaces, schools, shops, and leisure facilities are located. By providing opportunities to meet these needs locally, fewer and shorter trips are required which are more likely to be made walking, cycling and through using public transport (DfT, 2025). This mode shift reduces emissions from road transport, while encouraging more active and healthy lifestyles.

Ensuring needs are met locally is key for achieving the wider Local Plan objective. It reduces the need to travel by car, helping to cut carbon emissions from transport. It also reduces pressure for new road infrastructure, protecting the Cotswolds' natural, built and historic environment. It also enables a vibrant, low-carbon local economy by concentrating economic activity within towns and villages, promoting self-sustaining communities.

The types of policies and measures that could support this objective include:

- Building mixed-use developments that combine residential, commercial, and community uses;
- Situating new developments near existing services and employment opportunities;
- Maintaining or enhancing access to essential services within walking or cycling distance from new developments;
- Promoting remote access to services and ensuring developments accommodate remote working; and
- Designing streets for safe and convenient walking and cycling.

2.5.2 Objective 2: Healthier & greener transport

Healthier and greener transport means promoting travel options that minimise environmental impacts, improve air quality, and support active lifestyles. This includes encouraging walking, cycling, and the use of public transport for most everyday journeys. Where these options are not feasible, it prioritises ensuring that most motorised vehicle miles are undertaken by electric or other zero-emission vehicles.

Transport accounts for 44% of greenhouse gas emissions in the Cotswold District (DESNZ, 2023). Encouraging greener travel helps reduce transport emissions, improves air quality and support safer, more liveable streets. Healthier travel delivers physical and mental health benefits, increasing social interaction, and reducing traffic-related injuries. Low-emissions technologies, such as EVs, produce less negative health externalities (e.g. due to emissions) and when integrated with active travel infrastructure ensure healthier outcomes.

Healthier and greener transport is necessary to meet the wider objectives for the Local Plan, reducing carbon emissions from road transport and supports the transition to a low-carbon transport system. Promoting active and sustainable travel also supports inclusive, healthy communities by improving access to jobs, services and facilities, while creating safe, accessible and connected neighbourhoods.

The types of policies and measures that could support this objective include:

- Dedicated walking and cycling routes, cycle parking, and pedestrian-friendly streets;
- EV charging networks, incentives for electric vehicles, and low-emission zones;

- Reduced speed limits, establishing shared streets, and pedestrian priority areas;
- Integration of green corridors, trees, and shading along walking and cycling routes;
- Public awareness campaigns to promote active travel and low-emission modes; and
- Transitioning public transport and municipal fleets to low-emission vehicles.

2.5.3 Objective 3: Harmonious places

Harmonious places are designed to integrate transport and public spaces in a way that complements the natural, built, and historic environment while creating safe, attractive, and functional streets and public realms. They combine transport networks, streetscapes, and public spaces in ways that respect local character, enhance the quality of life for residents, and promote sustainable travel modes such as walking, cycling, and public transport.

The development of harmonious places ensures that transport networks enhance sustainability, connectivity, and community resilience. This can be achieved through measures such as sensitively designed streets and public spaces, careful landscaping, traffic calming, prioritising active and sustainable travel modes, and integrating transport improvements with heritage and natural conservation. This enables communities to become safer, more inclusive, and healthier.

Creating harmonious places is key to achieving the Local Plan objectives by ensuring that the natural, built, and historic environment is conserved and enhanced. This includes protecting heritage assets, landscapes, and biodiversity while integrating necessary transport infrastructure and supporting resilient communities that can adapt to climate change.

The types of policies and measures that could support this objective include:

- Streets and public spaces designed to reflect local heritage and character;
- Reducing vehicle dominance to create safer, more attractive environments;
- Walking and cycling routes are prioritised and integrated into public spaces;
- Improving lighting, seating, public art, and landscaping to enhance attractiveness of public spaces; and
- Engaging communities in designing streets and public spaces to ensure they are inclusive.

2.5.4 Objective 4: Safe & resilient places

Safe and resilient multi-modal networks are integrated transport systems that allow people to travel safely and efficiently using a variety of modes, including walking, cycling, public transport, and private vehicles. These networks should be designed in accordance with relevant transport, accessibility and safety standards, ensuring that infrastructure is inclusive, well-maintained, and suitable for people of all ages and abilities.

The design and management of multi-modal networks should align with Vision Zero principles, which seek to eliminate deaths and serious injuries on the transport network by prioritising safe system design and reducing risks. By embedding safety in transport planning, concerns over personal safety should not be a barrier to people choosing sustainable transport.

Resilient networks can withstand extreme weather events, infrastructure failures, or other disruptions, ensuing reliable connections and continued access to essential services. By integrating multiple modes and ensuring safe access, residents are more likely to use walking, cycling, or public transport, reducing reliance on private cars and cutting carbon emissions. Safety-focused design prevents accidents and injuries, making streets and transport corridors more inclusive and usable for people of all ages and abilities.

Safe and resilient multi-modal networks support wider Local Plan objectives by responding to the climate crisis through adaptation. Well-designed, resilient networks reduce vulnerability to climate risks, ensuring reliable access to essential services. By providing reliable connections to employment, education, retail, and leisure, multi-modal networks enable a vibrant, low-carbon local economy, supporting local businesses and reducing travel-related barriers to economic activity.

The types of policies and measures that could support this objective include:

- Ensuring transport infrastructure is designed to withstand flooding, heat, and extreme weather;
- Coordinated walking, cycling, public transport, and car networks;
- Regular inspection and maintenance to ensure reliability and safety; and
- Contingency routes and accessibility plans for essential services.

2.5.5 Objective 5: Attractive & viable public transport

Providing attractive and viable public transport choices means ensuring that buses, trains, and other shared transport services are frequent, reliable, affordable, and accessible for all residents. High quality transport provides public transport provides a practical alternative to private car travel for commuting, education, shopping, and leisure trips, helping reduce car dependency, transport emissions and congestion.

Accessible, inclusive, and reliable public transport ensures that all residents, including those without a car, older people, and people with disabilities, can participate fully in work, education, and community life. Integrating public transport with active travel, journeys become more convenient and more attractive.

This supports the Local Plan objectives by helping to address the climate crisis, enabling a low-carbon local economy, improving access to services and supporting sustainable, connected communities. A resilient public transport network also provides greater travel choice and adaptability to future challenges.

The types of policies and measures that could support this objective include:

- High quality, high frequency and reliable public transport services;
- Improved bus infrastructure such as dedicated bus lanes and traffic signal priority to improve reliability of services;
- Step-free access, seating, shelters, and real-time information for all users;
- Development of transport hubs linking public transport and active travel and increasing multi-modal travel; and
- Simplified multi-modal ticketing and fare structures.

2.6 Key performance indicators (KPIs) and targets

2.6.1 Key performance indicators

During the plan-making process, key performance indicators (KPIs) were developed to support the objectives. The KPIs serve the following purposes:

- They provide additional detail in terms of 'success factors' in terms of sustainable development (from a transport perspective). This draws on guidance and best practice such as the National Planning Policy Framework, National Planning Guidelines, Active Travel England design resources and best practice from other Local Plans.
- They highlight that some measures of success are inputs into the Vision & Validate approach and that this is worthy of proper consideration. This is typically where an input defines the behavioural outcome sought, for example vehicle trip rates. Testing different assumptions about such inputs is an important part of the vision and validate approach.
- They are the source of the criteria used to compare the potential impacts of the Preferred Spatial Option, and the effects of any transport interventions proposed (as part of the Multi-Criteria Assessment Framework).
- They identify the transport outputs that the package of Local Plan transport policies, interventions and services could deliver.
- They can be used as the basis for development of travel behaviour monitoring and evaluation programmes for individual Local Plan sites (or groups of sites). This would aid understanding of whether the transport vision is likely to be met ('validation') and, if not, to inform decisions about the need for further intervention.

Typically, two KPIs were identified for each transport sub-objective/overarching objective. Table 2-1**Error! Reference source not found.** provides a summary by showing the success factors for each sub-objective.

Table 2-1: Success factors by sub-objective

Success indicator
Objective 1: Meeting needs locally
Developments include (or are close to) local services, shops and local work hubs.
Development is designed to prioritise people over vehicles.
Superfast broadband is provided to all properties during construction. 100% 5G coverage in new developments.
Objective 2: Healthier and greener transport
New developments are located in close proximity to existing active travel networks, enabling and encouraging walking and cycling from the outset.
Cycle parking and supporting facilities are integrated as standard within new commercial developments.
High-quality pedestrian and cycle routes are delivered in and around developments, designed to be safe, direct, well-lit, and attractive for users.
New development contributes to a net reduction in transport-related emissions, particularly from road traffic.
Electric vehicle charging infrastructure is provided to support the transition to electric mobility.

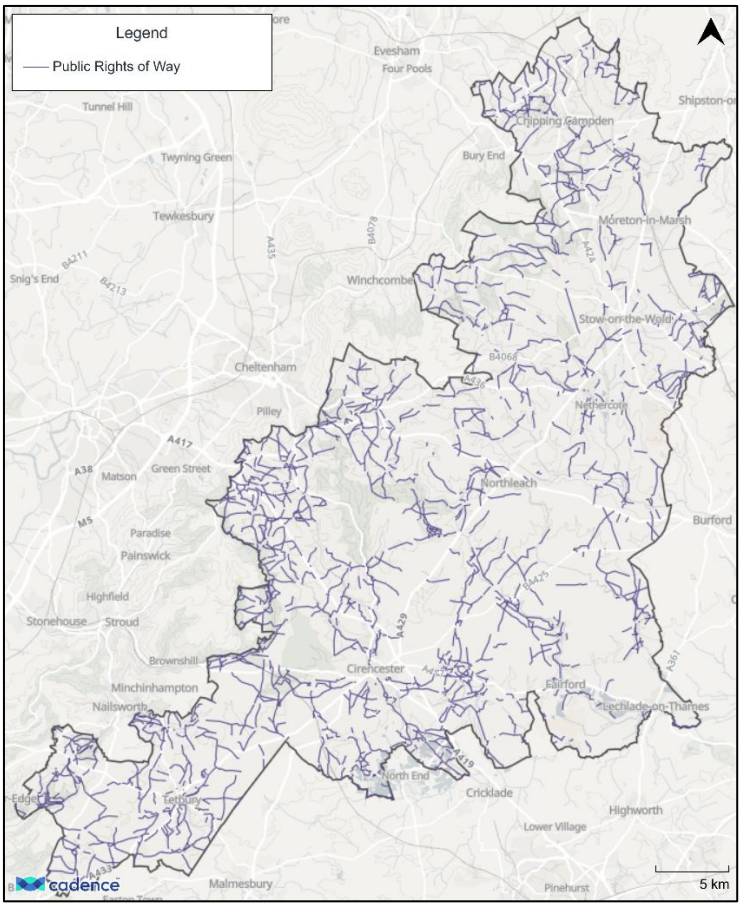
Success indicator
Local communities and urban centres support sustainable freight and servicing solutions, including e-cargo bike deliveries and dynamic kerbside management.
Objective 3: Harmonious places
Direct active travel routes are provided to local green and blue spaces.
Existing built and natural environments are protected from transport impacts of developments.
Air quality is improved across the district, with particularly high standards expected within new developments and their immediate surroundings.
New transport infrastructure enhances, rather than detracts from, the character of places.
Objective 4: Safe & resilient networks
Road safety improves in line with Vision Zero principles within new developments.
Adherence to relevant standards, guidance best practice within and beyond sites.
Concerns over personal safety are not a barrier to active travel.
Transport infrastructure is resilient to climate change and extreme weather events.
Transport system is not reliant on a small number of modes, junctions and links to function
Objective 5: Attractive & viable public transport
Development sites are located close to existing or planned public transport services.
Developments are well-served by direct and frequent public transport to employment and service locations.
Accessible and attractive active travel routes to public transport services.
Higher-density areas within developments close to core sustainable transport corridors.

3. Current transport & travel conditions

3.1 Introduction

This chapter sets out the existing transport baseline for the Cotswold district. It presents the current transport infrastructure and networks, assesses existing operating conditions, describes travel demand and movement characteristics, and identifies principal transport matters that require further consideration within the Sustainable Transport Assessment.

3.2 Current transport networks



3.2.1 Active travel

3.2.1.1 Walking and wheeling

The ability to walk, wheel and access local destinations safely is an important indicator of transport accessibility and community connectivity. Within the Cotswold District, active travel is influenced by the area's rural geography, dispersed settlements and historic built environment. While many towns and villages benefit from attractive walking environments and an extensive network of Public Rights of Way (PROW), the quality, directness and accessibility of routes can vary considerably.

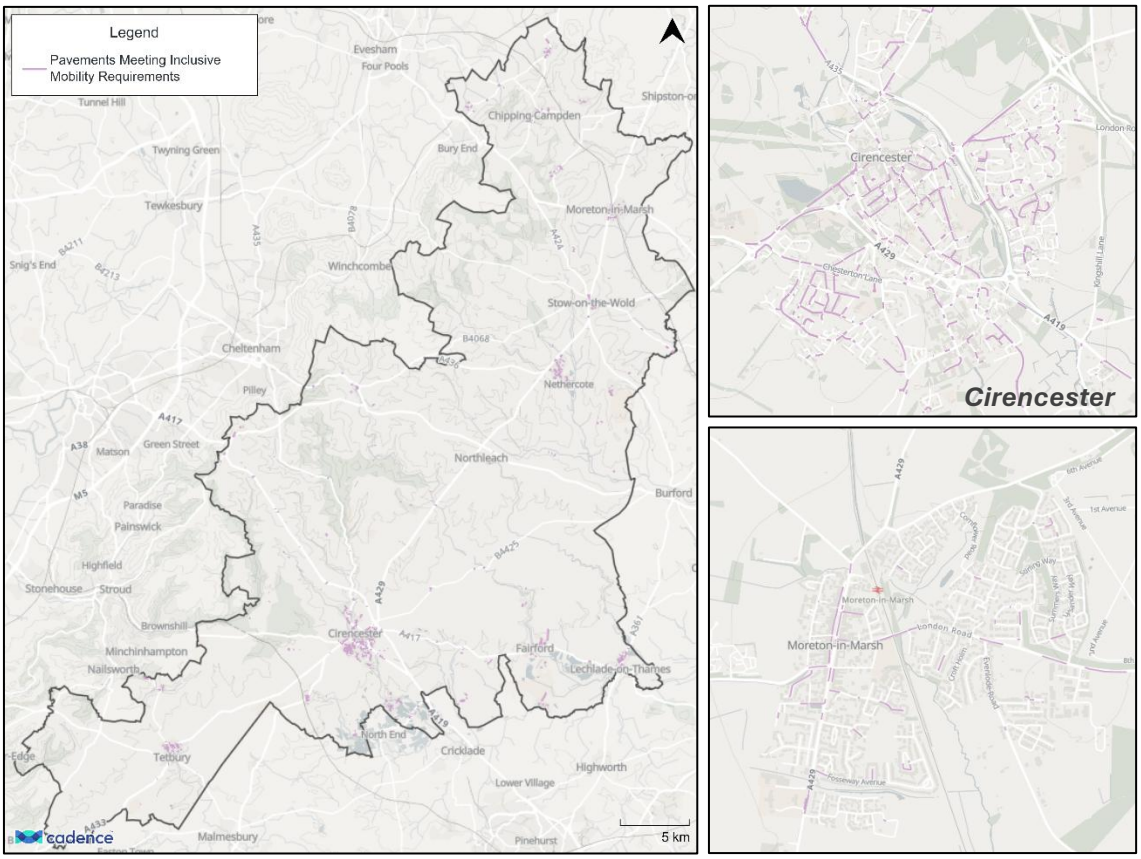


Figure 3-1 shows the distribution of Public Rights of Way across the district. Outside the main settlements, the PROW network is extensive and forms an important part of the wider green infrastructure network. However, it is mainly rural in nature and is used primarily for recreation and leisure walking. These routes are generally not designed to provide direct or continuous links to everyday services or employment areas, and are often constrained by surface condition, changes in elevation, limited width, and weak integration with settlements.

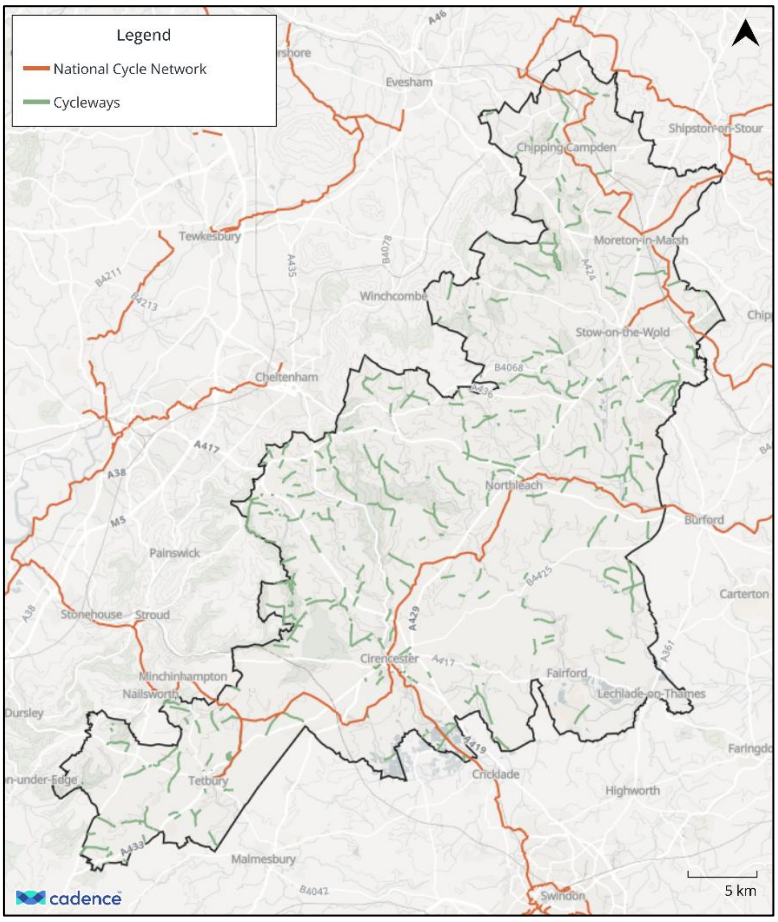
Figure 3-1: Rights of way (OpenStreetMap (OSM), 2022)

In many settlements, infrastructure has developed incrementally over time, resulting in gaps in provision and inconsistencies in route quality between settlements. Walking routes were assessed against the widths requirements of the DfT's Inclusive Mobility requirements. The highest concentration of suitable pedestrian infrastructure is generally found in the district's main settlements such as Cirencester, Fairford, Tetbury, Stow-on-the-Wold and Moreton-in-Marsh. However, within these settlements the network remains fragmented and route continuity and accessibility are often constrained by narrow footways, crossing difficulties and limited provision on the approaches to settlements.

Figure 3-2: Footpaths meeting Inclusive Design Mobility guidance (DfT, 2021) across the district and for key settlements within the district

Due to the relatively long distances between settlements and the dispersed nature of services and employment opportunities, inter-urban utility trips are unlikely to be undertaken on foot or by wheeling for most users. Thus, opportunities to increase utility walking and wheeling are likely to be focused on strengthening connections between new development sites, local services and public transport networks, ensuring that key destinations can be accessed safely and conveniently without reliance on the private car.

3.2.1.2 Cycle Network



Cycle networks in the Cotswold District are also influenced by the area's rural geography, dispersed settlement pattern and the relatively long distances between key settlements. As a result, cycling is generally most viable within towns and in their immediate surroundings, while longer inter-urban trips are less likely to be undertaken by bike. Some cycle tourism is, however, expected given the district's landscape quality and attraction.

Existing cycle provision is typically fragmented, with limited continuity between settlements and reliance upon on-road routes for key sections of the network, including parts of the National Cycle Network (NCN), as seen in Figure 3-3. The NCN within the Cotswold District is a composite network with variable provision, including a significant reliance upon on-road alignments, rather than a consistently off-road strategic cycle network. Where on-road sections are present, particularly on key corridors, perceived safety and attractiveness can be reduced, especially where cyclists are required to share space with higher-speed or higher-volume traffic.

As new development comes forward, additional traffic accessing these sites has the potential to further decrease the quality and attractiveness of existing on-road cycle routes, particularly where they form part of longer-distance or leisure-focused corridors.

Moreton-in-Marsh

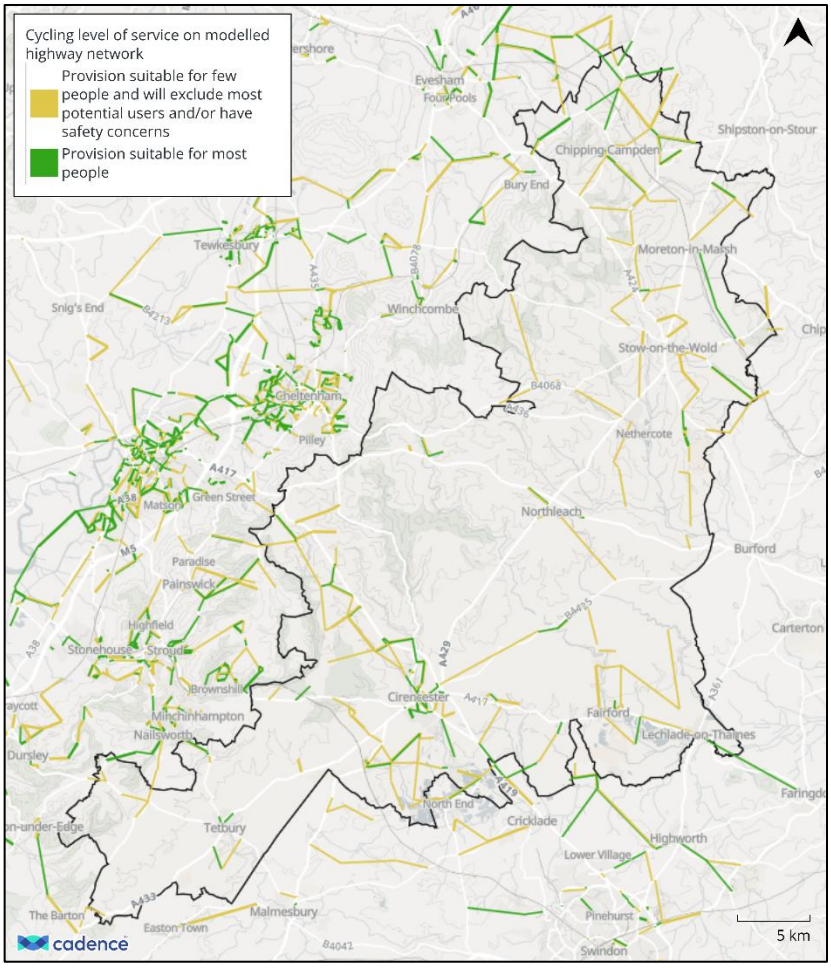


Figure 3-3: National cycle networks and cycleways (Ordnance Survey, 2023)

The extent and quality of cycle infrastructure influence cycling uptake, particularly in relation to perceived safety and comfort. Figure 3-4 displays the assessment of the highway network in the district using DfT LTN1/20 Cycling Levels of Service guidance. This determines the suitability of the highway network for active travel. A key factor is the degree of physical segregation required, which varies according to road speed and traffic volume. Traffic volumes were estimated using available Gloucestershire datasets, and speeds were derived from Ordnance Survey speed limits. Routes were classified as suitable where segregation requirements are met either through existing infrastructure or where traffic conditions are sufficiently low.

Applying Local Transport Note 1/20 (LTN 1/20) thresholds to the highway network suggests that there is some suitability for cycling; however, the network of roads currently suitable for everyday cycling remains limited and fragmented. Alongside this, there are several routes suitable for active travel dispersed across the district. At present viable cycling for all is largely delivered through traffic volumes being low enough to allow for mixed traffic rather than a lot of existing infrastructure.

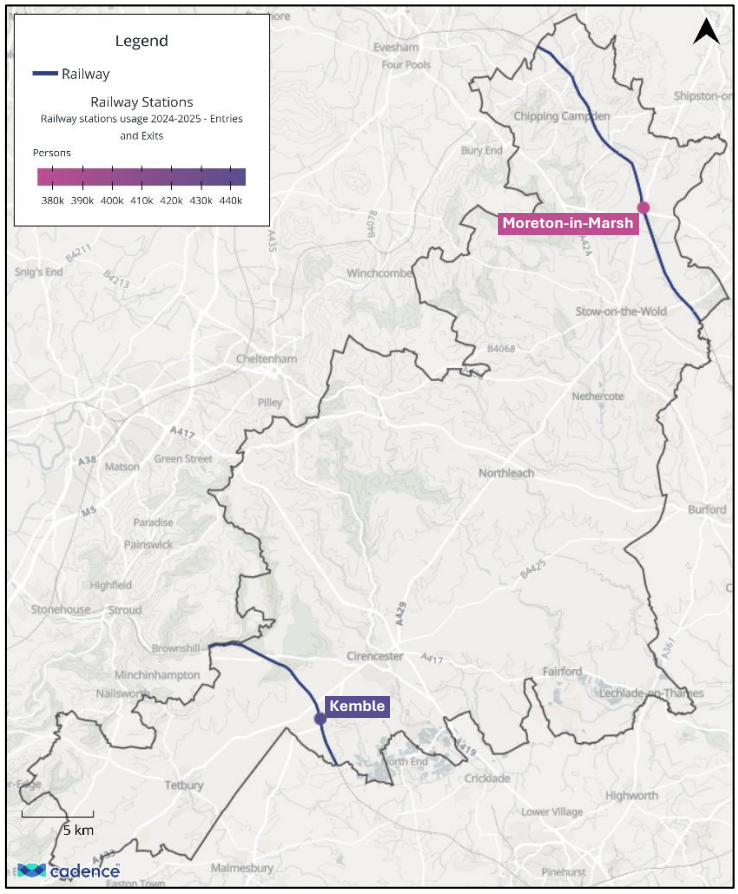
Figure 3-4: Cycling Level of Service (CLoS) rating for cycleways (City Science Analysis, 2025)

3.2.2 Public Transport

3.2.2.1 Rail

Rail provision within the Cotswold District is limited, with only two stations serving the area, namely Kemble and Moreton-in-Marsh, which do not have a direct connection to each other (Figure 3-5). As a result, rail is unlikely to function for movement between settlements within the district but instead provides targeted access to the wider regional and national rail network.

Kemble station is located on the Golden Valley Line between Swindon and Gloucester and is served by Great Western Railway services. It provides direct hourly connections to Gloucester, Cheltenham and London Paddington. Moreton-in-Marsh station is located on the Cotswold Line between Oxford and Worcester and is also served by Great Western Railway, providing direct hourly services to London, Worcester and Hereford. Together, these stations provide the district with access to the wider rail network, supporting commuting, business and leisure travel. Both stations provide supporting facilities for rail users, including car parking and cycle storage, although the scale of provision varies.



Cirencester, the largest settlement within the district, does not have its own railway station, following the closure of the former Cirencester branch line. Kemble Station, located approximately 8 km to the south-west, functions as the principal rail access for the town.

Access between Cirencester and Kemble is currently reliant on bus services, active travel connections and private vehicle travel, highlighting the importance of improving sustainable first- and last-mile connectivity.

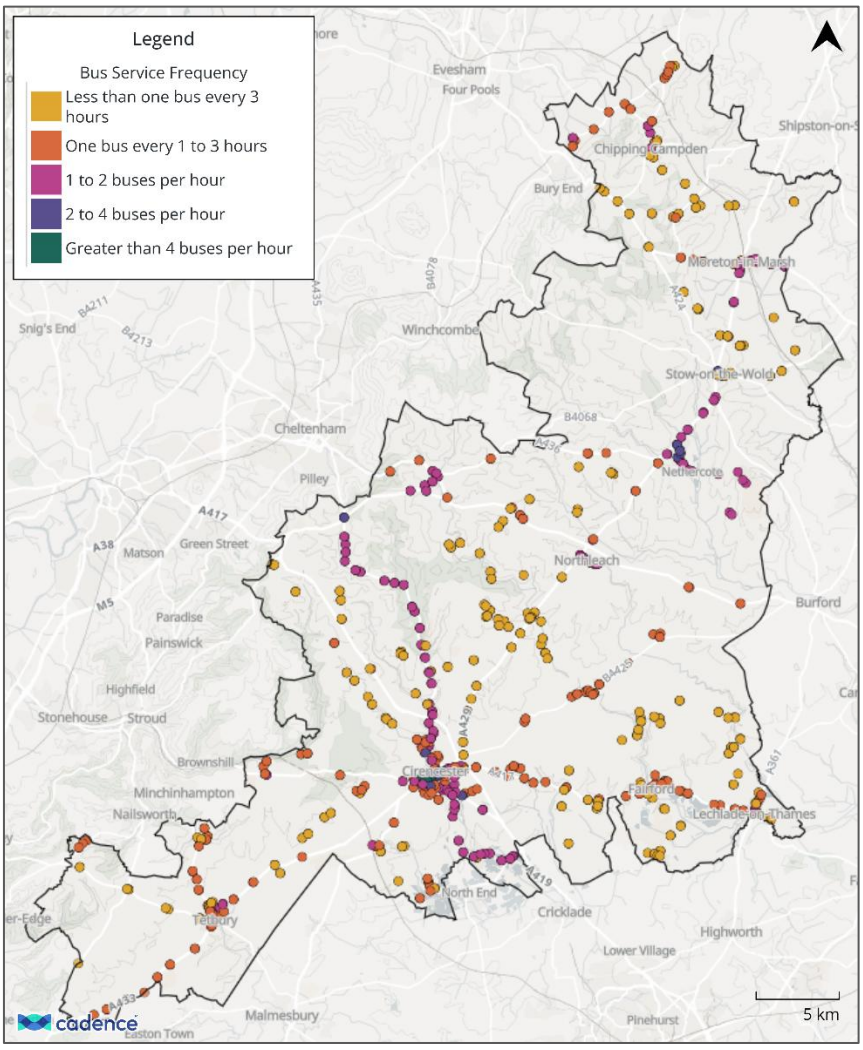
Annual station usage data from the Office of Rail and Road (2025) shows that Kemble accommodates significantly higher passenger numbers at just over 444,000 passenger entries and exits to the station between 2024-25. Comparatively, Moreton-in-Marsh station has just over 375,000 passenger entries and exits. This categorises both stations as Category D stations, which are defined as medium-sized staffed stations that typically serve a moderate level of passenger demand and provide staffed facilities during operation hours.

A key transport focus for the Local Plan is improving sustainable access to these stations, ensuring that the development is effectively connected through walking, cycling and public transport links to support rail use as part of multi-modal journeys.

Figure 3-5: Rail network (ORR, 2025)

3.2.2.2 Bus services

Bus service provision within the Cotswold District is largely focused on connecting the main settlements, with more limited coverage across rural areas (Figure 3-6). Service frequency is generally highest within and between the larger towns, while rural routes tend to operate less frequently, reflecting lower demand and longer journey distances. Figure 3-6 illustrates



that rural areas are served by low frequency services, with areas only having a handful of bus services a day. Whereas the bus stops within Cirencester have more than four services an hour in comparison.

The district has a relatively limited level of dedicated bus infrastructure. Bus services primarily operate on the local highway network alongside general traffic, with limited provision of bus priority measures to improve bus reliability and journey times.

Consequently, operational performance varies across the network. Bus punctuality is measured as the proportion of services operating 'on time', where a service is considered on time if it departs between 1 minute early and 5 minutes 59 seconds late compared to the scheduled time. Bus punctuality in some areas of Cirencester fell to around 50% across a three-month period, indicating reliability challenges on busier urban corridors.

While the bus network provides important access to services for non-car users, especially within main settlements, the combination of variable reliability and low frequency rural services can limit its attractiveness as an alternative to the private car. This is especially true for time-sensitive journeys.

Figure 3-6: Bus service frequency at each bus stop (BODS, 2025)

3.2.3 Highway network

The Cotswolds District highway network is formed by both Strategic Road Network (SRN) and Major Road Network (MRN), which primarily accommodate longer-distance and through traffic movements, as well as the local road network. The A417 forms part of the SRN, providing a strategic link between the M4 and M5 and supporting regional and national connectivity. Key MRN corridors, include the A429 and A40, connecting the district to major centres such as Gloucester, Swindon and Oxford, supporting commuting, business, freight and tourism movements.

As a predominantly rural district, many settlements rely on these strategic corridors for access to employment, education, healthcare and other services. Consequently, the SRN and MRN are critical to both the local economy and wider regional connectivity, which can lead to pressure on the network, particularly in and around market towns and larger villages.

3.3 Current network conditions and performance

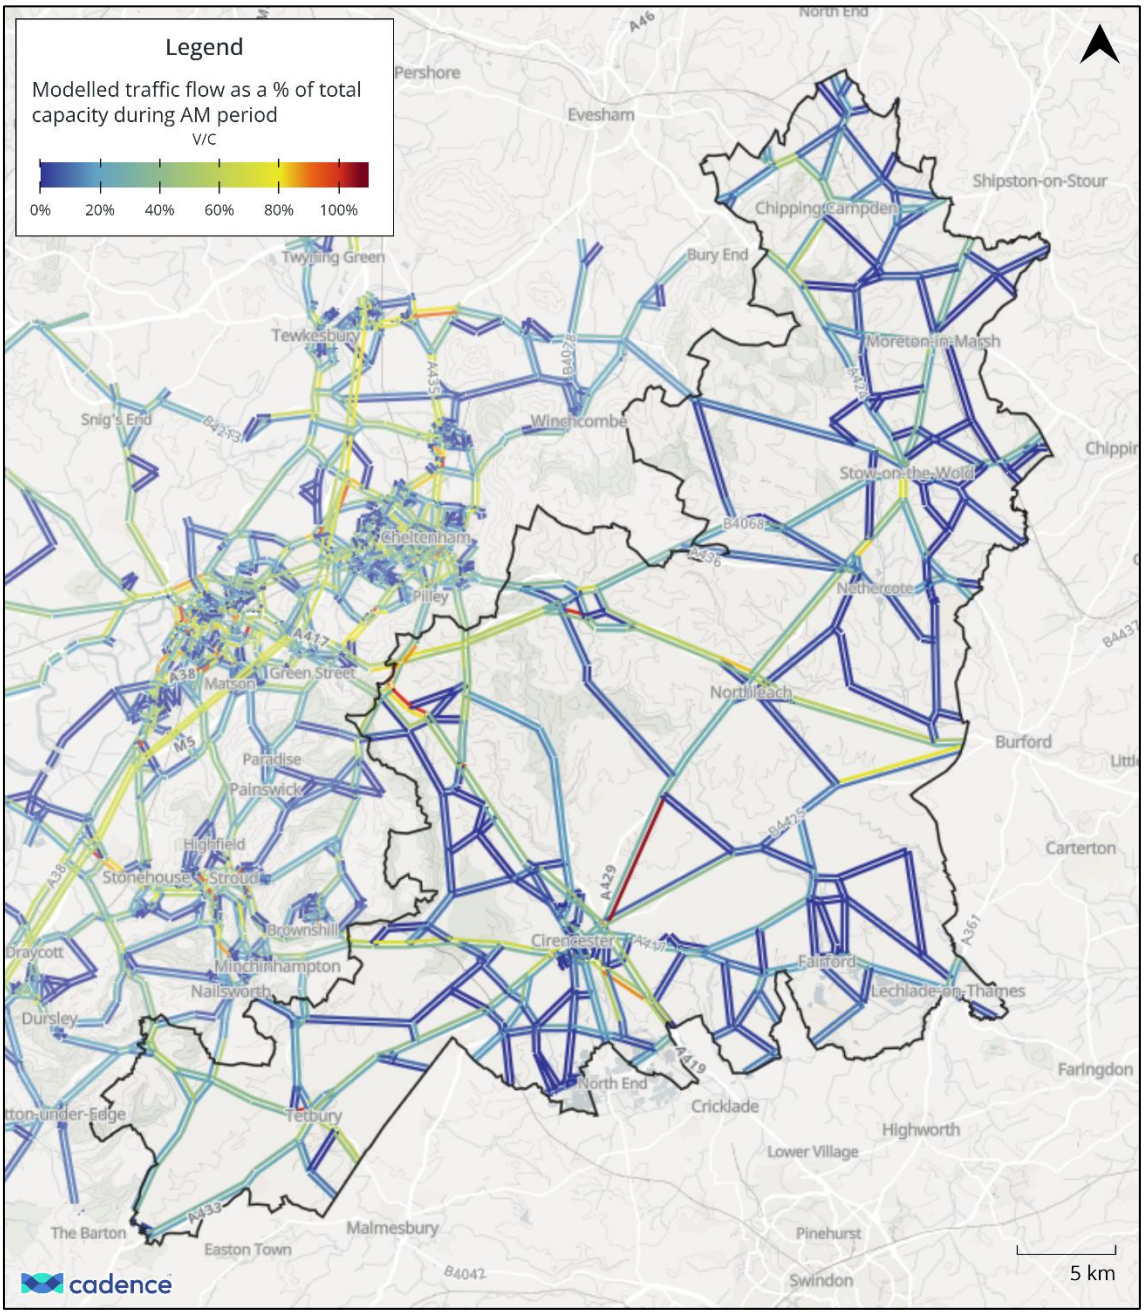
3.3.1 Congestion & capacity

Modelled 2024 base year outputs from the Gloucestershire County Council Countywide Model (GC3M), which has been calibrated and validated against observed data, for the morning peak hour (08:00–09:00) indicate that most of the highway network within the Cotswold District is operating within its capacity (Figure 3-7). However, several key routes and junctions are experiencing congestion and are operating at, or close to, capacity.

The most constrained locations include the southbound A429 approaching Cirencester (105% volume-to-capacity ratio), the A419 approaching the first roundabout on the eastern outskirts of Cirencester (100%), and the A417/B4070 junction connecting Cheltenham and Cirencester (100%). Several other sections of the A417 corridor are also operating at between 85% and 100% of capacity, indicating limited spare capacity and reduced resilience to future traffic growth.

Cirencester Road approaching Cirencester is operating at approximately 88% of its capacity. Overall, the model suggests that currently, congestion is largely concentrated on the main approaches to Cirencester and along strategic corridors, reflecting the towns role as the principal service and employment centre.

Figure 3-7: Modelled traffic flow at links as a percentage of total capacity during morning peak hour (08:00-09:00) in the 2024 Base Year



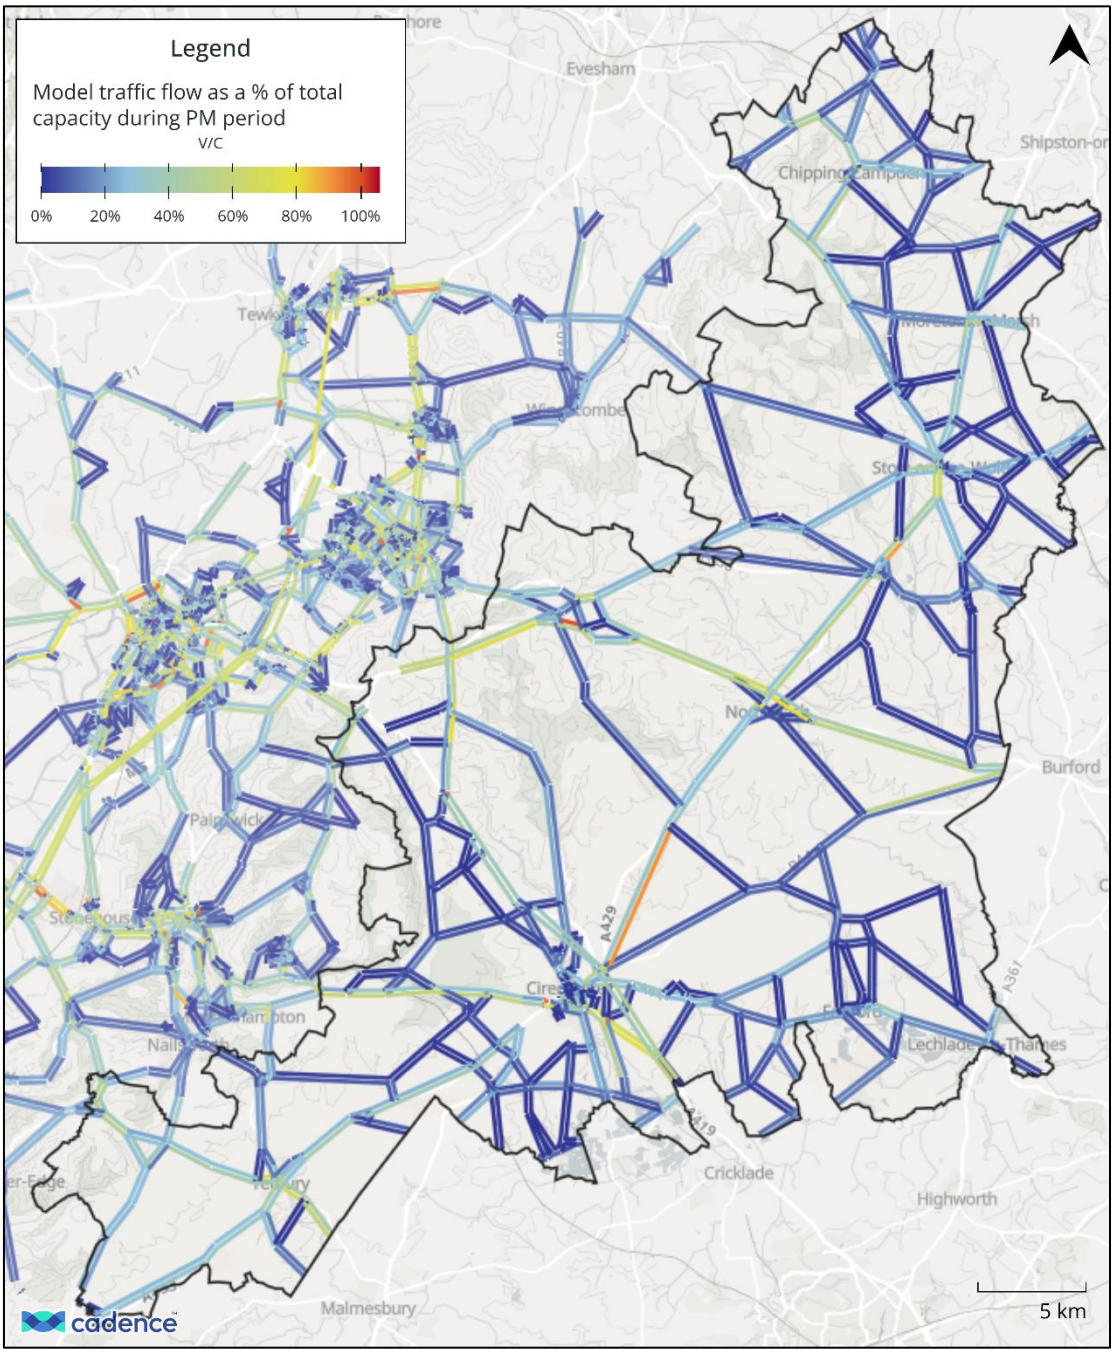


Figure 3-8: Modelled traffic flow at links as a percentage of total capacity during evening peak hour (17:00-18:00) in the 2024 Base Year

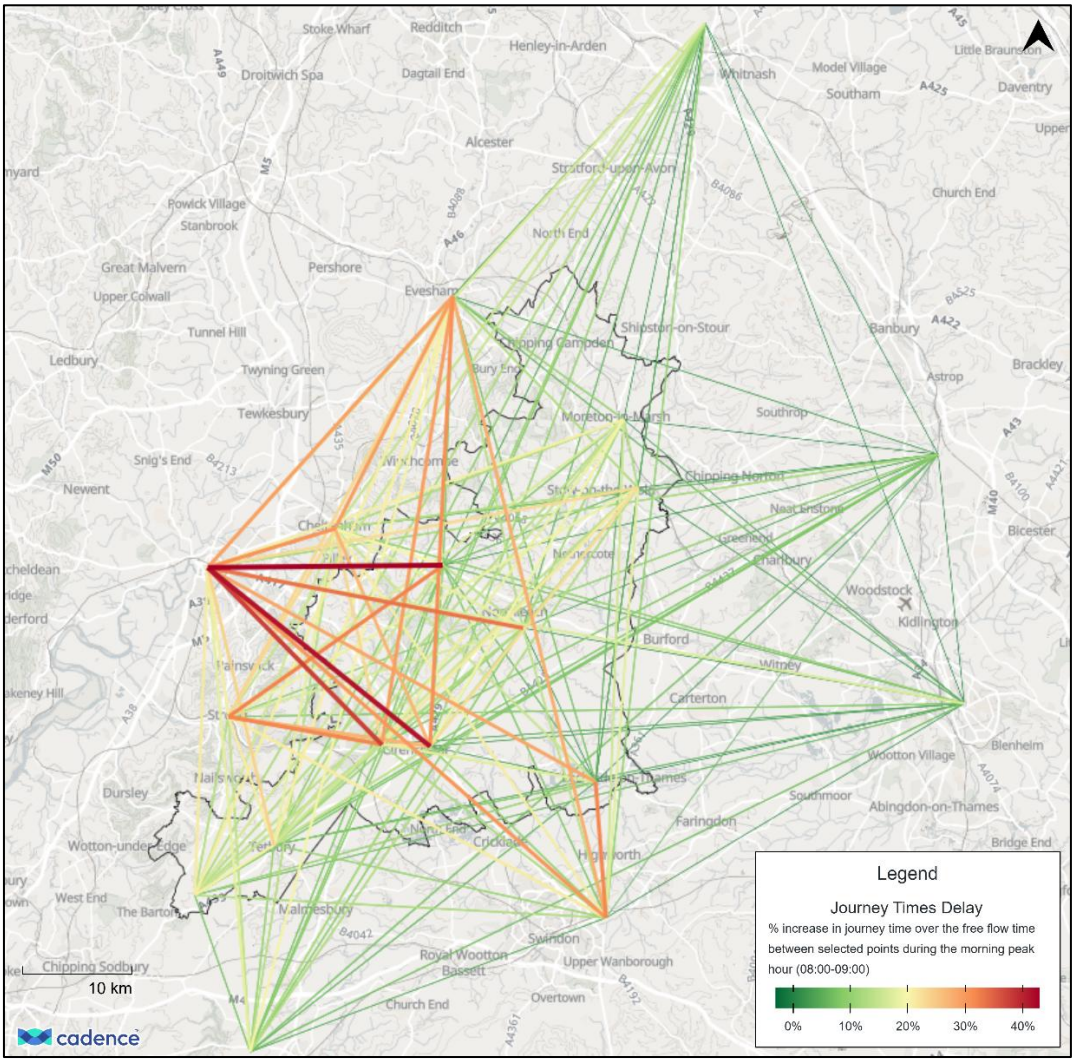


Alongside the assessment of network capacity, an analysis of journey time delays relative to free-flow conditions was undertaken using outputs from the GC3M 2024 base year. It identifies locations where congestion has the greatest impact on travel times. The results during the morning peak period (08:00-09:00) are shown in Figure 3-9. This period was selected as it exhibited the highest levels of journey time delays observed across the time periods.

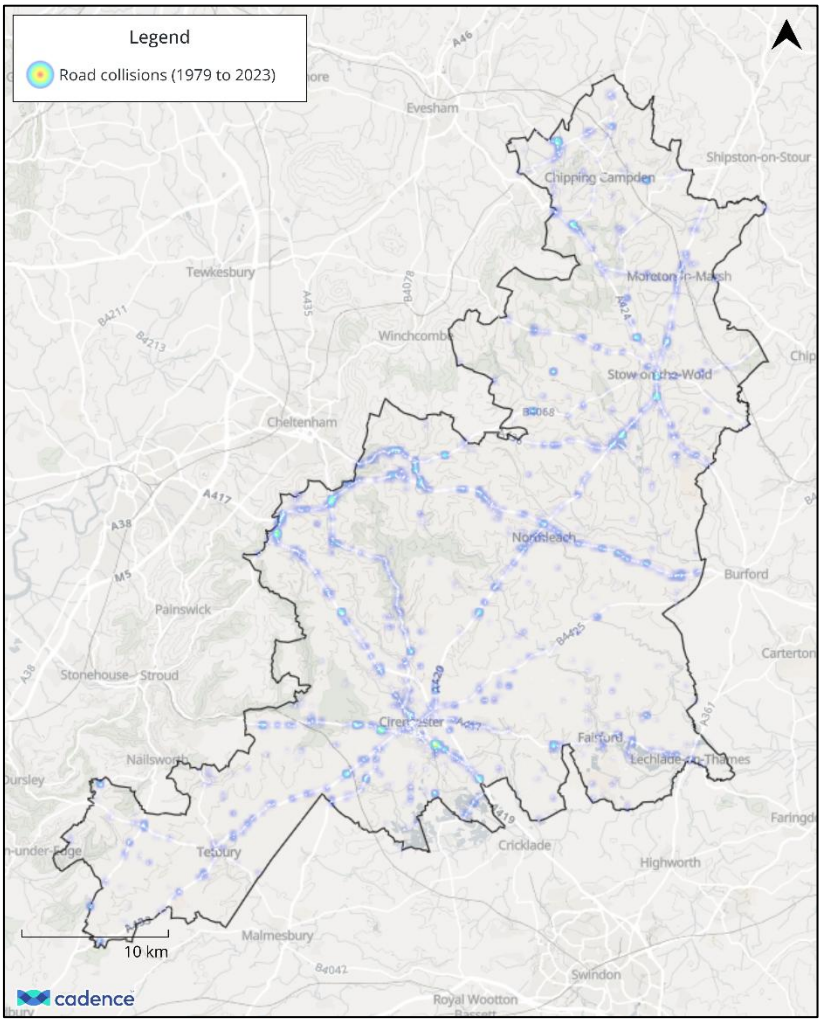
The results indicate that the most significant delays occur on routes to and from Cheltenham, as well as on routes to and through Cirencester. Journeys between Cheltenham and Cirencester experience travel times of up to 40% above free-flow conditions during the morning peak period.

Similarly, routes passing through Cirencester, including movements between Swindon, Evesham and Stroud, are subject to notable delays, reflecting the concentration of traffic demand on the district's key strategic corridors. Overall, this suggests that while network-wide capacity constraints are relatively limited, congestion at key locations can have a disproportionate effect on journey times.

Figure 3-9: Modelled percentage difference in journey times across the district compared to free flow times during the morning peak period (08:00-09:00) in the 2024 Base Year

The potential effects of Local Plan growth on the operation of these strategic corridors have been assessed, with consideration given to maintaining network resilience and operational safety. Where necessary, opportunities for mitigation and network improvements have also been identified.

The assessment has considered the transport impacts of Local Plan growth on these strategic corridors in line with the National Planning Policy Framework, including whether



safe and suitable access can be achieved and whether any residual cumulative impacts on the road network would be severe.

3.3.2 Road safety

Figure 3-10 shows a clear pattern of where severe road collisions and fatalities have happened across the Cotswold highway network between 1979 and 2023. Most collisions are concentrated around Cirencester, which is the main hotspot in the area. There is a clear radial pattern, with collisions occurring along the strategic routes connecting Cirencester to nearby towns, especially Cheltenham, Swindon, and Stroud.

Outside Cirencester, there are far fewer collisions, with only a few scattered cases in rural areas. However, small clusters can still be seen near key junctions and on approaches to towns like Stow-on-the-Wold and Moreton-in-Marsh.

Figure 3-10: Locations of killed or seriously injured collisions between (1979-2023) (DfT, Road Safety Data, 2024)

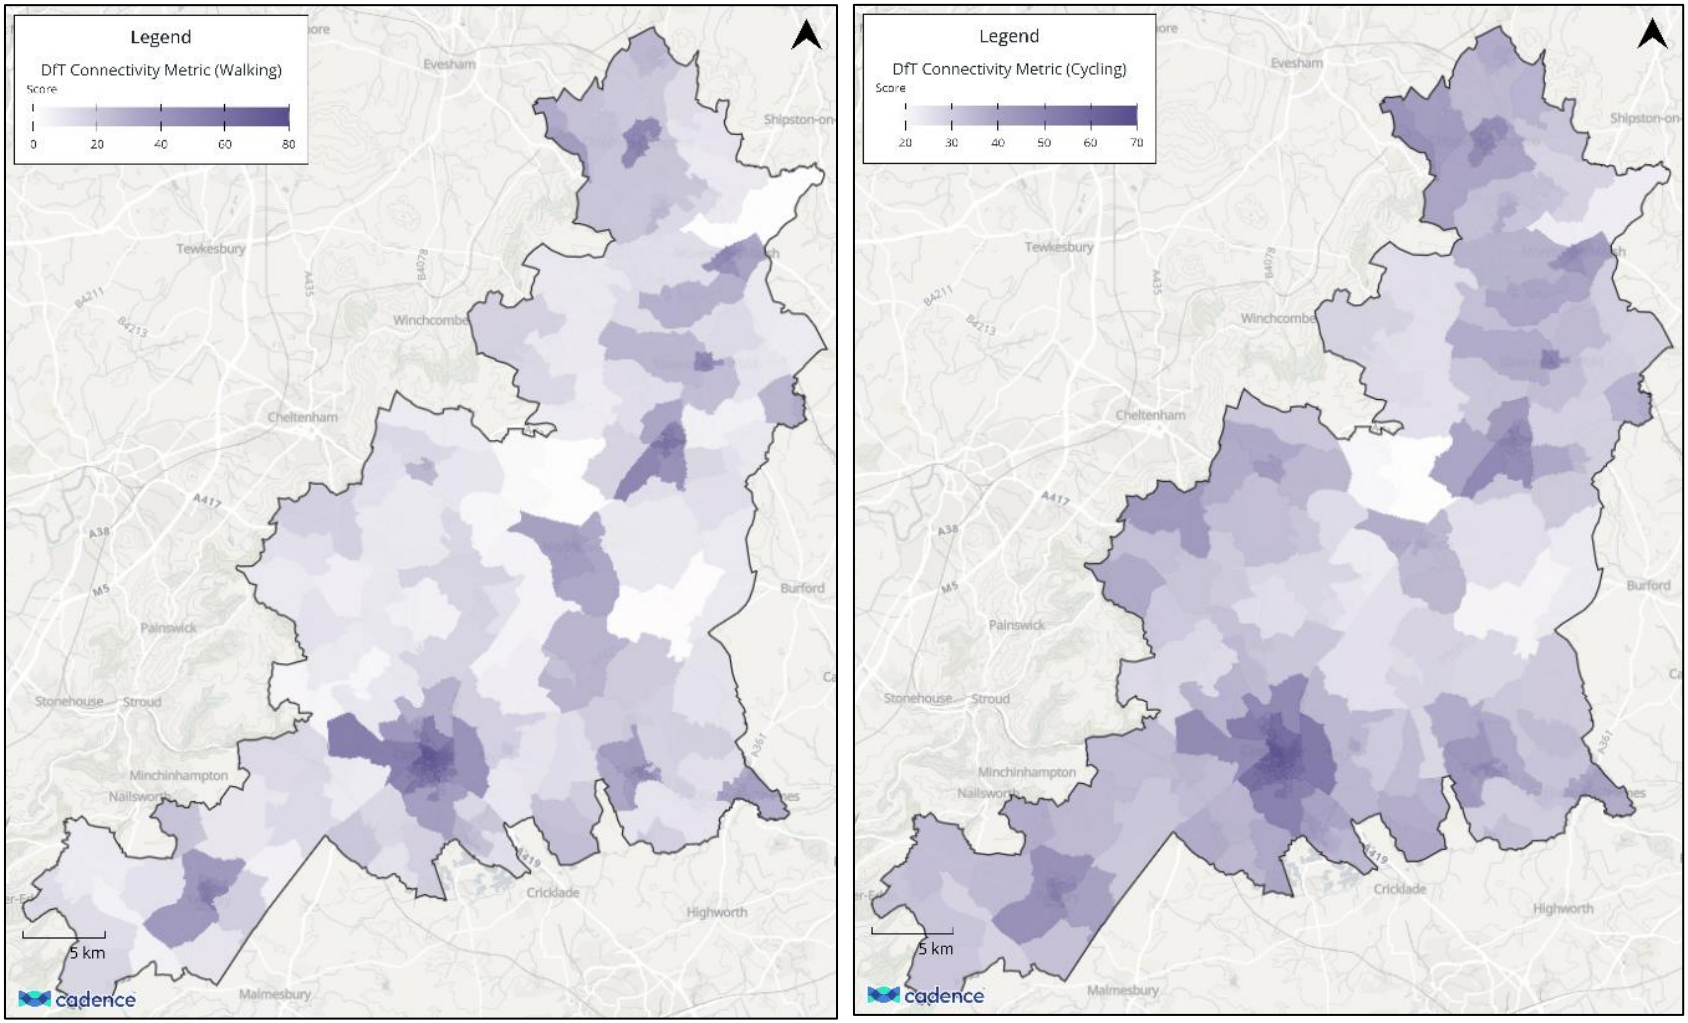
3.3.3 Accessibility & equity

Connectivity by mode varies across the district, as shown in Figure 3-11 and Figure 3-12 using the DfT's connectivity tool. This tool evaluates how many key destinations (retail, education, healthcare etc.) can be reached within 60 minutes using different modes of travel, with higher scores indicating better connectivity to key services. The highest levels of connectivity for active travel and public transport are found in towns, particularly Cirencester, where services, infrastructure, and shorter distances make walking, cycling and bus use more viable. These areas benefit from denser networks and stronger links between key services. In contrast, more rural villages have lower connectivity due to fewer services and limited active travel infrastructure.

In comparison, car connectivity is relatively strong across the district, with the road network providing direct links between most settlements. This reinforces the reliance on private vehicle outside of towns.

