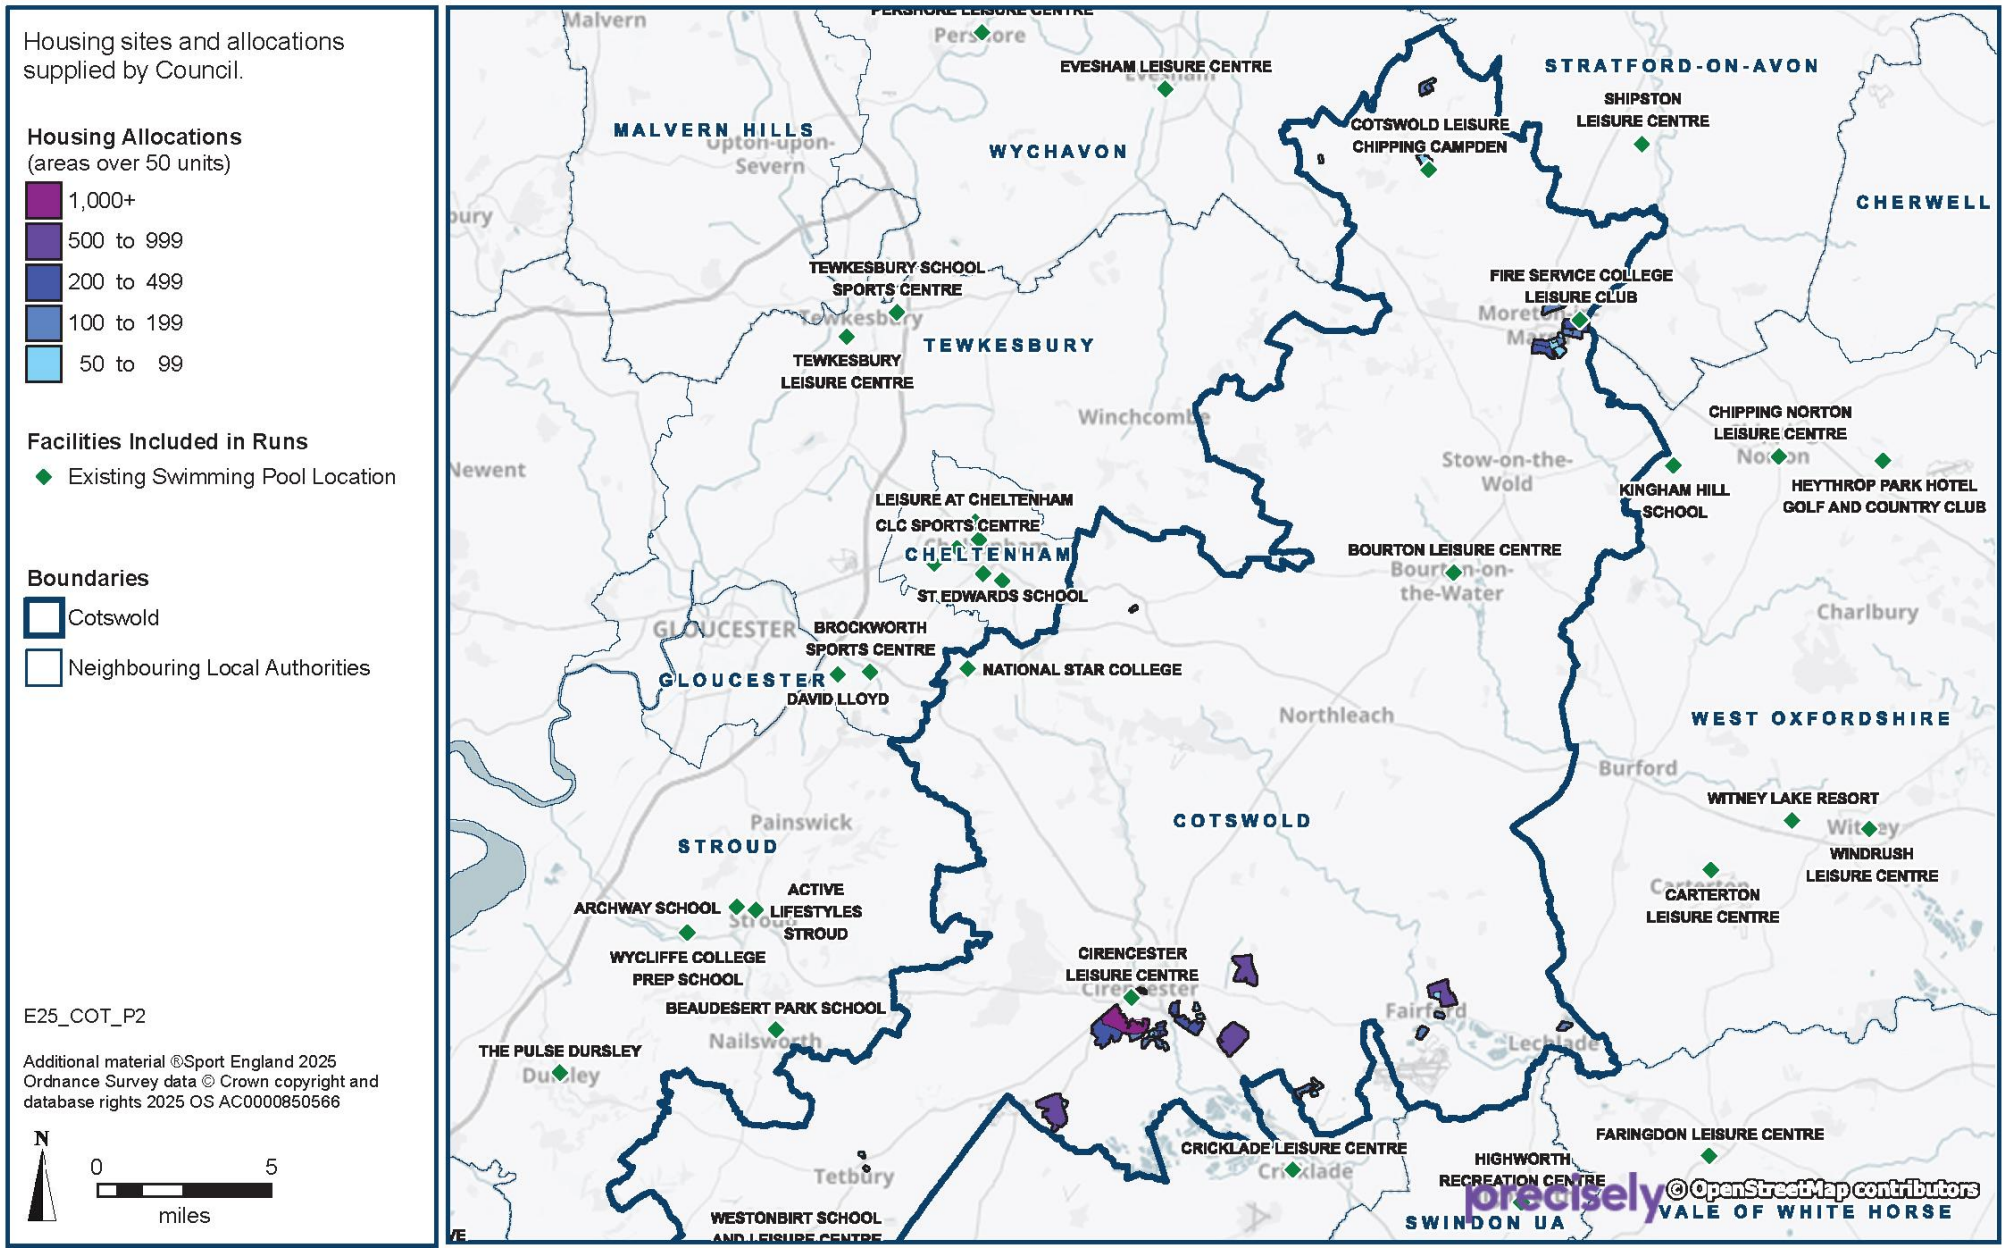
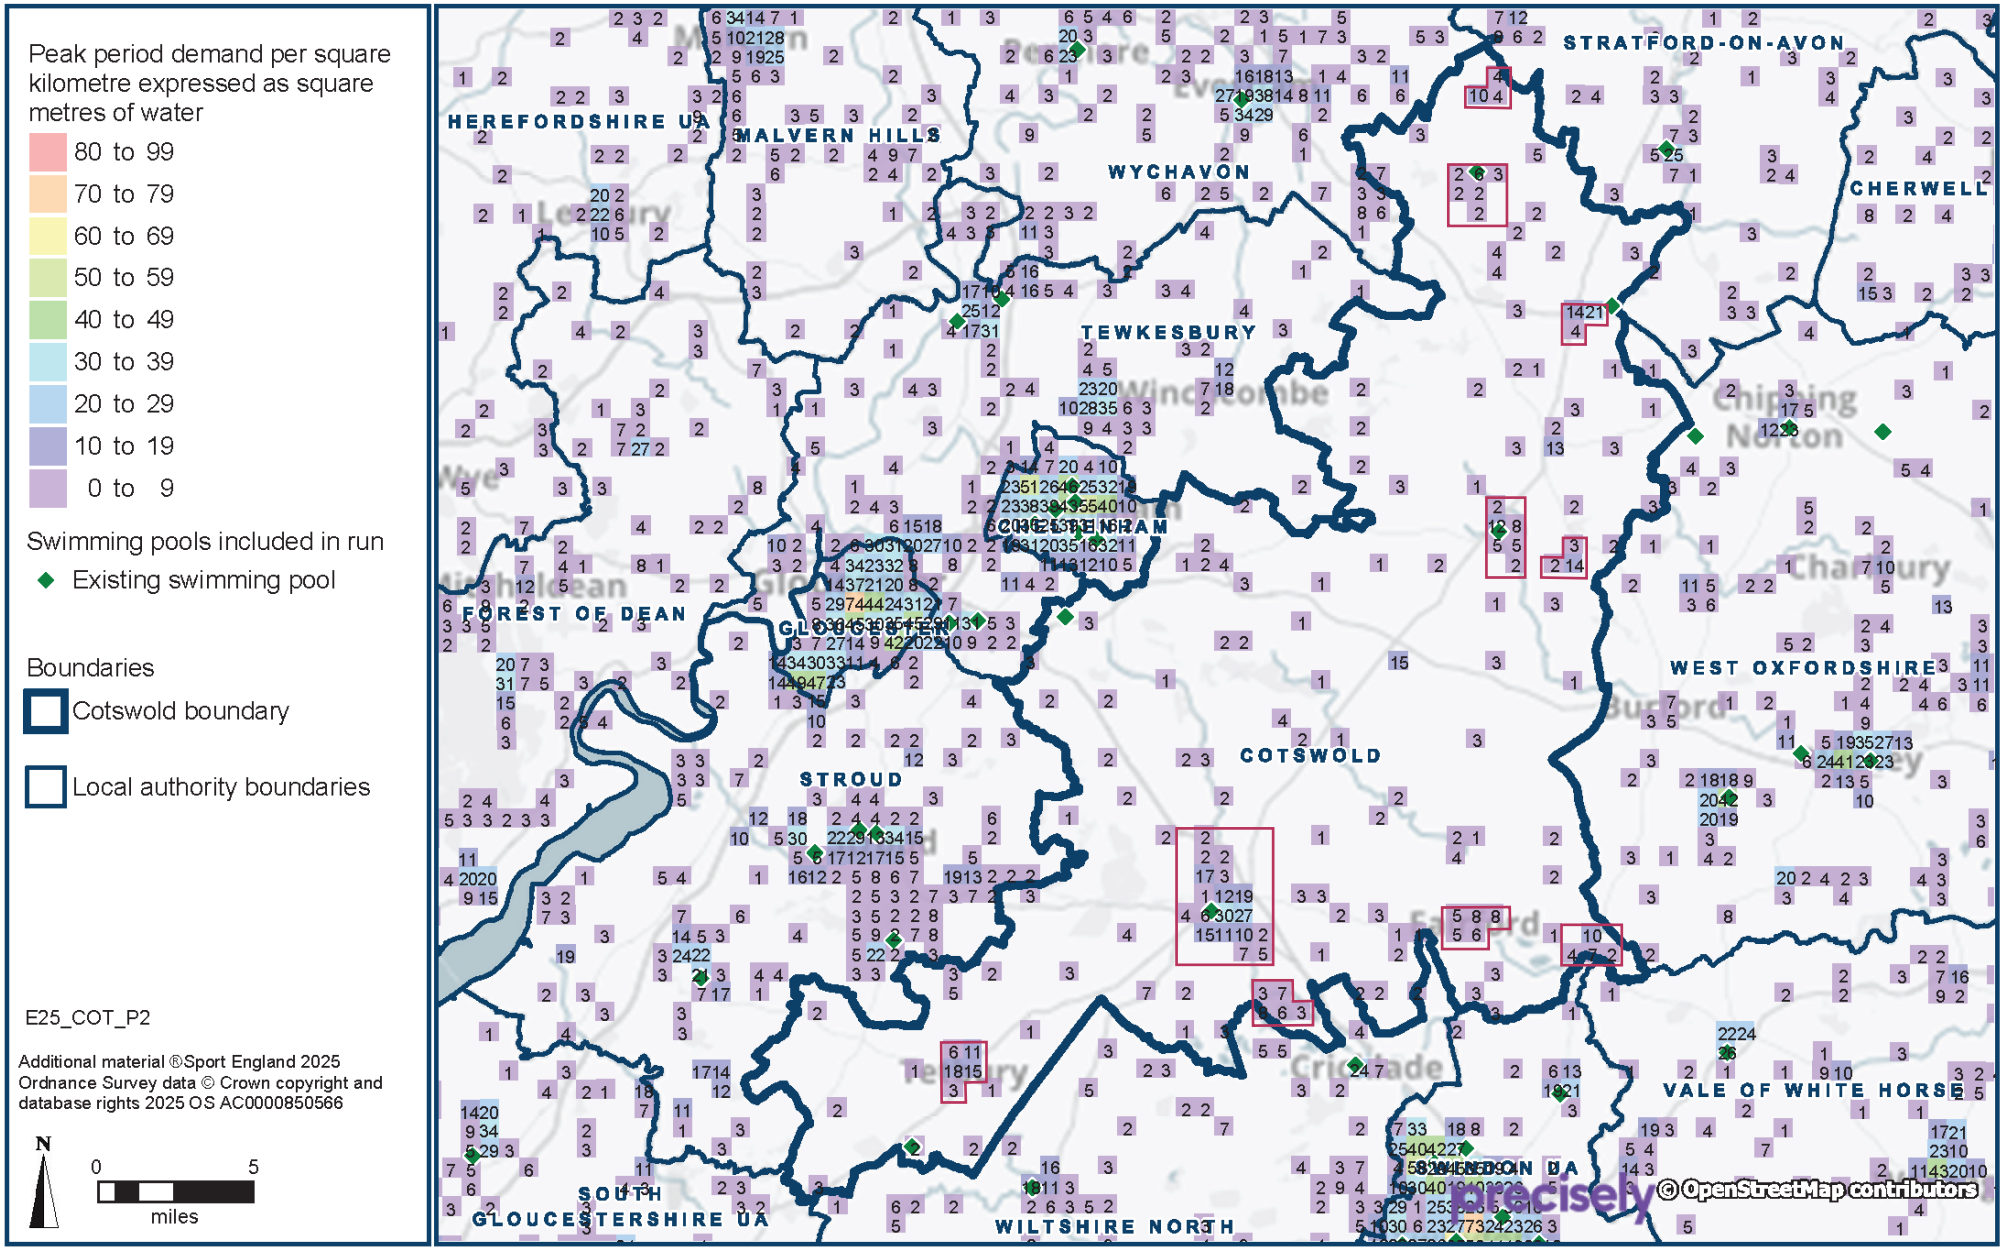
- South Cerney – decreases to 24 sqm of water across five square kilometres
- Lechlade – increases to 23 sqm of water across four square kilometres
- Mickleton – increases to 22 sqm of water across three square kilometres
- Rissington – decreases to 15 sqm of water across three square kilometres
- Chipping Camden – unchanged at 17 sqm of water but across a larger area of seven square kilometres

3.18 Outside of these areas demand is less than 15 sqm of water per square kilometre (dark blue and purple squares).



Deprivation

3.19 None of Cotswold's demand is in the 10% most-deprived lower super output areas (LSOAs) nationally. The area of greatest deprivation in Cotswold is in the 40% most-deprived LSOAs in south Cirencester (dark orange area in Map 3.4).



3.20 The Index of Multiple Deprivation (IMD) score is used in the FPM to limit whether people will use commercial facilities (see Appendix 3 for definition of IMD). A weighting factor is incorporated to reflect the cost element often associated with commercial facilities. The assumption is that the higher the IMD score (less affluence), the less likely the population of the LSOA would choose to go to a commercial facility.

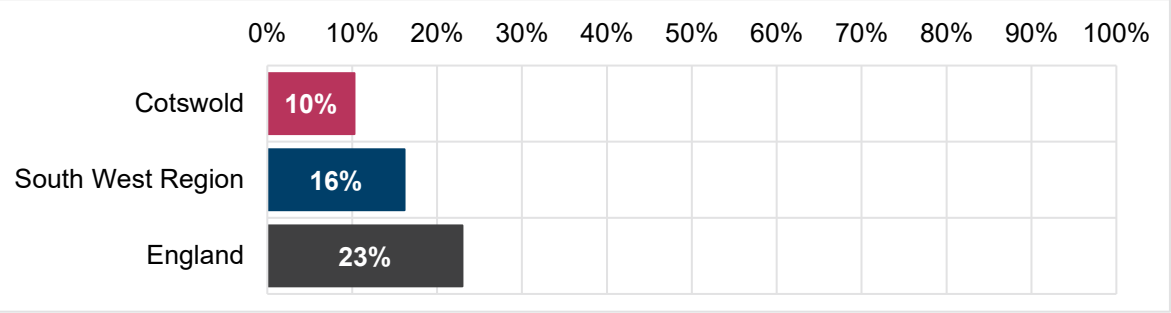
4 ACCESSIBILITY

In 2025, 17% of Cotswold's residents are within a 20-minute walk of a swimming pool. This reduces slightly in 2043 to 16%. The proportion is smaller in 2043 due to the location of the housing growth sites.

Travel to swimming pools on foot accounts for 6% of all visits in both years. Travel by public transport or bicycle is 4% in both years.

All the swimming pools are within a five-minute walk of an existing bus stop.



Access to swimming pools within a 20-minute drive is best in the west of the District.

Table 4.1: Travel Mode of Cotswold Demand to Swimming Pools by Run

Accessibility	Run 1	Run 2
Cotswold	2025	2043
% of total residents within a 20-minute walk of a swimming pool	17%	16%
% of demand satisfied when travelled:		
on foot	6%	6%
by public transport or bicycle	4%	4%
by car	90%	90%

Definition of accessibility – The FPM uses a distance decay function where the further a user is from a facility, the less likely they will travel. A description of the distance decay function is set out in Appendix 3. On average, a 20-minute travel time accounts for approximately 90% of visits to a swimming pool.

Chart 4.1: Proportion of Residents Without Access to a Car

4.1 In Cotswold 10% of residents do not have access to a car. This is lower than the regional average of 16% and the national average of 23%. For these residents, a network of accessible swimming pools is important in order to encourage swimming participation.

Walking Access

4.2 In 2025, 17% of Cotswold's residents are within a 20-minute walk of a swimming pool. This reduces slightly in 2043 to 16%.

4.3 The areas that are within a 20-minute walk of a swimming pool in 2025 and 2043 are shown in Map 4.1.

4.4 However, not all residents in these areas will walk to a swimming pool and some will travel further. It is estimated that 6% of journeys by Cotswold residents to swimming are made on foot in 2025 and 2043.

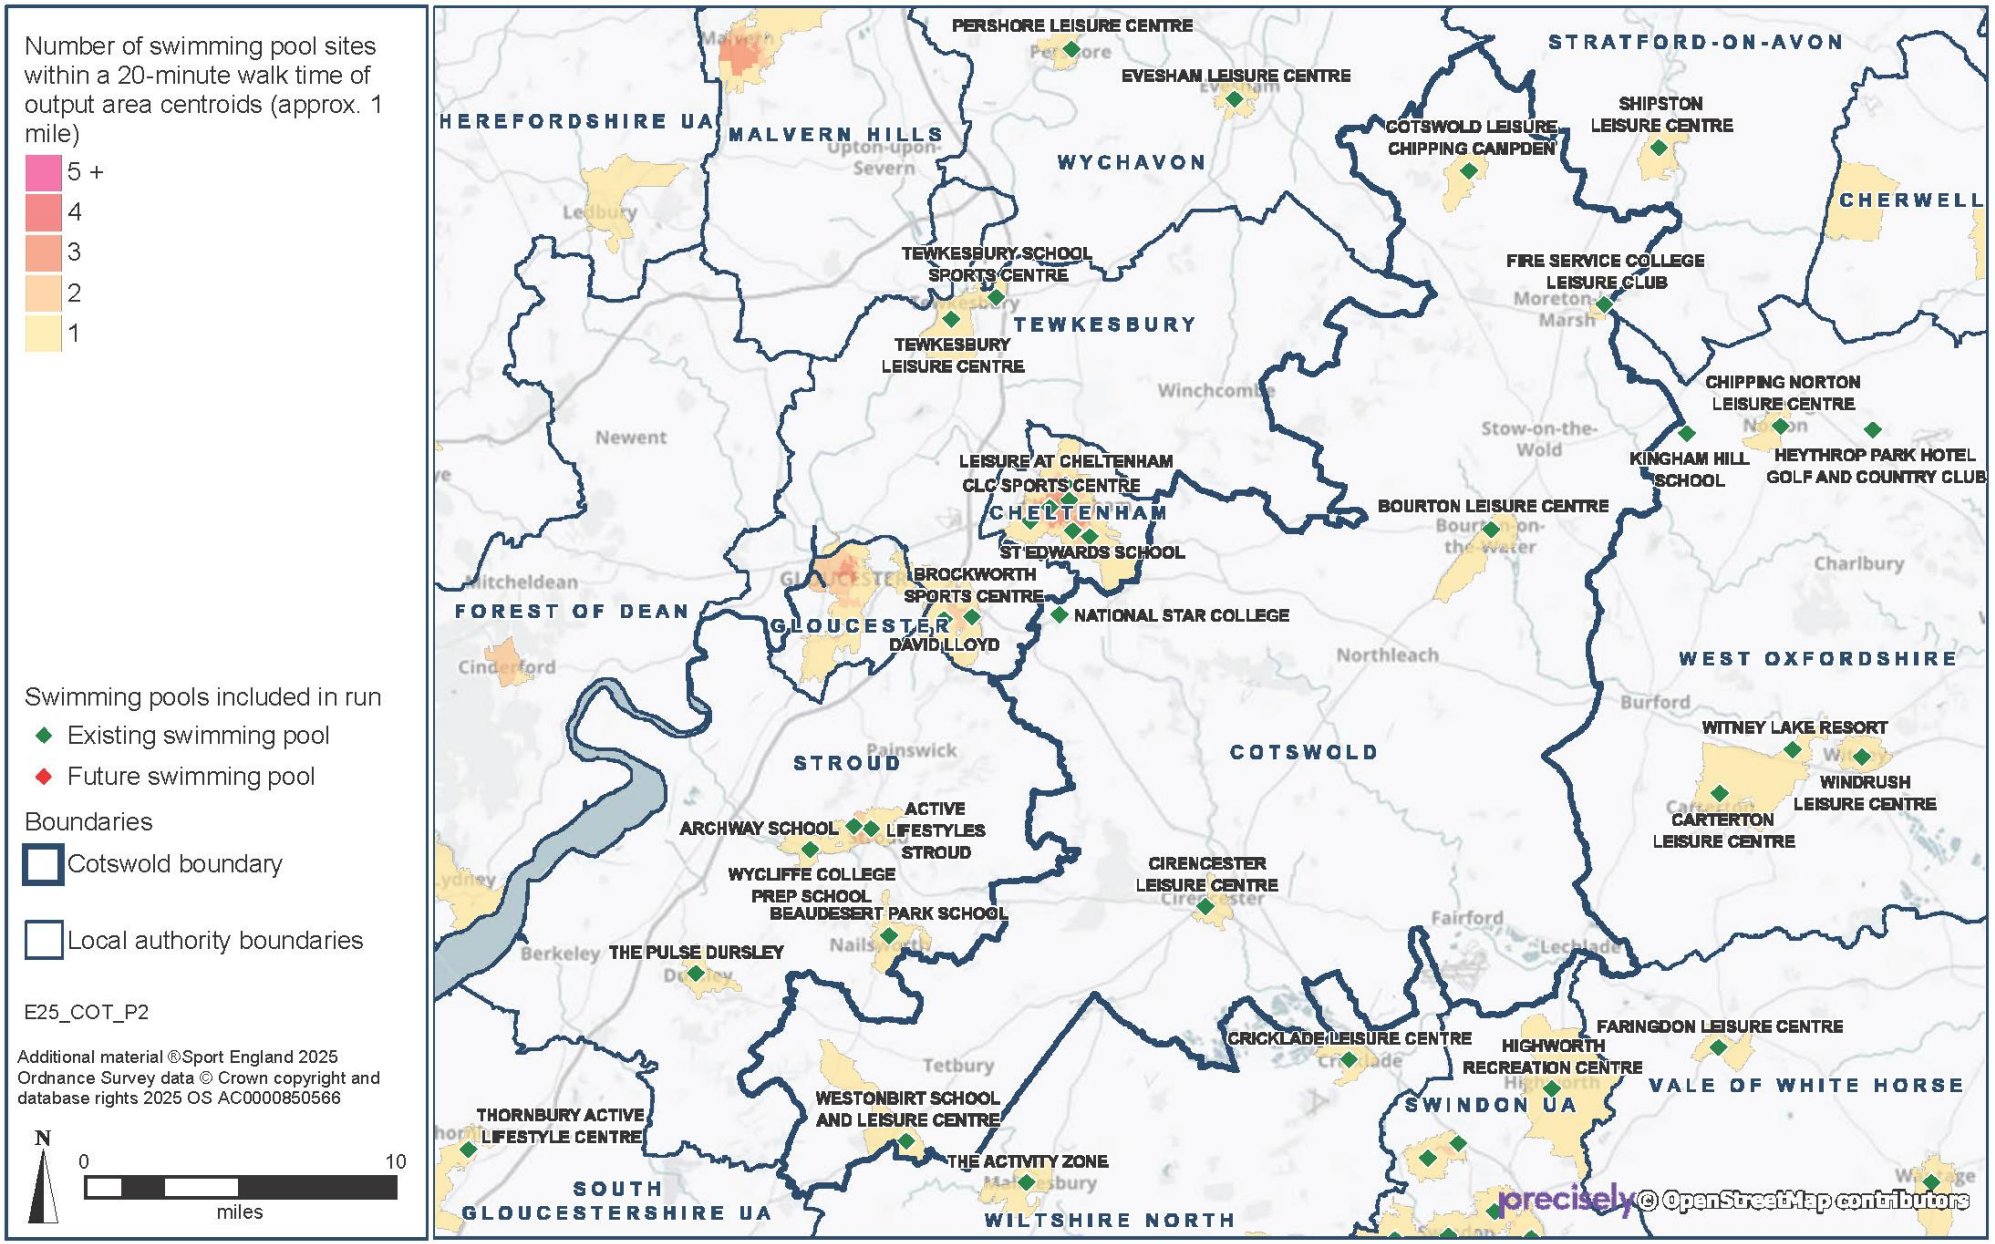
Public Transport Access

4.5 All the swimming pools are within a five-minute walk of an existing bus stop (pink areas in Map 4.2). However, the bus service is very limited, for example, in Southrop there is one return bus a day. This is the level of service in many villages.

4.6 None of the swimming pools are within a 15-minute walk of a railway station (purple areas).

4.7 It should be noted that, while most Cotswold residents can access an existing public transport stop, it may not mean they can get to a swimming pool within 20 minutes from home via a combination of walking and public transport.

4.8 Key finding 5 is that it is estimated that 4% of journeys by Cotswold residents to swimming pools are made by public transport or bicycle in 2025 and 2043. This is less than the regional proportion of 6% and the national proportion, which decreases from 10% in 2025 to 9% in 2043.



Driving Access

4.9 In both 2025 and 2043, all residents in Cotswold are within a 20-minute drive of at least one swimming pool (light green areas in Map 4.3). Access is highest in an area bordering south Tewkesbury and Cheltenham at between 15 and 19 swimming pool sites (dark blue area).

4.10 It is estimated that 90% of all journeys to swimming pools by Cotswold residents are made by car in 2025 and 2043.

Map 4.3: Driving Access to Swimming Pools in 2025 and 2043 (Runs 1 and 2)

5 SATISFIED DEMAND FOR SWIMMING POOLS

Of Cotswold's demand, 95% is satisfied in 2025, and 94% in 2043.

In both years 29% of Cotswold's demand is exported and met in neighbouring local authorities.

The largest amount of exported demand goes to West Oxfordshire in both years.

Six local authorities in the study area export more visits in the weekly peak period than Cotswold. South Gloucestershire exports the most visits.

Table 5.1: Satisfied Demand for Swimming Pools in Cotswold by Run

Satisfied Demand	Run 1	Run 2
Cotswold	2025	2043
Number of visits which are met per week in peak period	5,761	6,316
% of total demand satisfied	95%	94%
Number of visits retained per week in peak period	4,091	4,473
Demand retained as a % of satisfied demand	71%	71%
Number of visits exported per week in peak period	1,670	1,843
Demand exported as a % of satisfied demand	29%	29%

Definition of satisfied demand – This represents the proportion of total demand that is met by the capacity at the swimming pools from Cotswold residents who live within the travel time of a pool. This includes pools located both within and outside Cotswold.

5.1 **Key finding 6** is that 95% of Cotswold's demand is met in 2025; and 94% in 2043. However, the number of visits met in the weekly peak period increases from 5,761 in 2025 to 6,316 in 2043 because of the increase in demand in the District.

5.2 Cotswold's proportion of demand met is higher than both the regional average and national average of 93% in both years.

5.3 In 2025 seven of the neighbouring local authorities in the study area have a higher proportion of met demand than Cotswold. Stratford-on-Avon and Wychavon have the same proportion as Cotswold, and Stroud has a lower proportion at 94%.

5.4 In 2043 all the neighbouring local authorities have a higher proportion of met demand at between 95% and 98%, with the exception of Stroud which has the same proportion.

5.5 Details of the swimming pools in the neighbouring local authority areas are listed in Appendix 2.

Table 5.2: Proportion of Demand Met by Area and Run

Proportion of Demand Met	Run 1	Run 2
Area	2025	2043
Cotswold	**95%**	**94%**
Cheltenham	98%	98%
South Gloucestershire	98%	97%
Stratford-on-Avon	95%	95%
Stroud	94%	94%
Swindon	96%	95%
Tewkesbury	96%	96%
Vale of White Horse	97%	96%
West Oxfordshire	96%	96%
Wiltshire	96%	96%
Wychavon	95%	95%
South West Region	**93%**	**93%**
England	**93%**	**93%**

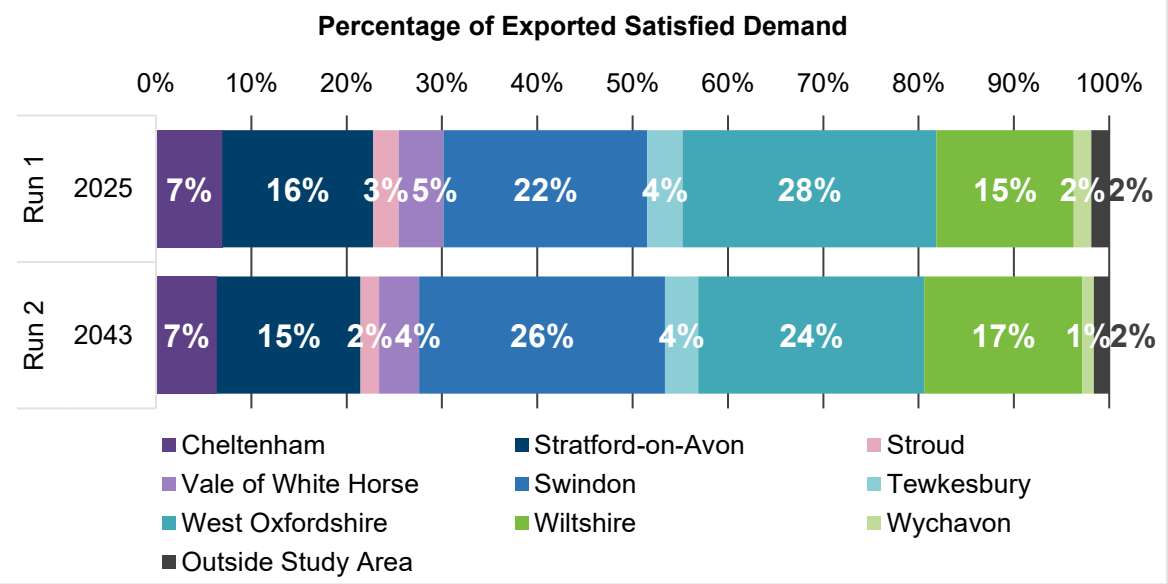
Retained Demand

Definition of retained demand – A subset of the satisfied demand findings shows how much of Cotswold residents' demand for swimming pools is met at pools located within the District. This assessment is based on the travel time from Cotswold's swimming pools and residents in the District participating at these pools.

5.6 **Key finding 7** is that 71% of Cotswold's satisfied demand is met within the District in both 2025 and 2043. In terms of visits, 4,091 are retained in the weekly peak period in 2025, increasing to 4,473 in 2043.

Exported Demand

Definition of exported demand – The residue of satisfied demand, after retained demand, is exported demand. This is based on Cotswold residents who live within the travel time of a swimming pool located outside Cotswold and use that pool.



5.7 Of Cotswold's satisfied demand, 29% is met at swimming pools in neighbouring local authority areas in 2025 and 2043.

5.8 Across the study area, eight local authorities export more visits in the weekly peak period than Cotswold in 2025, and seven local authorities in 2043. The highest is South Gloucestershire at 3,648 visits in the weekly peak period in 2025, and 4,062 visits in 2043.

Table 5.3: Visits Exported by Area and Run

Visits Exported per Week in Peak Period	Run 1	Run 2
Area	2025	2043
Cotswold	1,670	1,843
Cheltenham	782	771
South Gloucestershire	3,648	4,062
Stratford-on-Avon	2,567	2,982
Stroud	2,560	2,914
Swindon	1,709	1,471
Tewkesbury	3,304	3,706
Vale of White Horse	2,011	2,489
West Oxfordshire	1,066	1,098
Wiltshire	3,300	3,152
Wychavon	2,455	3,034

Chart 5.1: Percentage of Exported Satisfied Demand by Destination and Run

5.9 In 2025 the largest proportion of Cotswold's exported demand goes to West Oxfordshire, accounting for 28% and 443 visits in the weekly peak period (see Map 5.1).

5.10 There are three swimming pool sites in West Oxfordshire quite close to the border with Cotswold, including two public leisure centres. Carterton Leisure Centre opened in 2003 and is an extensive site with a 25m x 13m six-lane pool and a 10m x 7m teaching pool. Chipping Norton Leisure Centre opened in 2002 and has a 25m x 10m four-lane pool. Both are attractive sites in terms of their age and condition.

5.11 The second largest amount of exported demand goes to Swindon at 22% of Cotswold's exported demand and equating to 356 visits. There are no swimming pool sites in the

southeast of Cotswold. Highworth Recreation Centre in Swindon is accessible to some Cotswold residents. The centre has a 25m x 8.5m four-lane pool that opened in 1968 and was refurbished in 2008.

5.12 In 2043 the largest increase in the number of visits exported is to Swindon, accounting for 26% of Cotswold's exported demand and 474 visits in the weekly peak period (see Map 5.2). In Cotswold demand increases in Fairford as a result of housing growth and there being no change in supply.

5.13 The second largest increase in the number of exported visits in 2043 is to Wiltshire, accounting for 17% of Cotswold's exported demand and 305 visits in the weekly peak period (an increase from 240 visits in 2025).

5.14 Visits exported to West Oxfordshire decrease in 2043, but still account for 24% of Cotswold's exported demand and 436 visits in the weekly peak period.

6 UNMET DEMAND FOR SWIMMING POOLS

Cotswold's unmet demand equates to 5% of demand in 2025, and 6% in 2043.

Nearly all unmet demand is that which is too far from a facility. Unmet demand due to lack of swimming pool capacity is negligible.

Unmet demand is highest in Fairford and Cirencester at 4 sqm of water in both locations in 2025, and 7 sqm of water in 2043.

Table 6.1: Unmet Demand for Swimming Pools in Cotswold by Run

Unmet Demand	Run 1	Run 2
Cotswold	2025	2043
Number of visits unmet per week in peak period	318	380
Unmet demand as a % of total demand	5%	6%
Equivalent in sqm of water with comfort factor	52	62
% of unmet demand due to:		
Facility too far away:	98%	93%
% without access to a car	69%	67%
% with access to a car	29%	26%
Lack of facility capacity:	2%	7%
% without access to a car	1%	4%
% with access to a car	1%	3%

Definition of unmet demand – This has two parts; demand for swimming pools that cannot be met because either:

1. There is too much demand for any particular swimming pool within its travel time area and there is a lack of capacity.
2. The demand is located too far from any swimming pool that it can use (taking into account deprivation) or reach (taking into account car access) and is then classified as unmet demand.

6.1 Unmet demand in Cotswold increases from 318 visits in 2025 to 380 visits in 2043 due to the increase in demand and the ageing of the swimming pools.

6.2 **Key finding 8** is that unmet demand in Cotswold is 52 sqm of water in 2025, and 62 sqm in 2043. Unmet demand that is too far from a facility is 98% in 2025, and 93% in 2043. Lack of capacity accounts for 1 sqm of water in 2025, and 4 sqm of water in 2043.

6.3 Unmet demand that is too far from a swimming pool will always exist because it is not possible to achieve complete spatial coverage whereby all areas of a local authority are within walking distance of a swimming pool that is not commercial and not everyone will want, or is able, to drive the full distance.

6.4 The key point here is the scale of the unmet demand. Also, if it is clustered in one location, further provision should be considered to improve accessibility.

Location of Unmet Demand

2025

6.5 In 2025 unmet demand is highest in Cirencester, Tetbury and Fairford at 4 sqm of water in each location (see Map 6.1). Of the unmet demand in Cirencester, 3 sqm of water is east of Cirencester Leisure Centre.

6.6 There is unmet demand of 2 sqm of water in Northleach. Across the rest of Cotswold unmet demand is less than 2 sqm of water per square kilometre (dark blue and purple squares).