Overall, this creates an inequitable pattern of accessibility, where larger towns have a wider choice of transport options, and rural areas are more dependent on cars to access essential services.

Figure 3-11: Connectivity score for active travel (DfT Connectivity Tool, 2025)



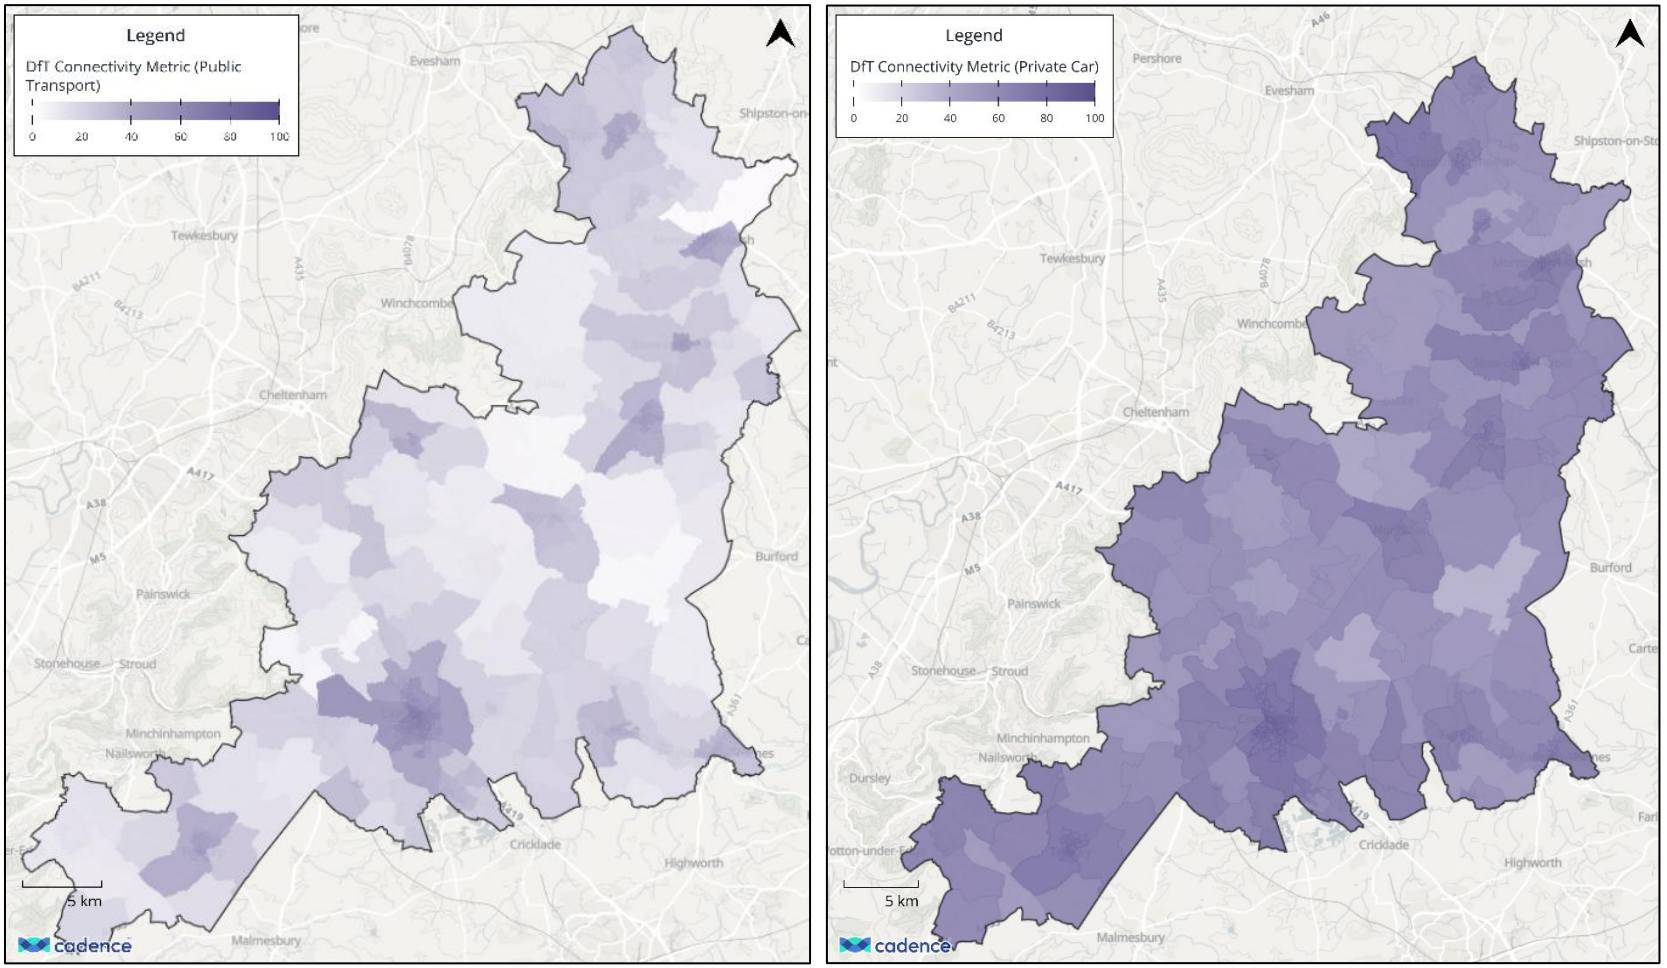


Figure 3-12: Connectivity score for public transport and private car (DfT Connectivity Tool, 2025)

3.4 Travel behaviour & movement patterns

Travel demand and movement patterns in the Cotswold district are strongly shaped by its rural settlement pattern, ageing population, and dispersed provision of key services. The district has a population of 91,360 (GCC, 2023), with most residents concentrated in Cirencester, as well as the smaller towns of Tetbury, Moreton-in-Marsh, Stow-on-the-Wold and Chipping Camden. These act as the main origin and destinations for most trips in the district. Outside these towns, low density rural settlements and longer distances to key services increase reliance on the highway network.

The population is older than the national average, with a median age of around 49 years and approximately 28% of residents aged over 65 years old (GCC, 2023). The ageing profile, alongside higher levels of long-term conditions, can increase dependence on accessible and reliable transport, particularly for essential journeys such as healthcare, education and shopping.

Overall, the combination of rurality and an ageing population mean that travel demand is unevenly distributed and strongly car-reliant, with towns concentrating most activity and rural areas facing more limited accessibility.

4. Policy context

4.1 Introduction

A comprehensive review of transport and planning policy, guidance and best practice relevant to the Local Plan transport evidence base was undertaken. The review included documents at national, county-wide and district levels, as well as policies of neighbouring authorities, best practice and guidance.

The review informed the Local Plan transport strategy by identifying best practice from elsewhere, and policies and plans to be considered when developing the Local Plan. The documents included in the review are shown in Figure 4-1.

Figure 4-1: Summary of documents reviewed

4.2 National policy

The national policy landscape is undergoing significant change following the July 2024 General Election, with economic growth, housing delivery, and decarbonisation central to the government's agenda. Five areas of national policy are of particular relevance to the Cotswold District Local Plan Transport evidence base: planning reform and housebuilding; major transport infrastructure; and net zero and local sustainable transport; the future of rural connectivity; and mobility for older people.

Primarily, significant planning reform in the form of the revised National Planning Policy Framework (NPPF) (2024) is the most relevant area of national policy, outlining a vision-led approach to transport planning, to provide a strong evidence base to inform decisions about transport policies and measures. It establishes the role of transport as a key enabler of achieving the new mandatory housing growth targets for Cotswold, and the importance of locating development where the need to travel is minimised and transport options exist.

Regarding major transport infrastructure, the government is shifting away from large capital schemes towards smaller evidence-led interventions. This is seen in the scaling back of HS2, which has potential implications for proposed local rail schemes such as the Cirencester - Kemble railway restoration. The A417 and A419 are the only Strategic Road Network routes in the district, and National Highways (2024) have shifted focus from network expansion and enhancement to prioritising renewals, resilience, and efficiency.

The government's 2050 net zero target requires local plans to demonstrate a shift away from private car use. Most active travel investment is directed at urban environments. Given the district's dispersed settlement pattern and higher road speeds, e-bikes and micromobility are likely to be more relevant than conventional cycling and walking infrastructure across much of the district. The DfT's Future of Transport: Supporting Rural Transport Innovation (2023) directly addresses this context, identifying high car dependency as both an environmental and socioeconomic issue and setting out nine principles for rural transport planning, which emphasise:

- Safety and accessibility for all users
- Micromobility as the default for short rural trips
- Affordable public transport and shared mobility as system fundamentals
- Rapid transition to zero emissions
- Integrated systems combining public, private, and community-led modes
- Open data sharing to improve user choice and system performance

Finally, with Cotswold district having a median age of 49 years old, exceeding the national average of 40 years old, the mobility needs of older residents are central to this assessment. The ORR's Accessible Travel Policy (2020) and the DfT's Inclusive Transport Strategy (2018) require adequate provision for mobility aid users, rest spaces at transport hubs, accessible wayfinding that does not assume high digital literacy, and early engagement with older and disabled people in the design of new infrastructure.

Collectively, the national policy context establishes clear expectation for this assessment. Sustainable and active travel should be prioritised where viable, with rural specific solutions implemented where conventional options are not appropriate. Additionally, given the district's demographic context, the needs of an aging population must be embedded throughout the assessment. Underpinning this is a vision-led approach, that puts the transport vision for Cotswolds at the centre from the outset.

4.3 County-wide policy

Gloucestershire County Council has developed strategies that collectively set the county transport policy framework. The Local Transport Plan (Gloucestershire County Council, 2020) establishes overarching ambitions around sustainable growth, rural connectivity, and equality of opportunity, with a target of net zero transport emissions by 2045. At the beginning of 2026, GCC has launched engagement to update their Local Transport Plan, for adoption of a new plan in 2027. This translates these ambitions into a practical plan, targeting an 80% reduction in transport emissions by 2030 through modal shift, avoiding unnecessary travel, and improving vehicle efficiency. The Climate Change Strategy provides the broader environmental framework, reinforcing the need for low-carbon travel and resilient, inclusive networks.

For Cotswold district, the key consideration across these strategies is balancing ambitious decarbonisation targets and the practical challenges of delivering sustainable transport in a dispersed, car-dependent rural district. Improving rural bus services is a key priority, though long routes, low passenger numbers, and high subsidy requirements make this particularly challenging in the district. Active travel investment is most deliverable within market towns such as Cirencester, while longer inter-settlement distances and higher road speeds limit its effectiveness across the wider rural area. Supporting the transition to electric vehicles is likely to play a greater role in reducing emissions across the district than modal shift alone, given the reliance on private cars for many journeys. Underpinning all of this is the need to maintain accessible, resilient transport networks that serve an ageing population and communities.

4.4 Cotswold District Council policy

The update of the Local Plan (2025-2043) forms part of a wider programme of work which moves towards achieving the Council's net zero ambitions, adopting the 'Do Everything' approach set out the Cotswold Transport Decarbonisation Plan (2023). Under this approach, there is no single solution to delivering CDC's net zero ambitions by 2045, all modes and options need to be considered. The Local Cycling and Walking Infrastructure Plans (LCWIPs) identify long-term improvements needed to support walking and cycling in the district. Within Cotswold, only Cirencester has an adopted LCWIP (Gloucestershire County Council, 2022), which identifies fragmented active travel routes, poor links to public transport and a high dependence on private car use. The plan proposes improved cycle corridors, enhanced pedestrian connections, and better access to key destinations such as schools, employment areas, the town centre, and Kemble Station.

The Cirencester LCWIP (2022) offers a detailed framework for local interventions, while the Gloucestershire Overarching Cycling Infrastructure Plan (Gloucestershire County Council, 2023) highlights the need to improve rural cycling connectivity and prioritises the Cirencester–Cricklade and Moreton-in-Marsh–Stow-on-the-Wold corridors. Together, they support the identification of active travel schemes that could reduce car dependency and improve sustainable access across the district.

4.5 Adjacent authorities' policy

A review of neighbouring authorities' Local Plans and comparable rural-tourism areas highlights several external factors that could influence transport demand and infrastructure requirements within the Cotswold District.

Neighbouring authorities, such as West Oxfordshire District council are currently in the process of reviewing their Local Plans. The current West Oxfordshire Local Plan was formally adopted in 2018 and sets out the district's planning framework from 2011 to 2031. The plan is currently in consultation for extending the plan to 2043, looking at currently delivery and potential new developments. Importantly for Cotswold, this could include further development at Chipping Norton, whic may impact traffic volumes on the A44 connecting to Moreton-in-Marsh.

Similarly, an emerging joint development plan is being prepared by Stratford-on-Avon District council and Warwick District Council, establishing a long-term spatial growth strategy up until 2050. Importantly for Cotswold, the Plan considers potential growth at Shipston-on-Stour, potentially impacting traffic volumes along the A429 through Moreton-in-Marsh. Additionally, the Plan puts forward a large strategic site near Long Marston, which could substantially impact traffic levels near Mickleton.

Alongside this, the emerging South Gloucestershire Local Plan proposes major growth at Brabazon and Charfield, supported by new rail stations, mobility hubs, public transport enhancements and a strong focus on reducing car dependency.

The review also highlights valuable lessons from rural tourism destinations such as the Highlands and the Lake District, where seasonal visitor demand places significant pressure on transport networks and local communities. Both areas emphasise the need for sustainable access measures, including seasonal public transport services, mobility hubs, park-and-ride facilities, active travel infrastructure and improved connections between visitor destinations. For the Cotswold Local Plan, this suggests that transport planning should consider not only local growth but also the cumulative impacts of neighbouring development and tourism-related travel demand. The findings support a stronger focus on sustainable transport, modal shift and integrated land-use planning, while recognising the need to balance economic benefits from tourism with the protection of resident quality of life, environmental objectives and network performance.

4.6 Guidance and best practice

Issues for consideration identified in guidance and best practice include:

- The DfT's Common Analytical Scenarios provide a useful reference point for understanding future uncertainties related to the economy, behaviour, and technology, and offer insights that can help shape local scenario development.
- National Design Guidance [3] promotes the creation of well-designed, climate-conscious communities where people can live, work, and thrive. It recommends developments that integrate environmental considerations and promote healthy, low-carbon lifestyles. This aligns with CDC's ambition for encouraging sustainable modes and vision-led transport planning.

[3] Ministry of Housing, Communities & Local Government, 2021

- The National Design Guidance also emphasises the importance of clear street layouts and accessible, safe, and efficient transport networks. It supports a multi-modal transport approach, highlighting walking, cycling, and public transport. This informed the Local Plan's overall objectives to encourage modal shift towards more sustainable and inclusive transport options.
- Encouragement for local planning authorities to define a clear vision for future growth and then test a range of development scenarios to determine the most sustainable and efficient transport solutions. [4]
- The importance of early engagement with National Highways strongly emphasises the importance of early and ongoing engagement to identify and address capacity, connectivity, and safety issues on the SRN.
- National Highways' focus on assessing the cumulative and residual impacts of proposed development on the SRN; the sustainability and accessibility of site allocations; and the extent to which transport policies are aligned with local and national infrastructure priorities
- Active Travel England recommends criteria that may be useful to inform the Local Plan in terms of sustainability. These include trip generation and assignment for non-vehicular modes; access to amenities and public transport, off-site transport infrastructure, place-making, end-of trip facilities (such as cycle parking) and travel planning. [5]
- LTN1/20 provides technical guidance on national standards for cycle infrastructure based on networks being coherent, direct, safe, comfortable and attractive. [6]
- Guidance sets out ten core principles of Active Design to help shape environments that encourage people to be active as part of daily life. The principles include: walkable communities, providing connected active travel routes, mixing land uses and high quality streets and spaces.[7]

5. Forecasting methodology

5.1 Introduction

This chapter describes the forecasting methodology adopted for the Cotswold District Local Plan transport assessment. It outlines the strategic transport model used to undertake the forecasting, the updates made to tailor the model for the Cotswold District, and the assumptions adopted to develop the future year scenarios. The chapter also describes the general approach used to forecast the Preferred Spatial Option (PSO) and the intervention packages, with the detailed application of the methodology presented in the subsequent chapters.

5.2 Summary of approach

Figure 5-1 provides an overview of the forecasting methodology. The primary strategic modelling tool used was the Gloucestershire Countywide Multi-Modal Model (GC3M) described in further detail in the following section. The existing base and future year models were updated to align with the Cotswold District Local Plan period and to provide greater network detail and representation within the Cotswolds. The GC3M has a 2019 base year, and a present-day validation exercise was undertaken comparing a November 2024 forecast year against observed 2024 traffic counts and journey time data. This ensured the model had a robust starting point for forecasting.

Future year forecasting followed a staged approach, progressing from the 2043 Core and Core Minus Scenarios to the assessment of the Spatial Options, the Preferred Spatial Option and the intervention packages. Each stage of the methodology is described in the following sections, with its application presented in Chapters 6 to 8.

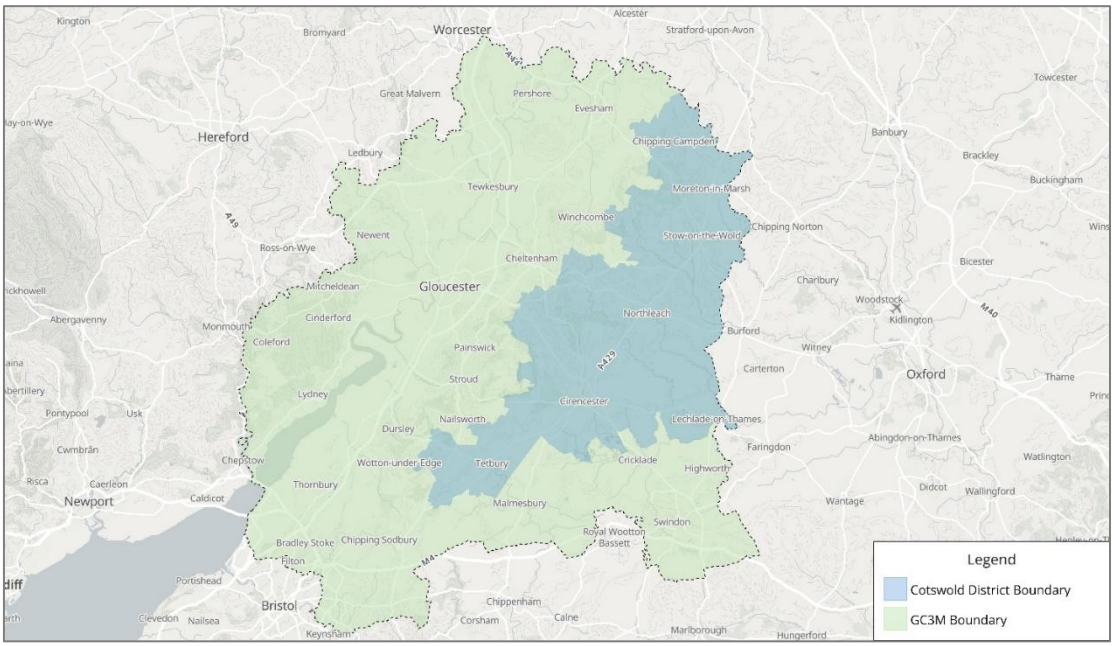

Figure 5-1: Summary of approach to forecasting

Order	Stage	Notes	Further detail
First	GC3M	• 2019 base year • 2031 and 2041 forecast years • Gloucestershire County Council Uncertainty Log	Chapter 5
	Present Year Validation	• Update the GC3M from a 2019 to a 2024 base year, including highway network updates • Validate the updated model against observed 2024 traffic counts and journey time data	Chapter 5
	2043 Core Scenario	• Incorporate committed land use changes and transport network schemes	Chapter 5
	2043 Core Minus Scenario	• Remove Local Plan development growth from the Cotswold District while retaining background traffic growth	Chapter 5
	Preferred Spatial Option	• Forecast the transport impacts of the Preferred Spatial Option	Chapter 6
Last	Preferred Spatial Option with Interventions	• Assess the Preferred Spatial Option under three intervention packages comprising: ○ (A) Business as Usual+ ○ (B) Visionary Ambition ○ (C) Residual Impacts Mitigation ○ (D) Vision Led Scenario (VLS)	Chapter 7

5.3 The GC3M

The GC3M is a strategic multi-modal model developed for Gloucestershire County Council, Figure 5-2 illustrates the extent of the area covered by the GC3M, showing that it encompasses the whole Cotswold District as well as the remainder of Gloucestershire and areas beyond. The GC3M consists of a highway model and a public transport and variable demand model, with travel segmented by car, goods vehicles, bus, rail, cycling and walking.

Figure 5-2: GC3M area of detailed modelling coverage

5.3.1 GC3M structure

The GC3M follows a traditional four-stage modelling structure (trip generation, trip distribution, mode choice and assignment). The trip distribution and mode choice stages are carried out by the Variable Demand Model, which is implemented in VISUM, while highway assignment is carried out in SATURN. VISUM is also used for the public transport model.

5.3.2 Modelled time periods

The GC3M represents a neutral weekday (Monday to Thursday) in 2024. The highway model includes derivatives for three time periods, while the public transport model represents the average hour across these periods. As the GC3M covers the whole of Gloucestershire County, the morning and evening peak periods in the highway model are aligned with the county-wide peaks, rather than being specific to the Cotswold District. These time periods are set out in Table 5-1.

Table 5-1: GC3M modelled time periods

Highway model	Public transport model
Morning - 08:00 to 09:00	AM average hour - 07:00 to 10:00
Inter peak average hour - 10:00 to 16:00	Inter peak average hour - 10:00 to 16:00
Evening - 17:00 to 18:00	PM average hour - 16:00 to 19:00

5.3.3 Variable demand model

The Variable Demand Model (VDM) is a 24-hour, logit-based model that determines both destination and mode choice. It does not include an explicit time-period choice; instead, daily trips are allocated to specific time periods using fixed factors. Freight is represented by a base-year origin–destination matrix, which can be scaled for future scenario years. The demand matrices produced by the VDM capture all trips across all modes, including active travel.

5.3.4 Highway network

The area within the GC3M boundary (see Figure 5-2) represents the detailed modelling area, where the highway network and junctions are simulated in detail (e.g., via simulation coding) to capture junction delay. Outside this boundary, links are coded using fixed speeds (e.g., via buffer network coding).

5.3.5 Public transport networks

The public transport network comprises rail, bus, rail-based Park & Ride, and bus-based Park & Ride services. While the bus-based Park & Ride element is uncalibrated, it accounts for only a minor proportion of total journeys; this omission is not considered significant in the context of this strategic-level assessment. The public transport model is timetable-based and consists of services imported directly from General Transit Feed Specification (GTFS) datasets.

5.3.6 Initial GC3M modifications for Cotswold District

Modifications were made to the GC3M to tailor it for use in the development of the CDC Local Plan as follows:

- The base year was updated from 2019 to 2024 as described in the 2024 Present Year Validation Technical Note
- the modelled highway network was updated to capture any highway schemes introduced between 2019 to 2024. A full list of schemes is provided in the Forecasting Approach Technical Note

Following these modifications the model base year was validated against observed counts and journey times to ensure the model was suitable for forecasting.

5.4 Future year Forecasting Assumptions

5.4.1 2043 Forecast Year

A future year model was developed for the 2043 forecast year, aligning with the plan period of the CDC Local Plan. Future year demand matrices were generated within the GC3M to reflect projected land-use changes across the study area.

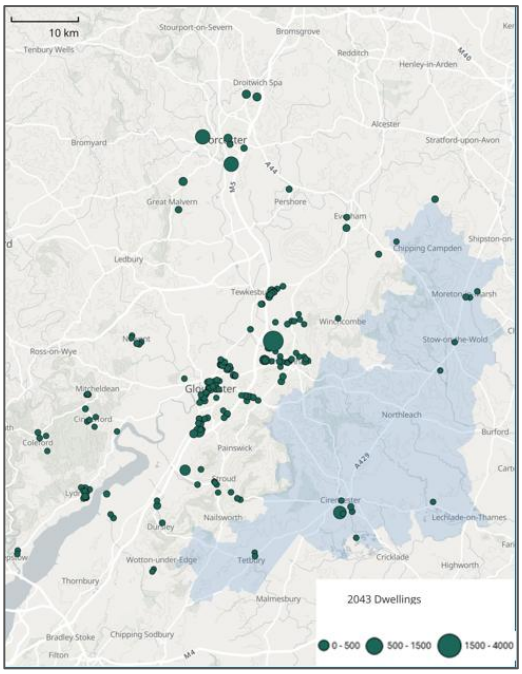
5.4.2 Core Scenario

The 2043 Core Scenario was developed for the Cotswold District using the GC3M to provide a robust and consistent baseline from which to derive background traffic growth, modal shares, and trip distribution for the PSO.

The Core Scenario represents forecast land use changes within the Cotswold District and the wider Gloucestershire County area in accordance with the GC3M Uncertainty Log (Version 2.1), as described in Annex D. The scenario includes all committed residential and non-residential developments classified as 'near certain' and 'more than likely' within the Uncertainty Log. Outside Gloucestershire County, background traffic growth has been applied using the Department for Transport's National Trip End Model (NTEM) forecasts through TEMPro.

Figure 5-3 and Figure 5-4 illustrate the locations of committed residential and employment sites from the baseline 2043 Core Scenario.

Figure 5-3:Uncertainty Log 2043 Committed Residential Sites



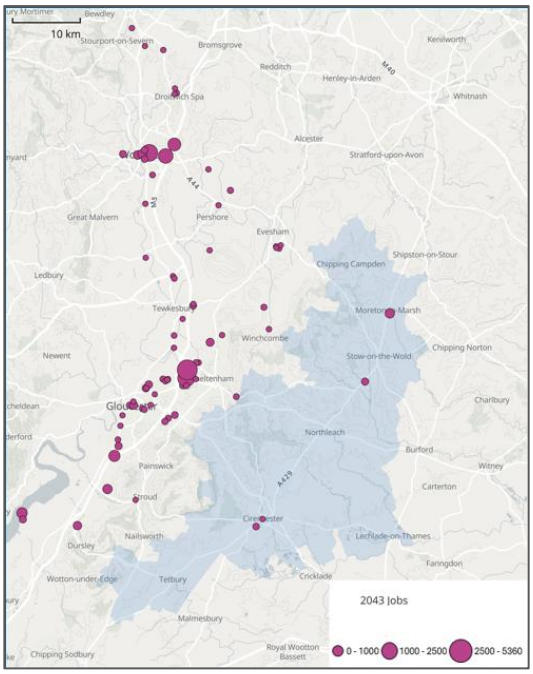


Figure 5-4: Uncertainty Log 2043 Committed Employment Sites

5.4.3 The Core Minus Scenario

The 2043 Core Minus Scenario was developed using the GC3M to provide the baseline comparator for the assessing the PSO. In the Core Minus Scenario, all development growth within the Cotswold District between 2024 and 2043 is removed. Background traffic growth is retained across the Cotswold area, while growth in areas outside the district is represented using the GC3M growth assumptions, which are equal to or exceed NTEM forecasts in all external locations.

5.4.4 Trip rates

Trip rates for residential, mixed-use and employment sites were derived from the TRICS database. This was achieved by classifying the sites and applying class-specific trip rates. This generalised approach is appropriate for the strategic nature of a local plan transport assessment. More detailed assessments of trip generation and distribution will be determined through site-specific transport assessments as part of the planning process for individual developments.

Residential sites were classified according to their location type, based on differences in travel behaviour, levels of car dependency, and access to public transport. The trip rates were further categorised into three location types: Residential, Residential Isolated, and Village, reflecting the characteristics associated with each location type.

illustrates the location of the strategic residential sites and their respective classification. Table 5-2 outlines the residential trip rates for each category. Full trip rates by mode are provided in the SLP and Cotswold Local Plan Trip Rate Technical Note. The classes are:

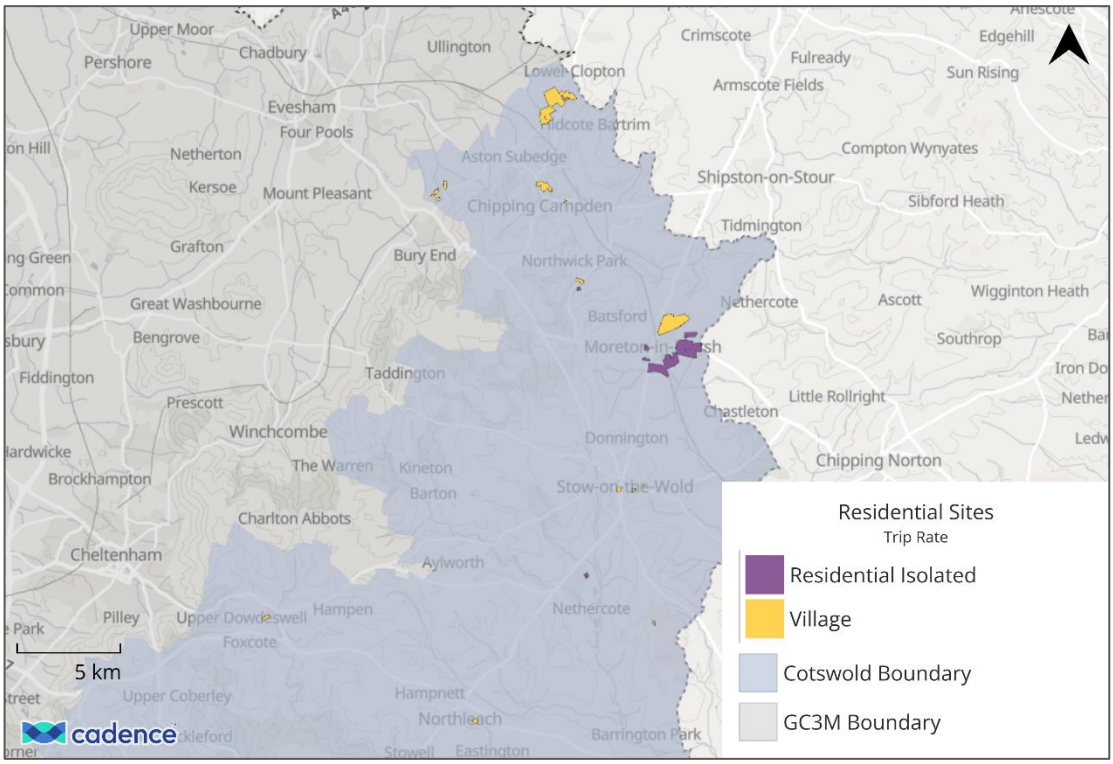
- **Residential:** Located within continuous urban built-up areas. Travel patterns and trip rates are lower compared with other categories, reflecting higher levels of accessibility and a lower reliance on private vehicles.
- **Residential Isolated**: Located within the vicinity of the main towns but surrounded predominantly by non-residential land uses. Travel patterns tend to differ from residential areas, as a greater reliance on private vehicles is expected, resulting in trip rates that reflect longer average journeys.
- **Village:** Located within rural areas and physically separated from main urban areas and towns, with the intervening land being mostly undeveloped. Travel behaviour and trip rates differ from both Residential and Residential Isolated areas, as accessing core services requires longer, rural journeys.

Table 5-2: Residential Trip Rates (per dwelling per hour) by location category

Category	Period	Vehicles		
		Arrivals	Departures	2-Way
Residential	AM (08:00-09:00)	0.120	0.313	**0.43**
	IP (Avg 10:00-16:00)	0.148	0.143	**0.29**
	PM (17:00-18:00)	0.293	0.145	**0.44**
Isolated Residential	AM (08:00-09:00)	0.124	0.349	**0.47**
	IP (Avg 10:00-16:00)	0.155	0.149	**0.30**
	PM (17:00-18:00)	0.309	0.164	**0.47**
Village	AM (08:00-09:00)	0.164	0.416	**0.58**
	IP (Avg 10:00-16:00)	0.159	0.153	**0.31**
	PM (17:00-18:00)	0.342	0.166	**0.51**

It should be noted that no residential sites within the Cotswold Study area were assessed as meeting the TRICs criteria for Residential classification. Consequently, all sites were classified as either Residential Isolated or Village in accordance with TRICS methodology (Figure 5-5 and Figure 5-6).

Figure 5-5: North Cotswold trip rate categories for residential sites in the PSO



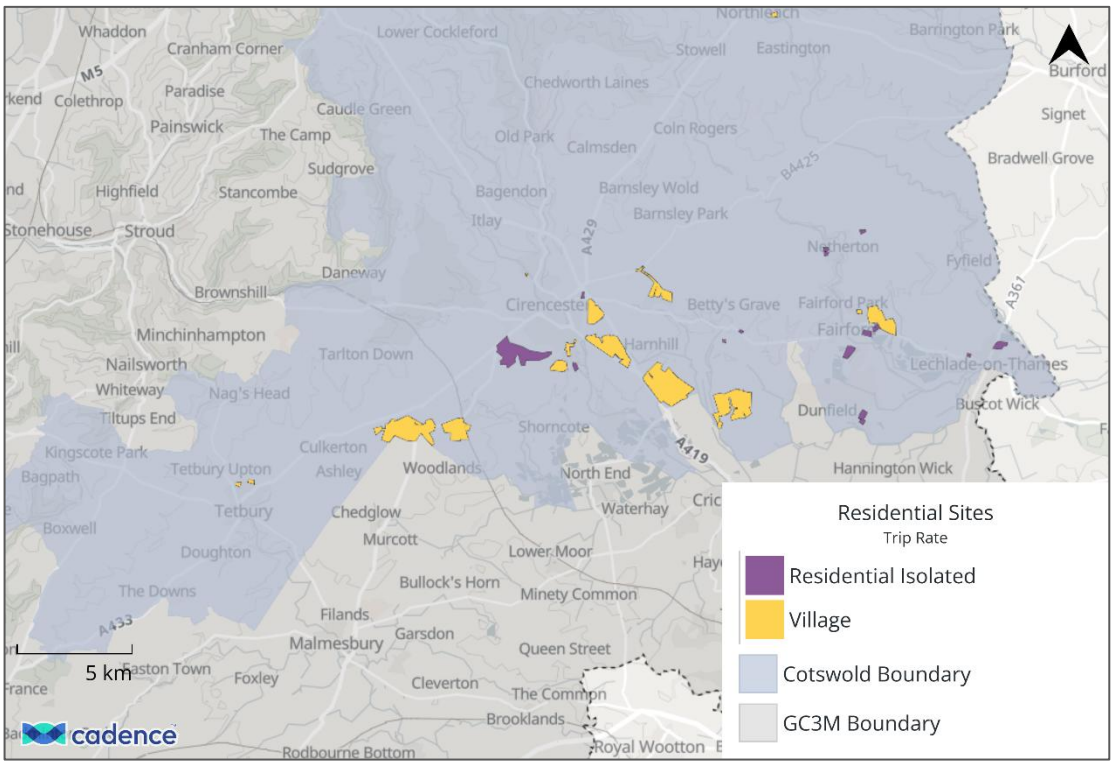


Figure 5-6: South Cotswold trip rate categories for residential sites in the PSO

Employment sites were classified according to the proposed land use in uncertainty log, with the classes being: Business Park (B1/Office), Industrial Estate (B2), or Warehousing (B8). Table 2-1 summarises the trip rates for each land use.

Table 5-3: Employment Trip Rates (per dwelling per hour) by location category

Category	Period	Vehicles		
		Arrivals	Departures	2-Way
Business Park	AM (08:00-09:00)	1.512	0.127	**1.64**
	IP (Avg 10:00-16:00)	0.126	0.161	**0.29**
	PM (17:00-18:00)	0.126	1.290	**1.42**
Industrial Estate	AM (08:00-09:00)	0.371	0.145	**0.52**
	IP (Avg 10:00-16:00)	0.221	0.237	**0.46**
	PM (17:00-18:00)	0.119	0.344	**0.46**
Warehousing	AM (08:00-09:00)	0.083	0.040	**0.12**
	IP (Avg 10:00-16:00)	0.057	0.068	**0.12**
	PM (17:00-18:00)	0.045	0.081	**0.13**

5.4.5 Trip Distribution

Trip distributions represent the spatial pattern of travel demand associated with each development site, determining how trips are allocated across the transport network between zones. These distributions were derived from the GC3M by extracting zone-to-zone trip patterns from the VDM output matrices. Consequently, new development trips were allocated across the network in proportion to the demand patterns derived from the VDM's destination choice module. This allocation is based on the generalised cost of travel, the residential and employment zonal data, and the trip rates derived from the TRICS analysis.

5.5 Forecasting the PSO

Following the selection of the PSO, the agreed residential and employment land use assumptions were incorporated into the GC3M. New model zones were created for residential sites exceeding 500 dwellings and for all employment sites, while smaller residential developments were allocated to the existing GC3M zoning system.

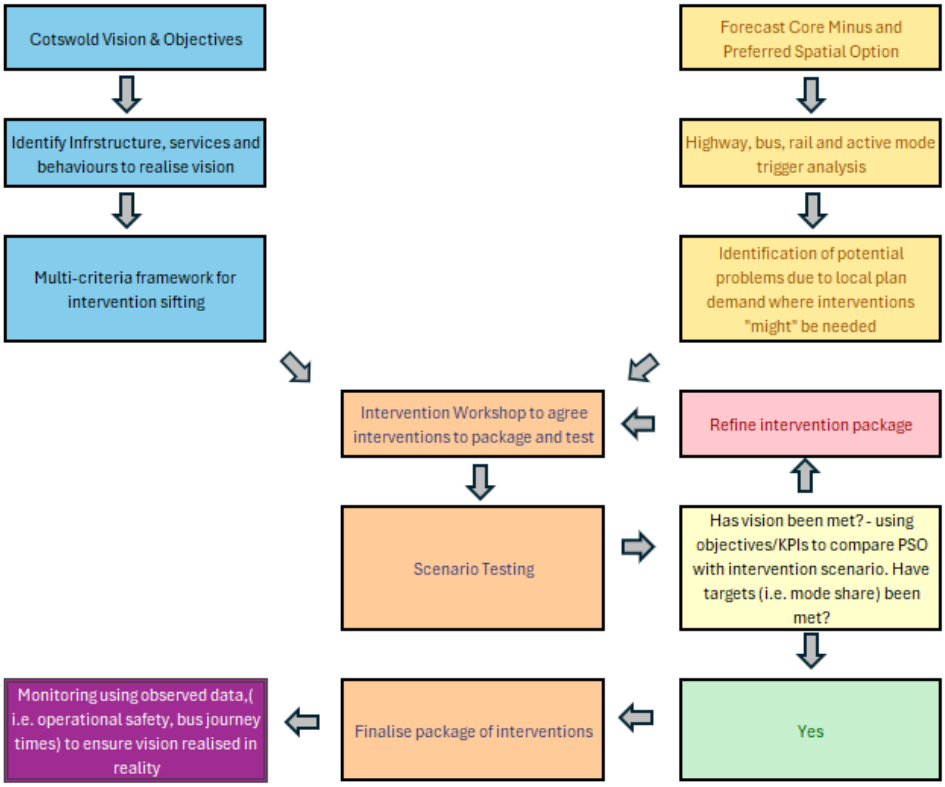
Trip rates, as described in Section 5.4.4, were applied to derive updated trip ends reflecting the additional travel demand generated by each scenario. The modelled demand was controlled to these trip ends, ensuring that the forecast demand remained consistent with the agreed trip rates. No internalisation reduction factor was applied, providing a robust assessment of the transport impacts. The resulting zonal demand was processed through the GC3M to determine destination and mode choice before the forecast trip matrices were assigned to the corresponding modal networks. The detailed Spatial Options assessment is presented in Chapter 6.

The resulting forecast represented the preferred development strategy and formed the basis for the subsequent assessment of the four intervention packages

5.6 Intervention Assessment Methodology

5.6.1 Introduction

Section 2.2 introduced the Vision & Validate approach, including the three key steps of:



- agreeing a long-term vision for the places the Local Plan seeks to create;

- identifying the infrastructure, services and behaviours needed to realise the vision; and
- validating whether the preferred spatial option achieves the outcomes described in the vision.

Transport modelling formed an important part of a wider assessment of the PSO. Historically, transport modelling has been shaped by a 'predict and provide' approach rather than being aligned with Vision & Validate. Fundamentally, the modelling approach used differs from a predict and provide approach as modelling is used as a proactive tool to inform the plan-making process rather than a reactive tool to simply assess the impacts of the spatial options and measures.

Figure 5-7 summarises the intervention assessment methodology, combining the vision and objectives as well as the flag analysis and the Multi Criteria Assessment Framework (MCAF) to develop and iteratively test intervention packages against the Local Plan transport objectives and associated Key Performance Indicators (KPIs).

Figure 5-7: Interventions Flow Chart

5.6.2 Informing visioning

Outputs from the GC3M model informed an understanding of the transport issues in the Cotswold District. In addition, the model inputs, such as trip rates, provided an understanding of expected travel behaviours in a scenario where the vision is not realised. Whilst Vision & Validate is not about extrapolating existing trends into the future, the model outputs still have an important role in informing the outcomes described in the vision and transport objectives.

As described in Section 2.6, success factors describing 'what good looks like' were developed for each transport objective and sub-objective, with related key performance

indicators (KPIs). As part of this process, consideration was given to how the model could provide measurable outputs to act as some of the KPIs, for example forecast mode share.

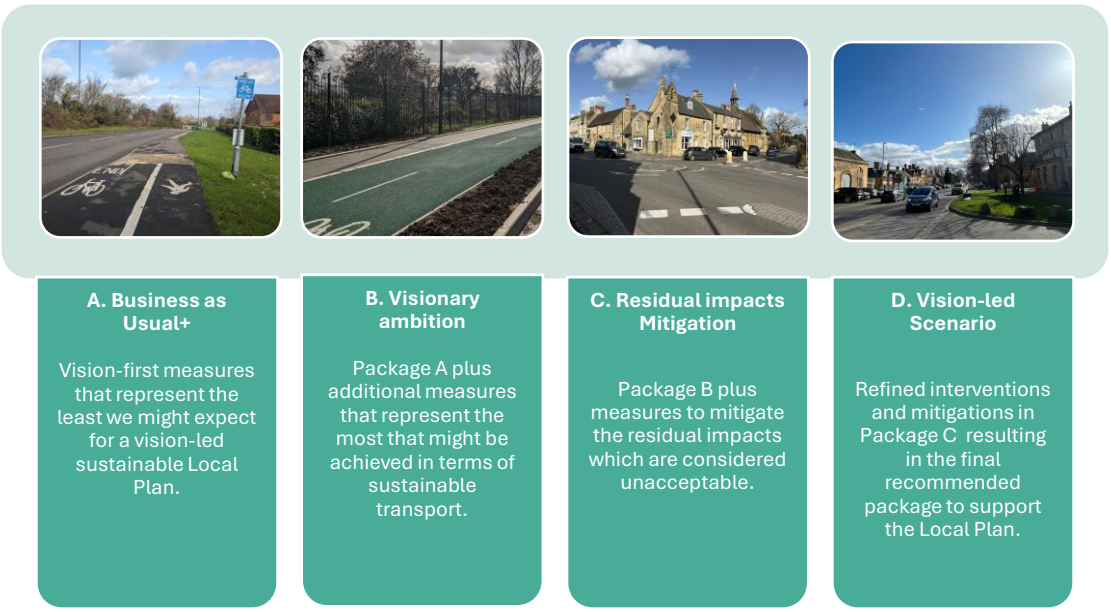
5.6.3 Flag Analysis

Transport modelling played an important role in identifying the infrastructure, services and behaviours needed to realise the vision under different spatial options. Following the forecasting of the PSO, a 'flag' analysis was undertaken to identify locations where Local Plan growth may result in transport impacts requiring intervention. The analysis compared the 2043 Core Minus Scenario with the Preferred Spatial Option to identify changes in network performance attributable to the Local Plan growth.

The flag analysis considered a range of transport metrics across highway, public transport and active travel. Table 5-4 summarises the flag analysis metrics used in the assessment.

Table 5-4: Flag Analysis Metrics

Mode	Metrics	Source
Active Modes	Actual flow by vehicle type	GC3M
	% HGVs	Derived from above
	Vehicle speeds	GC3M
Bus Service	Route journey times by scenario (including link and junction delays)	GC3M VISUM
	Frequencies	GC3M/GTFS
Rail	Change in traffic flow at level crossings	GC3M & National Rail station facilities design guidance
	Change in annual passengers causing a change to station category	GC3M & ORR station demand estimates
	Annual Station Patronage change	GC3M & ORR station demand estimates
Highway	Maximum queue length on SRN slips	GC3M
	Slip Road queue length as a % of capacity	GC3M
	v/c	GC3M
	Delays	GC3M



The flag analysis provided an evidence base for identifying potential intervention locations. These findings were considered alongside the Vision and Validate objectives and the Multi Criteria Assessment Framework (MCAF) to inform the development of the intervention packages, which were subsequently tested and refined through an iterative modelling process.

5.7 Intervention package testing and refinement

Three intervention packages were developed and assessed through an iterative modelling process (see Figure 5-8). Package A (Business as Usual+) represented the minimum level of vision-led intervention. Package B (Visionary Ambition) built upon Package A by introducing additional sustainable transport measures to maximise progress towards the Local Plan transport vision. Following the assessment of each package, the PSO was reviewed against the Local Plan transport objectives, Key Performance Indicators (KPIs) and flag analysis metrics to identify any remaining transport impacts requiring intervention.

Where residual impacts remained following the assessment of Package B, a third package was developed. Package C comprised the critical and essential measures from the Visionary Ambition package together with targeted highway mitigation measures to address the remaining impacts on network operation. Package D (Vision-Led Scenario) was developed following the refined PSO. It refined the interventions in response to the modelling results, stakeholder feedback and minor changes to the spatial strategy, resulting in the final recommended package of transport interventions to support the Local Plan.

Figure 5-8: Intervention Packages

5.8 Approach to forecasting effects of the interventions

The impact of the remaining intervention package was assessed collectively, but different approaches were taken for modelling the interventions in the package based on the type of intervention. The approaches were:

- **Assume already captured:** Some interventions were assumed to be necessary to deliver the accessibility and access requirements inherent in the trip rates. Our approach avoids double counting their impacts.
- **Code into VDM:** Used for interventions expected to be significant enough to have meaningful impact within the VDM, for example: new bus routes, altered bus frequencies, bus priority measures, or longer-distance greenways.
- **Adjust trip rates:** Since the modelling contains no internalisation, some interventions are assumed to alter the trip rate classification of a site, representing the generation of fewer trips. This approach was used for interventions which deliver significant on-site services such as schools, retail and GPs. This was only applied for sites classified to have the greatest trip rates (Village), with a shift to the next smallest category (Residential Isolated).

- **Adjust mode shares:** Interventions aimed at improving the overall quality and attractiveness of the active travel network were incorporated into mode-specific networks surrounding strategic-scale development sites. Their impact on the mode share of trips generated by each site was assessed and represented through post-VDM mode share adjustments. These mode share adjustments are based on the STB Carbon Assessment Playbook methodology. This is an online industry leading tool developed by City Science, WSP and Steer for the Sub-national Transport Bodies. The Playbook provides an evidence-based assessment of the impacts of transport interventions on travel behaviour, accounting for place-specific characteristics and existing travel patterns. It has been used to derive distance-dependent trip rate adjustment factors based on the intervention. These adjustments are only applied to short-distance trips, with mode share shifts ranging between 0.5% and 0.7% for eligible trips.
- **Withhold until later testing:** In line with the vision & validate approach, the intervention testing at this stage focuses on the impact of the vision-led interventions. Highway mitigations will be subsequently considered for mitigating unacceptable residual impacts of the Local Plan on highway operations.

6. The preferred spatial option

6.1 Introduction

The Preferred Spatial Option (PSO) is a set of residential, employment and mixed-use sites which are proposed to be included in the Local Plan. It is in these sites that new development is primarily expected to occur. In aggregate, these sites are planned to provide:

- sufficient land to accommodate the housing requirement for the 2025 - 2043 plan period of 18,859 homes; and
- sufficient land for the forecast employment need (79.68 hectares).

Background to the local plan work is described in Section 0.

6.2 Local Plan settlements

The PSO sets out a strategy involving predominantly targeted, planned expansion of existing settlements within the Cotswold district. Alongside this, several smaller scale development sites are dispersed across the district. The housing and employment figures, and distribution across strategic sites, are indicative assumptions used to inform the analysis. Although these assumptions are considered sufficiently robust for the purpose of this assessment, they are not intended to represent definitive site capacity or final development s proposals and may be refined through subsequent stages of planning.

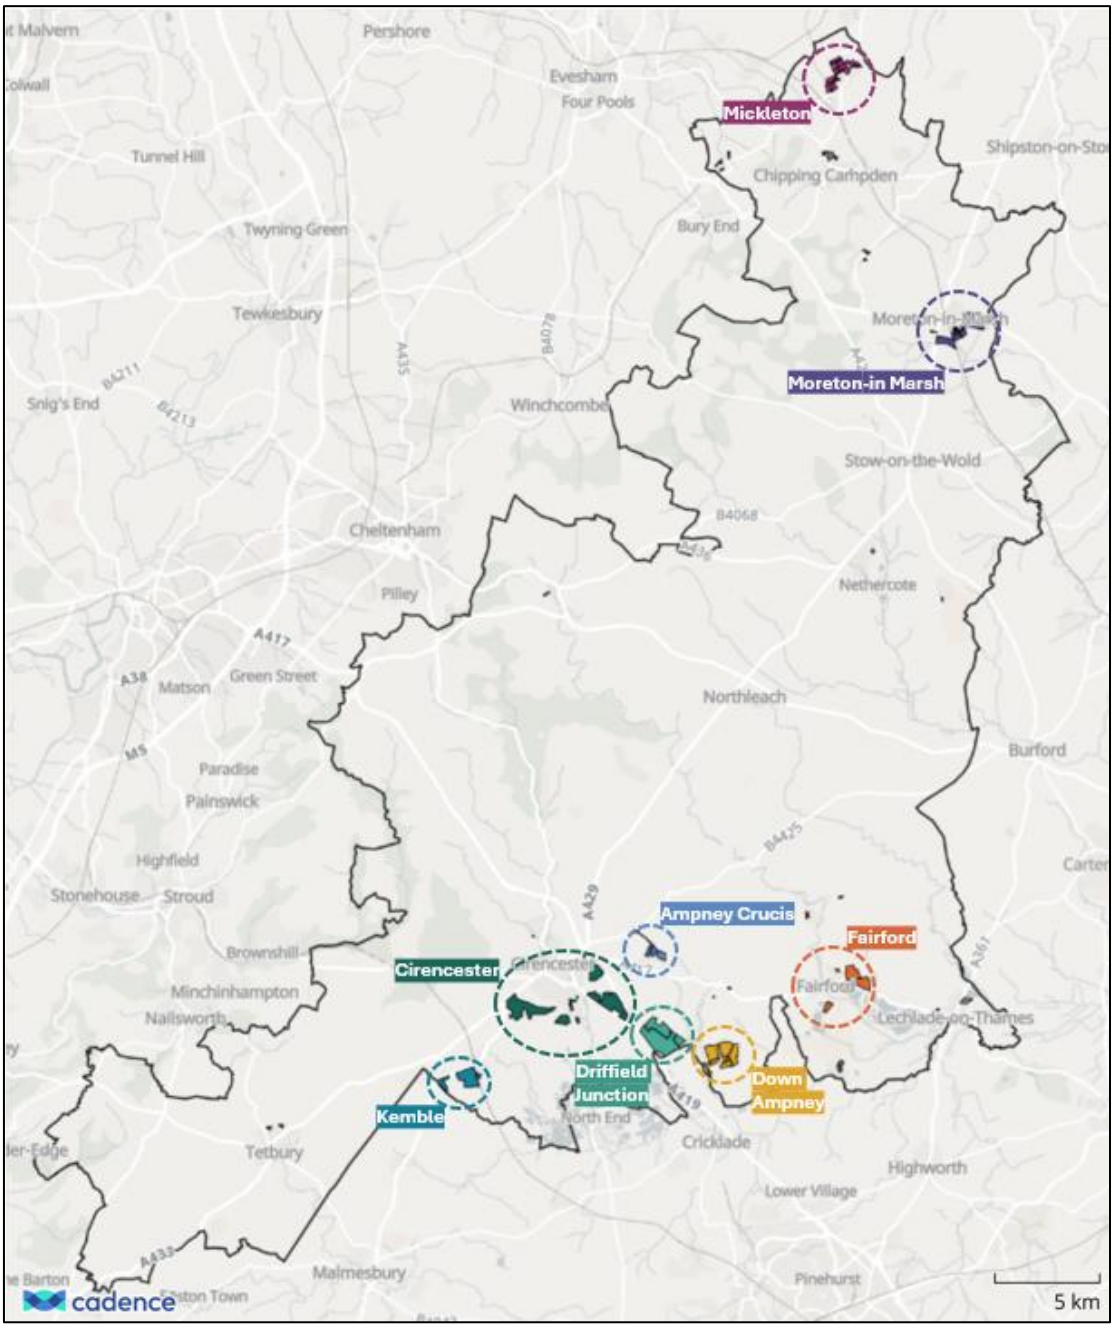


Table 6-1 below shows the number of dwellings and the amount of employment land by settlement. Figure 6-1 presents the locations of the development sites by location.

Table 6-1: Dwellings and employment land in PSO by location

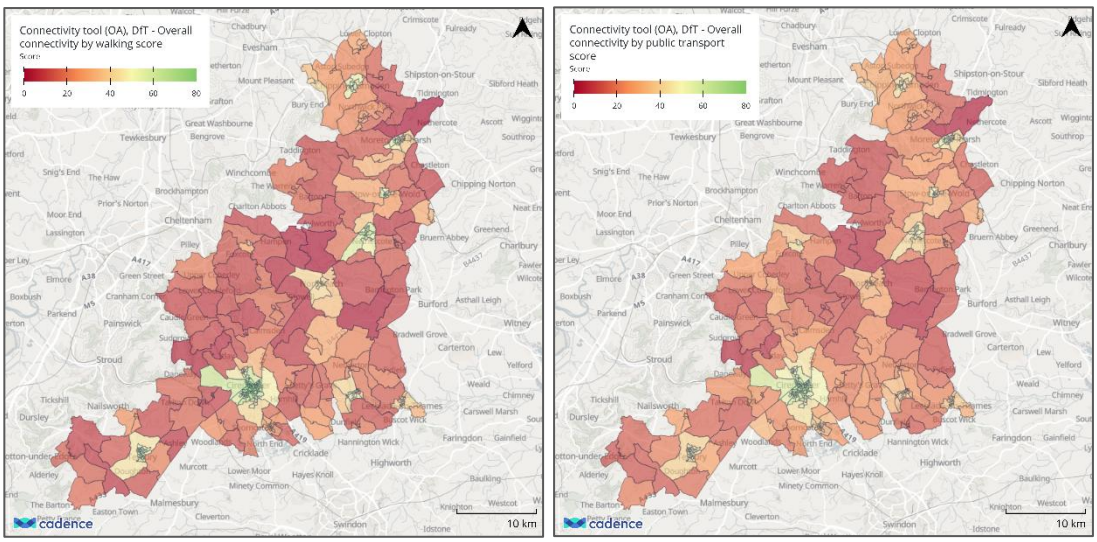
Location	Number of dwellings	Employment land (ha)
Ampney Crucis	660	-
Cirencester *(including Preston and Siddington)*	2,766	13.7
Down Ampney[8]	1,670	-
Driffield	1,090	10
Fairford	1,387	4
Kemble	1,020	27.03
Mickleton	1,413	1
Moreton-in-Marsh	1,972	5.5
Other settlements	6,881	9.65
Existing commitments	-	9.1
All sites	**18,859**	**79.68**

[8] It should be noted that the Ampney Crucis site has been included within the modelling assessment to provide a robust presentation of the potential transport impacts associated with the wider strategy. However, the development site at Ampney Crucis is not proposed as an allocation within the Regulation 19 Local Plan.

Figure 6-1: Locations of housing development sites by settlement

Since the modelling was undertaken, there have also been refinements to the transport strategy presented in the Regulation 19 Local Plan. As such, the modelling results provide an indication of the likely transport outcomes associated with the proposed development strategy, although the reported impacts may represent a more conservative scenario than would be expected from the final strategy.

6.3 Current accessibility of PSO sites



The Local Plan vision for transport is to maximise the sustainability of the development sites using the Avoid/Shift/Improve philosophy and the sustainable transport hierarchy (see Section 2.3 for details). An important consideration to achieving this vision is to locate new development as close as possible to existing amenities, such as schools, shops and jobs, and to existing public transport and active travel networks. By making walking, cycling, wheeling and public transport more attractive, residents and employees have greater choice in how they travel, and to do so sustainably.

The current accessibility of the PSO sites on foot and by public transport is shown in Figure 6-2. The data shows 'overall accessibility' to all destinations included in the DfT Connectivity Tool (business, education, employment, healthcare and leisure & community). The best-connected place in England and Wales has a score of 100, with other locations scored relative to the best-connected place.

In the Cotswold District, walking scores range from 70-80 in the largest settlement, Cirencester, to below 10 in the most rural areas. Other urban centres in the district are typically between 50-60, which are in the lowest 20-40% of locations in England and Wales.

Public transport scores are 60-70 in Cirencester but 40-50 in the other settlements, such as Moreton-in-Marsh and Mickleton. Fairford stands out with public transport scores below 40 across the settlement. As with the walking scores, in the most rural areas scores fall below 10. A public transport score of below 60 means that location is in the bottom 30% in England and Wales, and a score of below 40 in the bottom 10%. This clearly demonstrates most places in the district are poorly connected by public transport relative to the average of England and Wales.