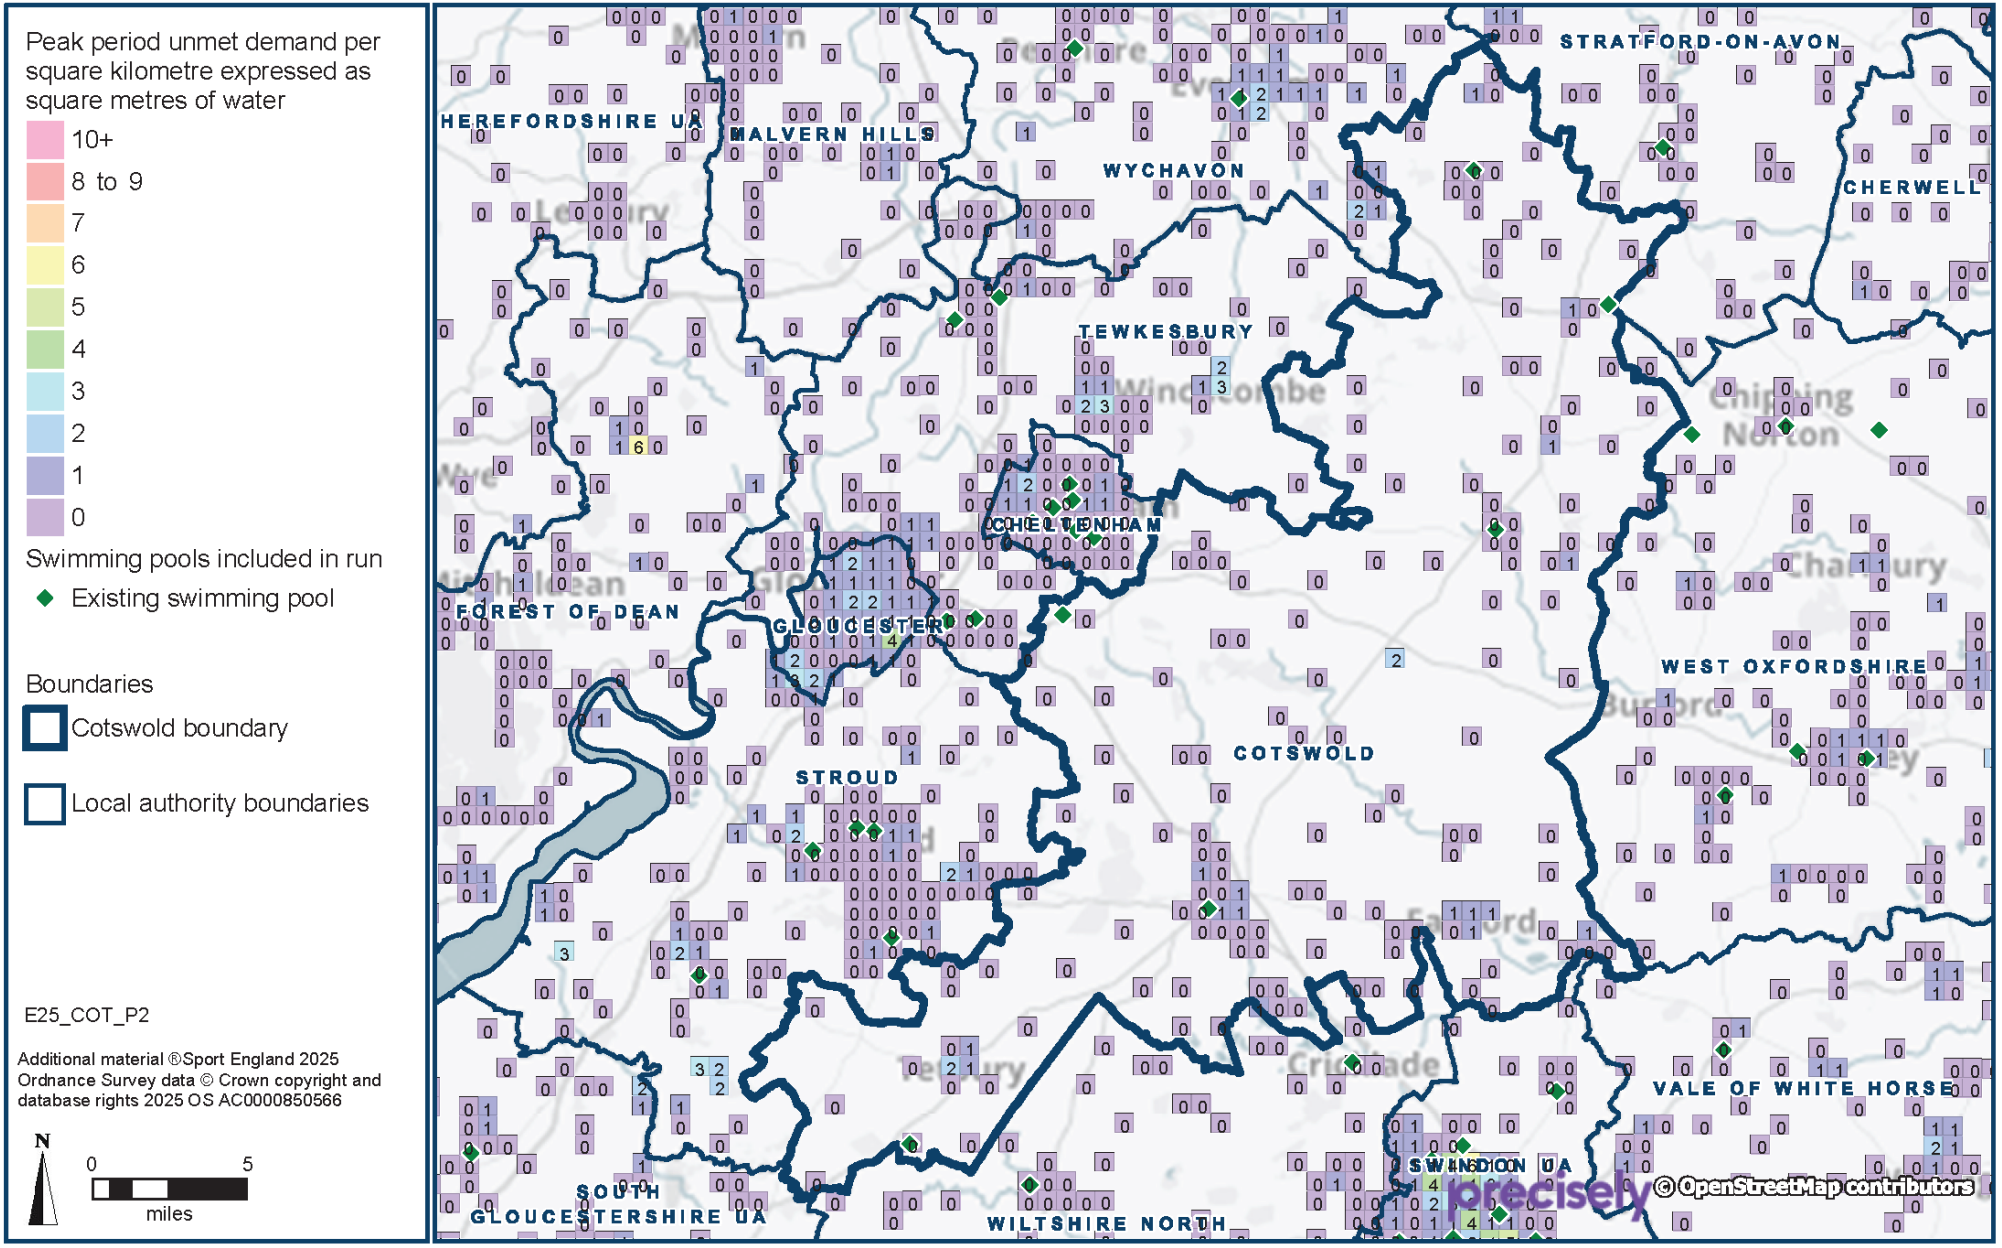
2043

6.7 In 2043 unmet demand across Cotswold increases by 10 sqm of water.

6.8 The changes in unmet demand are as follows (see Map 6.2):

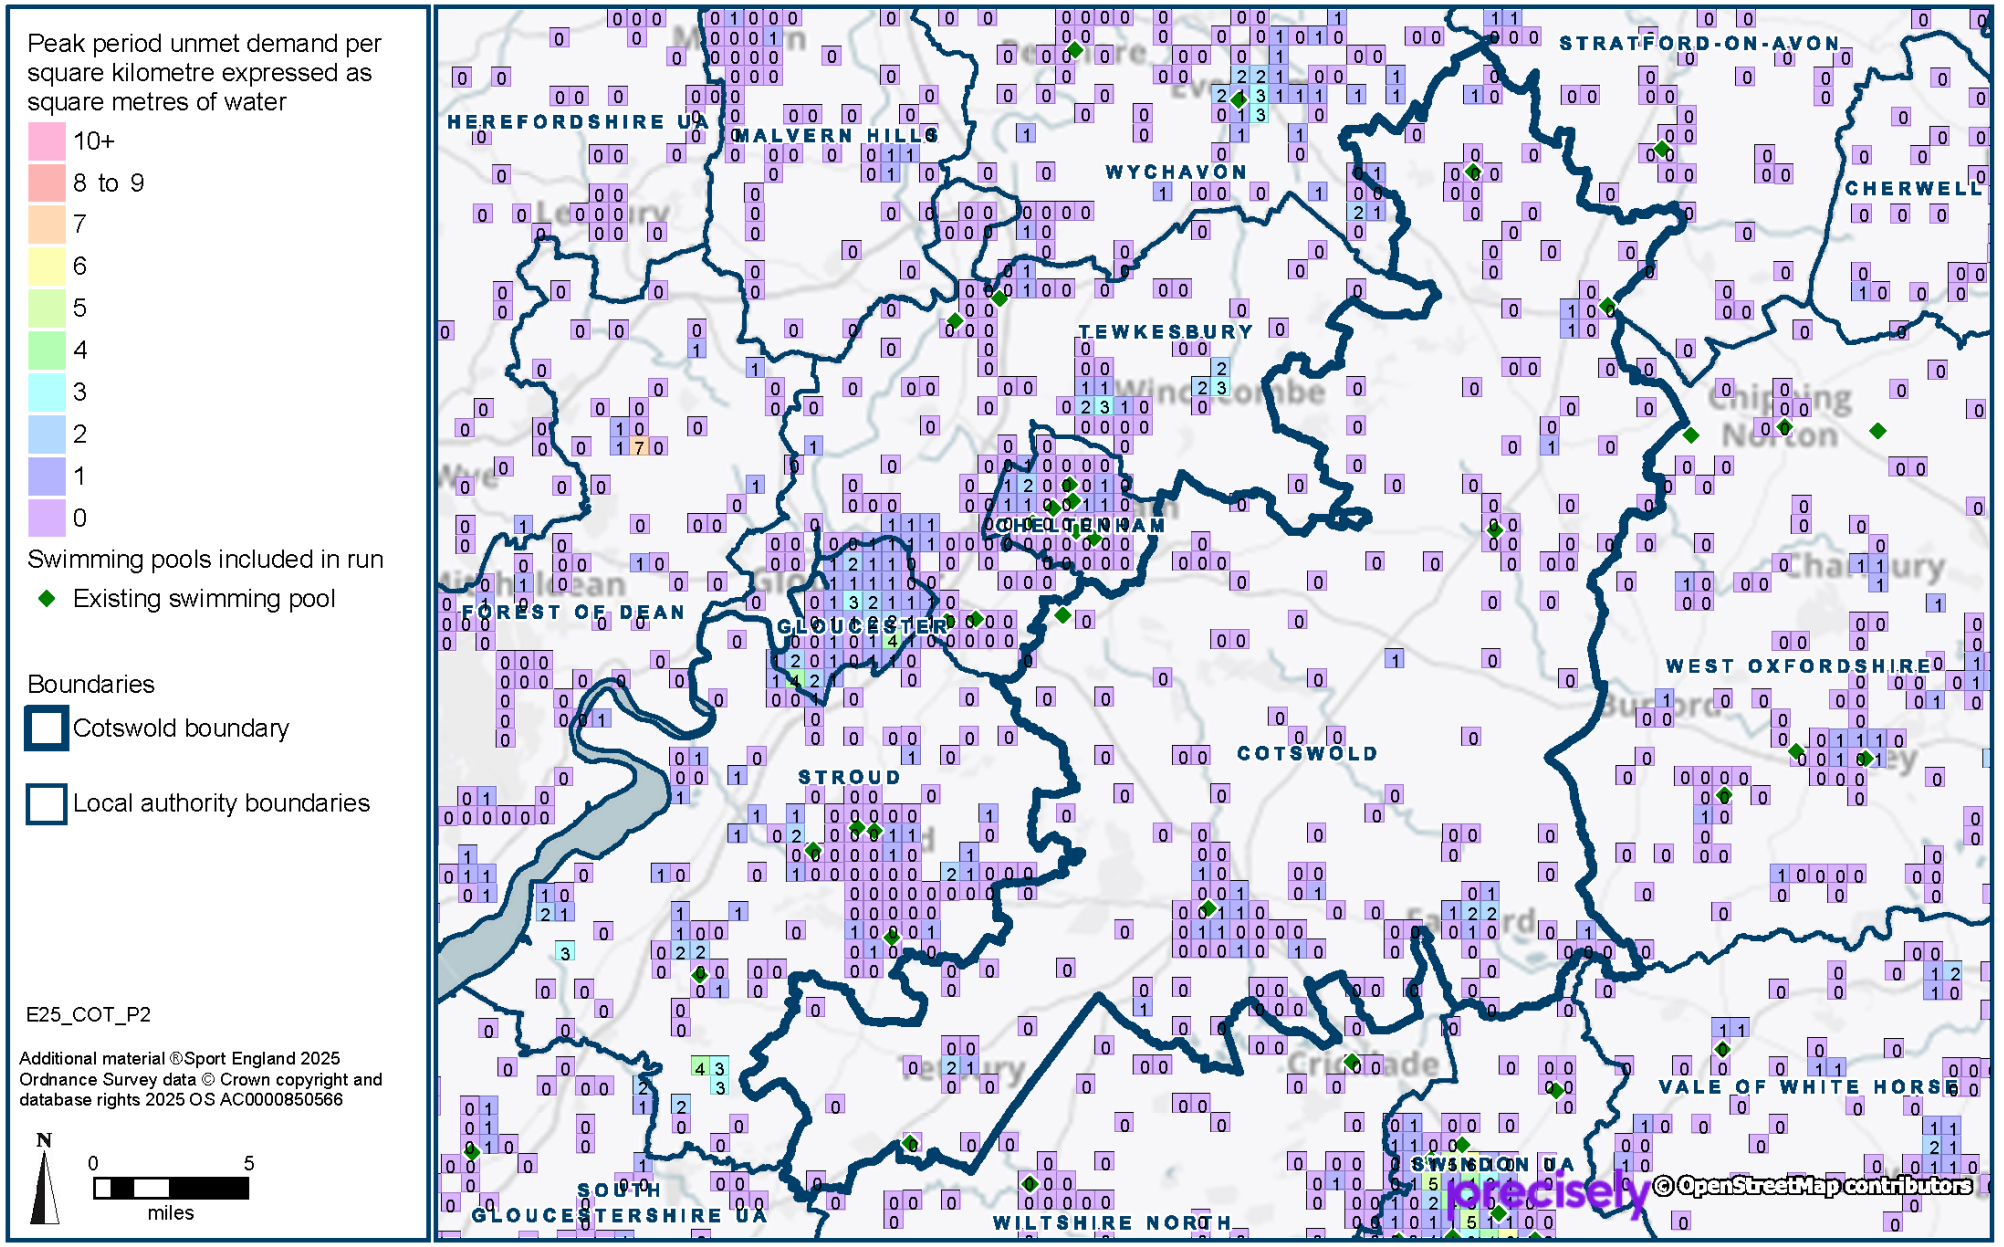
- Fairford – increases by 3 sqm of water to 7 sqm of water
- Cirencester – increases by 3 sqm of water to 7 sqm of water
- Tetbury – decreases by 1 sqm of water to 3 sqm of water
- Moreton-in-Marsh – increases by 1 sqm of water to 2 sqm of water
- Northleach – decreases by 1 sqm of water to 1 sqm of water

6.9 There are negligible differences in the distribution of unmet demand across the remainder of Cotswold.



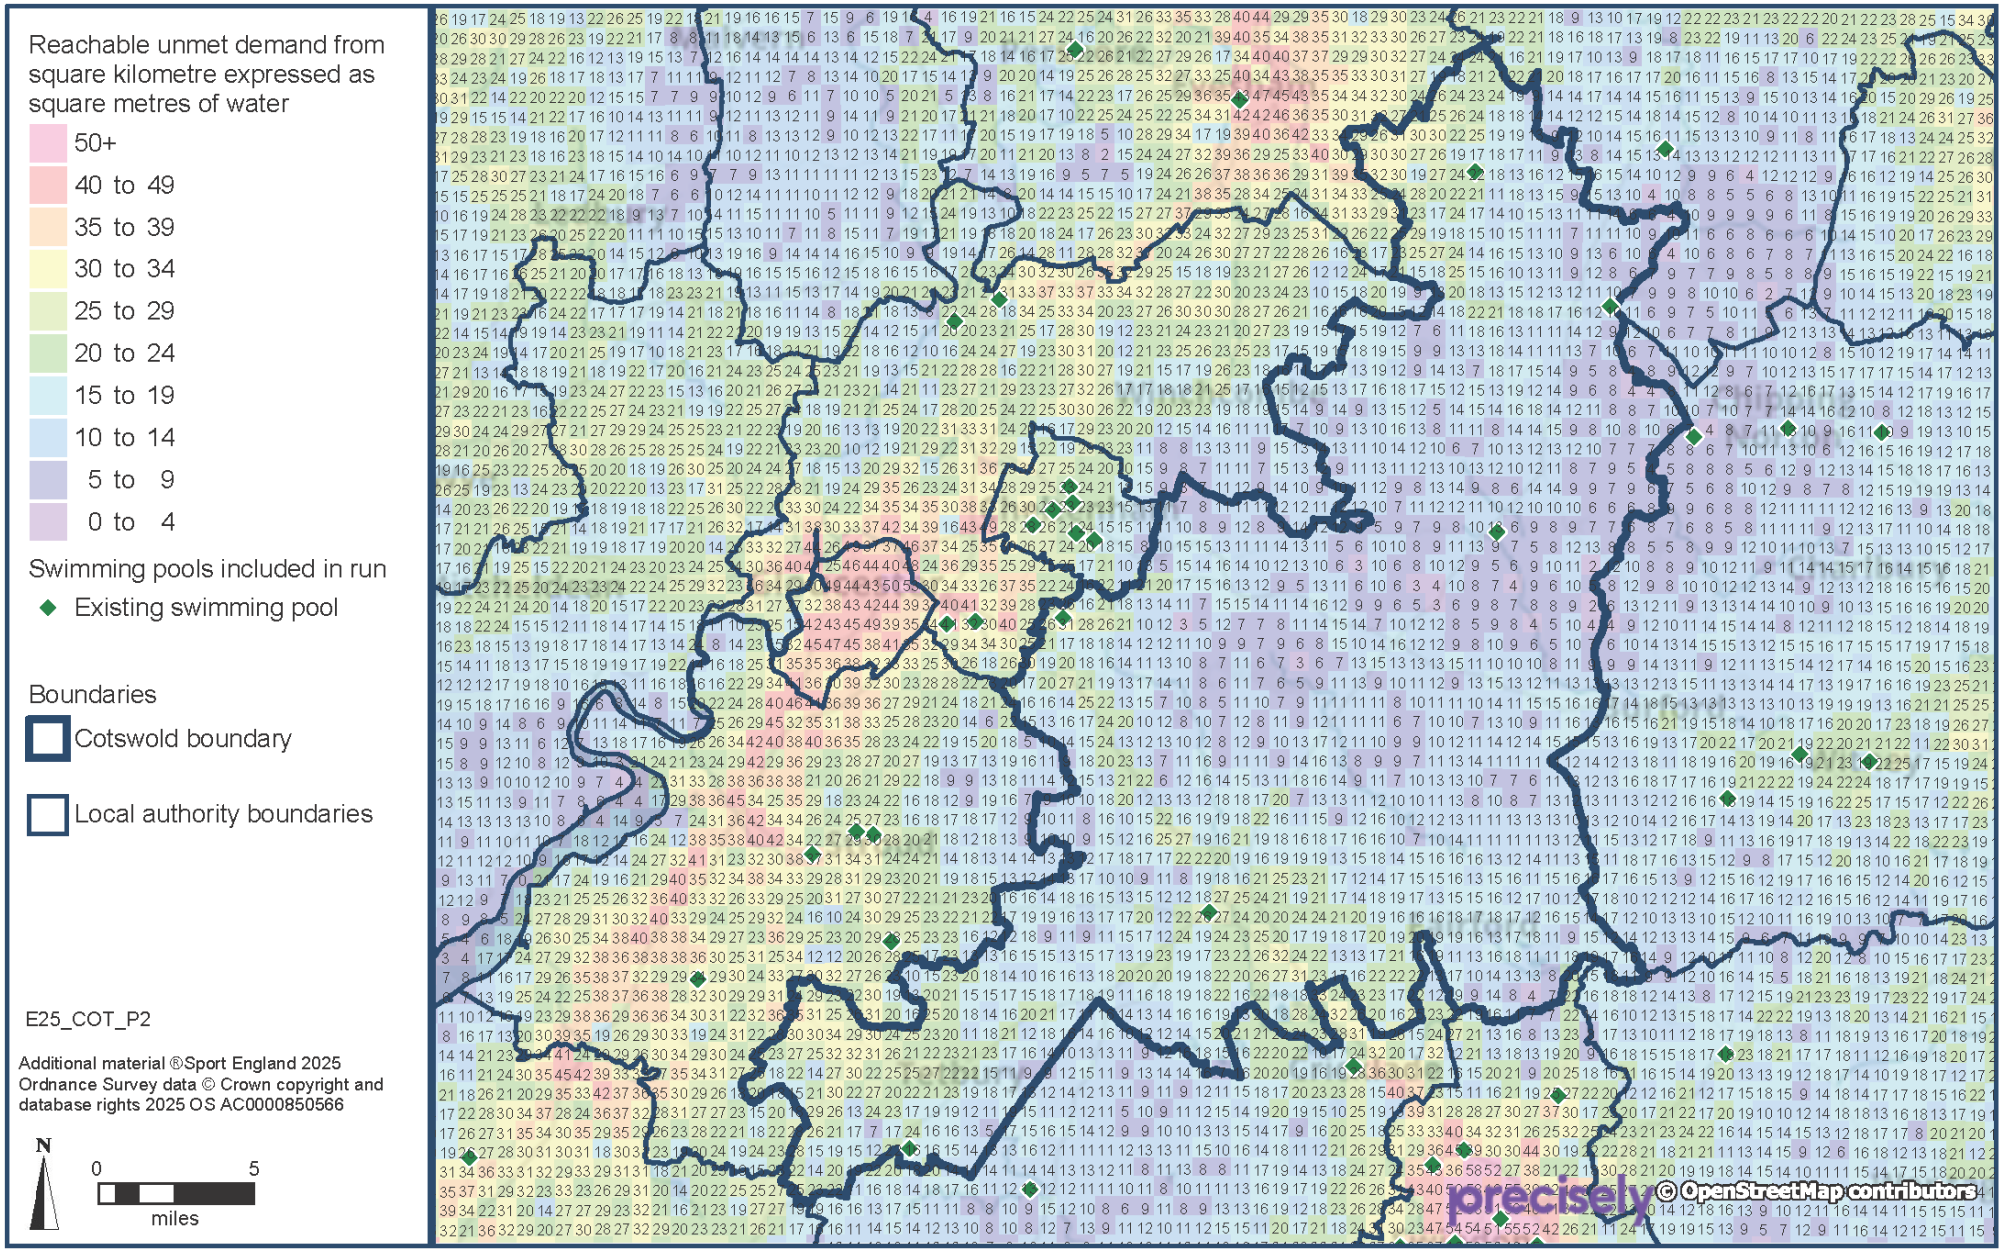
Meeting Unmet Demand

Definition of reachable unmet demand – Analysis of the spread of unmet demand shows the level of unmet demand that would be met by a potential new facility in any given location. This 'reachable unmet demand' is calculated for each one-kilometre grid square and figures are shown in the map.



6.10 **Key finding 9** is that, in 2043, the location in Cotswold where the most unmet demand can be met is Kingscote at 34 sqm of water (yellow square in Map 6.3). This is insufficient unmet demand to consider providing a new swimming pool.

For context, the minimum amount of reachable water space required to justify a new pool would be 120 sqm, which is a 15m x 8m Sport England Leisure Local facility.



Map 6.1: Unmet Demand for Swimming Pools in 2025 (Run 1)

Map 6.2: Unmet Demand for Swimming Pools in 2043 (Run 2)

Map 6.3: Reachable Unmet Demand for Swimming Pools in 2043 (Run 2)

7 USED CAPACITY OF FACILITIES

Utilisation of Cotswold's swimming pools is 62% at peak times in 2025, and 63% in 2043. However, Cirencester Leisure Centre is estimated to be uncomfortably busy (more than 70% of capacity used) at peak times in 2025, and fully utilised in 2043.

Imported demand equates to 37% of the used capacity of Cotswold's swimming pools at peak times in 2025, and 36% in 2043.

The largest amount of imported demand to Cotswold is from Stroud in both years.

Cotswold imports slightly more visits than it exports.

Table 7.1: Used Capacity of Swimming Pools in Cotswold by Run

Used Capacity	Run 1	Run 2
Cotswold	2025	2043
Number of visits used of capacity in weekly peak period	6,533	6,988
% of overall capacity of pools used	62%	66%

Definition of used capacity – This is a measure of usage at swimming pools and estimates how well used or how full facilities are. The FPM is designed to include a 'comfort factor', beyond which the venues are too full. The pool itself becomes too crowded to swim comfortably, and the changing and circulation areas also become too congested. In the model, Sport England assumes that usage above 70% of capacity is busy and that the swimming pool is operating at an uncomfortable level.

7.1 In 2025, 6,533 visits are met at Cotswold's swimming pools in the weekly peak period. This increases to 6,988 visits in 2043.

Table 7.2: Weekly Peak Period Used Capacity of Cotswold Swimming Pools by Run

Used Capacity	2025 (Run 1)		2043 (Run 2)		Provider	Peak Hours	Year Built	Year Refurb
Sites	Visits Met	Proportion	Visits Met	Proportion				
Cirencester Leisure Centre	3,441	95%	3,640	100%	Public	52.5	2006	
Bourton Leisure Centre	829	42%	758	39%	Edu. (3rd party)	52.5	2003	
Cotswold Leisure Chipping Campden	669	64%	778	75%	Edu. (3rd party)	38.5	1996	2003
National Star College	572	70%	524	65%	Edu. (in-house)	15	2000	2008
Westonbirt School and Leisure Centre	778	42%	860	47%	Edu. (in-house)	52.5	2005	
Fire Service College Leisure Club	244	19%	428	33%	Other (sport club)	35	1977	2004

Site Utilisation Factors

7.2 The estimated used capacity should be reviewed with the facility operator. There are several reasons for the variation in estimated used capacity by site. Often it is difficult to identify which of these reasons apply because several could be interacting simultaneously, but variation is generally caused by any of the following factors.

Type of site operator (public/educational/other)

- Public leisure centres have a 'draw effect' because they:
  - Are accessible for public and swimming club use
  - Have extensive opening hours and are proactively managed to encourage and support swimming participation and physical activity
  - Unlike commercial swimming pools, do not require payment of a monthly membership fee
  - Provide all activities
- Access to swimming pools for community use at educational sites will be determined by the policy of each educational provider and affects the hours available for community use.

Age of the pool and its 'attractiveness'

- To assess their comparative attractiveness to customers, all swimming pools in the model are weighted to reflect their age and whether they have been modernised.
- The effect of refurbishment at a site decreases as the site gets older, and it becomes less attractive than a site built in the same year as the refurbishment.

Location of demand and competition from other sites

- Where swimming pools are located close together, the demand for these sites is shared between the venues, and this contributes to the level of used capacity at each.
- Conversely, where a swimming pool is remotely located, it benefits from having no competition for the local demand.

Capacity

- When reviewing the estimated used capacity, it is important to consider the capacity of the site and not just the proportion in isolation. Centres with the same or similar proportions of used capacity can accommodate very different levels of demand.
- The hours when a site is available for community use affects its capacity at peak times.

Imported demand

- If residents in neighbouring local authority areas participate at a site in Cotswold, their usage becomes part of the used capacity of Cotswold's swimming pools.

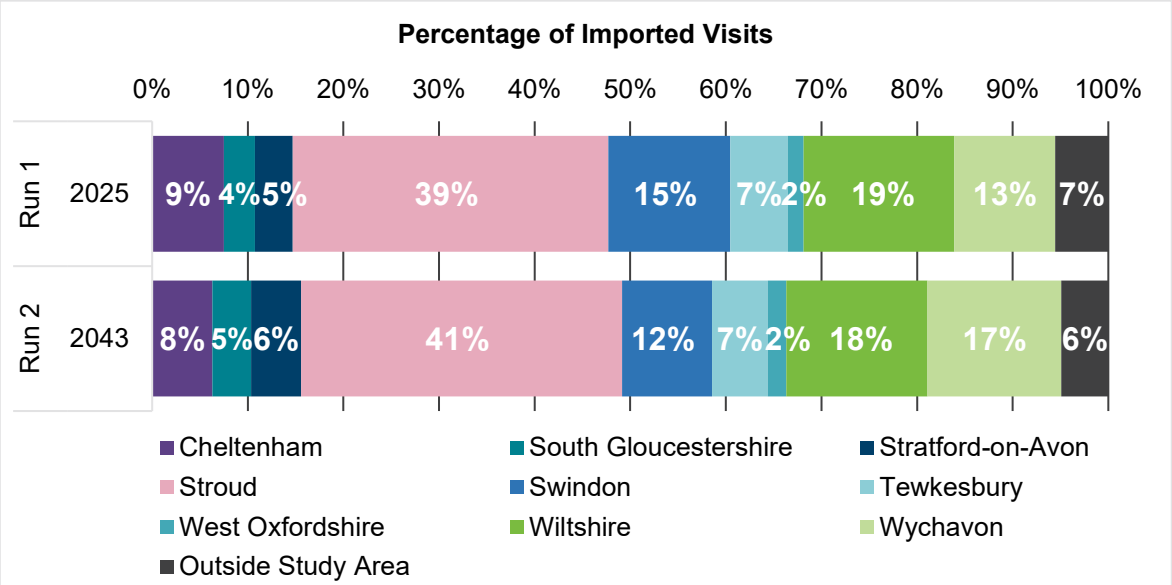
Highly Utilised Sites

7.3 Cirencester Leisure Centre is estimated to meet four times more visits in the weekly peak period than the other sites in Cotswold. It is highly utilised because it is the only public leisure centre in Cotswold, and is the only site in the area of highest demand in the District. It is the most recent site to open and has the largest capacity. The used capacity of the centre is estimated to increase from 95% in 2025 to 100% in 2043 due to the large housing growth sites around Cirencester. There is no scope to increase availability and capacity at peak times to reduce the proportion of used capacity.

7.4 Utilisation of Cotswold Leisure Chipping Campden is estimated to increase from 64% in 2025 to 75% in 2043. There are housing growth sites to the north of the swimming pool but also nearby in Moreton-in-Marsh. However, Cotswold Leisure Chipping Campden has the second smallest capacity in the District. There is some scope to increase availability at the site, but this is dependent on the usage of the school in the peak period.

Imported Demand

Table 7.3: Imported Demand for Swimming Pools in Cotswold by Run



Imported Demand	Run 1	Run 2
Cotswold	2025	2043
Number of visits imported per week in peak period	2,442	2,516
As a % of used capacity	37%	36%
Difference between visits imported and exported	771	673

7.5 In 2025, 2,442 visits are imported to Cotswold's swimming pools in the weekly peak period. Imported demand rises to 2,516 visits in 2043 as demand increases across the study area.

7.6 Imported demand equates to 37% of the used capacity of Cotswold's swimming pools at peak times in 2025, and 36% in 2043.

7.7 Cotswold is a net importer of demand in both years. The difference is greatest in 2025 when 771 more visits in the weekly peak period are imported than exported, and smaller in 2043 at 673 more visits.

Chart 7.1: Percentage of Imported Visits by Origin and Run

7.8 In 2025 the largest amount of imported demand to Cotswold is from Stroud, at 805 visits in the weekly peak period and the equivalent of 39% of Cotswold's imported demand (see Map 7.1). Demand in west Stroud can access more attractive swimming pools in Cotswold (see Appendix 2). While The Pulse Dursley in south Stroud is relatively new and attractive, provision in Stroud is poor compared to demand (see Local Share section).

7.9 The second largest amount of imported demand is from Wiltshire, at 384 visits in the weekly peak period and accounting for 19% of Cotswold's imported demand. Westonbirt School and Leisure Centre is located close to the Wiltshire border, and demand in north Wiltshire can also access Cirencester Leisure Centre.

7.10 In 2043 imported demand from Stroud increases slightly to 843 visits in the weekly peak period and equates to 41% of Cotswold's imported demand (see Map 7.2).

7.11 Imported demand from Wiltshire decreases very slightly to 371 visits in the weekly peak period and equates to 18% of imported demand. Cirencester Leisure Centre is fully utilised in 2043.

8 LOCAL SHARE OF FACILITIES

Cotswold's total water space per 1,000 population is above both the regional and national averages in 2025 and 2043. Cotswold has the joint second best provision in the study area in both years.

Table 8.1: Local Share of Swimming Pools in Cotswold by Run

Local Share	Run 1	Run 2
Cotswold	2025	2043
Local share of swimming pools relative to demand in local area: <1 = poorer, >1 = better	1.23	0.59

Definition of local share – This helps show which areas have a better or worse share of facility provision. It considers the size, availability and quality of facilities, and travel modes. Local share is useful for looking at 'equity' of provision. Local share is the available capacity that people want to visit in an area (considering deprivation), divided by the demand for that capacity in the area. Local share decreases as facilities age.

8.1 Local share shows how the access and share of swimming pools differs across the local authority area, as follows:

- A value of 1 means that there is sufficient suitable supply reachable by the demand
- A value of less than 1 indicates a shortage of suitable supply that can be reached by the demand
- A value greater than 1 indicates a surplus of suitable supply that can be reached by the demand

8.2 Overall, local share identifies the areas of the local authority where the share of swimming pools is better and worse. The intervention is to try and increase access for residents in the areas with the poorest access to swimming pools.

8.3 In 2025 local share in Cotswold is 1.23, meaning that there is sufficient suitable provision that demand can access based on the age, used capacity and operation of the swimming pools. Demand is lower in 2025 than in 2043.

8.4 In 2043 local share is 0.59, meaning there is insufficient suitable provision that demand can access. Demand has increased, there is no change in capacity, and the swimming pools have aged and become less attractive to residents.

Geographical Distribution of Local Share

8.5 Local share varies across Cotswold.

2025

8.6 In 2025 local share is best east of Stow-on-the-Wold at 2.8 (purple squares in Map 8.1). Demand in this area is quite low, and there are two swimming pools in Cotswold close by as well as two sites in West Oxfordshire. Bourton Leisure Centre opened in 2003 and has the second largest capacity in Cotswold. The two sites in West Oxfordshire are of a similar age, and Chipping Norton Leisure Centre has a larger capacity.

8.7 Local share is very good in the northeast of Cotswold and around Tetbury at more than 1.2 (blue and purple squares).

8.8 Local share is poorest in Fairford and Lechlade at 0.8 (light green squares) where there are no swimming pools.

8.9 Local share is also poor around Cirencester at 0.9 (light green squares). Demand is high in the area and Cirencester Leisure Centre is highly utilised.

2043

8.10 In 2043 local share is best in the same area east of Stow-on-the-Wold but is lower at 1.3 (light blue squares in Map 8.2). The facilities nearby have aged but have spare capacity.

8.11 Local share is poorest in parts of Fairford at 0.3 (red squares) and is poor around Cirencester at 0.4 (orange squares). Demand has increased in these areas and Cirencester Leisure Centre has aged and is fully utilised.

Comparative Measure of Provision

8.12 A comparative measure of swimming pool provision is total water space per 1,000 population.

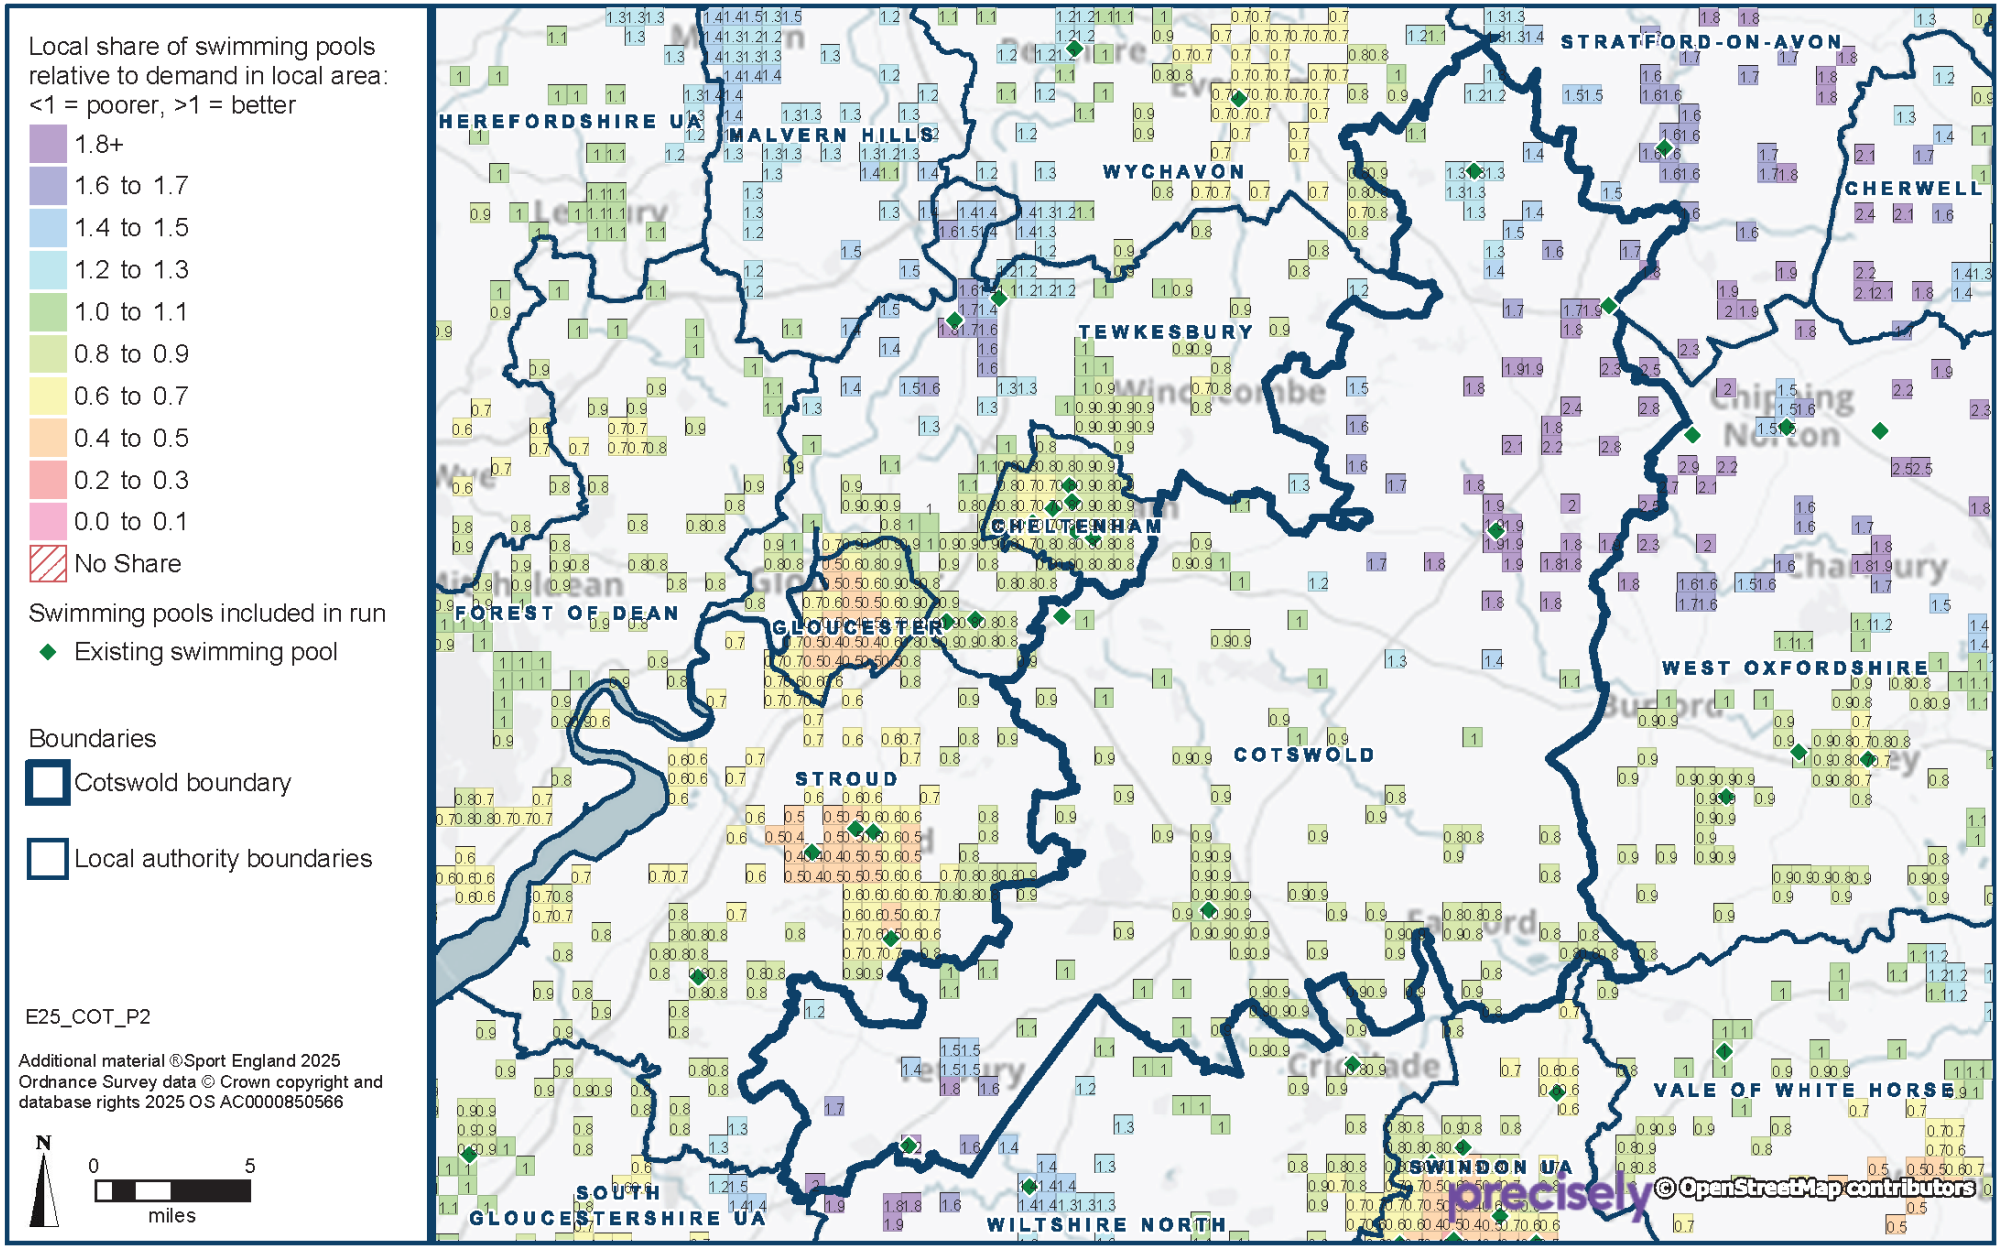
8.13 In 2025 Cotswold's provision is 17 sqm of water per 1,000 population. This is higher than the regional average of 13 sqm of water, and considerably above the national average of 11 sqm of water.

8.14 In 2043 Cotswold's provision decreases to 14 sqm of water per 1,000 population. Cotswold's comparatively better provision to the regional and national averages remains as these decrease to 11 sqm of water and 10 sqm of water respectively.

8.15 In both years Cotswold has the joint second highest provision in the study area with Vale of White Horse. Provision is only slightly below the best provision, which is in Cheltenham at 18 sqm of water per 1,000 population in 2025, and 17 sqm of water in 2043.

8.16 Provision is poorest in Stroud and Swindon at 8 sqm of water per 1,000 population in 2025, and 7 sqm of water in 2043.

Table 8.2: Water Space in sqm per 1,000 Population by Area and Run



Sqm of water per 1,000 population	Run 1	Run 2
Area	2025	2043
Cotswold	**17**	**14**
Cheltenham	18	17
South Gloucestershire	11	10
Stratford-on-Avon	12	9
Stroud	8	7
Swindon	8	7
Tewkesbury	11	9
Vale of White Horse	17	14
West Oxfordshire	14	12
Wiltshire	13	12
Wychavon	9	8
South West Region	**13**	**11**
England	**11**	**10**

8.17 **The findings on water space per 1,000 population are reported because some local authorities like to compare their quantitative provision with others; however, it does not set a standard of provision, and should not be used as such.**

8.18 The supply and demand assessment for swimming pools in Cotswold District Council is based on the findings from the previous six headings analysed in this report.

Map 8.2: Local Share of Swimming Pools in 2043 (Run 2)

APPENDIX 1: FACILITIES EXCLUDED

The audit excludes facilities that are deemed to be either for private use, too small, closed or there is a lack of information, particularly relating to hours of use. The following facilities were deemed to fall under one or more of these categories and therefore excluded from the modelling:

Site	Facility Type	Reason for Exclusion
Calcot Spa	Main	Too Small
Cirencester Open Air Pool	Lido x2	Lido
Hatherop Castle School	Lido	Private Use
Le Spa at Stratton Place	Main	Closed
Northleach Primary School	Lido	Private Use
Rendcomb College	Lido	Lido
SWR Leisure	Lido	Closed

APPENDIX 2: FACILITIES IN NEIGHBOURING LOCAL AUTHORITY AREAS INCLUDED IN THE ASSESSMENT

Site	Provider	Type	Dimensions (m)	Area (sqm)	Year Built	Year Refurb
Cheltenham						
Cheltenham College	Edu. (in-house)	6-lane	25 x 13	325	1996	
CLC Sports Centre	Edu. (3rd party)	6-lane	25 x 13.7	343	1994	
Dean Close School	Edu. (in-house)	4-lane	25 x 10	250	1971	2004
Everlast Gyms	Commercial	4-lane	20 x 10	200	2006	2010
Leisure at Cheltenham	Public	6-lane	33 x 12.8	422	1971	2008
Leisure at Cheltenham	Public	Teaching	23.8 x 9.65	230		
Leisure at Cheltenham	Public	Diving	12.8 x 12.8	164		
St Edward's School	Edu. (in-house)	4-lane	25 x 10	250	1965	2005
South Gloucestershire						
Bradley Stoke Active Lifestyle Centre	Public	6-lane	25 x 13	325	1999	2004
Bradley Stoke Active Lifestyle Centre	Public	Teaching	12 x 8	96		
David Lloyd (Bristol Emersons Green)	Commercial	4-lane	20 x 8	160	2019	
Elm Park Leisure Centre	Public	4-lane	25 x 10	250	1971	2002
Elm Park Leisure Centre	Public	Teaching	10 x 6	60		
Everlast Gyms (Bristol Filton)	Commercial	4-lane	20 x 9	180	2020

APPENDIX 3: MODEL DESCRIPTION, INCLUSION CRITERIA AND MODEL PARAMETERS

Included within this Appendix are the following:

- Model Description
- Facility Inclusion Criteria
- Model Parameters

Model Description

1 Background

1.1 The Facilities Planning Model (FPM) is a computer-based supply/demand model, which has been developed by Edinburgh University in conjunction with sportscotland and Sport England since the 1980s.

1.2 The model is a tool for helping to assess the strategic provision of community sports facilities in an area. It is currently applicable for use in assessing the provision of the following facilities that Sport England holds substantial demand data for:

- sports halls
- swimming pools
- indoor bowls centres
- artificial grass pitches (AGPs)

2 Use of FPM

2.1 The FPM is one of Sport England's principal tools and has been developed as a means for:

- Assessing the requirements for different types of community sports facilities on a local, regional and national scale.
- Helping local authorities to determine an adequate level of sports facility provision to meet their local needs.
- Helping to identify strategic gaps in the provision of sports facilities.
- Comparing alternative options for planned provision, taking account of changes in demand and supply. This includes testing the impact of opening, relocating and closing facilities, and the likely impact of population changes on the need for sports facilities.

2.2 The FPM has been used in the assessment of Lottery funding bids for community facilities and as a principal planning tool to assist local authorities in planning for the provision of community sports facilities.

3 How the Model Works

3.1 In its simplest form, the model seeks to assess whether the capacity of existing facilities for a particular sport is capable of meeting local demand for that sport, considering how far people are prepared to travel to such a facility.

3.2 In order to do this, the model compares the capacity of facilities (supply) within an area against the demand for that facility from the local population, similar to other social gravity models.

3.3 To do this, the FPM converts both demand (in terms of people) and supply (facilities) into a single comparable unit. This unit is 'visits in the weekly peak period'. Once converted, demand and supply can be compared.

3.4 The FPM uses a set of parameters to define how facilities are used and by whom. These parameters are primarily derived from a combination of data, including actual user surveys from a range of sites across the country in areas of good supply, together with participation survey data. These surveys provide core information on the profile of users such as their age and gender, how often they visit, the distance travelled, duration of stay, as well as information on the facilities themselves such as programming, peak times of use and capacity of facilities.

3.5 This survey information is combined with other data sources to provide a set of model parameters for each facility type. The original core user data for halls and pools comes from the National Halls and Pools survey undertaken in 1996. This data previously formed the basis for the National Benchmarking Service. For AGPs, the core data used comes from the user survey of AGPs carried out in 2005/06 jointly with sportscotland.

3.6 User survey data from the National Benchmarking Service and other appropriate sources are used to update the model's parameters on a regular basis. The parameters are set out at the end of the document, and the main data sources analysed are:

- Active Lives:
    - For the adult survey, this data is collected by an online survey or paper questionnaire on behalf of Sport England. Each annual sample includes approximately 175,000 people and covers the full age/gender range. Detailed questions are asked about over 200 separate sport categories in terms of participation and frequency.
    - For the children and young people survey, this data is collected through schools, with up to three mixed ability classes in up to three randomly chosen year groups completing an online survey.
- National Benchmarking Service (now ceased):
    - This was a centre-based survey whose primary purpose was to enable centres to benchmark themselves against other centres. Sample interviews were conducted on site. The number of people surveyed varied by year depending on how many centres took part. Approximately 10,000 swimmers and 3,500 sports hall users were surveyed per year. This data was used for journey

times, establishing proportions of particular activities in different hall types, the duration of activities and the time of activity (peak period).

- Moving Communities Customer Experience Survey:
    - Annual online survey distributed by participating local authorities and operators via email. Email invites are sent to any member or customer on their database who has attended their leisure centre in the last 3 months. The results inform the travel mode that residents use to access facilities.
- Scottish Health:
    - Annual survey of approximately 6,600 people (just under 5,000 adults). This data is primarily used to assess participation, frequency and activity duration.

3.7 Other data is used where available. For example, the following data sources are among those that have been used to cross-check results:

- Children's Participation in Culture and Sport, Scottish Government, 2008
- Young People's Participation in Sport, Sports Council for Wales, 2009
- Health and Social Care Information Centre, Lifestyle Statistics, 2012
- Young People and Sport, Sport England, 2002
- Data from Angus Council, 2013/14
- National Pools and Halls Survey, 1996
    - This survey was used to obtain capacities per sports hall for differing sport types for programming data.

4 Calculating Demand

4.1 Demand is calculated by applying the user information from the parameters, as referred to above, to the population[1]. This produces the number of visits for that facility that will be demanded by the population.

4.2 Depending on the age and gender composition of the population, this will affect the number of visits an area will generate. In order to reflect the different population profiles of the country, the FPM calculates demand based on the smallest census groupings. These are output areas (OAs)[2].

4.3 The use of OAs in the calculation of demand ensures that the FPM is able to reflect and portray differences in demand in areas at the most sensitive level based on available census

[1] For example, it is estimated that 7.72% of 16-24 year old males will demand to use an AGP 1.67 times a week. This calculation is done separately for the 12 age/gender groupings.

[2] Census OAs are the smallest grouping of census population data and provide the population information on which the FPM's demand parameters are applied. A demand figure can then be calculated for each OA based on the population profile. There are over 178,600 OAs in England. An OA has a target value of 125 households per OA.

information. Each OA used is given a demand value in visits in the weekly peak period by the FPM.

5 Calculating Supply Capacity

5.1 A facility's capacity varies depending on the following factors:

- Its size (area of pool or hall, number of pitches or rinks)
- How many hours the facility is available for use by the community in the weekly peak period
- How many visits can be accommodated by the facility at any one time (pools = 1 user/6 sqm, main halls/barns = 8 users/court, activity halls/studios = 15 users/court, AGPs = 28 users/pitch, indoor bowls = 6 users/rink)

5.2 The FPM calculates the maximum number of visits that a facility can accommodate, which gives it a theoretical capacity in visits in the weekly peak period.

5.3 Based on travel time information (see Travel Time section) taken from the user surveys, the FPM then calculates how much demand would be met by the facility, having regard to its capacity and how much demand can travel to the facility. The FPM includes an important feature of spatial interaction. This feature takes account of the location and capacity of all the facilities, having regard to their access and the size of demand, and assesses whether the facilities are in the right place to meet the demand.

5.4 It is important to note that the FPM does not simply add up the total demand within an area and compare that to the total supply within the same area. This approach would not take account of the spatial aspect of supply against demand in a particular area. For example, if an area has a total demand for five facilities and there are currently six facilities within the area, it would be too simplistic to conclude that there is an over-supply of one facility as this approach would not take account of whether the five facilities are in the correct location for local people to use them within that area. It may be that all the facilities are in one part of the local authority area, leaving other areas under-provided. An assessment of this kind would not reflect the true picture of provision. The FPM is able to assess supply and demand within an area based on the needs of the population within that area.

5.5 In making calculations as to supply and demand, visits made to sports facilities are not artificially restricted or calculated by reference to administrative boundaries, such as local authority areas. Users are generally expected to use their closest facility. The FPM reflects this through analysing the location of demand against the location of facilities, allowing for cross-boundary movement of visits. For example, if a facility is on the boundary of a local authority, users will generally be expected to come from the population living close to the facility, but who may be in a neighbouring authority.

6 Calculating the Capacity of Sports Halls – Badminton Court Equivalents

6.1 The capacity of sports halls is calculated in the same way as described above, with each sports hall site having a capacity in visits in the weekly peak period. In order for this capacity to be meaningful, these visits are converted into the equivalent of main hall badminton

courts. This 'court' figure is often mistakenly read as being the same as the number of 'marked courts' at the sports halls in the Active Places data, but it is not the same. There will usually be a difference between this figure and the number of 'marked courts' in Active Places.

6.2 The reason for this is that the badminton court equivalents are of all the main and activity halls' capacities; this is calculated based on hall size (area) and whether it is a main hall or an activity hall. This gives a more accurate reflection of the overall capacity of the halls than simply using the 'marked courts' figure, for two reasons:

- In calculating the capacity of halls, the model uses a different at-one-time parameter for main halls and for activity halls. Activity halls have a greater at-one-time capacity than main halls. Marked courts can sometimes not properly reflect the size of the actual main hall. For example, a hall may be marked out with four courts, when it has space for three courts. As the model uses the 'courts' as a unit of size, it is important that the hall's capacity is included as a 'three-court unit' rather than a 'four-court unit'.
- It is often difficult to visualise how much hall space there is when expressed as visits in the weekly peak period. To make things more meaningful, this capacity is converted back into badminton court equivalents and is noted in the output tables as hall space in courts.