Figure 6-2: Current accessibility by walking and public transport

6.4 Site context

This section describes the PSO sites covering:

- The approximate number of dwellings and/or amount of employment land (for modelling purposes);

- the location of the sites within the settlement, and the strategic context, for example proximity to neighbouring communities and facilities.

6.4.1 Cirencester

The Cirencester growth area, which includes the settlements at Siddington and Preston, comprises sites in and around the district's main settlement and plans to deliver a total of 2,766 dwellings and 13.7 hectares of employment land. The sites occupy a highly sustainable location on the southern and eastern edges of Cirencester, adjacent to existing residential areas and close to key services, employment opportunities, schools, healthcare provision and strategic transport corridors.

Central Cirencester sites:

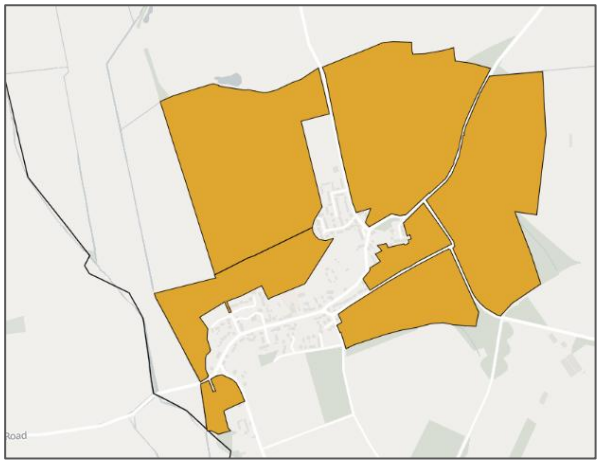
- Steading southern extension (585 dwellings & 1.7 employment hectares)
- Land adjacent 'Donside', off Barn Way (10 dwellings)
- Land west of Gardner Way (31 dwellings)

Preston sites:

- Land southeast of Cirencester and south of Preston (1,084 dwellings)
- Land east of Kingshill Lane (613 dwellings & 1 employment hectare)
- Land south-west of Preston (10 employment hectares)

Siddington sites:

- Land southwest of Siddington (381 dwellings)
- Plummers Farm, east of Ashton Road (35 dwellings)
- Land east of Siddington Road (5 dwellings)
- Land between disused canal and disused railway line, north of Park Way (22 dwellings)
- Land north of Clark's Lane and south of Old Canal (1 employment hectare)



6.4.2 Down Ampney

Down Ampney has a development site of approximately 1,670 dwellings. It represents a key strategic allocation that would significantly expand a small rural village. The village currently has a small number of services, including a small shop and a primary school, and has relatively limited active travel and public transport connections to the services in Cirencester.

It comprises the following major sites:

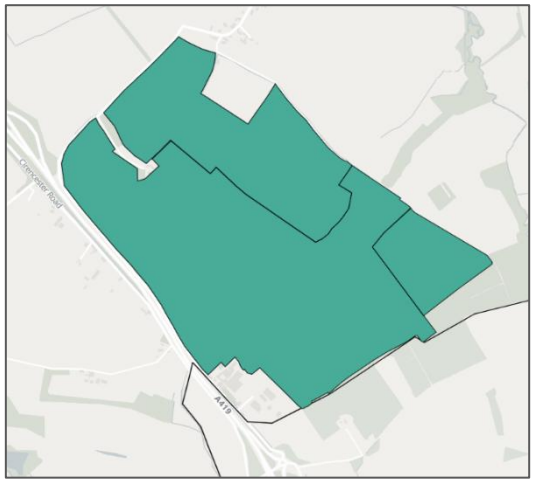
- Land at Rooktree Farm (77 dwellings)
- Down Ampney Airfield (Site A) (243 dwellings)
- Castle Hill Farm (Site A) (390 dwellings)
- Land between Poulton Road and Meysey Hampton Road (450 dwellings)
- Land north of Down Ampney (Site A) (320 dwellings)
- Land north of Chestnut Close and Suffolk Place (180 dwellings)
- Land west of Church Lane (10 dwellings)

6.4.3 Ampney Crucis

Ampney Crucis is a small village located approximately 3 miles east of Cirencester. It has a proposed single site development of 660 dwellings, doubling the current population of the village. The development includes improved highway access to the B4425, providing connections to Cirencester and the surrounding network. Beyond this proposed access, the village has relatively limited transport infrastructure and a restricted range of local services.

It comprises the following major site:

- Land north of Ampney Crucis (660 dwellings)

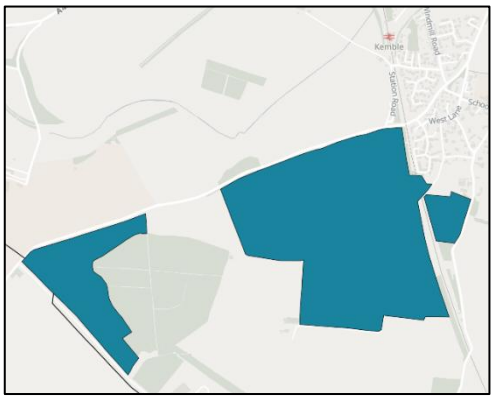


6.4.4 Driffield

Driffield has a proposed allocation of approximately 1,090 dwellings alongside 10 hectares of employment land, representing a substantial addition to a small settlement with limited existing services. It relies on connections to Cirencester for access to key services. Local road connectivity feeds into the A417/A419 network, offering reasonable regional road connectivity but causing a reliance on private cars for daily trips. Active and public transport is limited as the site is constrained by A417 along its western border.

It comprises the following major sites:

- Fosse Farm (475 dwellings & 10 employment hectares)
- Land south of Driffield (405 dwellings)
- Land north of The Folly (210 dwellings)

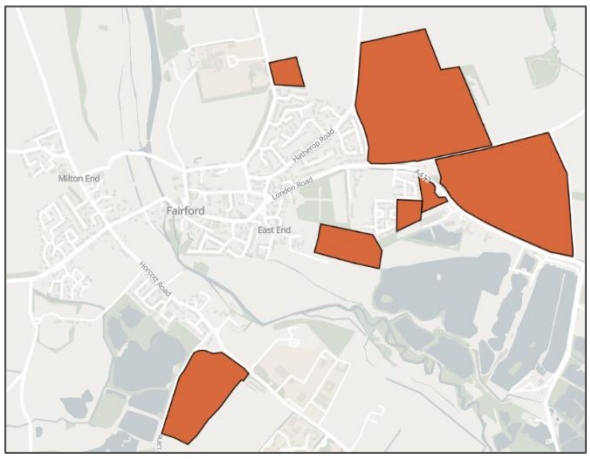


6.4.5 Kemble

Kemble has a proposed allocation of approximately 1,020 dwellings, alongside an additional 27.03 hectares of employment land assumed in the Kemble area. The development would roughly triple the existing scale of the village community. Local amenities in Kemble are currently limited, with a reliance on connections to the neighbouring settlements of Cirencester and Tetbury for a wider range of services. Distinct from other rural developments in the district, the site benefits from strategic public transport connectivity through Kemble Railway Station, with direct mainline links to London, Swindon, and Gloucester.

It comprises the following major site:

- Land south-west of Kemble (1,020 dwellings)



6.4.6 Fairford

Fairford has a proposed allocation of approximately 1,387 dwellings, alongside 4 hectares of employment land. The proposed development is broadly comparable in scale to the existing town, forming a major urban extension to an established settlement. Fairford has a range of services, including a town centre with independent retail shops, primary and secondary schools, and a GP surgery. Strategic access is via the A417 corridor, providing links to Cirencester and Lechlade, although local junctions may experience capacity constraints during peak periods. However, transport options are limited, with no rail access, only moderate-frequency bus services, and limited cycling infrastructure to nearby employment areas.

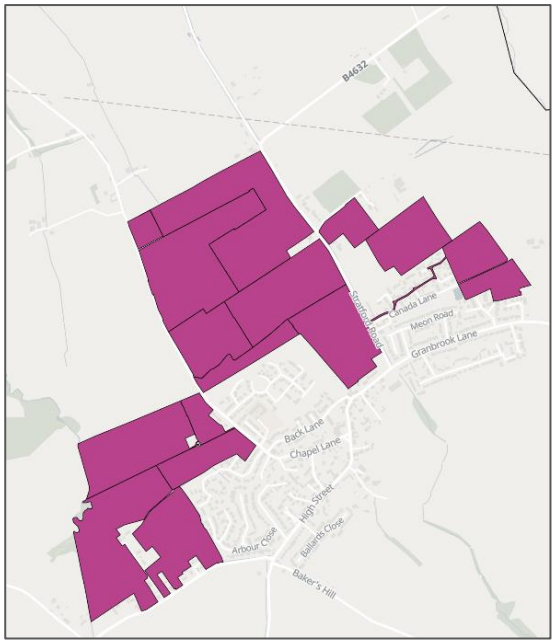
It comprises the following major sites:

- Land north-east of Fairford (1,108 dwellings & 4 employment hectares)
- Land south-east of Fairford (109 dwellings)
- Land west of Terminus Cottage and Station Cottage (20 dwellings)
- Land at Totterdown Hill, Horcott (150 dwellings

6.4.7 Moreton-in-Marsh

In the north of the Cotswold District, Moreton-in-Marsh has a proposed allocation of approximately 1,972 dwellings and 5.5 hectares of employment land. Moreton-in-Marsh acts as the primary service hub for the North Cotswolds, with a strong town centre, supermarkets, a community hospital, and established primary schools. The sites also benefit from the railway station, providing strong strategic public transport links, while road access via the A44 and Fosse Way (A429) offers good regional connectivity.

It comprises the following major sites:



- Fire Service College (638 dwellings and 4 employment hectares)
- Land east of Cotswold Business Village (195 dwellings)
- Land south of Fire Service College (485 dwellings)
- Dunstall Farm, Fosseway (644 dwellings)
- Land west of Aldi (10 dwellings)
- Land south of Moreton-in-Marsh (1.5 employment hectares)

6.4.8 Mickleton

Mickleton has a proposed allocation of approximately 1,413 dwellings, alongside 1 hectare of employment land. The proposed development would double the size of the village. The sites benefit from strategic road access, provided via the B4632, supporting wider regional travel. Public transport provision is limited in Mickleton, relying mainly on infrequent bus services. Active travel is also constrained by the rural setting and the village's location at the northern edge of the district, resulting in a high reliance on private car use for trips beyond the immediate area.

It comprises the following major sites:

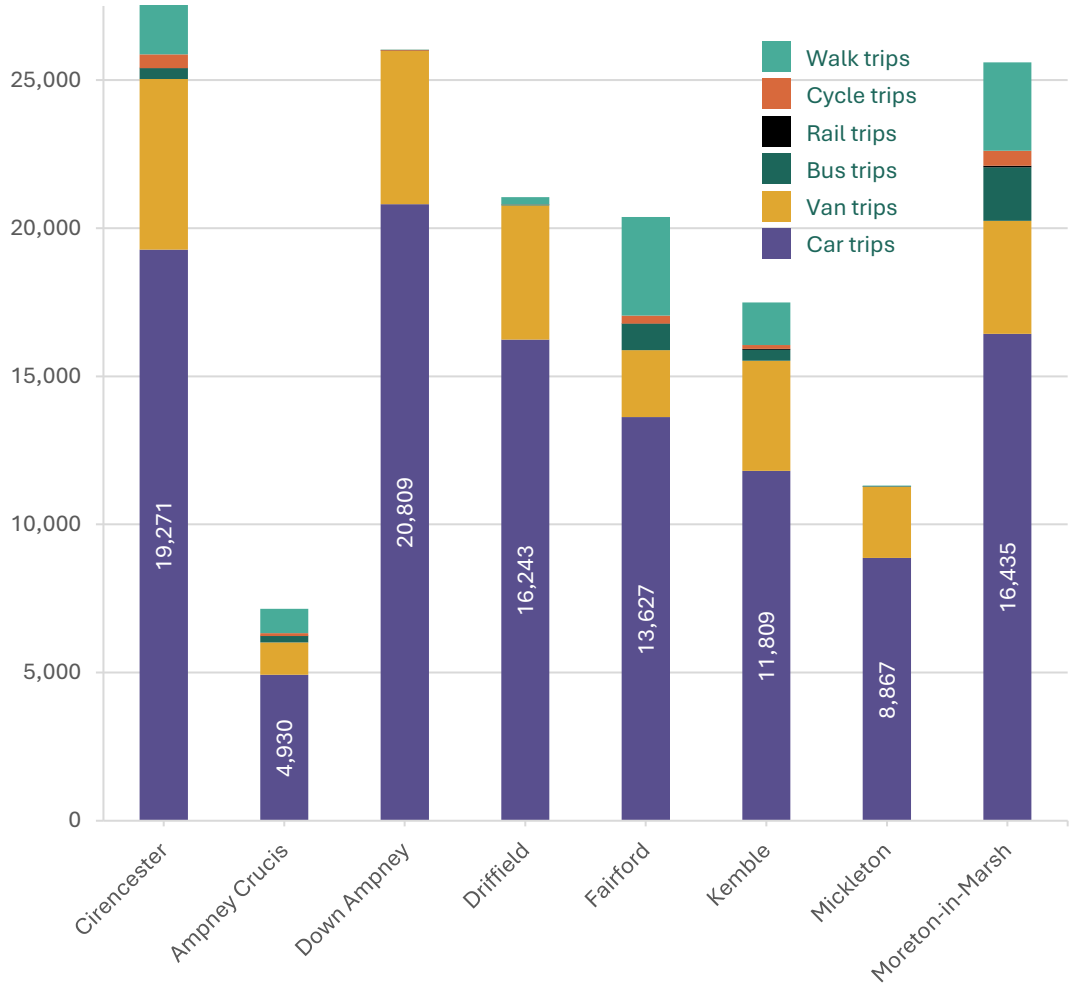
- Land at Prospect Gardens (109 dwellings)
- Land south-west of Mickleton (71 dwellings)
- Glebe Land, Broad Marston Road (109 dwellings)
- Land east of Broad Marston Road (109 dwellings)
- Meadow View (109 dwellings)
- Field adjoining Market Garden Close, Broad Marston Road (109 dwellings)
- Land west of Stratford Road (109 dwellings)
- Land south-west of Mickleton (33 dwellings)
- Land west of nurseries on Broad Marston Road (147 dwellings)
- Land north of Broadway Road and east of Norton Brook (179 dwellings)
- Land north-east of Mickleton (40 dwellings)
- Land between Summerville Ltd. and Stratford Road (33 dwellings)
- Land east of Stratford Road (76 dwellings)
  Land at Prospect Gardens (1 hectare of employment)

6.5 Forecast impacts of the PSO without intervention

6.5.1 Introduction

The forecasted impacts on the travel network as a result of the developments with the PSO were assessed. The focus was on the additional trips generated on the highway network, their routing and impacts of this traffic on network performance with regard to:

- attractiveness of the highway network for use by active modes; and
- delays and congestion affecting general traffic and bus services.



To isolate the impacts of the proposed PSO growth from committed development, the assessment compares the PSO scenario against the Core Minus scenario (both defined in Section 5.4. This comparison identifies cumulative network pressures and pinpoints where the PSO sites introduce specific, additional pressure beyond that already anticipated under the Core Minus scenario.

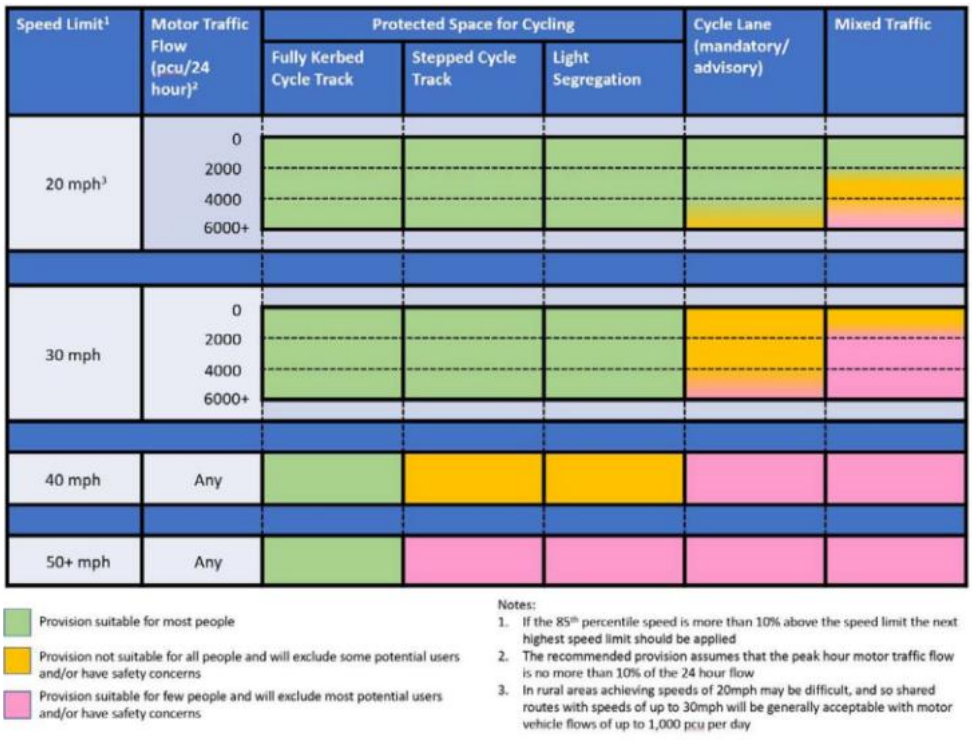
These findings expand the evidence base needed to target transport interventions and mitigation measures precisely where the proposed development impacts network operation most heavily. The vision-led interventions go beyond traditional mitigation measures by proactively addressing transport impacts through measures that support mode shift, improve sustainable travel options, and enhance network resilience. As a result, they provide a more comprehensive approach to managing development-related impacts and supporting the long-term operation of the transport network.

6.5.2 Changes in overall amount of trip-making

The introduction of the PSO development sites generates additional trips across the Cotswold District. Sites comprising more than 500 dwellings were represented as separate zones within the GC3M, allowing their trip generation and network impacts to be isolated. While the assessment considers the impacts of the PSO development in its entirety, Figure 6-3 illustrates the additional trips associated with these major development sites, aggregated by settlement. Collectively, the modelled sites are forecasted to result in an additional 157,600 trips across the district. Over 70% of these additional trips are taken by car. The main settlements of Cirencester and Moreton-in-Marsh contribute a large proportion of these trips, as well as the strategic sites at Down Ampney and Driffield.

Figure 6-3: Total number of trips to/from the PSO sites (without intervention) by settlement (during a weekday 12-hour period)

6.5.3 Impacts on active travel



6.5.3.1 Approach

To understand the potential impacts of the PSO on active travel, without intervention, all modelled links were assessed in terms of whether they offer appropriate protection from motor traffic. The factors considered were:

- The type of cycle infrastructure in place (from no provision to fully kerbed cycle track)
- The speed limit
- The traffic volume (from GC3M); and
- The proportion of HGVs (from GC3M).

Links were classified as having adequate protection based on Figure 4.1 of LTN 1/20 (reproduced in Figure 6-4)

Figure 6-4: Appropriate protection from motor traffic on highways

Reproduced from LTN1/20 Figure 4.1

The LTN1/20 guidance was combined with the change in motor traffic flow between the Core Minus scenario and the PSO, to determine which modelled links on the highway network become unsuitable for active travel due to Local Plan Growth. The thresholds are presented in Table 6-2 below.

Table 6-2: Active travel flag analysis

Change In Motor Traffic Flow (between Core Minus and with PSO)	Change in RAG Rating for LTN /120 (using traffic flow, traffic speeds and AT infrastructure)			
	No Detriment	Green to Amber	Amber to Red	Green to Red

Less than 5% Change	Low	Low	Low	Low
5% to 10% Increase	Low	Medium	Medium	High
More than 10% Increase	Low	High	High	High

6.5.3.2 Forecast impacts of the PSO on active travel

The assessment indicates that only a small proportion of the highway network in the Cotswold District is forecast to be suitable for active travel users under the Core Minus scenario (Figure 6-5). The inclusion of Local Plan growth in the PSO scenario results in some routes in the district flagging as 'high' impacts for active travel users. Key routes include Lewis Lane in the centre of Cirencester, as well as Somerfield Road and Sparsgate Lane, connecting the Siddington developments to the centre of Cirencester.

Near Mickleton, Bakers Hill/Hidcote Road additionally flags as high impact. In Fairford, the High Street, Park Street and Leafield Road flag as high risk for active travel users under the PSO scenario.

The findings suggest targeted interventions will be required to improve active travel connectivity, particularly for local trips in and around the developments.

Figure 6-5: Active travel flags on the highways network under the PSO

6.5.4 Impacts on public transport

6.5.4.1 Approach

Public transport impacts were assessed separately for rail stations and bus service impacts using the flag analysis approach introduced in Chapter 5. Rail impacts were assessed by

forecasting annual station patronage and identifying whether the resulting additional PSO demand would lead to a change in station category (at either Kemble or Moreton-in-Marsh). The flag analysis criteria for railway stations are presented in Table 6-3below and are based on the railway station categories defined in the Network Rail Station Facilities and Amenities Design Guidance (Figure 6-6). A change in station category indicates that the existing level of facilities may no longer be appropriate for the forecast demand and is therefore identified as a flag for further consideration, in parallel to the vision-led considerations.

Table 6-3: Rail Flag Analysis Criteria

			Station Type Category based on Annual Station Patronage					
			F	E	D	C	B	A
Change in annual passengers causing a change to station category	Change from F	Low	Low	High	High	High	High	High
	Change from E	Medium	n/a	Low	High	High	High	High
	Change from D	High	n/a	n/a	Low	High	High	High
	Change from C	High	n/a	n/a	n/a	Low	High	High
	Change from B	High	n/a	n/a	n/a	n/a	Low	High
	Change from A	High	n/a	n/a	n/a	n/a	n/a	High

Figure 6-6: Rail Station Type Categories

	No.	Type	Criteria per annum
A	28	National Hub	Over 2m trips: over £20m
B	67	Regional Interchange	Over 2m trips: over £20m
C	248	Important Feeder	0.5–2m trips: £2–20m
D	298	Medium Staffed	0.25–0.5m trips: £1–2m
E	695	Small Staffed	Under 0.25m trips: Under £1m
F	1,200	Small Unstaffed	Under 0.25m trips: Under £1m
Total	2,536		

Bus service impacts were assessed by comparing changes in end-to-end bus journey times between the 2043 Core Minus Scenario and the Preferred Spatial Option and the resultant impact on bus service frequencies (i.e. buses per hour). Frequency in this instance has been used as a proxy for bus passenger demand. Flag thresholds are presented in Table 6-4. A high impact was identified where end-to-end bus service journey times increased by more than 5 minutes or where the forecast impact resulted in a reduction of two or more bus services per hour. The 5 minute threshold comes from liaison with GCC's integrated transport team and rules set out nationally by the traffic commissioner as definition of a late running bus service.

Table 6-4: Bus Flag Analysis Criteria

		Impact on bus service vehicles/frequency		
		no frequency change	1 less bus per hour	>2 less buses per hour
Change in bus route end to end journey times (between Core Minus and PSO)	0-5 mins	Low	Medium	High
	5-10 mins	High	High	High
	>10 mins	High	High	High

6.5.4.2 Forecast impacts of the PSO on public transport

Rail impacts were assessed by forecasting annual station patronage for the two stations within the Cotswold District, Moreton-in-Marsh and Kemble. Forecast patronage was derived using a combination of TEMPro growth and additional demand associated with the Local Plan PSO development.

According to the latest Office of Rail and Road (ORR) station usage statistics (April 2024 to March 2025), both Moreton-in-Marsh and Kemble stations currently record fewer than 0.5 million annual passenger entries and exits, placing them within Station Category D (medium staffed station). Although forecast patronage increases under the Preferred Spatial Option, both stations remain below the 0.5 million passenger threshold and therefore remain within Category D. Consequently, no rail flag was identified.

Table 6-5: Forecast growth in rail station patronage

Station	2024 Patronage	2024 Station Category	2043 Patronage	2043 Station Category
Kemble	444,760	D	480,085	D
Moreton-in-Marsh	375,804	D	396,447	D

Bus service impacts were assessed by comparing changes in end-to-end bus journey times between the 2043 Core Minus Scenario and the Preferred Spatial Option and the resultant impact on bus service frequencies (i.e. buses per hour) as mentioned in the approach section. The assessment identified increased journey times on a small number of bus services, while no reductions in service frequency were forecast. The services identified as having a high impact were Route 51X (Swindon-Cirencester), Route 50 (Cirencester town service), Route 99 (Cheltenham-Gloucester), Route 606 (Cheltenham- Chipping Campden) and Route 93 (Crudwell-Cirencester).

A link-by-link review of these routes was undertaken to identify the locations contributing to the increased journey times. The analysis showed that the affected links coincide with highway congestion hotspots, reflecting the increased traffic demand associated with the Local Plan. These findings are consistent with the highway volume-to-capacity and delay assessments presented in the following section.

6.5.5 Impacts on delays and congestion affecting highway traffic

6.5.5.1 Approach

To understand the potential highway impacts of the PSO, an assessment of the operational performance of the highway network was undertaken for both the Core Minus scenario and the PSO scenario. The assessment drew on GC3M-based outputs for these scenarios, specifically:

- forecast differences in traffic flows between the Core Minus Scenario and the PSO
- forecast differences in the ratio of traffic volume and capacity ('V/C') of links and nodes; and
- where forecast increases (in the PSO scenario with respect to the Core Minus scenario) in traffic delay

Flow difference plots were used to identify the locations where Local Plan growth generates additional traffic on the highway network, while the V/C and delay assessments were used to determine whether these changes result in operational issues.

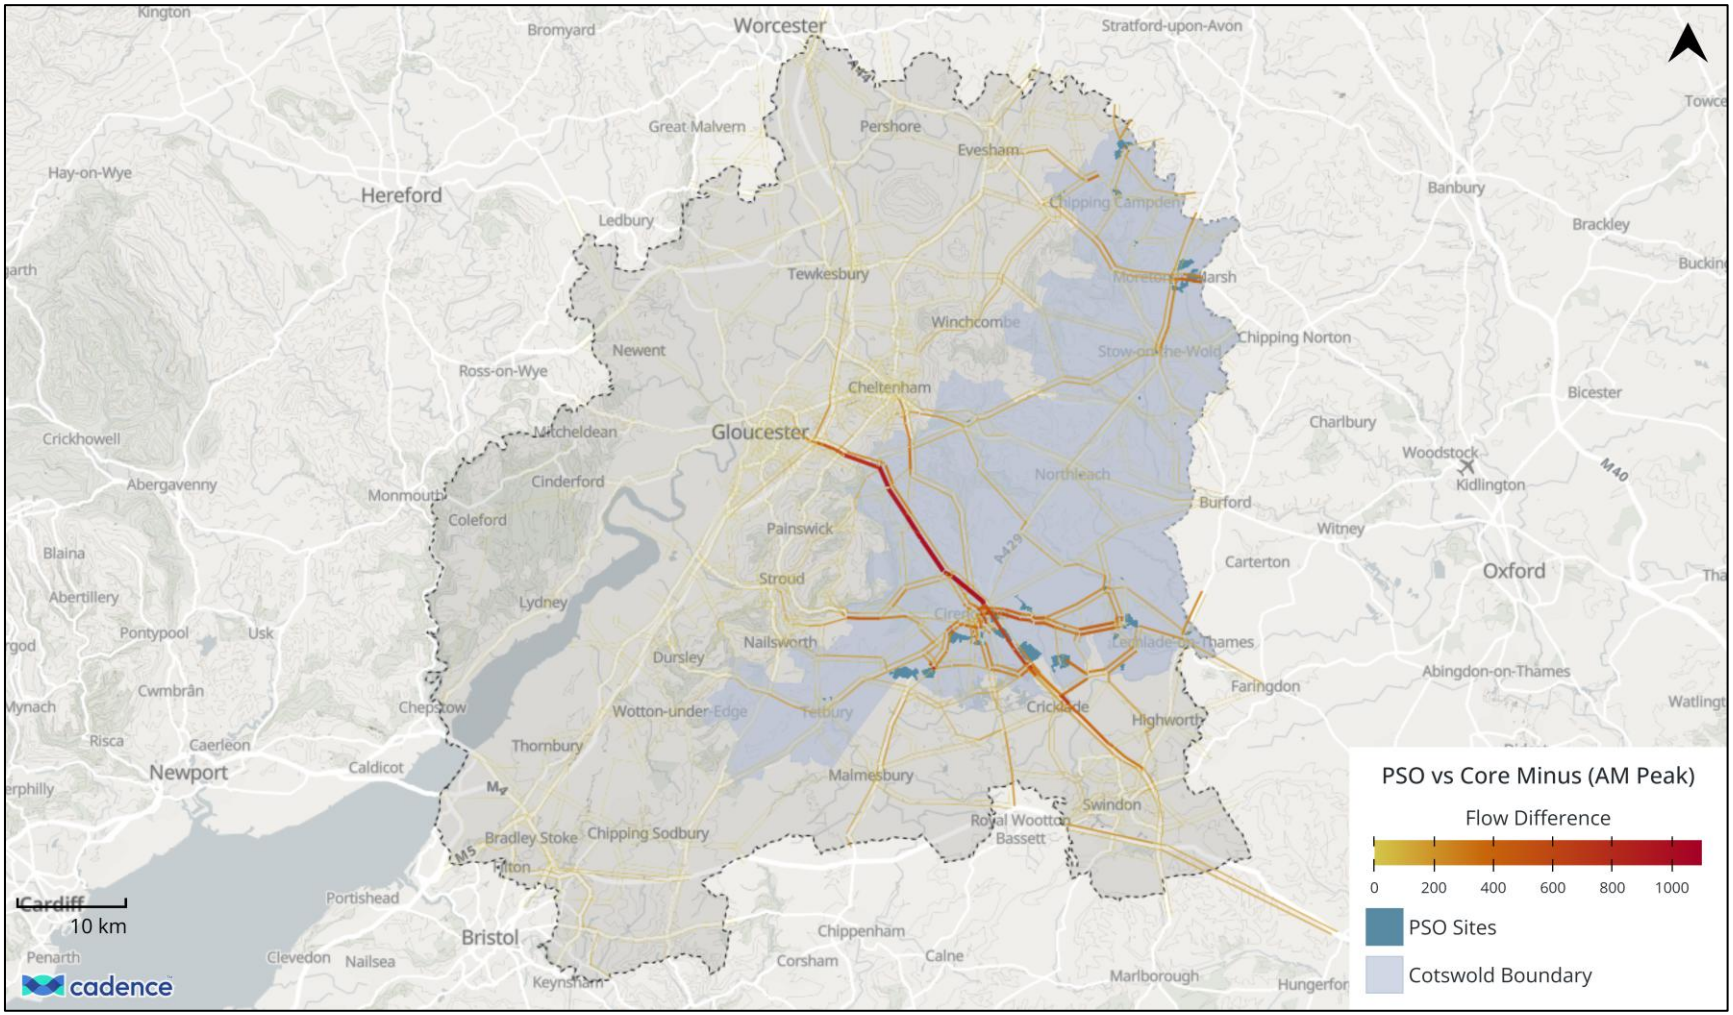
6.5.5.2 Forecast impacts of the PSO on traffic flows

Figure 6-7 and Figure 6-8 represent the forecast difference in traffic flows between the PSO and the 2043 Core Minus Scenario during the morning and evening peak hours. The plots highlight the redistribution of traffic associated with Local Plan growth with the greatest increases generally occurring on routes serving the proposed development sites.

The largest increases in traffic flow are concentrated around Cirencester, particularly along the A419 and A417 corridors, the A429 between Cirencester and Kemble, and the A417 London Road corridor serving both Cirencester and Fairford. Additional traffic is also evident on routes serving Moreton-in-Marsh and the northern part of the district, including the A429 and the A44 London Road.

These increases reflect the distribution of development proposed within the PSO.

Figure 6-7: Forecasted traffic flow difference on links between PSO and Core Minus scenario during morning peak hour (08:00-09:00)



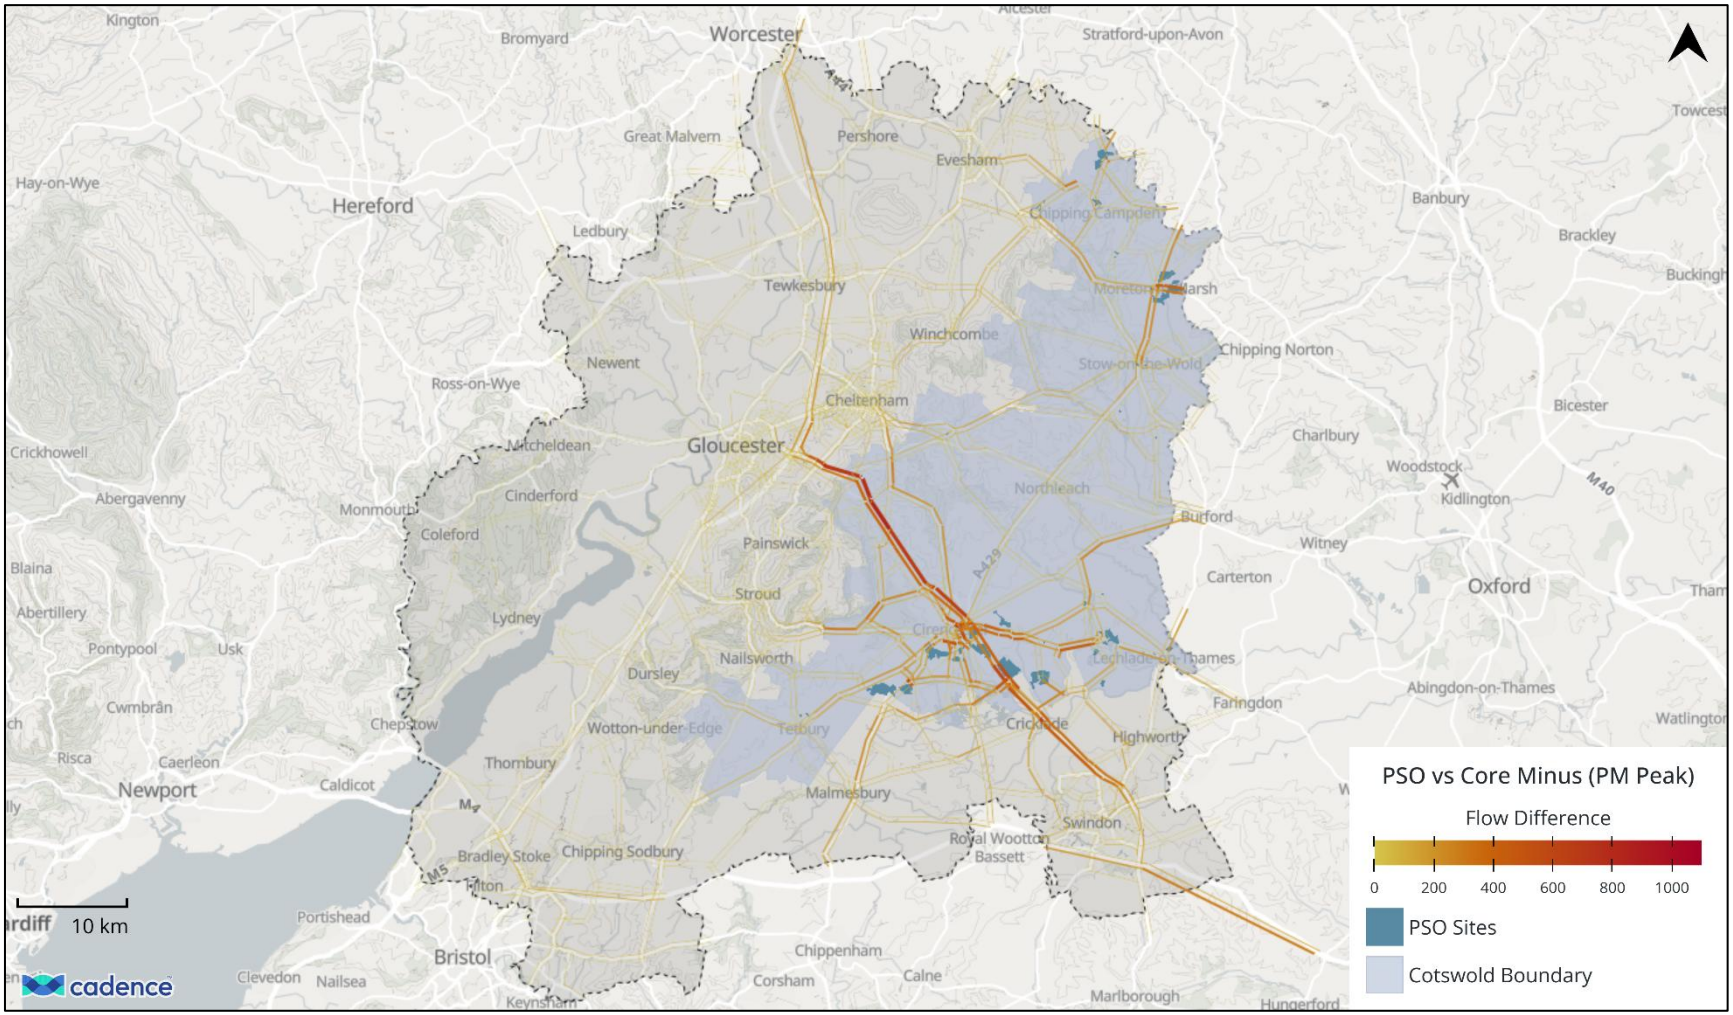


Figure 6-8: Forecasted traffic flow difference on links between PSO and Core Minus scenario during evening peak hour (17:00-18:00)

6.5.5.3 Forecast impacts of the PSO on the ratio of traffic volume and capacity ('V/C')

The modelling outputs show the V/C as a percentage for links on the network. The V/C value shows the forecast modelled flow on a link on the highway network as a proportion of the capacity of that link. A higher V/C value indicates increased congestion. V/C >100% indicates that the link is anticipated to exceed "absolute" capacity.

The model incorporates the capacity at junction stop lines. Some junctions have limited capacity to start with, and V/C is a function of level of capacity and number of vehicles, rather than solely the number of vehicles.

A comparison of modelled link V/C ratios in the Cotswold Core Minus scenario and the PSO in the future year morning peak hour (08:00-09:00) is shown in Figure 6-9. The figures show higher V/C ratios on several key network links in the PSO scenario. The most significant differences in the morning peak hours are on:

- B4081 southbound from Chipping Campden approaching A44/B4081 intersection;
- High street / Oxford Street junction in Moreton-in-Marsh;
- South Cirencester; Somerford Road, A429/Chesterton Lane;
- B4425 approaching A429/B4229 intersection;
- Spine Road East approaching Station Road/Cerney Wick Lane Intersection;
- High Street approaching a417 Roman Road

Figure 6-9: Forecasted PSO vs Core Minus volume to capacity ratio on links during morning peak hour

Core Minus Scenario

PSO

6.5.6 Delay and V/C ratio 'flag' analysis

6.5.6.1 Approach

In addition to assessing links and nodes with significantly worsening performance (above) a separate analysis identified ('flagged') links and nodes forecast to have:

- a large increase in V/C of more than 5% between the Core Minus scenario and the PSO scenario, resulting in a delay of greater than 100%; or
- a large increase in delay of more than 5% between the Core Minus scenario and the PSO scenario, resulting in a delay exceeding 5 minutes

Traffic volume changes of less than 20 vehicles or 1% between the Core Minus and PSO were screened out.

Figure 6-10 shows how these two factors were used to determine if the impact of the PSO without intervention should be rated as 'low', 'medium' or 'high'.

Figure 6-10: Derivation of ratings for 'flag analysis'

		Resultant V/C ratio (in PSO scenario)		
		Below 85%	85 to 100%	Over 100%
Increase in V/C ratio	Less than 5%	Low	Low	Medium
	5 to 10%	Low	Medium	High
	Over 10%	Low	Medium	High

		Resultant delay (in PSO scenario)		
		1-2 mins	2-5 mins	5 mins +
Increase in delay	Less than 5%	Low	Low	Medium
	5 to 10%	Low	Medium	High
	Over 10%	Low	Medium	High

Links and junctions rated as 'high' are those where additional traffic associated with the PSO could have a significant impact on the highway network which may require some form of mitigation, such as a junction improvement. Links and nodes rated as 'medium' were also flagged. These represent locations where the PSO is expected to have a noticeable impact on traffic conditions that may require monitoring.

6.5.6.2 Links and nodes flagged as 'high' or 'medium'

Following this assessment, there were several key network pinch points that flagged as high or medium for exceeding their operational capacity or delays.

Table 6-6 to Table 6-9 summarise the V/C and delay flag assessment results for highway links and junctions during the AM and PM peak hours.

The V/C assessment identified 13 high-impact locations during the AM peak hour and 10 during the PM peak hour. For the delay assessment, only one high-impact link or node was identified during the AM peak hour, increasing to two during the PM peak hour.

Table 6-6: Summary of link and junction V/C flag assessment results (AM Peak Hour)

		Resultant V/C ratio (in PSO scenario)		
		Below 85%	85 to 100%	Over 100%
Increase in V/C ratio	Less than 5%	2647	59	13
	5 to 10%	652	29	1
	Over 10%	715	42	12

Table 6-7: Summary of link and junction V/C flag assessment results (PM Peak Hour)

		Resultant V/C ratio (in PSO scenario)		
		Below 85%	85 to 100%	Over 100%
Increase in V/C ratio	Less than 5%	2722	47	10
	5 to 10%	716	25	3
	Over 10%	675	38	7

Table 6-8: Summary of link and junction delay flag assessment results (AM Peak Hour)

		Resultant delay (in PSO scenario)		
		1-2 mins	2-5 mins	5 mins +
Increase in delay	Less than 5%	2454	7	0
	5 to 10%	377	0	0
	Over 10%	1313	18	1

Table 6-9: Summary of link and junction delay flag assessment results (PM Peak Hour)

		Resultant delay (in PSO scenario)		
		1-2 mins	2-5 mins	5 mins +
Increase in delay	Less than 5%	2530	7	0
	5 to 10%	372	1	1
	Over 10%	1315	16	1

Figure 6-11 and Figure 6-12 shows the locations of these links across both peak periods. The assessment focuses on areas where the impacts of the Local Plan are forecast to result in notable changes in network performance, meaning areas where links have flagged 'high' risk. These include:

Cirencester

- A429 approaching A429/Chesterton Lane junction
- Somerfield Road approaching Somerford Road/Chesterton Lane intersection
- Midland Road approaching A429 Watermoor roundabout
- Swindon Road after Cirencester Road/Swindon Road mini roundabout
- Kingshill Lane approaching Swindon Road junction
- Kingshill Lane approaching London Road junction
- B4696 Spine Road Approach to Station Road/Cerney Wick Lane Intersection

- A429 approaching B4425/A429 Stow Road junction

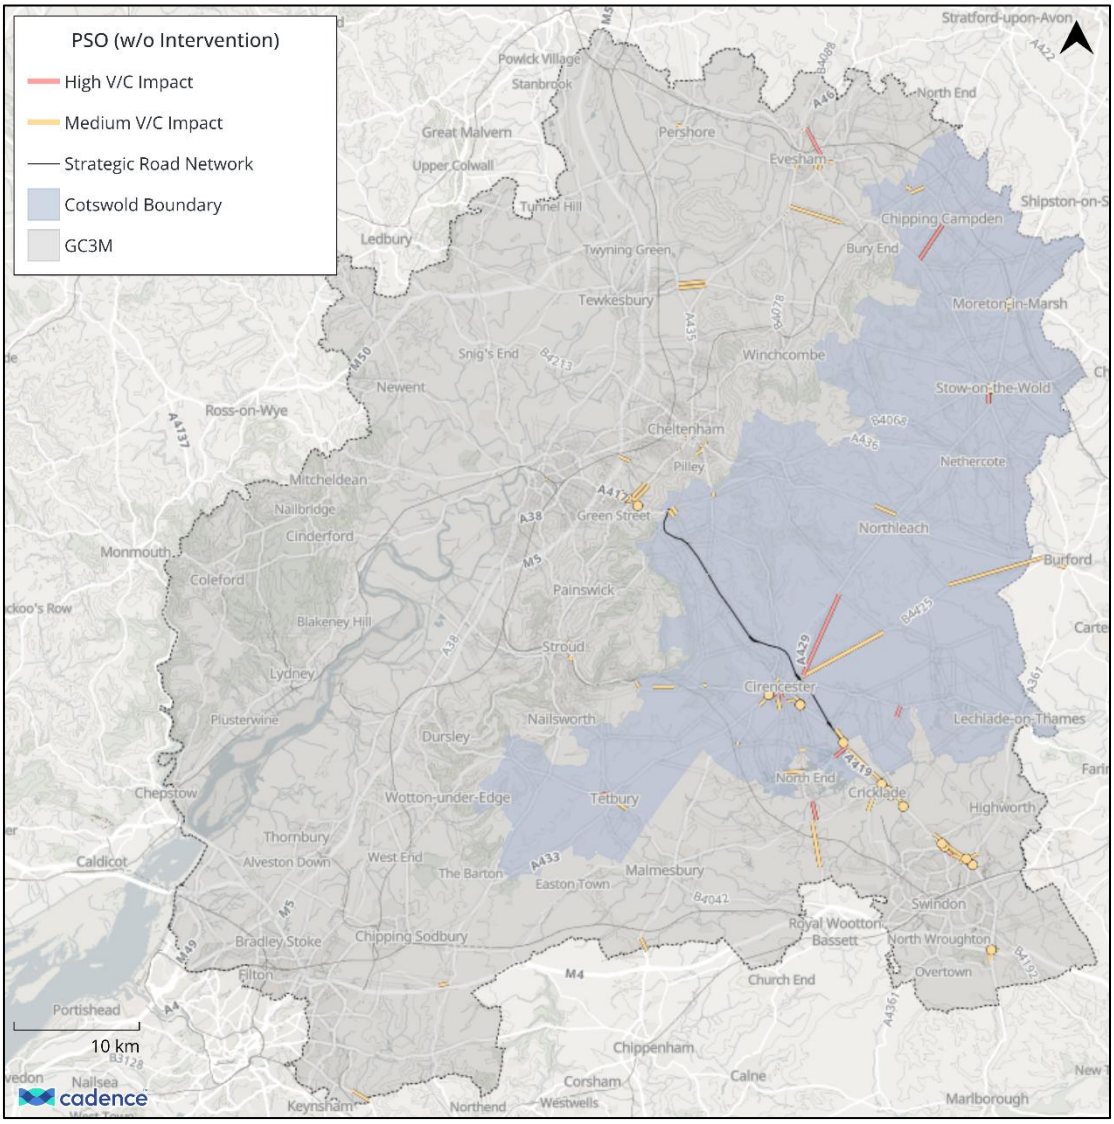
Moreton-in-Marsh

- Oxford Street approaching High St/Oxford St Roundabout
- High Street approaching High St/Oxford St Roundabout

Other areas for consideration:

- A4135 New Church St approaching A433 by Tetbury
- B4081 approaching A44/B4081 intersection
- Roads approaching A429 Fosse Way /A436 Sheep Street by Stow-on-the-Wold
- Stow-on-the-Wold High Street approaching Roman Road

Figure 6-11: Link flagging as 'high' or 'medium' risk for V/C under the PSO



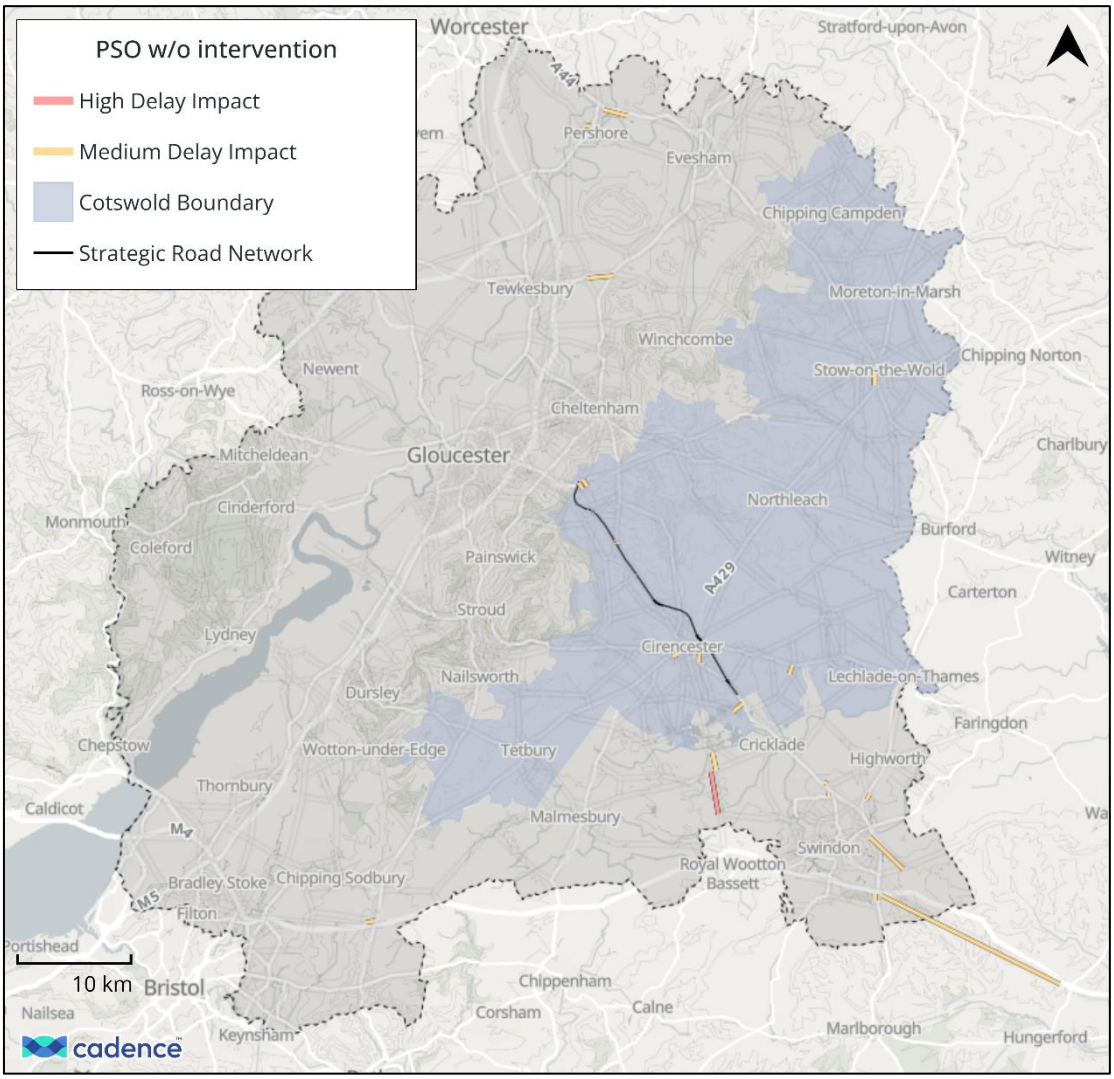


Figure 6-12: Link flagging as 'high' or 'medium' risk for delay under the PSO

The high risk locations have been considered further within the development of interventions and highways mitigations.

6.5.6.3 Highways Operational safety

In addition to the link and node V/C assessment described above, an operational safety flag analysis was undertaken for the Strategic Road Network (SRN), focusing on slip road queuing and operational capacity.

A location was flagged as high risk if

- a large increase in V/C of more than 5% between the Core Minus scenario and the PSO scenario, resulting in a delay of greater than 100%; or
- the change in the maximum SRN slip road queue length between the Core Minus and PSO scenarios exceeded 50 m, and the resulting slip road queue length (expressed as a percentage of link capacity) exceeded 100%.

Traffic volume changes of less than 20 vehicles or 1% were screened out.

Figure 6-13 shows how these two factors were used to determine if the impact of the PSO without intervention should be rated as 'low', 'medium' or 'high'.

Figure 6-13: Derivation of ratings for operational safety 'flag analysis'

		Resultant V/C ratio (in PSO scenario)		
		Below 85%	85 to 100%	Over 100%
Increase in V/C ratio	Less than 5%	Low	Low	Medium
	5 to 10%	Low	Medium	High
	Over 10%	Low	Medium	High

		Slip road queue length (as a % of link capacity)		
		Below 85%	85 to 100%	Over 100%
Change in slip road maximum queue length	Less than 50m	Low	Low	High
	50m to 400m	Low	Medium	High
	Over 400m	Low	Medium	High

Following this assessment, no SRN slip road locations were found to flag as medium or high risk for either queue length change or resultant V/C, in either the AM or PM peak period. On this basis, no operational safety concerns relating to SRN slip road queuing have been identified as a result of the PSO.

6.5.6.4 Level Crossings

There are two general traffic level crossings within the Cotswolds District: Blockley and Chipping Campden. According to Network Rail's current Level Crossing Risk Assessment, Blockley has a risk rating of K while Chipping Campden has a risk rating of J. The assessment uses a scale from A to M where A represents a very high risk and M represents a very low risk. Therefore, both level crossings are currently classified as being on the lower-risk end of the scale.

To assess the impact of the PSO, ALCRM outputs for the baseline level crossing risk have been considered alongside a high-level assessment of the changes in crossing usage arising from the Local Plan. The assessment criteria and thresholds were discussed and agreed with the Technical Working Group (TWG). The assessment considered a combination of the percentage increase in traffic flow across each level crossing under the PSO scenario compared with the Core Minus scenario, together with the maximum queue length.

A level crossing is flagged as high impact if:

- more than a 10% increase in traffic flow and a maximum queue length exceeding 75% of the available stacking distance;
- a maximum queue length exceeding 100% of the available stacking distance.

The assessment criteria are summarised in Table 6-10.

Table 6-10: Derivation of ratings for level crossing 'flag analysis'

			Maximum Queue Length		
			<75% stacking distance	75-100%	>100%
% increase in traffic flow across the level crossing with the PSO compared to the Core Minus	<5% increase in traffic flow	Low	Low	Medium	High
	5-10% increase in traffic flow	Medium	Low	Medium	High
	>10% increase in traffic flow	High	Low	High	High

This assessment identified that the majority of affected level crossings have a medium-low baseline risk. However, Northway and Blockley level crossings were identified as higher-risk crossings (ALCRM Risk Category D) where forecast peak hour traffic flows are expected to increase by more than 10%. These locations may therefore require further consideration by Network Rail through more detailed assessment of the potential impacts.

7. Vision-led transport strategy

7.1 Introduction

This chapter describes the process of identifying, assessing, shortlisting and packaging the transport policies, infrastructure and services which:

- are necessary to take every practical means to achieve the transport vision and objectives of the Local Plan;
- mitigate unacceptable, residual impacts of the Preferred Spatial Option (PSO); and
- are feasible and affordable.

7.2 Summary of approach

Primarily, a comprehensive long list of transport interventions was identified and assessed individually at a high level, including consideration and alignment with the Local Plan vision and objectives, feasibility, deliverability and affordability. This assessment informed the selection of interventions for a series of transport packages, previously introduced in Section 5.7.

In total, four intervention packages were developed and tested through an iterative process:

- **Package A (Business as Usual+)** represented the minimum level of vision-led intervention, comprising measures that are expected to be delivered through existing commitments together with additional interventions required to support the Local Plan
- **Package B (Visionary Ambition)** built on Package A by introducing additional sustainable transport measures intended to maximise progress towards the Local Plan transport vision and objectives.
- **Package C (Mitigation Measures)** was developed based on where residual impacts remained after the assessment of Package B. It retained the critical and essential measures from Package B and added targeted highways mitigation measures to address remaining impacts on the network.
- **Package D (Vision-Led Scenario)** was developed following refinement of the PSO, incorporating changes arising from the modelling results, stakeholder feedback and minor updates to the spatial strategy. It represents the final recommended package of vision-led transport interventions to support the Local Plan, alongside the residual mitigation measures identified in Package C.

The packaged interventions were then assessed collectively for their impact, using the forecasting approaches described in Section 5.8. This assessment is presented in Section 7.6.

7.3 Interventions 'long list'

7.3.1 Introduction

This section describes the long list of interventions and how they were identified. Later sections describe how the long list was reduced to the final Package D of interventions and policies for inclusion in the Local Plan and/or Infrastructure Delivery Plan.

It is important to note that the objective was to identify interventions to support achievement of the transport vision; and to mitigate unacceptable transport impacts of the Local Plan related growth. Measures to support the transport vision are inherently intended to provide sustainable travel options to and from the PSO sites and minimise the need for travel by private car. Connecting the sites to existing amenities and sustainable transport networks was therefore a priority.

Implicit in this approach, is that it was not the intention to identify interventions required to deal with existing transport issues or those expected in the future without the Local Plan. Such matters are the responsibility of relevant highway and local transport authorities within the district and beyond. The focus on interventions was therefore where the Local Plan development traffic would make the transport network unacceptably worse compared to a without Local Plan future scenario.

The long list of interventions is intentionally broad and includes both site-specific and wider strategic interventions. Inclusion within the long list does not imply confirmed delivery, funding, or policy commitment. Instead, it provides the basis for subsequent sifting, appraisal, and identification of potential transport packages capable of supporting the emerging Local Plan strategy.

7.3.2 Identification of interventions

The long list of interventions was developed iteratively over a period of weeks. The initial focus was on identification of 'vision-led' interventions, i.e. proactive, top-down interventions which could support achievement of the transport vision and objectives. Subsequent activities identified 'mitigation' measures, i.e. interventions which may be required to manage unacceptable impacts of PSO-related traffic on the highway network.