7 Facility Attractiveness – for Halls and Pools Only

7.1 Not all facilities are the same, and users will find certain facilities more attractive to use than others. The model attempts to reflect this by introducing an attractiveness weighting factor, which affects the way visits are distributed between facilities. Attractiveness, however, is very subjective. Currently weightings are only used for sports hall and swimming pool modelling.

7.2 Attractiveness weightings are based on the following:

- Age and refurbishment weighting (pools and halls): The older a facility is, the less attractive it will be to users. It is recognised that this is a general assumption and that there may be examples where older facilities are more attractive than newly built ones due to excellent local management, programming and sports development. Additionally, the date of any significant refurbishment is also included within the weighting factor; however, here attractiveness is set lower than a new build of the same year. It is assumed that a refurbishment that is older than 20 years will have a minimal impact on the facility's attractiveness. The information on year built/refurbished is taken from Active Places. A graduated curve is used to allocate the attractiveness weighting by year. This curve levels off at 70 years old with a 20% weighting. The refurbishment weighting is slightly lower than the new built year equivalent.
- Management and ownership weighting (halls only): Due to the large number of halls being provided by the education sector, an assumption is made that these halls will generally not provide as balanced a programme as halls run by local authorities, trusts, etc, with school halls more likely to be used by teams and groups through block booking. A less balanced programme is assumed to be less attractive to a general

pay-and-play user than a standard local authority leisure centre sports hall with a wider range of activities on offer.

7.3 To reflect this, two weighting curves are used:

- High weighted curve – includes non-education management (third party) and a more balanced programme, therefore more attractive
- Lower weighted curve – includes educational halls managed in-house, therefore less attractive

7.4 Commercial facilities (halls and pools): While there are relatively few sports halls provided by the commercial sector, an additional weighting factor is incorporated within the model to reflect the cost element often associated with commercial facilities. For each population OA, the Indices of Multiple Deprivation (IMD) score is used to limit whether people will use commercial facilities. The assumption is that the higher the IMD score (less affluence), the less likely the population of the OA would choose to go to a commercial facility.

7.5 The English Indices of Deprivation 2019, produced by the Ministry of Housing, Communities and Local Government, measure relative levels of deprivation in 32,844 lower super output areas in England. IMD is an overall relative measure of deprivation constructed by combining seven domains of deprivation according to their relative weights.

8 Used Capacity

8.1 Used capacity refers to how much of a facility's theoretical capacity is being used. At first this can appear to be unrealistically low, with local authority figures being in the 50-60% region. Without any further explanation, it would appear that facilities are half empty. The key point is not to see a facility's theoretical maximum capacity (100%) as being an optimum position. In practice this would mean that a facility would need to be completely full every hour it was open during the peak period. This would be both unrealistic from an operational perspective and undesirable from a user's perspective, as the facility would be completely full.

8.2 For example, a 25m four-lane pool has a theoretical capacity of 2,260 visits per week during a 52.5-hour peak period. Usage of a pool will vary throughout the evening, with some sessions being busier than others through programming, such as an aqua aerobics session between 19:00 and 20:00 and lane swimming between 20:00 and 21:00 (see table below). Other sessions will be quieter, such as between 21:00 and 22:00. This pattern of use would mean a total of 143 swims taking place. However, the pool's maximum theoretical capacity is 264 visits throughout the evening. In this instance the pool's used capacity for the evening would be 54%.

Visits per hour	16:00-17:00	17:00-18:00	18:00-19:00	19:00-20:00	20:00-21:00	21:00-22:00	Total visits for the evening
Theoretical maximum capacity	44	44	44	44	44	44	264
Actual usage	8	30	35	50	15	5	143
% of capacity used	18%	68%	80%	114%	34%	11%	54%

9 Comfort Factor – Halls and Pools

9.1 If the facilities were full to their theoretical capacity, there would simply not be the space to undertake the activity comfortably. In addition, there is a need to take account of a range of activities taking place which have different numbers of users; for example, aqua aerobics will have significantly more participants than lane swimming sessions. Additionally, there may be times and sessions that, while being within the peak period, are less busy and so will have fewer users.

9.2 To account for these factors the notion of a 'comfort factor' is applied within the model. For swimming pools, 70%, and for sports halls, 80%, of their theoretical capacity is considered as indicating where a facility starts to become uncomfortably busy. This should be seen only as a guide to help flag when facilities are becoming busier, rather than as a 'hard threshold'.

9.3 The comfort factor is also used to increase the capacity needed to comfortably meet unmet demand. If this comfort factor is not applied, then any facilities provided will be operating at their maximum theoretical capacity, which is not desirable as previously noted.

9.4 The comfort factor is not applied to AGPs due to the fact they are predominantly used by teams that have a set number of players, therefore, the notion of having a 'less busy' pitch is not applicable.

10 Travel Times

10.1 The model includes three different modes of travel:

- driving
- walking and wheeling
- public transport and cycling

10.2 Car access is also considered. In areas where there is less access to a car, the model reduces the number of visits made by car and increases those made on foot for shorter journeys and public transport for longer journeys.

10.3 Overall, surveys have shown that most visits to swimming pools, sports halls and AGPs are made by driving, with a significant minority of visits to facilities being made on foot.

Facility	Driving	Walking	Public Transport	Cycling
Swimming Pool	74%	18%	4%	4%
Sports Hall	76%	19%	2%	3%
AGP Combined AGP Football AGP Hockey	79% 74% 97%	18% 22% 2%	3% 4% 1%	unknown

10.4 The model includes a distance decay function where the further a user is from a facility, the less likely they will travel. Set out below is the survey data with the percentage of visits made

within each of the travel times. This shows that almost 90% of all visits, both by car and on foot, are made within 20 minutes. Hence, 20 minutes is often used as a rule of thumb for the coverage for sports halls and swimming pools.

Minutes	Swimming Pools		Sport Halls	
	Drive	Walk	Drive	Walk
0-10	56%	53%	54%	55%
11-20	35%	34%	36%	32%
21-30	7%	10%	7%	10%
31-45	2%	2%	2%	3%

10.5 For AGPs, there is a similar pattern to halls and pools, with hockey users observed as travelling slightly further (89% travel up to 30 minutes). Therefore, a 20-minute travel time can also be used for combined and football, and 30 minutes for hockey.

Minutes	AGP Combined		AGP Football		AGP Hockey	
	Drive	Walk	Drive	Walk	Drive	Walk
0-10	28%	38%	30%	32%	21%	60%
10-20	57%	48%	61%	50%	42%	40%
20-40	14%	12%	9%	15%	31%	0%

NOTE: These are approximate figures and should only be used as a guide

10.6 Ordnance Survey's Multi-Modal Network Roads average speed data is used to calculate the off-peak drive times between facilities and the population, observing any one-way and turn restrictions that apply. These travel times have been validated against national survey work, and therefore are based on the actual travel patterns of users.

10.7 The network is also used to calculate walk times along paths and roads, excluding motorways and trunk roads. A standard walking speed of 3 mph is used for all journeys.

10.8 Due to the complexity of public transport timetables, public transport travel times in the model are assumed to be twice as long as driving times.

10.9 A cycling speed of 12 mph is used for roads and shared use cycleways, which is approximately half the average speed of driving in urban areas. A speed of 7.5 mph is used for tracks and off-road travel.

Facility Inclusion Criteria

Swimming Pools

The following inclusion criteria were used for this analysis:

- Include all operational indoor pools available for community use ie, pay-and-play, membership, sports club/community association.
- Exclude all pools not available for community use, ie, private use.
- Exclude all outdoor pools, ie, lidos.
- Exclude all pools where the main pool is less than 20 metres in length, or the area is less than 160 square metres. If the principal pool is a leisure pool with an area less than 200 square metres, then all pools on the site should be excluded.
- For leisure pools, only the area of the water that is swimmable should be included. Water play or splash areas should be excluded from the useable space.
- Include all 'planned', 'under construction', and 'temporarily closed' facilities only where all data is available for inclusion.
- Where opening times are missing, availability is included based on similar facility types.
- Where the year built is missing, assume date 1975[3].

Facilities over the border in Wales and Scotland are included, as supplied by sportscotland and Sport Wales.

[3] Choosing a date in the mid-1970s ensures that the facility is included, while not overestimating its impact within the run.

COTSWOLD
District Council

Cotswold District Local Plan: Swimming Pools, Sports Halls and Playing Pitch Provision – Addendum July 2026

Introduction

Cotswold District Council (hereafter referred to as 'the Council') is reviewing its current provision of swimming pools and sports halls, assessing future demand and the level of provision required to meet the need associated with 17,918 new homes, as set out in the spatial strategy in the Local Plan for the plan period 2026 to 2043.

The Council has commission two separate reports by ORH, on behalf of Sports England, to assess the current provision of swimming pools and sports halls and to understand the projected need in relation to the number of homes proposed in the Local Plan.

- Facilities Planning Model Assessment of Swimming Pool Provision for Cotswold District Council (May 2026)[1]
- Facilities Planning Model Assessment for Sports Halls Provision for Cotswold District Council (May 2026)[2]

Since the preparation of these reports, the spatial strategy for the Cotswold Local Plan has increased the number of homes being delivered across the plan period. Whilst the majority of the key findings in relation to the total supply, available supply and the distribution of provision are still relevant for the purpose of the Local Plan, the outcomes in relation to the identified need up to 2043 for swimming pool and sports hall provision are based on a level of housing delivery that has been superseded.

This addendum seeks to outline the new requirement for swimming pools and sports halls based on the delivery of 17,918 new homes across the plan period to 2043.

The Council has used The Sports Facility Calculator (SFC)[3] to establish its need for Swimming Pools in the District to cover the Local Plan period 2026 up to the year 2043.

National Policy

Paragraph 98 of the National Planning Policy Framework (NPPF) 2024[4] stipulates that "*to provide the social, recreational and cultural facilities and services the community needs, planning policies and decisions should:*

> *a) plan positively for the provision and use of shared spaces, community facilities (such as local shops, meeting places, sports venues, open space, cultural buildings, public houses*

[4] National Planning Policy Framework, page 28, https://assets.publishing.service.gov.uk/media/67aafe8f3b41f783cca46251/NPPF_December_2024.pdf

and places of worship) and other local services to enhance the sustainability of communities and residential environments;

b) take into account and support the delivery of local strategies to improve health, social and cultural well-being for all sections of the community;

c) guard against the unnecessary loss of valued facilities and services, particularly where this would reduce the community's ability to meet its day-to-day needs;

d) ensure that established shops, facilities and services are able to develop and modernise, and are retained for the benefit of the community; and

e) ensure an integrated approach to considering the location of housing, economic uses and community facilities and services."

In addition, Paragraph 103 of the NPPF[5] specifies that "*Planning policies should be based on robust and up-to-date assessments of the need for open space, sport and recreation facilities (including quantitative or qualitative deficits or surpluses) and opportunities for new provision. Information gained from the assessments should be used to determine what open space, sport and recreational provision is needed, which plans should then seek to accommodate*."

This places a requirement on the Council to ensure that sufficient services and facilities (including swimming pools and sports halls) are provided that meet the needs of communities that are based on a robust and up-to-date assessment of the need for open space, sport and recreation facilities (including quantitative and qualitative deficits and surpluses) and opportunities for new provision.

Methodology

The SFC tool has been used to quantify the additional demand for key community sports facilities created by a new population and a new community as part of residential growth.

The SFC uses information on who uses facilities and applies this to the population profile of the local area. This ensures that the calculations are sensitive to the needs of the people who live there. It then turns this estimation of demand (visits per week) into the amount of facilities which are needed to meet the needs of the local community.

Using the SFC, the Council has established that the new housing figures and associated population increase will require:

- 1.7 new swimming pools (358.16 sqm and 6 lanes)
- two new Sports Centres (to provide 8 new courts)

Meeting the need for swimming pools in Cotswold District

The Facilities Planning Modelling Assessment for Swimming Pool Provision (2026) has identified that the need for an additional 1.7 new swimming pools cannot be accommodated at existing sites across the District. This main public swimming pool at Cirencester Leisure Centre currently operates at a maximum peak period (number of operation hours) and therefore has no scope to increase availability and capacity at peak times. The other swimming pools within the District are not publicly owned or operated and therefore also have no scope of expanding capacity.

[5] National Planning Policy Framework, page 30, https://assets.publishing.service.gov.uk/media/67aafe8f3b41f783cca46251/NPPF_December_2024.pdf

The need will therefore be need by the inclusion of the requirement for land to deliver new pools being identified in the Infrastructure Delivery Plan (IDP)[6]. Land for new pools is identified in the Site Development Frameworks and will be delivered later in the plan period by Cotswold District Council Leisure or Sports England.

The location of new swimming pools will be determined by the level of unmet need, which has been identified across the District at the following settlements:

- Fairford
- Cirencester
- Tetbury
- Moreton-in-Marsh
- Northleach

The Council will seek to identify the land necessary to accommodate a new facility in the north and south of District across the plan period.

Meeting the need for sports halls in Cotswold District

The SFC has identified a need for two new Sports Centres across the District. To meet the identified need the Infrastructure Delivery Plan will identify the requirement for land to deliver two new sports centres across the plan period at the strategic sites within the Local Plan.

Community hubs will be used to accommodate health and fitness opportunities for residents and will be provided and built to Sport England standards. Further, local need for sports facilities would be met by utilising the community hubs, which would make accessing fitness facilities easier, especially in rural areas.

To facilitate the delivery of new sports halls and spaces, the Council will also enter into a Community Use Agreement (CUA)[7]. CUAs provide the framework to protect the current supply and any new or replacement educational sports halls and Sport England will advise on the requirements as part of the planning process for any new or replacement sports hall.

Meeting the need for playing pitches within Cotswold District

The Play and Pitch Strategy and Action Plan was published and adopted in June 2023. Since its publication, the PPS has been constantly reviewed as part of Stage E.

Stage E of the Sport England Playing Pitch Strategy (PPS) focuses on the delivery, monitoring, and regular updating of the strategy. It ensures that the action plan developed in Stage D is actively implemented and that the data remains robust and responsive to community needs.

To date three meetings have taken place on the 26/03/2025, 21/10/2025, 21/04/2026. The next meeting will be in October 2026 date to be confirmed.

Meetings are around every 6 months, all NGBs are contacted in between meetings for Action updates for the PPS. Their top priority projects for the year are reported to Sport England.

[6] Infrastructure Delivery Plan (IDP), Prior + Partners, 2026, https://cotswold.gov.uk/planning-and-building/planning-policy/cotswold-district-council-local-plan/

[7] Community Use Agreements, Sports England, https://www.sportengland.org/how-we-can-help/facilities-and-planning/planning-for-sport/community-use-agreements

In order to support supply need in the future to cover the Local Plan 2026 to 2043 the Infrastructure Delivery Plan indicates that 20 new football pitches will be needed across the district and distributed across the district focussed areas of development. The report uses the Sport England's Playing Pitch Calculator[8] as a tool for helping to determine the additional demand for pitches and to estimate the likely developer contribution required linking to sites within the locality.

The calculator uses the current number of teams by sports pitch type contained within the Assessment Report and calculates the percentage within each age group that play that sport. That percentage is then applied to the population growth. The additional teams likely to be generated are then converted into match equivalent sessions and associated pitch requirements in the peak period, with the associated costs (both for providing the pitch/facility and for its life cycle) then given. The calculator splits the requirement into peak time demand for natural turf pitches, training demand for artificial grass pitches, and the number of new changing rooms required.

This estimates that for a 500 dwelling allocation, additional demand for a combined total of 0.65 pitches is required. On the basis of 17,935 homes within the plan period, this is equivalent to a plan wide need for approximately 20 pitches, 15 of which are generated by the new strategic sites. The strategic sites will be required to provide a minimum of 15 new playing pitches in accordance with the following distribution to meet the needs of the new and existing community:

Site Name	**No of pitches**
Steadings southern extension	2
Land south east of Cirencester and south of Preston	2
Land east of Kingshill Lane	1
Land south west of Siddington	1
Land surrounding Down Ampney	2
Land south of Driffield	2
Land north-east of Fairford	1
Land south-west of Kemble	1
Land North and west of Mickleton	1
Land north, east and south of Moreton-in-Marsh	2
Total	**15**

Contributions to increase carrying capacity of existing facilities Local Plan wide need for 20 playing pitches, typologies to be identified at the application stage. The costs will depend on the type of pitch provided. Sport England recommend that contributions should also be secured towards the first ten years of maintenance on new pitches (lifecycle costs), the cost of which is indicated by the Sport England Playing Pitch Calculator, and is a outlined in the Infrastructure Delivery Plan[9].

Chapter 1
Introduction

1.1 LUC has been commissioned to carry out a Habitats Regulations Assessment (HRA) of the emerging new Cotswold Local Plan.

1.2 The purpose of the HRA is to determine whether the Local Plan policies and site allocations are likely to have significant effects on, or adverse effects on the integrity of, any sites designated as Special Protection Areas (SPAs), Special Areas of Conservation (SACs), or Ramsar sites.

1.3 This HRA report sets out the assessment of the policies and site allocations proposed in the Regulation 19 (Reg.19) version of the Local Plan, and will be published for consultation alongside that plan.

Context of the Local Plan Full Review

1.4 The current Local Plan for Cotswold District was adopted in 2018 and covers the period 2011 to 2031.

1.5 In 2020, Cotswold District Council began work on a Partial Update to the Local Plan, with consultation on the Local Plan Partial Update (LPPU) 'Issues and Options' (Reg.18) taking place in 2022.

1.6 The Council is now proceeding with a full review of the Local Plan. The development strategy options were published for Reg.18 consultation in November 2025. Following the Reg.18 consultation, the Council has identified the preferred site allocations, which will be published for Reg.19 consultation in summer 2026. This HRA assesses the Reg.19 Local Plan (which is a full review of the adopted plan).

Previous HRA work

1.7 LUC prepared an HRA Scoping Report for the LPPU in 2022, to accompany the Issues and Options consultation. Natural England broadly agreed with the Habitats Sites and impact pathways scoped in and provided advice on additional issues to pick up in later iterations of the HRA (see Appendix D for how these have been addressed).

1.8 In December 2023, LUC prepared a Scoping Report covering letter to accompany the consultation on the development needs up to 2041 and options

for how these may be delivered, as well as the partial update to policies. The letter acknowledged differences between the LPPU and (at the time parallel) Local Plan full review (e.g. extension of plan period) and provided an update on work undertaken since the HRA Scoping Report was prepared (e.g. to recreation mitigation strategies for some Habitats Sites). The covering letter stated that the proposed HRA methodology would remain valid for the Local Plan full review.

1.9 The HRA Report (October 2025) that accompanied the Reg.18 consultation was a high-level screening of the development strategy options, which provided an indication of the impact pathways likely to be most relevant to each of the five options. This HRA builds upon the previous work and takes into account comments received on the Reg.18 HRA Report and subsequent discussions with Natural England (see Appendix D).

The requirement to undertake Habitats Regulations Assessment of development plans

1.10 The requirement to undertake HRA of development plans was confirmed by the amendments to the Habitats Regulations published for England and Wales in 2007 **[See reference 1]**; which is now known as the Habitats Regulations 2017 (as amended) **[See reference 2]**. When preparing the Local Plan, Cotswold District Council therefore required by law to carry out an HRA. The Council can commission consultants to undertake HRA work on its behalf, and this (the work documented in this report) is then reported to and considered by the Council as the 'competent authority'. It will consider this work and would usually only progress the Local Plan if they consider that the plan will not adversely affect the integrity **[See reference 3]** of any of the 'Habitats Sites', as defined below (the exception to this would be where 'imperative reasons of overriding public interest' can be demonstrated). The requirement for authorities to comply with the Habitats Regulations when preparing a development plan is also noted in the Government's online Planning Practice Guidance (PPG) **[See reference 4]**.

1.11 HRA refers to the assessment of the potential effects of a development plan on one or more sites afforded the highest level of protection in the UK: Special Protected Areas (SPAs) and Special Areas of Conservation (SACs). These were classified under European Union (EU) legislation, but since 1 January 2021, are protected in the UK by the Habitats Regulations 2017 (as amended) **[See reference 5]**. Although the EU Directives from which the UK's Habitats Regulations originally derived are no longer binding, the Regulations

still make reference to the lists of habitats and species that the sites were designated for, which are listed in annexes to the EU Directives:

- SACs are designated for particular habitat types (specified in Annex 1 of the EU Habitats Directive **[See reference** 6**]**) and species (Annex II). The listed habitat types and species (excluding birds) are those considered to be most in need of conservation at a European level. Designation of SACs also has regard to the threats of degradation or destruction to which the sites are exposed and, before EU exit day, to the coherence of the 'Natura 2000' network of 'European sites'. After EU exit day, regard is had to the importance of such sites for the coherence of the UK's 'National Site Network'.
- SPAs are classified for rare and vulnerable birds (Annex I of the EU Birds Directive **[See reference** 7**]**), and for regularly occurring migratory species not listed in Annex I.

1.12 The term 'European Sites' was previously commonly used in HRA to refer to 'Natura 2000' sites **[See reference** 8**]** and Ramsar sites (international designated under the Ramsar Convention). However, a Government Policy Paper **[See reference** 9**]** on changes to the Habitats Regulations 2017 post-Brexit states that:

- Any references to Natura 2000 in the 2017 Regulations and in guidance now refer to the new 'National Site Network';
- The National Site Network includes existing SACs and SPAs; and new SACs and SPAs designated under these Regulations; and
- Designated Wetlands of International Importance (known as Ramsar sites) do not form part of the national site network. Many Ramsar sites overlap with SACs and SPAs and may be designated for the same or different species and habitats.

1.13 Although Ramsar sites do not form part of the new National Site Network, Government guidance **[See reference** 10**]** states that:

> Any proposals affecting the following sites would also require an HRA because these are protected by government policy:
>
> - Proposed SACs
> - Potential SPAs
> - Ramsar sites – wetlands of international importance (both listed and proposed)

- Areas secured as sites compensating for damage to a European site."

1.14 Furthermore, the NPPF **[See reference** 11**]** and practice guidance **[See reference** 12**]** currently state that competent authorities responsible for carrying out HRA should treat Ramsar sites in the same way as SACs and SPAs. The legislative requirement for HRA does not apply to other nationally designated wildlife sites such as Sites of Special Scientific Interest or National Nature Reserves.

1.15 For simplicity, and in line with common usage, this report uses the term 'Habitats Site' to refer to all types of designated site within the 'National Site Network' for which Government guidance **[See reference** 13**]** requires an HRA.

1.16 The overall purpose of an HRA is to conclude whether or not a proposal or policy, or a whole development plan, would adversely affect the integrity of the Habitats Site in question. This is judged in terms of the implications of the plan for a site's 'qualifying features' (i.e. those Annex I habitats, Annex II species, and Annex I bird populations for which it has been designated). Significantly, HRA is based on the precautionary principle. Where uncertainty or doubt remains, an adverse effect should be assumed.

Structure of this report

1.17 This chapter (Chapter 1) has introduced the requirement to undertake HRA of the Cotswold Local Plan. The remainder of the report is structured as follows:

- Chapter 2 presents the aspects of the Reg.19 Local Plan that are relevant to this HRA.
- Chapter 3 describes the HRA methodology, which takes into account the requirements of the Habitats Regulations and relevant case law.
- Chapter 4 identifies the Habitats Sites requiring consideration in the HRA.
- Chapter 5 sets out the HRA Screening of the Local Plan policies and site allocations.
- Chapter 6 presents the Appropriate Assessment, for the impact pathways that could not be screened out.
- Chapter 7 summarises the HRA conclusions and describes the next steps to be undertaken.

1.18 The following appendices supplement the information provided in the report chapters:

- Appendix A: details of the Habitats Sites considered in this HRA.
- Appendix B: site allocations assessed in the HRA.
- Appendix C: details of the HRA screening of each policy and site allocation.
- Appendix D: record of consultation and LUC responses.
- Appendix E: an assessment of the potential for site allocations to be functionally linked to the Severn Estuary.
- Appendix F: Air quality assessment.

Chapter 2
Cotswold Local Plan

2.1 This chapter summarises the contents of the Draft (Regulation 19) Cotswold District Local Plan (June 2026), which is the subject of this report. The Plan sets out policies and proposals to meet the challenges facing the area over the period 2026-2043. The Regulation 19 Local Plan supersedes the earlier Regulation 18 draft, incorporating consultation feedback and presenting the final proposed plan for submission and examination.

2.2 The Local Plan has been prepared taking account of the National Planning Policy Framework (NPPF) and other relevant national policy and guidance, alongside an evolving evidence base.

Vision

2.3 The Draft Local Plan presents a Spatial Vision for Cotswold District by 2043 as follows:

Spatial Vision

By 2043, Cotswold District will be a resilient, inclusive, and forward-looking rural district that has responded to the climate crisis and ecological emergency, conserved and enhanced the Cotswolds National Landscape, delivered sustainable communities, and enabled a vibrant, low-carbon economy. Development will have been guided by a Spatial Strategy that prioritises environmental stewardship, social equity, and economic vitality, while respecting the District's unique landscape, heritage, and character. The roles of the District's settlements will be reinforced, with Cirencester continuing to function as the principal centre, supported by a network of market towns and villages that serve their rural hinterlands.

The Local Plan will have delivered a diverse range of housing, including a significant increase in socially rented smaller and more and affordable homes, enabling residents of all ages and backgrounds to live securely and sustainably. This will include homes that respond to the needs of an ageing population, support younger people and key workers to remain in the District, and provide a mix of sizes and tenures that improve affordability and maintain a balanced community. New development sites will have matured into thriving communities, offering high-quality homes, employment

opportunities, and essential services, all supported by integrated infrastructure and sustainable transport networks.

The District will have transitioned to zero-carbon development, with new buildings and infrastructure designed to minimise energy and water use and maximise renewable energy generation. Biodiversity Net Gain will be embedded across all larger development, contributing to a richer natural environment and improved ecological resilience. Water resources will be carefully managed, with development responding to water stress, flood risk and the need to protect and enhance water quality.

The Local Plan will have helped to reduce transport emissions through investment in active travel infrastructure, public transport, and strategic growth focused around transport nodes and ensuring local services and facilities are close enough to access by walking, wheeling or cycling, and/or other sustainable transport modes Communities will be healthier, more connected, and better supported by local services, green spaces, and digital infrastructure.

Cotswold District will continue to be 'Green to the Core,' with planning decisions consistently reflecting the long-term interests of people, place, and planet.

Strategic objectives

2.4 The Vision is supported by 6 Strategic Objectives. The Strategic Objectives set out in the Draft Local Plan are:

- SO1: Ensure infrastructure and services support sustainable communities
- SO2: Respond to the climate crisis through adaptation and mitigation
- SO3: Conserve and enhance the natural, built, and historic environment
- SO4: Deliver inclusive, healthy, and affordable housing
- SO5: Enable a vibrant, low-carbon local economy
- SO6: Promote sustainable transport use and connectivity

Spatial strategy

2.5 The Spatial Strategy (below) is underpinned by seven Core policies:

- Core Policy 1: Addressing Climate Change
- Core Policy 2: Meeting Housing Needs in Cotswold District: Strategic Sites
- Core Policy 2a: Stepped Housing Trajectory
- Core Policy 3: Meeting Housing Needs in Cotswold District: Non-Strategic Sites
- Core Policy 4: Settlement Hierarchy
- Core Policy 5: Meeting Business and Employment Needs in Cotswold District
- Core Policy 6: Infrastructure Delivery

2.6 The Draft Local Plan also sets out three Area Strategies to support the appropriate development of different parts of the district, which are set out in Chapters 5-7 of the Draft Plan. The Area Strategies are as follows:

- Cirencester and Surrounding Villages Area Strategy
- South Cotswold Area Strategy
- North Cotswold Area Strategy

2.7 District-wide policies are set out in Chapters 8-14 of the Draft Local Plan and cover Cotswold as a whole. These policies support the Spatial Strategy and Area Strategies, to deliver the Spatial Vision and Strategic Objectives.

Cotswold Local Plan 2026 – 2043: Spatial Strategy

Cirencester and Surrounding Villages - Strategy Area

- Cirencester is identified as the District's Main Settlement to reflect its status as the largest town within the District, where the majority of services and facilities are provided, along with the widest range of retail. It serves a wide hinterland of surrounding villages that rely upon it for day-to-day needs such as for shopping and leisure.
- Growth through strategic extensions in Cirencester will complement the existing settlement, forming high-quality sustainable development that provides appropriate services and facilities; with strong active travel connections linking the new neighbourhoods to Cirencester Town Centre, local schools, the National Cycle Network, and wider footpath routes. Sustainable travel connections will also link to nearby Kemble

Railway Station, which will be strengthened through careful infrastructure planning.

- growth through strategic extensions in and near the settlements of Siddington and Preston will be designed so the settlements retain their distinct identities separate from Cirencester while at the same time creating strong active travel connections between the development, Cirencester Town Centre and other nearby new developments in the South Cotswold Strategy area, and
- a new secondary school will be provided, covering both the need of new development in the Cirencester and Surrounding Villages Strategy Area as well as the need arising from development in the surrounding South Cotswold Strategy Area.

South Cotswold - Strategy Area

- four Strategic Site Allocations at Down Ampney, Fairford, Kemble and a new settlement south of Driffield form the basis of long-term growth in the Strategy Area, supported by 15 non-strategic site allocations across other towns and villages.
- growth at Down Ampney, Fairford, and Kemble will deliver well-planned, connected extensions that provide new homes, community infrastructure, and strong active travel links to existing settlements and key destinations, including Kemble Station.
- the new settlement to the south of Driffield will provide a sustainable new community of strategic scale, delivering homes, employment land, community facilities, transport connections and a comprehensive network of green and blue infrastructure.
- 12 non-strategic smaller-scale allocations across other settlements will support rural communities, while protecting and enhancing the area's historic environment, biodiversity and key assets including the Cotswold Lakes and River Thames corridors
- Tetbury, Fairford and Lechlade are recognised for their important role as the main service centres providing a wide range of services, facilities and employment opportunities for surrounding communities. Kemble is also recognised for its distinctive strategic function due to its railway station on the Swindon–Gloucester (Golden Valley) line, and
- it is especially important that growth in South Cotswold is high quality, sustainable and sensitive to landscape and environmental matters so

that it responds sensitively to the Cotswolds National Landscape and Special Landscape Areas, and the area's strong rural character.

North Cotswold - Strategy Area

- two Strategic Site Allocations in Moreton-in-Marsh and Mickleton form the basis of long-term growth in the Strategy Area. A further 16 non-strategic smaller scale site allocations are spread across other towns and villages.
- it is important that growth within these settlements is high quality and sustainable, but also supports the delivery of new services, facilities and infrastructure, including green and blue infrastructure to benefit the existing communities as and new residents
- Moreton-in-Marsh is recognised as an important settlement due to the role it plays within Cotswold District as the third largest settlement with one of only two railway stations in the District
- growth in Moreton-in-Marsh will complement the existing settlement, forming high-quality sustainable development, provide appropriate services and facilities with strong active travel connections linking the new neighbourhoods to the town centre (including providing for a new street through the development), the National Cycle Network, wider footpath routes, primary schools (existing and new) and a new secondary school. Growth should consider the Cotswolds National Landscape and Special Landscape Areas
- growth in Mickleton will reflect local character, and landscape context , supporting high quality place making for both new and existing residents and creating safe, direct and attractive walking and cycling routes linking the site to Mickleton village centre, schools, services and the surrounding countryside (including nearby Honeybourne Railway Station), and
- development in Mickleton will also establish a strong and enduring western edge to Mickleton, with development contained by a substantial landscape framework. The setting of the Cotswolds National Landscape and the adjoining Special Landscape Area will be safeguarded through generous buffers, sensitive layout, green and blue infrastructure and appropriate density.

Policies

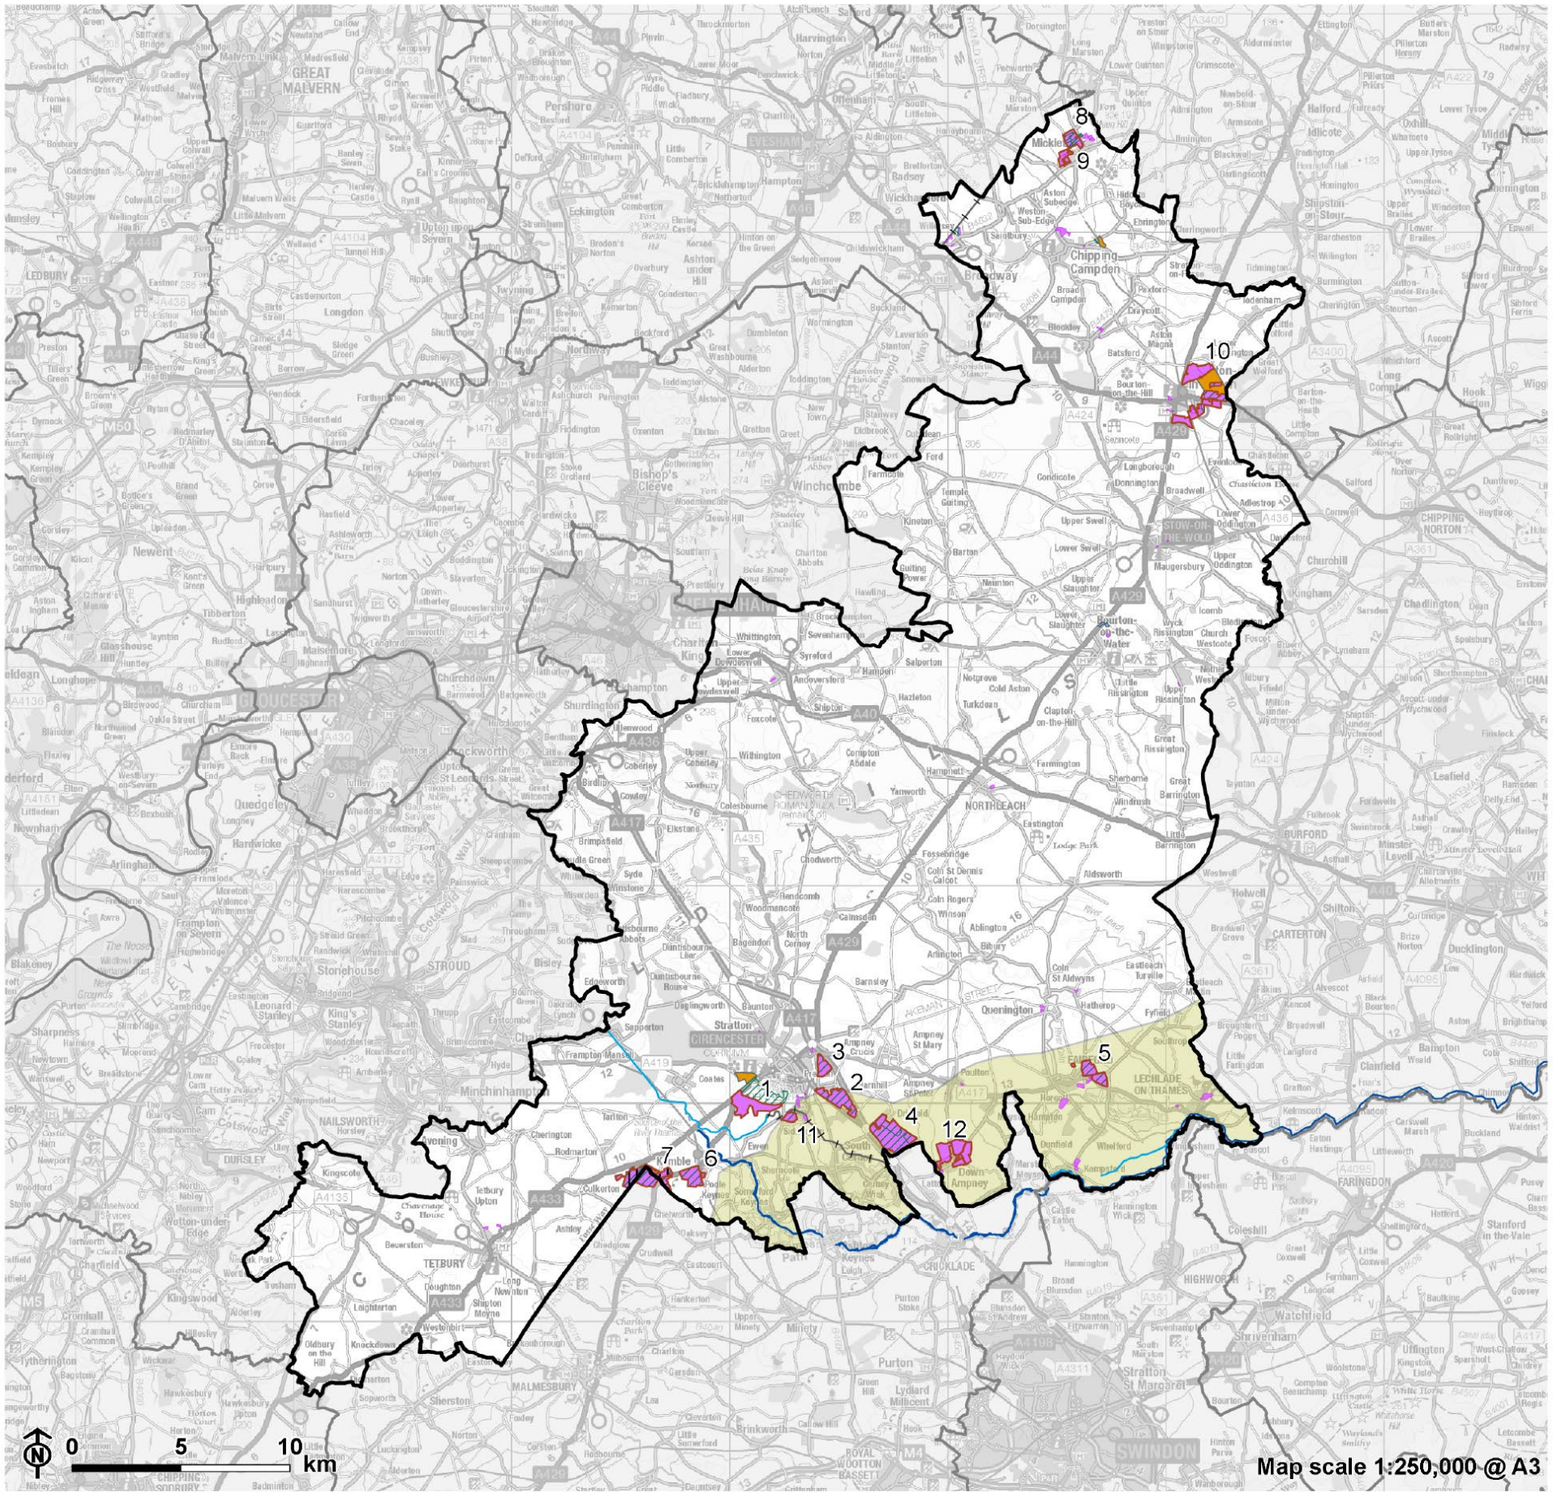
2.8 In addition to Core Policies 1-6 referenced above, the Draft Local Plan contains the following policies, set out in sections as below. Core Policies 7-22 relate to the three Area Strategies.

- Cirencester and Surrounding Villages Area Strategy (five policies);
- South Cotswold Area Strategy (seven policies);
- North Cotswold Area Strategy (seven policies);
- Sustainable Construction and Renewable Energy (seven policies);
- Transport (eight policies);
- Housing (ten policies);
- Economy, Retail and Tourism (eleven policies);
- Historic Environment (seven policies);
- Natural Environment (ten policies);
- Building Healthy and Sustainable Communities (seven policies); and
- Monitoring and Implementation (one policy).

Site allocations

2.9 The Local Plan site allocations are shown in **Figure 2.1**. **Appendix B** provides a full list of site allocations assessed in the HRA.

Residential



2.10 Core Policy 2 sets out that the housing requirement for the Cotswold District is for 17,918 homes to be delivered in the Plan period between 2026 and 2043. The Plan makes provision for at least 18,911 dwellings by 2043.

2.11 Around11,302 dwellings will be delivered through ten strategic allocations and one saved strategic allocation from the previous Local Plan 2011-2031. A further 1,468 dwellings will be delivered through non-strategic allocations (addressed in Core Policy 3). Additional dwellings will also be delivered through Neighbourhood Development Plans or the Development Management Process.

Employment

2.12 Core Policy 5 establishes that to meet the land requirement of 10.4 ha for office and R&R development, and 39.2 ha for industrial development over the Plan period (2026 to 2043), a further 29 ha is needed beyond known completions and commitments.

2.13 The Plan identifies 36.9 ha for future development across 12 strategic employment allocations.

Chapter 3
Approach to HRA

3.1 This chapter describes the approach that has been taken to the HRA of the Local Plan.

Stages of HRA

3.2 The HRA of development plans is undertaken in stages (as described below) and should conclude whether or not a proposal would adversely affect the integrity of the Habitats Site(s) in question.

3.3 The outputs are reported to and considered by the Council, as the competent authority, before adopting the Plan.

3.4 The HRA also requires close working with Natural England as the statutory nature conservation body **[See reference** 14**]** in order to obtain the necessary information, agree the process, outcomes and mitigation proposals. Non-statutory consultees may also be in a strong position to provide advice and information throughout the process, for example, the Environment Agency, which is required to undertake HRA for its existing licences and future licensing of activities. A record of consultation is provided in Appendix D.

Requirements of the Habitats Regulations

3.5 In assessing the effects of a development plan in accordance with Regulation 105 of the Conservation of Habitats and Species Regulations 2017 (as amended) (the 'Habitats Regulations'), there are potentially two tests to be applied by the competent authority: a 'Significance Test' followed, if necessary, by an Appropriate Assessment which would inform the 'Integrity Test'. The relevant sequence of questions is as follows:

- Step 1: Under Reg. 105(1)(b), consider whether the plan is directly connected with or necessary to the management of the sites. If not, proceed to Step 2.
- Step 2: Under Reg. 105(1)(a), consider whether the plan is likely to have a significant effect on a Habitats Site, either alone or in combination with other plans or projects (the 'Significance Test'). If yes, proceed to Step 3.

3.6 [Steps 1 and 2 are undertaken as part of Stage 1: HRA Screening.]

- Step 3: Under Reg. 105(1), make an Appropriate Assessment of the implications for the Habitats Site in view of its current conservation objectives (the 'Integrity Test'). In so doing, it is mandatory under Reg. 105(2) to consult Natural England, and optional under Reg. 105(3) to take the opinion of the general public.

3.7 [This step is undertaken during Stage 2: Appropriate Assessment.]

- Step 4: In accordance with Reg. 105(4), but subject to Reg. 107, give effect to the land use plan only after having ascertained that the plan would not adversely affect the integrity of a Habitats Site.

3.8 [This step follows Stage 2 where a finding of 'no adverse effect' is concluded. If it cannot be, it proceeds to Step 5 as part of Stage 3 of the HRA process].

- Step 5: Under Reg. 107, if Step 4 is unable to rule out adverse effects on the integrity of a Habitats Site and no alternative solutions exist then the competent authority may nevertheless agree to the plan or project if it must be carried out for 'imperative reasons of overriding public interest' (IROPI).

3.9 [This step is undertaken during Stage 3: Assessment where no alternatives exist, and adverse impacts remain taking into account mitigation].

Typical stages

3.10 The following sections summarise the stages and associated tasks and outcomes typically involved in carrying out a full HRA of a development plan, based on various guidance documents **[See reference** 15**]** **[See reference** 16**]** **[See reference** 17**]**. This report presents the outputs of the tasks outlined below under Stage 1: HRA Screening and Stage 2: Appropriate Assessment.

Stage 1: HRA Screening

3.11 Task:

- Description of the development plan and confirmation that it is not directly connected with or necessary to the management of Habitats Sites.
- Identification of potentially affected Habitats Sites and their conservation objectives **[See reference** 18**]**.

- Assessment of likely significant effects of the development plan alone or in combination with other plans and projects (without consideration of avoidance or reduction ('mitigation') measures) **[See reference** 19**]**.

3.12 Outcome:

- Where effects are unlikely, prepare a 'finding of no significant effect report'.
- Where effects judged likely, or lack of information to prove otherwise, proceed to Stage 2.

Stage 2: Appropriate Assessment (where Stage 1 does not rule out likely significant effects)

3.13 Task:

- Information gathering (development plan and Habitats Sites) **[See reference** 20**]**.
- Impact prediction.
- Evaluation of development plan impacts in view of conservation objectives of Habitats Sites.
- Where impacts are considered to directly or indirectly affect qualifying features of Habitats Sites, identify how these effects will be avoided or reduced ('mitigation').

3.14 Outcome:

- Appropriate assessment report describing the plan, Habitats Site baseline conditions, the adverse effects of the plan on the Habitats Site, how these effects will be avoided or reduced, including the mechanisms and timescale for these mitigation measures.
- If effects remain after all alternatives and mitigation measures have been considered proceed to Stage 3.

Stage 3: Assessment where no alternatives exist and adverse impacts remain taking into account mitigation

3.15 Task:

- Identify 'imperative reasons of overriding public interest' (IROPI).

- Demonstrate no alternatives exist.
- Identify potential compensatory measures.

3.16 Outcome:

- This stage should be avoided if at all possible. The test of IROPI and the requirements for compensation are extremely onerous.

3.17 It is normally anticipated that an emphasis on Stages 1 and 2 of this process will, through a series of iterations, help ensure that potential adverse effects are identified and eliminated through the inclusion of mitigation measures designed to avoid or reduce effects. The need to consider alternatives could imply more onerous changes to a plan document. It is generally understood that so called 'imperative reasons of overriding public interest' (IROPI) are likely to be justified only very occasionally and would involve engagement with the Government.

Case law

3.18 This HRA has been prepared in accordance with relevant case law, including most notably the *'People over Wind'* and *'Holohan'* rulings from the Court of Justice for the European Union (CJEU).

3.19 The *People over Wind, Peter Sweetman v Coillte Teoranta* (April 2018) judgment ruled that Article 6(3) of the Habitats Directive should be interpreted as meaning that mitigation measures should be assessed as part of an Appropriate Assessment and should not be taken into account at the Screening stage. The precise wording of the ruling is as follows:

> "Article 6(3) …….must be interpreted as meaning that, in order to determine whether it is necessary to carry out, subsequently, an appropriate assessment of the implications, for a site concerned, of a plan or project, it is not appropriate, at the screening stage, to take account of measures intended to avoid or reduce the harmful effects of the plan or project on that site."

3.20 In light of the above, the HRA Screening stage does not rely upon avoidance or mitigation measures to draw conclusions as to whether the Local Plan could result in likely significant effects on Habitats Sites, with any such measures being considered at the Appropriate Assessment stage as relevant.

3.21 This HRA is also be undertaken in line with the *Holohan v An Bord Pleanala* (November 2018) judgment which stated that:

> "Article 6(3) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora must be interpreted as meaning that an 'appropriate assessment' must, on the one hand, catalogue the entirety of habitat types and species for which a site is protected, and, on the other, identify and examine both the implications of the proposed project for the species present on that site, and for which that site has not been listed, and the implications for habitat types and species to be found outside the boundaries of that site, provided that those implications are liable to affect the conservation objectives of the site."

3.22 In undertaking HRA, LUC considers the potential for effects on species and habitats, including those not listed as qualifying features, to result in secondary effects upon the qualifying features of Habitats Sites, including the potential for complex interactions and dependencies. In addition, the potential for offsite impacts, such as through impacts to functionally linked land, and or species and habitats located beyond the boundaries of Habitats Sites, but which may be important in supporting the ecological processes of the qualifying features, is considered.

3.23 Similarly, effects on both qualifying and supporting habitats and species on functionally linked land (FLL) or habitat are considered, in line with the High Court judgment in RSPB and others v Secretary of State and London Ashford Airport Ltd [2014 EWHC 1523 Admin] (paragraph 27), which stated that:

> "There is no authority on the significance of the non-statutory status of the FLL. However, the fact that the FLL was not within a protected site does not mean that the effect which a deterioration in its quality or function could have on a protected site is to be ignored. The indirect effect was still protected. Although the question of its legal status was mooted, I am satisfied …. that while no particular legal status attaches to FLL, the fact that land is functionally linked to protected land means that the indirectly adverse effects on a protected site, produced by effects on FLL, are scrutinised in the same legal framework just as are the direct effects of acts carried out on the protected site itself. That is the only sensible and purposive approach where a species or effect is not confined by a line on a map or boundary fence. This is particularly important where the boundaries of designated sites are drawn tightly as may be the UK practice".

3.24 In addition to this, the HRA takes into consideration the *'Wealden'* judgment from the CJEU.

3.25 Wealden District Council v Secretary of State for Communities and Local Government, Lewes District Council and South Downs National Park Authority (2017) ruled that it was not appropriate to scope out the need for a detailed assessment for an individual plan or project based on the annual average daily traffic (AADT) figures detailed in the Design Manual for Roads and Bridges or the critical loads used by Defra or Environmental Agency without considering the in-combination impacts with other plans and projects.

3.26 In light of this judgment, HRA therefore considers traffic growth based on the effects of development from a development plan in combination with other drivers of growth such as development proposed in neighbouring boroughs and demographic change.

3.27 The HRA also takes into account the *Grace and Sweetman* (July 2018) judgment from the CJEU which stated that:

"there is a distinction to be drawn between protective measures forming part of a project and intended to avoid or reduce any direct adverse effects that may be caused by the project in order to ensure that the project does not adversely affect the integrity of the area, which are covered by Article 6(3), and measures which, in accordance with Article 6(4), are aimed at compensating for the negative effects of the project on a protected area and cannot be taken into account in the assessment of the implications of the project."

"As a general rule, any positive effects of the future creation of a new habitat, which is aimed at compensating for the loss of area and quality of that habitat type in a protected area, are highly difficult to forecast with any degree of certainty or will be visible only in the future."

"A mitigation strategy may only be taken into account at AA (a.6(3)) where the competent authority is "sufficiently certain that a measure will make an effective contribution to avoiding harm, guaranteeing beyond all reasonable doubt that the project will not adversely affect the integrity of the area."

> "Otherwise it falls to be considered to be a compensatory measure to be considered under a.6(4) only where there are: 'imperative reasons of overriding public interest'"

3.28 The Appropriate Assessment of the Local Plan therefore only considers the existence of measures to avoid or reduce its direct adverse effects (mitigation) if the expected benefits of those measures are beyond reasonable doubt at the time of the assessment.

Screening methodology

3.29 HRA Screening of the Local Plan has been undertaken in line with current available guidance and seeks to meet the requirements of the Habitats Regulations.

3.30 The purpose of the Screening stage is to:

- Identify all aspects of the plan which would have no effect on a Habitats Site, so that that they can be eliminated from further consideration in respect of this and other plans.
- Identify all aspects of the plan which would not be likely to have a significant effect on a Habitats Site (i.e. would have some effect, because of links/connectivity, but which are not significant), either alone or in combination with other aspects of the same plan or other plans or projects, which therefore do not require Appropriate Assessment.
- Identify those aspects of the plan where it is not possible to rule out the risk of significant effects on a Habitats Site, either alone or in combination with other plans or projects. This provides a clear scope for the parts of the plan that will require appropriate assessment.

3.31 A risk-based approach, involving the application of the precautionary principle, has been adopted in the assessment, such that a conclusion of 'no significant effect' is only reached where it is considered unlikely, based on current knowledge and the information available, that a policy or site allocation would have a significant effect on a Habitats Site.

3.32 Screening assessment considers the potential for likely significant effects resulting from each policy and site allocation, without taking mitigation (e.g. embedded in policy) into account, in accordance with the 'People over Wind' judgment.

3.33 For some types of impacts, the potential for likely significant effects can been determined on a proximity basis, using GIS data to determine the proximity of potential development locations to the Habitats Sites that are the subject of the assessment. However, there are many uncertainties associated with using set distances as there are very few standards available as a guide to how far impacts will travel. Therefore, where assumptions have been made or where additional information has been utilised to determine whether the Local Plan is likely to have a significant effect, these are set out in the HRA report.

3.34 Chapter 5 sets out the screening of the Local Plan policies and site allocations, with further detail in **Appendix C**.

Potential impacts of the Local Plan on Habitats Sites

3.35 In our experience of HRA of Local Plans, and based on previous statutory consultee comments on HRAs undertaken elsewhere, the type of development (and related activities) that are permitted by Local Plans have the potential to result in the following broad types of impacts that could affect Habitats Sites:

- **Physical loss of or damage to habitats** e.g. from development or activities within the Habitats Sites themselves or at functionally-linked sites;
- **Non-physical disturbance** e.g. noise, vibration or light from construction or development in close proximity to sensitive species;
- **Air pollution** e.g. from dust, or changes in traffic volumes on roads close to sensitive habitats;
- **Recreation pressure and urban edge effects** e.g. dog walking, cycling, trampling, littering, fire, or predation by pets; and
- **Changes in water quality or quantity** e.g. direct pollution from run-off or accidental spills, changes in flow caused by abstraction, or increase nutrient loading from wastewater treatment.

3.36 For each of the Local Plan policies and site allocations, consideration is given to the type of development or activity the policy could result in, impacts that could arise from that type of development or activity, and then whether there is an impact pathway to any Habitats Sites sensitive to that impact.

3.37 Further consideration of the types of impact that could be relevant to the Local Plan and impact pathways to Habitats Sites is provided in **Chapter 5**.

Identification of Habitats Sites which may be affected by the Local Plan

3.38 To begin the search of Habitats Sites that could potentially be affected by the Local Plan, it is established practice in HRAs to consider Habitats Sites within the local planning authority area covered by a plan, and also within a buffer distance from the boundary of the plan area.

3.39 A distance of 15km from the Local Plan area boundary has been used as a starting point to identify Habitats Sites that could be affected by impacts relating to the Local Plan. The use of this distance presents a precautionary approach to the Screening assessment; however, consideration is also given to Habitats Sites beyond this distance that may be functionally connected to the plan area, for example through hydrological pathways.

3.40 Detailed information about each Habitats Site screened into the HRA is provided in **Appendix A**, described with reference to Standard Data Forms, for the SPAs and SACs, Information Sheets for the Ramsar sites **[See reference 21]**, and Natural England's Site Improvement Plans **[See reference 22]**. Natural England's conservation objectives **[See reference 23]** and any supplementary advice on conserving and restoring site features for the SPAs and SACs have also been reviewed. A summary of relevant information about those Habitats Sites within 15 km of the district's boundary and those with connectivity to the plan area (for example via river systems); and sites which may have functionally linked habitats is provided in **Chapter 4**.

Functionally linked habitats

3.41 The assessment also takes into account areas that may be functionally linked to the Habitats Sites. The term 'functional linkage' can be used to refer to the role or 'function' that land or other habitats beyond the boundary of a Habitats Site might fulfil in supporting the species populations for which the site was designated or classified. Such an area is therefore 'linked' to the site in question because it provides a (potentially important) role in maintaining or restoring a protected population at favourable conservation status.

3.42 While the boundary of a Habitats Site will usually be drawn to include key supporting habitat for a qualifying species, this cannot always be the case where the population for which a site is designated or classified is particularly mobile. Individuals of the population will not necessarily remain in the site all the time. Sometimes, the mobility of qualifying species is considerable and may extend so far from the key habitat that forms the Habitats Site that it would be

entirely impractical to attempt to designate or classify all of the land or sea that may conceivably be used by the species. HRA therefore considers whether any qualifying species of nearby (or linked) Habitats Sites make use of functionally linked habitats, and the impacts that could affect those habitats.

Assessment of 'likely significant effect'

3.43 As required under Regulation 105 of The Conservation of Habitats and Species Regulations 2017 (SI 2017/1012), as amended by The Conservation of Habitats and Species (Amendment) (EU Exit) Regulations 2019 (SI 2019/579), an assessment has been undertaken of the 'likely significant effects' of the policy approaches set out within the emerging Local Plan. The assessment has been undertaken to identify which policies would be likely to have a significant effect on Habitats Sites in Local Plan area (+15km). This assessment will need to be repeated with each HRA iteration of the Local Plan.

3.44 A risk-based approach involving the application of the precautionary principle has been adopted in the assessment, such that a conclusion of 'no significant effect' will only be reached where it is considered very unlikely, based on current knowledge and the information available, that a proposal in the Local Plan would have a significant effect on the integrity of a Habitats Site.

Interpretation of 'likely significant effect'

3.45 Relevant case law helps to interpret when effects should be considered as a Likely Significant Effect (LSE), when carrying out HRA of a development plan.

3.46 In the Waddenzee case **[See reference** 24**]**, the European Court of Justice ruled on the interpretation of Article 6(3) of the Habitats Directive (translated into Reg. 102 in the Habitats Regulations), including that:

- An effect should be considered 'likely', "if it cannot be excluded, on the basis of objective information, that it will have a significant effect on the site" (para 44);
- An effect should be considered 'significant', "if it undermines the conservation objectives" (para 48); and
- Where a plan or project has an effect on a site "but is not likely to undermine its conservation objectives, it cannot be considered likely to have a significant effect on the site concerned" (para 47).

3.47 An opinion delivered to the Court of Justice of the European Union **[See reference** 25**]** commented that:

> "The requirement that an effect in question be 'significant' exists in order to lay down a de minimis threshold. Plans or projects that have no appreciable effect on the site are thereby excluded. If all plans or projects capable of having any effect whatsoever on the site were to be caught by Article 6(3), activities on or near the site would risk being impossible by reason of legislative overkill."

3.48 This opinion (the 'Sweetman' case) therefore allows for the authorisation of plans and projects whose possible effects, alone or in combination, can be considered 'trivial' or de minimis; referring to such cases as those "which have no appreciable effect on the site". In practice such effects could be screened out as having no likely significant effect; they would be 'insignificant'.

3.49 The HRA Screening assessment therefore considers whether the Local Plan policies could have likely significant effects either alone or in combination.

In-combination effects

3.50 Regulation 105 of the Habitats Regulations 2017 requires an Appropriate Assessment where "a land use plan is likely to have a significant effect on a Habitats Site (either alone or in combination with other plans or projects) and is not directly connected with or necessary to the management of the site". Therefore, the Screening assessment must consider whether any impacts identified from the Local Plan may combine with other plans or projects to give rise to significant effects in-combination.

3.51 If the HRA Screening determines that the Local Plan will have a particular type of effect (e.g. due to water pollution) on its own but it is not likely to be significant, the in-combination assessment at Screening stage would need to determine whether there may also be the same type of effect from other plans or projects that could combine with the Local Plan to produce a significant effect. If so, this likely significant effect arising from the Local Plan in combination with other plans or projects would then need to be considered through the Appropriate Assessment stage to determine if it would have an adverse effect on integrity of the relevant Habitats Site. However, if the Screening assessment concludes that there is no impact pathway by which development proposed in the Local Plan could affect the conditions necessary to maintain qualifying features of a Habitats Site, then there will be no in-

combination effects to assess at the Screening or Appropriate Assessment stage. This approach accords with recent guidance on HRA **[See reference 26]**.

3.52 If impact pathways are found to exist for a particular type of effect but it is not likely to be significant from the Local Plan alone, the in-combination assessment will identify which other plans and programmes could result in the same impact on the same Habitats Site. This focusses on planned growth (e.g. housing or employment) around the affected site, or along the impact corridor, for example, if impacts could arise as a result of changes to a waterway, then planned growth in local authorities along that waterway would be considered.

3.53 Where required, the potential for in-combination impacts therefore focusses on plans prepared by local authorities that overlap with the Habitats Sites that are within the scope of the HRA. The findings of any associated HRA work for those plans would then be reviewed where available. Where relevant, any strategic projects in the area that could have in-combination effects with the Local Plan are also identified and reviewed.

3.54 The online HRA Handbook suggests the following plans and projects may be relevant to consider as part of the in-combination assessment:

- Applications lodged but not yet determined, including refusals subject to an outstanding appeal or legal challenge;
- Projects subject to periodic review e.g. annual licences, during the time that their renewal is under consideration;
- Projects authorised but not yet started;
- Projects started but not yet completed;
- Known projects that do not require external authorisation;
- Proposals in adopted plans; and
- Proposals in draft plans formally published or submitted for final consultation, examination or adoption.

3.55 The need for in-combination assessment also arises at the Appropriate Assessment stage, and a similar approach is taken.

Appropriate Assessment methodology

3.56 Following the Screening stage, if likely significant effects on the Habitats Site are unable to be ruled out, the plan-making authority is required under

Regulation 105 of the Habitats Regulations 2017 to make an 'Appropriate Assessment' of the implications of the plan for the Habitats Site, in view of their conservation objectives. European Commission Guidance states that the Appropriate Assessment should consider the impacts of the plan (either alone or in combination with other projects or plans) on the integrity of the Habitats Site with respect to their conservation objectives and to their structure and function.

Assessing the effects on site integrity

3.57 A site's integrity depends on it being able to sustain its 'qualifying features' (i.e. those Annex 1 habitats, Annex II species, and Annex 1 bird populations for which it has been designated) and to ensure their continued viability. The 'Holohan' judgement also clarifies that effects on species and habitats not listed as qualifying features, but which could result in secondary effects upon the qualifying features of Habitats Sites also need to be considered. The Appropriate Assessment, where required, then builds upon the information set out in Appendix A of this report, to consider the characteristics of supporting habitats and species that could be affected by impacts identified at the Screening stage.

3.58 A high degree of integrity is considered to exist where the potential to meet a site's conservation objectives is realised and where the site is capable of self-repair and renewal with a minimum of external management support.

3.59 A conclusion needs to be reached as to whether or not the Local Plan would adversely affect the integrity of the Habitats Site. As stated in the European Commission Guidance, assessing the effects on the site(s) integrity involves considering whether the predicted impacts of the Local Plan policies (either alone or in combination) have the potential to:

- Cause delays to the achievement of conservation objectives for the site;
- Interrupt progress towards the achievement of conservation objectives for the site;
- Disrupt those factors that help to maintain the favourable conditions of the site;
- Interfere with the balance, distribution and density of key species that are the indicators of the favourable condition of the site;
- Cause changes to the vital defining aspects (e.g. nutrient balance) that determine how the site functions as a habitat or ecosystem;

- Change the dynamics of relationships that define the structure or function of the site (e.g. relationships between soil and water, or animals and plants);
- Interfere with anticipated natural changes to the site;
- Reduce the extent of key habitats or the population of key species;
- Reduce the diversity of the site;
- Result in disturbance that could affect the population, density or balance between key species;
- Result in fragmentation; or
- Result in the loss of key features.

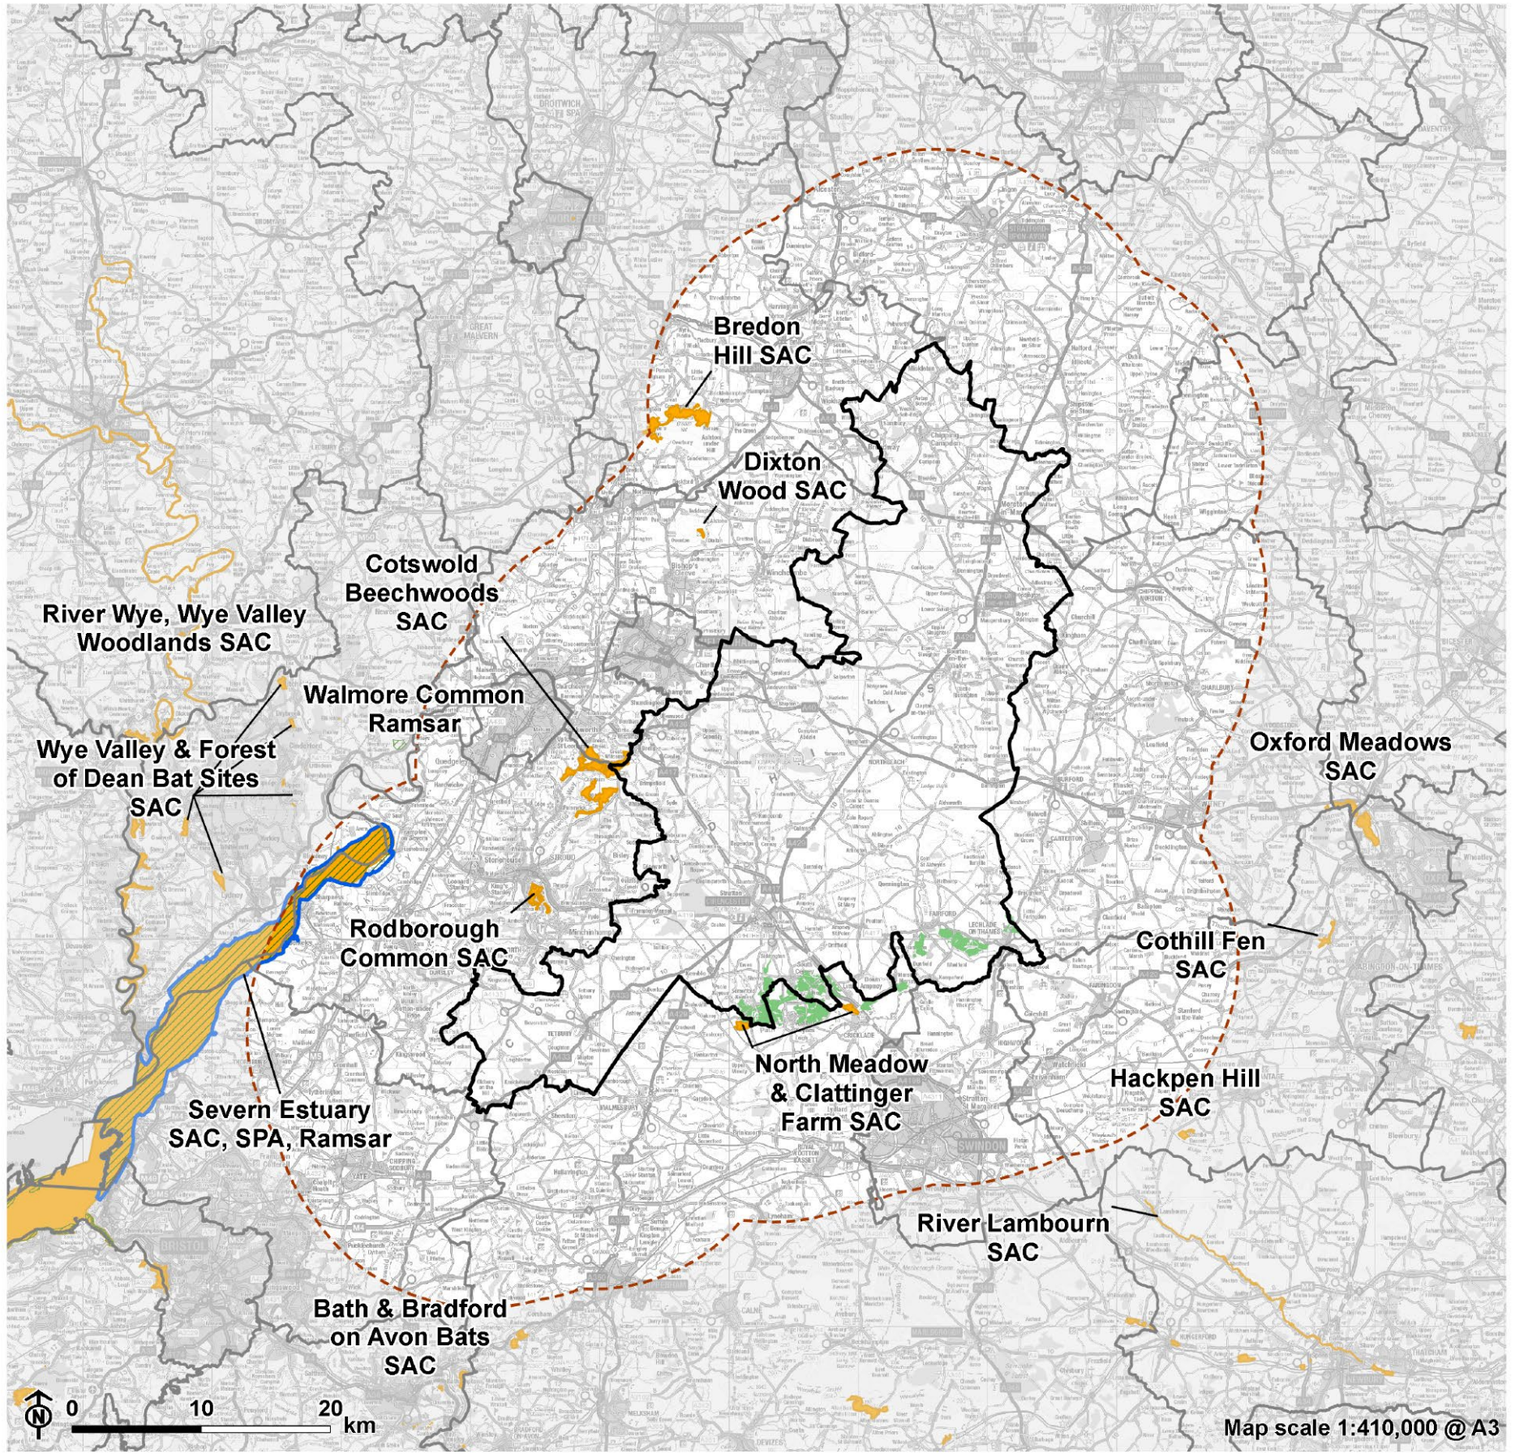
3.60 The conservation objectives for each Habitats Site (**Appendix A**) are generally to maintain the qualifying features in favourable condition. The Site Improvement Plans for each Habitats Site provide an overview of the issues (both current and predicted) affecting the condition of the qualifying features on the site(s) and outline the priority measures required to improve the condition of the features. These have been drawn on to help to understand what is needed to maintain the integrity of the Habitats Site.

3.61 For each Habitats Site where HRA Screening identified an uncertain or likely significant effect in relation to the Local Plan, the potential impacts are set out and judgements made (based on the information available) regarding whether the impact will have an adverse effect on the integrity of the site. Consideration has been given to the potential for mitigation measures to be implemented that could reduce the likelihood or severity of the potential impacts, such that there would not be an adverse effect on the integrity of the site.

Chapter 4
Relevant Habitats Sites

4.1 This chapter summarises information about Habitats Sites that are:

- within 15km of the Cotswold district boundary;
- any sites beyond that distance with connectivity to the plan area (for example via river systems); and
- any sites for which functionally linked habitats (or land; FLL) may be relevant.



Habitats Sites within or linked to the plan area

4.2 The following Habitats Sites are within the plan area or within 15km of it (Figure 4.1), and are therefore scoped into the HRA:

- Cotswold Beechwoods SAC – partially within plan area;
- North Meadow and Clattinger Farm SAC – adjacent to south of plan area;
- Rodborough Common SAC – 2.7km west;
- Dixton Wood SAC – 7.1km west;
- Bredon Hill SAC – 10.1km west; and
- Severn Estuary SAC, SPA & Ramsar – 10.4km west.

4.3 The following Habitats Site is beyond 15km from the Plan area but is hydrologically connected via the River Evenlode and River Thames:

- Oxford Meadows SAC – 23.9km east.

Functionally linked habitats

4.4 The following Habitats Sites have mobile species within their qualifying features, which may use habitats outside the designated Habitats Sites:

- Dixton Wood SAC: Violet click beetle;
- Bredon Hill SAC: Violet click beetle;
- Severn Estuary:
  - SAC: Sea lamprey, River lamprey, Twaite shad;
  - SPA: Gadwall, Greater white-fronted goose, Dunlin, Bewick's swan, Common shelduck, Common redshank, waterbird assemblage;
  - Ramsar: Gadwall, Greater white-fronted goose, Dunlin, Bewick's swan, Common shelduck, Common redshank; Atlantic salmon, sea trout, sea lamprey, river lamprey, allis shad, twaite shad and eel.

4.5 Further information on the potential for functionally linked habitats (also known as functionally linked land; FLL) associated with the species to be impacted by the Local Plan is set out below. In summary, FLL only needs to be considered in relation to birds of the Severn Estuary SPA/Ramsar and migratory fish of Severn Estuary SAC/Ramsar.

Invertebrates

4.6 Dixton Wood and Bredon Hill SACs are designated for violet click-beetle *Limoniscus violaceus*. Habitats located outside of these Habitats Sites may also contribute to maintaining the population of these species.

4.7 The violet click beetle is very rare and therefore very little is known about the species. Violet click beetles tend to be found in decaying ash or beech trees and are likely to remain in the same trees all of their lives **[See reference** 27**]** and the dispersal abilities of this species is considered to be limited **[See reference** 28**]**. FLL is therefore only likely if woodland within the Habitats Sites extends beyond the boundary of the site. For stag beetles, a precautionary distance of 2km is used to identify potential FLL **[See reference** 29**]**. Stag beetles are likely to travel further than violet click beetles, which are likely to remain in the same tree all their lives; therefore, applying the same distance to violet click beetle would be unnecessarily precautionary; for violet click beetle, a distance of 500m is considered sufficient.

4.8 Given the distance of these SACs from the Plan area (>7km), FLL relating to invertebrates does not need to be considered further in this HRA.

Birds

4.9 Severn Estuary SPA is designated for non-breeding bewick's swan Cygnus columbianus bewickii, common shelduck Tadorna Tadorna, gadwall Anas strepera, dunlin Calidris alpina alpina, common redshank Tringa tetanus, and greater white-fronted goose Anser albifrons albifrons. The Severn Estuary Ramsar site is designated for its assemblages of international importance which include: bewick's swan Cygnus columbianus bewickii, common shelduck Tadorna Tadorna, gadwall Anas strepera, dunlin Calidris alpina alpina, common redshank Tringa tetanus, and greater white-fronted goose Anser albifrons albifrons.

4.10 The habitat preferences for qualifying bird species of Severn Estuary SPA and Ramsar includes farmland, grassland, lakes, ponds, wetlands and rivers. Therefore, FLL for qualifying bird species of Severn Estuary SPA and Ramsar is likely to comprise these habitats.

4.11 To identify habitats used by birds from the Severn Estuary designated sites, Natural England has commissioned studies to identify land with proven or possible functional linkages to the SPA. These studies, by Link Ecology, have been undertaken in phases, for different areas of the estuary.

4.12 Phase 5 of the study (Gloucestershire and Worcestershire) **[See reference** 30**]** confirmed that a number of the qualifying bird species of the Severn Estuary SPA/Ramsar travel away from the designated site and make use of habitats some distance from the SPA/Ramsar site in Gloucestershire and Worcestershire for grazing/roosting. Cotswold District is outside the core area of the study; however, Cotswold Lakes (formerly known as Cotswold Water Park and which are designated as the Cotswold Water Park Site of Special Scientific Interest (SSSI) that includes the lakes around South Cerney, Fairford and Lechlade), in particular, are identified as locations in which the species counts meet or exceed 1% (i.e. a significant proportion) of the SPA population for one or more species; although some species are more widespread across the district. The presence of these species in Cotswold District does not prove that the individuals originated from the SPA/Ramsar; however, the study states that there is likely to be connectivity with Cotswold Lakes and recommends that a separate review of potential functional linkage to Cotswold Lakes is carried out.

4.13 It is also possible that birds moving between the Severn Estuary SPA/Ramsar and the Cotswold Water Park SSSI make use of habitats around the SSSI, for example arable fields. A review of available information on bird habitat preferences, functional linkages and habitats present in the plan area has been undertaken (see **Appendix E**), to inform an understanding of the bird species that might make use of FLL and where that could occur. The FLL assessment has identified that the following qualifying species of the SPA/Ramsar could rely on habitats within the plan area:

- Bewick's swan – wetlands; arable fields.
- Common shelduck – lakes.
- Gadwall – slow freshwater; flooded grassland.
- Greater white-fronted goose – wet grassland; arable fields.
- Lesser black-backed gull – landfills; farmland.
- Herring gull – urban landfills.
- Eurasian curlew – mudflats; wet grassland.
- Eurasian wigeon – shallow wetlands; grazed grassland.
- Northern shoveler – shallow wetlands; flooded fields.
- Spotted redshank – lagoons mudflats; flooded fields.
- Northern pintail – freshwater wetlands; inundated fields.
- Lapwing – wet grassland; arable farmland.

4.14 Given the likely functional linkage between Severn Estuary SPA, the Cotswold Lakes, and potentially other habitats within the District, Severn Estuary SPA and Ramsar have been scoped in for further assessment to determine whether the plan will result in likely significant effects on the qualifying bird species as a result of the loss of FLL.

Fish

4.15 The Severn Estuary SAC and Ramsar is designated for Atlantic salmon *Salmo salar*, sea trout *Salmon trutta*, sea lamprey *Petromyzon marinus*, river lamprey *Lampetra fluviatilis*, allis shad *Alosa alosa*, twaite shad *Alosa fallax* and eel *Anguilla Anguilla*.

4.16 All of these species are migratory and therefore have the potential to be dependent upon watercourses located outside the boundaries of the SAC and Ramsar but with functional hydrological connectivity.

4.17 The Severn Estuary is a key migration route to their spawning grounds in the many tributaries that flow into the estuary. Salmon, river lamprey, twaite shad, allis shad, sea trout, eel, and sea lamprey are migratory and therefore have the potential to be dependent upon watercourses located outside the boundaries of the SAC/Ramsar but with functional hydrological connectivity. Brook lamprey and bullhead are reliant on a mosaic of aquatic habitats, potentially including areas outside of the relevant SAC/Ramsar boundaries.

4.18 Significant functionally linked habitats are likely to be only larger tributaries of the Severn, as well as smaller ditches and rhines near to the Severn Estuary SAC/Ramsar.

4.19 The River Frome (near Stroud) forms part of the boundary of Cotswold District, and the upper reaches of River Chelt (near Cheltenham) extend into the Plan area. Both rivers flow into the Severn, which means that the Severn Estuary SAC and Ramsar is hydrologically connected to the Plan area. Taking a precautionary approach, potential for effects on FLL associated with fish from the Severn Estuary SAC / Ramsar therefore require further assessment.

Chapter 5
HRA Screening

5.1 This chapter sets out the assumptions applied to the HRA Screening of impacts and considers which of the Local Plan policies and site allocations could have a likely significant effect on a Habitats Site. Further details of the screening assessment are provided in **Appendix C**.

Physical damage or loss of habitat

5.2 Any development resulting from the Local Plan would take place within the District. Therefore, only Habitats Sites within or immediately adjacent to the District's boundary could be affected through physical damage or loss of habitat within the Habitats Site's boundaries. Only Cotswold Beechwoods SAC (small area of SAC is within the district) and North Meadow & Clattinger Farm SAC (immediately adjacent to District boundary) have the potential to be affected by physical damage and/or loss from development, directly.

5.3 Habitat loss from development in areas outside of the Habitats Site boundaries may also result where development occurs within or immediately adjacent to potential FLL; i.e. rivers, lakes or adjacent habitats used by birds or fish from the Severn Estuary SAC, SPA or Ramsar.

5.4 There are no site allocations within or immediately adjacent to Habitats Sites or rivers that could be used by fish from the Severn Estuary SAC, SPA or Ramsar site. However, the following policies allow for some rural and/or windfall development that could in theory be located within or immediately adjacent to Cotswold Beechwoods SAC or North Meadow and Clattinger Farm SAC, or FLL used by birds/fish from Severn Estuary SAC/SPA/Ramsar:

- Core Policy 27 Net Zero Carbon New Buildings.
- Core Policy 28 Renewable and Low Carbon Energy Generation, Storage and Transmission.
- Core Policy 45 Gypsy and Traveller Accommodation: defines the two locations for gypsy and traveller accommodation.
- Core Policy 46 New Employment Development: identifies broad locations for employment development (assessed in relation to site allocations) and permits some windfall development outside development boundaries.
- Core Policy 49 Development of Tourist Facilities and Visitor Attractions.

- Core Policy 50 Tourist and Visitor Accommodation.
- Core Policy 72 Social and Community Infrastructure.
- Development Policy 1 Affordable Housing on Rural Exception Sites: Sets out the circumstances in which windfall development would be permitted in rural areas.
- Development Policy 3 Dwellings for Rural Workers Outside Development Boundaries: Allows some small scale development within rural areas.
- Development Policy 6 Rural Diversification: permits development in rural areas.
- Development Policy 8 New Agricultural and Forestry Development: permits development in rural areas.
- Development Policy 9 Equestrian Related Development: permits development in rural areas.

5.5 An assessment has also been undertaken of the suitability of the Local Plan site allocations to contain habitats used by birds from the Severn Estuary and be functionally linked to the Severn Estuary SPA/Ramsar (see **Appendix E**). This has identified that the following site allocations have high potential to be FLL:

- F53A - Land at Totterdown Hill, Horcott.
- F20A - Land south-east of Fairford.
- Strategic site: Fairford - Land north east of Fairford.

5.6 The following site allocations have moderate potential to be FLL:

- Strategic site: Cirencester - Steadings southern extension.
- Strategic site: Cirencester - Land east of Kingshill Lane.
- Strategic site: Cirencester - Land south east of Cirencester and south of Preston.
- Strategic site: Siddington - Land south west of Siddington.
- Strategic site: Driffield - Land south of Driffield.
- Strategic site: Down Ampney - Land surrounding Down Ampney.
- SD15 – Siddington, Plummers Farm, east of Ashton Road.

- SD17 – Siddington, Land east of Siddington Road and west of Bluebell Drive.
- SD23 – Siddington, Land between disused canal and disused railway line, north of Park Way.
- F52/F39C - Land west of Terminus Cottage and Station Cottage.
- L19 - Land south of Butler's Court.
- L33 - Land south of Ferrers Park.

5.7 All other site allocations have been assessed either as negligible/low potential, or were not subject to detailed assessment as they are not considered to be in locations where FLL is possible.

5.8 In addition to the site allocations, the following policies permit development that could result in damage or loss of bird FLL:

- Core Policy 11 Special Policy Areas – Royal Agricultural University.
- Core Policy 15 Cotswold Airport.
- Core Policy 16 Thames and Severn Canal.
- Core Policy 17 The River Thames.
- Core Policy 18 Cotswold Lakes: Post Mineral Extraction After Use.

In summary, there is potential for likely significant effects at Cotswold Beechwoods SAC (directly), North Meadow & Clattinger Farm SAC (directly) and Severn Estuary SAC/SPA/Ramsar (indirectly, via bird/fish FLL) due to physical damage or loss habitats. These may be significant due to the Local Plan alone.

Non-physical disturbance

5.9 Noise and vibration effects, e.g. during the construction of new housing or other development, are most likely to disturb bird species and are thus a key consideration with respect to Habitats Sites where birds are the qualifying features, although such effects may also impact upon some mammals and fish species. Artificial lighting at night (e.g. from street lamps, flood lighting and security lights) is most likely to affect bat populations and some nocturnal bird species, and therefore have an adverse effect on the integrity of Habitats Sites where bats or nocturnal birds are a qualifying feature.

5.10 It has been assumed (on a precautionary basis and based on our experience of previous HRAs and consultation with Natural England) that the effects of noise, vibration and light pollution are capable of causing an adverse effect if development takes place within 500m of a Habitats Site (or functionally linked habitat) with qualifying features sensitive to these disturbances.

5.11 All Habitats Sites either do not support species likely to be significantly affected as a result of noise, vibration and light pollution and/or are located over 500m from the Plan area at the closest point.

5.12 However, the following qualifying species may use functionally linked habitat within the Plan area:

- Bird species of Severn Estuary SPA and Ramsar.
- Migratory fish species of Severn Estuary SAC and Ramsar.

5.13 Migratory fish species are unlikely to be significantly affected as a result of noise, vibration and light pollution resulting from the Local Plan and there are no site allocations within 500m of a river that is hydrologically connected to the Severn Estuary. This impact pathway is not considered further.

5.14 Non-physical disturbance can also adversely affect birds at functionally linked habitats, if the disturbance is of a sufficient scale to harm the population of species at the linked Habitats Site (the Severn Estuary SPA/Ramsar). For birds, the key FLL within the district is Cotswold Water Park SSSI. There are other habitats that have potential to be FLL (see **Appendix E**), but these are common within the district and it is unlikely that localised urban edge effects from development at these habitats would have a significant effect on the SPA/Ramsar.

5.15 The following site allocations and policy areas are within 500m of the Cotswold Water Park SSSI:

- Strategic site: Siddington - Land south west of Siddington.
- SD15 Plummers Farm, east of Ashton Road.
- R644 Driffield (part of strategic site: Land south of Driffield).
- Core Policy 17 The River Thames.
- Core Policy 18 Cotswold Lakes: Post Mineral Extraction After Use.

5.16 In addition, the policies listed in paragraph Chapter 10345021 allow for some rural and/or windfall development that could in theory be located within

500m of Cotswold Water Park SSSI and could result in non-physical disturbance.

In summary, there is the potential for likely significant effects at Severn Estuary SAC/SPA/Ramsar (indirectly, via bird FLL) due to non-physical disturbance. These may be significant due to the Local Plan alone.

Bird strike

5.17 Wind turbines and aircraft have the potential to impact upon birds from the Severn Estuary SPA/Ramsar site, where the development is in areas where birds could be flying between, for example, Severn Estuary SPA/Ramsar and Cotswold Water Park SSSI (e.g. in proximity to functionally linked habitats; although the flight routes are not known).

5.18 Wind turbine development could be permitted under the following policies:

- Core Policy 28: Renewable and Low Carbon Energy Generation, Storage and Transmission.
- Core Policy 29: Wind Energy Development.

5.19 Airfield development could be permitted under the following:

- Core Policy 15 Cotswold Airport.

5.20 Land use changes at sites in proximity to existing airfields (Cotswold Airport near Kemble, and RAF Fairford) also have the potential to increase the risk of bird strike to birds of the Severn Estuary SPA/Ramsar, for example the creation of new habitats within a development could attract birds.

There is the potential for likely significant effects at Severn Estuary SPA / Ramsar (via bird functionally linked habitats) as a result of bird strike. These are likely to be significant due to the Local Plan alone.

Air pollution

5.21 Air pollution is most likely to affect Habitats Sites where plant, soil and water habitats are the qualifying features, but some qualifying animal species may also be affected, either directly or indirectly, by any deterioration in habitat

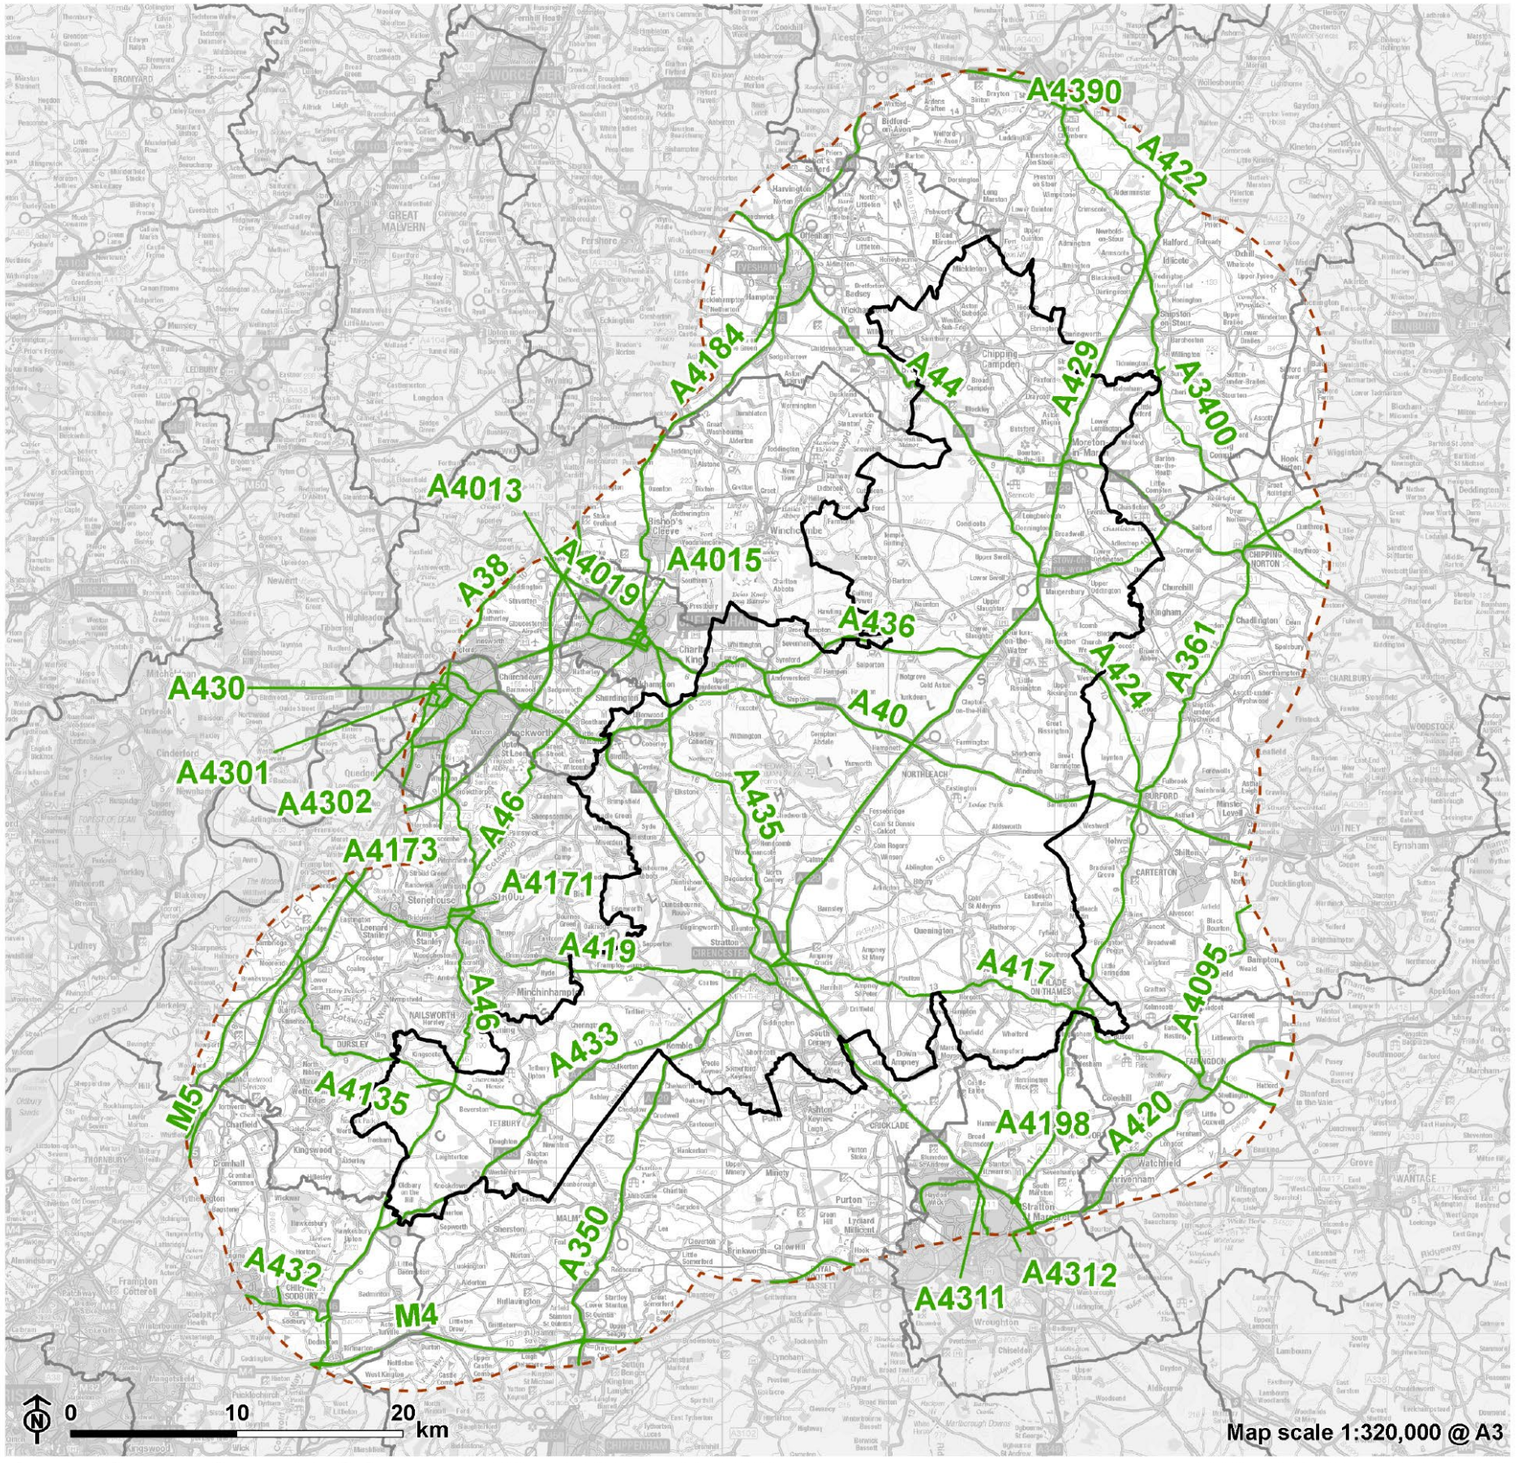
as a result of air pollution. Deposition of pollutants to the ground and vegetation can alter the characteristics of the soil, affecting the pH and nitrogen (N) availability that can then affect plant health, productivity and species composition; dust can also smother habitats and increase the turbidity of water. All of the sites have plant species and/or water habitats as their qualifying feature.

Vehicle emissions

5.22 In terms of vehicle traffic, nitrogen deposition, acid deposition, nitrogen oxides (NOx, i.e. NO and NO_2) and ammonia (NH3) are considered to be the key pollutants.

5.23 Based on the Highways Agency Design Manual for Road and Bridges (DMRB) Document LA105: Air Quality **[See reference** 31**],** which was produced to provide advice regarding the design, assessment and operation of trunk roads (including motorways), it is assumed that air pollution from roads is unlikely to be significant beyond 200m from the road itself. Where increases in traffic volumes are forecast, this 200m buffer needs to be applied to the relevant roads in order to make a judgement about the likely geographical extent of air pollution impacts (the 'affected road network').

5.24 The JNCC's 'Guidance on decision making thresholds for air pollution' **[See reference** 32**]** states that "For the purpose of decision-making, unless local circumstances support a wider zone, plan HRA should take account of the potential effects of traffic emissions on European sites located within 10 km of the plan boundary."



5.25 The DMRB Guidance for the assessment of local air quality in relation to highways developments provides criteria that should be applied to ascertain whether there are likely to be significant impacts associated with routes or corridors. Based on the DMRB guidance, affected roads which should be assessed are those where:

- Daily traffic flows will change by 1,000 AADT (Annual Average Daily Traffic) or more; or
- Heavy duty vehicle (HDV) flows will change by 200 AADT or more; or
- Daily average speed will change by 10 km/hr or more; or
- Peak hour speed will change by 20 km/hr or more; or
- Road alignment will change by 5 m or more.