Figure 7-1: Intervention classes

The following activities informed identification of the long list of interventions:

1. Review of existing infrastructure and service provision.
2. Examination of levels of connectivity by mode (using the DfT's Connectivity Tool) and current challenges and issues on the networks.
3. A review of existing delivery plans at district, county and national levels; for example the Gloucestershire County Council (GCC) Local Cycling & Walking Implementation Plans and Bus Service Improvement Plan.
4. Engagement with GCC, National Highways and other key stakeholders about investment plans under development (such as GCC's bus rapid transit proposal and updated Local Transport Plan).

5. Review of site masterplans (where existing).
6. Site visits to identify local connectivity measures to/from sites.
7. Examination of the location of existing local amenities, barriers to movement and opportunities to improve accessibility to identify additional local and strategic interventions.
8. Further engagement with GCC and National Highways to review the long list, identify any remaining gaps or issues.

7.4 The intervention 'long list'

Interventions within the long list can be broadly grouped as shown in Figure 7-2. All interventions are assumed to be compliant with relevant standard and best practice, and relevant Local Plan strategic policies.

Figure 7-2: Intervention typology

Class	Type	Example
Vision-led	Enhanced provision of **amenities and facilities** within new settlements and large sites.	Schools, retail, flexible office space.
	Local active travel infrastructure to provide direct access to the PSO sites.	New or improved walking and cycling routes.
	Strategic active travel infrastructure to provide high quality walking and/or cycling connectivity between sites and existing amenities, or to neighbouring settlements.	Greenways and 'quiet lanes'.
	New or enhanced **bus services** serving the sites.	Higher frequencies, route diversion, bus services.
	Rail service enhancements.	New stations, higher frequencies.
	New or enhanced **public transport infrastructure** to improve the reliability and attractiveness of public transport journeys.	Enhanced bus stops, mobility hubs, bus priority, bus gates.
	Infrastructure and/or services to support uptake of **micromobility and e-bikes**.	Micromobility trials, e-bike hire schemes.
	Improvements to the quality of **public realm** to enhance the quality of places.	Liveable neighbourhoods.
	Infrastructure or policies to **manage down the demand** for use of private cars.	Parking supply management, park & ride sites
Mitigation	Local **highway access** to sites.	New or improved junctions.
	Measures to **improve safety** for all road users including pedestrians and cyclists.	20 mph zones, traffic restrictions.
	Additional measures to ensure reliable bus services where PSO-related traffic increases delays.	Bus priority.

Class	Type	Example
	Targeted measures to **reduce unacceptable impacts (delays)** on general traffic and buses.	Junction capacity improvements, highway widening.

7.5 Initial intervention sift

7.5.1 Introduction

Following identification of the long list, an initial sifting process was followed to rule-out any interventions deemed to be undeliverable or unaffordable. The remaining interventions were taken forward for further assessment in terms of their impacts, feasibility and cost. A relatively small number of interventions were ruled out as the approach taken was to retain them unless there was a strong reason for, and agreement amongst stakeholders to, rule them out.

7.5.2 Approach to sifting

The sifting followed an approach considered proportionate to the stage in the planning process, the large number of interventions and the wide range of small active travel schemes to large infrastructure proposals.

The interventions were assessed against criteria which captured their alignment to the transport objectives (see Section 2.5) and their deliverability. The eleven criteria are shown in Figure 7-3; they are a combination of tests of alignment with the Local Plan transport objectives and a number of measures of deliverability.

Figure 7-3: Intervention assessment criteria and themes

Alignment to transport objectives	Fit with Objective #1: Meeting needs locally
	Fit with Objective #2: Healthier & greener transport
	Fit with Objective #3: Harmonious places
	Fit with Objective #4**:** Safe & resilient networks
	Fit with Objective #5**:** Attractive & viable public transport
Deliverability	Public acceptability
	Technical feasibility
	Timeliness
	Capital cost
	Affordability
	Alignment with wider policy and strategy objectives

The alignment to transport objective criteria were assessed by considering the:

- likely effectiveness of the intervention in supporting achievement of the objective; and
- the number of trips likely to be influenced by the intervention.

Interventions affecting a larger proportion of Local Plan trips and achieving stronger transport outcomes generally received higher ratings, while measures with limited effectiveness or influence received lower scores.

Each intervention was scored using a Red/Amber/Green (RAG) rating system against each criterion. The interventions were scored based on professional judgement informed by outcomes elsewhere. Scoring of the affordability of interventions was based on high level cost estimates based on unit rates and outturn costs from previous projects. Detailed costing, design or risk identification was not undertaken at this stage.

Following the high-level assessment and scoring of the intervention long list, together with detailed engagement with CDC and other key stakeholders, the long list was refined to develop Package A (Business as Usual+) and Package B (Visionary Ambition).

Each package was assessed and the outputs were reviewed against the vision and objectives, as well as the flag analysis presented in Section 7.5. This analysis evaluated the transport measures and identified locations where they had resolved or reduced transport impacts, meaning that highway interventions were not required. As part of this process, each intervention was reviewed and categorised as 'Critical', 'Essential' or 'Important', according to its relative importance in supporting the Local Plan.

These findings, together with stakeholder feedback, informed the development of Package C (Mitigation Package), which introduced the targeted highways mitigation measures to address any residual impacts on the network.

The assessment of Packages A, B and C, together with continued engagement with CDC and key stakeholders and revisions to the PSO informed the development of Package D, the final transport intervention package. It comprises the recommended combination of transport interventions required to support the delivery of the Local Plan, maximise progress towards the transport vision and objectives, and mitigate the residual transport impacts of the PSO.

A comprehensive list of the interventions and mitigation measures included within Package D is provided in Annex F. The locations of these interventions and mitigation measures are illustrated in the maps presented in Annex G.

7.6 Forecast impacts of the Vision-Led Scenario

The Vision-Led Scenario (VLS) for CDC is comprised of Package D, combining the Local Plan growth with the refined transport intervention and mitigations. This section compares the VLS with the PSO scenario (i.e. the PSO without transport interventions) to assess the impact of the Package D measures. Both scenarios assume the same Local Plan sites; however, only the VLS includes the final transport interventions and mitigation measures detailed in the final shortlist (Package D) set out in Annex F.

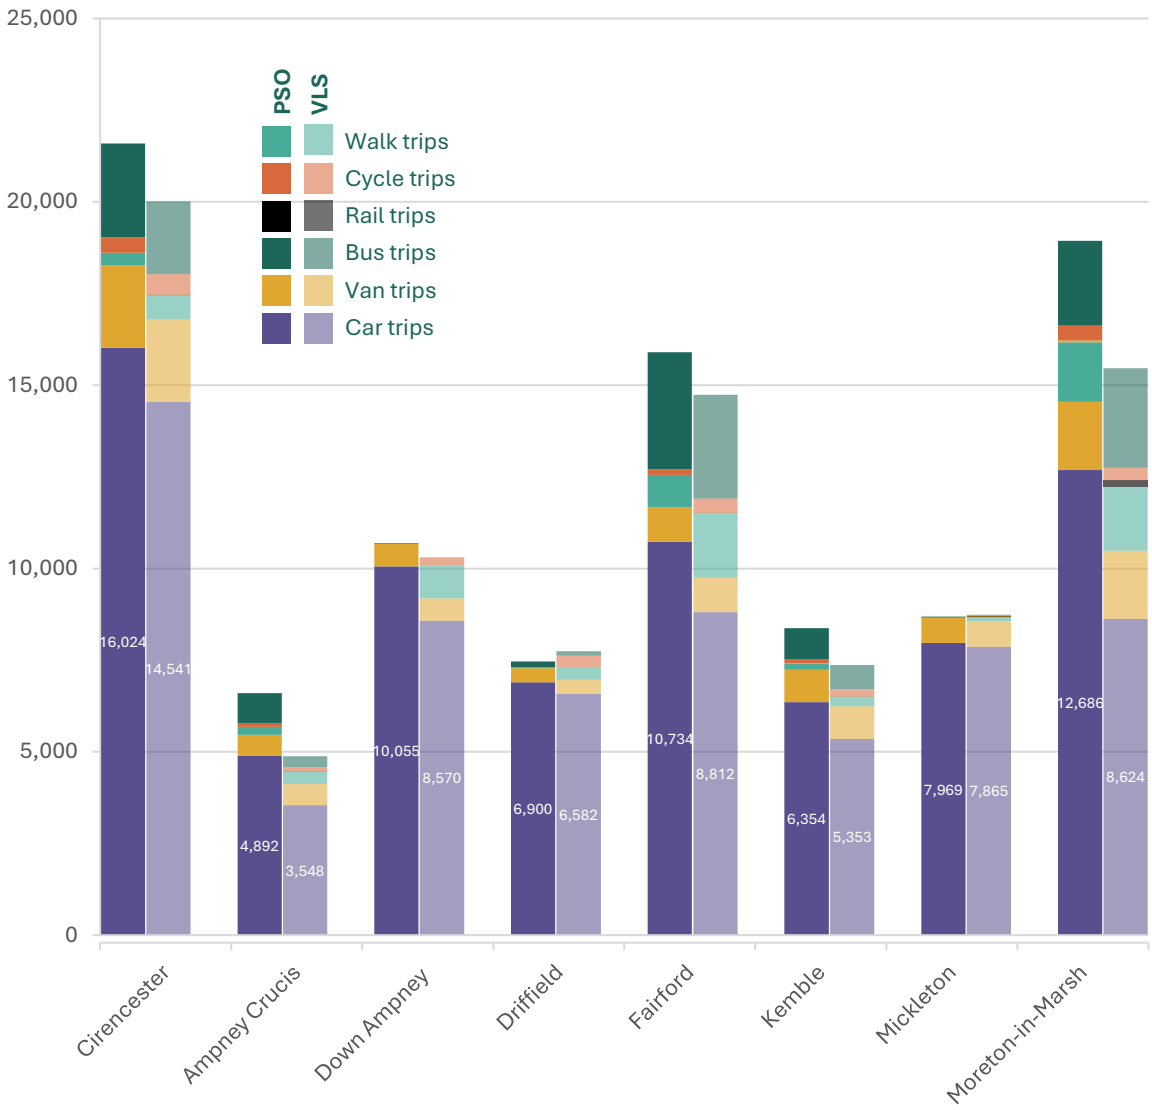
This section details the impact of the VLS in terms of changes to overall trip making and in regard to the KPIs set out in Section 2.6. Overall, it assesses the extent to which the transport interventions and mitigations present in the VLS fulfil the transport vision and objectives set out for the Local Plan.

The results presented are considered to be worst-case in terms of the share of trips which are made by modes other than car or van. This is because:

- The average public transport and active travel mode shares in the district are considerably higher than those assumed in the modelling via the trip rates, even for deeply rural locations.
- As the VDM predicts the mode shift, not the absolute mode share, a higher non-car mode share assumption pre-VDM would result in a higher non-car mode share post-VDM than can reliably be expected. They do not reflect:
  - understanding that new behaviour is easier to shift than existing behaviour;
  - cultural change factors e.g. Netherlands style change in attitudes towards cycling; or
  - multi-modal factors e.g. active travel improvements creating high viability of public transport for longer distance trips.

7.6.1 Overall changes to trip making

As previously discussed in Section 6.5.2, Local Plan growth is expected to substantially increase the number of trips undertaken in the district compared to the Core Minus scenario. Similar to modelling the impacts of the PSO, when modelling the impacts of the VLS, sites comprising more than 500 dwellings were represented as separate zones within the GC3M, allowing their trip generation and network impacts to be isolated. Figure 7-4 illustrates the additional trips associated with these major development sites, aggregated by settlement, after the introduction of the interventions and mitigations in the VLS.



The majority of this decrease is driven by a reduction in car travel, with car trips falling by around 11,700 across the settlements. While there are increases in bus, rail and cycle trips, these only partially offset the reduction in car use. Van trips remain effectively unchanged, reflecting that the VLS does not include any interventions specifically targeting van travel.

Walking trips appear to decrease under the VLS. This may reflect some short walking trips shifting to cycling or public transport as these modes become more attractive. It may also be influenced by the modelling approach, which does not fully capture the internalisation of trips, meaning the reduction in walking trip should be interpreted with caution.

Overall, the package results in a net reduction in total trips, driven primarily by lower levels of car travel and accompanied by a shift towards more sustainable modes. The reduction in car trips is likely to reflect a combination of trip evaporation and trip consolidation, as some interventions make some car journeys less convenient while encouraging travellers to combine trips or choose alternative modes. In addition, the several site masterplans include onsite services. There are expected to increase the number of shorter, intra-site trips that can be made on foot or cycle, which are not included in the trip outputs.

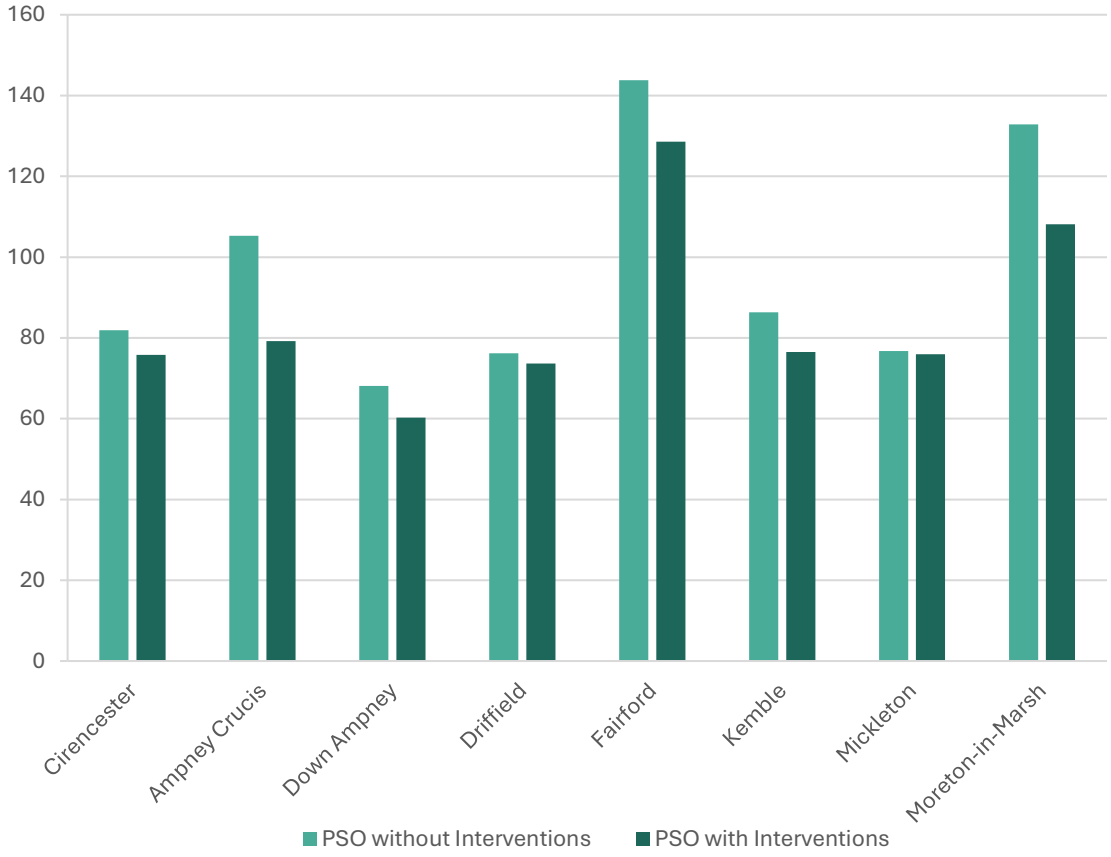
It should be noted that during model development, an issue with the VLS network connectors restricted access to bus stops close to the Ampney Crucis settlement, affecting access to routes and influencing the distribution of bus trips. This issue was resolved by adjusting the affected trips so access from an alternative direction was increased, restoring connectivity to the bus stops.

Figure 7-4: Total number of trips to/from the residential sites in the PSO and VLS by settlement (during a weekday 12-hour period)

7.6.2 Impact on meeting vision and objectives

7.6.2.1 Objective #1: Meeting needs locally

To achieve Objective #1, under the VLS the development sites masterplans are expected to deliver services and facilities within the sites where appropriate, reducing the need to travel. The masterplans are expected to prioritise walking and cycling journey within the sites, delivered alongside high quality active travel interventions connecting the sites to local services. This enables residents to access a wider range of services without relying on a private car.



To assess the impact of the VLS on Objective #1, the average total distance travelled per day by cars/van per resident was calculated across the settlements. Figure 7-5 shows that the VLS reduces average travel distances across all settlements, with the most significant

reductions observed in Ampney Crucis (-22%) and Moreton-in-Marsh (-18%). The smallest reduction is seen in Mickleton, where travel distances decrease by less than 1%.

Despite the reductions achieved through the VLS, average daily distance travelled per resident remains the highest in Fairford, at 128 km per day, followed by Moreton-in-Marsh at 108 km per day. Conversely, Down Ampney records the lowest average distance travelled per resident, at 60 km per day.

These results indicate that while the VLS helps reduce car and van travel across settlements, existing difference in travel patterns and settlement characteristics continue to influence overall travel demand.

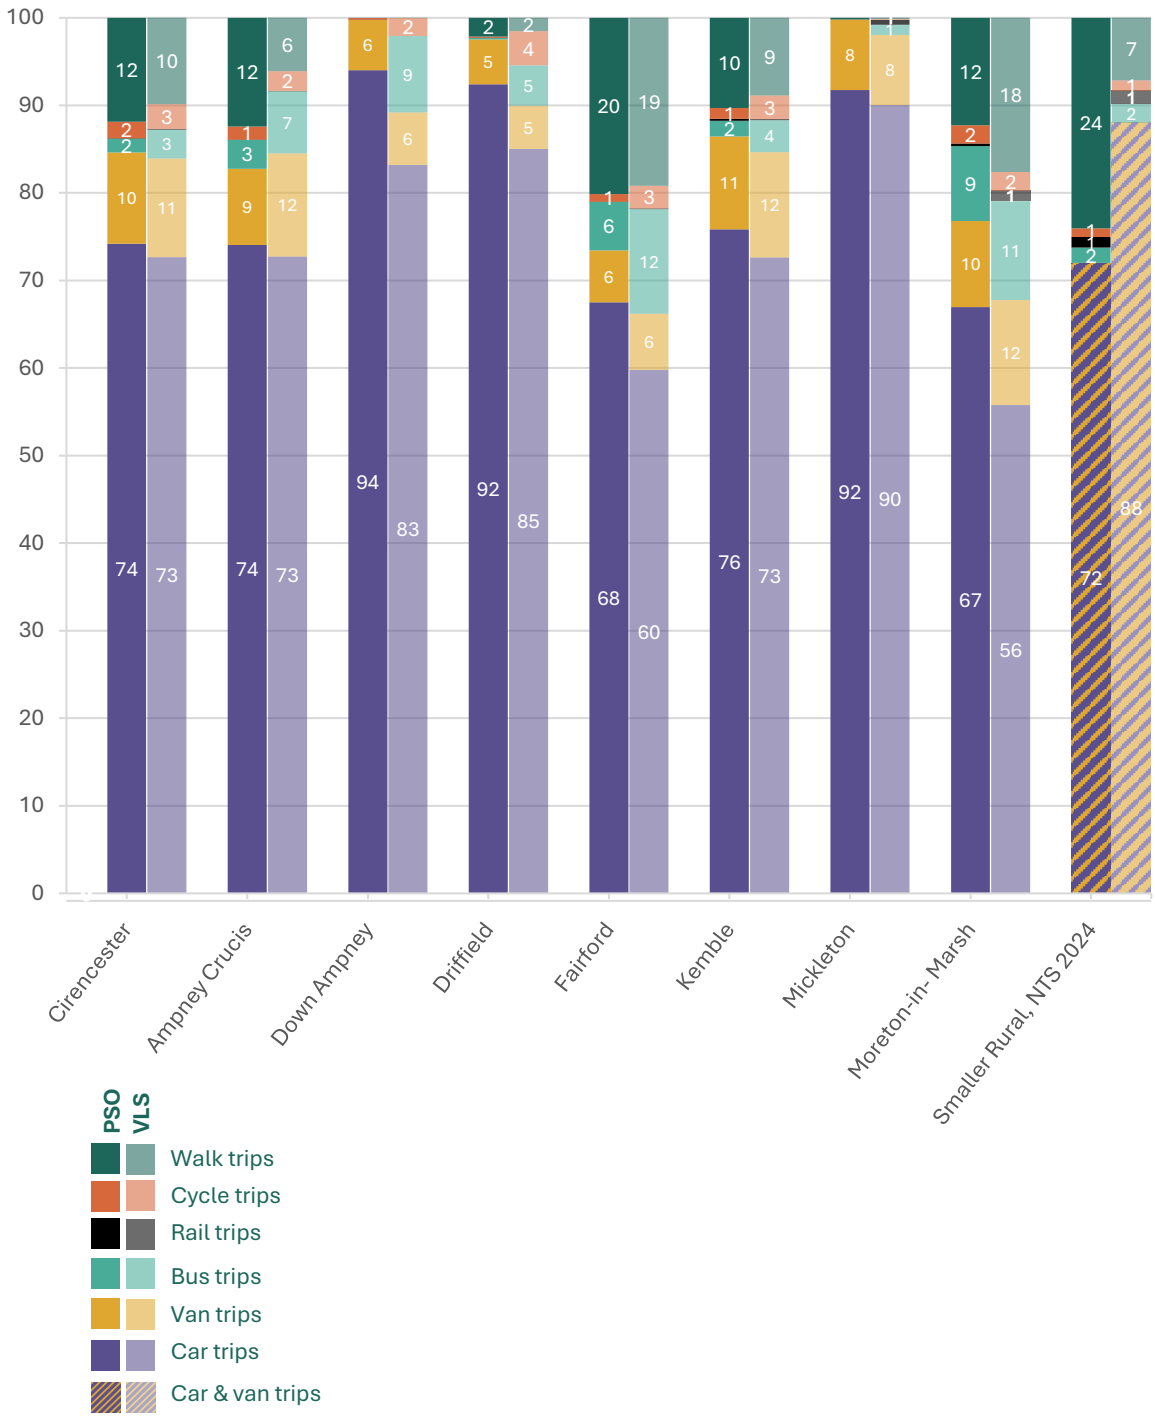
Figure 7-5: Average distance travelled per day per resident in the PSO and VLS (weekday 12 hours)

7.6.2.2 Objective #2: Healthier & greener transport

To support Objective #2, under the VLS the masterplans and policies for the proposed sites are assumed to promote active and sustainable travel and deliver best practice levels of infrastructure. This includes the delivery of high-quality active travel infrastructure within the sites, alongside wider interventions that enable healthier and greener travel patterns. These measures will support sustainable journeys both within the sites and to/from surrounding areas.

In addition, EV charging points are expected to be delivered across the sites, aligning with the wider district-wide EV charging strategy and supporting the transition towards lower-emission travel. Parcel hubs and dedicated drop-off/collection points are also expected to

be incorporated within the sites to support more efficient last-mile freight deliveries, reducing unnecessary vehicle trips.



To assess the impacts of VLS against Objective #2, the change in mode share for trips to/from the residential sites was calculated for each settlement. Figure 7-6 below present the mode share for each settlement in the PSO scenario and with the impacts of the VLS.

Under the VLS, a reduction in car and van mode share is observed in Down Ampney, Driffield, Fairford, Kemble and Moreton-in-Marsh, indicating a shift away from private vehicle use in these settlements. This change is accompanied by an increase in bus mode share across all settlements, with the most notable increases observed in Fairford, Ampney Crucis and Kemble. These results suggest that the VLS supports a shift towards more sustainable travel modes, particularly through improved uptake of public transport.

The GC3M strategic model generally forecasts lower levels of walking than would be expected in practice. This is likely because the model is not designed to capture many shorter walking trips, particularly those of less than one mile, which fall beyond the scope of the strategic model. To provide a more representative comparison, National Travel Survey (2024) benchmarks have been included for similar smaller rural settlements to account for these shorter walking trips. These benchmarks provide a reasonable range within which the walking mode share is likely to fall.

Taking this into account, the results indicate that, aside from the known limitations related to walking, the VLS mode shares are generally comparable to, or better than, those observed in similar settlements for cycling, bus and walking, and in the case of Moreton-in-Marsh, rail. Kemble remains below similar settlements for rail mode share, while Mickleton continues to perform below comparable settlements across sustainable modes, even following the implementation of the VLS.

Figure 7-6: Mode share of all trips to/from PSO residential sites only in the PSO and VLS (weekday 12 hours)

7.6.2.3 Objective #3: Harmonious places

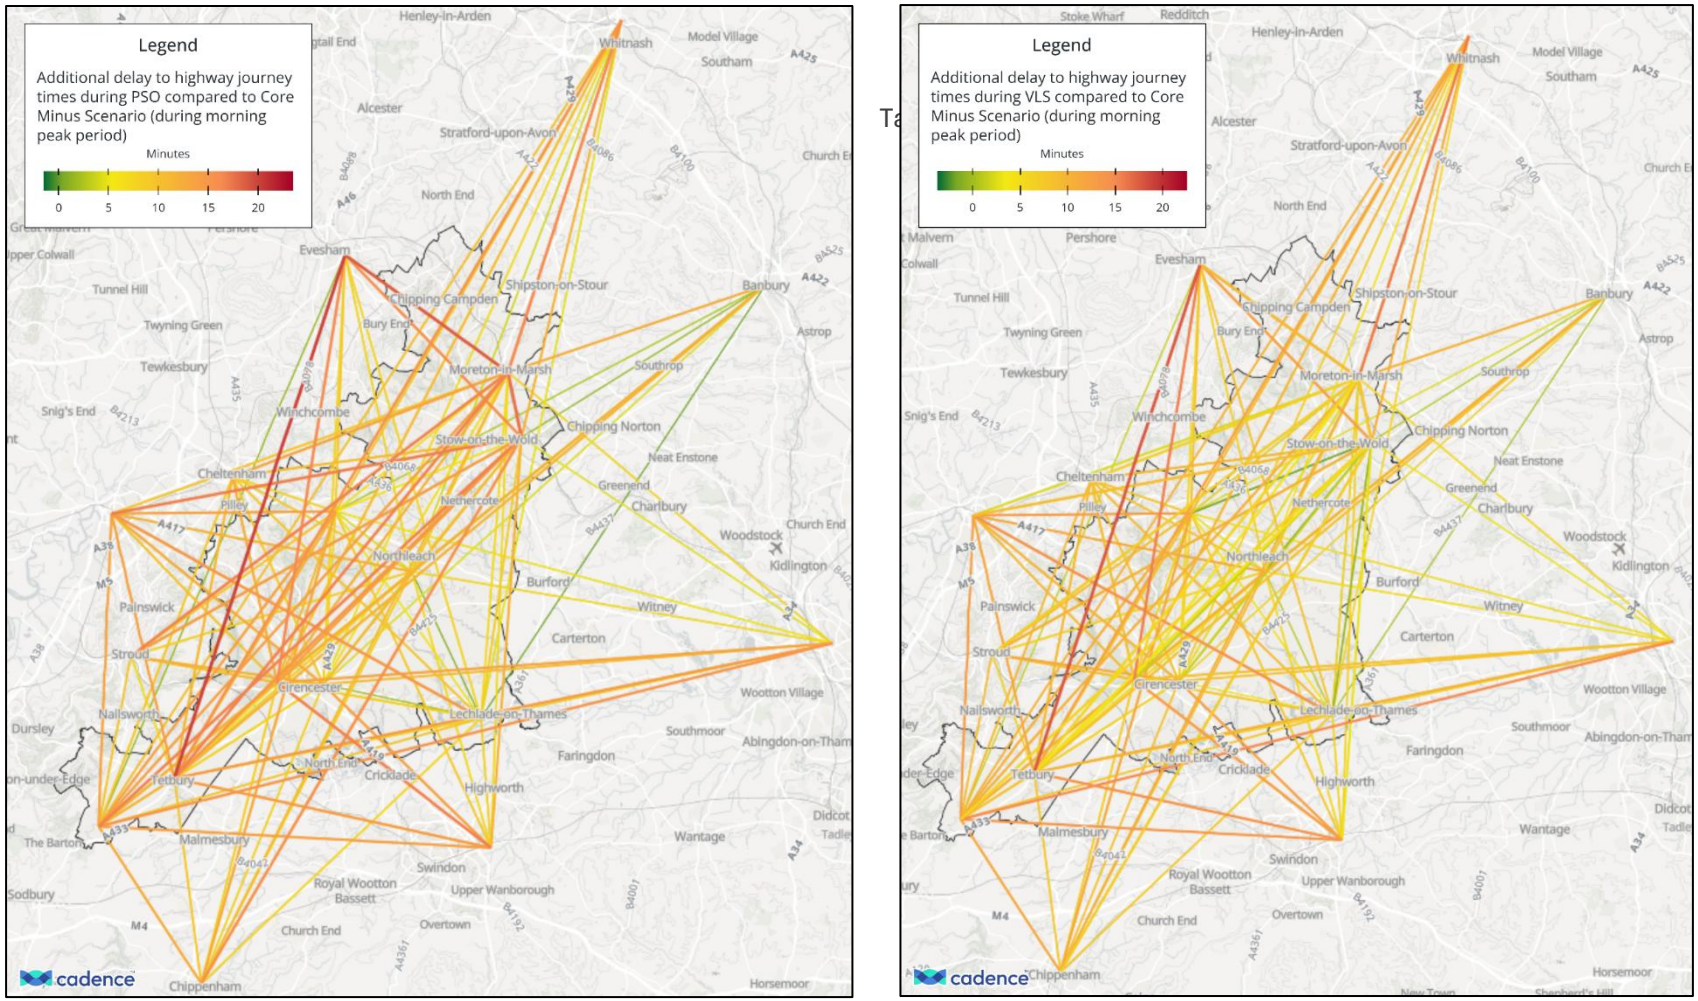
In achieving Objective #3, the development sites and the required transport infrastructure to support them are expected to be designed and delivered to a high standard. This includes minimising the impacts of through traffic on air quality, ensuring site layouts and

infrastructure proposals adhere to natural heritage and protected landscape guidelines, and integrating high-quality green spaces as part of the overall design.

Transport infrastructure should be carefully planned to enable safe and sustainable movement while complementing the character of the surrounding area. This means ensuring the roads and associated infrastructure do not dominate the landscape or detract from the quality and identity of the places being created.

7.6.2.4 Objective #4: Safe & resilient networks

To achieve Objective #4, it is expected that the masterplans of each site would adopt a Vision Zero approach, prioritising the prevention of serious injuries and improving safety through design. Alongside this, all new transport interventions and services are expected to be delivered to a high safety standard, incorporating appropriate measures such as lighting, clear visibility, barriers and signage to support safe movement for all users.



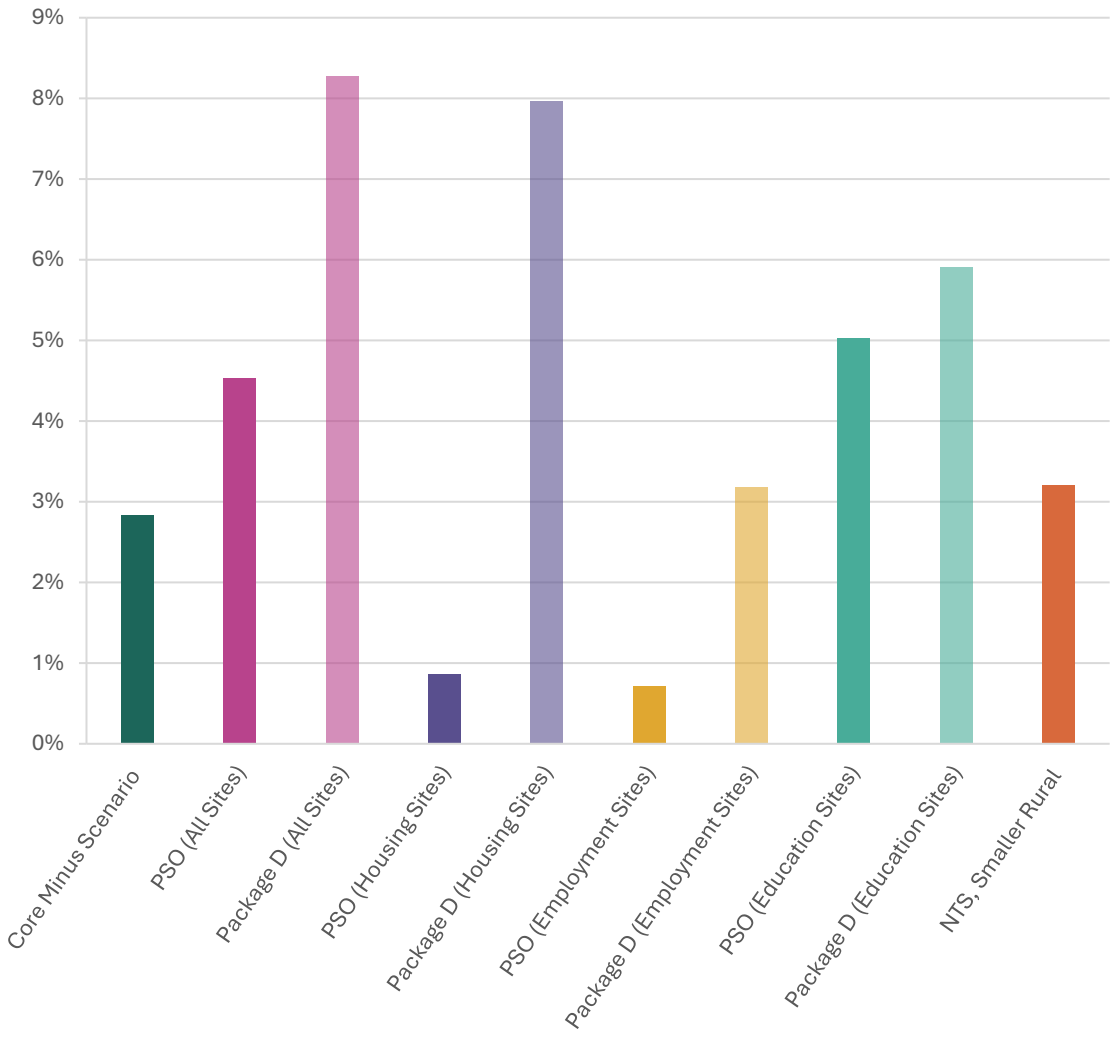
The VLS delivers a multimodal transport strategy, including improved active travel and public transport provision, providing users with a range of travel options for individual journeys. The new walking and cycling routes will be designed to be safe, attractive and resilient, providing reliable connections that can support travel in all conditions.

To assess the impact of the VLS on achieving Objective #3, highways journey times were compared under the PSO and VLS scenarios. This provides an indication of the highway network's resilience, showing the ability of the network to absorb disruption and support safe and reliable movement within the district.

Under the PSO scenario (Figure 7-7), a large proportion of routes within and to/from the district experience additional delays of at least 10 mins, compared to travel times in the Core Minus scenario. The greatest impacts are observed on inter district routes connecting Tetbury, Moreton-in-Marsh and Stow-on-the-Wold. In addition, intra-district routes originating from Tetbury experience the most significant delays, with journey times increasing by up to 20 minutes compared with the Core Minus scenario when travelling towards Evesham.

Under the VLS scenario (Figure 7-7), highway journey times experience comparatively lower additional delay of the Core Minus travel times than under the PSO scenario with intervention. The majority of routes within the district experience delays of between 1 and 10 minutes, demonstrating the effectiveness of the transport interventions and mitigations in the VLS. However, some intra-district routes continue to experience delays of over 15 minutes, including routes between Tetbury and Evesham, and Morton-in-Marsh and Leamington Spa. This indicates that areas with residual impacts remain.

Figure 7-7: Additional delay to highway journey times (mins) over the Core Minus scenario during morning peak period (08:00-09:00) under the PSO (left) and VLS (right)



7.6.2.5 Objective #5: Attractive & viable public transport

To achieve Objective #5, all new public transport routes under the VLS are expected to be delivered to a high standard, with high quality supporting infrastructure such as accessible stops, passenger waiting facilities, clear information and safe access.

To assess the impact of the VLS against Objective #5, the public transport mode share for all trips to/from PSO sites across the district was examined, in comparison to the public transport mode shares in the PSO scenario without intervention (Figure 7-8).

Figure 7-8 shows that averaged across all sites, the public transport mode share increases from 4.5% to 8.3% under the VLS. The largest increases are seen for housing and employment sites. Educations sites display a relatively smaller increase of only 0.9 percentage points. This is likely because trips to/from education sites already exhibit a comparatively high public transport mode share due to existing travel patterns.

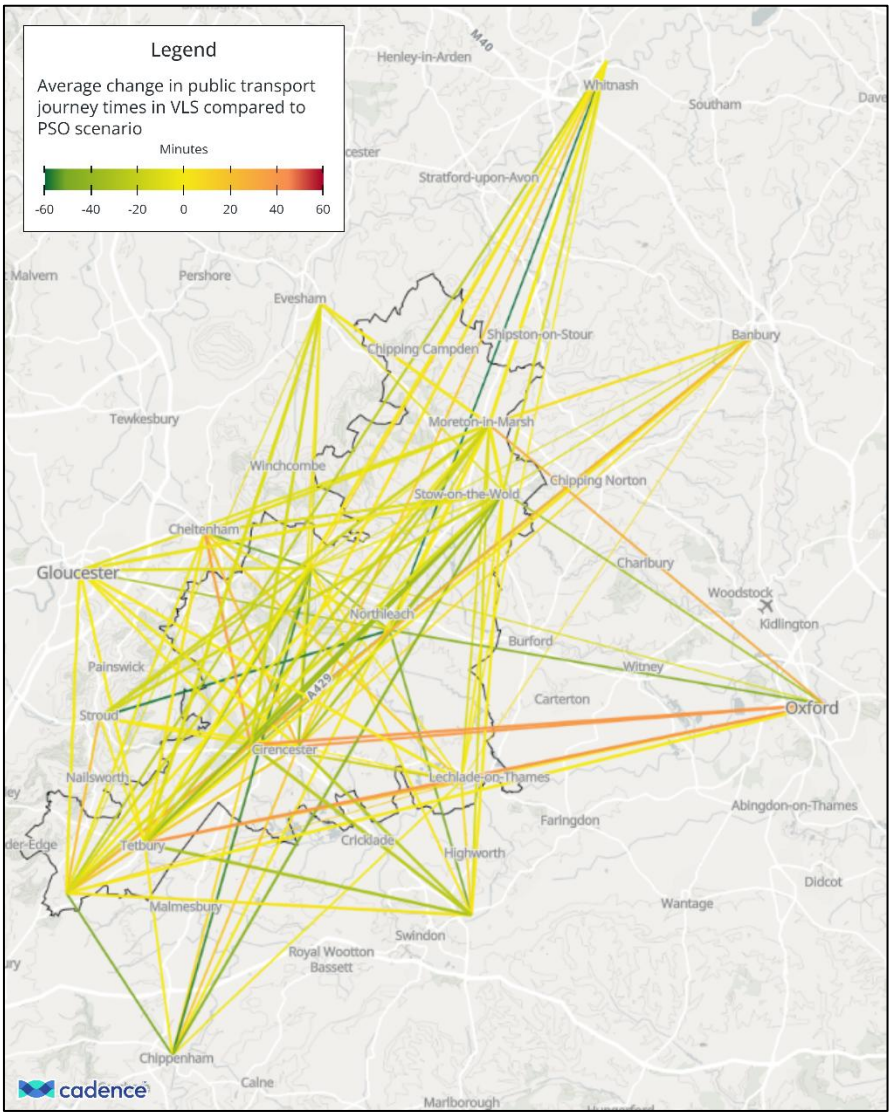


Figure 7-8: Public transport mode share of all trips to/from the PSO sites (weekday 12 hours)

Additionally, the average change of public transport journey times under the VLS, compared to the PSO was assessed to understand the impacts of the proposed public transport interventions on achieving Objective #5.

Figure 7-9 shows that intra-district public transport journey times either reduce or remain unchanged, whereas journeys to Oxford particularly appear to increase in time. Overall, the improvements to journey times within the district helps strengthen the attractiveness of the public transport network under the VLS.

Figure 7-9: Average change in public transport journey times (mins) in the VLS compared to the PSO scenario

ofImpacts on transport networks

7.6.2.6 Impacts on active travel

The impacts of the VLS on active travel networks was assessed following the approach used to assess the impacts of the PSO in Section 6.5.3. All modelled links were reviewed against the LTN 1/20 criteria to determine whether they provide adequate protection from motor traffic, based on cycling infrastructure, speed limits, traffic volumes, and HGV proportions.

The previous assessment of the PSO without intervention identified several routes, particularly in and around Cirencester, that became unsuitable for the majority of cyclists as a result of Local Plan growth. These flagged locations were subsequently assessed according to the scale and value of the mitigation required. For most of the active travel issues identified through the PSO, targeted interventions were incorporated into Package D to improve suitability for active travel. In addition, further active travel mitigation measures have been identified, although these were not included in the modelling at the time of the assessment.

Several active travel flags were considered not to require intervention or mitigation. These are summarised below in Table 7-1, together with the rationale for each decision.

Table 7-1: Active travel flags not receiving mitigation

Settlement	Flag Location	Reason
Cirencester	Spitalgate Lane/Thomas Street/Park Street	Methodology quirk- represents several different routes through one way system.
Cirencester	Unnamed Road from Cheltenham to Whiteway	This location is surrounded by an unsuitable active travel network and is therefore unlikely to attract or accommodate active travel movements.
Italy	Slip roads off A417 eastbound and westbound to Daglingworth	This flag arises from the methodology used to identify active travel flags, which is based on a speed assessment. Although the assessment highlights these locations, the roads are not considered suitable for active travel use and therefore no intervention or mitigation is proposed.
Kemble	Oxlease Road	This location is surrounded by an unsuitable active travel network and is therefore unlikely to attract or accommodate active travel movements.
Kemble	Unnamed road A433 to Rodmarton	This location is surrounded by an unsuitable active travel network and is therefore unlikely to attract or accommodate active travel movements.
Ewen	Ewen Road	This location is surrounded by an unsuitable active travel network and is therefore unlikely

Settlement	Flag Location	Reason
		to attract or accommodate active travel movements.
Driffield Junction	Slip road off A417 southbound at Spine Road Junction	This flag arises from the methodology used to identify active travel flags, which is based on a speed assessment. Although the assessment highlights these locations, the roads are not considered suitable for active travel use and therefore no intervention or mitigation is proposed.
Netherton	Springfield Road	This location is surrounded by an unsuitable active travel network and is therefore unlikely to attract or accommodate active travel movements.
Netherton	Church Road/Victoria Road	This location is surrounded by an unsuitable active travel network and is therefore unlikely to attract or accommodate active travel movements.
Northleach	West End/East End	This location is surrounded by an unsuitable active travel network and is therefore unlikely to attract or accommodate active travel movements.
Lower Slaughter	B4068	This location is surrounded by an unsuitable active travel network and is therefore unlikely to attract or accommodate active travel movements.
Stow-on-the-Wold	Parson's Corner	This location is surrounded by an unsuitable active travel network and is caused by only a minimal change in traffic flows along the route.
Evenlode	Adlestrop Road	This location is surrounded by an unsuitable active travel network and is therefore unlikely to attract or accommodate active travel movements.
Blockley	Station Road	This location is surrounded by an unsuitable active travel network and is therefore unlikely to attract or accommodate active travel movements.
Chipping Camden	Sheep Street	This is a result of the sensitivity of the methodology, where only minimal changes in flow cause locations to exceed the threshold considered unsuitable for active travel.

7.6.2.7 Impacts on delays and congestion affecting highway traffic

Approach

To understand the potential highway impacts of the PSO with Intervention, an identical VLS assessment of the operational performance of the highway network was undertaken for this scenario. The assessment drew on GC3M-based outputs for these scenarios, specifically:

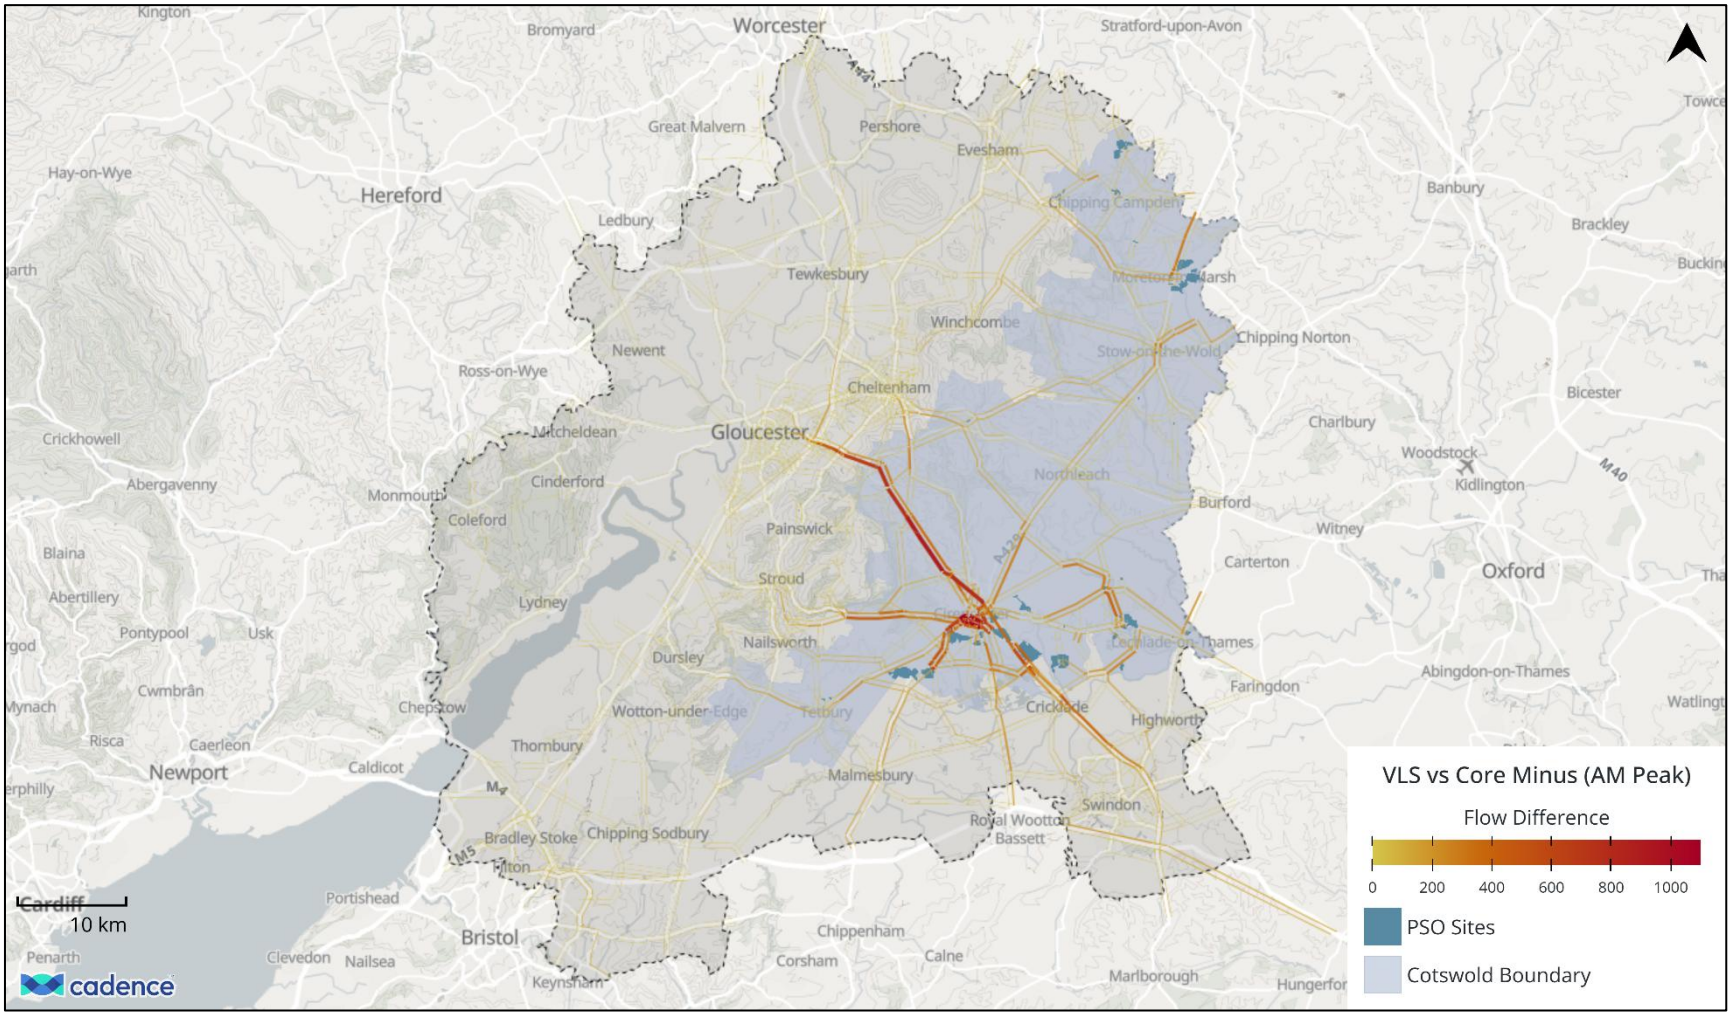
- forecast differences in traffic flows between the Core Minus Scenario and the VLS;
- forecast differences in the ratio of traffic volume and capacity ('V/C') of links and nodes; and
- where forecast increases (in the VLS scenario with respect to the Core Minus scenario) in traffic delay.

Forecast impact of the VLS on traffic flows

Figure 7-10 and Figure 7-11 represent the forecast difference in traffic flows between the VLS and the Core Minus scenario during the morning and evening peak hours, illustrating the impact of the proposed interventions and mitigations.

Compared to the PSO, the VLS results in a redistribution of traffic around Cirencester itself, with more traffic rerouted onto the Bristol Road/Swindon Road corridor and the A429 (Bristol Road) within the town, rather than concentrated on the A419/A417 approaches as under the PSO scenario. Additionally, under the VLS, traffic growth on the A429 north of Cirencester is reduced relative to PSO scenario, and the increases previously seen on routes serving Moreton-in-Marsh and the northern part of the district are also lower under the VLS.

Figure 7-10: Forecasted traffic flow difference on links between VLS and Core Minus scenario during morning peak hour (08:00-09:00)



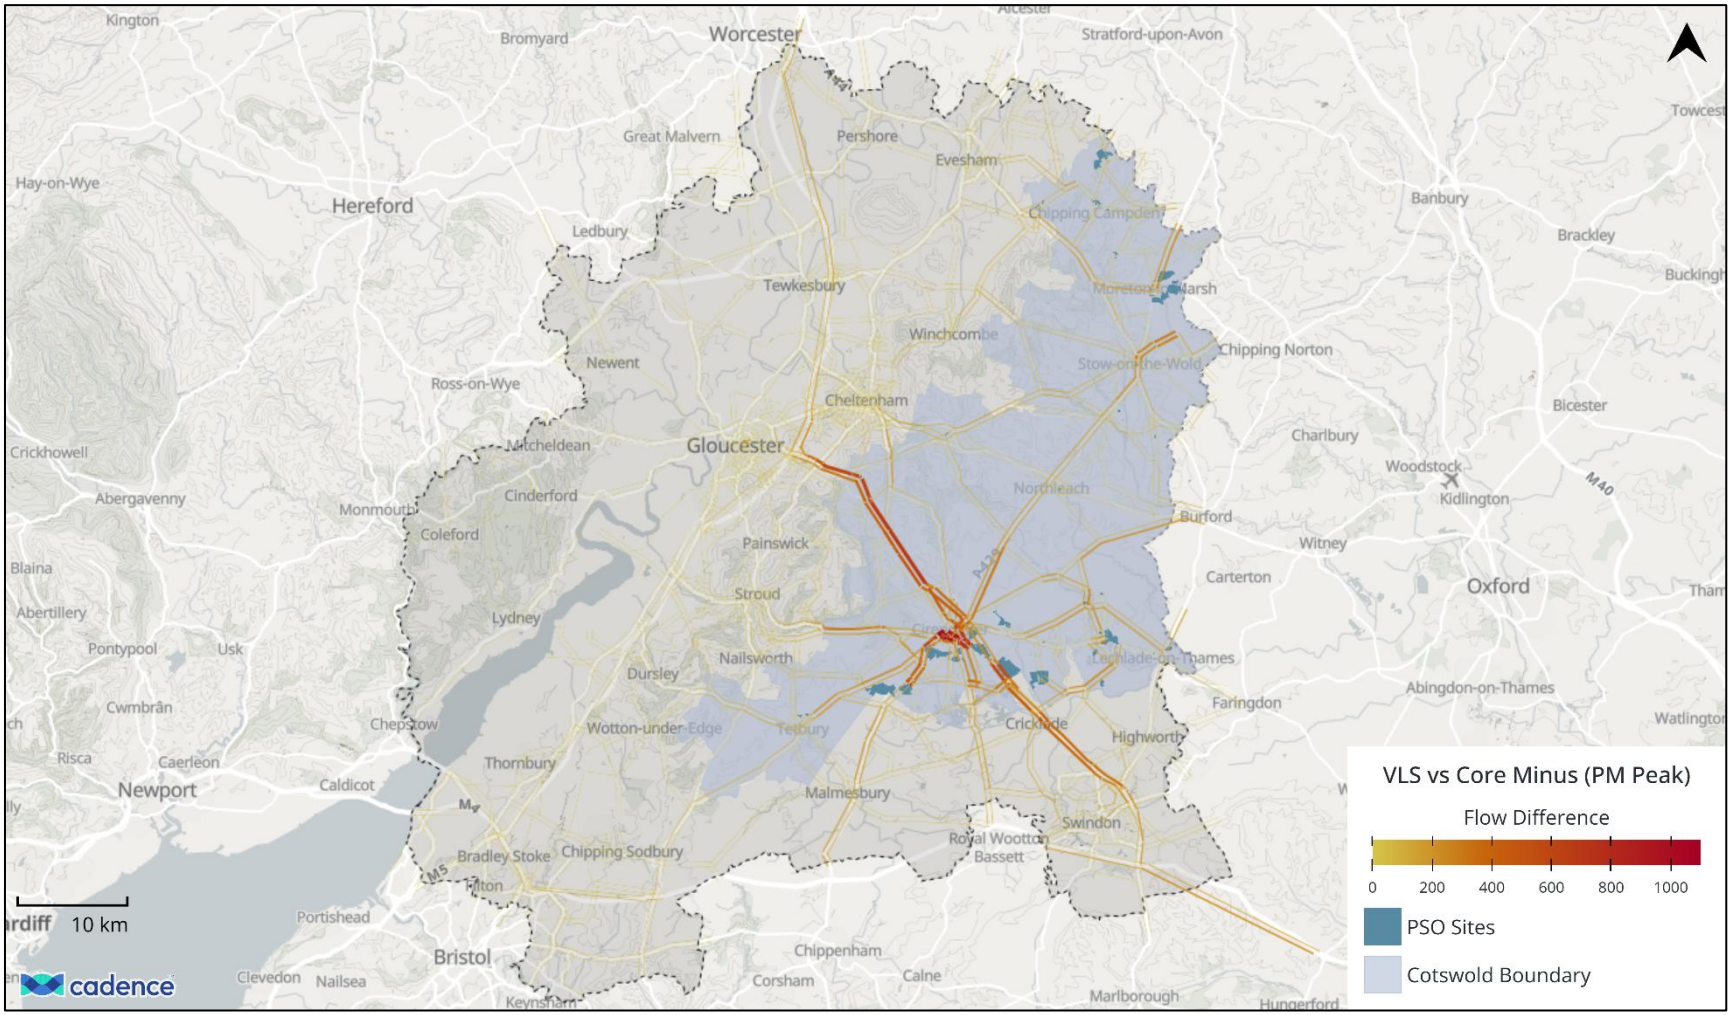


Figure 7-11: Forecasted traffic flow difference on links between VLS and Core Minus scenario during evening peak hour (17:00-18:00)

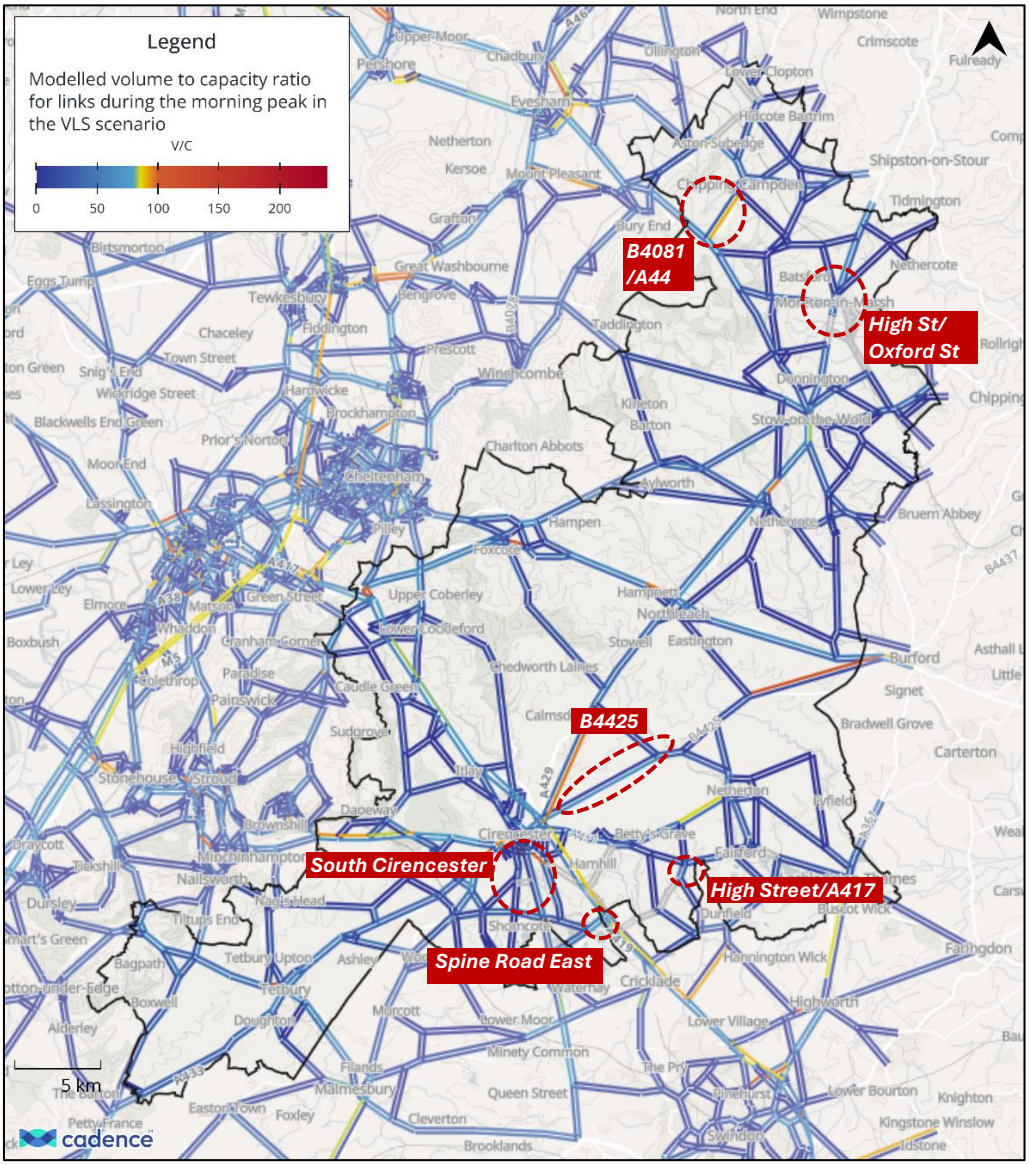
Forecast impacts of the VLS on the ratio of traffic volume and capacity ('V/C')



The modelled link V/C ratios for the VLS scenario in the future year morning peak hour (08:00-09:00) are shown in Figure 7-12.

Compared with the PSO, the VLS shows reduced V/C ratios on several key network links. This reflects the impact of the proposed interventions reducing traffic volumes at locations that were previously approaching or exceeding operational capacity.

The following locations were identified in the PSO as exceeding operational capacity during the morning peak hour but now have reduced V/C ratios:

- B4081 southbound from Chipping Campden approaching the A44/B4081 intersection, where V/C reduces from 101% to 90%;
- the High Street/Oxford Street junction in Moreton-in-Marsh, where V/C reduces from 105%/102% to 91%/74%;
- south Cirencester, where V/C on Somerford Road reduces substantially from 102%/97% to 14%/15%, and on the A429/Chesterton Lane junction reduces from 109% to 95%;
- the B4425 approaching the A429/B4229 intersection, where V/C reduces from 92% to 66%;
- Spine Road East approaching the Station Road/Cerney Wick Lane intersection, where V/C reduces from 101% to 78%;
- High Street approaching the A417 Roman Road junction, where V/C reduces from 103% to 59%.

Figure 7-12: Forecasted volume to capacity (V/C) ratio on modelled links under the VLS during morning peak hour (08:00-09:00)

7.6.2.8 Delay and V/C ratio 'flag' analysis

Delay and V/C ratio flag analysis was undertaken for the VLS in accordance with the methodology and rating thresholds set out in Section 6.5.6.

The analysis indicates that the majority of links and junctions initially identified as experiencing high impacts were successfully addressed through the tested mitigation measures. Results are summarised in Table 7-2 to Table 7-5.

In the AM peak, one junction remains flagged at the A419 Swindon Road/A429 Bristol Road Roundabout in Cirencester. A mitigation strategy has already been identified for this location. It is therefore recommended that any remaining operational concerns are

considered through more detailed junction assessment or microsimulation modelling at the detailed design stage, rather than through further strategic model testing.

In the PM Peak, the following junctions remain flagged:

- B4063 London Road/ Horton Road (In Gloucester);
- A4019 Swindon Road/Poole Way (In Cheltenham);
- B4014/A4135 (In Tetbury); and
- Merlin Way/Covingham Drive (In Covingham).

These locations lie outside the study area and beyond the Cotswold District boundary. As such, they are considered to represent modelled network 'noise' rather than impacts directly related to the proposed development. As such, they are not expected to require mitigation as part of this assessment and should instead be subject to a monitor and manage approach.

Table 7-2: Summary of link and junction V/C flag assessment results (AM Peak Hour)

		Resultant V/C ratio (in PSO scenario)		
		Below 85%	85 to 100%	Over 100%
Increase in V/C ratio	Less than 5%	2338	52	6
	5 to 10%	574	26	0
	Over 10%	580	33	1

Table 7-3: Summary of link and junction V/C flag assessment results (PM Peak Hour)

		Resultant V/C ratio (in PSO scenario)		
		Below 85%	85 to 100%	Over 100%
Increase in V/C ratio	Less than 5%	2400	45	10
	5 to 10%	629	22	1
	Over 10%	594	21	2

Table 7-4: Summary of link and junction delay flag assessment results (AM Peak Hour)

		Resultant delay (in PSO scenario)		
		1-2 mins	2-5 mins	5 mins +
Increase in delay	Less than 5%	2158	6	0
	5 to 10%	314	1	0
	Over 10%	1124	7	0

Table 7-5: Summary of link and junction delay flag assessment results (PM Peak Hour)

		Resultant delay (in PSO scenario)		
		1-2 mins	2-5 mins	5 mins +
Increase in delay	Less than 5%	2418	7	1
	5 to 10%	358	1	1
	Over 10%	1260	14	1

8. Costs, funding, delivery & viability

8.1 Introduction

This section describes the approach taken to assessing the viability and deliverability of interventions in the transport package. The assessment has been informed by ongoing engagement with key stakeholders including Cotswold District Council (CDC), Gloucestershire County Council (GCC), National Highways (NH) and the Infrastructure Delivery Plan (IDP) consultants. These discussions have helped inform the feasibility, cost estimates and deliverability of the proposed interventions.

8.2 Methodology for estimating costs

A comprehensive exercise was undertaken to estimate the costs of all identified transport interventions, with a particular focus on larger strategic interventions. Provision of on-site amenities such as schools and retail were not costed as are addressed in the IDP. The methodology estimated both the cost of constructing new assets (capital costs) and the cost of ongoing operations and commuted maintenance (revenue expenditure).

8.2.1 Estimation of capital costs ('capex')

Capital costs were estimated for each intervention based on unit rates derived from outturn prices and estimates from a range of sources. Details of sources are provided in Annex F. Unit rates were derived for the following intervention types:

- Active travel infrastructure (including links to new developments): Unit rates were on a per-kilometre basis.
- Public transport infrastructure: Unit rates were a mix of a per-kilometre basis (e.g. bus lanes) and per-scheme basis (e.g. mobility hubs). Where appropriate a range of unit rates were used depending on the scheme size.
- Highway infrastructure: As above, some unit rates were on a per-kilometre basis (e.g. acoustic barriers, traffic calming) whilst others were on a per-scheme basis (e.g. new junctions, junction signalisation).
- Micro-mobility trials: Unit rates were based on the number of residents in developments.
- Park & ride sites: Based on the published costs for a previously delivered similar park & ride scheme.
- Bus services: Capital costs were not included because depreciation is included in the calculation of bus operating costs (see below).

For some of the schemes indicative total cost was used in the absence of sufficient detail to allow use of unit rates at this time.

Outturn costs and cost estimates were converted to 2025/26 prices using the DfT's Cost inflation Series (TAG Table A1.2.1).

8.2.2 Estimation of maintenance and operating costs ('opex')

Maintenance and operating costs were estimated for each intervention as follows:

- Infrastructure projects delivering asset types requiring intensive upkeep: additional commuted sum over a 15-year lifecycle period. The value applied was a percentage of the original capex, intended to reflect annual routine maintenance and a single renewal event. This includes interventions such as structures.
- All other infrastructure projects: no additional maintenance, renewal, or operating costs were assumed.
- Bus services: A unit rate per service kilometre was applied to additional mileage from new or enhanced conventional bus services. The unit rate was derived from the annual Cost Monitor (June 2025) prepared by the Confederation for Passenger Transport. Operating costs were assumed to be incurred for a five-year period.

8.3 Viability and Deliverability

The proposed transport interventions have undergone proportionate technical feasibility testing to ensure they are physically deliverable within the plan period. This assessment draws on the structured sifting and appraisal process set out in Chapter 7, where technical feasibility has been considered alongside deliverability factors including cost, timeliness and policy alignment.

Overall, the assessment indicates that the majority of interventions are capable of delivery within the Local Plan period, with no fundamental constraints identified that would preclude implementation.

1. **Route Design and Cost Assessment**

Interventions have been developed to a proportionate level of design detail to demonstrate their deliverability and provide an appropriate basis for cost estimation. Route options, particularly for active travel corridors and highways improvements, have been reviewed against land requirements, accessibility considerations and likely construction requirements.

Indicative costs have been developed based on the level of design available at this stage, with assumptions reflecting typical infrastructure requirements. Further detailed design, surveys and cost refinement would be undertaken at subsequent stages. However, the current assessment provides sufficient confidence that the interventions and mitigations represent viable and deliverahas ble measures.

2. **Feasibility Constraints**

Interventions have been subject to a high-level feasibility assessment to consider local constraints, including road widths, available road space, junction geometry, accessibility requirements and existing infrastructure conditions. Particular consideration has been given to locations identified as challenges through stakeholder feedback.

Where constraints have been identified, interventions have been refined through design/route amendments or changes to the intervention type. Schemes with significant challenges or uncertainty have been removed through the sifting process.

3. **Geographical and Third Party Land Constraints**

Schemes have been designed within the boundary of the existing public highway wherever possible, particularly for local highway access, junction improvements and active travel interventions. This reflects the intention to minimise land take and reduce delivery risk.

Where third-party land acquisition is required for more strategic interventions, such as strategic active travel corridors, mobility hubs or highway capacity improvements, a high-level assessment has been undertaken. Land requirements have been minimised where possible, and alternative options or safeguarding approaches have been identified to reduce potential barriers to delivery.

At this stage, third-party land requirements are not considered to represent insurmountable constraints and are consistent with standard delivery mechanisms through the Local Plan and Infrastructure Delivery Plan.

Interventions with more significant land or infrastructure requirements, particularly major rail schemes, have been subject to initial sifting and, where necessary, excluded or identified as requiring further feasibility work.

4. **Topographical and Environmental Factors**

Active travel designs have been verified against local topography to ensure gradients are broadly consistent with LTN 1/20 accessibility standards. Route selection prioritised more direct and lower-gradient corridors where feasible. Complementary measures, such as micromobility, also support feasibility in more challenging locations.

Drainage and environmental considerations have been incorporated at a high level. In particular, drainage assessments ensure designs can accommodate sustainable drainage systems (SuDS), especially where highway widening or corridor interventions are proposed. Wider environmental constraints, including flood risk, have been considered in identifying feasible intervention types and locations.

5. **Utility Allocations**

Utility allocations have been considered proportionately within the feasibility assessment. For major junction and highway schemes, indicative layouts and cost assumptions allow for potential diversions of statutory undertakers' equipment, including fibre, gas and electricity infrastructure.

Whilst detailed ground investigations (e.g. GPR surveys) would be required at later design stages, these constraints have been appropriately reflected at this stage and are not considered to undermine the overall feasibility of the intervention package.

6. **Transport Impact and Intervention Justification**

The final intervention package has been informed by evidence from the transport modelling assessment, ensuring that the interventions are proportionate to the identified impacts of the development. Where the PSO assessment indicated a limited change in transport conditions or where the model demonstrated limited uptake or benefit from the proposed interventions, the schemes were reviewed and, where appropriate, removed or amended.

This ensures that the final intervention package is focused on measures that provide a clear and evidenced transport benefit and can be justified against the impacts of Local Plan growth.

7. **Stakeholder Engagement and Package Refinement**

Stakeholder feedback has been incorporated throughout the development of the intervention package. Comments received during workshops and engagement have informed changes to the intervention scope, feasibility and prioritisation.

Where stakeholders identified additional transport issues or opportunities, new interventions were considered and incorporated where they demonstrated sufficient justification, deliverability and alignment with the Local Plan objectives.

8. **Infrastructure Delivery Plan Alignment and Delivery Review**

The intervention package has been reviewed iteratively with the Infrastructure Delivery Plan (IDP) consultants (Prior and Partners) to ensure that infrastructure requirements are appropriately identified, justified, and align with the wider delivery framework. This has included consideration of overall package viability, funding requirements, delivery mechanisms and justification based on site impacts.

This process has supported the refinement of the package to ensure that interventions are proportionate, deliverable and capable of being incorporated within the IDP.

9. **Summary**

The proposed package of interventions is technically feasible overall. While some schemes will require further detailed design, land assembly, and utility coordination, no fundamental engineering or physical constraints have been identified that would prevent delivery.

Consistent with the vision & validate approach, interventions have only been excluded where there is clear evidence of deliverability risk. The remaining package therefore represents a realistic and deliverable set of measures which can be progressed through subsequent stages of design and implementation.

8.4 Funding

High-level indicative costs have been prepared for the transport intervention package, based on the level of design available at this stage and assumptions reflecting typical infrastructure requirements. These costs have been provided to the IDP process to support the consideration of potential funding sources and delivery mechanisms. The assessment demonstrated that, while costs will be refined through subsequent stages of design and development, the overall package represents a fundable and deliverable set of interventions.

9. Implementation & monitoring

9.1 Introduction

This section summarises the approach to delivering the vision-led and mitigation interventions described in this document.

This section also sets out our current thinking on how we monitor whether the Local Plan transport vision and objectives are being achieved on a site-by-site basis.

9.2 Proposed delivery framework and integration with business-as-usual

The interventions identified within the VLS have been developed to provide evidence of the transport measures required to support delivery of the Local Plan. All of the components of the package are considered necessary to achieve the Local Plan vision and objectives. Many are new, having been identified during the plan-making process. Some are strategic interventions required to unlock housing allocations or respond to the combined effects of several development sites. Others are smaller and are expected to be delivered by developers within or in proximity to their sites.

Some are previously identified proposals or measures which would be expected to be delivered as part of 'business as usual' through the future core programmes of agencies including GCC and National Highways. The delivery framework therefore distinguishes between standard Business-as-Usual (BAU) network management and plan-led strategic growth interventions.

This document provides the supporting evidence base for the Infrastructure Delivery Plan (IDP), including the rationale for interventions, their relationship with planned growth and an indication of potential delivery requirements. The IDP will establish the detailed delivery framework for these interventions, including responsibilities, phasing, funding mechanisms and integration with existing programmes. Some measures are expected to be delivered through the development process, while others may require coordination between delivering bodies and integration with wider transport programmes.

Further work will be undertaken through the IDP process to refine the delivery approach as the interventions are confirmed and the requirements for implementation become clearer.

9.3 Monitor and manage

'Monitor and manage' (M&M) is a best practice mechanism by which Cotswold District Council, as the planning authority, can require a developer to take action if the impacts of a development are not modelled and agreed at the time of planning consent. In example, it may require remedial action from a developer if the amount of car traffic to and from a site exceeds a previously agreed level.

To be effective, a M&M framework must be legally set in a S106 agreement during the consenting process. The make-up of M&M frameworks differs in terms of the approaches to monitoring travel behaviour, and the remedial measures required in response to monitoring.

At this point, the Cotswold District Council is not committing to establishing a M&M framework for the Local Plan sites but is discussing the practicalities of so doing with partners, particularly GCC. However, there are clear benefits; M&M is supportive of the concept of vision & validate as it allows the local planning authority to require corrective

action when indicators suggest that a development is not on track to meet the overall Local Plan vision. Regular course correction can result in better outcomes than remedial action once the development is fully complete.

10. Conclusions

10.1 Introduction

This concluding chapter shows how this Strategic Transport Assessment (STA) provides a robust, comprehensive, and legally compliant evidence base. It confirms that the transport implications of the spatial strategy have been fully evaluated and appropriately mitigated and integrated. Consequently, the transport evidence supports the Local Plan in satisfying all statutory tests of soundness and legal compliance required at Examination in Public (EiP).

10.2 Demonstration of soundness

In accordance with Paragraph 36 of the National Planning Policy Framework (updated December 2024), this assessment confirms that the Local Plan is sound regarding its transport impacts and strategies:

- **Positively Prepared:** The STA is based on an intervention strategy that seeks to meet the objectively assessed housing and employment needs of the Cotswold District Council. The transport measures described here and in the IDP proactively schedules infrastructure delivery to support sustainable growth using a vision & validate approach, rather than simply reflecting current and forecast patterns of congestion.
- **Justified:** Assessment included a rigorous multi-modal transport modelling process to iterate to a preferred package. The Local Plan as a whole relies on proportionate, evidence-based assumptions from the TRICS database and locally calibrated baseline data and models.
- **Effective:** The transport package is deliverable over the plan period. This document provides the evidence base for the IDP by setting out the rationale, relationship to planned growth, and potential delivery requirements for the interventions, with the detailed delivery framework, responsibilities, funding, and phasing to be developed through the IDP process.
- **Consistent with National Policy:** The STA reflects a shift away from traditional "predict and provide" methodologies. It adopts a vision-led approach that aligns with the National Planning Policy Framework, DfT's Local Transport Plan guidance and Active Travel England guidelines. It uses a sustainable transport hierarchy to maximise active travel opportunities and public transport capacity before proposing additional highway capacity and other mitigations. This aligns with the National Planning Policy Framework requirement for active travel and public transport opportunities to be provided to transport users, regardless of mitigating traffic impact.

10.3 Legal compliance

The preparation of the STA has strictly adhered to all relevant statutory requirements under the current anning system:

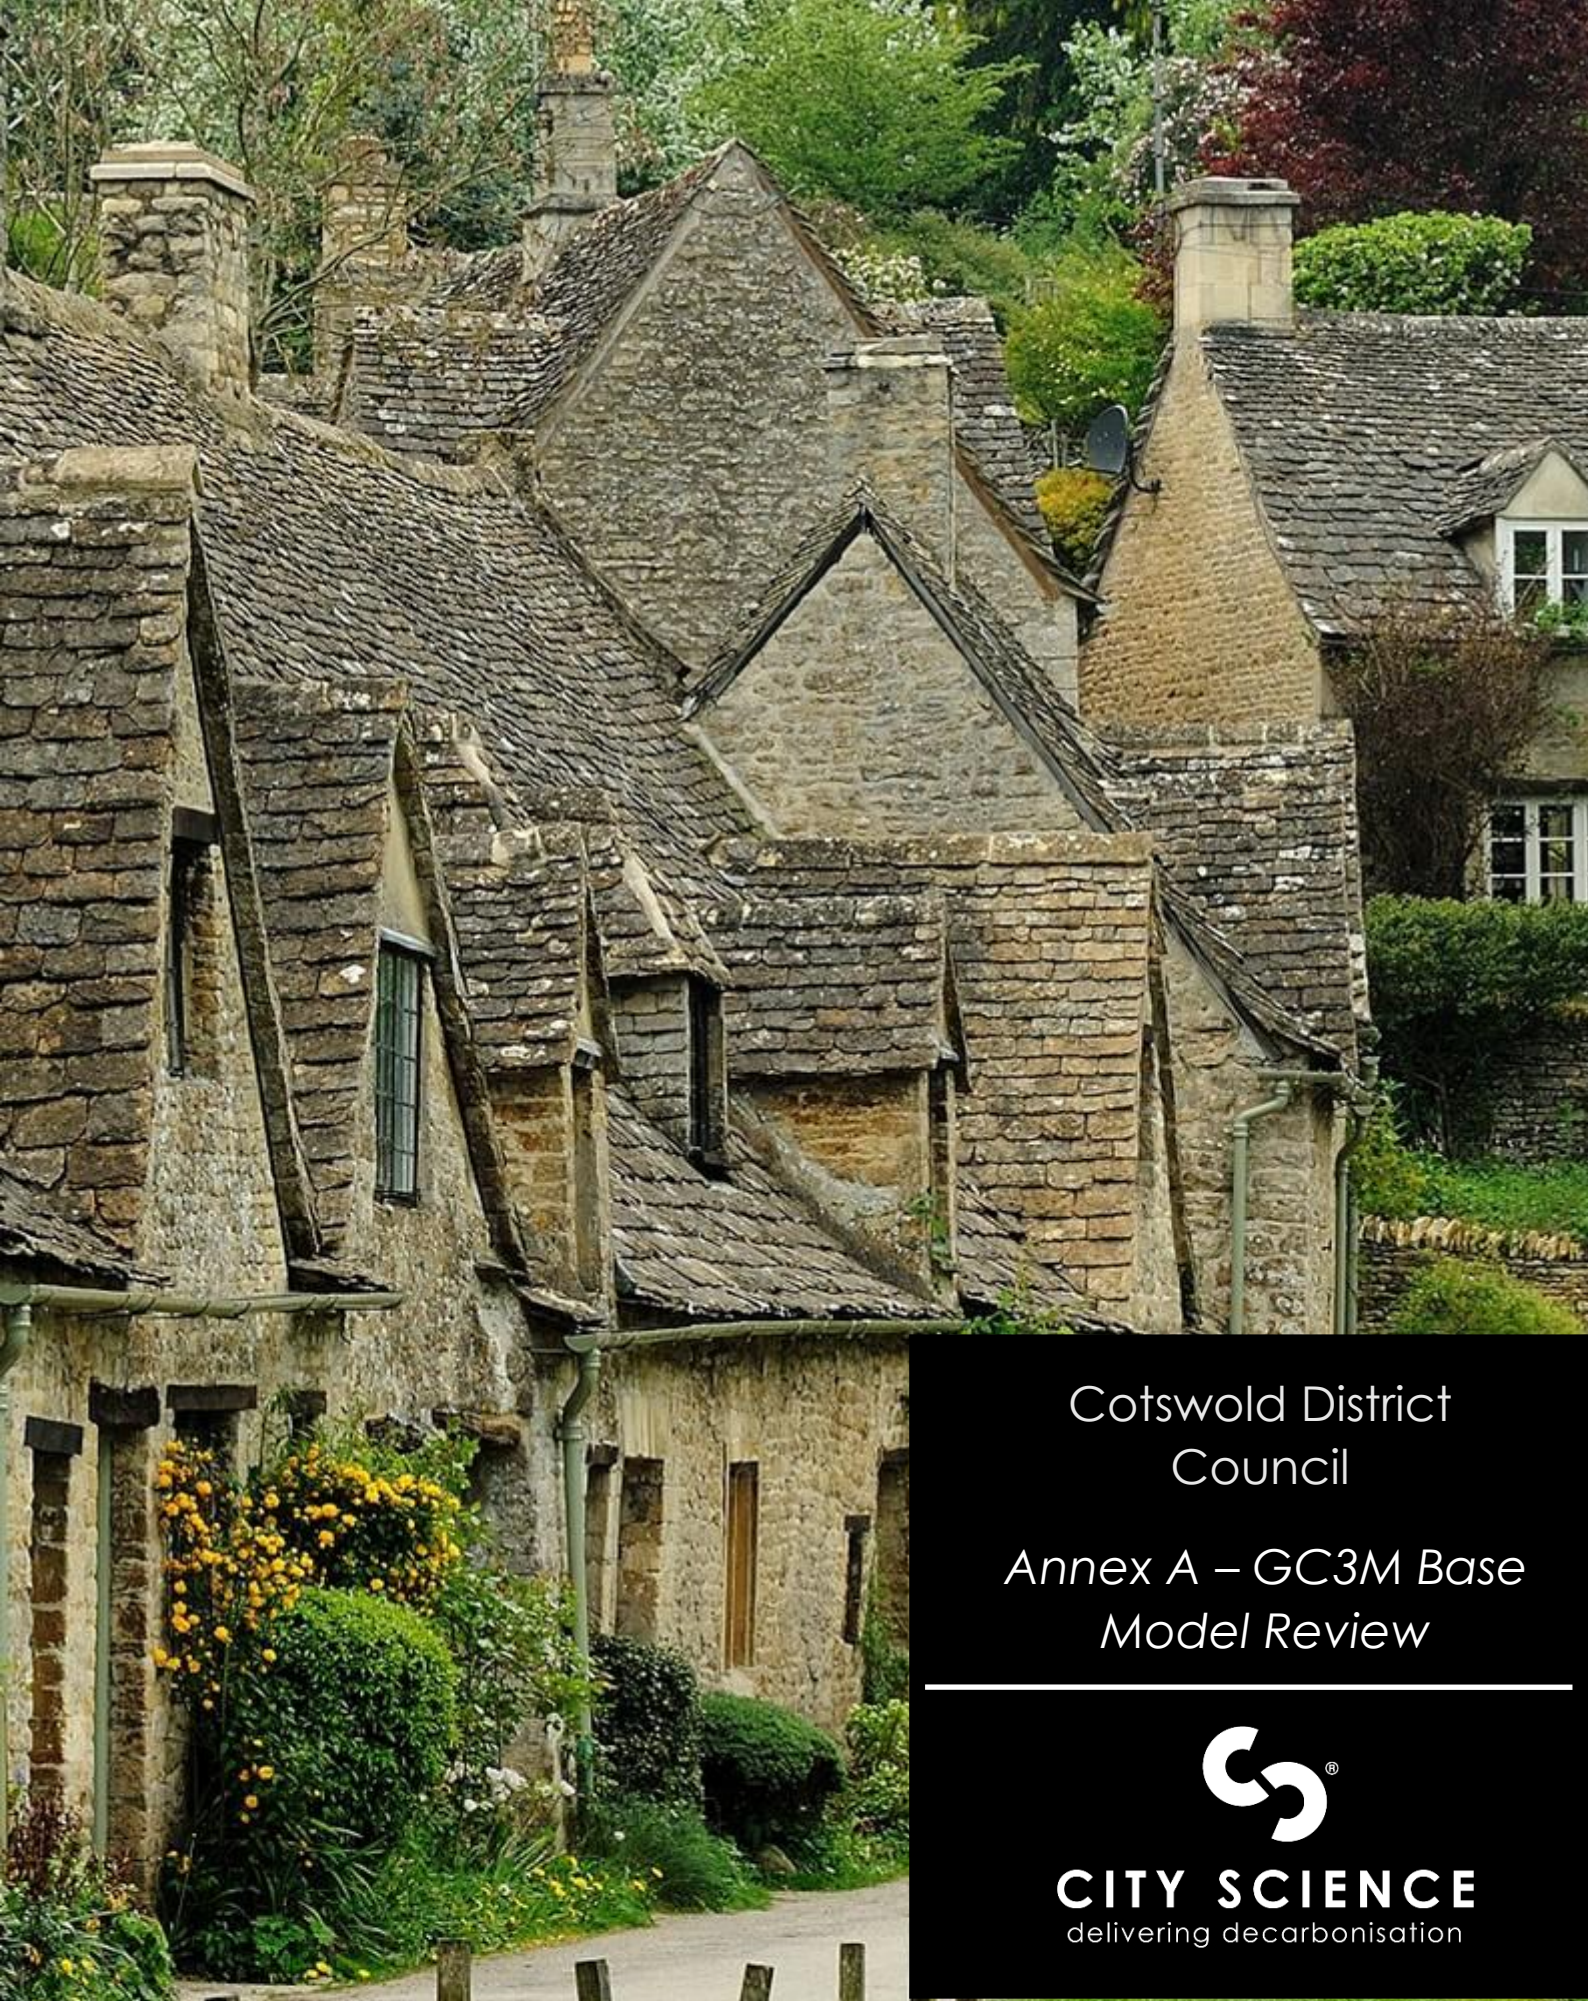
- **Planning & Compulsory Purchase Act 2004 (Section 19):** The STA ensures that the Local Plan policies contribute directly to the mitigation of, and adaptation to,

climate change. This is achieved through use of the sustainable travel hierarchy which prioritises positioning of developments and providing on-site amenities to reduce the overall need to travel, and use of low-carbon modes over private cars and vans.

- **Regulation 18 and 19 Compliance:** Transport evidence was published alongside the Local Plan consultation documents at both preferred options (Regulation 18) and publication (Regulation 19) stages. Responses from statutory consultees and members of the public directly influenced the final iteration of the transport mitigation package.
- **Alignment with the Planning and Infrastructure Act (2025):** The STA ensures that the transport evidence base is proportionate, relevant, and prepared to support fast-paced delivery. Funding structures and cross-boundary delivery proposals reflect the Act's focus on unlocking key growth zones efficiently.

The updated Local Plan will be submitted under the existing legislation in the Planning and Compulsory Purchase Act 2004. Ministry of Housing, Communities and Local Government (MHCLG) consultation on proposed revisions to the NPPF to reflect that these legislative changes are ongoing. Whilst they do not directly apply to the updated Cotswold District Council Local Plan, due regard has been made to ensure that this document remains sound and valid under the new regulations.

10.4 Demonstrating Effective Cooperation



The preparation of this STA involved continuous, constructive, and active engagement with key strategic partners compliant with the requirement for effective cooperation (NPPF).

- **Gloucestershire County Council (GCC):** Local Transport Authority and Local Highway Authority. The evidence presented in this STA was significantly shaped by engagement with transport planners and the transport development management team at GCC. GCC was a key stakeholder throughout the process and provided comments on all technical notes as well as allowing use of their strategic model, GC3M.
- **National Highways:** Highway Authority of the Strategic Road Network (SRN). Structured and detailed engagement was maintained throughout the Plan-making process with National Highways. Representatives sat on the Transport Working Group. Specific issues regarding impacts on the SRN, were frequently discussed and approaches to preparation of further evidence collaboratively developed.
- **Neighbouring Authorities:** Regular engagement has taken place with Gloucester, Cheltenham and Tewkesbury as promoters of the Strategic Local Plan (SLP), Wiltshire Council, Oxfordshire County Council, Worcestershire County Council, Warwickshire County Council, and Swindon Borough Council, through the Transport Working Group. The purpose of this engagement was to discuss potential cross-boundary and cumulative transport impacts, collaborate on the development of the evidence base, and consider potential mitigation measures and solutions.

10.5 Final summary conclusion

The transport evidence base is comprehensive, legally compliant, and sound. It establishes that the Local Plan's preferred spatial strategy will not cause a severe impact on the transport networks in the Cotswold District or neighbouring authority areas following mitigation. Instead, it provides a clear framework to achieve sustainable, vision-led growth. The plan is therefore ready for examination.

1 Introduction

1.1 Overview

City Science has been commissioned by Cotswold District Council (CDC) to support the development of the Regulation 19 transport evidence base for the Cotswold Local Plan. For this work, the Gloucestershire Countywide Multi-Modal Model (GC3M), owned by Gloucestershire County Council, has been identified as the most appropriate tool given its geographic coverage. The GC3M will support the identification of the preferred spatial option, assess the impacts of Local Plan land use on the transport network, and test potential transport interventions to inform the strategic transport assessment. Figure 1:1 illustrates the extent of the GC3M and highlights the Cotswold District area within its boundary.

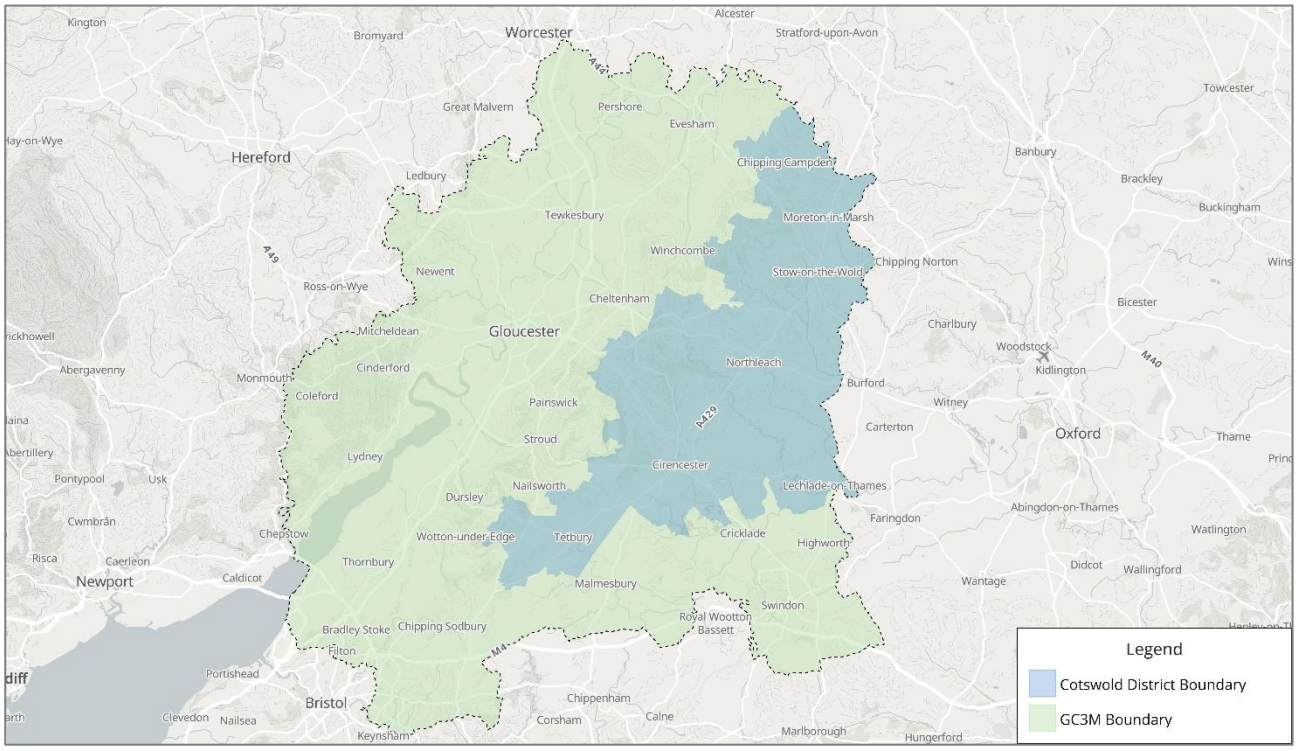

Figure 1:1: Extent of the GC3M and Cotswold District Boundary

1.2 Note Purpose

The purpose of this note is to present findings from our review of the GC3M 2019 base model, with the objective of assessing its suitability for supporting the Cotswold Local Plan strategic transport assessment, identifying areas requiring enhancement, and ensuring alignment with best practice and DfT Transport Appraisal Guidance (TAG).The GC3M is a strategic model covering both highway, public transport (bus and rail) and active modes, it was developed to test land use strategies and transport schemes. Its base year is 2019, which has been calibrated and validated against observed data. It has forecast years for 2031, 2041, 2046, and 2061. There are no plans to rebase the model.

Our review examines the GC3M's available data, network representation, model calibration and validation within the Cotswold area, and the various components of the model, namely the highway assignment model, the public transport model, and the Variable Demand Model (VDM). Particular attention is given to flow and journey time validation around major sites being considered in the local plan, as well as the adequacy of connectivity, network detail, and zone structure in representing these sites.

1.3 Summary

Overall, the review finds that the GC3M performs to a generally good standard, meeting most TAG calibration and validation criteria. Nevertheless, observations are made of area of model weakness including potential areas for improvement if required, given its use in supporting the transport evidence base for future decision-making.

2 Data Review

2.1 Overview

The most recent GC3M development, which has a 2019 base year, did not involve new data collection; existing sources were used and adjusted to represent 2019 conditions. For the Cotswold area, existing data including rail data, bus data, traffic counts, screenlines and journey time routes have been reviewed and are summarised below.

2.2 Rail Data

Due to the absence of new boarding and alighting rail passenger surveys, the availability of independent rail passenger count data is limited. Validation of modelled rail passenger flows from the GC3M public transport assignment was undertaken at an aggregated annual level using the Office of Rail and Road annual station usage statistics. While this provides a high-level check, the lack of finer granular validation data limits confidence in local model performance.

It is noted that at the time of the model build, it was not possible to undertake on-site surveys due to COVID shutdowns. However, it is also important to note although model validation was carried out using the annual Office of Road and Rail statistics, granular MOIRA data at the hourly level was used for calibration. It is considered that MOIRA is a robust source for station entries and exits, and from experience it is typically closely aligned with well-conducted survey data.

2.3 Bus Data

Similarly, no new bus passenger surveys were conducted. Validation of modelled bus passenger flows from the public transport assignment relies on aggregated annual data from the Department for Transport bus statistics. This approach provides only a broad assessment of bus passenger demand and does not support route-level validation.

Similar to the rail data approach, it is noted that, electronic ticket machine (ETM) data was collected from bus operators. This data is highly granular, recorded at the fare stage level with time stamps, and serves as a robust source for boarding information. However, ETM data lacks direct alighting information. To address this, alighting points were inferred from single and return tickets, where accurate alighting data is available - this accounts for approximately 20% of total ticket sales. These partial tickets were then expanded to represent total ticket sales, as outlined in Section 7.4.3 of the Model Development and Validation Report (MDVR).

2.4 Traffic Counts

Traffic counts within the GC3M base model provide a good representation of travel patterns across the Cotswold District, as they are well distributed across the network rather than concentrated in a single area. The coverage ensures that both strategic and local routes are captured, improving the robustness of the model calibration. Cirencester is well covered, with a cluster of counts located on its key entry and exit roads, ensuring that traffic movements into and out of the town are accurately reflected. Additional counts are also spread across important corridors such as the A429 and towards Stow-on-the-Wold, Northleach, and Moreton-in-Marsh. Figure 2:1 illustrates the existing traffic counts in the Cotswold district.

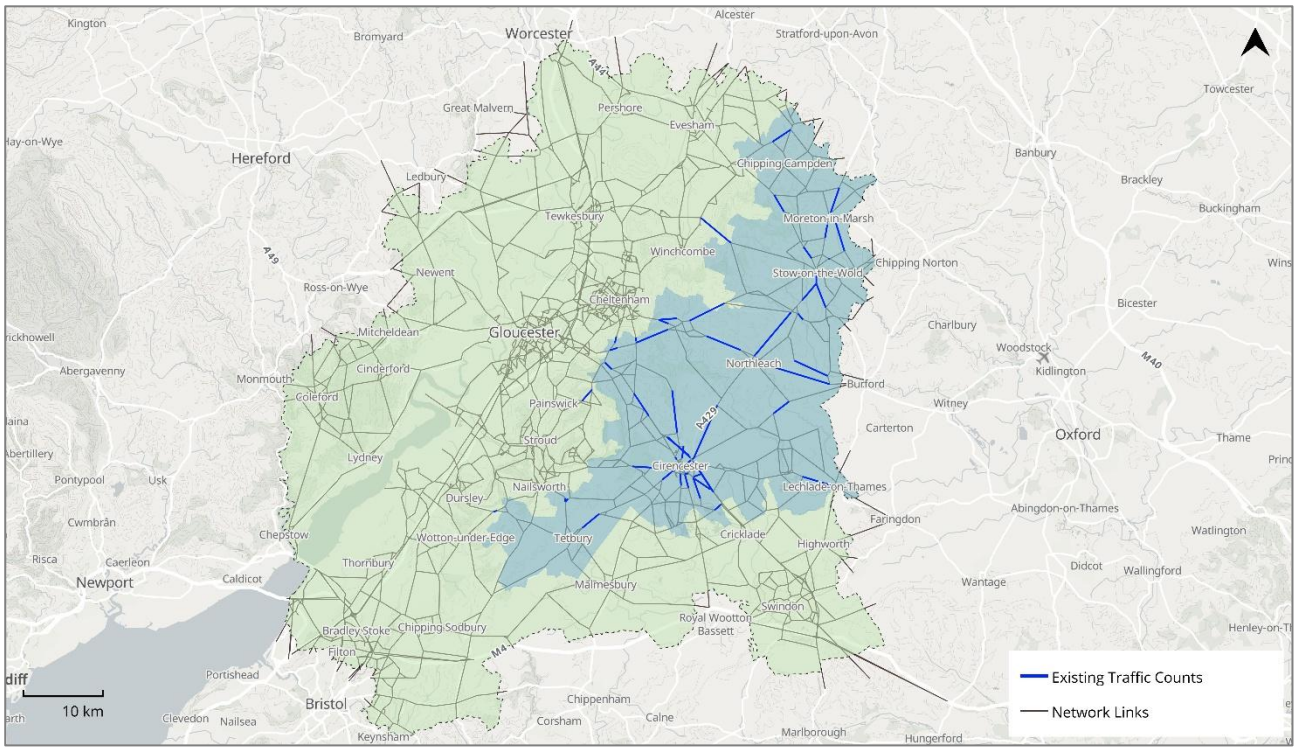

Figure 2:1. Existing Traffic Counts in the Cotswold District

2.5 Screenlines

The 2019 base GC3M includes a set of cordons and screenlines that provide a good framework for validating traffic movements across the Cotswold District. A cordon is established around Cirencester, capturing entry and exit flows to this key urban area. In addition, wider screenlines are positioned to the east of the district (covering Stow-on-the-Wold and Moreton-in-Marsh), south of Nailsworth, and to the west of the Cotswolds. These locations are effective in capturing both strategic through-traffic and local trips, providing a good spread across the district's network. Two screenlines (west of Cotswold and south of Nailsworth) were used for calibration, while one screenline (east of Cotswold) and the Cirencester cordon were used for model validation. Together, they give confidence that traffic flows are being robustly checked in both urban and rural contexts. Figure 2:2 shows the GC3M screenlines and cordons in the Cotswold district.

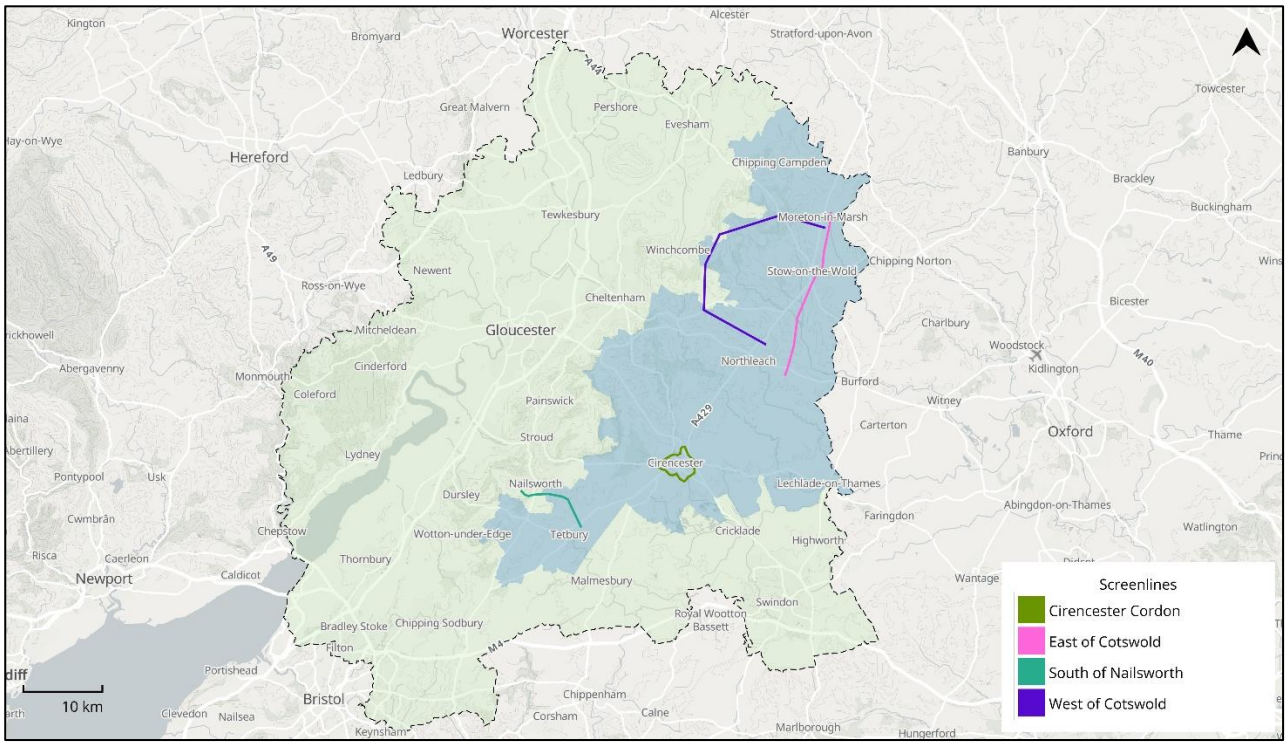

Figure 2:2 GC3M Screenlines and Cordons in the Cotswold District

2.6 Journey Time Routes

In total, six two-directional journey time (JT) routes have been defined in the base model (refer to Figure 2:3). These cover the major corridors within the Cotswold District, including the A40, A4135, A429, and A435, as well as key parts of the Strategic Road Network (SRN), namely the A417 and A419. Collectively, these routes provide good coverage of the network, allowing journey time validation to be undertaken across both local and strategic movements.

However, it is recommended that two additional journey time routes be introduced to strengthen the coverage of the network, particularly in the north of the Cotswold District. These would include:

- A44 – forming an important east–west corridor through Moreton-in-Marsh.
- A424 – serving as a key corridor through Stow-on-the-Wold.

Figure 2:4 shows the location of the proposed journey time routes.

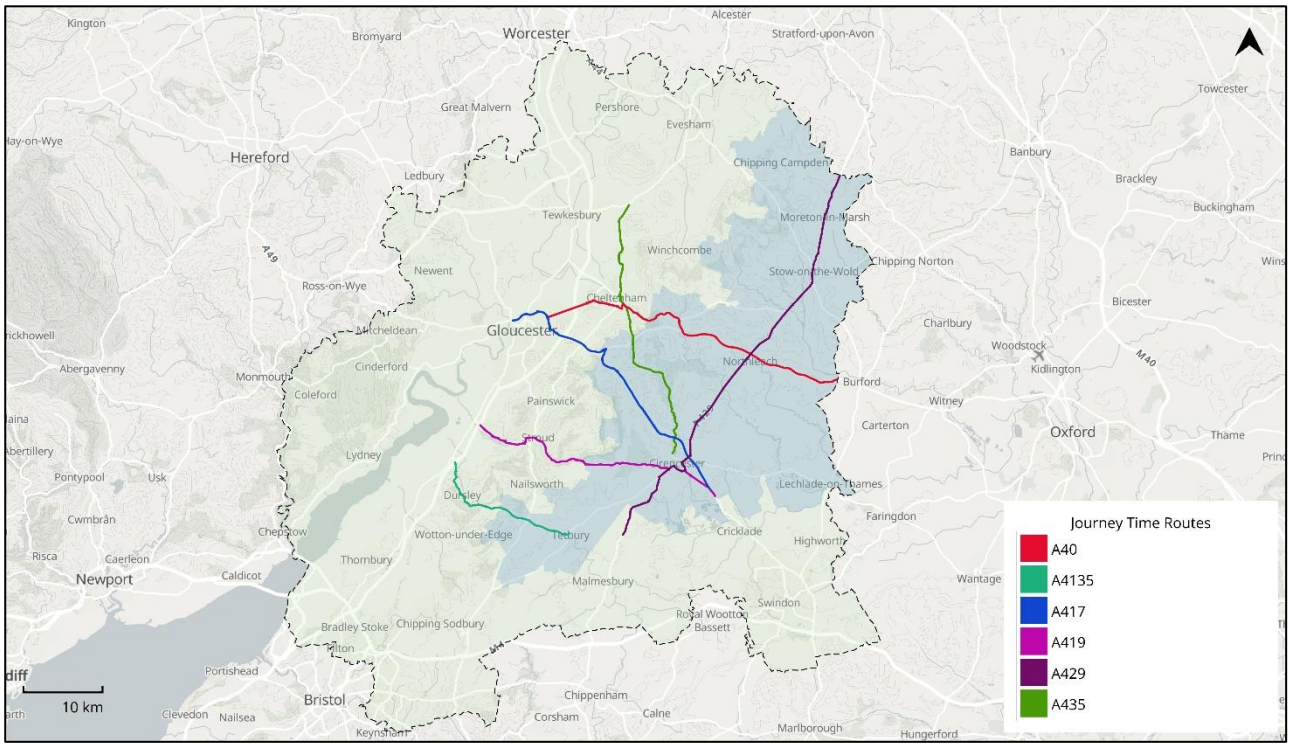

Figure 2:3 GC3M Journey Time Routes in the Cotswold District (from 2019)

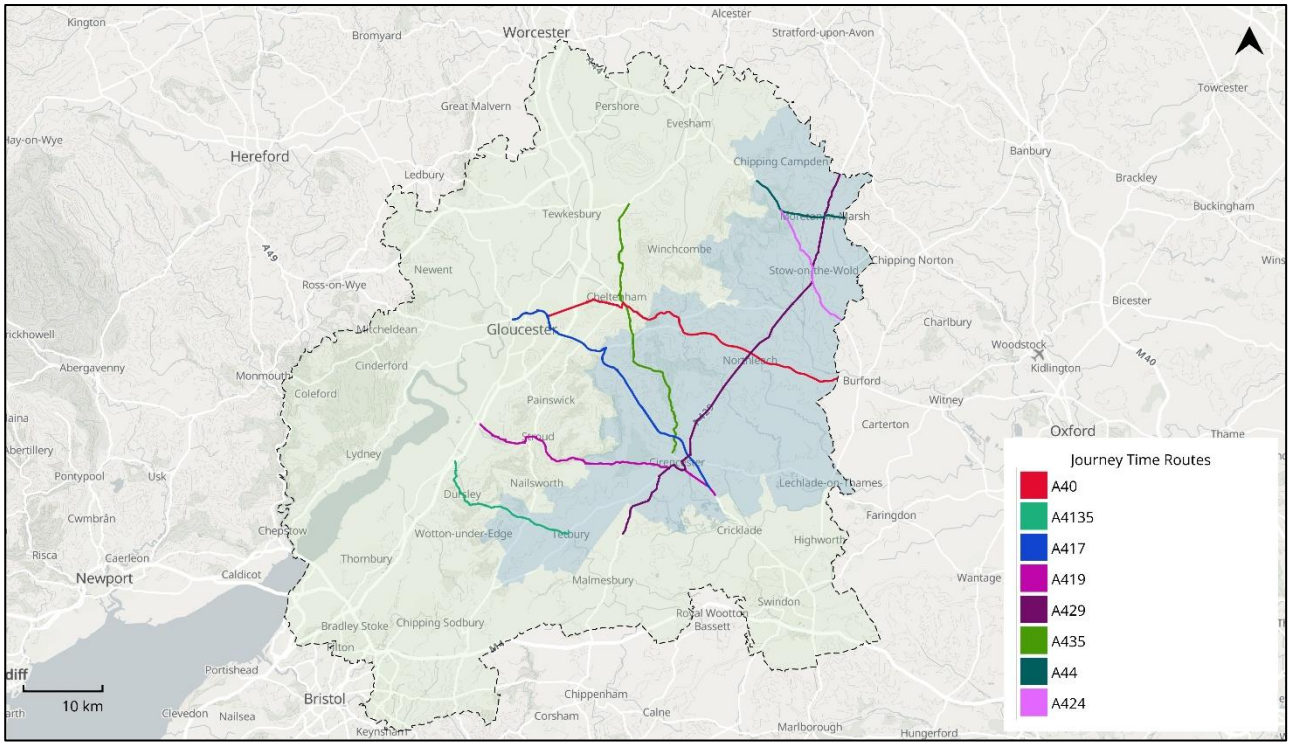

Figure 2:4 Proposed Journey Time Routes (including the two additional) for 2024

3 Network Review

3.1 Node & Link Structure

Review of the GC3M SATURN network representation indicates that dummy nodes are primarily located outside of the simulation external areas of the model for example around the Bristol area. While these are often used to simplify coding or support assignment stability, their excessive use can reduce the accuracy of the network representation and should be reviewed. This is not considered a concern at this stage of the model review. Furthermore, the locations of large developments have been provided, and none are in proximity to dummy nodes

3.2 Signal Coding

There are 18 signalised junctions with observed data available. The remainder are coded using template or default settings. Where possible, observed data should be incorporated to better reflect actual signal timings and delay patterns. In addition to this, pedestrian phases are missing for some modelled junctions. As part of the review, we identified three signalised junctions where the staging, timings, or saturation flows are incorrect, as illustrated in the figure below.

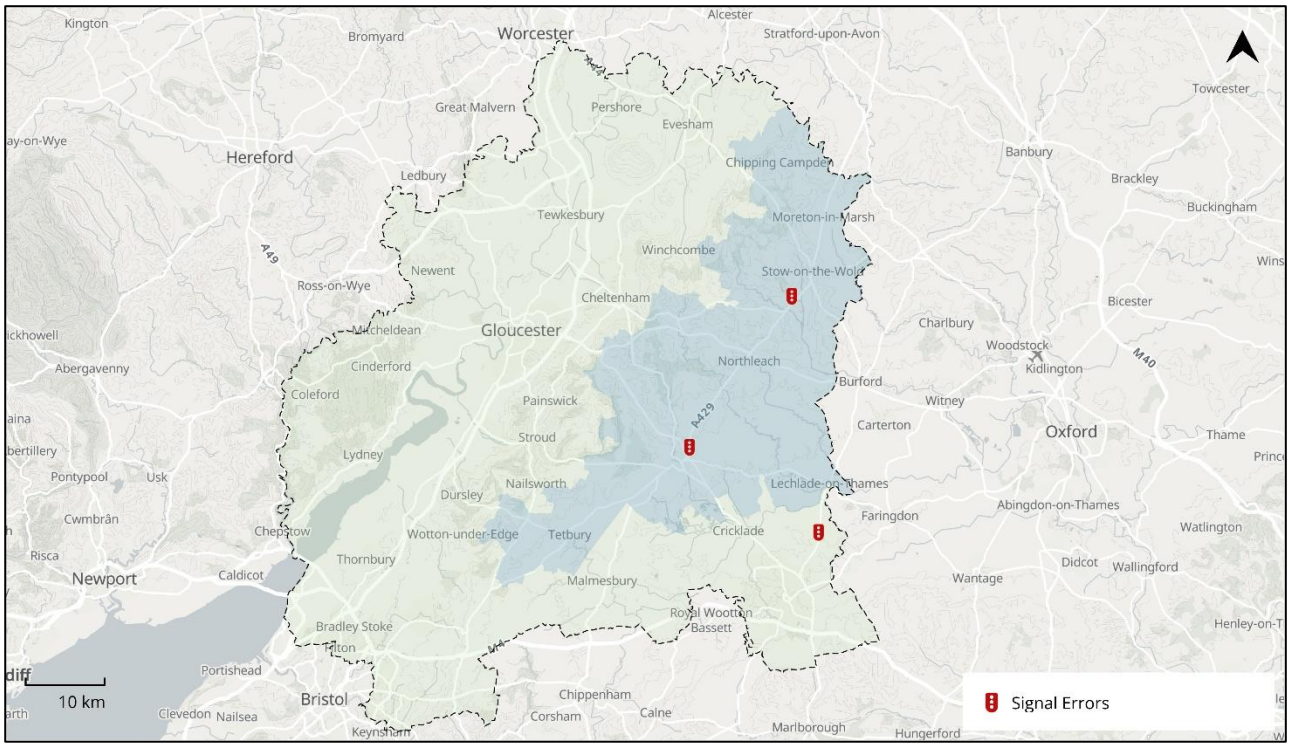

Figure 3:1 Signalised Junctions with Incorrect Inputs

3.3 Buffer Area Speeds

The fixed speeds applied in the buffer area remain unchanged from the 2015 model. Given network changes and evolving travel behaviour, it is recommended that buffer area speeds are reviewed and, where necessary, updated to ensure appropriate route choice behaviour compared with the simulated areas. However, since the journey time routes in the Cotswold area do not compete with any routes in the model's buffer area, it may not be necessary to update buffer link speeds in this case.

3.4 Connector Coding

The internal zoning system mainly uses standard spanning connectors, which distribute trips along a link. While stub connectors can better represent zone-to-network interaction in dense urban areas, a selective review near strategic allocations is recommended. However, the review indicates that

spanning connectors remain more appropriate overall, given the low density and rural nature of the Cotswold District.

3.5 Sector and Zoning System

Based on the GC3M development, the Cotswold District is currently divided into six sectors, each comprising groups of model zones that allow inputs and results to be conveniently aggregated for review and analysis. These sectors are:

- Cirencester (10 zones)
- Cotswold South (20 zones)
- Cotswold Central (29 zones
- Cotswold East (15 zones)
- Cotswold West (4 zones)
- Cotswold North (11 zones)

The size of model zones is an important consideration, as it defines the spatial area within which trips are generated and attracted. Larger zones concentrate more demand into a single network loading point. TAG guidance (Unit M3.1, section 2.3.11) suggests that the number of trips entering or leaving a zone should typically be limited to 200-300 per hour, to avoid such overloading. By contrast, smaller zones provide greater detail and allow more accurate representation of trip origins and destinations, particularly in areas of interest.

Therefore, large development sites would benefit from their own dedicated zones in line with the assumptions set out in Table 3-1. This ensures that development-related trips can be isolated and analysed independently, rather than being merged with surrounding demand that may exhibit different trip characteristics. Specific connectors can then be assigned to accurately represent access to and from the development.