5.26 In line with the Wealden judgment **[See reference** 33**]**, in-combination air pollution effects must be screened using the same criteria. The implication of the judgment is that, where the road traffic effects of other plans or projects are known or can be reasonably estimated (including those of adopted plans or consented projects), then these should be included in road traffic modelling by the local authority whose local plan or project is being assessed. The screening criteria of 1,000 AADT should then be applied to the traffic flows of the plans in combination.

5.27 It is usually only those roads forming part of the primary road network (motorways and 'A' roads) that might be likely to experience any significant increases in vehicle traffic as a result of development (i.e. greater than 1,000 AADT etc.), although there are exceptions; the affected road network is confirmed as part of the traffic assessment. The primary road network in Cotswold district is shown on **Figure 5.1**.

- Cotswold District boundary
- Neighbouring Local Authority
- 10km buffer from Cotswold District boundary
- Strategic road

Contains Ordnance Survey data © Crown copyright and database right 2026

5.28 Strategic roads within 200m of Habitats Sites and within 10km of the plan area are:

- Cotswold Beechwoods SAC: A46 (and potentially B4070).
- North Meadow and Clattinger Farm SAC: A419.
- Rodborough Common SAC: A46.

5.29 All of the other Habitats Sites are situated over 10km from the plan area or 200m from strategic roads and have therefore been scoped out. Potential FLL within the plan area primarily comprise water habitats and arable fields (see paragraphs 4.13 & 4.17, and Appendix E), which are not highly sensitive to air pollution. It is unlikely that air pollution from vehicles would degrade these habitats to the extent that the population of birds/fish at Severn Estuary SAC/SPA/Ramsar would be affected. Therefore, there are no additional roads that need to be screened in to assess FLL.

5.30 Development in any part of the district could contribute to traffic on the identified roads, in-combination, therefore all of the Local Plan site allocations could contribute to air pollution from vehicle emissions. The following policies are associated with the site allocations and overall quantum of development:

- Core Policy 2: Meeting Housing Needs in Cotswold District: Strategic Sites
- Core Policy 3: Meeting Housing Needs in Cotswold District: Non-Strategic Sites
- Core Policy 5: Meeting Business and Employment Needs in Cotswold District

5.31 Traffic data that models the effects of the Local Plan on traffic flows, for roads within 200m of Habitats Sites, has been provided by City Science. Traffic flows have been modelled in relation to the baseline traffic flow in 2024, in relation to two scenarios:

- the future baseline traffic flow in 2043 with general background growth including other neighbouring Local Plans (i.e. without the development proposed in the Local Plan) – this informs the in-combination assessment; and
- the above, plus the development proposed within the Local Plan – this informs the assessment of the Local Plan alone.

5.32 The data is summarised in **Table 5.1** below. Traffic flows on road links that exceed the screening threshold of 1,000 AADT are shown in bold.

Table 5.1: Changes in traffic flow (AADT) for all vehicles, due to the Local Plan alone and in combination (Cotswold Beechwoods SAC)

Road	Baseline traffic flow (2024)	Future baseline traffic flow (2043)	Future baseline with Local Plan	Change due to Local Plan alone	Change due to Local Plan in combination

Unnamed road between Butterow Hill and Rodbor-ough Common	79	81	82	1	2

5.33 Due to the changes in AADT exceeding the screening thresholds for a number of roads, AECOM have undertaken an air quality assessment (see **Appendix F**), to model nitrogen (N) deposition, nitrogen oxides (NOx), ammonia (NH3) and acid deposition. The modelling screens the predicted levels of these pollutants, due to the Local Plan alone and in-combination against the screening criteria of 1% of the critical load/level. There are no exceedances of the screening criteria for NOx or acid deposition, but some exceedances for nitrogen deposition and ammonia. The data in Table 5.7 has been provided by AECOM and shows the maximum distances from the roads that the screening criteria (1% of critical load/level) are exceeded, for nitrogen deposition and ammonia.

Table 5.7: Maximum distance from road that exceeds 1% critical load

Habitats Site	Road	Transect	LP alone - N dep	LP alone - NH3	In comb. - N dep	In comb. - NH3
North Meadow & Clattinger	A419	ET1	200m	200m	200m	200m
Rodborough	Spine Road w	ET2	-	-	0.04m	20m
Rodborough	Spine Road e	ET3	-	0.03m	0.03m	50m
Rodborough	A46 / Selsey Road	ET7	-	-	-	-
Cotswold Beechwoods	B4070 Buckholt	ET4	30m	40m	90m	110m
Cotswold Beechwoods	B4070 Birdlip	ET5	-	-	100m	120m
Cotswold Beechwoods	B4070 Sheepscombe	ET6	-	-	70m	80m

5.34 Other locations did not exceed the screening criteria.

5.35 Likely significant effects are therefore predicted at the following locations:

- Cotswold Beechwoods SAC: B4070 at Buckholt, due to the Local Plan alone (and in combination); and on the B4070 at Birdlip and Sheepscombe, due to the Local Plan in combination with other plans and projects only.
- North Meadow & Clattinger Farm SAC: A419, due to the Local Plan alone (and in combination).

- Rodborough Common SAC: Rodborough Common (Spine Road), due to Local Plan alone for NH3 and in combination with other plans and projects for nitrogen deposition.

5.36 The effect of these increases in nitrogen deposition and ammonia are set out in Chapter 6, with further detail available in **Appendix F**.

In summary, there is the potential for likely significant effects at Cotswold Beechwoods SAC, North Meadow & Clattinger Farm SAC, and Rodborough Common SAC (all directly), due to air pollution from vehicle emissions. These will be significant due to the Local Plan alone.

Dust

5.37 The effects of dust are most likely to be significant at qualifying features sensitive to dust, such as riparian and wetland habitats, or sites designated for habitats and plant species.

5.38 The effects of dust deposition in terrestrial habitats are relevant to Cotswold Beechwoods SAC and North Meadow and Clattinger Farm SAC. The effects of dust deposition to the water environment are relevant to functionally linked habitat within the Cotswold District Boundary that is used by:

- Bird species of Severn Estuary SPA and Ramsar.
- Migratory fish species of Severn Estuary SAC and Ramsar.

5.39 There are no major sources of operational dust emissions (e.g. minerals extraction) proposed in the Local Plan; however, construction work for new development can involve temporary dust emissions. Large particles will mostly deposit close to the source and the assumption is that the vast majority of dust deposition would occur within 100m, although some smaller particles may travel up to 200-500m **[See reference** 34**]**.Therefore, significant effects on Habitats Sites from dust are unlikely beyond 100m.

5.40 As the effects are temporary and local, it is considered unlikely that dust deposition from construction would affect FLL to the extent that there was a likely significant effect at a Habitats Site.

5.41 There are no site allocations within 100m of the SACs; however, the following policy area is:

- Core Policy 18 Cotswold Lakes: Post Mineral Extraction After Use – within 500m of North Meadow & Clattinger Farm SAC.

5.42 Some rural and/or windfall development (associated with the policies listed in paragraph Chapter 10345021) could also in theory be located within 100m one of the SACs, but this would be small in scale and unlikely to result in likely significant effects due to dust.

There is the potential for likely significant effects at North Meadow & Clattinger Farm SAC (both directly), due to air pollution from dust. These may be significant due to the Local Plan alone or in combination.

Recreation pressure and urban edge effects

5.43 Recreational activities and human presence can result in significant effects on Habitats Sites as a result of erosion and trampling, or disturbance to sensitive features, such as birds through both terrestrial and water-based forms of recreation. The proximity of urban development to Habitats Sites can also result in significant effects due to fire and vandalism, as well an increase in invasive species and pet predation. For example, research has shown that habitats close to urban areas can have higher densities of mammalian predators such as foxes **[See reference** 35**]** and that there is an increase in the numbers of crows and magpies on sites with greater human activity **[See reference** 36**]**.

5.44 The Local Plan will result in housing growth and associated population increase, which will in turn increase visits to accessible greenspaces.

5.45 Habitats Sites with qualifying bird species are likely to be particularly susceptible to recreational disturbances from walking, dog walking, angling, illegal use of off-road vehicles and motorbikes, wildfowling (shooting wildfowl), and water sports. An increase in recreational pressure from development therefore has the potential to disturb bird populations of SPA and Ramsar sites as a result of both terrestrial and water-based recreation.

5.46 In addition, recreation can physically damage habitat as a result of trampling and also through erosion associated with boat wash (e.g. associated with increased boat moorings and traffic) and terrestrial activities such as use of vehicles.

Recreation pressure

5.47 Each Habitats Site will typically have a 'Zone of Influence' (ZOI) within which increases in population would be expected to result in likely significant effects at sensitive sites. ZOIs are usually established following targeted visitor surveys and the findings are therefore typically specific to each Habitats Site (and often to specific areas within a Habitats Site). ZOIs are typically based on the distance that 75% of visitors travel from.

5.48 At Cotswold Beechwoods SAC, a ZOI of 15.4km is used, based on work by Stroud District Council **[See reference** 37**]**. The ZOI for Rodborough Common SAC is 3.9km, also based on work by Stroud District Council **[See reference** 38**]**.

5.49 At Oxford Meadows SAC, a ZOI of 7km is suggested, based on 2025 work by LUC in the HRA Screening of the West Oxfordshire Local Plan **[See reference** 39**]**. This is based on ZOIs of similar sites elsewhere.

5.50 For North Meadow & Clattinger Farm SAC, the ZOI was established through work by Cotswold District Council and neighbouring authorities and is set out in the North Meadow & Clattinger Farm interim recreation mitigation strategy **[See reference** 40**]**. The strategy states that: “The Clattinger Farm SSSI component of the SAC is managed by the Wiltshire Wildlife Trust. Access to the area is through a visitor centre and is carefully managed by the Trust. At North Meadow, which is Common Land, the public have access on foot over the whole area, unlike at Clattinger Farm where the Trust can open and close areas and routes. The habitats at Clattinger Farm are not considered to be subjected to damaging recreational pressures at present and the site is therefore not considered further in this Interim Mitigation Strategy”. For the North Meadow, Cricklade SSSI component of the SAC, the following ZOIs have been established:

- Year round users: 4.2km; and
- Seasonal summer visitors (snakes head fritillary season): 9.4km.

5.51 At Severn Estuary SAC/SPA/Ramsar, a ZOI of 12.6km has been established through work by Stroud District Council **[See reference** 41**]** and South Gloucestershire Council **[See reference** 42**]**.

5.52 Where the ZOIs are based on visitor survey work and the Habitats Sites have mitigation strategies (all of the above except Oxford Meadows SAC), any residential development within the ZOI is considered to have a likely significant effect. Taking a precautionary approach, this assumption has also been applied to Oxford Meadows SAC.

5.53 The following Habitats Sites have been scoped out of further assessment:

- Bredon Hill SAC – not identified as sensitive to recreation pressure within the SAC's Site Improvement Plan or Supplementary Advice for Conservation Objectives **[See reference** 43**]**.
- Dixton Wood SAC – does not have public access.

5.54 Recreational disturbance can also adversely affect qualifying features at functionally linked habitats, if the disturbance is of a sufficient scale to harm the population of species at the linked Habitats Sites. Potential FLL within the district may be used by:

- Bird species of Severn Estuary SPA and Ramsar (e.g. at Cotswold Water Park).
- Migratory fish species of Severn Estuary SAC and Ramsar (e.g. River Frome, River Chelt).

5.55 A general increase in population due to new development would not be expected to cause a significant increase in recreational activity that could affect fish. Direct recreational activities in rivers, e.g. fishing, are carefully controlled or licensed; the effects of recreation pressure on fish habitat used by species from the Severn Estuary SAC and Ramsar are therefore screened out.

5.56 Bird species are more susceptible to disturbance from recreation and therefore the effects of recreation pressure at the Cotswold Water Park (where functionally linked to the Severn Estuary SPA/Ramsar) have been scoped in as a precaution. Other bird FLL is primarily habitats without public access (e.g. arable fields) and does not need to be considered in relation to recreation pressure. While ZOIs for Habitats Sites are sometimes applied to their associated FLL, this is usually the case where the FLL is near to the Habitats Site and likely to be subject to similar recreation pressure. The Cotswold Lakes are c.29km from the Severn Estuary SPA/Ramsar and likely to have very different patterns of visitor travel and access. The SPA/Ramsar bird populations are also less sensitive to recreation pressure at FLL than from direct impacts within the SPA/Ramsar; i.e. recreation pressure at FLL is less likely to prevent the conservation objectives at the SPA/Ramsar from being met.

5.57 There is no visitor survey information available for Cotswold Water Park SSSI, but it is a popular site for visitors. Taking a very precautionary approach, it is assumed that all of the residential site allocations in the south of the district could increase recreation pressure at the Cotswold Water Park SSSI. These site allocations are all within c.15km of the SSSI, whereas the site allocations in the north of the district are >30km and are not likely to increase recreation pressure at the SSSI (and therefore impact the Severn Estuary SPA/Ramsar bird species).

5.58 Table 5.8 summarises the ZOIs used in this assessment.

Table 5.8: Zones of Influence (ZOIs) used

Habitats Site	ZOI
Cotswold Beechwoods SAC	15.4km
North Meadow and Clattinger Farm SAC	4.2km year round / 9.4km seasonal visitors
Rodborough Common SAC	3.9km
Oxford Meadows SAC	7.0km
Severn Estuary SAC, SPA and Ramsar (direct)	12.6km from Severn Estuary SAC/SPA/Ramsar
Severn Estuary SPA/Ramsar (via FLL)	n/a (all residential site allocations in south of district)

5.59 The ZOI for Oxford Meadows SAC does not extend into the Cotswold District boundary and impacts on this site can be screened out.

5.60 Only a very small area of the district is within the ZOI for Rodborough Common or the ZOI for Severn Estuary SAC/SPA/Ramsar, and there are no site allocations in these areas. Rural development / windfall (see paragraph Chapter 10345021) could in theory result in residential development within the ZOI/s but would be small scale. Impacts on these sites are screened in as a precaution.

5.61 The following site allocations are within the ZOIs of Habitats Sites:

- Cotswold Beechwoods SAC: A2, C71, C81B, K7A, K15, T31B, T71A, K7B.; and strategic sites: Steadings southern extension, New settlement at Cotswold Airport, and Land south west of Kemble.
- North Meadow & Clattinger Farm SAC (4.2km): strategic sites: Land south of Driffield, and Land surrounding Down Ampney.
- North Meadow & Clattinger Farm SAC (9.4km): C81B, F20A, F29C, F52, F53A, R203A-C, R607, SD15, SD17, SD23; and strategic sites: Steadings southern extension, Land east of Kingshill Lane, Land south east of Cirencester and south of Preston, Land south west of Siddington, Land south of Driffield, Land surrounding Down Ampney, and Land north east of Fairford.

5.62 Residential (or other overnight) development in these locations is associated with the following policies:

- Core Policy 2 Meeting Housing Needs in Cotswold District

- Core Policy 3 Meeting Housing Needs in Cotswold District
- Core Policy 49 Development of Tourist Facilities and Visitor Attractions
- Core Policy 50 Tourist and Visitor Accommodation

In summary, there is the potential for likely significant effects at Cotswold Beechwoods SAC (directly), North Meadow & Clattinger Farm (directly), Rodborough Common SAC (directly) and Severn Estuary SPA/Ramsar (directly; and indirectly via bird FLL), due to recreation pressure. These are likely to be significant due to the Local Plan in combination with other plans, for example residential development proposed in the Stroud, South Gloucestershire and Wiltshire Local Plan.

Urban edge effects

5.63 Urban edge effects (e.g. vandalism, litter, vermin or pet predation) occur where residential development is in close proximity to Habitats Sites. Similarly to non-physical disturbance, it is assumed that these are effects are most likely to be significant where residential development is within 500m of a Habitats Site; i.e. within 500m of Cotswold Beechwoods SAC or North Meadow & Clattinger Farm SAC.

5.64 There are no site allocations within 500m of Cotswold Beechwoods SAC or North Meadow & Clattinger Farm SAC. Windfall/rural development could fall within 500m of either SAC (associated with the policies list in paragraph Chapter 10345021); however, the small scale and rural nature of this development is unlikely to result in significant urban effects.

5.65 Urban edge effects can also adversely affect birds at functionally linked habitats, if the impact is of a sufficient scale to harm the population of species at the linked Habitats Site (the Severn Estuary SPA/Ramsar). For birds, the key FLL within the district is Cotswold Water Park SSSI. There are other habitats that have potential to be FLL (see Appendix E), but these are common within the district and it is unlikely that localised urban edge effects at these habitats would have a significant effect on the SPA/Ramsar.

5.66 The following site allocations and policy areas are within 500m of the Cotswold Water Park SSSI:

- Strategic site: Siddington - Land south west of Siddington.
- Strategic site: Land south of Driffield.

- SD15 Plummers Farm, east of Ashton Road.
- Core Policy 17 The River Thames.
- Core Policy 18 Cotswold Lakes: Post Mineral Extraction After Use.

5.67 In addition, the policies listed in paragraph Chapter 10345021 allow for some rural and/or windfall development that could in theory be located within 500m of Cotswold Water Park SSSI and could result in urban edge effects.

In summary, there are no likely significant effects associated with urban edge effects at Cotswold Beechwoods SAC or North Meadow & Clattinger Farm SAC, as a result of urban edge effects. This impact has been screened out.

Water quantity and quality

5.68 All of the Habitats Sites have qualifying features that have some potential to be sensitive to changes in water quantity or quality. However, the Habitats Sites with the potential to be significantly affected by changes in water quantity or quality are likely to be sites that lie within the district or sites with wetland habitats or species, that are hydrologically connected to the district.

5.69 The following Habitats Sites have wetland habitats, are sensitive to changes in water quality or quantity, and also have connectivity to the Plan area:

- Severn Estuary SAC, SPA and Ramsar – connected via River Frome, River Chelt and tributaries (Ozleworth Brook, Nailsworth Stream, Bretforton Brook and Broadway-Badsey Brook). Water is abstracted from the Severn to supply the district. FLL associated with this site's fish and bird species may also be affected by direct run-off, abstraction or discharge.
- Oxford Meadows SAC – connected via River Evenlode and River Thames. Water is abstracted from the Thames to supply the district and wastewater from Cotswold district is discharged into tributaries of the Thames, upstream of the SAC.
- North Meadow and Clattinger Farm SAC – connected via Cerney Wick Brook and River Churn. The sensitivity of the site to hydrological change is primarily related to the flooding regime **[See reference** 44**]**, but water quality of flood waters (due to wastewater treatment or direct pollution) can affect the meadow habitats.

5.70 In addition, Cotswold Beechwoods SAC is screened in as a precaution as it is within the district and could be affected by direct run-off, although it does not have wetland habitats.

5.71 The following Habitats Sites are screened out:

- Rodborough Common SAC – lies close to but uphill from the River Frome and Nailsworth Stream, so no direct connectivity to the Plan area. The site has no wetland habitats.
- Dixton Wood SAC – moist clay soils support the qualifying features but there are no abstraction licences impacting the site **[See reference** 45**]** and no other hydrological connectivity.
- Bredon Hill SAC – moist soils support the qualifying features **[See reference** 46**]**, but the site does not overlay the same aquifer/s as the Plan area; there is no other hydrological connectivity.

Direct pollution

5.72 Direct run-off or deposition of pollutants, for example during construction, could have a significant effect on a Habitats Site where development occurs immediately adjacent to or upstream of a site or FLL (if the pollution incident is sufficient to prevent birds/fish from a Habitats Site from using that habitat).

5.73 There are no site allocations near to and upstream of Cotswolds Beechwoods SAC, North Meadow & Clattinger Farm SAC or Oxford Meadows SAC; although windfall/rural development could occur near to the SACs (associated with the policies in paragraph Chapter 10345021). The scale of impact from windfall development is likely to be small but is screened in as a precaution.

5.74 Waterbodies in the Local Plan area that are potentially functionally linked to Habitats Sites are the Cotswold Water Park SSSI (Severn Estuary SPA/Ramsar birds) and the River Frome near Stroud and River Chelt near Cheltenham (Severn Estuary SAC/Ramsar fish).

5.75 There are no site allocations in proximity to the River Frome. One site allocation at Andoversford (A2) is c.200m from the River Chelt. This single development, which is c.200m from the river and >20km upstream of the River Severn (and any windfall development) is unlikely to have a significant effect on SAC/Ramsar fish species. This impact pathway is not considered further.

5.76 Development that is adjacent to the Cotswold Water Park SSSI could result in pollution that could indirectly affect Severn Estuary SPA/Ramsar bird species. The

following site allocations and policy areas have the potential to result in direct pollution at the Cotswold Water Park SSSI:

- Fairford: F53A, F20A, F39C, F52, and part of strategic site: Land north east of Fairford.
- Lechlade-on-Thames: L33.
- Cerney Wick: R644 (part of strategic site: Land south of Driffield).
- Core Policy 17 The River Thames.
- Core Policy 18 Cotswold Lakes: Post Mineral Extraction After Use.

5.77 Windfall / rural development (see paragraph Chapter 10345021) in these areas or other locations near to the SSSI (e.g. Somerset Keynes) could also result in direct pollution that could affect Severn Estuary SPA/Ramsar bird species.

5.78 Although direct pollution from individual development on the Cotswold Water Park SSSI is unlikely to be of a scale that is significant to the Severn Estuary SPA/Ramsar, the potential in-combination effects from multiple developments are screened in as a precaution.

There is the potential for likely significant effects at Cotswold Beechwoods SAC (directly), North Meadow & Clattinger Farm (directly), Oxford Meadows SAC (directly) and Severn Estuary SPA/Ramsar (indirectly, via bird FLL), due to direct pollution. These are likely to be significant due to the Local Plan alone (at the SACs) and in combination with other plans e.g. development in South Gloucestershire or Stroud Local Plans that is near the estuary (at the SPA/Ramsar).

Wastewater treatment

5.79 Thames Water manages wastewater collection and treatment for most of Cotswold District. Wessex Water is responsible for wastewater in the southwest corner of the district (around Tetbury); and Severn Trent Water is responsible for wastewater treatment in small areas along the western edge and north of the district (around Avening, Birdlip, and Chipping Campden).

5.80 The following wastewater treatment works serve the district:

- Severn Trent Water (River Avon catchment): Blockley, Chipping Campden, Willersley, Mickleton. Hydrologically linked to the River Severn SAC/SPA/Ramsar (and FLL used by fish from the SAC/Ramsar).

- Thames Water (River Thames catchment): Ampney St Peter, Andoversford, Bourton on the Water, Broadwell, Cirencester, Fairford, Lechlade, Moreton-in-Marsh, Northleach. Hydrologically linked to Oxford Meadows SAC, North Meadow & Clattinger Farm SAC, and FLL used by birds of Severn Estuary SPA/Ramsar (Cotswold Water Park SSSI).
- Wessex Water (River Avon catchment): Tetbury. Hydrologically linked to the River Severn SAC/SPA/Ramsar (and FLL used by fish from the SAC/Ramsar).

5.81 All of the Local Plan site allocations therefore have the potential to contribute to impacts from wastewater, as all of the wastewater treatment works serving the district are hydrologically connected to one or more Habitats Sites and/or bird FLL.

5.82 Policies that could contribute to an increased demand for wastewater treatment are:

- Core Policy 2 Meeting Housing Needs in Cotswold District.
- Core Policy 3 Meeting Housing Needs in Cotswold District.
- Core Policy 5 Meeting Business and Employment Needs in Cotswold District.
- Core Policy 11 Special Policy Areas – Royal Agricultural University: Supports the expansion / redevelopment of the existing campus and sets out what a masterplan is expected.
- Core Policy 15 Cotswold Airport: supports aviation-related development (and safeguards existing uses).
- Core Policy 18 Cotswold Lakes: Post-Mineral Extraction After Use: permits leisure/recreation development on former mineral extraction sites.
- Core Policy 24: Special Policy Area – Campden BRI.
- Core Policy 25: Special Policy Area – Fire Service College.
- Core Policy 49 Development of Tourist Facilities and Visitor Attractions.
- Core Policy 50 Tourist and Visitor Accommodation.
- Core Policy 72 Social and Community Infrastructure.
- The policies that permit windfall development (see paragraph Chapter 10345021).

There is the potential for likely significant effects at North Meadow & Clattinger Farm SAC (directly), Oxford Meadows SAC (directly), Severn Estuary SAC (directly), SAC/Ramsar (indirectly; via fish FLL) and SPA/Ramsar (indirectly; via

bird FLL), due to wastewater treatment. These are likely to be significant due to the Local Plan alone.

Water abstraction

5.83 Water supply in the district is as follows:

- Thames Water: supplies most of the district.
- Bristol Water: supplies the southwest corner of the district, including Tetbury.
- Severn Trent Water: supplies some western parts of the district, including Chipping Campden, Cowley and Birdlip.

5.84 Water supplied to Cotswold District comes from a mix of groundwater, rivers (Severn and Thames) and reservoirs. The Severn Estuary SAC/SPA/Ramsar and Oxford Meadows SAC are linked to the Plan area via surface waterbodies: Oxford Meadows SAC via the River Thames (Thames Water); and Severn Estuary SAC/Ramsar (and SPA indirectly) via the River Severn (Bristol Water & Severn Trent Water). Development could therefore increase abstraction that affects these sites. No water is supplied from water bodies in Cotswold Lakes and the tributaries of the River Severn/Thames are not a significant source of water supply; therefore, there are no likely significant effects on North Meadow & Clattinger Farm SAC or on bird FLL.

5.85 The majority of the site allocations are in the Thames Water-served areas of the district; therefore, the impacts are most likely to be significant at Oxford Meadows SAC. The Severn Estuary is tidal but water volumes in the upstream river could affect its habitats via, for example, the salinity and nutrient balance; and there may be FLL used by fish in freshwater tributaries from which water is abstracted. Impacts on the Severn Estuary SAC/Ramsar have been screened in as a precaution. Abstraction is unlikely to impact the estuary to the extent that the SPA/Ramsar bird species are significantly affected.

5.86 All of the Local Plan site allocations therefore have the potential to contribute to impacts from abstraction. The policies that would contribute to these impacts are as set out in paragraph Chapter 10345021.

There is the potential for likely significant effects at Oxford Meadows SAC and Severn Estuary SAC/Ramsar (directly, and indirectly via fish FLL), due to water abstraction. These are likely to be significant due to the Local Plan alone.

Summary of screening findings

5.87 The HRA screening was able to rule out likely significant effects in relation to the following impact pathways, which have therefore been screened out:

- Urban edge effects.

5.88 All impact pathways were also screened out for the following two Habitats Sites:

- Bredon Hill SAC; and
- Dixton Wood SAC.

5.89 The screening findings for all other impact pathways are summarised below. Impacts are listed as either 'no impact pathway', 'no likely significant effect' (there is an impact pathway but the scale is sufficiently small that significant effects can be ruled out from the Local Plan alone and in-combination), or 'likely significant effects'.

Physical damage and loss of habitat:

- No impact pathway (screened out): Oxford Meadows SAC, Rodborough Common SAC and direct impacts at Severn Estuary SAC/SPA/Ramsar.
- Likely significant effects (screened in): Cotswold Beechwoods SAC, North Meadow & Clattinger Farm SAC, and Severn Estuary SAC/SPA/Ramsar (bird/fish FLL).

Non-physical disturbance

- No impact pathway (screened out): Cotswold Beechwoods SAC, North Meadow & Clattinger Farm SAC, Oxford Meadows SAC, Rodborough Common SAC and direct impacts at Severn Estuary SAC/SPA/Ramsar.
- No likely significant effects (screened out): Severn Estuary SPA/Ramsar (fish FLL).
- Likely significant effects (screened in): Severn Estuary SAC/Ramsar (bird FLL).

Bird strike

- No impact pathway (screened out): Oxford Meadows SAC, Rodborough Common SAC Cotswold Beechwoods SAC, North Meadow & Clattinger Farm SAC, Severn Estuary SAC (directly and fish FLL).

- Likely significant effects (screened in): Severn Estuary SPA/Ramsar (directly and bird FLL).

Air pollution – vehicle emissions

- No likely significant effects (screened out): Oxford Meadows SAC, Severn Estuary SAC/SPA/Ramsar.
- Likely significant effects (screened in): Cotswold Beechwoods SAC, North Meadow & Clattinger Farm SAC and Rodborough Common SAC.

Air pollution – dust

- No impact pathway (screened out): Cotswold Beechwoods SAC, Oxford Meadows SAC, Rodborough Common SAC, Severn Estuary SAC/SPA/Ramsar (directly and fish FLL).
- No likely significant effects (screened out): Severn Estuary SPA/Ramsar (bird FLL).
- Likely significant effects (screened in): North Meadows & Clattinger Farm SAC.

Recreation pressure

- No likely significant effects (screened out): Oxford Meadows SAC and Severn Estuary SAC/Ramsar (fish FLL).
- Likely significant effects (screened in): Cotswold Beechwoods SAC, North Meadow & Clattinger Farm SAC, Rodborough Common SAC, Severn Estuary SAC/SPA/Ramsar (directly and bird FLL).

Water quality – direct pollution

- No impact pathway (screened out): Rodborough Common SAC.
- No likely significant effects: Severn Estuary SAC/SPA/Ramsar (directly and fish FLL).
- Likely significant effects (screened in): Cotswold Beechwoods SAC, North Meadow & Clattinger Farm SAC, Oxford Meadows SAC and Severn Estuary SPA/Ramsar (bird FLL).

Water quality / quantity– wastewater treatment

- No impact pathway (screened out): Cotswold Beechwoods SAC and Rodborough Common SAC.
- Likely significant effects (screened in): North Meadow & Clattinger Farm SAC, Oxford Meadows SAC, Severn Estuary SAC/SPA/Ramsar (directly and bird/fish FLL).

Water quality / quantity – abstraction

- No impact pathway (screened out): Cotswold Beechwoods SAC and Rodborough Common SAC.
- No likely significant effects (screened out): North Meadow & Clattinger Farm SAC and Severn Estuary SPA/Ramsar (bird FLL).
- Likely significant effects (screened in): Oxford Meadows SAC and Severn Estuary SAC/Ramsar (directly and fish FLL).

5.90 The following policies and all of the plan's site allocations would contribute to one or more of these impact pathways:

- Core Policy 2 Meeting Housing Needs in Cotswold District: Strategic Sites: specifies the scale and location of new strategic housing.
- Core Policy 3 Meeting Housing Needs in Cotswold District: non-Strategic Sites: Specifies the scale and location of non-strategic housing.
- Core Policy 5 Meeting Business and Employment Needs in Cotswold District: specifies the scale and location of opportunities for economic growth to ensure that sufficient new jobs are provided across Cotswold in appropriate locations.
- Core Policy 11 Special Policy Areas – Royal Agricultural University: Supports the expansion / redevelopment of the existing campus and sets out what a masterplan is expected.
- Core Policy 15 Cotswold Airport: supports aviation-related development (and safeguards existing uses).
- Core Policy 16 Thames and Severn Canal: supports development impacting the Canal and towpath.
- Core Policy 17 The River Thames: supports proposals for increased moorings and development related to sport and recreation.

- Core Policy 18 Cotswold Lakes: Post-Mineral Extraction After Use: permits leisure/recreation development on former mineral extraction sites.
- Core Policy 23 Former Cheltenham to Stratford-Upon-Avon Railway Line: permits restoration and reinstatement of railway between Broadway and Honeybourne.
- Core Policy 24: Special Policy Area – Campden BRI: Identifies the type of development suitable at this site and sets out the expectations for masterplans at these locations.
- Core Policy 25: Special Policy Area – Fire Service College: Identifies the type of development suitable at this site and sets out the expectations for masterplans at these locations.
- Core Policy 27 Net Zero Carbon New Buildings: requires all new development to include on-site renewable energy – non-physical disturbance, bird strike.
- Core Policy 28 Renewable and Low Carbon Energy Generation, Storage and Transmission: permits renewable energy and energy storage development – non-physical disturbance, bird strike.
- Core Policy 45 Gypsy and Traveller Accommodation: defines the two locations for gypsy and traveller accommodation.
- Core Policy 46 New Employment Development: identifies broad locations for employment development (assessed in relation to site allocations) and permits some windfall development outside development boundaries.
- Core Policy 49 Development of Tourist Facilities and Visitor Attractions: policy supports proposals for facilities and attractions where they meet requirements – recreation pressure, air pollution, water quality/quantity, and location-based impacts e.g. loss of habitat.
- Core Policy 50 Tourist and Visitor Accommodation: permits new or extended hotels and serviced accommodation in settlement centres – recreation pressure, air pollution, water quality/quantity, and location-based impacts e.g. loss of habitat.
- Core Policy 72 Social and Community Infrastructure: permits new social and community facilities – air pollution, water quality/quantity, and location-based impacts e.g. loss of habitat.
- Development Policy 1 Affordable Housing on Rural Exception Sites: Sets out the circumstances in which windfall development would be permitted in rural areas.

- Development Policy 3 Dwellings for Rural Workers Outside Development Boundaries: Allows some small scale development within rural areas.
- Development Policy 6 Rural Diversification: permits development in rural areas.
- Development Policy 8 New Agricultural and Forestry Development: permits development in rural areas.
- Development Policy 9 Equestrian Related Development: permits development in rural areas.

Chapter 6
Appropriate Assessment

6.1 The Appropriate Assessment provides a more detailed assessment of the likely significant effects identified during the Screening stage. It considers whether, once mitigation is taken into account, there will be adverse effects on the integrity of a Habitats Site.

6.2 The main policy in the Local Plan that provides mitigation for impacts at Habitats Sites is Core Policy 60 Biodiversity and Geodiversity. This policy states that:

Development proposals will be supported where they protect and enhance sites internationally, nationally and/ or locally designated for their importance to natura conservation, ecological or geological value as well as non-designated sites of ecological or geological value. An ecological survey is required to be submitted with the application if the proposed development affects or has the potential to affect any site of biodiversity or geodiversity interest, including:

- any internationally designated Habitats Sites including Special Area of Conservation (SAC), Special Protection Area (SPA) and Ramsar Site
- any nationally designated site, for example: SSSI's and National Nature Reserves
- any locally designated site, for example: Local Wildlife Sites
- priority habitats, and
- protected species:
- special on the Red Data list of threatened species
- habitats suitable for protected species or species on the Red Data list.

Habitats Sites

The highest level of protection will be given to Habitats Sites (formerly known as European Sites). Development will not be permitted if it would adversely affect the integrity of a Habitats Site either alone or in combination with other developments. Proposals having a harmful impact on the integrity of Habitats Sites that cannot be avoided or adequately mitigated will not be permitted.

To mitigate the impacts of development on the Cotswold Beechwoods SAC and the North Meadow and Clattinger Farm SAC, financial contributions can be

secured to fund the mitigation measures identified in the adopted strategies. Alternatively, applicants may submit their own shadow Habitats Regulations Assessment (HRA), demonstrating the likely recreational impacts arising from the development and setting out the mitigation measures that will be implemented for the lifetime of the development to address those impacts.

Mitigation will be required for all new development resulting in a net increase in housing and/or holiday accommodation within the identified Zones of Influence, as shown on the Policies Map and Figure 13.1, including Permitted Development which is required to comply with the Habitats Regulations.

Other Biodiversity and Geodiversity

Development proposals which would result in significant harm to any other biodiversity or geodiversity interest will only be considered for approval after alternative sites that would result in less or no harm have been considered. In the absence of alternative available sites development proposals must include adequate mitigation measures. Where harm cannot be prevented or adequately mitigated against, appropriate compensation measures will be sought.

To ensure that mitigation or compensation measures take place, which may include Biodiversity Offsetting, these will be secured by conditions or planning obligations and will need to include financial support for continued maintenance.

If significant harm to biodiversity of geodiversity cannot be adequately mitigated against, or compensated for, permission will be refused.

The design of development should incorporate measures to improve the biodiversity and geodiversity of the development site. Such measures should include making a contribution to the network of biodiversity sites, including open spaces and green infrastructure and water bodies which make links between habitats and support wildlife. Measures should also attempt to link wildlife habitats together, improving access to, between and across them. These measures will be secured by conditions or planning obligations and many need to include a biodiversity management plan and financial support for continued maintenance.

A biosecurity protocol method statement will be required for all development proposals where there is potential to impact sites protected for biodiversity importance to ensure the introduction of invasive non-native species of both flora and fauna is prevented.

Measures to enhance biodiversity should be designed so as not to increase the risk from bird strike to the operation of aircraft at Kemble Airport and RAF Fairford. Where appropriate, the implementation of a bird hazard management plan will be secured by condition of planning obligation

Irreplaceable Habitats

Development resulting in the loss or deterioration of irreplaceable habitats, according to the latest Defra Biodiversity Metric, will be refused, save for where exceptional circumstances are demonstrated and appropriate mitigation and compensation is provided, including but not limited to:

- Ancient Woodland
- Coastal and Floodplain Grazing Marsh
- Lowland Meadows
- Chalk Rivers/ Streams
- Ancient or Veteran Trees.

6.3 A number of other policies also provide safeguards that are relevant to specific impact pathways. These are identified in the sections below.

Physical damage and loss of habitat

6.4 The HRA screening identified the potential for likely significant effects from damage or loss of habitat at Cotswold Beechwoods SAC (directly), North Meadow & Clattinger Farm SAC (directly) and Severn Estuary SAC/SPA/Ramsar (indirectly, via bird/fish FLL). These may be significant due to the Local Plan alone.

6.5 Direct impacts would occur if development took place within or immediately adjacent to Cotswolds Beechwoods SAC or North Meadow & Clattinger Farm SAC. In practice, this would not be permitted due to Core Policy 60 (see paragraph Chapter 10345021), which states that “Development will not be permitted if it would adversely affect the integrity of a Habitats Site either alone or in combination with other developments”.

6.6 Impacts on FLL would occur if development takes place at site allocations (or windfall development locations) that have moderate or high potential to be used by birds from Severn Estuary SPA/Ramsar, or windfall development immediately adjacent to watercourses hydrologically linked and used by fish from Severn Estuary SAC/Ramsar.

6.7 Core Policy 60 provides some general protection to FLL via the protection of Habitats Sites themselves and biodiversity more generally, for example in relation to priority habitats. The policy also requires ecological surveys where development has the potential to affect Habitats Sites. Additional safeguards are provided within:

- Core Policy 65 Watercourses: "Development of land that contains or is close to, for example 10m, to a watercourse must protect and where possible, enhance the function and setting of the watercourse and its biodiversity. As a last resort development should provide mitigation for any unavoidable impacts. Development should include a 10m buffer zone along a watercourse to conserve and enhance biodiversity. Where a 10m wide buffer zone is not demonstrably possible, a suitable mitigation strategy will be required to prevent harm to biodiversity. Where possible the strategy should also include ecological enhancement to the watercourse." This provides protection for habitats that could be FLL used by fish.
- Development Policy 10 Trees, Hedgerows and Woodlands: provides protection for ancient woodland, hedgerows and woodlands, which are one of the types of habitat that could be FLL used by birds.

6.8 The policies are sufficient to avoid direct impacts from physical damage and loss of habitat, and impacts on FLL used by fish from Severn Estuary SAC/Ramsar. They are also sufficient to avoid adverse effects on bird FLL associated with Severn Estuary SPA/Ramsar from windfall development, as windfall development would be small scale and unlikely to contribute to significant in-combination effects, but any impacts associated with the sites alone would be mitigated by the policies; the general provisions in Core Policy 60 would be sufficient to ensure protection/enhancement/compensation of ecological features generally. Core Policy 65 (and to a lesser extent Development Policy 10) would also reduce the risk of impacts on FLL used by birds from Severn Estuary SPA/Ramsar.

6.9 However, in relation to bird FLL associated with Severn Estuary SPA/Ramsar, adverse effects on integrity could occur, unless more targeted mitigation is provided in the Local Plan. The HRA recommended that policies or development frameworks for site allocations that have been identified as having moderate or high potential to be used by birds from Severn Estuary SPA/Ramsar (listed in **Appendix E** and **Chapter 7**) contain a requirement for ecological survey to determine the site's suitability to be habitat used by Bewick's swan, common shelduck, gadwall, greater white-fronted goose, lesser black-backed gull, herring gull, Eurasian curlew, Eurasian wigeon, northern shoveler, spotted redshank, northern pintail, or lapwing. If the site is of moderate or high suitability, over-wintering bird surveys will be required to confirm whether the site is likely to be functionally linked to the SPA/Ramsar. Sites that are functionally linked will require mitigation, which could include compensatory habitats

on or off site. This recommendation has been addressed in the Regulation 19 Local Plan in a general requirement for the strategic site allocations at the start of Appendix B of the Local Plan, and in the individual Site Development Templates for non-strategic site allocations in Appendix C of the Local Plan.

6.10 The habitats that SPA/Ramsar birds are likely to use within the plan area are common and widespread; and all of the site allocations that have been identified as being of moderate or high potential to be FLL are arable fields. The nature of land use rotation on farmland is such that birds will readily use an available resource, even if available only temporarily; therefore, they are resilient and adaptable to some change. The suitability of sites for use by SPA/Ramsar bird species can change quickly, e.g. due to changes in land management, crops planted, and drainage. It is therefore appropriate for mitigation to be identified at the time of a planning application, so that survey information is up to date. Incorporation of this requirement for bird survey, and if necessary, mitigation within the Local Plan appendices, provides sufficient mitigation for potential in-combination effects of physical damage/loss of bird FLL on a site by site basis.

6.11 It was also recommended that Policy 60 was revised to state: “The highest level of protection will be given to Habitat Sites (formerly known as European Sites). Development will not be permitted if it would adversely affect the integrity of a Habitats Site either alone or in combination with other developments, and directly or via functionally linked habitats.” This recommendation has been addressed in the Regulation 19 Local Plan.

There will be no adverse effects on the integrity of Cotswolds Beechwoods SAC or North Meadow & Clattinger Farm SAC; or Severn Estuary SAC/Ramsar via fish FLL; or Severn Estuary SPA/Ramsar via bird FLL, due to physical damage and loss of habitat.

Non-physical disturbance

6.12 The HRA screening identified the potential for likely significant effects from non-physical disturbance on bird species from Severn Estuary SPA/Ramsar (indirectly, at bird FLL). These may be significant due to the Local Plan alone.

6.13 Impacts on FLL would occur if development takes place at allocated sites (or windfall development locations) that have moderate or high potential to be used by birds from Severn Estuary SPA/Ramsar or are within 500m of locations with moderate/high potential (including within 500m of Cotswold Water Park SSSI). These sites are identified in **Appendix E**.

6.14 Core Policy 60 provides protection to FLL via the protection of Habitats Sites themselves and biodiversity more generally, for example in relation to priority habitats. The policy also requires ecological surveys where development has the potential to affect Habitats Sites. Additional safeguards are provided within:

- Core Policy 66: Pollution and Contaminated Land – states that development will only be permitted if it does not result in unacceptable risk to health or the natural environment from "generation of noise or light levels, or other disturbance such as spillage, flicker, vibration, dust or smell".
- Development Policy 11 Dark Skies – Requires developments with external lighting to minimise light spill/trespass, avoid adverse effects on biodiversity and maintain dark corridors along watercourses, woodland edges and hedgerows.

6.15 These are considered sufficient safeguards to avoid adverse effects from non-physical disturbance.

There will be no adverse effects on the integrity of Severn Estuary SAC/Ramsar via bird FLL, due to non-physical disturbance.

Bird strike

6.16 The HRA screening identified the potential for likely significant effects at Severn Estuary SPA/Ramsar (and near to associated bird functionally linked habitats) as a result of bird strike. These are likely to be significant due to the Local Plan alone.

6.17 Wind turbines and aircraft permitted by the Local Plan have the potential to increase the risk of bird strike through collision where birds are flying between designated sites (e.g. Severn Estuary SPA/Ramsar and Cotswold Water Park SSSI), particularly where development is located within or close to functionally linked habitats, although specific flight routes are uncertain. Land use changes designed to enhance biodiversity at sites near to existing airfields in Kemble and Fairford may also attract birds and increase the risk of bird strike.

6.18 Core Policy 60: Biodiversity and Geodiversity provides general protection for Habitats Sites and would ensure that development that would have an adverse effect on a Habitats Site would not be permitted. The policy also provides some mitigation for the risks associated with development near to existing airfields (within 13km, in line with the Council's guidance **[See reference** 47**]**), stating that: "Measures to enhance biodiversity should be designed so as not to increase the risk from bird strike to the operation of aircraft at Kemble Airport and RAF Fairford. Where

appropriate, the implementation of a bird hazard management plan will be secured by condition of planning obligation".

6.19 For clarity, it was recommended that Cotswold Airport and the similar risks from wind turbines are included within the wording of Policy 60, as shown: "Developments within 13km of Kemble Airport or RAF Fairford or those involving airfield development should be designed so as not to increase the risk from bird strike. Where appropriate, the implementation of a bird hazard management plan will be secured by condition or planning obligation. The siting of wind turbines should also be informed by ecological survey to identify and minimise the risks to birds" The last sentence related to wind turbines could also, or instead, be included in Core Policy 29 Wind Energy Development.

There will be no adverse effects on the integrity of Severn Estuary SPA/Ramsar via bird FLL due to bird strike.

For clarity, policy wording edits are recommended, but this will not affect the conclusions.

Air pollution – vehicle emissions

6.20 The HRA screening identified the potential for likely significant effects at Cotswold Beechwoods SAC, North Meadow & Clattinger Farm, and Rodborough Common SAC (all directly), due to air pollution from vehicle emissions. The assessment of the predicted increases in nitrogen deposition and ammonia on the Habitats Sites' qualifying features has been carried out (**Appendix F**).

6.21 The assessment has enabled adverse effects on integrity to be ruled out in relation to the following:

- North Meadow & Clattinger Farm SAC:
  - Ammonia levels remain below critical levels with the Local Plan and other 'in combination' sources of vehicle emissions.
- Rodborough Common SAC:
  - Screening thresholds not exceeded on the A46 / Selsey Road.
  - Nitrogen deposition effects on the two Spine Road transects have been ruled out as they are roadside only (0.03m) and habitats are likely to be degraded due to the presence of the road.

6.22 However, it has not been possible to rule out adverse effects on integrity at:

- North Meadow & Clattinger Farm SAC:
  - Nitrogen deposition, due to the Local Plan alone and in combination; near the A419.
- Rodborough Common SAC:
  - Ammonia, due to the Local Plan in combination, at both transects on the Spine Road.
- Cotswold Beechwoods SAC
  - Nitrogen deposition and ammonia at all three transects on the B4070, due to the Local Plan alone at Buckholt and in combination at the other two transects.

6.23 Policy 67 Air Quality, provides some mitigation for vehicle emissions by stating that:

Core Policy 67: Air Quality

Development will not be permitted if air pollution impacts lead to significant adverse effects on health, the environment, or protected sites (as defined by the Environment Act 2021) or amenity, including residential amenity.

Applicants must have regard to the most up to date National Guidance and shall, where appropriate, prepare and submit an air quality assessment with their application.

Applicants should demonstrate that:

- any identified emissions will not lead to significant adverse effects on health, the environment or amenity
- development will not lead to an increase in emissions, degradation of air quality or increase in exposure to pollutants at or above the health-based air quality objective and interim targets referenced in the Local Management Technical Guidance (TG22), or latest version
- any impacts on the proposed use from existing poor air quality are appropriately mitigated
- the development promotes sustainable transport measures and use of low emission vehicles to reduce air quality impacts of vehicles, and

- the development is designed in a way to encourage non-habitable rooms on roadside facades (and habitable rooms as far from roads as possible) with consideration for the Design Code requirements for solar gain/ overheating.