To support this, CDC has provided a list of potential major settlements at the time of this report (see Figure 3:2) These sites have been used to inform the proposed zoning structure.

Assumption	Proposed Approach Taken
0 – 9 dwellings / jobs	Not specifically modelled- included as part of background growth.
10 – 500 dwellings / jobs	Development applied to current GC3M Zones.
500+ dwellings / jobs	Development is modelled fully. Allocated to its own zone with specific network and accesses modelled.

4 Calibration & Validation

4.1 Highway Calibration & Validation Summary

The model has been assessed against DfT's TAG calibration and validation standards.. For link flow validation, the following measures were used:

- The GEH statistic, which is a commonly used measure in transport modelling to assess discrepancies between modelled and observed flows, incorporating both relative and absolute errors.
- The absolute and percentage difference between modelled flows and observed counts.

According to TAG guidance, a link is generally considered to pass if it meets either the GEH threshold of less than 5 or satisfies the 'TAG Flow' criterion (as set out in Table 4-1).

Type	Description of Criteria	Acceptability Guideline
1	Individual flows within 100 vehicles/hour of counts for flows less than 700 vehicles/hour	>85% of cases
	Individual flows within 15% of counts for flows from 700 to 2700 vehicles/hour	>85% of cases
	Individual flows within 400 vehicles/hour of counts for flows more than 2,700 vehicles/hour	>85% of cases
2	GEH < 5 for individual flows	>85% of cases

Table 4-1 Acceptability guidelines for link flow validation (Source: TAG Unit M3.1 (3.2.8, Table 2))

For screenline flow validation, TAG requires that all or nearly all (95%) screenlines have differences between modelled flows and observed counts of less than 5% of the counts.

For Journey Time routes, TAG requires that at least 85% of routes have modelled times within 15% of surveyed times (or within 1 minute, where this is greater than 15%).

4.1.1 Analysis of Results:

Figures 4.1, 4.2, and 4.3 summarise the performance of the GC3M 2019 base model in the Cotswold District for the AM, IP and PM time periods.

- Calibration performance is very strong across all modelled periods, with 100% of screenlines passing the <5% difference test and over 85% of links meeting either the GEH or flow criterion. This indicates that the model is well calibrated to observed data.
- Validation performance is slightly weaker, as would be expected, but still within TAG acceptability ranges. Validation screenlines show strong results in the AM and PM (100% pass), though performance in the IP is lower (50% pass, 50% near).
- For validation link flows, between 70–72% of links pass the GEH <5 criterion, with a further proportion falling into the 'near' category. When combining GEH and flow criteria, overall validation success rates rise to 85–94% across periods, indicating the model represents observed traffic patterns reasonably well.
- Journey time validation is excellent, with 100% of routes passing the <15% difference threshold across all time periods.

Overall, the GC3M 2019 base year model meets most of the TAG calibration and validation criteria, providing confidence in its ability to represent traffic conditions in the Cotswold district.

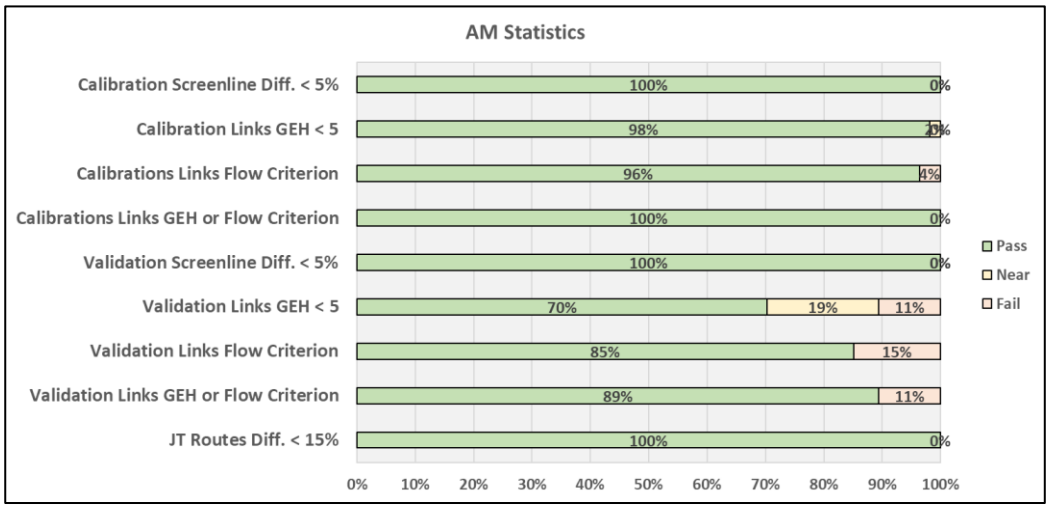

Figure 4:1. AM Calibration and Validation Summary Statistics

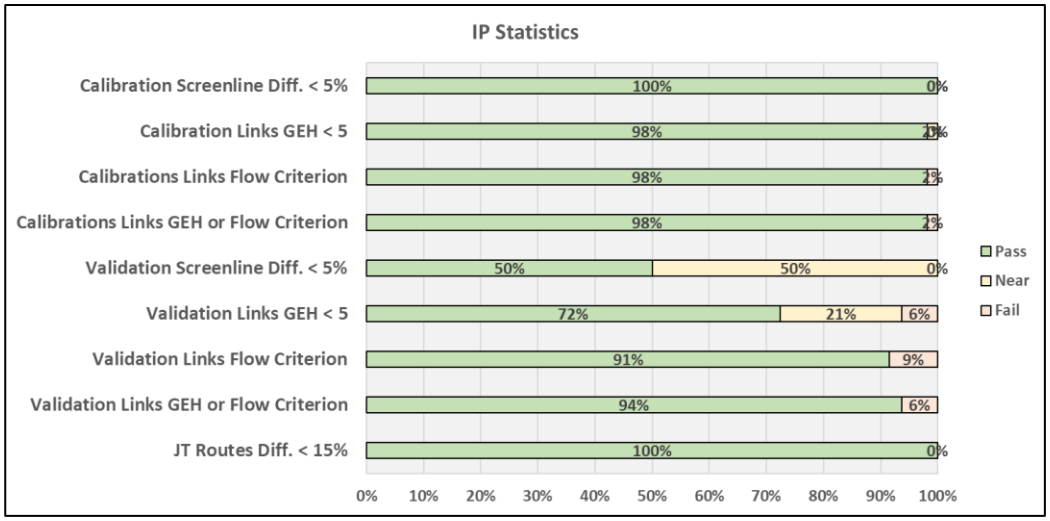

Figure 4:2 IP Calibration and Validation Summary Statistics

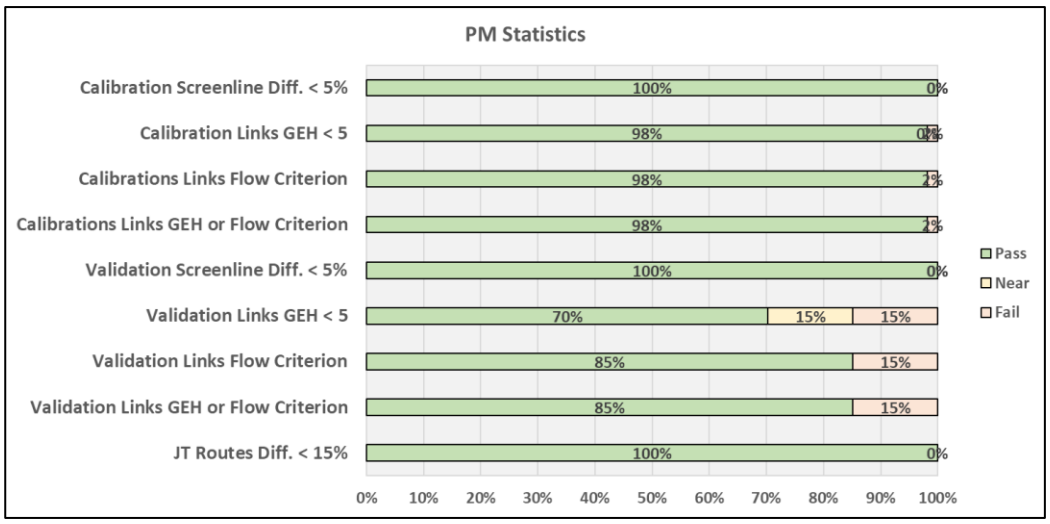

Figure 4:3 PM Calibration and Validation Summary Statistics

4.2 GEH Performance Near Potential Major Development Sites

4.2.1.1 Context and Findings

The GEH performance for each modelled period is summarised in Figures 4.4, 4.5, and 4.6, which highlight model count locations with GEH <5 shown in green, 5 ≤ GEH <10 in orange, and GEH ≥10 in red. Reviewing traffic count sites near major development locations is important to identify modelled flows that may require improvement to better reflect existing traffic conditions.

Most links across the district are green, indicating that modelled flows are very close to observed counts and meet TAG standards. A smaller number of links are orange, showing moderate discrepancies, while only a few are red, where modelled flows diverge more significantly from observed counts.

The orange and red GEH results are concentrated around Cirencester, Siddington, Preston, Moreton-in-Marsh, and Willersey in all three time periods, with additional discrepancies observed in Mickleton during the AM peak. Addressing these discrepancies will help strengthen the model and ensure it provides a more robust and reliable assessment of development impacts.

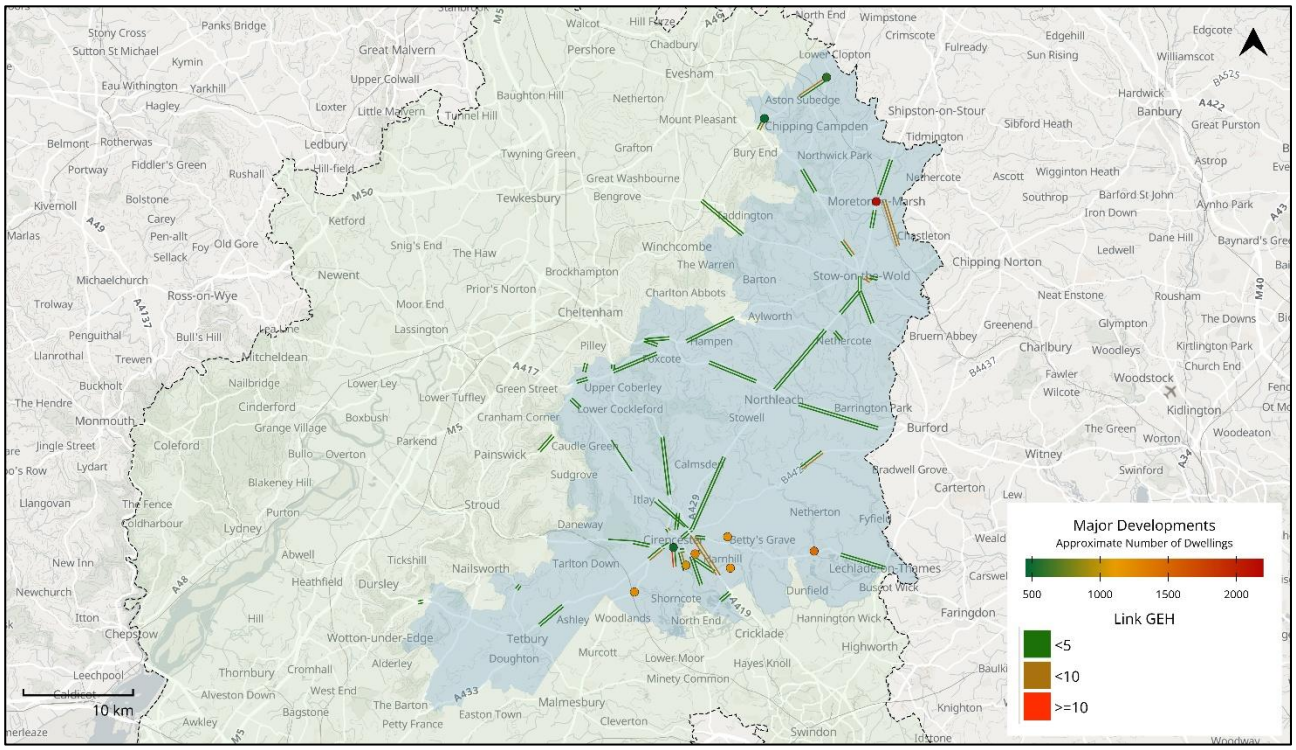

Figure 4:4 AM Peak GEH Performance Near Potential Major Development Sites

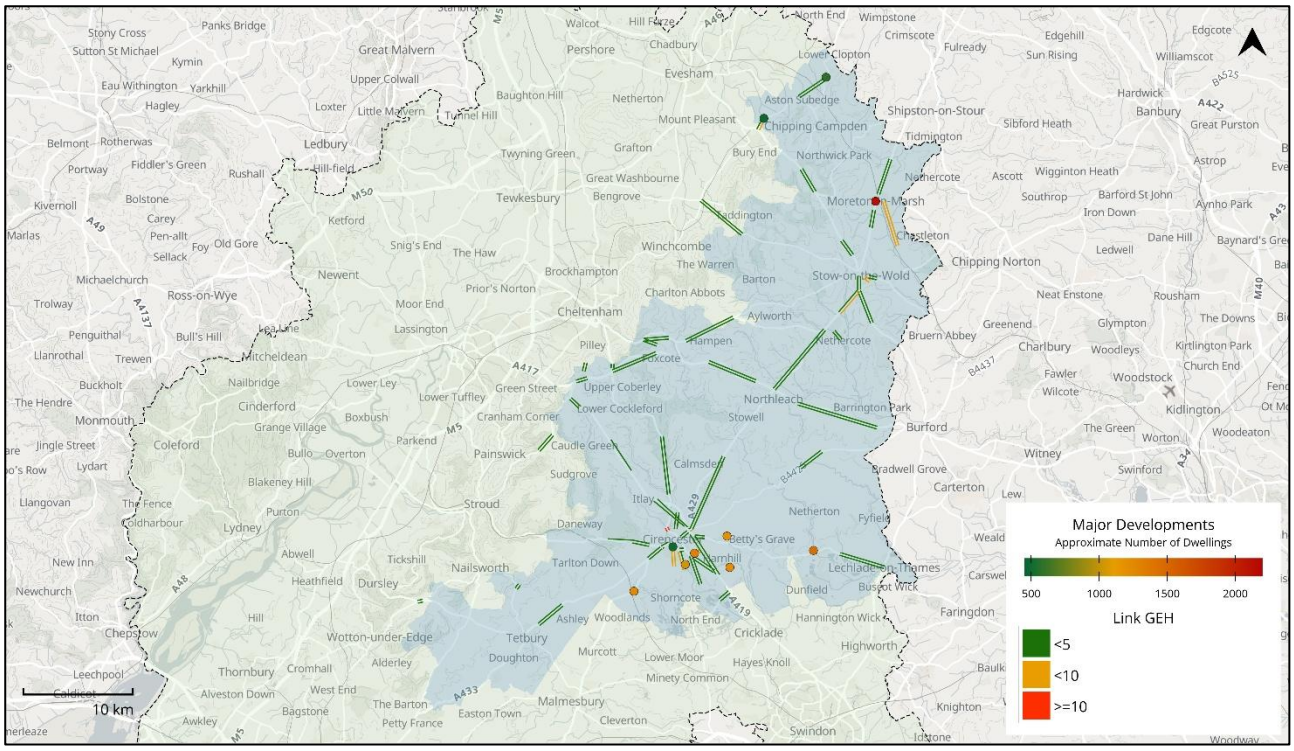

Figure 4:5 Inter-Peak GEH Performance Near Potential Major Development Sites

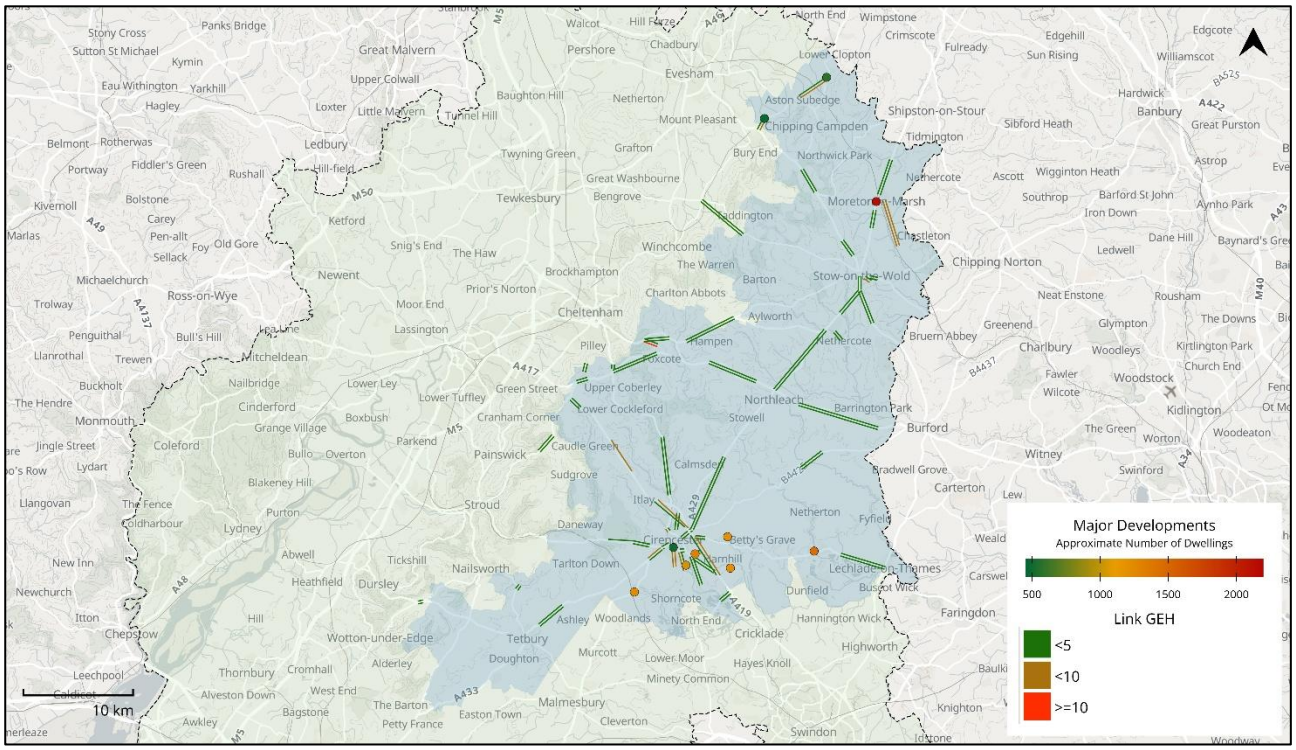

Figure 4:6 PM Peak GEH Performance Near Potential Major Development Sites

4.3 Public Transport Calibration & Validation Summary

4.3.1 Rail

In the Cotswold District, there are only two railway stations: Kemble and Moreton-in-Marsh. Moira data at the hourly level was used to calibrate the station entries and exits. The calibration results for each modelled period are presented in Tables 4.2 to 4.7. TAG requires that, for all or nearly all individual railway stations, the difference between observed and modelled entries and exits should be less than 25%, except where flows are below 150 passengers per hour, in which case the GEH statistic applies. The results show that both railway stations meet the GEH criteria; however, noticeable differences remain between the observed and modelled values. For validation, the annual calculated entries and exits of each station were compared with ORR data. This revealed a significant difference of 71% for Moreton-in-Marsh (refer to Table 4-8). It is recommended that further adjustments be made to improve alignment with the ORR figures.

Name	Observed Entry	Modelled Entry	% Diff	GEH	Absolute Difference	Pass / Fail (% diff <= 25%; GEH <5 if flow <150)
Kemble	91	53	-42%	5	-38	Pass
Moreton In Marsh	61	36	-41%	4	-25	Pass

Table 4-8 AM Rail Entries Validation

4.3.2 Bus

Bus passenger flow validation was carried out at the sector level by grouping stops within each sector. TAG requires that, for all or nearly all stops, the difference in boardings and alightings between observed and modelled values should be less than 15%, with the GEH statistic applied where flows are low. Tables 4.9 to 4.11 present the results for the Cotswold sectors across each modelled period. Cirencester, notably, fails to meet the 15% criterion and does not satisfy the more flexible 25% threshold. Cotswolds central also fails to meet both criteria in the PM. As Cirencester is a key urban area within the Cotswold District, improvements should be prioritised there, alongside adjustments to better represent passenger flows in the Cotswolds Central sector.

Sector	Observed Boardings	Modelled Boardings	% Diff	GEH	Absolute Difference	Pass / Fail (% diff <= 15%; GEH <5 if flow <150)	Pass / Fail (% diff <= 25%; GEH <5 if flow <150)

5 Public Transport Fare & Journey Time Elasticities

5.1 Overview

The public transport (PT) fare elasticity test examines how PT trip-making, across all sub-modes, responds to a 10% increase in both bus and rail fares, applied consistently across all demand segments.

5.2 Model Performance

The modelled elasticities are broadly in line with TAG Unit M2.1 guidance, though some deviations have been identified that may warrant further review:

- Bus Fare Elasticity: The modelled elasticity is -0.2, which lies at the lower end of the typical TAG range (-0.2 to -0.9 for public transport trips and −0.35 to −0.9 for bus trips for full fare paying passengers) and below the recommended value of -0.4 for bus sub-mode choice. This suggests that the model may understate bus users' sensitivity to fare changes, potentially limiting its responsiveness to pricing interventions. However, it is noted that that around 25% of the daily ticket sales within Gloucestershire are free journeys which would impact the derived elasticities.
- Rail Fare Elasticity: It is noted that the latest TAG includes sub-mode elasticities (-0.7 to-1.5), which were not available at the time of 2019 model build. However, the modelled elasticity is higher than expected relative to TAG guidance, indicating that demand appears overly responsive to rail fare increases. This could result in exaggerated mode shift away from rail and reduce the reliability of rail demand forecasts under fare change scenarios. It is noted in the MDVR that further improvements can be done to better match synthetic and assignment matrices. The MDVR also notes that the rail passenger demand levels are relatively small when compared to the total trips and no proposed rail use cases were identified at the time of model development.

5.3 Conclusion

The model generally performs well. Further calibration could be considered to better align fare elasticities with TAG, although limitations should be noted.

6 Variable Demand Model

6.1 Key Results

The Variable Demand Model (VDM) results show differences between the synthetic and final assigned models, suggesting that the demand responses such as modal shift are not well replicated. This will be important given the focus on sustainable transport measures as part of the Cotswold Local Plan and capturing demand changes accurately. This highlights a need for further monitoring, with a view to identifying refinements if required, particularly regarding how mode shift and trip length are represented. Section 6.14 of the MDVR report discusses the different pivoting processes that are used, depending on the relative difference between synthetic and assignment trips at a zonal level. These are chosen per-zone and are dependent on values of these parameters. The intention is to use the standard Absolute Model Applied Incrementally whenever possible though to fall back to an additive function where required.

Time Period	HAM Matrix Total	VDM Matrix Total	Difference	% Difference
AM Peak	97,726	86,271	-11,456	-12%
IP Peak	72,915	57,201	-15,714	-22%
PM Peak	106,901	101,851	-5,050	-5%

Figure 6:1 Comparison of Total Matrix Sizes for Car (VDM vs final HAM, both vehicle trips)

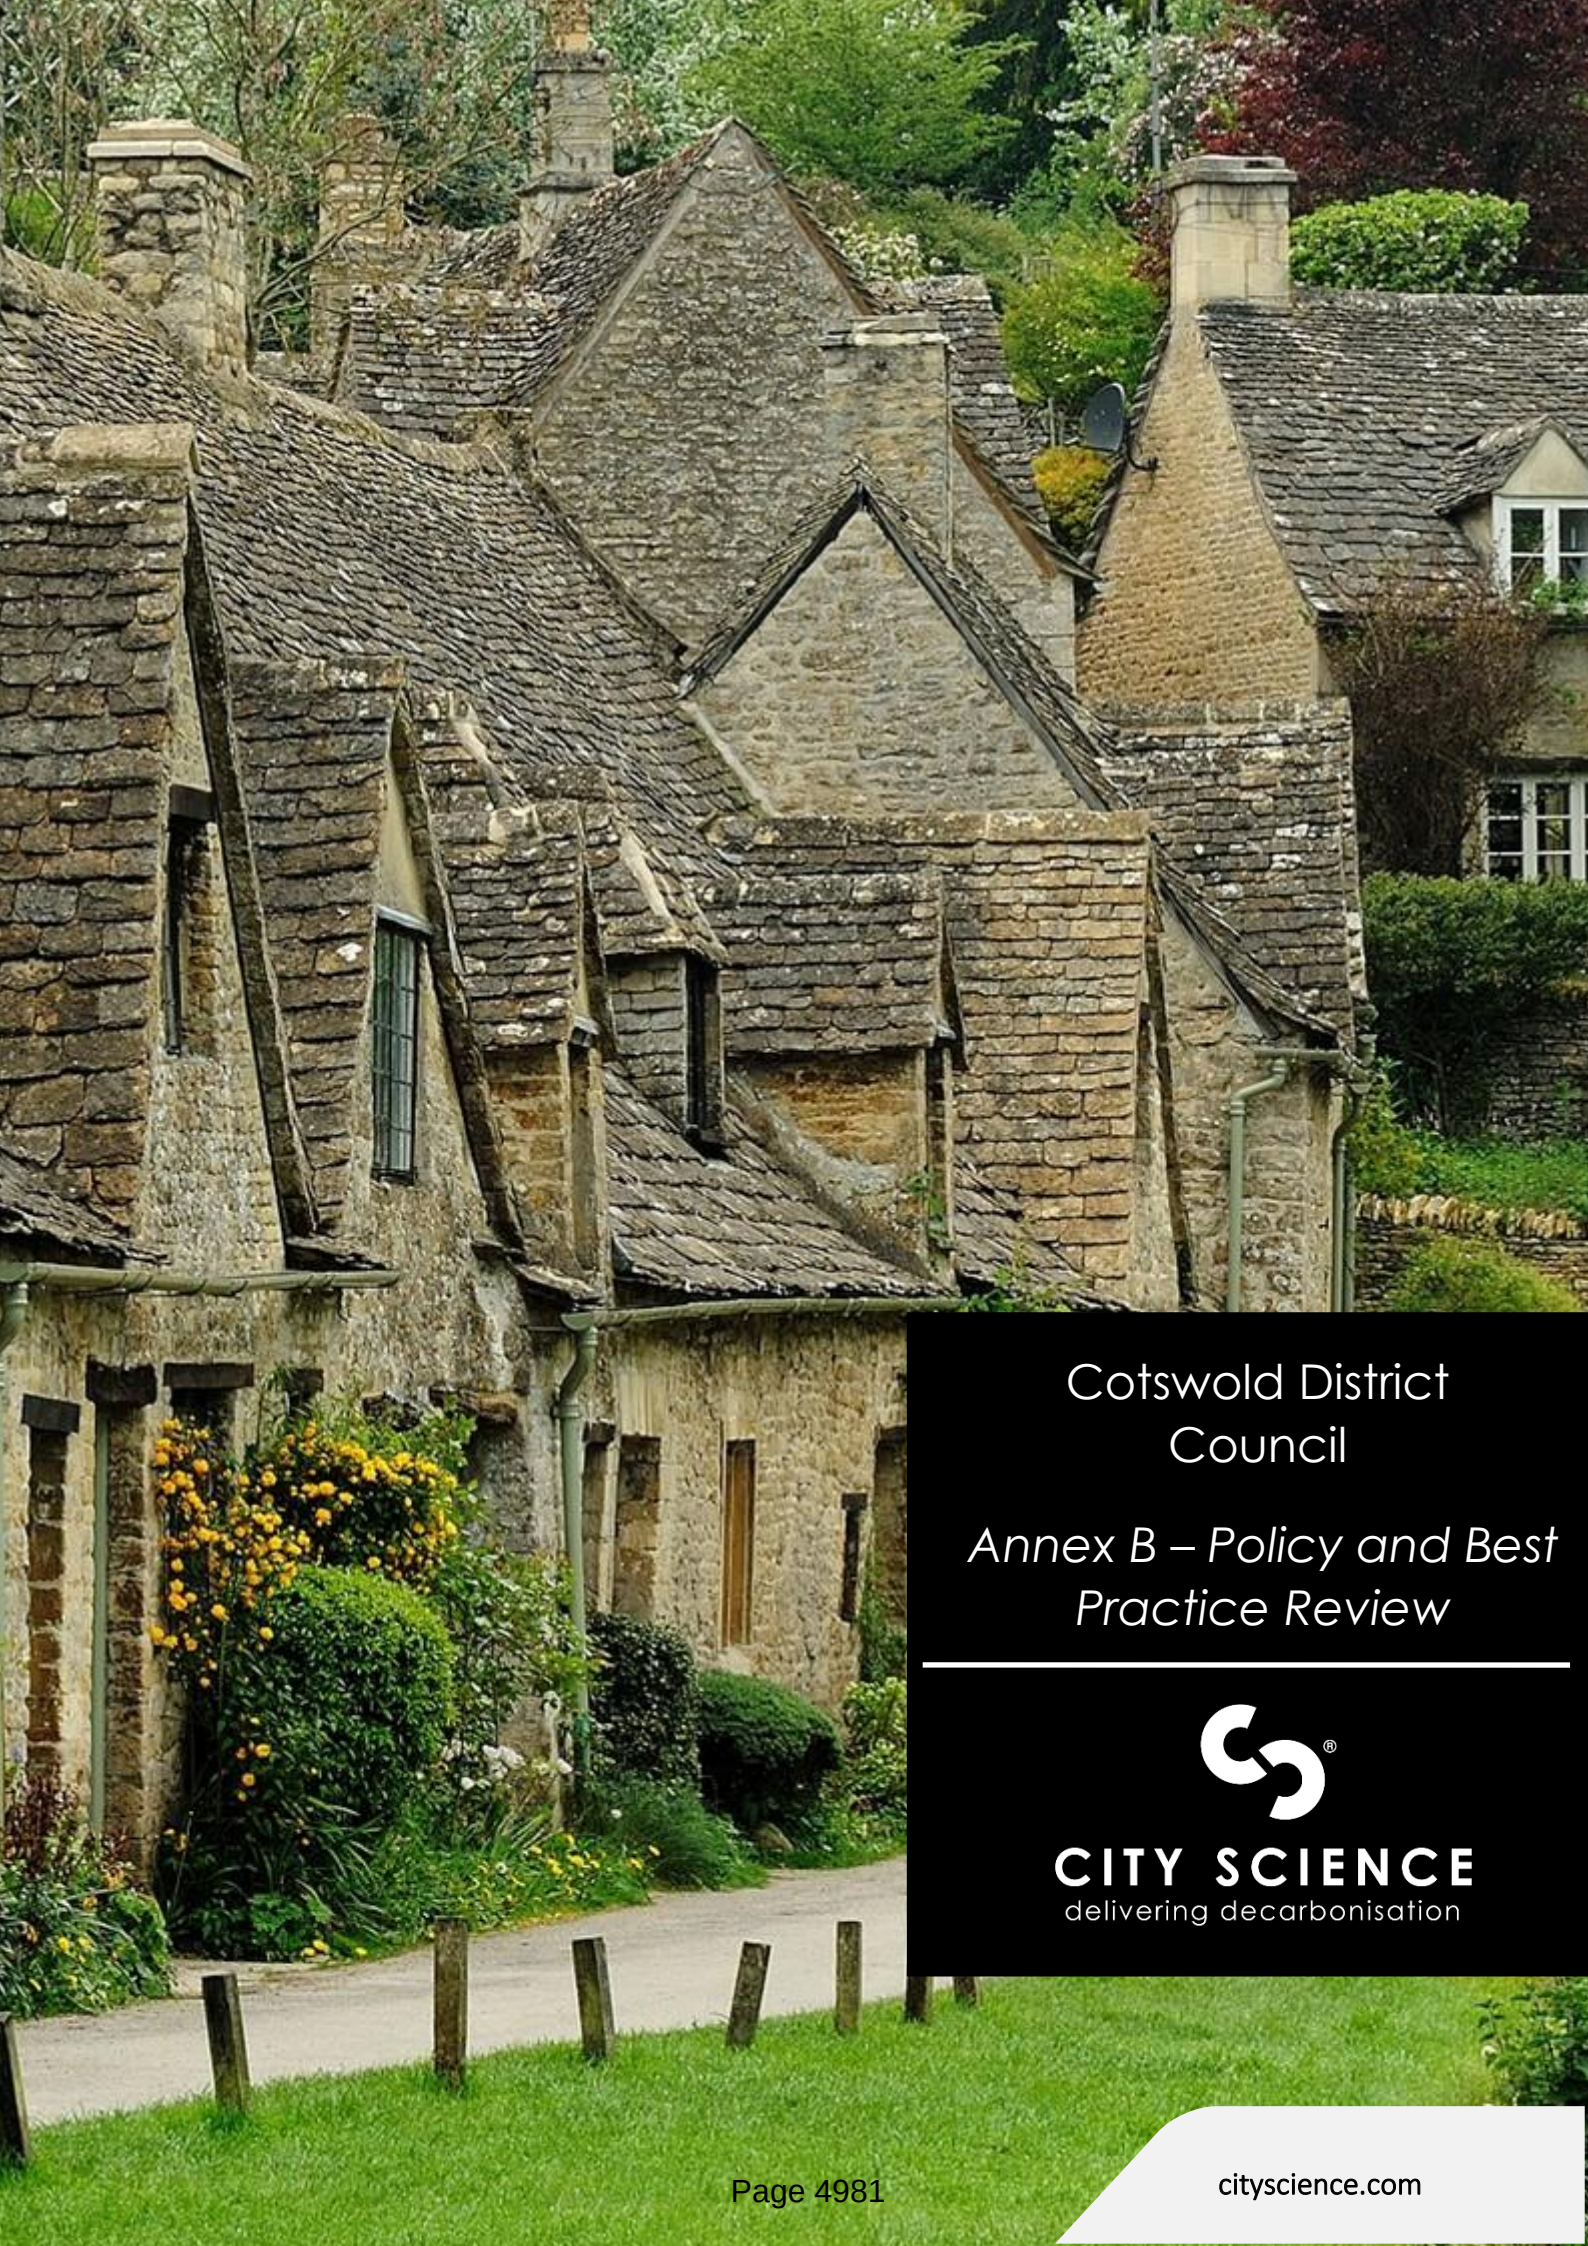
Mode	Time Period	PT AM Matrix Total	VDM Matrix Total	Difference	% Difference
Bus	AM Peak	4,842	4,007	-835	-17%
	IP Peak	4,477	4,817	340	8%
	PM Peak	4,126	5,586	1,460	35%
Rail	AM Peak	1,551	2,720	1,169	75%
	IP Peak	800	762	-38	-5%
	PM Peak	1,597	2,481	884	55%

Figure 6:2 Comparison of Total Matrix Sizes for public transport (VDM vs PTAM)

7 Recommendations & Conclusion

7.1 Recommendations

Several recommendations emerged from the review of the GC3M 2019 base model, including:



1. Additional Journey Time Routes: Introducing additional journey time routes to cover all the main roads in the area and enhance the reliability of the model, particularly around large sites under consideration such as in Mickleton, Willersey, and Moreton-in-Marsh.
2. Signal Data Enhancement: Correcting the identified issues at three signalised junctions where staging, timings, or saturation flows are inaccurate.
3. Additional Zones: Adding dedicated zones for each of the 10 potential development sites with high number of dwellings. This will ensure consistency with the future year structure and allow site to be fully modelled with its own zone and associated connectors.
4. Enhancing count validation: Improving validation of traffic counts, particularly around major development sites, including Cirencester, Siddington, Preston, Moreton-in-Marsh, and Willersey, where GEH performance is weaker. This will help minimise discrepancies between modelled and observed flows and ensure the model provides a more robust assessment of development impacts.
5. Improving Public Transport Validation: Enhance the validation of rail stations, with a focus on Moreton-in-Marsh, to closely match the ORR values, and improve bus validation in the Cirencester area to bring results within the required criteria.
6. Bus and Rail fare elasticities: The modelled elasticities are broadly in line with TAG Unit M2.1 guidance, though some deviations have been identified that may warrant further review. We note that the bus sub-mode fare elasticity is outside the TAG range however it is noted that that around 25% of the daily ticket sales within Gloucestershire are free journeys which would impact the derived elasticities, therefore no further action is needed. In addition, the rail sub-mode fare elasticity is higher than the TAG range but it is noted that rail demand constitutes a small proportion of total trips, we therefore don't intend to make changes as we think the resultant adjustment would have minimal impact.
7. VDM: Given the observations regarding the VDM it is recommended to benchmark the forecast modal splits and shift against available datasets such as NTS (i.e. modal split) and observed modal shifts from outturn data when equivalent polices are enacted.

7.2 Conclusion

The GC3M demonstrates a generally good level of performance, meeting most TAG criteria for calibration and validation. Some refinement is possible on the demand side; for example, VDM results show differences between synthetic and assigned demand. Similarly, the average trip length between prior and post matrix estimation could be improved to fully meet TAG criteria, although some deviation on demand-related criteria is common. Targeted enhancements, particularly near large developments, would further strengthen model reliability and forecasting accuracy, reinforcing its value as a robust evidence base for future decision-making.

In summary, this note highlights key aspects of the GC3M that may benefit from refinement or ongoing monitoring during the Cotswold local plan strategic transport assessment. Overall, the GC3M demonstrates good performance, but areas for improvement have been identified. Enhancements around the potential strategic site allocations are recommended, and further localised assessments of the model's network structure, zoning, calibration, and validation will be carried out.

1 Policy & Technical Guidance Review

Cotswold District Council is preparing a new Local Plan, which will establish the planning framework for development and land use across the district. *The Plan will set out both strategic priorities and locally tailored policies to guide growth and change. The Local Plan covers the Cotswold District, shown in* Figure 1-1.

City Science has been commissioned to support the development of the transport evidence base for the Local Plan through the preparation of a Strategic Transport Assessment. The Review gives particular attention to three themes that are deemed to define the Cotswolds' context: an ageing population, the challenges of rural living, and the district's strong role in leisure and tourism. These themes are considered throughout the Review and help shape the findings and recommendations of this report.

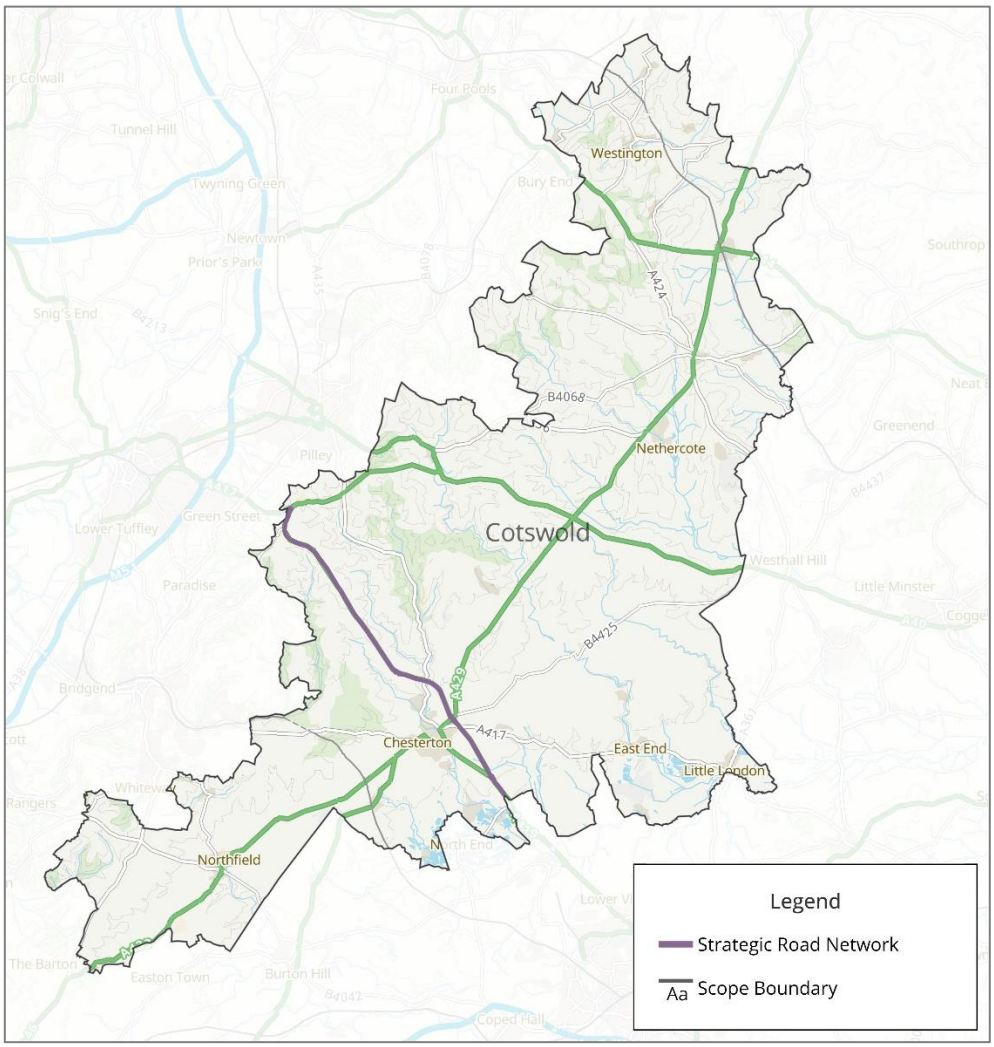

Figure 1-1: Core Study Area & Strategic Road Network

1.1 National Policy Context

1.1.1 Introduction

The national policy context is undergoing a period of significant change following the July 2024 General Election. Additionally, a new Secretary of State for Housing, Communities and Local Government has recently been appointed however no major changes in policy direction is expected. Policies and legislation have largely been designed to reflect the government's five 'missions' set out in the Plan for Change (HM Government, 2024). These are shown in Figure 1-2.

Kick Start Economic Growth | Build an NHS Fit for Future | Safer Streets | Break Down the Barriers to Opportunity | Make Britain a Clean Energy Superpower

Figure 1-2: The Government's five missions

The legislative agenda of the current parliament (running to July 2029 unless an early election is triggered) was set out in the King's Speech (2024). Economic growth was identified as the driving aim of the government, and this has been reinforced in recent policy announcements.

In April 2025, the Secretary of State for Transport announced her vision for transport including tasks for a better decade of transport

- **Towards a better Railway:** Establishing Great British Railways and seeking to unify track and train.
- **Towards Public Ownership:** Moving all operators into public hands starting with Southwestern and c2c.
- **Towards Better Buses:** Greater control for local authorities for buses including franchising options.
- **Towards Better Roads:** Increased financing for local highways with a focus on dealing with road surface quality.
- **Towards Fairer Work:** Greater protections for seafarers.
- **Towards Cleaner Skies:** New Sustainable Aviation Fuel mandate.
- **Towards a Fossil-Free Future:** Driving the decarbonisation of all modes of transport.

Having run a call for ideas until February 2025 an Integrated National Transport Strategy is currently being drafted and is due to be published by the end of the year. Initial showcases of the strategy suggest that it will focus on embedding people at the heart of transport planning rather than a focus of on major infrastructure projects. Balancing the benefits of devolution with a national strategic vision is also expected to feature.

In parallel, the Ministry of Housing, Communities and Local Government has embarked on a programme of reform to the planning system, and to local government devolution and reorganisation. This has included changes to the National Planning Policy Framework as well as an English Devolution white paper. These changes are intended to drive shorter development times for infrastructure as well as increase the accountability of transport systems.

This section summarises the national policy environment (as of **July 2025**) most relevant to the development of the **Cotswold Local Plan**, organised under the themes shown in Figure 1-3.

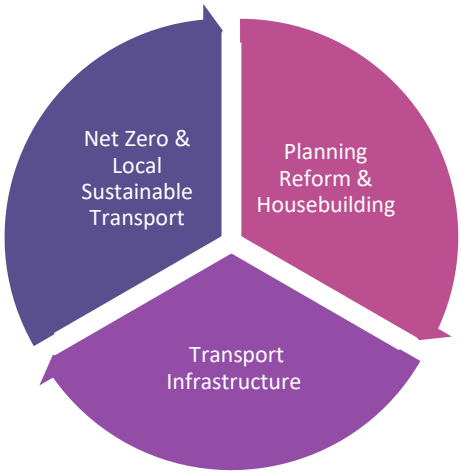

Figure 1-3: National Policy Themes Described in this Section

1.1.2 Planning Reform & Housebuilding

One identified key enabler of the missions is reform of the planning system to be more 'pro-growth' and, 'pro-infrastructure'. This is intended to build in a default approval to development occurring on brownfield sites as well as critically important infrastructure. To support this, the Government has committed to fast-tracking planning decisions for at least 150 major economic infrastructure projects within the current parliamentary term. These policies centre on:

- Updating: All relevant National Policy Statements (NPS) planned by summer 2025. Consultations on updates to the NPS were completed in May 2025. A new Water Resources Infrastructure NPS was deployed in July 2025 with other updates expected.
- Publishing: A revised National Planning Policy Framework (NPPF). This was published in December 2024.
- Improving: Local planning processes and increasing capacity. The government has recently launched a consultation on changes to streamline the planning of nationally significant infrastructure planning.

Whilst all are important, revision of the NPPF is of particular significance in the context of the Cotswold local plan. The revised NPPF (2024b), released in December 2024, places greater emphasis in several areas including achieving sustainable development, prioritising economic growth and addressing climate change. Promoting' healthy and safe communities' and 'sustainable transport' are key planks of the framework, outlining the following recommendations:

- Places should promote social interaction and community cohesion through mixed-use spaces, walkable street layouts, and accessible, active public areas.
- Ensure environments are safe, inclusive, and support healthy lifestyles by reducing crime, providing green spaces, and encouraging walking, cycling, and access to healthy amenities.
- Considering transport in the early stages of the plan-making process.
- Using a vision-led approach to identify transport interventions which will deliver well-designed, sustainable and popular places, with internal transport networks and external connectivity considered in full.
- Locating development in locations where the need to travel can be minimised and which can offer a genuine choice of travel modes.
- Providing a mix of uses which will minimise the number and length of journeys.
- Providing attractive active travel infrastructure to maximise the share of short journeys made on foot or by bicycle.
- Providing appropriate public transport facilities and services and connecting to existing networks.
- Developments that generate significant movement must provide a travel plan and be supported by a vision-led transport statement or transport assessment.
- Be prepared with the active involvement of local highways authorities, other transport infrastructure providers and operators, and neighbouring councils.

The Government has identified a pressing need to speed up housebuilding, including affordable and social housing (Prime Minister's Office, 2024b). The Planning & Infrastructure Bill (2025b), currently in the committee stage in the House of Lords, would enact tools to support this ambition, including Spatial Development Strategies which will support cross-boundary strategic planning, and amending the Transport & Works Act (1992) to streamline delivery of transport infrastructure supporting new housing.

More generally, the Government has set out the importance of appropriate investment, devolution of local government decision-making, and planning reform (including reintroducing mandatory housing targets with a new calculation method) to achieve a step-change in the number of houses built. In the Plan for Change, the Government sets a milestone of delivering 1.5 million new homes within this Parliament (by July 2029 at the latest), some of which will be in "a new generation of new towns" and major urban extensions.

Relevance to the Cotswold Transport Evidence Base

- **Rural Connectivity**: Given the rural nature of the district, transport planning must focus on improving accessibility across dispersed settlements, maintaining essential services, and connecting communities to necessary services such as employment, education, and healthcare.
- **Engagement:** The Transport Working Group will comprise representatives of relevant local and transport authorities across this project. Each organisation will be actively involved in the ongoing process of the evidence base, interventions and modelling.
- **Vision-led:** Transport proposals will be guided by a vision-led methodology, maximising sustainability for Local Plan sites and the wider district, while considering the distinctive social, economic, and environmental characteristics of the Cotswolds.
- **Scenario Planning:** Multiple scenarios will be assessed to understand the effects of development on transport networks and the wider environment. This ensures that proposed interventions are robust, adaptable, and responsive to the district's unique challenges, including seasonal tourism pressures and rural access.

1.1.3 Transport Infrastructure

Transport infrastructure investment is a key focus of the Government's agenda for delivering national and regional economic growth. While many national initiatives focus on large urban or nationally significant projects, the Cotswolds' rural context, dispersed settlements, and tourism-driven traffic mean that infrastructure planning must carefully balance local needs with broader policy objectives. Policies to date suggest that the Government is seeking local authorities to focus on building and developing communities that can promote sustainable transport solutions.

The Infrastructure Strategy (HM Treasury, 2025b) and related announcements reinforce this commitment, focusing on projects that directly support housing and job creation. Central to these efforts is integrated spatial planning, ensuring transport systems effectively support new developments. Key initiatives include:

- Over 50 nationally significant road and rail upgrades, designed to unlock approximately 39,000 new homes and create 42,000 new jobs.
- Renewed backing for major regional projects like East West Rail and TransPennine Route Upgrades, to enhance connectivity.
- Encouragement of transport investment that closely integrates with spatial planning and the wider industrial strategy for sustainable growth.

However, Phase 1 of the Spending Review (HM Treasury, 2025a) introduced a more selective, evidence-driven funding approach. Several large transport schemes were paused or cancelled due to concerns about cost, deliverability, and local impacts, signalling a pivot towards investments with clear, measurable benefits for communities and economies.

Large transport investments projects have been scaled back or cancelled suggesting a government focus on delivering smaller scale interventions that can still provide an impact. For example, the scaling back of HS2, reflects the growing emphasis on affordability, regional benefit, and deliverability (DfT, 2024e). This is likely to have implications for potential local rail schemes such as the Cirencester-Kemble railway restoration.

The Strategic Road Network (SRN) provides vital connections between the Cotswolds and regional centres. Key routes such as the A40, A429, and A436 link Cirencester to major hubs such as Gloucester, Birmingham and Bristol, providing important access for both residents and visitors. The National Highways Initial Report (2024b) highlights a shift from network expansion and enhancement to prioritising renewals, resilience, and efficiency. Further, DfT Circular 01/2022 (2022) requires local authorities to develop robust transport evidence bases and collaborate closely with National Highways to ensure sustainable growth that does not overburden the SRN. Reducing local trip demand on strategic roads by expanding active travel and public transport is a key government expectation - highly relevant for new developments across the Cotswold District.

Although some nationally significant schemes have been paused or scaled back, local transport funding remains a priority. The Local Transport Fund commits £2.4 billion over the same period for local priorities, including supporting housing growth. Road maintenance remains a priority too, with the Government allocating funding for pothole repairs and road maintenance, signalling its intent to promote road safety.

To ensure investments meet broader economic, social, and environmental goals, new appraisal guidance and a comprehensive Transport Infrastructure Review are being introduced. These reforms aim to promote accountability, and projects that advance levelling up, social inclusion and net zero ambitions.

Relevance to the Cotswold Transport Evidence Base

- **Vision & Validate:** A vision-led approach will guide the development of Transport Evidence Base ensuring proposals support sustainable growth, rural accessibility, and the distinctive character of the Cotswolds. This methodology naturally aligns with the guidance set out by National Highways, strengthening the case for delivering well-designed transport infrastructure that supports long-term place-based goals.
- **Robust Evidence:** Transport interventions will be assessed for cost, deliverability, and local impact, ensuring decisions are well-justified and deliver measurable benefits.
- **Local Priorities:** The Transport Evidence Base will be informed by local transport priorities, including improving rural transport links, supporting the mobility needs of an ageing population, and managing seasonal pressures from leisure and tourism.
- **Multi-Criteria Appraisal:** Proposals will be evaluated using a multi-criteria framework considering economic, social, and environmental factors, including climate and net zero objectives.
- **Integration with Planning:** Transport evidence will inform all stages of the Local Plan, ensuring housing, economic development, and leisure/tourism infrastructure are well-connected and accessible, and that new developments are in the most sustainable locations from a transport perspective

1.1.4 Net zero & Local Sustainable Transport

The UK Government remains committed to its legally binding target to achieve net zero emissions by 2050, with transport seen as both a major contributor to emissions and a critical solution. The Plan for Change reinforces this ambition, positioning net zero as a driver of economic growth, job creation, and investment. While it does not set detailed transport policy, it reaffirms that carbon budgets will be used to measure progress, underlining the importance of aligning local planning decisions with national climate goals.

The Transport Decarbonisation Plan (DfT, 2021a) remains a critical strategy, setting out a national vision for reducing transport emissions through modal shift, electrification, demand management, and investment in active and public transport. While the current government has not indicated that it intends to reissue the Plan, sector-specific initiatives have continued including:

- Bus Reform: The Bus Services (No.2) Bill (2025b) includes provisions to expand local authority powers over service franchising, mandate zero-emission buses by 2030, and strengthen duties around socially necessary services. In parallel, the Government continues to provide financial support for network improvement through initiatives like the Bus Service Improvement Plans (BSIPs) (DfT, 2023a), the Bus Service Operators Grant Plus (DfT, 2023b), and a recent £38 million allocation to purchase over 300 new electric buses (DfT, 2025e). Ongoing national fare caps (DfT, 2024b) and a focus on affordability and reliability make buses a key strategic priority, particularly for spatial strategies aiming to reduce car dependency in both urban and rural settings. The rural context of the Cotswolds provides a challenging area for buses with services requiring high subsidies with longer journeys and fewer passengers. Additionally, the Spending Review (2025a) committed £750 million per annum during this Parliament to improve bus services, including around £250 million per annum of Bus Service Operators' Grant.
- Active Travel & Mode Shift: The Spending Review (2025a) has committed £616m in active travel funding from 2026/27 to 2029/30. Alongside this, Gear Change (DfT, 2021b), prepared under the previous government, sets a strong foundation with ambitions for half of all journeys in towns and cities being cycled or walked by 2030. Recent funding allocations for active travel include over £300 million through the Third Cycling and Walking Investment Strategy (CWIS3) (DfT, 2025g). This is aimed to support local authorities in delivering better connected, walkable and cycle-friendly neighbourhoods. This direction aligns closely with the updated NPPF (2024b), which reinforces expectations that new development should prioritise active and sustainable modes of travel. The focus on active travel for towns and cities means there has been comparatively less focus on active travels role in rural trips. Rural trips and often longer and are more likely to require full segregation due to higher road speeds. Due to the longer trips a focus on e-micromobility may be most relevant to the Cotswolds.
- Local Sustainable Transport: The Local Transport Fund (SR2025) was suggested to represent a major shift in national policy, by devolving over £2.4 billion for locally led transport schemes (DfT, 2025f). Funding focuses on bus improvements, cycling and walking infrastructure, road safety, and digital mobility - particularly outside major city-regions. This new funding stream supports the principle of devolved responsibility for transport planning, encouraging councils to integrate transport upgrades with wider regeneration, housing, and climate goals.
- Climate Adaptation & Resilience in Transport Systems: The Government has launched a consultation on improving climate resilience within transport systems (DfT, 2024a), including proposals for infrastructure risk assessments and updated design standards.

Relevance to the Cotswold Transport Evidence Base:

- **Decarbonising Transport:** National policy places strong emphasis on decarbonising all aspects of the transport system, with significant commitments to accelerate the transition away from fossil fuel dependence. Across EV incentives, bus reform, and modal shift strategies, the clear objective is to reduce car dependency and promote cleaner, more efficient alternatives. The Transport Evidence Base will support this by testing how transport interventions enable low-carbon travel choices to support sustainable development.
- **Prioritising Sustainable Transport:** The national vision supports a long-term shift toward more sustainable travel modes - walking, cycling, and public transport - within new development and regeneration areas. The Transport Decarbonisation Plan and supporting strategies set out ambitions for a significant reduction in car use in favour of sustainable travel, while the Local Transport Fund reinforces the importance of locally led, place-based delivery. The Transport Evidence Base will help embed these principles by identifying where sustainable transport infrastructure is most needed and can be most effective in shaping future growth.
- **Prioritising Active Travel & Mirco-Mobility:** Government strategy sets clear goals that half of all journeys in towns and cities will be cycled or walked by 2030. In the Cotswolds, long distances between towns and villages limit the uptake of conventional walking and cycling. Within market towns such as Cirencester and Tetbury, pedestrian- and cycle-friendly neighbourhoods can be successfully promoted. In more rural areas, e-bikes, e-scooters, and other micromobility solutions may be essential to enable short, low-carbon trips. The Transport Evidence Base will assess where infrastructure can be most effectively delivered to support these modes, helping to prioritise investment and maximise accessibility.
- **Rural Buses:** The upcoming Bus Services (No. 2) Bill will give local authorities greater control over franchising, route planning, and protection of socially necessary services. Delivering sustainable bus networks in rural areas is challenging due to longer routes, low passenger numbers, and higher subsidy requirements. The Transport Evidence Base will provide detailed analysis of demand, route viability, and service design to support reliable and affordable bus provision across the district. New developments could focus on attempting to bolster the demand for existing services.
- **Network Resilience and Climate Adaptation:** Sparse transport networks in rural areas mean disruptions, such as road closures or infrastructure failures, have disproportionate effects. Climate adaptation and resilient design are therefore crucial. The Transport Evidence Base will help identify vulnerable routes, assess risk, and prioritise interventions, ensuring continuity of access for residents, visitors, and businesses.

1.1.5 Future of Rural Transport

There is an increasing understanding and focus on the different challenges faced by rural communities. To address this, the DfT issued a report following a consultation called “Future of Transport: supporting rural transport innovation” (DfT, 2023). The report found that:

- **Car Dependence:** The rural environment makes the socio-economic impact of a lack of access to a car more pronounced. This means that there is a higher importance for the reliability of rural roads but also the additional challenges to sustain an alternative system.
- **Local Integrated Transport Strategies:** Local plans in rural areas need to be more integrated across land use, economic growth and housing to maximise the connectivity that can be delivered through sustainable transport.
- **Innovative in Rural Mobility:** Rural areas can benefit from emerging and innovative technologies such as Demand Responsive Services, automated and shared mobility options.

- **Electrification Infrastructure:** The higher dependence on private vehicles for transport in rural areas means that meeting sustainability goals will rely more heavily on electrification than in urban areas and as such a higher focus on electric charging infrastructure is needed.

The report outlines nine rural principles for transport:

1. New modes of transport and new mobility services must be safe and secure by design.
2. Innovation in transport should consider the needs of rural transport users and must be available and accessible to all parts of the UK and all segments of society.
3. Walking, wheeling, cycling and micromobility must be enabled as the best options for short rural journeys.
4. Affordable and accessible public transport and shared mobility must be fundamental to an efficient rural transport system.
5. New transport modes and services in rural areas should support a rapid transition to zero emissions and be adapted to climate change.
6. Innovation should improve road efficiency and reduce congestion by promoting shared mobility, improving user choice and consolidating freight.
7. The marketplace for mobility must be open to stimulate innovation and give the best deal to users, working alongside local authorities to complement existing services.
8. New transport services must be designed to operate as part of an integrated system that combines public and private modes with community-led schemes for transport users.
9. Data from new transport services must be shared where appropriate to improve both choice and the operation of the transport system.

1.1.6 Mobility for Older People

The median age of the Cotswold (49 years old) is above the median for the region (44 years) and England as a whole (40 years old). Over the last decade the median age of the Cotswolds has also increased from 46 years old suggesting that the region is likely to continue to have an aging population and this should be reflected in its wider local planning. There are several national policies and guidelines that determine how to integrate older people into planning.

1.1.6.1 Accessible Travel Policy by the Office of Road and Rail (ORR, 2020)

The Accessible Travel Policy by the Office of Road and Rail (ORR, 2020) the document provides guidance around the provision of transport to be fair and equitable to those with disabilities as well as older people. It highlights the need to provide:

- **Space and Clearance:** Standards for ensuring that transport spaces provide enough clearance and space for wheelchair and mobility assistance users
- **Spaces to Rest:** The guidance highlights the need for older and disabled people to have spaces to sit down and rest to facilitate their transport needs. This includes walks to transport hubs as well as within transport systems themselves (e.g. bus stops)
- **Toilet Provision:** Ensuring that public spaces provide adequate facilities for going to the toilet is of more importance to older and disabled individuals.
- **Wayfinding and Journey Planning:** Additional consideration should also be given to neurodiverse users and ensuring that transport systems and spaces provide welcoming and easy to navigate spaces.

1.1.6.2 Inclusive Transport Strategy

The inclusive transport strategy (DfT, 2018) outlined the Government's strategy for ensuring the needs of those with additional needs (such as reduced mobility) were being fully accounted for in transport planning. It identified five key themes.

1. **Existing Rights:** The report identified that existing rights of equality were not always known and enforcement needed to improve.

2. **Staff Training:** The report identified that staff awareness (e.g. bus drivers) was lacking about the needs and rights of disabled people
3. **Improved Information:** The report highlighted the need to produce information in forms that all people could access and understand. For older people this highlights the need to consider lower digital literacy.
4. **Inclusive Infrastructure:** New systems must ensure that the infrastructure is built without barriers to those with mobility and other impairments.
5. **Future:** Early involvement and engagement with disabled people was deemed to be highly important for these communities in any change or innovation to the transport system.

1.2 Sub-national Policies & Plans

1.2.1 Route Strategy Initial Overview Report Route 19: Birmingham to Exeter (National Highways, 2023)

Route 19 forms part of the M5 corridor between Birmingham and Exeter and is one of 20 routes assessed by National Highways. The Initial Overview Report (2023) identifies strategic issues and opportunities, including connectivity with the Cotswolds and wider regional networks. Key pressures are safety, congestion, and severance at junctions where the M5 interacts key A roads. These factors directly influence access into and across the Cotswolds, particularly via key east-west links.

A particular link along this route relevant to Cotswold is between M5 J11A and J12 (Gloucester). This stretch of the motorway is strategically important for the Cotswolds, as J11A provides direct access to the A417, the main east-west route across the Cotswolds towards Cirencester, Swindon, and the M4 corridor. As a result, pressures on this section of the M5 affect both the reliability of long-distance travel and visitor movement to and from the Cotswolds.

Another relevant section is between M5 Junctions 12 and 14, which provides onward connectivity from Cirencester and the central Cotswolds to the M5 corridor. This link supports both commuter movements and visitor travel, linking the A419 corridor via Stroud. It also links Cirencester with destinations further south, including Bristol and the South West. Ensuring resilience along this section is key for both for local accessibility and for sustaining the visitor economy.

Generally, both sections record relatively low collision rates compared with other parts of the corridor. However, pressures remain around these junctions, particularly in the form of long slip-road queues and the associated risks of poor air quality and elevated noise levels. The report identifies measures to strengthen local connections and safeguard environmental receptors around Junctions 11A and 12, alongside proposals to improve resilience to seasonal traffic flows along the M5.

Relevance to the Cotswold Transport Evidence Base

- **Engagement with National Highways:** Ongoing collaboration with National Highways ensures alignment with strategic road planning, including recognition of existing issues and anticipated pressures along the M5 corridor affecting the Cotswolds.
- **Severance & Connectivity:** Observed severance at junctions such as J11A and J11 highlights the importance of planning for inclusive, well-connected development, particularly in areas divided by major infrastructure. Ensuring smooth east–west movement across the Cotswolds remains a key consideration.

1.3 Gloucestershire-wide policies and plans

1.3.1 Gloucestershire Local Transport Plan (2020-2041) (Gloucestershire County Council, 2020b)

The Gloucestershire Local Transport Plan (LTP) set out Gloucestershire County Council's (GCCs) local transport ambitions for the next 20 years. The main priorities are to: protect and enhance the natural and built environment; support sustainable economic growth; enable safe and affordable community connectivity; improve community health and wellbeing; and promote equality of opportunity.

Relevance to the Cotswolds Transport Evidence Base

- **Transport Emissions Reductions:** Gloucestershire County Council's aim for net zero transport emissions by 2045 is significant for the Cotswolds, where dispersed settlements and reliance on private vehicles contribute significantly to emissions. Strategies that improve sustainable transport options, such as public transport enhancements, active travel, and low-emission modes, are essential for reducing the environmental impact of travel across the rural area.
- **Rural Connectivity and Mode Choice:** The LTP highlights the importance of supporting accessible and reliable transport networks in rural areas. In the Cotswolds, this includes improving bus and rail services, as well as safe walking, wheeling, and cycling routes between key employment and service hubs. Enhancing these networks supports local mobility and reduces dependence on private vehicles.
- **Managing Population and Travel Demand:** With an ageing population and dispersed communities, transport interventions must address accessibility for all residents, particularly those without access to a car. Targeted improvements to local transport infrastructure can maintain social inclusion and enable access to healthcare, education, and essential services.
- **Major Transport Projects:** Key infrastructure improvements relevant to the Cotswolds include enhancements to the M5 corridor and bus priority schemes. These projects improve regional connectivity while supporting rural communities, facilitating both commuter and visitor travel.

1.3.2 Gloucestershire Bus Service Improvement Plan (BSIP) 2024 (Gloucestershire County Council, 2024a)

The BSIP outlines GCC's strategy to increase bus use, and support decarbonisation by improving service quality, coverage and integration. It includes a range of proposed measures such as faster and more reliable routes, new ticketing options, zero-emissions buses, and plans for a future mass rapid transit system.

Relevance to the Cotswolds Transport Evidence Base

- **Enhancing Rural Accessibility:** The Bus Service Improvement Plan (BSIP) focuses on improving service quality, coverage, and integration, which is particularly relevant for Cotswold's dispersed rural communities. Reliable and frequent bus services can support residents without access to private vehicles, enhancing access to employment, education, healthcare, and other essential services.
- **Informing Future Transport Planning:** The BSIP provides input for planning and scenario development, particularly in assessing how bus service improvements could influence mode shift and connectivity within the Cotswolds. By integrating these measures, transport strategies can better reflect the needs of rural populations and visitor demand.
- **Integration with Wider Transport Networks:** Proposals for bus priority measures also contribute to more integrated regional travel, linking the Cotswolds to neighbouring centres and major corridors, supporting both daily mobility and the visitor economy.

1.3.3 Journey to Net Zero (Gloucestershire County Council, 2024b)

This Roadmap, published by GCC, provides a summary of the current transport emissions in the county and a resulting plan to reach net zero by 2045, reducing emissions by 80% by 2030. It focuses on three overarching aims of avoiding the need to travel, shifting mode of travel, and improving vehicles and driving via more efficient networks and more low carbon vehicles.

Relevance to Cotswolds Transport Evidence Base

- **Supporting Behavioural Shifts in Rural Areas**: The Roadmap identifies five key behavioural changes including making more local trips, shifting from private cars to sustainable modes, and adopting smaller or zero-emission vehicles. In the Cotswolds, achieving these outcomes requires not only transport interventions but also developments that support sustainable behaviours, particularly in dispersed rural settlements.
- **Reducing Transport Emissions:** With transport accounting for a significant portion of local emissions, these measures are critical to achieving net zero targets while maintaining access for residents and visitors. Rural-focused solutions, such as low-emission buses, active travel routes, and improvements to key corridors, help reduce reliance on private vehicles and support decarbonisation.
- **Stakeholder Collaboration:** The Roadmap highlights the importance of working with a range of stakeholders, including transport operators, and strategic bodies such as National Highways. For the Cotswolds, such collaboration ensures that transport strategies reflect local needs, support connectivity across rural communities.

1.3.4 Gloucestershire Climate Change Strategy (Gloucestershire County Council, 2025)

Published in 2019, this Strategy (Gloucestershire County Council, 2019) establishes clear decarbonisation targets (e.g. carbon neutral by 2050 and 80% reduction in emissions by 203). Since then, it has been operating on a five-year rolling Action Plan with themes and targets updated as relevant.

Relevance to the Cotswold Transport Evidence Base

- **Low-Carbon Transport Options: The** Strategy emphasises providing practical, low-carbon travel solutions for all, including improvements to local bus services, school transport, and cycling and walking infrastructure, particularly relevant for dispersed rural settlements in the Cotswolds.
- **Behavioural Change: En**couraging residents to shift away from private car use is a central focus. Supporting behaviour change alongside transport interventions helps reduce emissions while maintaining accessibility in rural areas.
- **Rural Resilience and Accessibility:** By embedding decarbonisation measures into planning, the Strategy encourages that transport networks remain resilient, inclusive, and capable of meeting the mobility needs of Cotswolds communities.

1.4 Local Policies & Plans

1.4.1 Local Cycling & Walking Infrastructure Plans

Local Cycling and Walking Infrastructure Plans (LCWIPs) identify cycling and walking improvements required in local areas and set out a long-term approach to developing local cycling and walking networks. Much of the LCWIP and national focus has been on urban environments and as such there are no LCWIPs in the Cotswold District outside of Cirencester.

Policy	Relevance to the Cotswold Transport Evidence Base
Cirencester Local Cycling & Walking Infrastructure Plan (Gloucestershire County Council, 2022)	The plan identified both existing barriers to active travel and a series of proposed measures to address them. It highlights that Cirencester suffers from fragmented walking and cycling routes and poor integration with wider transport networks, leading to high dependency on private cars even for short trips. It sets out a package of improvements including the development of continuous and safer cycle corridors, enhanced pedestrian routes to schools and employment areas, and better connections to public transport hubs such as Cirencester town centre and Kemble Station. Its detailed route mapping and community engagement insights can be used to inform broader transport planning, guide infrastructure investment, and support scenario development in the Cotswold Transport Evidence base.
Overarching Cycling Infrastructure Plan (Gloucestershire County Council, 2023)	The countywide plan determined that existing cycle routes were concentrated within the urban environments particularly Gloucester and Cheltenham. The plan focuses on filling the gaps between LCWIPs to promote a cohesive cross-county network accounting for the more rural character. In particular the challenges of building LTN1/20 compliant routes in rural areas where high speeds and traffic volumes limit the ability for segregation despite it being most necessary in those places. Five routes are found to have a high degree of deliverability and impact: Coleford to Lydney, Tewkesbury - Bishops Cleeve, Moreton in Marsh - Stow-on-the-Wold, Stonehouse – Dursley and Cirencester to Cricklade. Of these only Cirencester to Cricklade and Moreton in Marsh to Stow-on-the-Wold within the Cotswold District are prioritised.

Table 1-1: Cotswold Area Local Cycling and Walking Plans

1.5 Relevant Policies & Plans of Neighbouring and Similar Authorities

The Local Plans of adjacent LPAs have been reviewed to understand current and emerging growth ambitions, and to identify strategic developments, infrastructure proposals, and cross-boundary transport pressures that could influence outcomes within the Cotswold District. The table below summarises some of the most relevant and recent plans.

Policy	Relevance to the Cotswold Transport Evidence Base
South Gloucestershire New Local Plan (Reg 19) (South Gloucestershire Council, 2025)	South Gloucestershire is currently in the process of developing a new Local Plan that will guide and manage growth across the district to 2041. The Regulation 19 consultation closed in April 2025, with submission to the Planning Inspectorate expected by September 2025. The Plan is strongly aligned with the principles of Vision and Validate planning, setting out a clear long-term vision for 2041 and using strategic objectives and policies to guide development toward that desired future. South Gloucestershire's vision centres on sustainable, connected, and thriving communities, reduced car dependency, and integrated, resilient transport infrastructure. Strategic objectives and policies, such as LPS9 (Sustainable Movement) and LPS10 (Climate Change) support development patterns that reduce the need to travel, promote active and sustainable modes over private vehicles, and embed modal shift principles. These policies go beyond reacting to current transport conditions and instead set clear ambitions for reducing emissions, enhancing accessibility, and shifting travel behaviour. As a neighbouring authority, South Gloucestershire provides a valuable example of applying a Vision and Validate approach to spatial and transport planning, offering a clear framework that the Cotswold district can utilise. The Plan proposes major developments at: • Brabazon (Filton Airfield) with a minimum of 6,500 homes, a new railway station, student accommodation, new offices, services and amenities as well as a 17,000-seat arena. • Charfield Village, delivering over 3,000 new homes as well as a mobility hub, new commercial and retail space and a community meeting space. To service these developments there will be significant improvements to transport infrastructure, including MetroBus service extensions and a new railway station in development at Charfield. These developments, combined with enhanced public transport provision, are expected to increase commuter flows, influence modal shift and reshape cross-border travel patterns, particularly along the M5 and A38 corridors.
Forest of Dean Draft Local Plan 2021-2041 (Forest of Dean District Council, 2024)	The Plan places strong emphasis on sustainable development, net zero construction, and climate adaptation. These policy directions contribute to the broader regional commitment to sustainability and inform how future interventions might align across boundaries.

Policy	Relevance to the Cotswold Transport Evidence Base
Worcestershire Local Transport Plan 2018-2030 (Worcestershire County Council, 2017)	The Worcestershire LTP shares key themes with Gloucestershire's LTP, particularly around investment in transport technology, promoting travel choice, and increasing capacity. Its objectives - centred on economic development, environmental sustainability, public health, safety, equality, and quality of life.
Sustainable Tourism Strategy 2024 to 2030 (Highland Council, 2024)	The highlands in Scotland have a similar transport profile to the Cotswolds. That is that a high proportion of transport in the council is made up of tourism alongside an area that is strongly rural. The council has developed a strategy to deliver a sustainable tourism sector. The strategy identified that domestic tourism as a sector was likely to increase due to more conscious approach to travel. They outlined the need to provide effective infrastructure (including housing) that can meet the growth in tourism. They identify the importance of providing seasonal transport options and working closely with the tourism sector to promote them.
Lake District Local Plan	The Lake District is another area where seasonal tourism contributes a large amount of the total traffic and carbon emissions of the region. The local plan outlines the dichotomy the region has wishing to ensure high quality of life for local people as well provide vibrant places to sustain its tourism sector and ultimately its economy. There are two policies that are highly relevant for the Cotswolds: • Accommodation for tourism: The need for housing and buildings that can sustain longer stays with high quality experiences whilst not jeopardising the needs of local people. ` • Sustainable Access: The local plan focuses on building out sustainable transport options including park and ride and mobility hubs as well restoring lost railway connections and pursuing novel electric micromobility. They identify that protecting and enhancing the rights of way and cycle network will be key to allow modal shift.

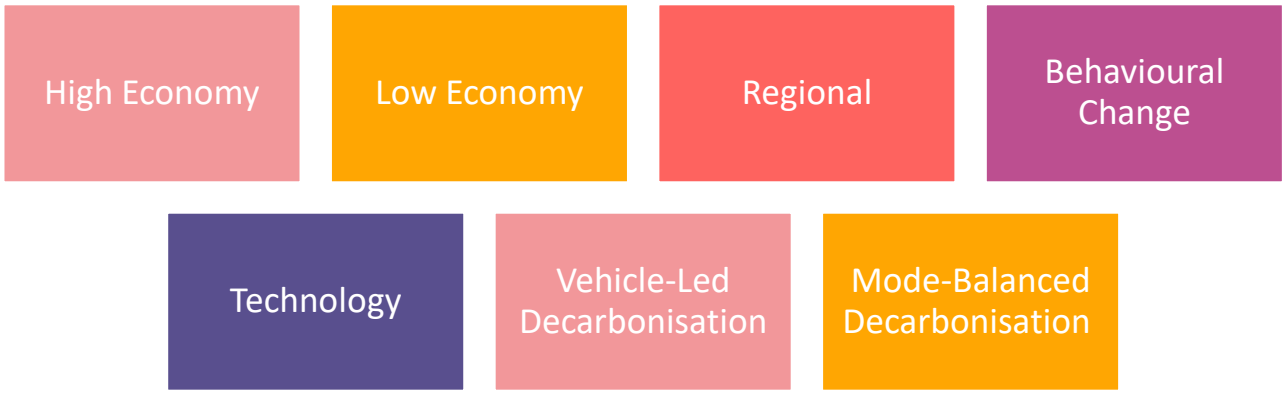

Table 1-2: Neighbouring Authorities' Local Plans

1.6 Technical Documents & Guidance

1.6.1 TAG Uncertainty Toolkit, Data Book & Common Analytical Scenarios (DfT, 2023c)

These documents, published as part of the DfT's Transport Analysis Guidance (TAG), are primarily designed to support scheme-level transport modelling and appraisal, rather than local plan-making. However, they provide a structured approach to handling uncertainty in forecasting and appraisals, which can still offer useful principles when considering future transport scenarios.

- The TAG Uncertainty Toolkit outlines how to assess uncertainty and introduces the Common Analytical Scenarios - seven standardised, cross-modal futures designed for consistent national-level analysis including:

- The TAG Data Book provides model input assumptions and appraisal values aligned with TAG methodology.

Relevance to the Cotswold Transport Evidence Base

- **Scenario Development:** The base model which is the foundation for forecasting for the Transport evidence base of the Cotswold local plan will need to be consistent with TAG. Forecasting will also need to consider future uncertainties at the national level around the economy and behaviour to ensure the local scenarios can validate the vision put forward.

1.6.2 National Design Guidance (Ministry of Housing, Communities & Local Government, 2021)

This guidance sits alongside the NPPF to confirm the national stance on designs for new developments. It works to support the NPPF and focuses on specific design aspects of developments, including movement and public spaces.

Relevance to the Cotswold Transport Evidence Base

- **Sustainable Places:** The guidance promotes the creation of well-designed, climate-conscious communities where people can live, work, and thrive. A vision for the Cotswolds that can promote a tourism sector which can grow whilst also providing sustainable transport options in a highly rural setting is crucial. New developments can provide increased demand that can help make existing sustainable transport options more viable.
- **Sustainable Movement:** The guidance emphasises the importance of clear street layouts and accessible, safe, and efficient transport networks. It supports a multi-modal transport approach, highlighting walking, cycling, and public transport. Multi-modality and innovative transport solutions will likely play a key role in the Cotswolds rural locations

1.6.3 Economic Role of National Highways - Role 3: Planning and Placemaking (2024a)

This document suggests a clear and practical framework for how LPAs can collaborate with infrastructure providers, such as National Highways, to develop robust, deliverable, and sustainable Local Plans.

Relevance to the Cotswold Transport Evidence Base

- **Support for Vision-led & Scenario-based Planning:** A central theme is the promotion of vision-led, scenario-based planning, encouraging LPAs to define a clear vision for future growth and then test a range of development scenarios to determine the most sustainable and efficient transport solutions. The evidence base will utilise the vision-led methodology. A clear vision is needed that meets stakeholder needs and requirements. Early engagement with stakeholders will be used and combined with the key goals and desired of the region (e.g. decarbonisation).
- **Early Engagement:** National Highways strongly emphasises the importance of early and ongoing engagement. It advocates for LPAs to work collaboratively with transport infrastructure providers well before Regulation 19 consultation to identify and address capacity, connectivity, and safety issues on the SRN. There is a limited amount of the SRN that lies within the Cotswolds (only the A417) and this means that other local roads will likely be more important in considering the impacts of development.
- **Evaluation Framework:** Key themes are outlined that National Highways will assess when reviewing Local Plans. These include:
  - The cumulative and residual impacts of proposed development on the SRN. Due to the nature of the Cotswolds this will largely focus on any development in or around Cirencester.
  - The sustainability and accessibility of site allocations.
  - The extent to which transport policies are aligned with local and national infrastructure priorities

  Our transport assessments and modelling outputs will be structured to reflect National Highways' evaluation priorities, including safety, operational performance, and accessibility. Given that so little of the SRN is within the Cotswolds it will also account for local priorities
- **Funding:** The document stresses the importance of using Section 278 agreements and developer contributions to support transport infrastructure delivery. Given the rural nature of this area and the increased need for subsidy for sustainable transport this will be fully integrated into the evidence base.

1.6.4 Active Travel England Standing Advice Note: Active Travel & Sustainable Development (Active Travel England, 2024)

This supplementary guidance is designed to support the implementation of active travel in new developments. Whilst primarily designed to support development-level planning, the advice includes useful principles to consider in a plan making context. Active Travel England is a statutory consultee for larger developments, so its advice will be relevant to applications that may arise from the Cotswold area. It includes a Planning Application Assessment Toolkit, which sets out ten criteria for planning developments (listed below).

Relevance to the Cotswold Transport Evidence Base

- **Sustainable Development:** The Standing Advice Note sets out criteria that may be useful to inform the Transport Strategy for the Cotswolds:
  - Trip generation and assignment for non-vehicular modes
  - Qualitative route audits
  - Access to amenities
  - Access to public transport and passenger facilities

- Off-site transport infrastructure
- Masterplanning and site permeability
- Placemaking
- Cycle parking and end-of trip facilities
- Travel planning

1.6.5 Local Transport Note (LTN1/20) Cycle Infrastructure Design (DfT, 2020)

LTN1/20 sets out national standards for designing high-quality cycle infrastructure. It aims to make cycling a safer, more attractive, and practical mode of transport for all ages and abilities. The document emphasises the need for inclusive design, ensuring accessibility for everyone, including disabled users. It outlines core design principles such as coherence, directness, safety, comfort, and attractiveness. LTN 1/20 promotes the separation of cyclists from motor traffic on busy roads. It supports integrated planning with other transport modes and land use strategies. Overall, it provides technical guidance for local authorities to create cycling environments that encourage more people to cycle, more often. Of particular relevance to the Cotswolds due its rural nature and its ageing population is the advice guidance around facilitating the use of electrically assisted bikes. Developments should account for the need to facilitate charging of such bikes. Non-standard cycles (such as those for people with mobility needs) will also require parking that can facilitate them.

Relevance to the Cotswold Transport Evidence Base

- **Sustainable Development:** LTN1/20 sets out the following criteria that may be useful to inform the Transport Evidence Base and Strategy for the Cotswolds:
  - Sets national standards for cycle infrastructure
  - Supports active travel in spatial planning
  - Informs requirements for new developments
  - Promotes inclusive, safe and accessible design
  - Guides sustainable site allocations
  - Aligns with climate and health objectives
  - Justifies developer-funded cycle improvements
  - Strengthens Local Plan policy compliance

New development sites will be assessed for their ability to provide sustainable sites as well as ensuring that new developments enhance not detract from existing infrastructure.

1.6.6 Active Design (Sport England, Active Travel England and Office for Health Improvement and Disparities, 2023)

Active Design offers guidance on how the built environment can promote physical activity, health, and well-being through thoughtful planning and design. It outlines ten key principles to embed activity into everyday life, focusing on movement, access, and inclusivity. The document is aimed at planners, designers, developers, and policymakers working across all scales of development. It encourages integration of walking, cycling, and play into neighbourhood layouts, green spaces, and transport links. The guidance supports national planning objectives around sustainability, health, and reducing inequalities. It highlights co-benefits like improved mental health, community cohesion, and

climate resilience. Ultimately, Active Design promotes places where being active is easy, natural, and part of daily routines.

Relevance to the Cotswold Transport Evidence Base

- The ten core principles of Active Design **(Sports England , 2023)** are designed to help shape environments that encourage people to be active as part of daily life. The principles, listed below, may be useful to inform the Transport Evidence Base and Strategy:
  - **Activity for All:** Ensure everyone can be active, regardless of age, ability, or background.
  - **Walkable Communities:** Prioritise walking and cycling through connected, compact, and permeable layouts.
  - **Providing Connected Active Travel Routes:** Direct, safe, and attractive routes linking homes, work, and services.
  - **Mixing Uses & Co-locating Facilities:** Cluster everyday destinations to encourage multi-purpose trips and reduce car dependency.
  - **Network of Multifunctional Open Spaces:** Design inclusive, high-quality open spaces that support formal and informal activity.
  - **High-Quality Streets & Spaces:** Make public spaces inviting, safe, and sociable to encourage active travel and community use.
  - **Providing Activity Infrastructure:** Delivering cycle parking, showers, and wayfinding to support active lifestyles.
  - **Active Buildings:** Design buildings that promote movement and shared activity spaces.
  - **Maintaining High-quality Flexible Spaces:** Ensuring spaces remain clean, safe, and welcoming over time.
  - **Activating Spaces:** Celebrate local culture and promote active use through signage, events, and engagement.

Whilst the rural disperse nature of the Cotswolds means that services are less likely to be able to fully walkable the guidance should still ensure that communities are walkable and provide the ability to sustain active lifestyles.

1.6.7 Decarbonising Rural Communities and Economies (Rural Services Network, 2021)

Rural areas account for more than a sixth of the population of England and a majority of its land. The challenge for decarbonisation is that the whole country and every sector must reach net-zero carbon emissions. Net-zero emissions will come primarily from a reduction in carbon emissions rather than negative emissions technology. This means that every place and sector in the UK will need to see significant change in our it currently operates. As it has a smaller share of the population than urban areas decarbonising rural communities has received less focus. The Decarbonising Rural Communities and Economies (Rural Services Network, 2021) report attempts to fill this gap. It outlines several key features of decarbonising rural communities.

- **Renewable Power:** Rural locations are the sites of the majority (60%) of renewable power generation in England and that is likely to increase as recent planning changes to wind turbines take effect.
- **Building Decarbonisation Challenges:** The report showcases evidence that building in predominantly rural areas are older and have more significant challenges to being made more energy efficient. It also highlights that many of them are off grid for both gas and waste.

- **Electrification Infrastructure:** The report highlights how electric charging infrastructure in rural areas will offer high costs for fewer returns. This is due to the larger distances and lower density of customers. Current progress is slower in rural areas than in urban ores. There are additional challenges with ensuring the electrical grid in rural areas can cope with demand.

The report identifies several policies solutions:

- **Housing:** A targeted focus on ensuring that development and housing is built to the highest possible energy efficiency standards with energy generation included. Rural areas are likely to need a wider range of technologies for retrofitting e.g. heat networks.
- **Electric Vehicle Charging:** A well-planned strategy of roll-out of charging infrastructure that accounts for the longer distances between rural places. It is identified that where rural infrastructure has been built it has largely focussed on SRN chargers to help accommodate through traffic and more needed to be done for communities far away from the SRN.
- **Rural Buses:** The report suggests that the higher route distances and the lower revenue will make rural buses harder to electrify. A study is called for including investigating non-electric options such as a hydrogen.
- **Electricity Grid:** The electricity grid is less developed in rural areas and sustained action must be taken to ensure that carrying capacity is high enough for households and business that transition as well as new supply that comes online. The report also calls for the investigation of the use of microgrids in rural settings.
- **Digital Connectivity and Local Services:** Ensuring that all services can be accessed either physically or digitally will ensure the greatest impact in reduction of carbon emissions.

1.6.8 Compendium of Practice in Rural Mobility (Transport East, 2023)

The Transport East area has a high proportion of rural areas. The STB produced a compendium of best practice rural mobility. The report found that

- **Access to Services:** There was a high degree of variability in what services were available. Secondary and tertiary services had the least availability. These are predominantly infrequent services (supermarkets, larger goods and post-primary education.
- **Mobile Services:** Some rural areas were experimenting with mobile services such as banking and libraries which was seen as a way of reducing the need for travel.
- **Fuel:** Access to fuel and charging facilities was notably poor away from the main roads. This has implications for changing ranges for electrification.
- **No Expansion of Services:** The study found an appetite for increased services accessible locally but also found that the economics and dynamics of rural places meant that there were few considering such an expansion.
- **Poor Transport Options:** Overall, residents had low perceptions of the available transport offerings in rural areas. Rail scored the worst due to the focus placed on commuting trips rather than everyday trips. Buses also scored poorly with many indicating very poor reliable access to bus routes.
- **Community Transport:** Community Transport was well regarded in rural areas and provided evidence that it provided a key transport role in rural communities.
- **Antisocial Driver Behaviour:** All communities reported a high degree of problems arising from congestion and high speeds of cars in their areas. This was exacerbated in areas with points of interest where there are a high proportion of visitors without the infrastructure to support them.

1.6.9 Best Practice Review (Low Carbon Destinations, 2023)

Low Carbon Destinations is a research project studying the carbon impacts in areas that are destinations. That is areas with a large component of tourism. The work has studied national and international cases to determine key priorities for regions in this category. They found that

- Increase Capacity: Transport services specifically targeting full home-to-destination trips. This is required to limit the number of private cars driven into the areas. It suggests that dedication and innovation is needed to develop and promote new multi-model options particularly in rural areas away from mainline train stations.
- Diversity is Growth: The study found that there are already significant numbers of people nationwide with low access to cars (25%) and that increasing alternative transport provisions meant that the tourism sector could benefit.
- User Costs: Making sure that costs of sustainable travel are kept competitive. It also stressed the need to increase the full costs of car use and utilise policy to bring the externalities of car use into the user costs.
- Active Demand Management: They argue that active demand management can be achieved through engagement with existing service providers.

The work also outlines a six-step approach to decarbonisation of visitors:

1. Back-casting: Working backwards from the desired endpoint to identify first steps to delivery.
2. Stakeholder Mapping: Mapping key people to include and at which point in the process.
3. Place-Based Design: Design mobility options in place-based way.
4. Co-Benefits: Determine and maximise the co-benefits of the system. Co-benefits will help to ensure wider support.
5. Economic Model Development: Determine the nature and scale of investment required and where likely funding will come from. Outline expected governance of the scheme.
6. Delivery Pathway: Plot the delivery pathway for the scheme.

2 Good Practice & Lessons Learnt

The significant changes in legislation and policy described in Chapter 1 mean that the requirements for local plan transport evidence bases continues to develop. All relevant good practice and lessons learnt from the development of local plans in other areas will be considered in developing the local plan for the Cotswolds. Space and the evolving nature of this practice preclude an exhaustive summary, so this section highlights a selection that is particularly relevant to the Cotswolds.

2.1 Examples of Good Practice

2.1.1 The Chichester Local Plan 2021–2039 (Chichester District Council, 2023)

The Chichester Local Plan covers the Chichester District (excluding the South Downs National Park) and sets the framework for development up to 2039. The Plan is currently at the Regulation 19 stage and awaiting examination.

Relevance to the Cotswold Transport Evidence Base

- **Integrated Transport Evidence Base:** The Chichester Transport Study (Stantec, 2023) assessed the impacts of proposed development on the transport network and identified potential enabling measures. This Study evaluated various growth scenarios and their effects on the highway network, particularly focusing on the A27 corridor. This supports the Plan in meeting the tests of soundness under Regulation 19 and reduces the risk of sites being found unsound due to transport objections at examination. For the Cotswold Transport Evidence Base will adopt this same approach - developing a multimodal STA in partnership with key stakeholders to ensure that up-to-date, proportionate evidence supports infrastructure planning and site selection across the district.
- **Monitor & Manage:** The Plan embraces a Monitor & Manage Approach, co-identifying a suite of potential transport interventions with National Highways and West Sussex County Council, and deploying them responsively, if necessary, as development progresses. It thereby focused on transport mitigation only when it is justified by actual patterns of growth and behaviour.
  - The monitoring focused on network performance including real traffic flows, queuing levels and delays at key junctions, mode share outcomes from travel plans, and cumulative impacts from multiple development sites.
  - A dedicated Traffic & Infrastructure Management Group oversaw the monitoring process, using this evidence to determine whether and when specific interventions should be triggered. Monitoring focused on locations such as the A27 Chichester Bypass and its key junctions, as well as local distributor roads.
  - This approach was largely adopted as costs of improvements to the A27 junction could not be funded through contributions from new development alone and no additional funding sources were identified.
- **Early & Structured Collaboration:** A Traffic and Management Group was established as a standing governance mechanism, with key stakeholders including Chichester District Council, National Highways and West Sussex County Council, ensuring strategic buy-in and alignment across organisations as the Plan was developed. The Cotswold Local Plan will also look to establish a similar mechanism through the Transport Working Group, in collaboration with GCC, National Highways, and neighbouring authorities. Ensuring structured engagement throughout the programme helps to secure buy-in to the methodology, outputs and overarching evidence base. This ensures regional travel patterns and strategic corridors are accounted for and addressed consistently.

2.1.2 Oxfordshire's Local Transport & Connectivity Plan

Oxfordshire's most recent Local Transport and Connectivity Plan, adopted in July 2022, introduces a forward-thinking approach to transport planning, emphasising sustainability and active travel.

Relevance to the Cotswold Transport Evidence Base

- **Vision-led Approach:** Oxfordshire has moved away from the traditional 'predict and provide' model by first establishing a desired future transport outcome - such as reducing car dependency and promoting sustainable modes - and then identifying the infrastructure and policy interventions needed to achieve that outcome. In line with the updated NPPF the Cotswold Local plan will also seek to adopt a vision-led approach. To do this an engagement session with the key stakeholders will be pursued in order to collate a shared vision for the district. This will form a distinct transport vision for the developments and from this vision key measurable objectives will be outlined and tests will be run against these outcomes.
- **Prioritisation of Active Travel & Public Transport Connections:** In preparing site-specific and countywide transport strategies, Oxfordshire placed a strong emphasis on demonstrating connectivity through walking, cycling, and public transport, and diverted funding from road-based interventions to sustainable alternatives. This was achieved by setting active travel mode share targets linked to bonds that can be drawn on if those outcomes are not achieved. As part of the Strategic Transport Assessment, a detailed analysis of current active travel and public transport networks will be undertaken to identify gaps in accessibility for proposed development areas. The Cotswold district has only small stretches of SRN and national rail which means that the scope for growth in major road and rail capacity is likely to be limited. The Cotswold Local Plan will focus on key measures using public and active transport that could be delivered with maximal cost effectiveness.

2.2 Building on Lessons Learnt

In preparing the Local Plan for the Cotswolds it is essential to reflect on recent examination outcomes to help ensure the strategy is robust, deliverable, and capable of passing soundness tests at examination. Ensuring that consensus can be achieved to ensure that a strong local plan can be adopted.

2.2.1 Stroud District Local Plan Examination Review

A particularly relevant case is the Stroud District Local Plan Review, which underwent an extended examination and was ultimately recommended for withdrawal by Inspectors in February 2025. Despite additional work and a ten-month pause to address earlier concerns, the Inspectors concluded that the Plan remained unsound. This decision was primarily due to unresolved issues relating to the transport and infrastructure evidence base - particularly related to the deliverability and funding strategy for critical infrastructure, and uncertainties around the deliverability of major allocations.

The Cotswold Local Plan and Evidence Base will ensure that these lessons are learnt from the outset. The main challenges and associated lessons have been reviewed. The reviewed documents include:

- SDC Letter to Inspectors - December 2024 (Stroud District Council, 2024)
- Stroud District Local Plan Review Examination - February 2025 (Lucas & Wright, 2025a)
- SDC Letter in Response to Inspectors - March 2025 (Stroud District Council, 2025)
- Letter from Inspectors – April 2025 (Lucas & Wright, 2025b)

The findings from this review are summarised below, with a focus on ensuring the Cotswold transport evidence builds on the identified lessons learnt and ultimately presents a strong case to Inspectors.

Relevance to the Cotswold Transport Evidence Base

- Right Development in the Right Place: It is important that the development of spatial strategies consider transport impacts and infrastructure needs from an early stage. With the limited scope for new infrastructure in the region this is even more important. This shows the importance of front-loading the transport evidence and letting this shape the plan. Our approach puts transport at the heart of strategy-making from the outset, so that development is directed to the right places, at the right time, with the right infrastructure to support it. We will focus where development can increase the viability and effectiveness of existing infrastructure
- Clear & Credible Funding Strategy: The rural nature of the Cotswold will make funding a challenge, and it vital to identify clear realistic funding pathways for proposed measures early in the process. We will prepare a deliverability assessment once the preferred option package is agreed, including a high-level appraisal of costs, risks, and funding options.
- Engagement with Key Stakeholders: Unresolved issues with key stakeholders, such as National Highways and Network Rail, undermine confidence in deliverability. Utilising our extensive experience of engagement we will prioritise early and sustained engagement with infrastructure stakeholders to jointly develop and validate transport modelling assumptions. We will pursue a consensus-based approach that ensures a strategy with maximal support across the stakeholders.
- Robust Transport Modelling & Evidence to Justify Decision-making: The lack of proportionate, shared and transparent transport evidence - particularly for key sites – can lead Inspectors to question housing delivery assumptions and spatial strategies. To address this, our approach commits to scenario-based testing of spatial options. Full documentation and open sharing of modelling methods and outputs will be embedded throughout the process.

1 Introduction

1.1 Overview

City Science has been commissioned by Cotswold District Council (CDC) to support the development of the Regulation 19 transport evidence base for the Cotswold Local Plan. The Gloucestershire Countywide Multi-Modal Model (GC3M) will support the identification of the preferred spatial option, assess the impacts of Local Plan land use on the transport network, and test potential transport interventions to inform the strategic transport assessment. Figure 1-1 illustrates the geographical extent of the GC3M and highlights the Cotswold District area.

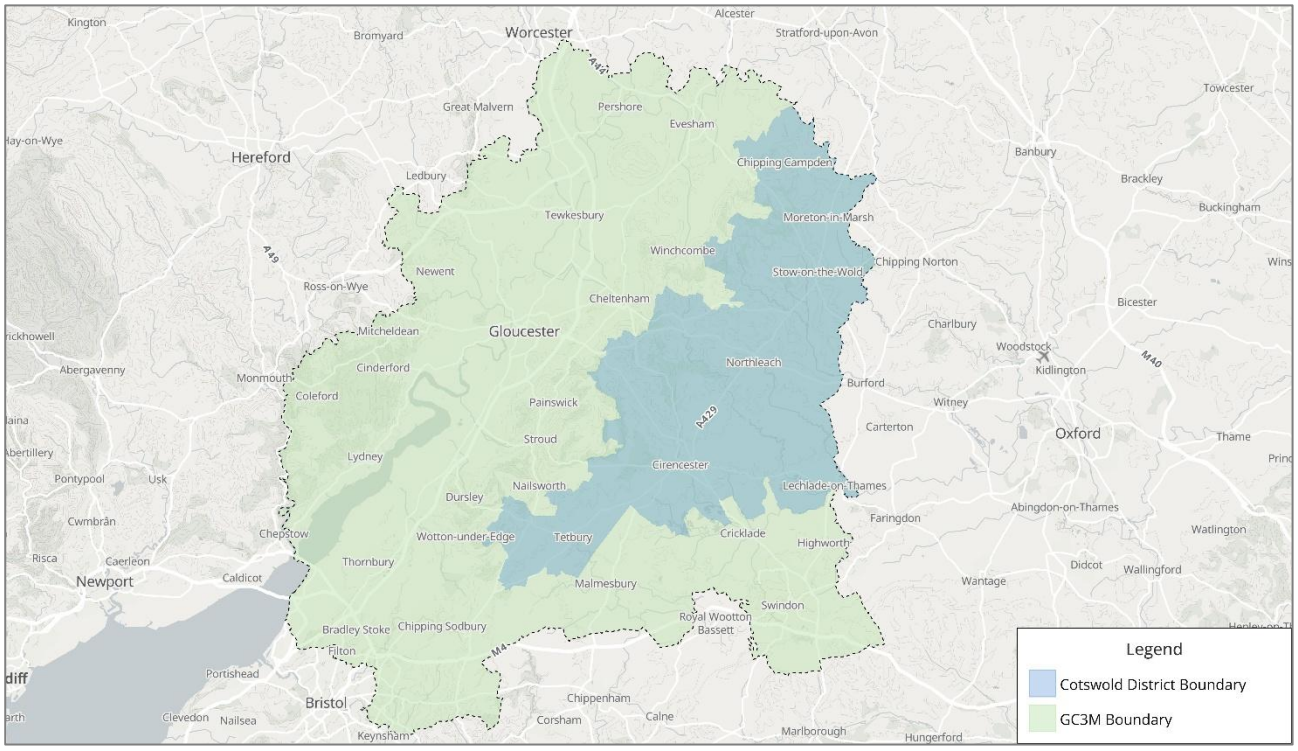

Figure 1-1: Extent of the GC3M and Cotswold District Boundary

1.2 Note Purpose

The purpose of this technical note is to present the methodology and results of the present year (2024) validation of the updated version of the GC3M that is being utilised and developed as part of the Cotswold Local Plan Regulation 19 transport evidence base. To ensure the transport evidence base for Cotswold is accurately informed, this validation was conducted to confirm the reliability of the GC3M. This note presents the validation of the 2024 Highway and Public Transport models against the available data sources, with reference to the Department for Transport's (DfT) Transport Analysis Guidance (TAG) criteria, and their suitability for future forecasting scenarios and evaluation of the Cotswold local plan.

2 Highway Model Validation

2.1 Overview

This Chapter details the development of the 2024 GC3M highway model present year validation, utilising the data sources outlined in Section 2.2. The following updates have been undertaken:

- **Network Updates:** All identified uncertainty log schemes between 2019-2024 have been included in the modelled network (see Section 2.3)
- **Parameters:** Assignment Value of Time (VoT) and Vehicle Operating Costs (VOC) parameters have been updated based on TAG Databook v1.24 (November 2024).
- **Matrix Adjustments**: In line with the observed traffic trends, matrix adjustments have been applied by modelled period and vehicle class.
- **Highway**: Highway assignments have been undertaken using SATURN version 11.6.03E.

2.2 Present Year Highway Data Analysis

2.2.1 Data Sources

A 2024 present year validation of the GC3M has been undertaken to check the accuracy of the model against observed post-pandemic travel behaviour using updated demand and network data. This 2024 present year validation has been undertaken utilising available traffic counts from Gloucestershire County Council and National Highways. The Gloucestershire County Council counts cover local roads within Cheltenham, Gloucester, Tewkesbury, and Cotswold and have been sourced through Gloucestershire County Council's Drakewell C2 cloud-based traffic count platform. This includes counts from the following sources:

- Vivacity sensors (November 2024 data).
- Permanent count sites (on both trunk and non-trunk networks, with data taken from 2024).
- Temporary Automatic Traffic Count sites (November 2024 data).

Figure 2-1 below shows the coverage of the existing GC3M 2019 traffic count data as well as the additional observed 2024 validation data. INRIX 2024 data, mapped against the Ordnance Survey Highway Network, has been used for journey time validation. The present year validation journey time routes are presented in Figure 2-3.These data sources have been used to undertake the validation of the highway model as follows:

- **Screenline Validation:** Based on the previous 2019 GC3M screenline count data uplifted to 2024 (See Section 2.2.2).
- **Link Flow Validation:** Separate evaluations have been undertaken based on the previous 2019 GC3M data uplifted to 2024, as well as a selection of new 2024 observed validation data sites.
- **Journey Time Validation**: For the 2024 Journey Time Route Validation, several GC3M 2019 model routes within the Cotswold area were divided, as the original routes did not meet the TAG criteria for route length. According to TAG guidance, validation routes should be neither excessively long (greater than 15 km) nor excessively short (less than 3 km). All routes have now been reviewed and adjusted to ensure compliance with these criteria. The observed journey time data used for validation was derived from 2024 INRIX data.

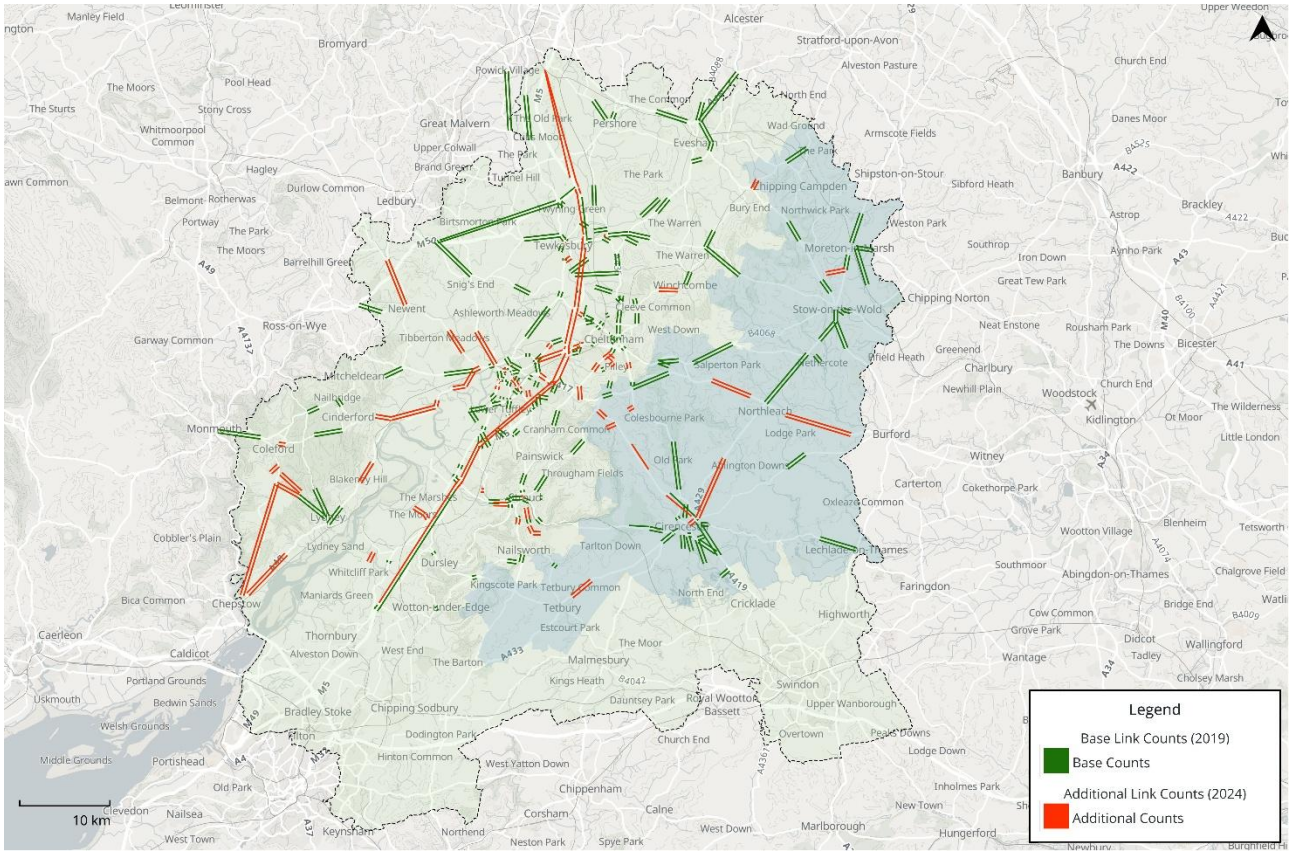

Figure 2-1: GC3M Present Year Validation – Traffic Count Data Coverage

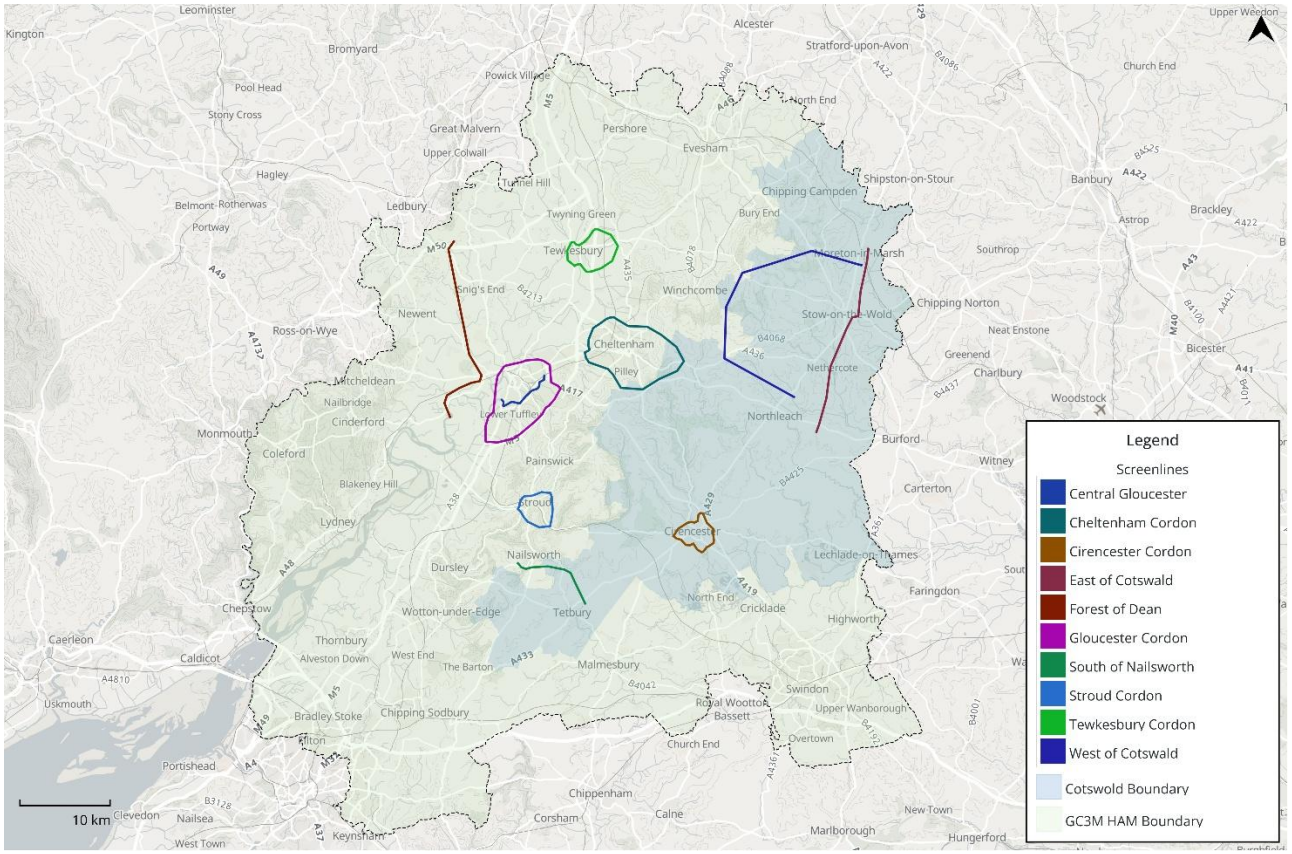

Figure 2-2: GC3M Screenlines & Cordons

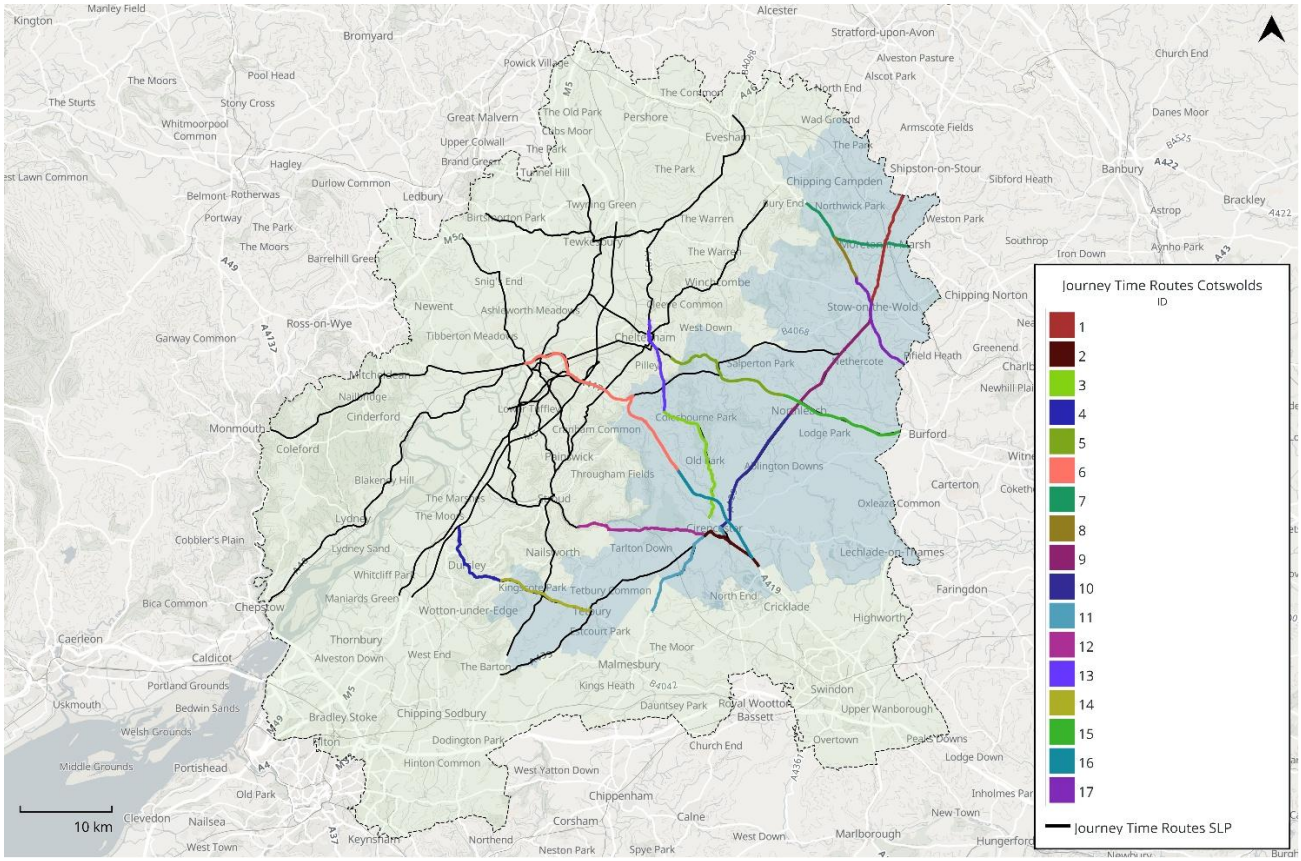

Figure 2-3: GC3M Present Year Validation - Journey Time Routes

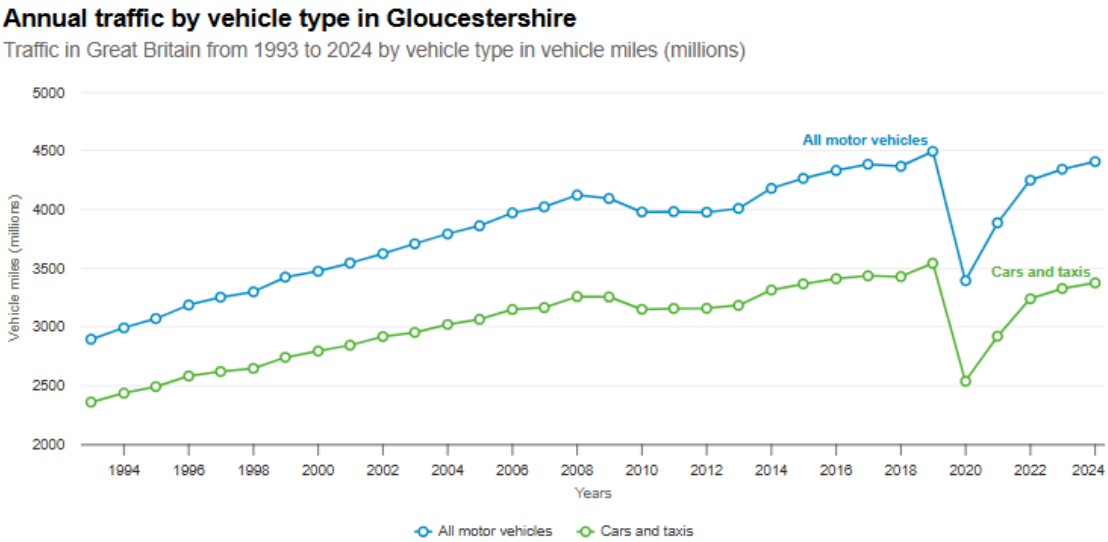
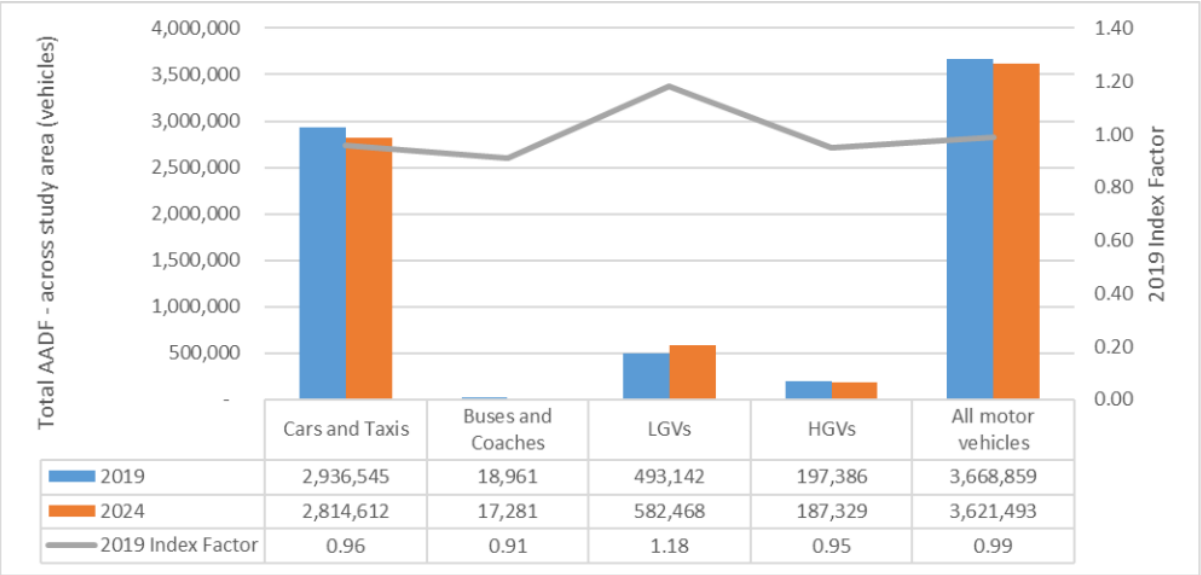
2.2.2 Traffic Growth: 2019 to 2024

Highways traffic trends have been derived from the analysis of DfT and National Highways' WebTRIS data sources. Figure 2-4 below shows the overall annual traffic trends across Gloucestershire derived from DfT road traffic statistics. Figure 2-5 shows the total analysis of all comparable DfT Average Annual Daily Flow traffic counters between 2019 and 2024. Overall, there has been a decrease in traffic of around 1% in total traffic and around 4% in car and taxi traffic. HGV traffic trends also show a decrease in traffic of around 5% whereas LGVs (with a gross weight below 3.5 tonnes or 4.25 tonnes if zero emission, including many vans for example) show an increase of approximately 18% between 2019 and 2024.