Where development proposals would be subject to unacceptable air quality standards or would have an unacceptable impact on air quality standards they will be refused.

[…]

6.24 This policy provides mitigation that may be appropriate for impacts arising from a single site; however, the assessed impacts may require a strategic rather than site-by-site approach.

6.25 Some of the policies in the Local Plan are intended to reduce trips by car and will help to contribute towards a reduction in traffic:

- Core Policy 33 Sustainable Transport & Connectivity: sets out guidelines for the delivery of sustainable modes of transport in new development - relevant to air pollution.
- Core Policy 34 Assessing and Managing Transport Impacts: directs development near to key services and facilities and requires proposals to assess transport impacts - relevant to air pollution.
- Core Policy 35 Active Travel: Walking, Cycling & Wheeling: supports the provision of routes for active transport - relevant to air pollution and recreation pressure.
- Core Policy 37 Public Transport, Shared Transport and Interchanges: addresses how public transport links should be incorporated into development - relevant to air pollution.
- Core Policy 38 Our Kerbside Space and Parking: addresses parking requirements for development proposals, including space for secure cycle parking and electric cycle charging, as well as provision of electric car club schemes - relevant to air pollution.
- Core Policy 39 Electric and Low Emission Vehicles: promotes opportunities for the use of electric and low emission vehicles - relevant to air pollution.
- The Strategic Site Allocation Development Frameworks include Design Principles (in Appendix B of the Local Plan) which require delivery of active travel routes connecting the sites to nearby settlements, rail stations (Kemble) and cycle routes and a strong emphasis on enhancing walking and cycling plus

contributions to improving bus service frequency in some locations. Two strategic allocations (Steadings Southern Extension, Land south of Driffield) will provide a mobility hub that act as a focal point for modal interchange and support sustainable travel choices, and three (Steadings Southern Extension, Land south east of Cirencester and south of Preston and Land surrounding Down Ampney) will deliver bus routes through the site. All strategic allocations require additional proportional contributions to the relevant sub areas (Cirencester, Down Ampney, Driffield, Fairford, Kemble, Moreton-in-Marsh and Mickleton) and district wide mitigation requirements identified in the IDP.

- In addition, the Land south of Driffield strategic allocation refers to a sustainable transport outcome, which will require coordination and collaboration in delivery of shared infrastructure between the Land East of Cirencester and South of Preston, Down Ampney and Driffield sites; collectively providing a transport strategy with key links into Cirencester underpinned by active mode and public transport networks. Where one site is brought forward ahead of the others it will need to consider how this infrastructure is phased and attributed across the sites.

6.26 The reduction in AADT forecasts taking into account the mitigation provided by these policies has been modelled by City Science, but is not large enough to result in AADTs below the screening threshold of 1,000 for vehicles and 200 for HDVs on the relevant roads referred to in paragraph 6.21. However, further air quality assessment is being undertaken to determine whether the critical levels/loads for nitrogen deposition and ammonia would still be exceeded taking this mitigation into account. If so, the need for further mitigation within the Local Plan policies and what this needs to comprise will be discussed with Natural England and agreed in a Statement of Common Ground prior to Submission of the Local Plan.

Adverse effects on the integrity of Cotswold Beechwoods SAC, North Meadow & Clattinger Farm, and Rodborough Common SAC due to air pollution from vehicle emissions are uncertain. The conclusions are pending updated air quality assessment and agreement of appropriate mitigation with Natural England.

Air pollution – dust

6.27 The HRA screening identified potential likely significant effects at North Meadow & Clattinger Farm SAC (directly), due to dust. These may be significant due to the Local Plan alone.

6.28 Core Policy 60 (see paragraph Chapter 10345021) provides general protection for Habitats Sites and biodiversity more generally and Policy 67 provides more specific mitigation relevant to air quality (see paragraph Chapter 10345021). The following policy provides additional safeguards, in relation to dust at these Habitats Sites:

- Core Policy 66: Pollution and Contaminated Land – states that development will only be permitted if it does not result in unacceptable risk to health or the natural environment from "generation of noise or light levels, or other disturbance such as spillage, flicker, vibration, dust or smell".

6.29 These are considered sufficient safeguards to avoid adverse effects on integrity from air pollution due to dust.

There will be no adverse effects on the integrity of North Meadow & Clattinger Farm SAC, due to dust.

Recreation pressure

6.30 The HRA screening identified potential likely significant effects at Cotswold Beechwoods SAC (directly), North Meadow & Clattinger Farm SAC (directly), Rodborough Common SAC (directly) and Severn Estuary SPA/Ramsar (directly; and indirectly via bird FLL), due to recreation pressure. These are likely to be significant due to the Local Plan in combination with other plans, for example residential development allocated in the Stroud, South Gloucestershire or Wiltshire Local Plans.

6.31 The following policies in the Local Plan contribute to mitigation from recreation pressure impacts:

- Core Policy 60 Biodiversity and Geodiversity: states that "To mitigate the impacts of development on the Cotswold Beechwoods SAC and the North Meadow and Clattinger Farm SAC, financial contributions can be secured to fund the mitigation measures identified in the adopted strategies. Alternatively, applicants may submit their own shadow Habitats Regulations Assessment (HRA), demonstrating the likely recreational impacts arising from the development and setting out the mitigation measures that will be implemented for the lifetime of the development to address those impacts. Mitigation will be required for all new development resulting in a net increase in housing and/or holiday accommodation within the identified Zones of Influence, as shown on the Policies Map and Figure 13.1, including Permitted Development which is required to comply with the Habitats Regulations."

- Core Policy 68 Planning for Health and Wellbeing: includes a requirement for major developments to demonstrate how they have incorporated open/green spaces, which would help to alleviate recreation pressure on the Habitats Sites.
- Core Policy 70 Green and Blue Infrastructure: supports the implementation of well-considered, integrated Green and Blue Infrastructure into major development schemes.
- Core Policy 71 Management of Accessible Green Open Spaces in Residential Developments: States that "Large developments are expected to provide their own ANRG [Alternative Natural Recreational Greenspaces]. Where the sites are unable to provide ANRG capacity, the option remains for large developments to provide an off-site ANRG or purchase ANRG capacity from third party providers if available and within the catchment of the development. Where a large allocation requiring a bespoke ANRG has been subdivided into smaller sites for development, developers will be encouraged to work with one another to secure a bespoke ANRG solution. Where this is not possible the option remains for these sites to provide an off-site ANRG or purchase ANRG capacity from third party providers." It also requires long-term management of the Accessible Green Open Spaces, where delivered in a development.
- Core Policy 6 Infrastructure Delivery: Ensures that new services and facilities are delivered alongside new housing and employment.

6.32 There is additional information in the supporting text of Policy 60, which states: "Where Alternative Natural Recreational Greenspace (ANRG) and Strategic Access Management and Monitoring (SAMM) mitigation measures are required for residential development, the Council will follow a consistent approach to mitigation, based on the zone of influence (as identified on the Policies Map). The approach is set out in Core Policy 71. The zones of influence for the North Meadow SAC are defined as:

- a straight-line distance of between 0 and 4.2 kilometres from the SAC boundary. Within this zone, measures must be provided for all residential proposals for 1 or more net new dwellings to ensure that the integrity of the SAC is protected. Mitigation measures will be based on a combination of the provision of ANRG and SAMM measures and will be delivered prior to occupation and managed in perpetuity in accordance with the ANRG Management Plan, and
- a straight-line distance of between 4.2 and 9.4 kilometres from the SAC boundary. Within this zone, measures must be provided for all residential proposals for 1 or more net new dwellings to ensure that the integrity of the SAC is protected. For most developments, mitigation measures will be limited to SAMM measures, however larger developments may need to provide additional

mitigation in the form of ANRG as advised by Natural England on a case-by-case basis."

6.33 Only a very small area of the district is within the ZOI for Rodborough Common or the ZOI for Severn Estuary SAC/SPA/Ramsar. There are no site allocations in these areas, although rural development / windfall could in theory result in residential development within the ZOI/s. Safeguards within Core Policy 60, which states that "The design of development should incorporate measures to improve the biodiversity and geodiversity of the development site. Such measures should include making a contribution to the network of biodiversity sites, including open spaces and green infrastructure and water bodies which make links between habitats and support wildlife" are sufficient to avoid adverse effects on integrity at these Habitats Sites, due to recreation pressure associated with windfall development.

6.34 Indirect impacts on Severn Estuary SPA/Ramsar, via functionally linked habitats could occur if visitor numbers significantly increase at Cotswold Water Park SSSI (other habitats that have been identified as having potential to be bird FLL are arable fields or other common habitats types without significant public access). The majority of the accessible lakes are managed by the Cotswold Lakes Trust, Gloucestershire Wildlife Trust and Wiltshire Wildlife Trust **[See reference** 48**]**.

6.35 The accessible lakes are well managed for visitor access to nature, with visitors encouraged to visit the site for its nature interest and to use designated paths **[See reference** 49**]**; and access to some is restricted during bird nesting season **[See reference** 50**]**. This management of access to the lakes within the SSSI means that there will be no adverse effects on the Severn Estuary SPA/Ramsar, via bird FLL at the SSSI.

6.36 Impacts on Cotswold Beechwoods SAC have been identified as arising from residential development within 15.4km of the SAC; i.e. A2, C71, C81B, K7A, K15, T31B, T71A, K7B; and strategic sites: Steadings southern extension, New settlement at Cotswold Airport, and Land south west of Kemble.

6.37 There is an existing mitigation strategy for recreation pressure at Cotswold Beechwoods SAC **[See reference** 51**]** which requires residential development within the 15.4km ZOI to:

- Contribute (per dwelling) to Strategic Access Management and Monitoring (SAMM); and
- Provide or contribute towards Suitable Alternative Natural Greenspace (SANG) – new accessible green space that will divert some of the trips arising from new development that would otherwise have gone to the SAC (e.g. local trips for dog walking).

6.38 The majority of the residential development proposed on sites within the Cotswold Beechwoods SAC ZOI is also within the ZOI of North Meadow and Clattinger Farm SAC; therefore, a Recreation Mitigation Study has been prepared for CDC to identify the locations in which SANG could be provided **[See reference 52]**.

6.39 Impacts on North Meadow and Clattinger Farm SAC have been identified as arising from residential development within 9.4km of the SAC, i.e. C81B, F20A, F29C, F52, F53A, R203A-C, R607, SD15, SD17, SD23; and strategic sites: Steadings southern extension, Land east of Kingshill Lane, Land south east of Cirencester and south of Preston, Land south west of Siddington, Land south of Driffield, Land surrounding Down Ampney, and Land north east of Fairford.

6.40 As for Cotswold Beechwoods SAC, there is an existing (interim) mitigation strategy **[See reference 53]**, which has been revisited in the Cotswold SANG study (reference 52, as above), and mitigation is set out within Policy 60 (see paragraph Chapter 10345021-Chapter 10345021). Based on the number of proposed homes to be delivered within the ZOIs for both SACs, the Recreation Mitigation Study identifies a need for 60.77ha of SANG and 70.08ha of ANRG. The majority of the new homes will be delivered by strategic site allocations, and it is expected that these will provide most, if not all, of the SANG and ANRG mitigation onsite. High level masterplanning to date has shown the following land available for SANG/ANRG at strategic sites:

- Cirencester: Land east of Kingshill Lane – no requirement for SANG/ANRG:
- Cirencester: Land south east of Cirencester and south of Preston – no requirement for SANG/ANRG;
- Cirencester: Steadings southern extension – 10.3ha SANG required; 26.6ha SANG proposed;
- Land surrounding Down Ampney – 29.18ha ANRG required; 32ha ANRG proposed;
- Land south of Driffield – 19.18ha ANRG required; 51.7ha ANRG proposed;
- Land northeast of Fairford – no requirement for SANG/ANRG;
- Land south west of Kemble – 17.93ha SANG required; 19.3ha SANG proposed; and
- Land southwest of Siddington – no requirement for SANG/ANRG.

6.41 Between them, these sites have the capacity to provide sufficient SANG/ANRG for all of the allocated development within the ZOIs of the SACs. However, there is a need to secure an additional 18.84 ha of SANG for the 1,070 dwellings delivered by non-strategic residential and windfall development within the Cotswold Beechwoods

SAC ZOI. These sites are likely to be too small to deliver SANG or ANRG of sufficient scale on-site.

6.42 The Recreation Mitigation Study states that "To maintain flexibility and support sustainable growth, financial contributions may therefore be secured in lieu of on-site provision and used to purchase units or capacity at a Strategic SANG or capacity at other mitigation sites." It also states "a site to the south of the Kemble Strategic site allocation has been identified within the Masterplanning work to be available and capable of providing sufficient SANG capacity. It is located within the vicinity of the majority of the proposed development within the district and has a reasonable prospect of being delivered to meet the SANG needs. This site would be designated as a Strategic SANG, and, with the agreement of NE, would need to be brought up to SANG standard."

6.43 The evidence within the Recreation Mitigation Study, which has informed the identification of specific on-site SANG/ANRG requirements within strategic allocations, plus the identification of a Strategic SANG site enables residential development proposed in the Local Plan to avoid adverse effects on the integrity of Cotswold Beechwoods SAC and North Meadow & Clattinger Farm SAC.

There will be no adverse effects on the integrity of Cotswolds Beechwoods SAC, North Meadow & Clattinger Farm SAC; Rodborough Common SAC, or Severn Estuary SAC/Ramsar via bird FLL, due to recreation pressure.

Water quality – direct pollution

6.44 The HRA screening identified the potential for likely significant effects at Cotswold Beechwoods SAC (directly), North Meadow & Clattinger Farm SAC (directly), Oxford Meadows SAC (directly) and Severn Estuary SPA/Ramsar (indirectly, via bird FLL), due to direct water pollution. These are likely to be significant due to the Local Plan alone (at the SACs) and in combination with other plans/projects e.g. development near the estuary from the Stroud or South Gloucestershire Local Plans (at the SPA/Ramsar).

6.45 Core Policy 60 (see paragraph Chapter 10345021) provides general protection for Habitats Sites and biodiversity more generally. The following policies provide specific safeguards, in relation to direct water pollution:

- Core Policy 65: Watercourses – states that "Development of land that contains or is close to, for example 10m, to a watercourse must protect and where possible, enhance the function and setting of the watercourse and its

biodiversity. As a last resort development should provide mitigation for any unavoidable impacts. Development should include a 10m buffer zone along a watercourse to conserve and enhance biodiversity. Where a 10m wide buffer zone is not demonstrably possible, a suitable mitigation strategy will be required to prevent harm to biodiversity. Where possible the strategy should also include ecological enhancement to the watercourse." In addition, "Major development proposals which are located within 20m of a watercourse may need an accompanying Construction Management Plan. This will be dependent upon, and in agreement with, the Council before commencement of work to ensure that the watercourse will be satisfactorily protected from damage, disturbance or pollution."

- Core Policy 64: Water Management Infrastructure – states that "Proposals will be permitted that…c) do not result in a demonstrable deterioration in water quality of the water environment, as required by the Water Framework Directive (WFD) (or its successor). Development should not prevent a waterbody achieving 'Good' Status for WFD, and where possible should lead to improvements to current WFD status. Where a need for improvement or a risk of deterioration in water quality is identified, the Council will require satisfactory improvement or mitigation measures to be implemented in full prior to occupation of the development, and d) incorporate integrated, suitable and multi-functional Sustainable Drainage Systems (SuDS) in all such development, unless demonstrably in appropriate. Proposals will be permitted that do not result in pollution of groundwater sources. Development proposals within Source Protection Zone 1 (SPZ1) will be designed to allow for contamination being encountered and for restrictions on deep penetrative foundation methods, together with avoidance of: deep borehole soakaways; foul sewage discharge to groundwater; direct discharge of hazardous substances to groundwater; discharge of trade effluent to ground water; and underground oil storage tanks."
- Core Policy 66: Pollution and Contaminated Land – states that development will only be permitted if it does not result in unacceptable risk to health or the natural environment from "pollution of the air, land, surface water, or ground water sources".
- Core Policy 63: Managing Flood Risk – requires developments to incorporate sustainable drainage systems.

6.46 These are considered sufficient safeguards to avoid adverse effects from direct pollution.

There will be no adverse effects on the integrity of Cotswold Beechwoods SAC, North Meadow & Clattinger Farm SAC, Oxford Meadows SAC or Severn Estuary SPA/Ramsar, due to direct pollution.

Water quality/quantity – abstraction and wastewater treatment

6.47 The HRA screening identified the potential for likely significant effects at North Meadow & Clattinger Farm SAC (directly), Oxford Meadows SAC (directly), Severn Estuary SAC (directly), SAC/Ramsar (indirectly; via fish FLL) and SPA/Ramsar (indirectly; via bird FLL), due to wastewater treatment; and at Oxford Meadows SAC and Severn Estuary SAC/Ramsar (directly, and indirectly via fish FLL), due to water abstraction. These are likely to be significant due to the Local Plan alone.

6.48 Water abstraction and the discharge of treated wastewater into waterbodies is controlled by environmental permitting by the Environment Agency; and water companies have a duty to deliver services while meeting their obligations under the Habitats Regulations and Water Framework Directive. To ensure that the infrastructure required to deliver water supply and wastewater treatment meet the expected demand (e.g. from the Local Plan and other development in the region), water companies produce Water Resources Management Plans and Drainage and Wastewater Management Plans. The statuses of these are:

- Severn Trent Water: WRMP24 published April 2025 **[See reference** 54**]**, DWMP28 in progress **[See reference** 55**]**.
- Thames Water: WRMP24 published October 2025 **[See reference** 56**]**, SWMP28 in progress **[See reference** 57**]**
- Wessex Water (wastewater treatment only, within the district): DWMP28 in early stages of preparation **[See reference** 58**]**
- Bristol Water (water supply only, within the district): WRMP24 published in October 2024 **[See reference** 59**]**

6.49 The WRMPs and DWMPs were produced before the location and quantum of development within the Local Plan was confirmed. The Council therefore needs to confirm that the development proposed to come forward in the Local Plan, and its phasing, can be accommodated by the water companies; and therefore that there will be no adverse effects on Habitats Sites (which could arise if the capacity was exceeded). The Council commissioned a Water Cycle Study (WCS) **[See reference** 60**]**, which identifies existing infrastructure capacity and explores future water supply

and wastewater treatment needs and capacity. A WCS requires engagement with stakeholders and the Council has collaborated with water companies and requested comments on housing growth impacts on infrastructure, to ensure that the Local Plan aligns with infrastructure provision.

6.50 The WCS explains that water supply is provided predominantly by Thames Water in the plan area. Bristol Water and Severn Trent Water also supply small areas. Thames Water provided a site-by-site assessment of potential allocations in their supply area. This identified 15 sites where further modelling by TW would definitely be required, and a further 20 where modelling may be required, in both cases, upgrades to the water supply network may be needed to accommodate development. The WCS concludes that upgrades to the local supply network would be funded as part of the developer infrastructure charge. Early engagement between developers, CDC and the water companies is recommended at the planning application stage to ensure upgrades are in place prior to occupation.

6.51 In terms of wastewater treatment, the WCS found that five wastewater treatment works (WwTWs) are expected to have capacity for growth during the plan period and will not require further upgrades for capacity. Seven WwTWs are expected to exceed their permit limit during the Local Plan period or be close to their permit limit by the end of the plan period. Where an increase in capacity may be required, sufficient time is needed for the water company to plan and deliver the upgrade scheme. This would typically be planned for delivery in the next AMP period. i.e. a need to upgrade a WwTW would be identified in DWMP28 and delivered between 2030 and 2035. Therefore, these seven WwTWs that are already at their permit limit and do not have upgrades planned within this AMP period may constrain development within the first five years of the plan. Beyond 2030, there should be sufficient time once the Local Plan is adopted for water companies to provide additional capacity where required. None of the strategic site allocations will be coming forward before 2030 and CDC will be preparing Statements of Common Ground with the water companies to ensure the phasing of infrastructure delivery aligns with the phasing of site allocations within the Local Plan.

6.52 The following policies within the Local Plan will also reduce the demand for water and ensure that required infrastructure is delivered prior to development:

- Core Policy 64: Water Management Infrastructure – sets out the requirement for adequate water and wastewater infrastructure associated with development, and states that any required infrastructure must be in place prior to the occupation of development or within a timeframe agreed by the Local Planning Authority. The policy defines a water efficiency standard of 100 litres per person per day for new dwellings. Non-residential development will be required to meet BREEAM water-efficiency credits or their latest equivalent.

- Core Policy 6 Infrastructure Delivery: sets out the mechanisms by which new services and facilities will be delivered alongside new housing.

There will be no adverse effects on the integrity of Oxford Meadows SAC and Severn Estuary SAC/Ramsar (directly and fish FLL) due to water abstraction as there are measures in place to ensure that the required water abstraction to meet planned growth in the Local Plan can be accommodated.

Adverse effects on the integrity of North Meadow & Clattinger Farm SAC, Oxford Meadows SAC, Severn Estuary SAC/SAC/Ramsar (bird/fish FLL) due to wastewater treatment are uncertain pending completion of Statements of Common Ground and confirmation from the water companies that sufficient upgrades in wastewater treatment capacity will be delivered prior to development at the strategic site allocations.

Chapter 7
Conclusions and next steps

7.1 The HRA screening identified likely significant effects relation to physical damage and loss of habitat; non-physical disturbance; bird strike; air pollution from vehicle emissions and dust; recreation pressure; water quality from wastewater treatment and direct pollution; and water quantity.

7.2 However, the Appropriate Assessment has been able to rule out adverse effects on the integrity of Habitats Sites due to physical damage and loss of habitat, non-physical disturbance, bird strike, dust, recreation pressure, direct water pollution and water abstraction by taking into account additional evidence and safeguards within the Local Plan policies.

7.3 Adverse effects on integrity could not be ruled out for the following:

- Air pollution from vehicle emissions – further work, including consultation with Natural England, is required to inform the identification of mitigation, in relation to Cotswold Beechwoods SAC, North Meadow & Clattinger Farm SAC, and Rodborough Common SAC.
- Water quality (wastewater treatment) – requires agreed Statements of Common Ground with water companies that required wastewater treatment capacity upgrades will be delivered prior to development of strategic site allocations within the Local Plan.

7.4 The work required to resolve these outstanding issues is set out below.

7.5 This HRA will be published alongside the Local Plan, as part of the Regulation 19 consultation. If there are any issues arising from consultees' comments on the Reg.19 HRA or from further evidence work, this will be documented in an addendum to the HRA and/or Statements of Common Ground (as required), prior to Submission and/or during the Examination period. If there are main modifications to the plan, following Examination, these will be subject to HRA.

Air quality assessment

7.6 The modelled traffic forecasts including sustainable transport policies within the Local Plan and other interventions need to be incorporated into the air quality model to understand the potential influence of the mitigation on vehicle emissions over the plan period, and whether the critical levels/loads would still be exceeded for the three SACs identified above. Natural England will also need to be consulted to inform any

further mitigation the Local Plan might need to provide. Any further information and assessment will be documented in an addendum to this HRA, and agreements with Natural England will be documented in a Statement of Common Ground.

Wastewater treatment capacity

7.7 Seven WwTWs are expected to exceed their permit limit during the Local Plan period or be close to their permit limit by the end of the plan period. Where an increase in wastewater treatment capacity may be required, sufficient time is needed for the water company to plan and deliver the upgrade scheme. This would typically be planned for delivery in the next AMP period. i.e. a need to upgrade a WwTW would be identified in DWMP28 and delivered between 2030 and 2035. None of the strategic site allocations will be coming forward before 2030 and CDC will be preparing Statements of Common Ground with the water companies to ensure the phasing of wastewater treatment infrastructure delivery aligns with the phasing of site allocations within the Local Plan.

LUC

July 2026

Appendix A

Attributes of Habitats Sites considered in the HRA

A.1 This appendix contains information about the Habitats Sites scoped into the HRA. Information about each site's area, the site descriptions, qualifying features and pressures and threats are drawn from Natural England's Site Improvement Plans (SIPs), Supplementary Advice Notes, and the Standard Data Forms or Ramsar Information Sheets available from the JNCC website. Site conservation objectives are drawn from Natural England's website and are only available for SACs and SPAs.

Bredon Hill SAC

Site description

A.2 Bredon Hill is an outlier of the Cotswolds with remnants of wood pasture and many veteran trees. Their dead wood supports one of the three known populations of the Violet click beetle *Limoniscus violaceus*, in the UK.

Qualifying features

A.3 Annex II species that are a primary reason for selection of this site:

- 1079 Violet click beetle *Limoniscus violaceus*

Conservation objectives

A.4 Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the Favourable Conservation Status of its Qualifying Features, by maintaining or restoring;

- The extent and distribution of the habitats of qualifying species;
- The structure and function of the habitats of qualifying species;
- The supporting processes on which the habitats of qualifying species rely;
- The populations of qualifying species; and
- The distribution of qualifying species within the site.

Key vulnerabilities

A.5 The main current threats to the site include:

- Forestry and Woodland Management - The lack of succession in veteran tree cohorts is an issue, as current planting will only benefit the beetles after about 400 years and it is uncertain how long tree surgery will prolong the veterans' lives. The beetle depends on the production of humid wood mould within decaying trees and the amount of available wood mould in the SAC is unknown.

- Feature Location/Extent/Condition Unknown - There is a current lack of information on the distribution across the site of the rare and secretive Violet click beetle.
- Disease - Ash die-back caused by the *Chalara fraxinea* fungus threatens the large number of current veteran ash trees and their replacements on which the Violet click beetle depends. Whilst the beetle is known to use other species elsewhere (eg Windsor), ash dominates the trees on Bredon Hill. The scale of this impact on the persistence and continuity of wood mould is uncertain and is likely to be beyond human control.
- Air Pollution: impact of atmospheric nitrogen deposition - Nitrogen deposition exceeds site relevant critical loads. This site is sensitive to nitrogen deposition.
- Climate Change - The likelihood of increased violent storm events and the viability of ash in a changed environment threatens the veteran ash trees on which the beetle depends.

Non-qualifying habitats and species on which the qualifying habitats and/or species depend

A.6 Violet click beetle

- Habitat preferences – ancient and veteran trees
- Diet – wood mould

Cotswold Beechwoods SAC

Site description

A.7 The Cotswold Beechwoods represent the most westerly extensive blocks of *Asperulo-Fagetum* beech forests in the UK.

A.8 The woods are floristically rich, and rare plants include red helleborine *Cephalanthera rubra*, stinking hellebore *Helleborus foetidus*, narrow-lipped helleborine *Epipactis leptochila* and wood barley *Hordelymus europaeus*. There is a rich mollusc fauna. The woods are structurally varied, including blocks of high forest and some areas of remnant beech coppice.

Qualifying features

A.9 Annex 1 habitats that are a primary reason for the selection of this site:

- 9130 *Asperulo-Fagetum* beech forests

A.10 Annex I habitats present as a qualifying feature, but not a primary reason for selection of this site:

- 6210 Semi-natural dry grasslands and scrubland facies on calcareous substrates (*Festuco-Brometalia*) (important orchid sites)

Conservation objectives

A.11 Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the Favourable Conservation Status of its Qualifying Features, by maintaining or restoring;

- The extent and distribution of qualifying natural habitats;
- The structure and function (including typical species) of qualifying natural habitats; and
- The supporting processes on which qualifying natural habitats rely.

Key vulnerabilities

A.12 The main current threats to the site include:

- Invasive Species - The dumping of garden waste and the consequent spread of invasive plants is an on-going threat. The spread of the non-native sycamore provides a challenge and has made particular use of canopy gaps created by storm damage. Although sycamore is considered an acceptable component of woodlands, including beechwoods, on the continent, in the Cotswold it tends to dominate understorey and canopy to the detriment of other (native) tree species.
- Deer - Deer browsing of regenerating trees (and possibly ground flora) remains a major threat to favourable condition throughout the beechwoods.
- Invasive Species - Grey squirrel numbers have increased sharply over the past decade or so and now cause significant damage to tree species, in particular beech. In places, this can lead to pole stage beech being systematically ring barked and killed.
- Disease - Although not known to be present in the Cotswold as yet, Chalara (ash disease) is a major future threat to the beechwoods.
- Public Access/Disturbance - . A particular increase has been the use of mountain bikes and horse-riding which use the woods far beyond the limited network of bridleways. This has created numerous additional trackways and so increasing the erosion of the ground flora and potentially opportunities for water erosion. Although the routes away from bridleways are not usually permitted, much of the SAC woodland is NNR or has public access by foot. Additionally, dog walking has increased within the SAC especially at Coopers Hill where car parking is available. This has become a particular issue where professional dog walkers release large numbers of dogs (up to 12) to run uncontrolled through the woods. This causes disturbance to wildlife as well as local nutrification through dog faeces.
- Changes in Species Distributions - There is a risk that global warming will increase the risk of drought to beech trees (which are shallow rooted).
- Air Pollution: impact of atmospheric nitrogen deposition - Nitrogen deposition exceeds site relevant critical loads. High atmospheric nitrogen levels could affect the SAC features through: changes in ground vegetation and mycorrhiza; nutrient imbalance; changes to soil fauna; increase in tall grasses; decline in diversity; increased mineralisation; N leaching; or surface acidification.

Non-qualifying habitats and species on which the qualifying habitats and/or species depend

A.13 The qualifying habitats rely upon soil quality and water quality/quantity.

Dixton Wood SAC

Site description

A.14 Violet click beetle *Limoniscus violaceus* was discovered at Dixton Wood in 1998 and it has been found at the site on a single occasion subsequently. It is

A.15 a small site with large number of ancient ash *Fraxinus excelsior* pollards, and supports a rich fauna of scarce invertebrate species associated with decaying timber on ancient trees.

Qualifying features

A.16 Annex II species that are a primary reason for selection of this site:

- 1079 Violet click beetle *Limoniscus violaceus.*

Conservation objectives

A.17 Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the Favourable Conservation Status of its Qualifying Features, by maintaining or restoring;

- The extent and distribution of the habitats of qualifying species;
- The structure and function of the habitats of qualifying species;
- The supporting processes on which the habitats of qualifying species rely;
- The populations of qualifying species; and
- The distribution of qualifying species within the site.

Key vulnerabilities

A.18 The main current threats to the site include:

- Changes in Species Distributions - Because of its rarity and highly specialised ecology associated with decaying wood and leaf litter in tree cavities, specialist involvement is required for survey, monitoring and the provision of detailed habitat management advice.

- Forestry and Woodland Management - The beetle depends on the production of humid wood mould where it lives for part of its life cycle within decaying trees; this is typically found in veteran trees where they show signs of rot. The amount of suitable and available wood mould in the SAC is unknown. The lack of succession in veteran cohorts is an issue and it make the need for extending the life of the existing veteran trees even more important.
- Disease - Ash dieback disease *Chalara fraxinea* is a potential threat to the site. The Violet click beetle population at Dixton Wood is thought only to use ash trees.

Non-qualifying habitats and species on which the qualifying habitats and/or species depend

A.19 Violet click beetle

- Habitat preferences – ancient and veteran trees
- Diet – wood mould

North Meadow & Clattinger Farm SAC

Site description

A.20 North Meadow & Clattinger Farm Meadows SAC consists of a series of traditionally managed unimproved grasslands within the floodplain of the Upper Thames which continue to be managed as pasture and as hay-meadow.

A.21 It contains a rich variety of species-rich grassland types including the rare MG4 community for which the SAC is designated as well as a number of notable plant species. These grasslands represent rare and scattered remnants of a much more widespread unimproved grassland habitat before agricultural intensification and extensive gravel quarrying locally were responsible for widespread losses of this habitat and its subsequent fragmentation.

Qualifying features

A.22 Annex I habitats that are a primary reason for selection of this site:

- 6510 Lowland hay meadows (*Alopecurus pratensis, Sanguisorba officinalis*)

Conservation objectives

A.23 Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the Favourable Conservation Status of its Qualifying Features, by maintaining or restoring;

- The extent and distribution of qualifying natural habitats;
- The structure and function (including typical species) of qualifying natural habitats; and
- The supporting processes on which qualifying natural habitats rely.

Key vulnerabilities

A.24 The main current threats to the site include:

- Inappropriate Water Levels - An effective WLMP needs to be in place in order to protect the integrity of the site. There have been several

unseasonal floods over the last six years which are beginning to cause changes and losses in the vegetation communities on the site.

- Water Pollution - Both sediment and nutrient input are of concern. A diffuse pollution plan is in place and catchment sensitive farming initiative covers the catchment. Diffuse pollution has the potential to affect aquatic habitats and species as well as habitat quality in areas of riverside habitat supporting *Vertigo moulinsiana*. Diffuse pollution is arising from highway runoff as well as from farmland. Pollution also results from overflowing sewers (a result of high groundwater levels infiltrating sewers) with ongoing/recurring incidents at numerous locations on the River Lambourn.
- Habitat Fragmentation - The two component SSSIs are located 8km apart. Inclusion and restoration of a number of intervening sites locally would increase the habitat, thereby making it more resilient to fluctuating water levels in the face of climate change. The NNR team at North Meadow has, over a number of years, been working to achieve this aim. Also, one option is that additional land should be included within the North Meadow SSSI for this purpose. This would help buffer the site, possibly provide space for adaptation in anticipation of the effects of climate change, and better manage visitor impacts. Clattinger forms part of a more extensive site which provides good opportunities for on-site management.
- Commons Management - Fencing is required to keep livestock from straying off site. North Meadow NNR is common land and it is the responsibility of neighbouring landowners to erect fences. There are a number of problems involved in achieving this.
- Public Access/Disturbance - There is increasing visitor pressure especially during the flowering time of Snake's-head Fritillary leading to localised damage on sites in the SAC.
- Water Pollution - The SAC's hay meadow vegetation communities are sensitive to elevated nutrient levels. With increasing flooding there is an increased risk of flood water carrying diffuse pollution onto the site and causing soil enrichment with negative consequences for the species richness of the meadows.

Non-qualifying habitats and species on which the qualifying habitats and/or species depend

A.25 The qualifying habitats rely upon soil quality and water quality/quantity.

Oxford Meadows SAC

Site description

A.26 Oxford Meadows is one of two SACs that represent lowland hay meadows (*Alopecurus pratensis, Sanguisorba officinalis*) in the Thames Valley. It includes vegetation communities that are perhaps unique in the world in reflecting the influence of long-term grazing and hay-cutting on lowland hay meadows. The site has benefited from the survival of traditional management, which has been undertaken for several centuries, and so exhibits good conservation of structure and function. The site is selected because Port Meadow is the larger of only two known sites in the UK for creeping marshwort *Apium repens*.

Qualifying features

A.27 Annex I habitats that are a primary reason for selection of this site:

- H6510 Lowland hay meadows (*Alopecurus pratensis, Sanguisorba officinalis*)
- S1614 *Apium repens*: Creeping marshwort

Conservation objectives

A.28 Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the Favourable Conservation Status of its Qualifying Features, by maintaining or restoring:

- The extent and distribution of qualifying natural habitats and habitats of qualifying species
- The structure and function (including typical species) of qualifying natural habitats
- The structure and function of the habitats of qualifying species
- The supporting processes on which qualifying natural habitats and the habitats of qualifying species rely
- The populations of qualifying species, and,
- The distribution of qualifying species within the site.

Key vulnerabilities

A.29 The main current threats to the site include:

A.30 Hydrological changes: A recent survey (August 2014) indicates the Apium repens population in Port Meadow has significantly declined in size. It is considered that this change may be associated directly or indirectly with hydrological changes possibly deeper, more prolonged and frequent flood episodes. Adjustment of the water level management is proposed as a means to help mitigate for these changes.

A.31 Invasive species: The interest features for Oxford Meadows SAC are MG4 grassland and *Apium repens*. The *Apium repens* only occurs on Port Meadow SSSI. The concern is that *Crassula* will spread to the lower areas on Port Meadow where the *Apium repens* occurs and that it will swamp it out.

Non-qualifying habitats and species on which the qualifying habitats and/or species depend

A.32 The qualifying habitats rely upon soil quality and water quality/quantity.

Rodborough Common SAC

Site description

A.33 Rodborough Common is the most extensive area of semi-natural dry grasslands surviving in the Cotswolds of central southern England, and represents CG5 *Bromus erectus – Brachypodium pinnatum* grassland, which is more or less confined to the Cotswolds.

A.34 The site contains a wide range of structural types, ranging from short turf through to scrub margins, although short-turf vegetation is mainly confined to areas of shallower soils.

Qualifying features

A.35 Annex I habitats that are a primary reason for selection of this site

- 6210 Semi-natural dry grasslands and scrubland facies on calcareous substrates (*Festuco-Brometalia*) (important orchid sites)

Conservation objectives

A.36 Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the Favourable Conservation Status of its Qualifying Features, by maintaining or restoring;

- The extent and distribution of qualifying natural habitat;
- The structure and function (including typical species) of qualifying natural habitat; and
- The supporting processes on which qualifying natural habitat rely.

Key vulnerabilities

A.37 The main current threats to the site include:

- Undergrazing - Undergrazing is an issue due to the reliance on the rights of commoners to turn out cattle. The number of stock have dropped over the years to the point that additional cattle now need to be electric fenced on to the most species-rich areas on the slopes. It is the lower slopes that are the most species-rich and are suffering from a lack of grazing.

- Public Access/Disturbance - The common is very close to Stroud and recreational use has greatly increased over the past few decades. This has created many new paths and parking areas which cause soil compaction to the detriment of the surrounding sward. Dog faeces is a particular issue which also damages the sward. New and proposed housing continues to add to the problem.
- Air Pollution: risk of atmospheric nitrogen deposition - Nitrogen deposition exceeds the site-relevant critical load for ecosystem protection and hence there is a risk of harmful effects, but the sensitive features are currently considered to be in favourable condition on the site.

Non-qualifying habitats and species on which the qualifying habitats and/or species depend

A.38 The qualifying habitats rely upon soil quality and water quality/quantity.

Severn Estuary SAC

Site description

A.39 The Severn Estuary is located between Wales and England in south-west Britain. It is a large estuary with extensive intertidal mud-flats and sand-flats, rocky platforms and islands. Saltmarsh fringes the coast backed by grazing marsh with freshwater ditches and occasional brackish ditches. The subtidal seabed is rock and gravel with subtidal sandbanks. The site also supports reefs of the tube forming worm *Sabellaria alveolata*.

A.40 The estuary's classic funnel shape, unique in the UK, is a factor causing the Severn to have one of the highest tidal ranges in the world. A consequence of the large tidal range is an extensive intertidal zone, one of the largest in the UK. The tidal regime results in plant and animal communities typical of the extreme physical conditions of liquid mud and tide-swept sand and rock. The species-poor intertidal invertebrate community includes high densities of ragworms, lugworms and other invertebrates forming an important food source for passage and wintering waders and fish.

A.41 The site is of importance during the spring and autumn migration periods for waders, as well as in winter for large numbers of waterbirds, especially swans, ducks and waders. The fish fauna is very diverse with more than 110 species identified. The site is of particular importance for migratory fish.

Qualifying features

A.42 Annex I habitats that are a primary reason for selection of this site:

- 1130 Estuaries
- 1140 Mudflats and sandflats not covered by seawater at low tide
- 1330 Atlantic salt meadows (*Glauco-Puccinellietalia maritimae*)

A.43 Annex I habitats present as a qualifying feature, but not a primary reason for selection of this site:

- 1110 Sandbanks which are slightly covered by sea water all the time
- 1170 Reefs

A.44 Annex II species that are a primary reason for selection of this site:

- 1095 Sea lamprey *Petromyzon marinus*
- 1099 River lamprey *Lampetra fluviatilis*
- 1103 Twaite shad *Alosa fallax*

Conservation objectives

A.45 Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the Favourable Conservation Status of its Qualifying Features, by maintaining or restoring;

- The extent and distribution of qualifying natural habitats and habitats of qualifying species;
- The structure and function (including typical species) of qualifying natural habitats;
- The structure and function of the habitats of qualifying species;
- The supporting processes on which qualifying natural habitats and the habitats of qualifying species rely;
- The populations of qualifying species; and
- The distribution of qualifying species within the site.

Key vulnerabilities

A.46 The main current threats to the site include:

- Public Access/Disturbance - Public access and recreation (including third party activities) may have an impact on bird species sensitive to disturbance, causing displacement from feeding, roosting and moulting areas, and if severe could affect long term survival and population numbers and distributions within the Estuary.
- Physical Modification - Modification to water courses and barriers to Annex II migratory fish (and those included in the fish assemblage) in the tributary rivers are preventing completion of the life cycle and potentially altering the hydrodynamics of the site.
- Impacts of Development - Strategic planning issue. More rigorous assessment of cumulative, in-combination and offsite impacts (drainage, disturbance, runoff, impacts on managed realignment etc) on sensitive bird

species and other habitats and species may be required, given the range of planned development within and adjacent to the Estuary (including residential, transport, energy and other industrial developments).

- Coastal Squeeze - As sea levels rise, man-made defences are constraining the natural roll back of estuarine habitats, causing squeeze and loss of habitat and having impacts on species dependent upon those habitats (birds: feeding/ roosting, and fish: feeding/ nursery and shelter areas).
- Change in Land Management - Changes in management and use of grassland and saltmarsh habitat within and bordering the estuary. Changes in ownership and other land practices can result in changes in management and use of land (e.g. changes in grazing practice) which affects species composition, habitat availability, and quality of saltmarsh habitats and use of land for other activities that may cause damage or disturbance.
- Changes in Species Distributions - There is a risk of significant changes in estuarine populations (including declines in some SPA bird populations) in parts of the Estuary resulting from climate change and other man-made and natural modifications to on and offsite environments. In many cases the causes of the changes to species distribution are unknown.
- Water Pollution - There is uncertainty over water quality in the Estuary due to diffuse (including agricultural) or direct pollution (e.g. industrial, sewage treatment works, thermal, radioactive).
- Air Pollution: impact of atmospheric nitrogen deposition - Activities around the Estuary include fertiliser application, potentially dairy and poultry production, road traffic, industry (including power stations), and shipping which are all sources of nitrogen pollution. Nitrogen deposition exceeds site relevant critical loads, with potential impacts on vegetation structure and diversity.
- Marine Consents and Permits: minerals and waste - The cumulative impacts of aggregate extraction, maintenance dredging and disposal can have adverse impacts on features. While most activity is regulated under marine licences, cumulative effects are not always fully considered.
- Fisheries: Recreational marine and estuarine - Further information is required on the levels and location of activity and potential impact of recreational bait digging and recreational fishing/angling. There are unknown impacts in the vicinity of potentially sensitive roosting and feeding areas, and on intertidal reef habitats.

- Fisheries: Commercial marine and estuarine - Dredges (inc. hydraulic), benthic trawls and seines are categorised as 'red' for the reef features (specifically the sub-feature *Sabellaria* spp. reef) as part of Defra's revised approach to commercial fisheries management in European Marine Sites (EMS).
- Invasive Species - There are recent reports of marine invasive non-native species (the Australian barnacle *Austrominius modestus*, Mitten crab *Eriocheir sinensis*, and the Pacific Oyster *Crassostrea gigas*) in the Estuary (or the Bristol Channel). These could have an impact on native species and habitats but the abundance and impact in the Severn Estuary of these species is unclear.
- Marine Litter - The marine environment is a sink for man-made litter which often originates from rivers. Impacts are not fully understood.
- Marine Pollution Incidents - Marine pollution incidents and responses to such incidents have the potential for significant negative impacts on the site and its features.

Non-qualifying habitats and species on which the qualifying habitats and/or species depend

A.47 The qualifying habitats rely upon water quality/quantity.

A.48 River lamprey

- Habitat preferences – freshwater and wetlands
- Diet – aquatic fauna

A.49 Sea lamprey

- Habitat preferences – marine, although spawns in freshwater rivers, requiring clean gravel or silt/sand for borrowing juveniles.
- Diet – aquatic fauna

A.50 Twaite shad

- Habitat preferences – marine, although spawns in freshwater rivers, requiring deep pools.
- Diet – aquatic fauna

Severn Estuary SPA

Site description

A.51 As for Severn Estuary SAC.

Qualifying features

- A037 *Cygnus columbianus bewickii*; Bewick's swan (Non-breeding)
- A048 *Tadorna tadorna*; Common shelduck (Non-breeding)
- A051 *Anas strepera*; Gadwall (Non-breeding)
- A149 *Calidris alpina alpina*; Dunlin (Non-breeding)
- A162 *Tringa totanus*; Common redshank (Non-breeding)
- A394 *Anser albifrons albifrons*; Greater white-fronted goose (Non-breeding)
- Waterbird assemblage:
  - Bewick's swan;
  - Greater white-fronted goose;
  - Common shelduck;
  - Gadwall;
  - Dunlin; and
  - Common redshank.

Conservation objectives

A.52 Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the aims of the Wild Birds Directive, by maintaining or restoring;

- The extent and distribution of the habitats of the qualifying features;
- The structure and function of the habitats of the qualifying features;
- The supporting processes on which the habitats of the qualifying features rely;

- The population of each of the qualifying features; and
- The distribution of the qualifying features within the site.

Key vulnerabilities

A.53 Severn Estuary Site Improvement Plan covers both the Severn Estuary SPA and Severn Estuary SAC. See Severn Estuary SAC for further information.

Non-qualifying habitats and species on which the qualifying habitats and/or species depend

A.54 The qualifying habitats rely upon water quality/quantity.

A.55 Bewick's swan

- Habitat preference – freshwater, farmland, coastal, wetlands
- Diet – potatoes, grain, aquatic plants and grasses

A.56 Common shelduck

- Habitat preference – coastal areas, inland reservoirs and gravel workings.
- Diet – invertebrates, small shellfish and aquatic snails

A.57 Gadwall

- Habitat preference – marshes, lakes, and on migration also rivers and estuaries.
- Diet – leaves, shoots, mostly while swimming with head under water.

A.58 Dunlin

- Habitat preference – tundra, moor, heath, and on migration estuaries and coastal habitat.
- Diet - insects, snails and worms.

A.59 Common redshank

- Habitat preference – rivers, wet grassland, moors and estuaries.
- Diet - invertebrates, especially earthworms, cranefly larvae (inland) crustaceans, molluscs, marine worms (estuaries).

A.60 Greater white-fronted goose

- Habitat preference – farmland grassland marine and intertidal wetland
- Diet - grass, clover, grain, winter wheat and potatoes.

Severn Estuary Ramsar

Site description

A.61 The estuary's classic funnel shape, unique in Britain, is a factor causing the Severn to have the second-largest tidal range in the world (after the Bay of Fundy, Canada). This tidal regime results in plant and animal communities typical of the extreme physical conditions of liquid mud and tide swept sand and rock. The species-poor invertebrate community includes high densities of ragworms, lugworms and other invertebrates forming an important food source for passage and wintering waders.

A.62 A further consequence of the large tidal range is the extensive intertidal zone, one of the largest in the UK, comprising mudflats, sand banks, shingle, and rocky platforms.

A.63 Glassworts and annual sea-blite colonise the open mud, with beds of all three species of eelgrass *Zostera* occurring on more sheltered mud and sandbanks. Large expanses of common cord-grass also occur on the outer marshes. Heavily grazed saltmarsh fringes the estuary with a range of saltmarsh types present. The middle marsh sward is dominated by common saltmarsh-grass with typical associated species. In the upper marsh, red fescue and saltmarsh rush become more prominent.

Qualifying features

Criterion 1

A.64 Due to immense tidal range (second-largest in world), this affects both the physical environment and biological communities.