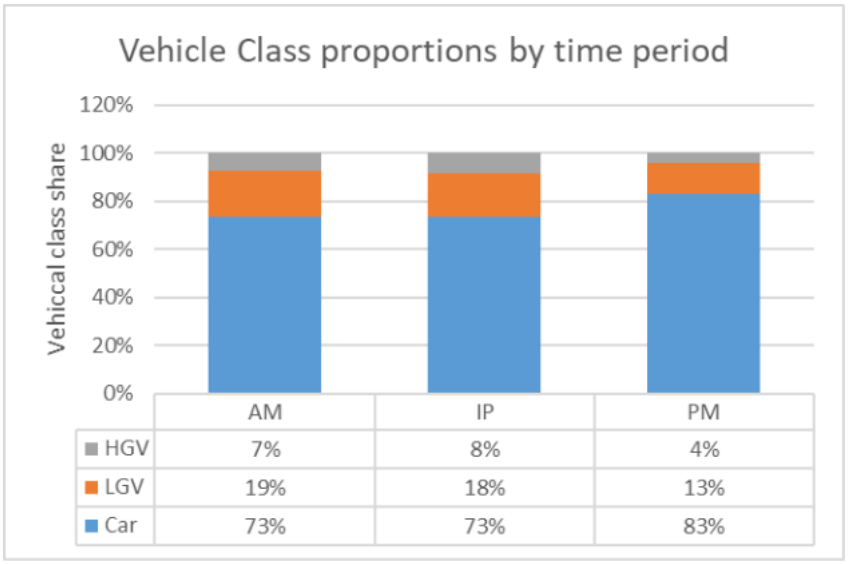


Figure 2-4: DfT Annual Traffic Trends (DfT, 2024a)

	Cars and Taxis	Buses and Coaches	LGVs	HGVs	All motor vehicles
2019	2,936,545	18,961	493,142	197,386	3,668,859
2024	2,814,612	17,281	582,468	187,329	3,621,493
2019 Index Factor	0.96	0.91	1.18	0.95	0.99

Figure 2-5: DfT Average Annual Daily Flow Traffic Comparison 2019 vs 2024 (DfT, 2024a)

From the DfT raw traffic count information a database of around 670 one-day Manual Classified Counts, within the GC3M's simulation network, were extracted for 2024. Figure 2-6 below shows the aggregate vehicle class proportions derived from the AM, IP and PM peak traffic counts.

	AM	IP	PM
HGV	7%	8%	4%
LGV	19%	18%	13%
Car	73%	73%	83%

Figure 2-6: DfT Raw Traffic Count Vehicle Class Proportions (DfT, 2024a)

Table 2-1 below shows the traffic trends by model period (AM, IP, PM) derived from a sample of consistent traffic counters between November 2019 and 2024 in Gloucestershire Area. Overall, a consistent pattern of traffic trends was observed, showing a decrease in the AM (8:00-9:00) and PM (17:00-18:00) peaks of around 4% and 5% respectively. Whereas the IP shows only a slight decrease of less than 1% between 2019 and 2024. The traffic counts cover various areas across Gloucestershire, and the factors were derived using the same method as the SLP model to maintain consistency.

Site			2019			2024			Difference			Factor

Table 2-1: WebTRIS Traffic Comparison 2019 vs 2024 (National Highways, 2025)

Table 2-2 below shows the combined DfT and National Highways' WebTRIS growth factors between 2019 and 2024. The DfT daily Car growth factors have been adjusted to fit the WebTRIS data at a time period level based on the vehicle class proportions derived in Figure 2-6, whilst LGV and HGV factors have been held constant over the day. Therefore, the LGV and HGV growth factors are weighted by the DfT proportions of vehicle class traffic by modelled period and the Car factors are adjusted in line with the WebTRIS data. As expected, the factors derived across the three time periods are relatively consistent with the daily DfT traffic factors, in particular the IP factors which represent a larger proportion of the total daily traffic (IP: Car 0.96, Daily (DfT) 0.96). The primary adjustment to the WebTRIS time period data relates to the Car AM and PM peak factors, which have been reduced in line with the DfT vehicle class proportion data (AM: 0.91, PM 0.91, Daily (DfT) 0.96).

Vehicle Class	AM	IP	PM	Daily (DfT)
Car	0.91	0.96	0.91	0.96
LGV	1.18	1.18	1.18	1.18
HGV	0.95	0.95	0.95	0.95
Total	0.960	0.997	0.945	0.99

Table 2-2: Traffic Growth Factors split by Modelled Period and Vehicle Class - 2019 vs 2024 (National Highways, 2025)

2.3 Highway Network Updates

Table 2-3 below shows the network scheme changes completed between 2019 and 2024, identified from the latest Uncertainty Log (v5.0) provided by Gloucestershire County Council. These schemes were verified using Google Map imagery, comparing historical street views from previous years up to 2024 where available. These schemes were also cross-referenced with information available on Gloucestershire County Council website, which provided further detail (e.g. planned construction start dates and expected completion dates). In addition to the schemes listed below, additional network coding was added to represent the access arrangements to the Fiddington Masterplan, located to the east of the M5 Junction 9. Figure 2-7 below shows the extent of the SATURN simulation node network alterations applied to produce the 2024 present day validation.

Highway Scheme Name
Elmbridge Transport Scheme, Gloucester
A417/A40 Barnwood Link
A40 Over Roundabout Improvement (phase 2), Gloucester
Junction improvement A40 Longford Roundabout, Gloucester
A38 Cross Key Roundabout
West Cheltenham Transport Improvement P1 Arle Court
West Cheltenham Transport Improvement P2 (J11)
West Cheltenham Transport Improvement P3 Arle Court
West Cheltenham Transport Improvement P4 Arle Court
Arle Court Transport Hub (access improvements for all vehicles)
Twigworth Development Access (new roundabout on A38, and new roundabout within site)
Perrybrook Development Access (new roundabout on Court Road for site access)
Fiddington development A46/A438 mitigation
Innsworth Development Roundabout Improvement (new roundabout on A40)
Junction improvement A429 Cherry Tree junction, Cirencester
A46 / Kidnappers Lane, Cheltenham
M5 Gloucester Motorway Services
Land at Barnwood Link Road (Centre Severn – Barnwood)

Highway Scheme Name
Staverton crossroads junction (B4063 / B4634), Staverton
Highway improvement A435 corridor improvement, Bishops Cleeve
Highway improvement Thames Street / High Street, Lechlade on Thames
Junction improvement Highfield Hill including traffic calming, Lydney
Land west of Farm Lane, Shurdington. Site Access Junctions.
Parcel 3745, Land At Pirton Fields, Churchdown (new priority access junction)
Land At North Road West/Grovefield Way
M4 J16
M49 Avonmouth Junction
Land at Quedgeley Trading Estate
SA3 Land northeast of Draycott Cam - 3x site access junctions on Box Road, 1x site access junction on A4135
SA2 Land west of Stonehouse, site link road, and 3x new access points into development site

Table 2-3: Completed Highway Schemes (2019-2024)

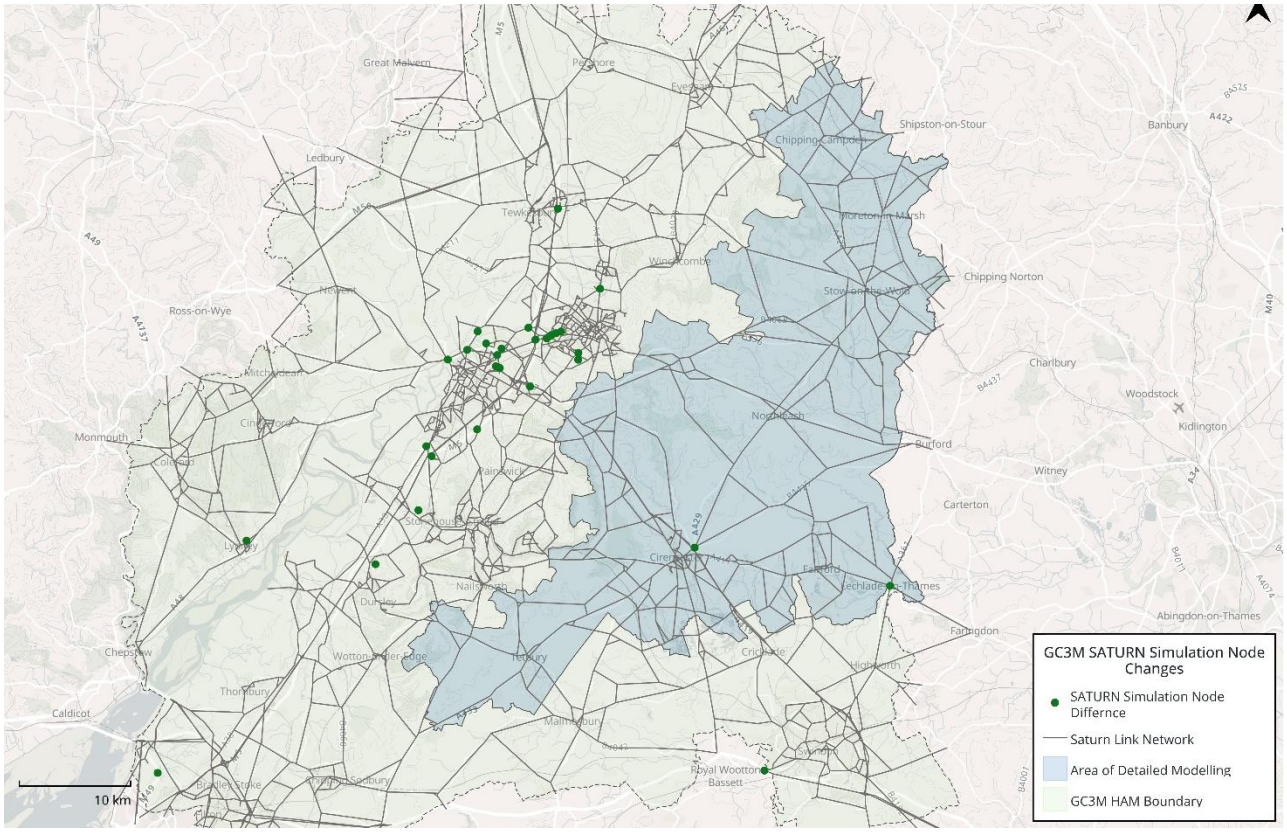

Figure 2-7: GC3M SATURN Simulation Node Changes between 2019 and 2024

Table 2-4 and Table 2-5 show the generalised cost parameters, VoT and VOC, used in the 2024 GC3M highway model. The VoT and VOC parameters were derived from TAG Databook v1.24 (November 2024) and are displayed below in units of Pence Per Minute (PPM) and Pence Per Kilometre (PPK) respectively.

Time Period	Car - Business	Car - Commuting	Car - Other	LGV	HGV
AM	31.23	20.95	14.45	23.23	48.52
IP	32.01	21.29	15.39	23.23	48.52
PM	31.68	21.02	15.13	23.23	48.52

Table 2-4: Value of Time (PPM) - 2024

Time Period	Car - Business	Car - Commuting	Car - Other	LGV	HGV
AM, IP, and PM	11.66	5.89	5.89	13.22	37.04

Table 2-5: Vehicle Operating Cost (PPK) - 2024

2.4 Matrix Adjustments

Table 2-6 below shows the derived 2019-2024 matrix adjustment factors applied to the 2019 base year matrix, to create 2024 present year demand matrices by modelled period. The TAG adjustments, correspond to the proposed TAG Post-Covid adjustments by journey purpose (DfT, 2023). The 'Global Factors' shown in Table 2-6 below are calculated for all Car user classes combined based on the total 2024 validation data set. The 'Adjusted TAG factors' are based on the combination of the TAG proposed factors, which are split by journey purpose, and the 'Global Factors' which match the total 2024 validation data set. Overall, a decrease of around 0.02 is derived in the AM and PM, between the proposed TAG and adjusted values.

User Class	TAG Adjustments			Global Factors			Adjusted TAG Factors		
	AM	IP	PM	AM	IP	PM	AM	IP	PM
Car-EB	0.91	0.91	0.91	0.93	0.99	0.93	0.89	0.94	0.89
Car-Work	0.94	0.94	0.94	0.93	0.99	0.93	0.92	0.98	0.92
Car-Other	0.96	0.96	0.96	0.93	0.99	0.93	0.94	1.00	0.94
LGV	1.14	1.14	1.16	1.14	1.14	1.16	1.14	1.14	1.16
HGV	0.99	0.97	0.94	0.99	0.97	0.94	0.99	0.97	0.94
Car Total	0.95	0.95	0.95	0.93	0.99	0.93	0.93	0.99	0.93
Total	0.98	0.98	0.97	0.96	1.00	0.96	0.96	1.00	0.96

Table 2-6: Matrix Adjustment Factors (DfT, 2023)

2.5 TAG Criteria

Model calibration and validation is a vital part of model development. It is the basis on which the model can be considered suitable for use for future year reference case model production, scheme option testing, changes in land use and future year forecasting. TAG Unit M3.1 provides criteria and acceptability guidelines for the following features of the model:

- Modelled flows and observed counts on screenlines (See Table 2-7 (Source: TAG Unit M3.1 Paragraph 3.3.7 - Table 1) (DfT, 2024b)))
- Modelled flows and observed counts on links (See Table 2-8 (Source: TAG Unit M3.1 Paragraph 3.3.11 - Table 2) (DfT, 2024b))
- Modelled and observed journey times (See Table 2-9 (Source: TAG Unit M3.1 Paragraph 3.3.15 - Table 3) (DfT, 2024b)))

While the evaluation of the model against TAG criteria has been reported on in this technical note, it should be recognised that TAG is primarily designed for scheme appraisal and central government business cases. Furthermore, TAG notes that 'achievement of the validation acceptability guidelines specified in this section does not necessarily guarantee that a model is 'fit for purpose' and likewise a failure to meet the specified validation standards does not mean that a model is not 'fit for purpose'. It is therefore considered that, if in most cases TAG criteria have been met (or exceeded), then where they are not met and the differences are relatively minor a slight widening of the criteria allows them to be met.

Description of Criteria	Acceptability Guideline
Total screenline flows (normally >5 links) to be within ±5%.	All or nearly all screenlines

Table 2-7: Screenline Calibration Criteria and Acceptability Guideline (DfT, 2024b)

Criteria	Description of Criteria	Acceptability Guideline
1	Individual flows within 100 vehicles/hour of counts for flows less than 700 vehicles/hour	> 85% of cases
	Individual flows within 15% of counts for flows from 700 to 2,700 vehicles/hour	> 85% of cases
	Individual flows within 400 vehicles/hour of counts for flows more than 2,700 vehicles/hour	> 85% of cases
2	GEH < 5 for individual flows	> 85% of cases

Table 2-8: Link Flow Validation Criteria and Acceptability Guideline (DfT, 2024b)

Description of Criteria	Acceptability Guideline
Modelled times along routes should be within 15% of surveyed times (or 1 minute, if higher)	> 85% of routes

Table 2-9: Journey Time Validation Criteria and Acceptability Guideline (DfT, 2024b)

2.6 Screenline Validation

Table 2-10 below summarises the screenline validation across the GC3M simulation area. Table 2-11 details the validation results of total traffic flow (in vehicles) across all 30 screenlines by time period. The results indicate that a good level of validation has been achieved. The 5% flow difference criterion is met for 100% of screenlines in the AM Peak, 87% of screenlines in the Inter Peak and 90% of screenlines in the PM Peak. The screenline 10% flow difference criterion is achieved for 100%, 93% and 97% of Screenlines for the AM Peak, Inter Peak and PM Peak respectively.

Only the East of Cotswold screenline in the Westbound direction for IP and the Central Gloucester screenline in the Southeast bound direction for both IP and PM do not pass the 10% criteria. On a link validation level, most of the counts pass the TAG link criteria and all are within GEH 7.5. However, the screenline totals are calculated from the difference between the summed modelled and observed flows across the individual count locations contained within the screenline. This indicates that as the modelled flows are consistently higher across the screenline than the observed flows, the total screenline flows add up to be slightly above the +10% boundary. As the screenline is relatively short, only consisting of six counts in total, it is not considered that this positive bias (slightly above the 10% threshold) will unduly impact the model's overall validation.

The total flow differences are negligible at just approximately 1% to 2%. The 2024 GC3M therefore is in line with the TAG screenline criteria for all model periods, with nearly all screenlines having total model flows within +/-5% of the observed across the screenlines.

Screenline	AM Peak	Inter-Peak	PM Peak
No of Screenlines	30	30	30
No of Screenlines with Differences within ±5%	30	26	27
Pass Rates	100%	87%	90%
No of Screenlines with Differences within ±10%	30	28	29
Pass Rates	100%	93%	97%

Table 2-11: Screenline Validation Detailed Results

2.7 Link Flow Validation

Table 2-13 summarises the GC3M link validation results across the following datasets:

- **2019 Uplifted Dataset:** The existing GC3M 2019 count data set, uplifted to 2024 (factors detailed in Section 2.2), with no 2024 data included
- **2024 Dataset:** The additional 2024 observed independent validation data sites
- **Total:** Both the factored 2019 and additional 2024 count data sets combined

2.7.1 GC3M Area

For all three modelled periods, the TAG criteria (passing either GEH 5 or the TAG flow criterion) are met for 87-94% of the "Total" data set defined above, exceeding the 85% acceptability guideline in all periods. For the 2024 validation data TAG criterion pass rates are between 83% and 93%. If a slightly wider pass range of GEH 7.5 is considered, then the model achieves a pass rate of between 92% to 96% for the 2024 validation data set. **Appendix D – Link flow Validation Tables** details the flow validation per link within the GC3M model for cars and total vehicles in each time period.

Count	AM			IP			PM		
	2019 Uplifted Dataset	2024 Dataset	Total	2019 data set	2024 data set	Total	2019 data set	2024 data set	Total
No of counts	512	168	680	512	168	680	512	168	680
Total flow difference across all counts	2%	3%	2%	1%	-3%	0%	2%	3%	2%
Counts satisfying TAG criteria	89%	83%	88%	93%	93%	93%	88%	84%	87%
Counts with GEH <7.5	93%	92%	93%	95%	96%	95%	92%	93%	92%

Table 2-12: GC3M Count Data Validation

2.7.2 Cotswold Area

For all three modelled periods, the TAG criteria (passing either GEH 5 or the TAG flow criterion) are met for 88-93%, exceeding the 85% acceptability guideline in all periods. Furthermore, Figure 2-8 to Figure 2-10 illustrate the spatial distribution of GEH results across the GC3M study area around key developments in Cotswold. As part of the process, we ensured that traffic counts in the vicinity of this location achieved a good level of validation. As shown in the figures, most links are within acceptable limits (GEH < 5), and there are no nearby locations with GEH values exceeding 10.

Validation All Flows				
Link Counts		DMRB Diff Test	GEH<5	DMRB and GEH<5
AM Peak	% Pass	88%	75%	88%
Inter-Peak	% Pass	93%	83%	93%
PM Peak	% Pass	88%	80%	88%

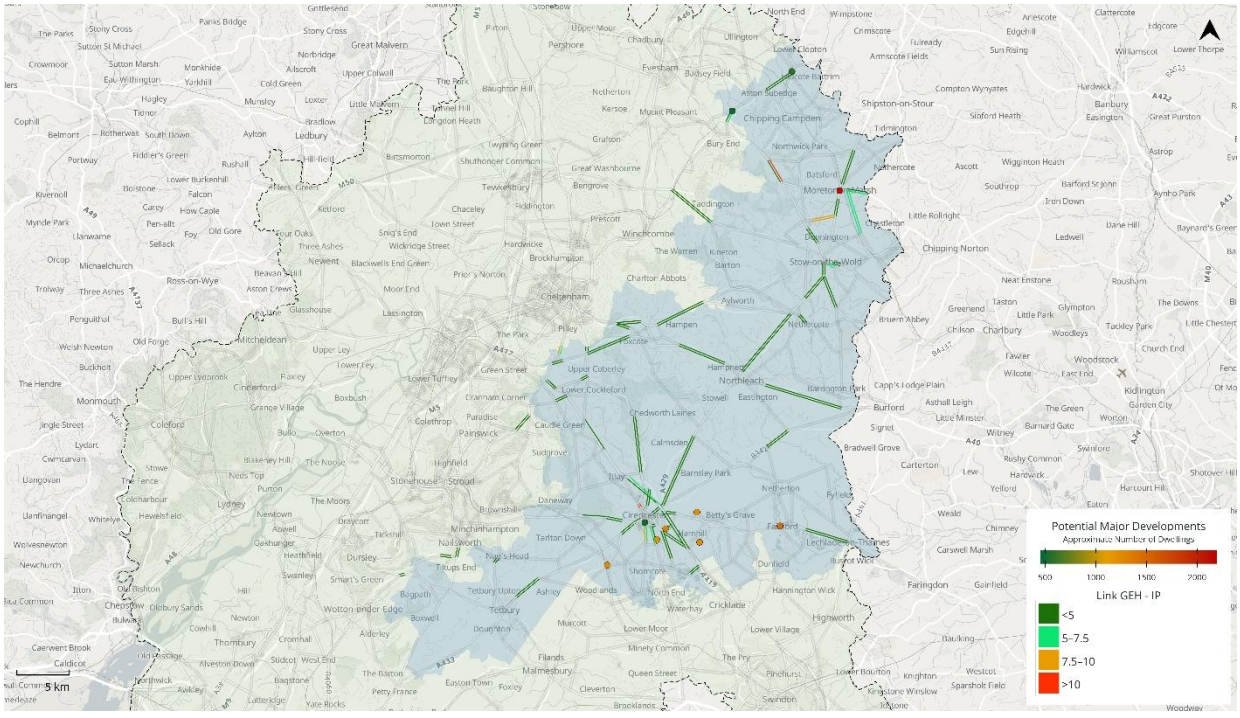

Figure 2-9: IP Peak Count GEH Statistics by link

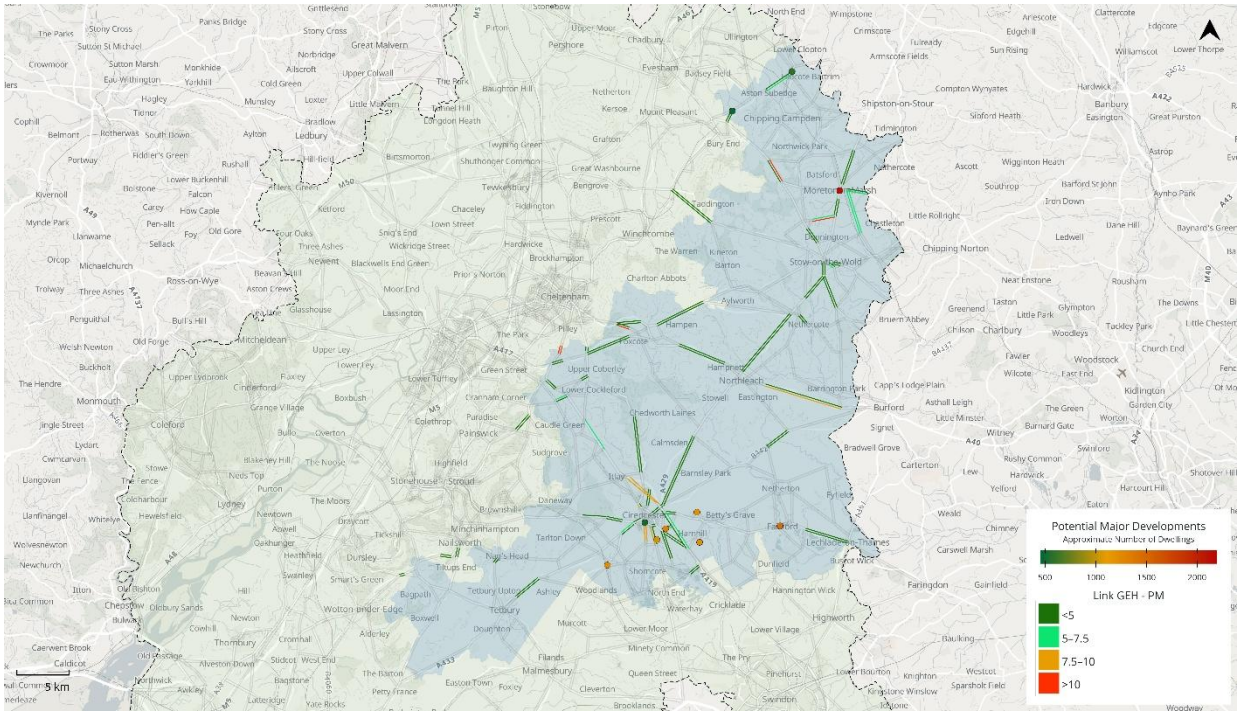

Figure 2-10: PM Peak Count GEH Statistics by Link

2.8 Journey Time Validation

2.8.1 GC3M Area

Table 2-14 summarises the present year GC3M journey time validation results. **Appendix B – Journey Time Route Graphs** provides the time distance profile of all journey times results and all time periods. In summary 93%, 100% and 96% of routes fall within ±15% (or 1 minute if greater) of observed journey times for the AM Peak, Inter Peak and PM Peak respectively. This exceeds the TAG acceptability guidance of 85% for this criterion in all periods. Based on a wider pass criterion of ±25%, the AM and PM peak pass rates increase further to 100%.

Table 2-14: GC3M Present Year Validation - Journey Time Validation

2.8.2 Cotswold Area

Further validation was undertaken focusing on the Cotswold area. Tables 2-16 to 2-18 summarise the 2024 GC3M journey time within Cotswold validation results. Overall, 91% of routes in the AM Peak and Inter Peak, and 88% in the PM Peak, are within ±15% (or 1 minute, if greater) of the observed journey times. Where validation failures occur, they are generally marginal, indicating that the model demonstrates a very good level of validation against the 2024 observed data. Some delays on the A417 routes are not reflected in the observed data, which could be due to seasonality. After reviewing the model outputs, Google Maps data, and 2019 data, we believe the model accurately represents the level of delay, while the observed data for this section of the A417 (Route 6SB, just south of A436) appears to be inaccurate or not fully capturing actual conditions. The difference for this section is 1–2 minutes, but coding has been checked against the layout, and the capacity index reflects the road characteristics. A few subsections of routes show discrepancies of more than 25%, or 2–3 minutes; however, for the full routes in Gloucestershire as mentioned earlier, we achieve 100% of routes with less than 25% deviation. We therefore did not adjust the CI or the road characteristics solely to achieve a validation pass. This approach has been consistently applied to all JT routes. **Appendix B – Journey Time Route Graphs** includes journey time graphs by showing detailed information for each route and a visual comparison of modelled and observed journey times for each modelled peak period. Table 2-15 below identifies the journey time routes incorporated within the GC3M Model for Cotswold and classifies them by route name and direction.

Table 2-18: Journey Time Route Validation - PM Peak

2.9 Convergence

2.9.1 Convergence Criteria

Model convergence is essential to produce a stable model suitable for forecasting and option testing. As described in TAG Unit M1.1, it refers to the process of ensuring the model reaches a stable balance between supply and demand so that the results are reliable. Models typically run iteratively, with each cycle adjusting travel choices such as mode and destination until they are close to optimum. While perfect convergence is rarely achieved, the process should reduce changes in costs and demand to a small level, giving confidence that the outputs are robust enough for analysis.

Table 2-19 summarises the TAG guidelines for convergence measures of proximity and stability (Source: TAG Unit M3.1 Paragraph 3.4.17 - Table 4 (DfT, 2024b))

Measure of Convergence	Base Model Acceptable Values (TAG Unit M3.1)
Delta and %Gap	Less than 0.1% or at least stable with convergence fully documented and all other criteria met
Percentage of Links with Flow Change Less than 1%	Four consecutive iterations greater than 98%
Percentage of links with Cost Change Less than 1%	Four consecutive iterations greater than 98%

Table 2-19: Convergence Guidelines and Stopping Criteria (DfT, 2024b)

2.9.2 Model Convergence

The convergence results in the final four loops for the AM Peak, Inter Peak and PM Peak are shown in Table 2-20 to Table 2-22. The results show high levels of convergence throughout. Achieving convergence to better than 0.001% for all three periods indicates a good level of convergence. In addition, the TAG %Flow and %Delay criteria are achieved across all three modelled periods.

Loop	Delta (δ)	%Flows	%Delays	%Gap
35	0.0001	99.8	99.8	0.0001
36	0.0001	99.9	99.8	0.00012
37	0.0001	99.7	99.8	0.00017
38	0.0001	99.5	99.7	0.00018

Table 2-20: AM Peak Convergence

70	0.0001	99.7	99.8	0.00006

Table 2-22: PM Peak Convergence

2.10 Route Validation

As part of the model validation process, routing was assessed by comparing modelled routes against those suggested by Google Maps. This helped confirm that key journey paths are logical, reflect expected driver behaviour, and are free from significant anomalies such as inappropriate rat-running.

The review also ensured that the network connectivity is functioning correctly and that no unrealistic diversions or missing links are impacting route choice. Where discrepancies were identified, further checks were carried out to verify junction coding, restrictions, and turn penalties. Detailed routing validation results are presented in Appendix A – Highway Route Choice Validation Checks

2.11 Assignment Stress Testing

In line with TAG, a stress test was undertaken on the Cotswold highway model to assess how it performs under artificially increased traffic demand. This exercise helps identify any issues such as unrealistic congestion or route choice - that may not emerge during base year calibration but could affect future forecasting scenarios. TAG suggests increasing demand by 10% to 20%; for Cotswold, a 20% increase was applied, reflecting the scale of growth anticipated in future years based on TEMPro projections.

The model assignment results were closely reviewed to identify any locations where excessive delays appeared under this increased demand. Where delays were found to be the result of network coding issues, the model was refined accordingly. However, where increased delays were a natural outcome of higher traffic volumes, no further adjustments were made. This process ensured the model is resilient and performs realistically under future growth conditions.

2.12 Cross Boundary Count Validation

We compared the modelled flows against some DfT counts, including observed data from outside the study area and counts from the buffer area, to assess how the model performs in these locations, particularly in Wiltshire. The results of this comparison are presented in Appendix C.

Please note that these data are based on a single day of MCC data. Additionally, these areas were not modelled in great detail and were not part of the formal validation process. However, taking these factors into account, the results appear reasonable and the model behaviour is considered robust.

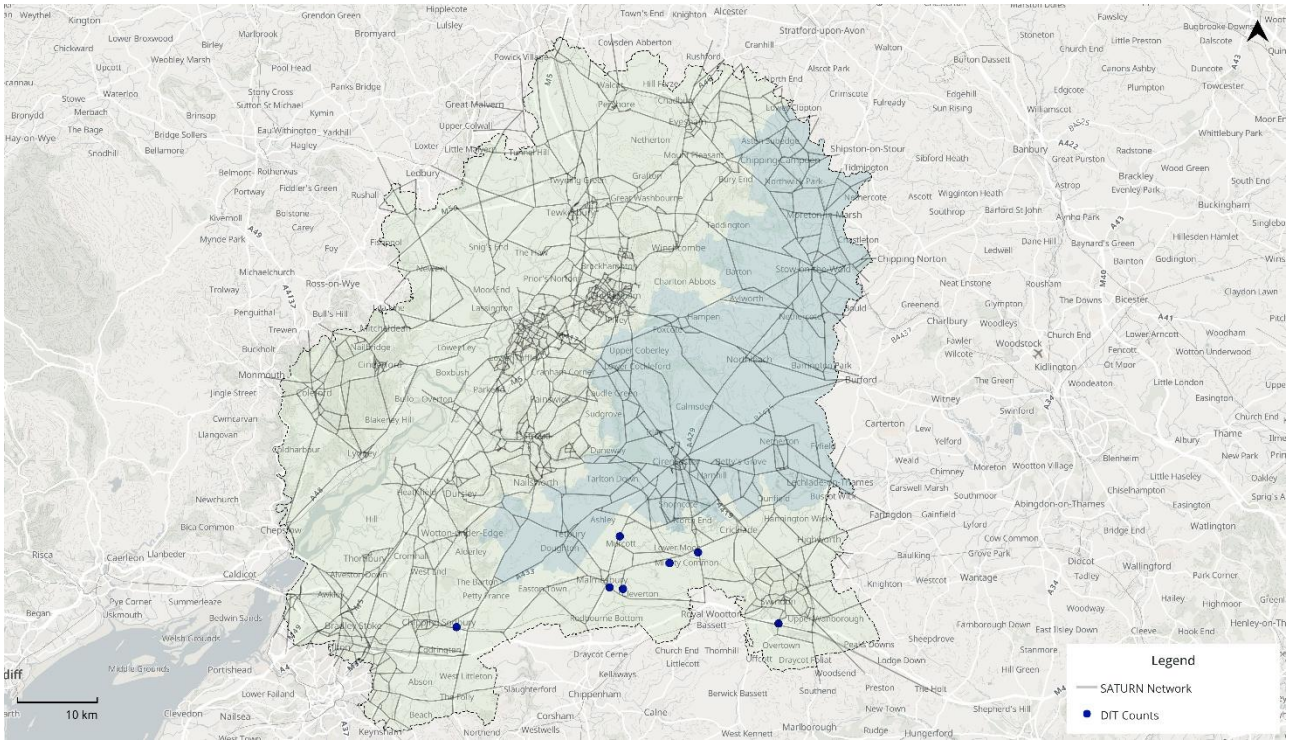

Figure 2-11 Additional Counts in Buffer Area

3 Public Transport Model Validation

3.1 Overview

This section details the 2024 present year validation of the updated GC3M public transport model. The following updates have been undertaken:

- **Bus Network Lines:** Updated from 2019 to 2024 based on the latest (July 2025) DfT Bus Open Data Service (BODS) data.
- **Fare Parameters:** Updated to 2024 based on TAG Databook v1.24 (DfT, 2024c)
- **Matrix Adjustments:** DfT and Office of Rail and Road statistics (ORR) data has been reviewed to assess the change in aggregate level passenger demand from 2019 to 2024.

The Public Transport assignments have been undertaken utilising PTV VISUM 2025. Section 4 of the GC3M forecasting note details the application of network forecasting changes in the Foundation Case GC3M post covid forecasting. As part of this assessment BODs 2025 (August) data was utilised to updated bus routes and timetables.

3.2 Bus Service Updates

Bus routes and timetables were obtained from the DfT's BODS data set. All bus services that are within the study area were included. Bus service data was imported to VISUM as GTFS files and modelled as full timetabled services. Therefore, the GC3M has been updated to reflect the latest bus supply data, including bus routes and timetables. As part of the GTFS import, the following bus routes have been identified as being discontinued since 2019 and therefore removed from the 2024 modelled bus network:

- E
- 24A
- 61
- 60F
- 66X
- 94U
- 132
- 761
- 827
- 864
- 805
- 860
- 861
- 862
- 863
- 865
- 866
- 867
- 869
- 710
- 748

3.3 Rail Service Updates

The rail network has been updated to include three additional service lines, each fully coded with their corresponding time profiles and vehicle journeys. These services were taken from the GC3M foundation case forecast models. The newly added services include:

- A rail passenger service line between Cheltenham Spa and Maesteg
- A rail passenger service line between Bristol Temple Meads and Gloucester
- A rail passenger service line between Worcester Foregate Street and Westbury

3.4 Fare Adjustments

Bus and Rail fares are included and represented in the GC3M using generalised journey time (minutes). Therefore, based on TAG databook (DfT, 2024c), the fares were uplifted to represent the generalised journey time based on the ratio of 2019 and 2024 VOT. In addition, real term Retail Price Index (RPI) growth was applied to represent increases in fares between 2019 to 2024. It is noted that in 2024 a £2 national bus fare price cap was introduced by DfT, which was subsequently increased to £3 in 2025. However, as bus fare is applied in the GC3M by distance band, the cap would only be relevant to relatively larger distances (circa 25km trips). Therefore, given that this cap is only applicable to single journey bus services and is not relevant to other fare types (i.e. single, weekly, Day Rider, Return, Monthly etc), concessionary users or coach services, the price cap has not been

directly applied as a cap within the model. Table 3-1 below details the VOT and RPI fare adjustment factors derived from the TAG databook.

User Class	VOT Adjustment	RPI Growth	Fare Adjustment Factor
PT Fare Adjustment Parameters	100.4%	110.7%	111.1%

Table 3-1: GC3M 2024 PT Fare Adjustment Parameters (DfT, 2024c)

3.5 Matrix Adjustments

Figure 3-1 below show the long-term trend in bus passenger journeys across Gloucestershire based on the DfT's local bus passenger journeys information. Overall, a relative decrease in the level of passenger journeys is observed, of around 25% in 2024 compared to 2019.

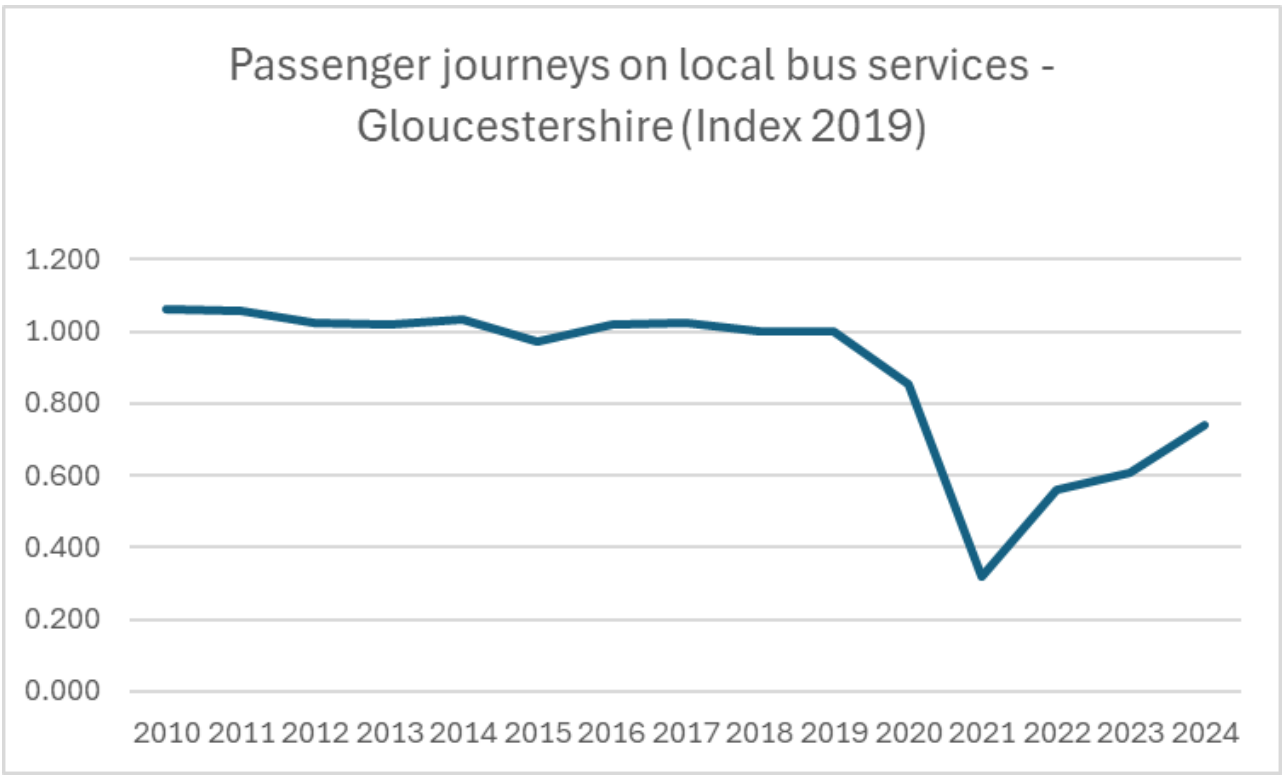

Figure 3-1: DfT Passenger Journeys on Local Bus Services in Gloucestershire (Dft, 2025)

Figure 3-2 below shows the long-term trends in total station entries and exits derived from the ORR data. It should be noted that data is only available up until 2023-24 so data for 2024-25 has been extrapolated from the latest 2023-2024 trend.

Overall rail passenger flows for Gloucester have recovered to above the 2019 (pre-covid) observations (approximately 2% above 2019 in 2023-24 and 10% in 2024-2025). Whereas at Cheltenham Spa railway station passenger flows, although showing an increasing yearly trend, passenger numbers are still below the 2019 observations (approximately -20% below 2019 in in 2023-24 and -18% in 2024-2025). Ashchurch for Tewkesbury shows a slight decrease of around 2% compared to the 2019 observations.

In contrast, rail passenger flows within the Cotswold area have demonstrated a stronger recovery, exceeding 2019 levels by approximately 10 percent in 2024/25.

To account for varying levels of post-COVID rail passenger recovery across different areas, separate adjustment factors have been applied to the GC3M rail passenger demand matrix, one for zones within the Cotswold area and another combined factor for all remaining origin and destination pairs. Accordingly, the rail passenger demand matrix has been factored using the following values:

- Cotswold Rail Factor: 1.096
- Rest of GCC Rail Factor: 0.944

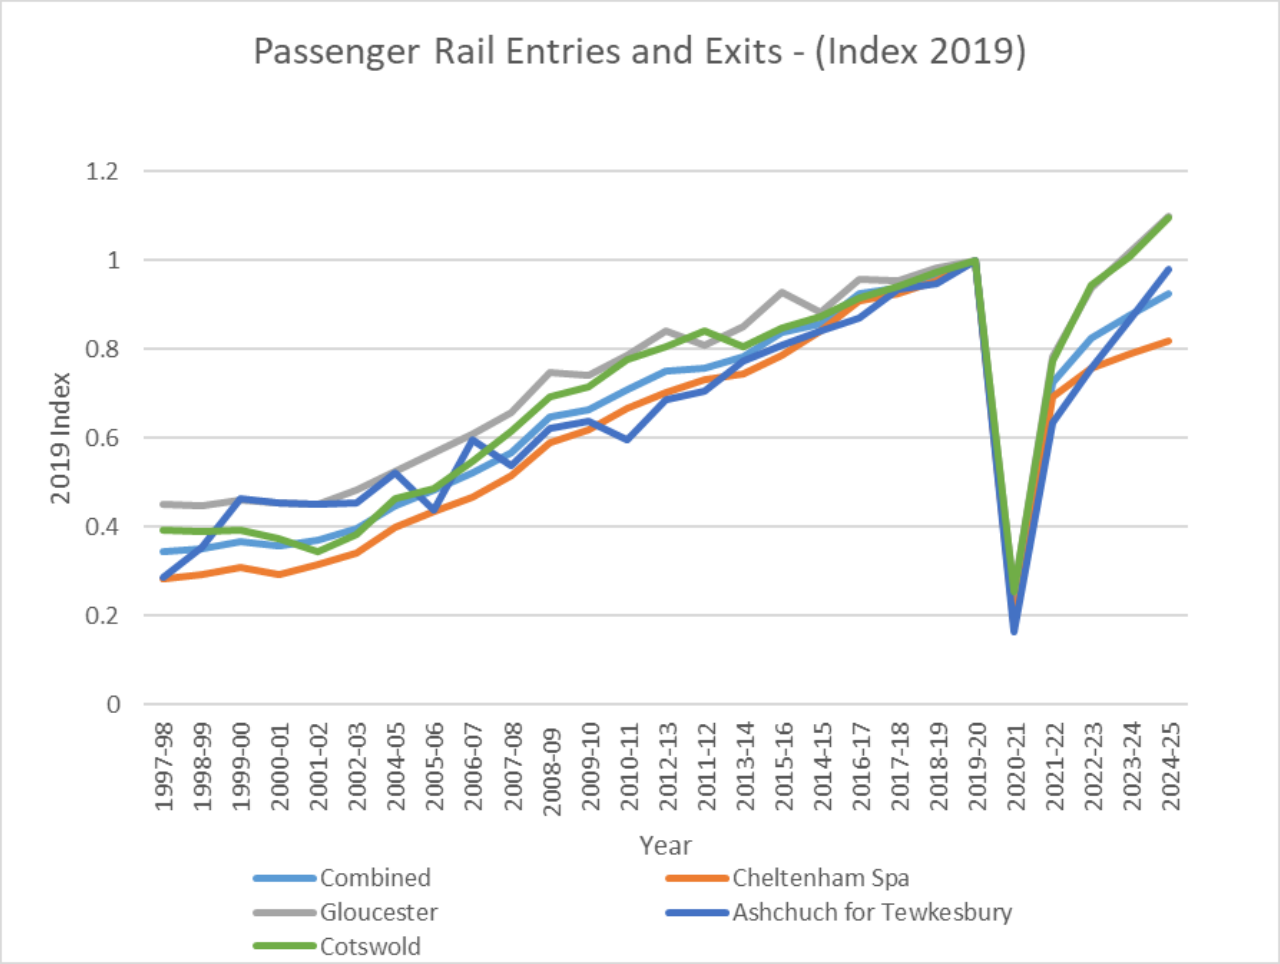

Figure 3-2:ORR passenger entries and exits – Index 2019 (ORR, 2025)

3.6 TAG Criteria

TAG Unit M3.2 provides the primary source for guidance for all public transport modelling. The criteria and acceptability guidelines adopted for the GC3M assignment validation are listed below:

- Grouped stops/stations by fare stages or corridors, applied at a sector level (See Table 3-2 (Source: TAG Unit M3.2 Paragraph 4.3.3 - Table 4) (DfT, 2024d)
- Individual stops/stations (See Table 3-3 for validation criteria (Source: TAG Unit M3.2 Paragraph 4.3.9 - Table 5 (DfT, 2024d))
- Annual Patronage (Source: TAG Unit M3.2 Paragraph 4.3.17) (DfT, 2024d))
  "Wherever possible, a check should be made between the annual patronage derived from the model and annual patronage obtained from the operators (TAG unit M1.2 Data Sources and Surveys provides advice on annualisation). Differences in total patronage should be as small as possible (for instance less than 5% for services with significant patronage). Greater differences need to be explained, including how model results might be used to predict future patronage and revenue. Practitioners should note and make adjustment for definitional inconsistencies, for example, operator patronage may be boardings and not trips. Boarding information will contain the start location but not the end of the journey, whereas trip data contains start to end information for a journey"

As discussed in Section 2.5, that while the evaluation of the model against TAG criteria has been reported on in this technical note, it should be recognised that TAG is primarily designed for scheme appraisal and central government business cases. As, TAG notes that 'achievement of the validation acceptability guidelines specified in this section does not necessarily guarantee that a model is 'fit for purpose' and likewise a failure to meet the specified validation standards does not mean that a model is not 'fit for purpose'. It is therefore considered that, if in most cases TAG criteria have been met (or exceeded), then where they are not met and the differences are relatively minor where a slight widening of the criteria allows them to be met, then the model can still be deemed fit for purpose. Furthermore, consideration of the relative age of the observed data as well as any other data limitations, such as annualisation parameters, should also be considered when evaluating the model's validation.

Description of Criteria	Acceptability Guideline	GC3M Supplementary Criteria
Differences between assigned and observed flows should be less than 15% across screenline, boarding, alighting and service groups.	All or nearly all screenlines (e.g. 95%)	GEH values of <5 are also monitored if the observed flows < 150 passengers per hour.

Table 3-2: Screenline Calibration Criteria and Acceptability Guideline (DfT, 2024d)

Description of Criteria	Acceptability Guideline	GC3M Supplementary Criteria
Individual stops/stations (total passengers) passengers) < 25% (except where observed flows < 150 passengers per hour).	All or nearly all (e.g. 95%) stops/stations.	GEH values of <5 are also monitored if the observed flows < 150 passengers per hour.

Table 3-3 Individual Stops/Stations Validation Criteria and Acceptability Guideline (DfT, 2024d)

3.7 Validation Summary

Table 3-4 compares the observed annual bus passenger journeys, derived from DfT Bus statistics (Table BUS01e), compared to annualised boardings taken from the assignment model. Table 3-5 Table 3-7 presents the validation of the bus boarding validation results, based on the GC3M sector definitions defined in Section 12 of the MDVR Report, compared to the 2019 observations adjusted to 2024 as discussed in Section 3.4 above.

In summary, the updated 2024 present year validation of the GC3M, with the refreshed 2024 public transport lines and timetables, retains a good level of validation at an aggregated boarding sector level.

Furthermore the 2024 present year validated GC3M compares well to the observed DfT annual bus passenger journeys. As discussed in Section 3.5 above there has been a decrease in overall bus passenger journeys across the Gloucestershire region since 2019 of around 25%. Therefore, the annual validation, presented in Table 3-4, indicates that this decrease in bus passenger journeys has been replicated in the GC3M. As noted in the GC3M Model Development and Validation Report, considering the uncertainty in the expansion of the model from weekday periods to annualised boardings, the assignment compares well to the observed data across the region.

Authority	Observed Annual Pax Journeys (millions)	Annualised Modelled Boardings (millions)	% Difference
Gloucestershire	14.9	13.9	-7%

Table 3-7: Bus PM Peak Boarding Comparison

3.7.1 Cotswold Area

Network Rail's SRAM 2023 data has been collated and processed for the two rail stations within the Cotswold District, namely Kemble and Moreton-in-Marsh, and subsequently factored to 2024 using ORR-derived growth factors. As the SRAM dataset represents post-COVID conditions, relies on a good sample of OD data from mobile phone data and is closer to the modelled 2024 present year, it has been considered more suitable for comparison and validation purposes.

Table 3-8 to Table 3-13 present the validation of rail entries and exits by time-period. Overall, the validation results show a good level of alignment, with modelled values closely matching the observed entries and exits. The only notable exception is Kemble station exits, which currently fall outside the acceptable validation range.

A closer review of the observed data indicates that the results may have been influenced by an unusually high observation recorded during a specific hour, which has skewed the average. When focusing on the 16:00–17:00 hour, the observed exits are 12 passengers, which aligns closely with the modelled value. Furthermore, when comparing against the earlier 2019 observed counts from the GC3M model data collation, the number of entries was only 8.

Based on this evidence, it is considered likely that the observed data for Kemble station contains an inconsistency. As there is insufficient recent data to verify this further, no adjustment has been made to the modelled values at this stage.

Table 3-14 to Table 3-16 presents the validation of the bus boarding validation results within Cotswold, based on the GC3M sector definitions defined in Section 12 of the MDVR Report, compared to the 2019 observations adjusted to 2024 as discussed in Section 3.4 above.

All sectors within the Cotswold District record fewer than 150 observed boardings during peak periods. Despite the low observed totals, the modelled results show comparable values and low GEH statistics, indicating a satisfactory level of validation for all sectors except Cirencester in the PM peak, which was also identified as an issue in the original 2019 GC3M model validation.

It is important to note that the 2019 observed data for Cotswold sectors are based on relatively small sample sizes. When these observed values were factored to 2024 using a growth factor derived for the wider Gloucestershire area, rather than specifically for Cotswold, the adjusted values decreased by approximately 25 percent. This reduction may not accurately represent local conditions, particularly for Cirencester, which is served by more than 50 bus stops across the town. The observed values therefore appear to under-represent actual demand.

Given this uncertainty and the limited availability of more recent data, no further adjustment or down-lifting has been applied to the modelled values at this stage.

Name	AM Observed Entries	AM Modelled Entries	% Diff	GEH	Absolute Difference	Pass / Fail (% diff <= 15%; GEH <5 if flow <150)
Kemble	56	50	-10%	1	-6	Pass

4 Conclusion & Next Steps

4.1 Conclusion

Chapter 2 provides the statistics for the highway model validation for screenline, counts and journey time assessments for each modelled time period. The evidence presented in Chapter 2 demonstrates a high level of model calibration and validation performance has been achieved. In summary:

- Networks have been updated based on the latest 2024 uncertainty log information and matrices adjusted based on observed count data.
- Screenline validation (Flow Difference <5%): Screenline 1 meets the TAG criterion of in all time periods. Screenline 2 was validated using GEH values, as this approach is more appropriate for screenlines with low observed traffic volumes. GEH values are below 5 across all periods and directions, indicating good performance, though a stricter margin of GEH <4 criterion shows minor deviations mainly during the PM peak period.
- Link flow calibration for the combined 'total' data set: AM =88%, IP = 96% PM =88%. This exceeds the TAG acceptability guideline of 85% for this criterion in all periods.
- Journey time validation: AM = 91%, IP = 91%, PM = 94%. This exceeds the TAG acceptability guideline of 85% for this criterion in all periods.
- TAG Convergence criteria achieved all time periods.

Similarly, Chapter 3 summarises the development of the 2024 present year public transport validation assessment:

- Bus supply and demand data have been updated to incorporate the latest DfT data and 2024 bus timetables.
- A high level of validation has been achieved across AM, IP and PM periods for bus boardings.
- A good match against the aggregate annualised DfT passenger journey data has been achieved. Since 2019, there has been a decrease in overall bus passenger journeys across the Gloucestershire region of around 25%. Therefore, the aggregated annualised validation indicates that this decrease in passenger journeys has been replicated in the GC3M
- Within the Cotswold area, rail demand has shown strong recovery, exceeding 2019 levels by approximately 10 percent.
- Network Rail's SRAM 2023 rail validation data for Kemble and Moreton-in-Marsh, factored to 2024 using ORR-derived growth rates, confirm that the rail model provides a good level of alignment with observed data. All validation results fall within acceptable ranges, except for Kemble station exits, where anomalies in the observed data are suspected and no model adjustment has been applied.

Overall, the model results demonstrate a good level of validation against 2024 data has been achieved for both GC3M's Highway and Public Transport models. With respect to the Highways model, a good level of screenline calibration was achieved, with the flow difference criterion met for all Screenlines in all peak periods. Link flow calibration results are appropriate for a strategic model. Furthermore, the modelling achieved a good level of journey time validation in the context of a strategic modelling assessment with most routes meeting the DfT TAG criterion. TAG Convergence criteria are achieved for all time periods.

As discussed in Sections 2.5 and 3.5, that the evaluation of the model against TAG criteria does not necessarily guarantee that a model is 'fit for purpose' and likewise a failure to meet the specified validation standards does not mean that a model is not 'fit for purpose'. Overall, for the 2024 present year validation of the GC3M, in most cases TAG criteria have been met (or exceeded). Where they are not met the differences are relatively minor and slight widening of the criteria allows them to be met. This performance, against TAG criteria designed for more detailed appraisals, represents a strong performance for a strategic model for the purpose of assessing a local plan's impact.

Therefore, given the overall high level of validation achieved, the model is regarded as 'fit for purpose' for assessing the Cotswold's Local Plan.

4.2 Next Steps

This document details the development of the 2024 present year validation of the GC3M. The updated GC3M will provide the baseline for forecasting the impacts of the Cotswold development scenarios, as well as assessing public transport and highway network impacts and improvements. As such the 2024 demand matrix alterations and supply side updates will be incorporated into the forecast year models. In addition, further analysis of the base year highway model will be conducted when the location of the local plan spatial options has been defined. This will provide further information on the validation of the model in the specific area impacted by any potential development sites.