A.65 Habitats Directive Annex I features present on the Ramsar site include H1110 Sandbanks which are slightly covered by sea water all the time, H1130 Estuaries, H1140 Mudflats and sandflats not covered by seawater at low tide, and H1330 Atlantic salt meadows (*Glauco-Puccinellietalia maritimae*).

Criterion 3

A.66 Due to unusual estuarine communities, reduced diversity and high productivity.

Criterion 4

A.67 This site is important for the run of migratory fish between sea and river via estuary. Species include Salmon *Salmo salar,* sea trout *Salmo trutta,* sea lamprey *Petromyzon marinus,* river lamprey *Lampetra fluviatilis,* allis shad *Alosa alosa,* twaite shad *Alosa fallax,* and eel *Anguilla anguilla*.

A.68 It is also of particular importance for migratory birds during spring and autumn.

Criterion 5

A.69 Assemblages of international importance:

- Species with peak counts in winter:
  - 70919 waterfowl (5 year peak mean 1998/99-2002/2003).

Criterion 6

A.70 Species/populations occurring at levels of international importance:

- Bewick's swan *Cygnus columbianus bewickii;*
- Common shelduck *Tadorna tadorna;*
- Gadwall *Anas strepera;*
- Dunlin *Calidris alpina alpina;*
- Common redshank *Tringa tetanus;* and
- Greater white-fronted goose *Anser albifrons albifrons.*

Criterion 8

A.71 The fish of the whole estuarine and river system is one of the most diverse in Britain, with over 110 species recorded. Salmon *Salmo salar,* sea trout *Salmo trutta*, sea lamprey *Petromyzon marinus,* river lamprey *Lampetra fluviatilis,* allis shad *Alosa alosa,* twaite shad *Alosa fallax*, and eel *Anguilla anguilla* use the Severn Estuary as a key migration route to their spawning grounds in the many tributaries that flow into the estuary.

A.72 The site is important as a feeding and nursery ground for many fish species particularly allis shad *Alosa alosa* and twaite shad *Alosa fallax* which feed on mysid shrimps in the salt wedge.

Conservation objectives

A.73 None available.

Key vulnerabilities

- Dredging
- Erosion
- Recreational/tourism disturbance (unspecified)

Non-qualifying habitats and species on which the qualifying habitats and/or species depend

A.74 See Severn Estuary SPA

Appendix B
Site allocations assessed in the HRA

Table B.1: Site allocations assessed in the HRA

Site ID	Address	Parish	Use	Number of homes
Strategic site allocations				
-	Cirencester - Steadings southern extension	Cirencester	Mixed use	779 (585 over plan period)
-	Preston - Land south east of Cirencester and south of Preston	Preston	Mixed use	1,368 over plan period
-	Preston - Land east of Kingshill Lane	Preston	Mixed use	613 over plan period
-	Down Ampney - Land surrounding Down Ampney	Down Ampney	Mixed use	1,658 over plan period
-	Driffield - Land south of Driffield	Driffield	Mixed use	1,132 (1,090 over plan period)
-	Fairford - Land north-east of Fairford	Fairford	Mixed use	1,141 over plan period
-	Kemble - Land south-west of Kemble	Kemble	Mixed use	1,020 over plan period
-	Mickleton - Land north and west of Mickleton	Mickleton	Mixed use	1,238 over plan period
	Moreton-in-Marsh - Land north, east and south of Moreton-in-Marsh	Moreton-in-Marsh	Residential	2,217 over plan period
	Siddington - Land south west of Siddington	Siddington	Mixed use	372 over plan period
Non-Strategic site allocations				
A2	Land to rear of Templefields and Crossfields	Andovers-ford	Residential	52
B56	Land off Mallard Crescent	Bourton-on-the-Water	Residential	53
BK11	Former Station Road Allotments	Blockley	Residential	40
BK14A	The Limes, Station Road	Blockley	Residential	8
C71	Land adjacent ‘Donside’, off Barn Way	Cirencester	Residential	10

Site ID	Address	Parish	Use	Number of homes
C81B	Land west of Gardner Way	Cirencester	Residential	31
CC10A	Land east of Chandlers, Station Road	Chipping Campden	Residential	8
CC66B	Land north-west of Aston Road	Chipping Campden	Residential	10
CC68	Land north-east of Aston Road	Chipping Campden	Residential	150
F20A	Land south-east of Fairford	Fairford	Residential	53
F39C / F52	Land west of Terminus Cottage and Station Cottage	Fairford	Residential	30
F53A	Land at Totterdown Hill, Horcott	Fairford	Residential	150
L19	Land south of Butler's Court	Lechlade-on-Thames	Residential	15
L33	Land south of Ferrers Park	Lechlade-on-Thames	Residential	150
M28B	Land west of Aldi	Moreton-in-Marsh	Residential	20
M74A	Land South of Moreton and West of Fosse Way (Eastern Part of Site)	Moreton-in-Marsh	Residential	44
MK11A	Land east of Stratford Road (Site A)	Mickleton	Residential	76
MK2B/C	Land north-east of Mickleton	Mickleton	Residential	40
MK7	Land between Summerville Ltd. and Stratford Road	Mickleton	Residential	33
R203A-C	Land to rear of the Knoll, Whelford Road	Kempsford	Residential	149
R591	Former Godwin Pumps factory Springfield Road, Quenington	Coln St Aldwyns, Hatherop, Quenington	Residential	47
R607	Land north of London Road	Poulton	Residential	10
R670	Glebe Farm Yard, Hatherop	Coln St Aldwyns, Hatherop, Quenington	Residential	12

Site ID	Address	Parish	Use	Number of homes
S14B	Land off Oddington Road (A436) (remaining land after 23/01513/FUL)	Stow-on-the-Wold	Residential	10
S55B	Land adjoining Tall Trees, Oddington Road	Stow-on-the-Wold	Residential	8
S68	The Hollies, Lower Swell Road	Stow-on-the-Wold	Residential	35
SD15	Plummers Farm, east of Ashton Road	Siddington	Residential	35
SD17	Land east of Siddington Road and west of Bluebell Drive	Siddington	Residential	5
SD23	Land between disused canal and disused railway line, north of Park Way	Siddington	Residential	22
T31B	Land adjacent to Blind Lane	Tetbury	Residential	44
T71A	Land north-west of Highfield Cottage	Tetbury	Residential	50
UR1A	Upper Rissington Business Park	Upper Rissington	Residential	26
W4B	Land between Colin Lane and future Heritage Railway	Willersey	Residential	40

Appendix C
Screening of policies and site allocations

Policies

Policies screened out

No new development / activities

C.1 The following policies have been screened out of further assessment (no Appropriate Assessment is required) as they will not result in new development / activities.

- Core Policy 1 Addressing Climate Change: sets out principles for development to ensure it mitigates and is resilient to climate change.
- Core Policy 2a: Stepped Housing Trajectory Sets out when homes will be delivered over the plan period but will not itself result in development.
- Core Policy 4 Settlement Hierarchy: classifies settlements according to their role and service function, as well as ensuring development is built in appropriate locations.
- Core Policy 6 Infrastructure Delivery: sets out the mechanisms by which new services and facilities will be delivered alongside new housing and employment.
- Core Policy 7 Cirencester and Surrounding Villages Area Strategy: Identifies site allocations in the area, but will not directly result in new development - development in this area has been assessed in relation to the site allocations and overall quantum of development set out in Core Policies 2, 3 & 5.
- Core Policy 8 Cirencester and Surrounding Villages Area Strategic Infrastructure: identifies the strategic cycle links, transport hubs, highway improvements, land to support a new GP surgery, Suitable Alternative Natural Greenspace, primary schools and secondary schools that will be delivered by sites allocated for development – assessed as part of the site allocations.

- Core Policy 9 Safeguarding of Land for Strategic Infrastructure Schemes in the Cirencester and Surrounding Villages Area: safeguards land for projects that are associated with other development plans (transport).
- Core Policy 10 Cirencester Central Area Strategy: Identifies character areas and opportunity areas within the designated Cirencester Central Area but will not directly result in new development – development in this area has been assessed in relation to the site allocations and overall quantum of development set out in Core Policies 2, 3 & 5.
- Core Policy 12 South Cotswold Strategy Area: Identifies site allocations in the area, but will not directly result in new development - development in this area has been assessed in relation to the site allocations and overall quantum of development set out in Core Policies 2, 3 & 5.
- Core Policy 13 South Cotswold Strategic Infrastructure Delivery: identifies the strategic infrastructure requirements that will be delivered by sites allocated for development – assessed as part of the site allocations.
- Core Policy 19 North Cotswold Strategy Area Identifies site allocations in the area, but will not directly result in new development - development in this area has been assessed in relation to the site allocations and overall quantum of development set out in Core Policies 2, 3 & 5.
- Core Policy 20 North Cotswold Strategic Infrastructure Delivery: identifies the strategic infrastructure that will be delivered by sites allocated for development – assessed as part of the site allocations.
- Core Policy 21 Safeguarding of Land for Strategic Infrastructure Schemes in the North Cotswold Area: policy safeguards existing uses and will not itself result in new development.
- Core Policy 22 Gloucester and Cheltenham Green Belt: policy safeguards Green Belt and will not directly result in development.
- Core Policy 29 Wind Energy Development: policy sets out requirements for wind energy development proposals but will not directly result in new development – new renewables development has been assessed under Core Policy 25 Renewable and Low Carbon Energy Generation, Storage and Transmission.
- Core Policy 30 Roof-Mounted and Ground-Mounted Solar Panels: sets out requirements for solar panels but will not directly result in new development – new renewables development has been assessed under Core Policy 28 Renewable and Low Carbon Energy Generation, Storage and Transmission.

- Core Policy 31 Community Renewable Energy Schemes: supports community renewables schemes but will not directly result in new development – new renewables development has been assessed under Core Policy 28 Renewable and Low Carbon Energy Generation, Storage and Transmission.
- Core Policy 32 Low Carbon Heat Networks: sets out requirements for low carbon heat networks but will not directly result in new development – new renewables development has been assessed under Core Policy 28 Renewable and Low Carbon Energy Generation, Storage and Transmission.
- Core Policy 33 Sustainable Transport & Connectivity: requires developments to provide sustainable modes of travel but will not directly result in new development.
- Core Policy 34 Assessing and Managing Transport Impacts: requires development to be located near to key services and facilities and requires proposals to assess transport impacts.
- Core Policy 35 Active Travel: Walking, Cycling & Wheeling: supports the provision of routes for active transport.
- Core Policy 36 Healthy, Safe and Inclusive Design: provides guidelines for design.
- Core Policy 37 Public Transport, Shared Transport and Interchanges: addresses how public transport links should be incorporated into development.
- Core Policy 38 Our Kerbside Space and Parking: addresses parking requirements for development proposals.
- Core Policy 39 Electric and Low Emission Vehicles: promotes opportunities for the use of electric and low emission vehicles.
- Core Policy 40 Aerodrome Safeguarding: safeguards the operation of aerodrome sites.
- Core Policy 41 Standards for New Residential Development: sets out development standards/housing mix, not quantum.
- Core Policy 42 Affordable Housing: policy defines affordable housing mix not quantum.

- Core Policy 43 Self-build and Custom-build Housing: Aims to increase opportunities for self-build and custom-build housing as part of larger residential developments but does not itself result in new development.
- Core Policy 47 Safeguarding Employment Sites: policy safeguards existing uses.
- Core Policy 48 Ancillary Uses on Employment Sites: guidance on when ancillary uses will be permitted, does not itself result in new development.
- Core Policy 51 Town Centre Uses: policy defines appropriate uses, not quantum.
- Core Policy 52 New Local Centres: policies identifies the strategic allocations that will include local services, but does not itself result in development.
- Core Policy 53 The Historic Environment: policy sets out measures to protect designated heritage assets.
- Core Policy 54 Listed Buildings: sets out requirement for development to conserve the significance, character and setting of listed buildings.
- Core Policy 55 Conservation Areas: policy sets out measures to preserve and enhance Conservation Areas.
- Core Policy 56 Non-Designated Heritage Assets: policy will not result in new development.
- Core Policy 57 Archaeological Assets: policy will not result in new development.
- Core Policy 58 Registered Parks and Gardens: policy will not result in new development.
- Core Policy 59 The Conservation of Non-Domestic Historic Buildings (Designated and Non-Designated Heritage Assets): policy will not result in new development.
- Core Policy 60 Biodiversity and Geodiversity: policy will not result in new development but provides mitigation.
- Core Policy 61 Local Green Spaces: policy establishes Local Green Space designations, will not result in new development.
- Core Policy 62 Landscape: policy will not result in new development but provides mitigation.

- Core Policy 63 Managing Flood Risk: policy will not result in new development but provides mitigation.
- Core Policy 64 Water Management Infrastructure: policy will not result in new development but provides mitigation.
- Core Policy 65 Watercourses: policy will not result in new development but provides mitigation.
- Core Policy 66 Pollution and Contaminated Land: policy will not result in new development but provides mitigation.
- Core Policy 67 Air Quality: policy will not result in new development but provides mitigation.
- Development Policy 10 Trees, Hedgerows, and Woodlands: policy will not result in new development but provides mitigation.
- Development Policy 11 Dark Skies: policy will not result in new development but provides mitigation.
- Core Policy 68 Planning for Health and Well-Being: policy seeks to promote improved health outcomes through development but will not result in new development.
- Core Policy 69 Good Design Outcomes and Process: policy sets out design expectations but will not result in new development.
- Core Policy 69a Good Design Outcomes and Process for Strategic Allocations: policy sets out design expectations but will not result in new development.
- Core Policy 70 Green Infrastructure: policy will not result in new development but provides mitigation.
- Core Policy 71 Management of Accessible Green Open Spaces in Residential Developments: policy will not result in new development but provides mitigation.
- Core Policy 74 Monitoring and Implementation: policy will not result in new development.

New development / activities but no likely significant effects

C.2 The following policies will result in some new development / activities, but these are not likely to have significant effects on Habitats Sites, alone or in combination with other plans/projects, for example due to their scale, and

therefore have been screened out of further assessment; no Appropriate Assessment is required:

- Core Policy 26 Future-Fitting and Decarbonisation of Existing Buildings: sets out how buildings of modern and traditional construction can be designed and adapted to be energy efficient and incorporate renewable energy technologies. The micro-renewables encourage by this policy would be small scale (e.g. single building) and unlikely to result in significant effects.
- Core Policy 44: Specialist Accommodation: permits specialise or supporting house development that would be small in scale.
- Development Policy 2: Community-led Housing: development would be small in scale and within existing settlements.
- Development Policy 4 Removal of Occupancy Conditions: policy removes individual buildings from residential use.
- Development Policy 5 Replacement Dwellings: development would be small in scale e.g. single dwelling.
- Development Policy 7 Conversion of Rural Buildings: policy sets out principles for conversion of existing rural buildings.
- Core Policy 73 Telecommunications Infrastructure: development would be small in scale.

Policies screened in

C.3 The following policies are considered likely to have significant effects on Habitats Sites and have therefore been screened in for further consideration in the Appropriate Assessment.

C.4 The main policies that determine the overall quantum of development associated with the Local Plan and therefore may be associated with likely significant effects relating to number of residents (e.g. recreation pressure), travel (air pollution) and water consumption/treatment are:

- Core Policy 2 Meeting Housing Needs in Cotswold District: Strategic Sites: Specifies the scale and location of new strategic housing.
- Core Policy 3 Meeting Housing Needs in Cotswold District: non-Strategic Sites: Specifies the scale and location of non-strategic housing.

- Core Policy 5 Meeting Business and Employment Needs in Cotswold District: Specifies the scale and location of opportunities for economic growth.

C.5 These policies have associated site allocations, which have also been assessed (see **Appendix B** and the site allocation screening, below). Some policies define a specific location for development but are a policy area rather than site allocation. These have been assessed in a similar way to site allocations, i.e. the specific location of development has been considered. Depending on where they are, these policies could contribute to location-based impacts such as loss of habitat, non-physical disturbance, or direct pollution; as well as contributing to in-combination impacts e.g. relating to water use/treatment:

- Core Policy 11 Special Policy Areas – Royal Agricultural University: Supports the expansion / redevelopment of the existing campus and sets out what a masterplan is expected.
- Core Policy 15 Cotswold Airport: supports aviation-related development (and safeguards existing uses).
- Core Policy 16 Thames and Severn Canal: supports development impacting the Canal and towpath.
- Core Policy 17 The River Thames: supports proposals for increased moorings and development related to sport and recreation.
- Core Policy 18 Cotswold Lakes: Post-Mineral Extraction After Use: permits leisure/recreation development on former mineral extraction sites.
- Core Policy 23 Former Cheltenham to Stratford-Upon-Avon Railway Line: permits restoration and reinstatement of railway between Broadway and Honeybourne.
- Core Policy 24 Campden BRI Special Policy Areas: Identifies the type of development suitable at this site and sets out the expectations for masterplanning at this location.
- Core Policy 25: Fire Services College Moreton-in-Marsh: Identifies the type of development suitable at this site and sets out the expectations for masterplanning at this location.

C.6 Several policies permit specific types of development, which would contribute to the impact pathways summarised below:

- Core Policy 27 Net Zero Carbon New Buildings: requires all new development to include on-site renewable energy – non-physical disturbance, bird strike.
- Core Policy 28 Renewable and Low Carbon Energy Generation, Storage and Transmission: permits renewable energy and energy storage development – non-physical disturbance, bird strike.
- Core Policy 49 Development of Tourist Facilities and Visitor Attractions: policy supports proposals for facilities and attractions where they meet requirements – recreation pressure, air pollution, water quality/quantity, and location-based impacts e.g. loss of habitat.
- Core Policy 50 Tourist and Visitor Accommodation: permits new or extended hotels and serviced accommodation in Town and Local Centres – recreation pressure, air pollution, water quality/quantity, and location-based impacts e.g. loss of habitat.
- Core Policy 72 Social and Community Infrastructure: permits new social and community facilities – air pollution, water quality/quantity, and location-based impacts e.g. loss of habitat.

C.7 The remainder of the policies that have been screened permit development in unspecified rural locations. Although the scale of development is generally small, the rural location of development means that these policies could result in loss of habitat, non-physical disturbance, or direct pollution, which could have likely significant effects (due to the sites alone, if in a sensitive location):

- Core Policy 45 Gypsy and Traveller Accommodation: defines the two locations for gypsy and traveller accommodation.
- Core Policy 46 New Employment Development: identifies broad locations for employment development (assessed in relation to site allocations) and permits some windfall development outside development boundaries.
- Development Policy 1 Affordable Housing on Rural Exception Sites: Sets out the circumstances in which windfall development would be permitted in rural areas.
- Development Policy 3 Dwellings for Rural Workers Outside Development Boundaries: Allows some small scale development within rural areas.
- Development Policy 6 Rural Diversification: permits development in rural areas.
- Development Policy 8 New Agricultural and Forestry Development: permits development in rural areas.

- Development Policy 9 Equestrian Related Development: permits development in rural areas.

Policies providing potential mitigation

C.8 Mitigation cannot be considered at the screening stage. However, it is useful to identify the policies that include safeguards and mitigation at the screening stage, as this information, along with the screening for likely significant effects will be taken into consideration at the next stage (Appropriate Assessment).

C.9 The following policies may contribute to mitigation for impacts associated with the Plan:

- Core Policy 6 Infrastructure Delivery: sets out the mechanisms by which new services and facilities will be delivered alongside new housing and employment – relevant to recreation pressure, wastewater treatment and water abstraction.
- Core Policy 33 Sustainable Transport & Connectivity: sets out guidelines for the delivery of sustainable modes of transport in new development- relevant to air pollution.
- Core Policy 34 Assessing and Managing Transport Impacts: directs development near to key services and facilities and requires proposals to assess transport impacts- relevant to air pollution.
- Core Policy 35 Active Travel: Walking, Cycling & Wheeling: supports the provision of routes for active transport- relevant to air pollution and recreation pressure.
- Core Policy 36 Healthy, Safe and Inclusive Design: provides guidelines for street design- relevant to recreation pressure and urban edge effects
- Core Policy 37 Public Transport, Shared Transport and Interchanges: addresses how public transport links should be incorporated into development- relevant to air pollution.
- Core Policy 38 Our Kerbside Space and Parking: addresses parking requirements for development proposals- relevant to air pollution
- Core Policy 39 Electric and Low Emission Vehicles: promotes opportunities for the use of electric and low emission vehicles- relevant to air pollution.

- Core Policy 60 Biodiversity and Geodiversity: policy provides general protection and mitigation for habitat loss
- Core Policy 62 Landscape: includes requirements to restore, manage and enhance existing habitats and where appropriate create new habitats- relevant to physical loss of or damage to habitats.
- Core Policy 63 Managing Flood Risk addresses the sequential approach and mitigation for minimising flood risk and providing resilience to flooding - relevant to water quality.
- Core Policy 64 Water Management Infrastructure: addresses requirements for adequate water and wastewater infrastructure associated with development- relevant to water quality and quantity.
- Core Policy 65 Watercourses: sets out that development in close proximity to a watercourse must protect or enhance the function of the watercourse and its biodiversity-relevant to water quality and physical loss of or damage to habitats.
- Core Policy 66 Pollution and Contaminated Land: ensures that development will not have an unacceptable impact on public health or the natural environment- relevant to non-physical disturbance, dust, water quality.
- Core Policy 67 Air Quality: requires applicants to demonstrate that there will be no significant adverse effects from emissions, on health or the environment – relevant to air pollution.
- Core Policy 68 Planning for Health and Wellbeing: includes a requirement for developments to demonstrate how they have incorporated open/green spaces- relevant to recreation pressure.
- Core Policy 70 Green and Blue Infrastructure: requires major developments to provide multifunctional green infrastructure, and to protect existing features e.g. trees and hedgerows- relevant to recreation pressure.
- Development Policy 8 New Agricultural and Forestry Development: addresses mitigation for new or extended agricultural and forestry development- relevant to physical loss of or damage to habitats.
- Development Policy 10 Trees, Hedgerows, and Woodlands: Requires the conservation and enhancements of natural assets affected by development- relevant to physical loss of or damage to habitats.

- Development Policy 11 Dark Skies: Requires developments with external lighting to minimise light spill/trespass, avoid adverse effects on biodiversity and maintain dark corridors along watercourses, woodland edges and hedgerows- relevant to non-physical disturbance.

C.10 The site development briefs (site-based policies) also set out requirements for each site allocation and may include, for example: requirements for infrastructure (green space, transport etc) and environmental protection. These have been taken into account in the Appropriate Assessment, where relevant.

Site allocations

C.11 The following site allocations meet screening criteria ('development site could have a significant impact if…') for the assessed impact pathways.

Physical damage and loss of habitat

C.12 Screening criteria:

- Development occurs within or immediately adjacent to a Habitats Site.
- Development occurs within or immediately adjacent to FLL used by
  - Fish of Severn Estuary SAC/Ramsar - River Frome (near Stroud) and River Chelt (near Cheltenham).
  - Birds of Severn Estuary SPA/Ramsar – sites identified as being of moderate or high potential to be bird FLL (see also **Appendix E**).

C.13 Site allocations meeting screening criteria:

- Within or immediately adjacent to a Habitats Site: none.
- Immediately adjacent to fish FLL: none.
- Within or immediately adjacent to bird FLL:
  - Strategic site: Cirencester - Steadings southern extension.
  - Strategic site: Cirencester - Land east of Kingshill Lane.
  - Strategic site: Cirencester - Land south east of Cirencester and south of Preston.
  - Strategic site: Siddington - Land south west of Siddington.
  - Strategic site: Driffield - Land south of Driffield.

- Strategic site: Down Ampney - Land surrounding Down Ampney.
- Strategic site: Fairford - Land north east of Fairford.
- SD15 – Siddington, Plummers Farm, east of Ashton Road.
- SD17 – Siddington, Land east of Siddington Road and west of Bluebell Drive.
- F53A - Land at Totterdown Hill, Horcott.
- F20A - Land south-east of Fairford.
- F52 - Land west of Terminus Cottage and Station Cottage.
- F39C - Land west of Terminus Cottage and Station Cottage.
- L19 - Land south of Butler's Court.
- L33 - Land south of Ferrers Park.

Non-physical disturbance

C.14 Screening criteria:

- Development occurs within 500m of a Habitats Site with qualifying features susceptible to impacts from noise, vibration or light.
- Development occurs within 500m of FLL that supports qualifying features susceptible to impacts from noise, vibration or light:
  - Birds of Severn Estuary SPA/Ramsar – sites identified as being of moderate or high potential to be bird FLL and/or within 500m of locations with moderate/high potential (see also **Appendix E**).

C.15 Site allocations meeting screening criteria:

- Within 500m of a Habitats Site: none.
- Within 500m of bird FLL:
  - Strategic site: Cirencester - Steadings southern extension.
  - Strategic site: Cirencester - Land east of Kingshill Lane.
  - Strategic site: Cirencester - Land south east of Cirencester and south of Preston.
  - Strategic site: Siddington - Land south west of Siddington.
  - SD15 – Siddington, Plummers Farm, east of Ashton Road.

- SD17 – Siddington, Land east of Siddington Road and west of Bluebell Drive.
- Strategic site: Driffield - Land south of Driffield.
- Strategic site: Down Ampney - Land surrounding Down Ampney.
- F53A - Land at Totterdown Hill, Horcott.
- F20A - Land south-east of Fairford.
- Strategic site: Fairford - Land north east of Fairford.
- F52 - Land west of Terminus Cottage and Station Cottage.
- F39C - Land west of Terminus Cottage and Station Cottage.
- L19 - Land south of Butler's Court.
- L33 - Land south of Ferrers Park.

Air pollution – vehicle emissions

C.16 Screening criteria:

- Development increases traffic flows by at least 1,000 AADT or 200HDV (alone or in combination) on roads within 10km of the district and within 200m of a Habitats Site; i.e. the following roads:
  - Cotswold Beechwoods SAC: A46 (and potentially B4070).
  - North Meadow and Clattinger Farm SAC: A419.
  - Rodborough Common SAC: A46.

C.17 Site allocations meeting screening criteria:

- All site allocations and windfall development.

Air pollution – dust

C.18 Screening criteria:

- Development occurs within 100m of a Habitats Site.

C.19 Site allocations meeting criteria:

- None.

Recreation pressure

C.20 Screening criteria:

- Residential development proposed within one of the following zones of influence (ZOIs):
  - 15.4km of Cotswold Beechwoods SAC.
  - 4.2km of North Meadow and Clattinger Farm SAC (ZOI for year round visitors); or
  - 9.4km of North Meadow and Clattinger Farm SAC (ZOI for seasonal visitors).
  - 3.9km of Rodborough Common SAC.
  - 7.0km of Oxford Meadows SAC.
  - 12.6km of Severn Estuary SAC, SPA and Ramsar.
  - n/a (all residential development in the south of district - FLL used by birds of Severn Estuary SPA/Ramsar)

C.21 Site allocations meeting screening criteria:

- Within 15.4km of Cotswold Beechwoods SAC: A2, C71, C81B, K7A, K15, T31B, T71A, K7B; and strategic sites: Steadings southern extension, New settlement at Cotswold Airport, and Land south west of Kemble.
- Within 4.2km of North Meadow and Clattinger Farm SAC (ZOI for year round visitors): strategic sites Land south of Driffield, and Land surrounding Down Ampney.
- Within 9.4km of North Meadow and Clattinger Farm SAC (ZOI for seasonal visitors): C81B, F20A, F29C, F52, F53A, R203A-C, R607, SD15, SD17, SD23; and strategic sites: Steadings southern extension, Land east of Kingshill Lane, Land south east of Cirencester and south of Preston, Land south west of Siddington, Land south of Driffield, Land surrounding Down Ampney, and Land north east of Fairford.
- Within 3.9km of Rodborough Common SAC: none.
- Within 7.0km of Oxford Meadows SAC: none.
- Within 12.6km of Severn Estuary SAC, SPA and Ramsar: none.
- FLL used by birds of Severn Estuary SPA/Ramsar: all residential development in the south of district.

Water quality – direct pollution

C.22 Screening criteria:

- Development is near to and uphill/upstream of Cotswold Beechwoods SAC.
- Development is near to or upstream of River Thames or tributaries, and upstream of North Meadow & Clattinger Farm SAC or Oxford Meadows SAC.
- Development is near to or upstream of River Severn or tributaries, and Severn Estuary SAC/SPA/Ramsar (direct impacts and fish FLL).
- Development is near to or upstream of Cotswold Water Park SSSI (bird FLL, Severn Estuary SAC/Ramsar).

C.23 Site allocations meeting criteria:

- Near/upstream of Cotswold Beechwoods SAC: none.
- Near/upstream of River Thames or tributaries, and upstream of North Meadow & Clattinger Farm SAC or Oxford Meadows SAC: none.
- Near/upstream of River Severn or tributaries, and Severn Estuary SAC/SPA/Ramsar: A2.
- Near/upstream of Cotswold Water Park SSSI:
  - Fairford: F53A, F20A, F39C, F52, and part of strategic site: Land north east of Fairford.
  - Lechlade-on-Thames: L33.
  - Cerney Wick: R644 (part of strategic site: Land south of Driffield).

Water quality / quantity – wastewater treatment

C.24 Screening criteria:

- Development requires wastewater treatment that discharges into the River Avon (Severn Trent Water and Wessex Water) or River Thames (Thames Water) catchments.

C.25 Site allocations meeting criteria:

- All site allocations.

Water quality / quantity – abstraction

C.26 Screening criteria:

- Development requires water supplied from the River Thames (Thames Water) or River Severn (Bristol Water & Severn Trent Water) catchments.

C.27 Site allocations meeting criteria:

- All site allocations.

Appendix D
Record of consultation

D.1 Table D.1 sets out comments received during consultation on previous iterations of the HRA, and how those have been addressed.

Table D.1: Record of HRA consultation comments and LUC response

Consultee, date, consultation stage	Comments (relevant excerpts)	LUC response
Natural England February 2022 LPPU Issues and Options Consultation (Reg.18)	*Have we correctly identified the European sites that should be scoped-in to the HRA of the Local Plan Partial Update (see Chapter 3 and Appendix A)?* For the most part yes – please see detailed comments below *Have we correctly identified the sensitivities of the scoped-in European sites to potential impacts from the Local Plan Partial Plan Update (see Chapter 4 and Appendix B)?* Yes – subject to detailed comments below *Is the proposed approach to HRA of the Local Plan Partial Update reasonable (see Chapters 2 and 4)* Yes – subject to detailed comments below	Noted – Natural England in broad agreement with scope of HRA
Natural England February 2022 LPPU Issues and Options Consultation (Reg.18)	2.23 – Definition of terms - 'recreation impacts' – We propose that the council distinguishes recreation impacts from urban effects. Arson, fly tipping, litter and vandalism may be argued to be separate from recreation issues. Stroud DC's Regulation 19 HRA report provides an example where this approach has been used. The document is in the Stroud DC Examination Library on their website: https://www.stroud.gov.uk/environment/planning-and-building-control/planning-strategy/stroud-district-local-plan-review/local-plan-examination/examination-library	Urban effects separated from recreation impacts in later HRA reports (including this report).

Consultee, date, consultation stage	Comments (relevant excerpts)	LUC response
	4.10 - Severn Estuary Special Protection Area (SPA) – reference to functional linkages with Cotswold Water Park. We would welcome further dialogue with the Council on this subject in the light of the report's status as a preliminary assessment.	Further work has been completed on this study, since 2022; the HRA references the most up to date work.
Natural England February 2022 LPPU Issues and Options Consultation (Reg.18)	4.30 - Highways Agency "Design Manual for Road and Bridges (DMRB) Document LA105: Air Quality" – this paragraph refers to what is otherwise known as the 'affected road network'. Table 4.1: European sites which are situated within 200 m of a strategic road and their corresponding SSSI units condition With regard to SSSI unit condition we draw the Council's attention to the fact that air quality data available on APIS – www.apis.ac.uk - (Site Relevant Critical Load) data is NOT currently reflected in the SSSI condition assessment summary information. A number of additional information sources on this theme are evolving at the time of writing. We would welcome continued dialogue with the Council to ensure the partial review reflects the most up to date relevant information and evidence. Table 4.2: AADT data provided by Cotswold DC for those European sites within 200m of a strategic road. Natural England notes the nil return for the Cotswold Beechwoods SAC and A46. We therefore draw your attention to Stroud DC's Reg19 HRA findings in the light of the Wealden judgement. Paragraphs 8.41-8.43 refer (link to HRA report above). The Council should check whether any cumulative increase in traffic associated with the Cotswold District plan review needs further consideration.	Traffic data has been updated for the Reg.19 Local Plan and takes into account the impacts of the Local Plan alone and in combination.

Consultee, date, consultation stage	Comments (relevant excerpts)	LUC response
Natural England February 2022 LPPU Issues and Options Consultation (Reg.18)	Recreational disturbance 4.48 A review of the European sites and their recreational ZOI determined that the following European sites do not have a recreational ZOI that extends into the CDC boundary and can therefore be scoped out of further assessment: ■ Bredon Hill SAC; ■ Oxford Meadows SAC; and ■ Severn Estuary SAC, SPA and Ramsar. NB Current Severn Estuary SAC/SPA/Ramsar Site recreation commission by the Gloucestershire local planning authorities – No Zone of influence (ZOI) has yet been determined. However the plan review should recognise that visitor surveys are due to be completed by the end of March and a report is expected April/May 2022. The visitor survey report is expected to define the extent of the ZOI.	Further work has been completed on this study, since 2022; the HRA references the most up to date work.
Natural England February 2022 LPPU Issues and Options Consultation (Reg.18)	Table 4.4 – inclusion of Dixton Wood SAC (recreation pressure) – NB To our knowledge no public rights of way exist within this SAC. The Council may screen out this SAC from recreation considerations accordingly.	Dixton Wood SAC scoped out for recreation pressure on this basis.
Natural England December 2025 Local Plan full review Preferred Options (Reg.18)	Natural England wait to be consulted at the appropriate assessment stage, which should include any necessary mitigation required for the above protected sites and their functionally linked habitat. Regarding site allocation, Natural England advises that mitigation and avoidance measures identified through the HRA should be secured through policies in the Plan. Where mitigation or avoidance is not possible the site should not	The HRA accompanying this stage was a high-level screening of five spatial options. Full HRA (screening and appropriate assessment) has been undertaken for Reg.19.

Consultee, date, consultation stage	Comments (relevant excerpts)	LUC response
	be allocated. Natural England advises that a full and comprehensive HRA is required for all Local Plans. Without a HRA as described above, Natural England would see this as a soundness issue going forwards	
Natural England December 2025 Local Plan full review Preferred Options (Reg.18)	The HRA screening conclusion identifies recreational mitigation strategies in place to mitigate the impact pathway of recreational pressure on protected sites. The HRA screening also identifies that there is likely to be further work required (Section 6.4). Natural England are currently in conversation with the relevant Local Authority's for the Cotswold Beechwoods SAC recreational mitigation strategy; this is due to concerns with its implementation, as it is currently set out. Further discussions are due to take place.	A SANG strategy has been undertaken to identify additional strategic mitigation.
Natural England February 2026 Review of strategic sites	Many of the strategic sites are located near the Cotswold Water Park SSSI and the North Meadow and Clattinger Farm SAC. There must be provision and adherence to the highest quality mitigation. We will expect to see the highest quality drainage and water quality management.	Noted – Appropriate Assessment takes this into account
Natural England February 2026 Review of strategic sites	NE has identified a significant number of additional residential units in the area up to 9.4km from North Meadow and Clattinger Farm SAC. The level of additional development coming forward within the 9.4km zone of interest is of a scale over 5,135 additional units Strategic Sites (up to 2043) to c. 12,698 dwellings. This is in comparison to the 486 units set out in the current mitigation strategy (2023-2028: https://www.cotswold.gov.uk/media/hmvfdoos/north-meadow-sac-mitigation-strategy-final-2023.pdf) for which mitigation measures have been designed. This significant increase in Strategic Sites will have a likely	A SANG strategy has been undertaken to identify additional strategic mitigation

Consultee, date, consultation stage	Comments (relevant excerpts)	LUC response
	adverse effects on the SAC in-combination and perhaps alone in the absence of suitable mitigation. Natural England advise the Council that, through its HRA, you will need to consider additional mitigation measures (above those set out in the Interim Strategy) to ensure that the Council can be certain of avoiding harm to the SAC and that allocation promoters can demonstrate delivery of suitable measures in a timely manner.	
Natural England February 2026 Review of strategic sites	We have no specific comment to make regarding the Severn Estuary and Recreational Disturbance. We draw your attention to Natural England's evidence on FLL for the Severn Estuary SPA: NECR401 - https://publications.naturalengland.org.uk/publication/5694125407207424	This has been taken into account in the assessment of FLL
Natural England February 2026 Review of strategic sites	[the letter then provides commentary on potential impact pathways associated with the strategic allocations that CDC asked NE to consider. The points relevant to the HRA are summarised below] ■ **Land North of Ampney Crucis** – [n/a, site not allocated in Reg.19 plan] ■ **Steadings Southern Extension** – within ZOI of Cotswold Beechwoods SAC, mitigation required.	The sensitivity of North Meadow and Clattinger Farm SAC to nutrient enriched flood water is noted. The screening assessment has been updated in the Reg.19 HRA to screen in this impact pathway. The recreation and water quality mitigation requirements suggested have been taken into account in the Appropriate Assessment, and a SANG strategy prepared, as above.

Consultee, date, consultation stage	Comments (relevant excerpts)	LUC response
	■ **Land at Driffield** – partially within outer ZOI of North Meadow, SAMM required and may require 'Infrastructure Mitigation Measures'. There is potential hydrological connectivity (during flooding) between the proposal site and North Meadow and Clattinger Farm SAC. Nutrient enriched flood water is an issue for this SAC (European Site Conservation Objectives for North Meadow and Clattinger Farm SAC). The promoter should provide evidence (eg that suitable areas of land are available) to confirm that surface water from the development area will be managed through appropriate SuDs to avoid pollutants. Mitigation for recreational impacts and water quality impacts will be required for this site. The proposal site is within 1.5km of Cotswold Water Park SSSI, and is hydrologically connected to the SSSI. This site could therefore impact on the water quality of the nearby SSSI lakes. We would expect confirmation of details of how critical construction works will avoid damage to the SSSI. How run-off will be controlled (eg SuDs and suitable land availability to confirm these can be delivered) to prevent pollutants entering the lake, details of storage of materials, how any lighting will be controlled, how certain activities will be limited in time, location or noise level to minimise the risk of disturbance to SSSI birds. ■ **Land North-East of Fairford** - partially within outer ZOI of North Meadow and Clattinger Farm SAC, SAMM required. This allocation is hydrologically linked to the Cotswold Water Park SSSI, and we would advise there is the potential for the site to be hydrologically linked to	Impacts on Cotswold Water Park SSSI have been considered in relation to FLL and potential indirect impacts on the Severn Estuary SPA/Ramsar (rather than the SSSI itself).

Consultee, date, consultation stage	Comments (relevant excerpts)	LUC response
	the SAC through watercourses. The promoter should provide evidence (eg that suitable areas of land are available) to confirm that surface water from the development area will be managed through appropriate SuDs to avoid pollutants. ■ **Land South-West of Kemble** – within inner ZOI of North Meadow and Clattinger Farm SAC, will require SANG and SAMM. This should be secured in the policy wording and the location of the SANG identified on a concept plan and in the Local Plan as an allocation. The site is within close proximity (between 2-3km) to the Cotswold Water Park SSSI. However, we do not consider it to be hydrologically connected to the SSSI, or within a flood zone. There are potential impacts on the SSSI and its interested features from this allocation in terms of disturbance. Information should be provided by the promoter on how impacts on the SSSI and its interest features will be avoided or mitigated. ■ **Land North, East and South of Moreton-in-Marsh** – [no comments relevant to HRA] ■ **Land South of Preston** – within outer ZOI of North Meadow and Clattinger Farm SAC, SAMM required. The northern parcels, and some southern parcels, of the allocation are hydrologically connected to the SSSI. The proposal site is within 1.9km of Cotswold Water Park SSSI. This proposal could impact on the water quality of the nearby SSSI lakes. There is also potential hydrological connectivity (during	

Consultee, date, consultation stage	Comments (relevant excerpts)	LUC response
	flooding) between the proposal site and North Meadow and Clattinger Farm SAC. Nutrient rich flood water is an issue for this SAC (European Site Conservation Objectives for North Meadow and Clattinger Farm SAC). We would expect confirmation of details of how critical construction works will avoid damage to the SSSI. How run-off will be controlled (eg SuDs and suitable land availability to confirm these can be delivered) to prevent pollutants entering the lake, details of storage of materials, how any lighting will be controlled, how certain activities will be limited in time, location or noise level to minimise the risk of disturbance to SSSI birds. The proposed development should also detail how high quality water quality measures and drainage measures should feature in the proposal during the operational phase. There are potential impacts on the SSSI and its interested features from this allocation in terms of disturbance to birds. Information should be provided on how impacts on the SSSI and its interest features will be avoided or mitigated. ■ **Land surrounding Siddington** – [n/a, site not allocated in Reg.19 plan]	
Natural England March 2026 Review of additional site allocations	Following our written advice, NE also attended a face-to-face meeting to discuss mitigation measures for water quality, quantity and recreational disturbance. Natural England will continue to engage with the following actions when consulted: ■ Cotswold DC are going to complete a statement of Common Ground to be reviewed by April 26.	The SANG strategy and FLL work have been completed and the findings incorporate into this report.

Consultee, date, consultation stage	Comments (relevant excerpts)	LUC response
	■ A SANG strategy for North Meadow and Clattinger Farm SAC is going to be completed. ■ Further bird survey work (relating to the Severn Estuary SPA/Ramsar) on FLL will be undertaken. Natural England will engage further with you in this process.	
Natural England March 2026 Review of additional site allocations	NE has identified a significant number of additional residential units in the area up to 9.4km from North Meadow and Clattinger Farm SAC. The level of additional development coming forward within the 9.4km zone of interest is of a scale over 5,135 additional units Strategic Sites (up to 2043) to c. 12,698 dwellings. This is in comparison to the 486 units set out in the current mitigation strategy (2023-2028) for which mitigation measures have been designed. This significant increase in Strategic Sites will have a likely adverse effects on the SAC in combination and perhaps alone in the absence of suitable mitigation. Natural England advise the Council that, through its HRA, you will need to consider additional mitigation measures (above those set out in the Interim Strategy) to ensure that the Council can be certain of avoiding harm to the SAC and that allocation promoters can demonstrate delivery of suitable measures in a timely manner. Allocations for the Cotswold Local Plan may fall into the Zone of Influence (ZOI) for the Cotswold Beechwoods SAC. The Local Plan should include the correct mitigation, in line with the Recreational Mitigation Strategy for this site.	Noted (repeats earlier advice, see above)

Consultee, date, consultation stage	Comments (relevant excerpts)	LUC response
	As part of our response to the Strategic Sites for the Cotswold Pre. Reg.18, we have shared the report "Identification of land with actual or possible functional linkages with the Severn Estuary SPA Phase 5 (Gloucestershire and Worcestershire)" with Cotswold District Council to assist with the preparation of the Habitats Regulation Assessment for the forthcoming Regulation 19 submission. We are aware that you may be engaging in further work to evidence possible impacts on FLL from the allocations.	Noted (repeats earlier advice, see above)
Natural England March 2026 Review of additional site allocations	Natural England makes our assessment of a development's likely significant impacts using our recently published set of mapped Impact Risk Zones (IRZs) for SSSI/SAC/SPA/Ramsar sites. These IRZs are available for viewing on www.magic.gov.uk and can be downloaded from Natural England Open Data Geoportal. For guidance on how to access and use the Impact Risk Zones see the link to user guide - SSSI IRZ User Guidance MAGIC.pdf (defra.gov.uk). IRZs are specifically tailored to each SSSI (which can either be notified for geological or biological reasons) and highlight the types of development that would have the most impact. This should not be used as a screening tool for HRA purposes.	Noted – reference to the IRZs in establishing potential indirect effects on the Severn Estuary SPA/Ramsar via Cotswold Water Park SSSI have been removed

Appendix E
Functionally linked land assessment

Assessment approach

E.1 A desk-based study has been undertaken to identify potential impacts from proposed site allocations on offsite habitat used by the qualifying bird species of Severn Estuary SPA/Ramsar site; i.e. functionally linked land (FLL).

E.2 The methodology draws primarily on desk-based evidence and existing datasets. Existing evidence from published information including HRAs prepared by neighbouring authorities and Natural England datasets relating to FLL for the Severn Estuary SPA/Ramsar have been used to inform professional judgement regarding likely functional relationships **[See reference** 61, 62, 63, 64, 65**]**.

E.3 Consideration has been given to the ecological characteristics of relevant bird species, including their known use of arable crops and improved pasture, and their propensity to move between the SPA and inland sites. The assessment recognises that functional linkage may be seasonal, intermittent or variable between years, and that land does not need to be used continuously to be considered functionally linked.

E.4 The desk-based study takes a sequential approach, whereby if a site's suitability for qualifying bird species is considered negligible or low for a specific reason (e.g. distance or habitat type) no further investigations for that site have been carried out.

E.5 If, following the initial review of distance and habitat, a site's potential suitability for qualifying bird species could not be ruled out, a more detailed assessment including mapping of existing relevant bird records may be required. Where this is the case, this is considered in the main body of the HRA report (Chapters 5 & 6).

E.6 The initial desk study has involved the following:

- A review of existing information on functional linkages with the Severn Estuary SPA/Ramsar.
- Identification of the Severn Estuary SPA/Ramsar qualifying bird species that are susceptible to the loss of the habitat types affected; and ruling out those species unlikely to utilise the habitat types located within the sites (e.g. species restricted to marine habitats).

- A review of aerial imagery and Magic Map to identify the main habitat types and land use within each site allocation and establish their potential value for the qualifying bird species.
- Recognition of factors likely to affect suitability of sites for bird species, including openness, size, shape, proximity of negative factors such as tall boundary features and urban environs, and potential existing source of disturbance.
- Consideration of the site's location within the landscape. For example, is there direct functional connectivity that could be used as flight lines between the site allocations and the Habitats sites? Are there landscape scale features which would reduce the suitability of the site, e.g. urban areas located along flight lines?
- A review of the site's location within flood risk zones, because many of the SPA bird species favour sites which do or do not flood.

E.7 Following the establishment of typical habitat preferences for each species, each proposed site listed in the Local Plan with the potential to be functionally linked between the Severn Estuary SPA and Ramsar site and the Cotswold Water Park SSSI was assessed for its suitability in supporting the qualifying bird species listed above. The assessment has been based on a number of parameters, as described below. Typically, proposed site allocation display varying combinations of the parameters outlined below and findings on suitability for SPA and Ramsar site qualifying birds have therefore been subject to professional judgement.

Habitat suitability rating criteria

E.8 Site with high suitability to be used by SPA/Ramsar species:

- Large sites' area of suitable habitat (e.g. lowland farmland, heathland, wetland, woodland) capable of supporting significant numbers of SPA birds; absence of any notable negative factors such as public rights of way (PRoW) and edge features; land parcel functionally linked with wider habitat and directly linked to SPA via green corridor; site may be prone to flooding (although note absence of flooding favoured by common quail and stone-curlew); typically close to SPA.

E.9 Site with moderate suitability to be used by SPA/Ramsar species:

- Sites support large areas of functionally linked suitable habitat capable of attracting numbers of SPA birds which by themselves are unlikely to be significant, but which may contribute to supporting significant numbers of birds in-combination with other sites. Likely to be further from SPA, and with presence of some limiting factors.

E.10 Site with low suitability to be used by SPA/Ramsar species:

- Smaller or fragmented sites; habitats present may be suitable for supporting low numbers of SPA birds on occasion but limited by negative factors such as size, distance from SPA; absence of sight lines and reductions in 'openness' as a result of edge features such as trees, scrub, and buildings; edge features likely to be close to centre of site; suitability may be compromised by existing recreational use; may be isolated within urban areas.

E.11 Site with negligible suitability to be used by SPA/Ramsar species:

- Habitats present are entirely unsuitable for SPA birds, for example existing developed land or small urban infill sites.

Existing information on functional linkages

E.12 The Severn Estuary SPA and Ramsar site is located approximately 10 km west of Cotswold disrict. Natural England Research Report NECR401 confirms that the Severn Estuary SPA relies on a wider network of habitats beyond its designated boundary to support its qualifying bird species and waterbird assemblage **[See reference** 66**]**. Due to the highly mobile nature of many SPA and Ramsar site species, particularly during the wintering and passage periods, functionally linked land plays a critical role in providing feeding, roosting, staging and, in some cases, breeding habitat.

E.13 NECR401 identifies numerous inland wetland and floodplain sites within the Severn and Avon Vales that either demonstrate proven functional linkage to the SPA or have the potential to support SPA and Ramsar site species under specific environmental conditions, such as flooding, disturbance or adverse weather. The report emphasises that functional linkage may be intermittent or seasonal, but nonetheless ecologically meaningful in maintaining SPA populations at favourable conservation status.

E.14 This approach is consistent with wider evidence collated by Natural England from other estuarine systems, where existing bird records have been used to understand movement patterns and establish functional buffer distances around designated sites, improving understanding of how qualifying species utilise inland supporting habitats beyond SPA boundaries **[See reference** 67, 68**]**.

E.15 The Cotswold Water Park SSSI is partly within the Cotswold district, and comprises a complex mosaic of open water bodies, wet grassland, marginal habitats and gravel pit lakes that collectively support nationally important populations of wintering and passage waterbirds. The lakes – a series of shallow and deep open

waters – are also supported by a range of other habitats including sparsely-vegetated islands, gravel bars and shorelines, reedbed, marsh, wet ditches, rush pasture, semi-natural and improved grasslands and woodland. This provides valuable nesting, resting and feeding conditions for nationally important populations of birds in the breeding and non-breeding seasons **[See reference** 69**]**.

E.16 The Cotswolds Water Park SSSI supports species assemblages that overlap with those for which the Severn Estuary SPA and Ramsar site is designated, including wetland species, dabbling and diving ducks and migratory waders. Of the qualifying species of the Severn Estuary SPA and Ramsar site, the following species are considered to be of special interest to the Cotswold Water Park SSSI:

- non-breeding
  - shoveler Spatula clypeata,
  - gadwall *Mareca strepera*,
  - pochard *Aythya ferina*,
  - tufted duck *A. fuligula*,
  - great crested grebe *Podiceps cristatus*,
  - lesser black-backed gull *Larus fuscus*;
- breeding
  - great crested grebe *Podiceps cristatus*
  - little egret *Egretta garzetta*
  - little ringed plover *Charadrius dubius*

E.17 Other habitats within the Cotswold district are also considered to provide FLL for SPA and Ramsar qualifying species. These locations may act as stepping-stone habitats for qualifying species, facilitating movement, dispersal and temporary use between the Severn Estuary SPA/Ramsar site and Local Plan site allocations.

E.18 Based on the findings of Natural England commissioned Report NECR401 and associated supporting evidence **[See reference** 70**]**, the following locations within Cotswold District are identified as areas that may function as Functionally Linked Land (FLL) and/or stepping-stones for qualifying species of the Severn Estuary SPA and Ramsar site, and are therefore relevant to consideration within Habitats Regulations Assessment:

- River Thames (Upper Thames) floodplain including Lechlade-on-Thames, Downington, Upper Thames meadows.

- River Evenlode corridor including Moreton-in-Marsh fringe, Lower Evenlode floodplain.
- Churn Valley (Upper River Churn).
- Isolated lakes, reservoirs and restored gravel pits outside CWP.
- Severn Springs, Gloucestershire.

E.19 The River Thames floodplain includes Lechlade-on-Thames, Downington, Upper Thames meadows. The habitat includes floodplain grasslands which are critical to SPA species including Lapwing, Curlew, Wigeon and Teal. This area is therefore considered to be FLL during flooded periods.

E.20 While the River Evenlode corridor contains limited areas of floodplain pasture capable of supporting occasional use by certain SPA/Ramsar qualifying species, any functional linkage to the Severn Estuary is considered precautionary and of low significance, and the Upper Churn Valley is not considered to comprise Functionally Linked Land due to its enclosed character, limited habitat extent and lack of evidence of functionally meaningful use.

E.21 Isolated lakes, reservoirs and restored gravel pits within Cotswold district, although non-floodplain and artificial in origin, may nevertheless function as stepping-stone habitats for certain Severn Estuary SPA/Ramsar qualifying species. Such sites may be used intermittently for roosting, resting or refuge during wintering and passage movements, thereby facilitating dispersal and connectivity between the designated site and inland habitats. While these sites are not considered to represent functionally essential supporting habitat in isolation, they may contribute to a wider ecological network.

E.22 Seven Springs, Gloucestershire, is not considered to constitute Functionally Linked Land for the Severn Estuary SPA or Ramsar site, due to its upland location, enclosed landscape character and lack of suitable open floodplain or wet grassland habitats required by SPA qualifying species, and in the absence of evidence demonstrating regular or functionally significant use by those species.

E.23 A site-specific assessment of site allocations will therefore be undertaken within the Habitats Regulations Assessment to determine whether functional linkage exists and whether development could affect the integrity of the designated site.

Bird habitat preferences

E.24 Identification of the Severn Estuary SPA/Ramsar qualifying bird species that are susceptible to the loss of the habitat types affected; and ruling out those species

unlikely to utilise the habitat types located within the sites (e.g. species restricted to marine habitats).

E.25 Bird habitat preferences have been cross-referenced against the habitat types present within each proposed site allocation to determine the suitability of proposed sites for use by qualifying bird species. Habitat types present within the proposed site allocations are confined to arable land parcels, grasslands and developed lands.

E.26 Known habitat preferences are summarised below, which have been taken from the RSPB and British Trust for Ornithology websites. This considers whether each bird species is susceptible to the loss of habitats located within the proposed site allocations.

E.27 The stated 'season' relates to the how that species is designated at the SPA/Ramsar, e.g. wintering or breeding season.

E.28 This assessment is informed by a review of all SPA/Ramsar qualifying bird species, with species ruled out where functional linkage to Cotswold District can reasonably be excluded based on known habitat preferences or behaviour, for example where species are reliant on deep open water, coastal or intertidal habitats, or where available inland habitats such as arable land are unlikely to support relevant feeding, roosting or movement.

E.29 The assessment focuses on those qualifying species of the Severn Estuary SPA and Ramsar site. Qualifying species and habitat preferences, key vulnerabilities and core areas of FLL to be considered are outlined below.

Bewick's Swan, *Cygnus columbianus bewickii*

- Qualifying feature of Severn Estuary SPA and Ramsar site.
- **Season**: Wintering
- **Species Habitat Preference (relative to season of designation):** During the winter, Bewick's Swans primarily use lowland wetlands, estuaries and associated flooded landscapes for roosting, while foraging widely on inland wet grassland and arable land.
- **Species susceptible to loss of off-site habitat as a result of the plan:** Yes – relies on inland feeding areas away from core roost sites, including grassland and arable habitats.
- **Core area within which FLL could occur:** Although the literature does not define a specific distance over which Bewick's Swans move between roosting

and foraging areas, the species is well documented as highly mobile and capable of long-distance flight **[See reference** 71**]**. During the winter period, Bewick's Swans routinely forage on inland pasture and arable land away from estuarine roosts, using the wider lowland landscape to meet their ecological requirements. Given the absence of a defined movement threshold and the known inland feeding ecology of the species, it is considered reasonable to include the Cotswold district within the broader core area in which functionally linked land could occur.

Common shelduck, *Tadorna tadorna*

- Qualifying feature of Severn Estuary SPA and Ramsar site.
- **Season:** Wintering
- **Species Habitat Preference (relative to season of designation):** During winter, Shelduck mainly use estuarine and coastal habitats for feeding and moulting, but also exploit inland waterbodies, wet grasslands and floodplain habitats where available.
- **Species susceptible to loss of off-site habitat as a result of the plan:** Yes – may use inland wetlands and flooded grassland as supporting habitats away from estuaries.
- **Core area within which FLL could occur:** The literature does not define a consistent or routine distance over which Common Shelduck commute between estuarine roosting and inland foraging areas. Tracking studies indicate that most winter movements occur within relatively localised areas associated with estuaries, although occasional longer exploratory movements exceeding 40 km have been recorded **[See reference** 72**]**. Common Shelduck are highly mobile and capable of long-distance flight and are known to utilise inland freshwater and grazing habitats under certain conditions, particularly where suitable coastal resources are constrained. In the absence of a defined movement threshold and given the species' mobility and potential use of inland habitats, it is considered precautionary to include the Cotswold district within the broader core area in which functionally linked land for Common Shelduck could occur.

Gadwall, *Anas strepera*

- Qualifying feature of Severn Estuary SPA and Ramsar site.
- **Season**: Wintering

- **Species Habitat Preference (relative to season of designation):** In winter, Gadwall predominantly use freshwater lakes, reservoirs, flooded gravel pits and sheltered estuarine waters, favouring shallow open water and associated marginal habitats.
- **Species susceptible to loss of off-site habitat as a result of the plan:** Occasionally – the Gadwall is a dabbling duck strongly associated with wetlands, lakes and reservoirs. This species is occasionally known to use grassland when it is flooded, damp, or immediately adjacent to wetlands.
- **Core area within which FLL could occur:** Satellite-tracking studies in the UK demonstrate that Gadwall regularly move between freshwater wetland systems within a single winter, with recorded movements of at least 20 km between core areas of use **[See reference** 73**]**. Gadwall may occasionally use wet grassland or flooded fields in close proximity to waterbodies, but it does not routinely feed or roost on dry grassland or arable land. Functional linkage for this species is therefore most plausibly associated with standing open water and wetland habitats, rather than terrestrial agricultural land.

Dunlin, *Calidris alpina alpina*

- Qualifying feature of Severn Estuary SPA and Ramsar site.
- **Season**: Wintering
- **Species Habitat Preference (relative to season of designation):** Primarily coastal during the winter season, including mudflats in bays and river estuaries.
- **Species susceptible to loss of offsite habitat as a result of the plan:** No – Dunlin is a coastal and estuarine wader and is a strong coastal species that is functionally dependent on estuarine and intertidal habitats and does not make meaningful use of inland grassland or arable land. It is therefore highly unlikely to be functionally linked to the site allocations habitats within Cotswold district, either directly or via stepping-stone habitats, and can be confidently ruled out of further functional linkage assessment.
- **Core area within which FLL could occur:** Functionally linked land for wintering Dunlin is likely to be restricted to areas close to estuarine feeding grounds within the SPA and Ramsar site that are used for roosting, rather than extending across wider inland areas.

Common redshank, *Tringa totanus*

- Qualifying feature of Severn Estuary SPA and Ramsar site.

- **Season:** Wintering
- **Species Habitat Preference (relative to season of designation):** In winter, Redshanks flock to mudflats around the UK's coasts where they predate on crustaceans and other invertebrates. As spring arrives and insects begin to emerge, they head to the saltmarshes and inland wet grasslands, with the aim of raising chicks.
- **Species susceptible to loss of offsite habitat as a result of the plan:** Yes – may utilise grassland close to wetlands.
- **Core area within which FLL could occur:** Small numbers of Common redshank may occasionally use inland wetlands or floodplain sites, however, such use is typically limited, highly site-specific and closely associated with the estuary system **[See reference** 74**]**. Evidence from wintering studies demonstrates that the vast majority of Redshank remain functionally tied to estuaries, with inland sites supporting only a minor proportion of the population. Accordingly, functionally linked land for Common Redshank is likely to be restricted to clearly defined roosting or foraging sites close to the estuary that are demonstrably and regularly used, rather than extending across wider inland areas.

Greater white-fronted goose, *Anser albifrons albifrons*

- Qualifying feature of Severn Estuary SPA and Ramsar site.
- **Season:** Wintering
- **Species Habitat Preference (relative to season of designation):** Great White-fronted Geese roost communally on estuaries, coastal lagoons or large open water bodies and undertake regular daily movements inland to forage. Foraging takes place predominantly on wet grassland, floodplain grazing marsh and improved pasture, and occasionally on arable land such as stubble or winter cereals.
- **Species susceptible to loss of offsite habitat as a result of the plan:** Yes. they rely heavily on inland feeding habitats outside designated sites, particularly grassland and floodplain habitats functionally linked to estuarine or open-water roosts.
- **Core area within which FLL could occur:** highly mobile wintering species that typically roosts on estuarine or open-water habitats but relies on inland floodplain grasslands and agricultural land for foraging. Birds routinely undertake daily commuting flights between roosting and feeding areas, often over distances of many kilometres, and may make use of a network of feeding

sites within a wintering season. Therefore, it is considered reasonable to include the Cotswold district within the broader core area in which functionally linked land could occur.

E.30 Species/populations identified subsequent to designation for possible future consideration, noteworthy fauna and European populations of importance **[See reference** 75**]**

Lesser black-backed gull, *Larus fuscus graellsii*

- Species/populations identified subsequent to designation for possible future consideration of Severn Estuary Ramsar site.
- **Season:** Breeding
- **Species Habitat Preference (relative to season of designation):** While breeding, adults forage widely over a broad marine and terrestrial landscape, including intertidal areas, farmland (pasture and arable), landfill sites, urban areas and inshore waters.
- **Species susceptible to loss of offsite habitat as a result of the plan:** Yes. they depend on a network of off-site foraging habitats beyond colony boundaries, including improved and flooded grassland.
- **Core area within which FLL could occur:** Functionally Linked Land may extend well beyond SPA boundaries **[See reference** 76**]**, and may include coastal, estuarine, agricultural and urban habitats that are regularly used for feeding during the breeding season.

Ringed plover

- Species/populations identified subsequent to designation for possible future consideration of Severn Estuary Ramsar site, and supported European population of importance for Severn Estuary SPA.
- **Season**: Wintering and passage
- **Species Habitat Preference (relative to season of designation):** Ringed plover mostly breed on beaches around the coast, but they have also now begun breeding inland in sand and gravel pits and former industrial sites. Many UK birds live here all year round, but birds from Europe winter in Britain, and birds from Greenland and Canada pass through on migration.

- **Species susceptible to loss of offsite habitat as a result of the plan:** No – does not make meaningful use of inland grassland, arable land or wetland sites as part of its wintering or passage ecology.
- **Core area within which FLL could occur:** Ringed Plover does not have a defined or standardised home range in UK conservation guidance. The species is characterised by localised habitat use, with feeding and roosting typically occurring within the same coastal or estuarine area. Movements during both breeding and non-breeding seasons are small-scale, and there is no evidence for routine long-distance commuting to inland habitats. Any functionally linked land would therefore be limited, site-specific and confined to areas immediately adjacent to the estuary, rather than occurring across a wider landscape.

Eurasian teal, *Anas crecca*

- Species/populations identified subsequent to designation for possible future consideration of Severn Estuary Ramsar site, and supported European population of importance for Severn Estuary SPA.
- **Season:** Wintering and passage
- **Species Habitat Preference (relative to season of designation):** During winter and passage, Eurasian Teal primarily use estuarine and coastal wetland habitats, feeding on intertidal mudflats, saltmarsh creeks, coastal lagoons and sheltered coastal waters, particularly at night.
- **Species susceptible to loss of offsite habitat as a result of the plan:** Yes – often depends on freshwater wetlands and grazing marsh located outside SPA boundaries for roosting and, in some cases, for feeding.
- **Core area within which FLL could occur:** Local to sub-regional (estuary-focused). Functionally Linked Land for Eurasian Teal is most likely to occur within the same estuarine system and adjacent floodplain, typically comprising nearby freshwater wetlands, grazing marsh and managed waterbodies within a few kilometres of the estuary.

Herring gull, *Larus argentatus argentatus*

- Noteworthy species of Severn Estuary Ramsar site.
- **Season:** Breeding
- **Species Habitat Preference (relative to season of designation):** Herring Gulls use a broad range of coastal, estuarine and terrestrial habitats.

- **Species susceptible to loss of offsite habitat as a result of the plan:** Yes – during the breeding season, Herring Gulls depend on a network of off-site foraging habitats beyond the nesting location, including inland grassland and agricultural areas.
- **Core area within which FLL could occur:** GPS-tracking studies demonstrate that Herring Gulls routinely forage at distances of 10–30 km or more from principal roost sites, utilising both coastal and inland habitats **[See reference 77]**. Functionally Linked Land for Herring Gull therefore may extend well beyond the estuary boundary, typically encompassing coastal habitats, inland farmland, landfill sites, urban areas and freshwater bodies within a wide foraging radius from principal roost sites.

Little egret, *Egretta garzetta*

- Noteworthy species of Severn Estuary Ramsar site.
- **Season:** peak counts in spring/autumn
- **Species Habitat Preference (relative to season of designation):** Little Egrets feed mainly in shallow coastal and estuarine habitats, including intertidal mudflats, saltmarsh creeks, tidal channels and lagoons, where they take small fish and invertebrates in shallow water. They also make frequent use of freshwater wetlands, such as drainage ditches, flooded fields, grazing marsh, pools and river margins, particularly when estuarine feeding opportunities are limited by tide or disturbance.
- **Species susceptible to loss of offsite habitat as a result of the plan:** Possibly - uses wet grassland, floodplain habitats and shallow freshwater wetlands and is capable of moving between coastal and inland sites via a network of stepping-stone habitats, however it is unlikely when habitats are dry, enclosed or disconnected from wetland networks.
- **Core area within which FLL could occur:** Local to estuary-scale (generally limited). Functionally Linked Land for Little Egret is most likely to occur within the same estuarine system and adjacent floodplain, typically comprising nearby freshwater wetlands, grazing marsh, ditches and roosting habitat within a few kilometres of the estuary.

Ruff, *Philomachus pugnax*

- Noteworthy species of Severn Estuary Ramsar site.
- **Season:** peak counts in spring/autumn

- **Species Habitat Preference (relative to season of designation):** During spring and autumn passage, Ruff show a strong preference for shallow freshwater and brackish wetlands rather than exposed intertidal mudflats. Favoured habitats include flooded grazing marsh, wet grassland, waterlogged fields, ditches, pools, lagoons and the margins of estuaries and freshwater bodies.
- **Species susceptible to loss of offsite habitat as a result of the plan:** Yes. dependent on off-site inland grassland during passage.
- **Core area within which FLL could occur:** Local to sub-regional. During spring and autumn passage, Ruff relies heavily on inland wet grassland and shallow freshwater wetlands outside the Severn Estuary boundary, indicating potential for functionally linked land where such habitats support migration stopover feeding and roosting.

Whimbrel, *Numenius phaeopus*

- Noteworthy species of Severn Estuary Ramsar site.
- **Season:** Wintering
- **Species Habitat Preference (relative to season of designation):** Whimbrel predominantly use coastal and estuarine habitats, favouring intertidal mudflats, sandflats, saltmarsh edges, tidal creeks and shorelines, where they feed on invertebrates such as worms, crustaceans and molluscs. Birds also make opportunistic use of coastal grassland, short turf, rough grazing and occasionally inland wetlands for feeding and roosting, particularly during stopover periods or at high tide.
- **Species susceptible to loss of offsite habitat as a result of the plan:** Occasionally – primarily associated with the estuary, however, opportunistic use of grassland and arable habitats, typically in close proximity to estuaries and coastal environments.
- **Core area within which FLL could occur:** During spring and autumn passage, Whimbrel uses the Severn Estuary primarily for intertidal foraging, with limited reliance on adjacent coastal grassland and roosting habitat, indicating that any functionally linked land is likely to be local in extent and closely associated with the estuary.

Eurasian curlew *Numenius arquata arquata* (breeding)

- Noteworthy species of Severn Estuary Ramsar site.

- **Season:** Breeding
- **Species Habitat Preference (relative to season of designation):** In winter, Curlew use estuarine mudflats extensively but also range widely across inland wet grassland, floodplain habitats and arable land for foraging.
- **Species susceptible to loss of off-site habitat as a result of the plan:** Yes – frequently reliant on inland terrestrial habitats away from core estuarine areas.
- **Core area within which FLL could occur:** Within the NECR483 report, a functionally linked land buffer of 15km is established for the Curlew. For breeding Curlew, Functionally Linked Land may occur over a relatively large spatial extent, reflecting the species' use of multiple habitat types within the breeding landscape **[See reference** 78**]**.

Common greenshank, *Tringa nebularia*

- Noteworthy species of Severn Estuary Ramsar site.
- **Season:** Spring/autumn
- **Species Habitat Preference (relative to season of designation):** During passage, Greenshank primarily uses coastal and estuarine wetlands, favouring intertidal mudflats, muddy shorelines, tidal creeks, lagoons and saltmarsh pools, where it feeds on aquatic invertebrates, small fish and crustaceans.
- **Species susceptible to loss of offsite habitat as a result of the plan:** Yes, individuals use off-site freshwater wetlands and coastal grassland as alternative feeding or roosting areas.
- **Core area within which FLL could occur:** During spring and autumn passage, Common Greenshank uses the Severn Estuary primarily for intertidal foraging, with limited functional reliance on adjacent coastal and freshwater wetlands, indicating that any functionally linked land is likely to be local in extent and directly associated with the estuary **[See reference** 79**]**.

Eurasian wigeon, *Anas penelope*

- Species/populations identified subsequent to designation for possible future consideration of Severn Estuary Ramsar site, and supported European population of importance for Severn Estuary SPA.
- **Season:** Wintering

- **Species Habitat Preference (relative to season of designation):** During winter and passage, wigeon primarily use estuarine and coastal habitats, including intertidal mudflats, saltmarsh, tidal creeks and shallow coastal waters, which provide feeding and loafing opportunities. The species is also strongly associated with grazing marsh, low-lying pasture, floodplain grassland and freshwater wetlands, where birds feed extensively on grasses and aquatic vegetation, often grazing terrestrially during daylight or at high tide.
- **Species susceptible to loss of offsite habitat as a result of the plan:** Yes – dabbling duck with strongly terrestrial feeding habits. May utilise floodplain pastures, wet grasslands and freshwater bodies within the wider Severn and Avon Vales.
- **Core area within which FLL could occur:** Within the NECR483 report, a functionally linked land buffer of 2km is established for the Wigeon. Eurasian wigeon wintering on the Severn Estuary rely on a network of estuarine and inland floodplain habitats, with functionally linked land extending across grazing marsh and freshwater wetlands within the wider Severn landscape.

Northern shoveler, *Anas clypeata*

- Species/populations identified subsequent to designation for possible future consideration of Severn Estuary Ramsar site, and supported European population of importance for Severn Estuary SPA.
- **Season:** Wintering
- **Species Habitat Preference (relative to season of designation):** During winter, northern shoveler favours shallow wetlands and calm waters, including freshwater marshes, lagoons, pools, flooded grassland, and sheltered estuarine margins.
- **Species susceptible to loss of offsite habitat as a result of the plan:** Yes – may utilise freshwater wetlands, flooded fields, grazing marsh and pools adjacent to estuarine systems.
- **Core area within which FLL could occur:** Localised and habitat-specific within the wider estuarine hinterland. Functionally Linked Land for northern shoveler is most likely to occur within shallow freshwater and brackish wetlands close to the estuary, including coastal grazing marsh, wet grassland and managed waterbodies used for feeding and roosting, particularly at high tide.

Common pochard, *Aythya farina*

- Species/populations identified subsequent to designation for possible future consideration of Severn Estuary Ramsar site, and supported European population of importance for Severn Estuary SPA.
- **Season:** Wintering
- **Species Habitat Preference (relative to season of designation):** During winter, pochard is strongly associated with deep, still or slow-moving freshwater habitats that support diving behaviour, including lakes, reservoirs, flooded gravel pits and large wetlands with high nutrient status.
- **Species susceptible to loss of offsite habitat as a result of the plan:** No – susceptible to loss of off-site lakes, reservoirs and wetlands.

Water rail, *Rallus aquaticus*

- Noteworthy species of Severn Estuary Ramsar site.
- **Season:** Wintering
- **Species Habitat Preference (relative to season of designation):** In winter, Water rail is strongly associated with dense wetland vegetation, particularly reedbeds, sedge beds, wet ditches, marshes and flooded margins with shallow water or muddy substrates.
- **Species susceptible to loss of offsite habitat as a result of the plan:** No – susceptible to loss of off-site discrete patches of dense wetland vegetation (e.g. reedbeds, wet margins, ditches and managed wetlands).

Spotted redshank, *Tringa erythropus*

- Noteworthy species of Severn Estuary Ramsar site.
- **Season:** Wintering
- **Species Habitat Preference (relative to season of designation):** Spotted redshank favours shallow estuarine and coastal wetlands, including mudflats, creeks, saline lagoons, saltmarsh pools and sheltered bays.
- **Species susceptible to loss of offsite habitat as a result of the plan:** Yes – may utilise flooded grassland close to estuaries.
- **Core area within which FLL could occur:**

Northern pintail, *Anas acuta*

- Supported European population of importance for Severn Estuary SPA.
- **Season:** Wintering
- **Species Habitat Preference (relative to season of designation)**: During winter, Pintail utilise estuaries and large freshwater bodies for roosting while foraging across floodplain wetlands and suitable inland feeding habitats, including agricultural land.
- **Species susceptible to loss of off-site habitat as a result of the plan:** Yes – may depend on inland feeding areas away from primary roost sites, including agricultural land.
- **Core area within which FLL could occur:** Within the NECR483 report, a functionally linked land buffer of 2km is established for the Pintail. Functionally Linked Land for northern pintail is most likely to comprise wet grassland, grazing marsh, floodplain wetlands and shallow waterbodies in close proximity to the Severn Estuary SPA.

Lapwing, *Vanellus Vanellus*

- Supported European population of importance for Severn Estuary SPA.
- **Season:** Wintering
- **Species Habitat Preference (relative to season of designation)**: During winter and passage, lapwing shows a strong preference for open, low-lying habitats including estuarine margins, saltmarsh, wet grassland, grazing marsh, floodplain pasture and damp arable fields.
- **Species susceptible to loss of off-site habitat as a result of the plan:** Yes – reliant on wet grassland, grazing marsh and floodplain farmland.
- **Core area within which FLL could occur:** Lapwing is a regular wintering and passage species in the Severn Estuary, strongly dependent on floodplain grassland and wet agricultural habitats, and has a home range of more than 15km.

Mallard, *Anasplatyrhynchos*

- Supported European population of importance for Severn Estuary SPA.
- **Season:** Wintering

- **Species Habitat Preference (relative to season of designation)**: During winter, mallard primarily uses shallow inshore waters, estuarine creeks, saltmarsh edges, grazing marsh, freshwater ditches, ponds and flooded pasture. .
- **Species susceptible to loss of off-site habitat as a result of the plan:** Yes – may depend on floodplain grazing marsh, wetlands, ditches and farmland used for feeding and roosting.
- **Core area within which FLL could occur:** Estuarine margins and associated lowland wetlands and floodplains. Functionally Linked Land for mallard is most likely to occur within the Severn Estuary floodplain, including coastal and floodplain grazing marsh, freshwater and brackish ditches, ponds, slow-flowing watercourses and adjacent agricultural land**.**

Tufted Duck, *Aythyafuligula*

- Supported European population of importance for Severn Estuary SPA.
- **Season:** Wintering
- **Species Habitat Preference (relative to season of designation)**: During winter, Pintail utilise estuaries and large freshwater bodies for roosting while foraging across floodplain wetlands and suitable inland feeding habitats, including agricultural land.
- **Species susceptible to loss of off-site habitat as a result of the plan:** Yes – may depend on inland feeding areas away from primary roost sites.
- **Core area within which FLL could occur:** Sheltered estuarine waters and associated inland open water habitats. Functionally Linked Land for tufted duck is most likely to occur within the Severn Estuary hinterland, including reservoirs, docks, flooded gravel pits, large ponds and slow-flowing rivers connected ecologically to the estuary.

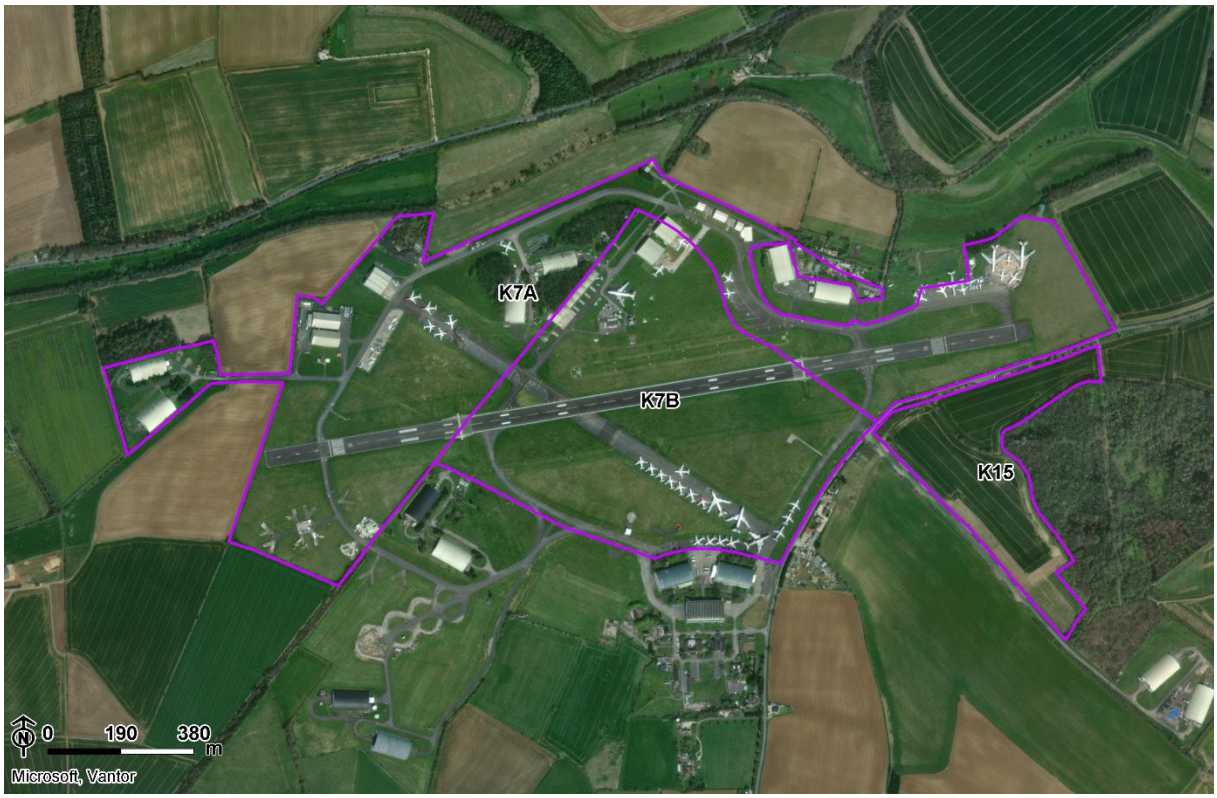
Grey Plover, *Pluvialis squatarola*

- Supported European population of importance for Severn Estuary SPA.
- **Season:** Wintering
- **Species Habitat Preference (relative to season of designation)**: Tufted duck is a diving duck that favours calm, open water in winter, including lakes, reservoirs, flooded gravel pits, docks, slow-flowing rivers and sheltered estuarine waters.

- **Species susceptible to loss of off-site habitat as a result of the plan:** No – sensitive to loss of inland waterbodies such as reservoirs, flooded pits, ponds and slow rivers.
- **Core area within which FLL could occur:** Intertidal–coastal interface within and adjacent to the estuary. Functionally Linked Land for Grey Plover is most likely to occur close to feeding areas, typically within the wider Severn Estuary coastal zone, encompassing upper shorelines, flood embankments, saltmarsh fringes and adjacent open coastal land used at high tide.

E.31 The species that will be taken forwards for further consideration are those that may potentially rely on land within the Cotswold district that have been allocated within the Local Plan for development. This land includes arable fields, grassland, urban and already developed land, and scrub or small woodland patches.

E.32 Based on the above specifies information, the following qualifying species of the Severn Estuary SPA and Ramsar site will be considered for further assessment. The list below summarises the principal on-site habitats used by each qualifying species, together with typical off-site supporting habitats (functionally linked land) that may be utilised for feeding, roosting or loafing within the wider ecological network.



- Bewick's swan – wetlands; arable fields.
- Common shelduck – estuaries; saltmarsh lagoons (outside the district); and lakes (within the district).
- Gadwall – slow freshwater; flooded grassland.
- Greater white-fronted goose – wet grassland; arable fields.
- Lesser black-backed gull – coasts (outside the district); and landfills or farmland (within the district).
- Herring gull – coasts (outside the district); urban landfills (within the district).
- Eurasian curlew – mudflats; wet grassland.
- Eurasian wigeon – shallow wetlands; grazed grassland.
- Northern shoveler – shallow wetlands; flooded fields.
- Spotted redshank – lagoons mudflats; flooded fields.
- Northern pintail – freshwater wetlands; inundated fields.
- Lapwing – wet grassland; arable farmland.

Assessment of site allocations

E.33 A review of the proposed development within the Local Plan identified the following site allocations which will need to be considered further for functionally linked land.

E.34 Assessment of site allocations included reference to the Habitat Suitability Criteria, as well as flood risk information which has been included to count for species such as Northern shoveler and Spotted redshank which rely on flooded field and grasslands.

K7A and B Kemble - Kemble - New settlement at Cotswold Airport

- **Distance from Habitat Site:** This site is located 4.18km from the SSSI and 23.13km from the SPA and Ramsar site at the closest point
- **Size:** 156ha
- **Habitats present:** The site comprised an airfield, including commercial buildings and a runway. To the east of the site, a small arable field is disconnected from the airfield by a single carriageway road.

- **Use of the site**: The site was used for commercial and flying use.
- **Habitat suitability:** Negligible – due to the high disturbance associated with the function of the land as an airfield and the arable nature of the site, the site was considered of negligible suitability for qualifying bird species.

K15 Kemble and Ewen

[Adjacent to Cotswold Airport and shown on image above.]

- **Distance from Habitat Site:** This site is located 3.51km from the SSSI and 25.95km from the SPA and Ramsar site at the closest point
- **Size:** 16.28ha
- **Habitats present:** The site comprised a small arable field to the southeast of an airfield. The small arable field is disconnected from the airfield by a single carriageway road which bounds the western and northern extent of the site and is bounded to the east and south by woodland.
- **Use of the site**: The site was used for agriculture.
- **Habitat suitability:** Low – due to small size of the site, the disturbance associated with the neighbouring airfield and the arable nature of the site, the site was considered of low suitability for qualifying bird species.

Strategic site: Land south west of Kemble

- **Distance from Habitat Site:** This site is located 2.6km from the SSSI and 25km from the SPA and Ramsar site at the closest point
- **Size:** 68.71ha
- **Habitats present:** The site comprised of eight large arable field, surrounded by other arable fields and a residential and industrial areas to the northwest and southwest of the site respectively.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Low – due to the extensive areas of arable land and the surrounding residential and commercial development, the site was considered of low suitability for qualifying bird species.

Strategic site: Cirencester - Steadings southern extension

- **Distance from Habitat Site:** This site is located 1.5km from the SSSI and 26.82km from the SPA and Ramsar site at the closest point
- **Size:** 116.5ha
- **Habitats present:** The site comprised of ten small, medium and large arable fields, surrounded by other arable fields and a residential area to the northeast. Several farm roads are also present within the fields, as well as electricity pylons.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Moderate – the site allocation is located within 2km of the CWP and has extensive areas of arable land. However, it is of very low flood risk **[See reference** 80**]** and is surrounded by dense residential development and therefore has been considered of moderate suitability for qualifying bird species.

C71 - Land adjacent ‘Donside’, off Barn Way

- **Distance from Habitat Site:** This site is located 4.79km from the SSSI and 27.46km from the SPA and Ramsar site at the closest point
- **Size:** 0.33ha
- **Habitats present:** The site comprised of a sealed entrance road and small vegetated parcels of scrub and woodland. The site was surrounded by residential development and opening into arable land to the west.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Low – due to the small size, scrub and woodland vegetation, and surrounding extensive areas of arable land and residential development, the site was considered of low suitability for qualifying bird species.

C81B - Land west of Gardner Way

- **Distance from Habitat Site:** This site is located 3.55km from the SSSI and 30km from the SPA and Ramsar site at the closest point
- **Size:** 1.60ha
- **Habitats present:** The site comprised of 2 small, grassed fields, within a dense residential area. To the north, the site is bounded by a 40m strip of woodland which forms part of the highway buffer. An electricity pylon is also located with the site.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Low – due to the small size, boundary features which increase the risk of predation, and the surrounding residential, the site was considered of low suitability for qualifying bird species.

Strategic site: Cirencester - Land east of Kingshill Lane

- **Distance from Habitat Site:** This site is located 2.5km from the SSSI and 28.6km from the SPA and Ramsar site at the closest point
- **Size:** 41.93ha
- **Habitats present:** The site comprised of 5 small and medium arable fields, bound to the northeast by a dual carriageway highway, and by other arable fields and smaller local roads in all other directions. In the wider landscape, the area was characterised by residential development. Several woodland belts were also identified within the site, creating additional boundary features.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Moderate – the site allocation is located within 2km of the CWP and has extensive areas of arable land. However, it is of very low flood risk and is bounded by hedgerow boundaries which promotes predation and therefore has been considered of moderate suitability for qualifying bird species.

Strategic site: Cirencester - Land south east of Cirencester and south of Preston

- **Distance from Habitat Site:** This site is located 1.8km from the SSSI and 30.56km from the SPA and Ramsar site at the closest point
- **Size:** 100ha
- **Habitats present:** The site comprised of 15 small, medium and large arable fields, surrounded by other arable fields and scattered residential development. A dual carriageway highway runs immediately to the north and a single carriageway to the south. All fields are bounded by hedgerows and trees, and several patches of woodland.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Moderate – the site allocation is located within 2km of the CWP and has extensive areas of arable land. The site is of low flood risk with a small tributary to the northwest of the site allocation, and the field boundaries which promotes predation. This has been considered of moderate suitability for qualifying bird species.

Strategic site: Siddington - Land south west of Siddington

- **Distance from Habitat Site:** This site is located <500m from the SSSI and 29.34km from the SPA and Ramsar site at the closest point
- **Size:** 21.66ha
- **Habitats present:** The site comprised of one medium arable field, surrounded by other arable fields and scattered residential infrastructure. Two roads are also present around the site boundary to the west and east.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Moderate – the site allocation is located within 500m the CWP. However, it is of very low flood risk, is a relatively small area of arable land providing limited potential habitat and has high levels of disturbance due to roads and surrounding residential areas. Therefore, the site was considered of moderate suitability for qualifying bird species.

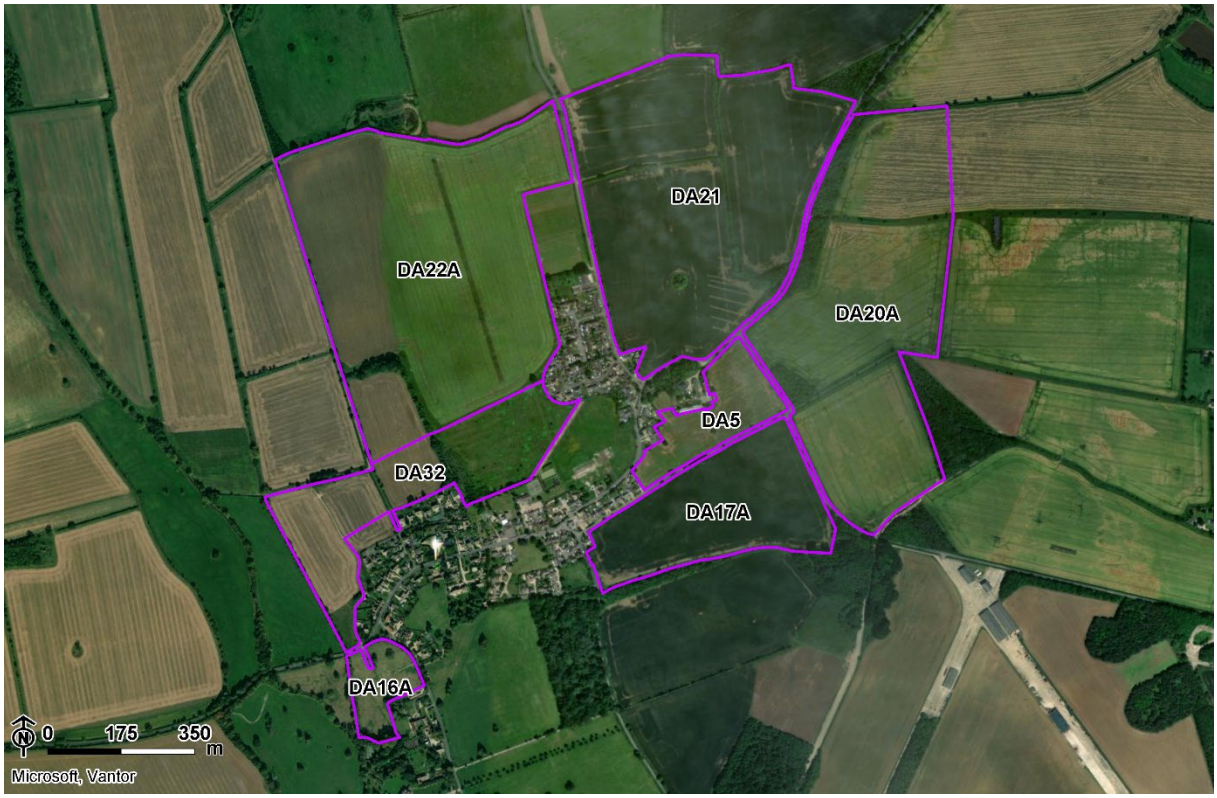
SD15 – Siddington, Plummers Farm, east of Ashton Road

- **Distance from Habitat Site:** This site is located <500m from the SSSI and 30.1km from the SPA and Ramsar site at the closest point
- **Size:** 3.17ha
- **Habitats present:** The site comprised of one small field, surrounded by arable fields and residential infrastructure. The site is bounded by hedgerows and trees, and roads are also present around north and west edges of the site.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Moderate – the site allocation is located within 500m the CWP. However, it is of very low flood risk, is a relatively small area of arable land providing limited potential habitat and field boundaries which promotes predation. Therefore, the site was considered of moderate suitability for qualifying bird species.

SD23 – Siddington, Land between disused canal and disused railway line, north of Park Way

- **Distance from Habitat Site:** This site is located 1km from the SSSI and 29.69km from the SPA and Ramsar site at the closest point
- **Size:** 5.68ha
- **Habitats present:** The site comprised of three small field, and a dirt road accessway. The site is bounded by hedgerows and trees, and within a wider residential and commercial area.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Moderate – the site allocation is located within 1km of the CWP. However, the site is relatively small, is of very low flood risk and is bounded by hedgerow boundaries which promotes predation and therefore has been considered of moderate suitability for qualifying bird species.

SD17 – Siddington, Land east of Siddington Road and west of Bluebell Drive



- **Distance from Habitat Site:** This site is located 1.57km from the SSSI and 30.5km from the SPA and Ramsar site at the closest point
- **Size:** 0.63ha
- **Habitats present:** The site comprised of a small section of field, adjacent to a main road and residential neighbourhood. The site is bounded by hedgerows and trees to the west, and a gate to the east which separates the site from the wider residential area.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Moderate – the site allocation is located within 2km of the CWP. However, the site is relatively small providing limited potential habitat, is of very low flood risk and is bounded by hedgerow boundaries which promotes predation and therefore has been considered of moderate suitability for qualifying bird species.

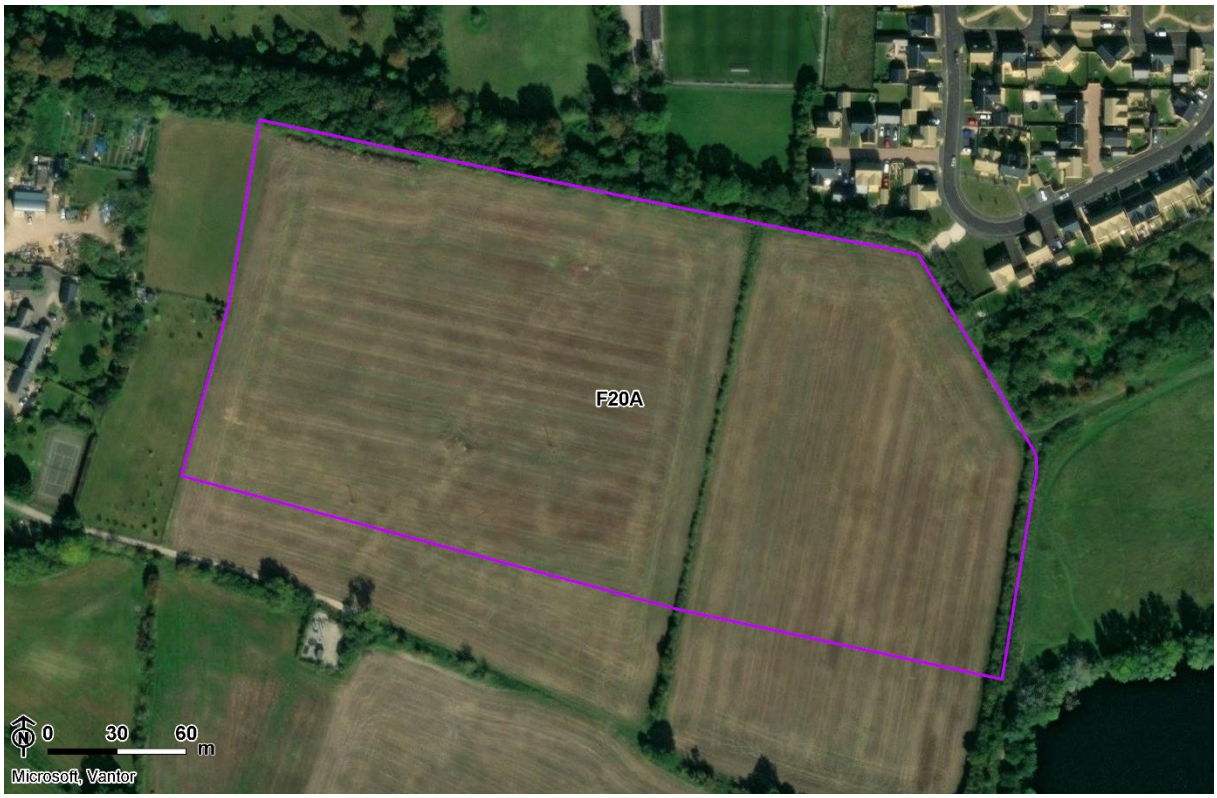
Strategic site: Driffield - Land south of Driffield

- **Distance from Habitat Site:** This site is located 600m from the SSSI and 36.56km from the SPA and Ramsar site at the closest point
- **Size:** 199.4ha
- **Habitats present:** The site comprised of 18 small, medium and large arable fields, bounded by a highway to the south, and other arable fields tin all other directions. The wider area was characterised by arable fields and agricultural use with scattered residential development. Add fields were bounded by hedgerows and several belts of woodland are within the site.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Moderate – the site allocation being located less 1km of the CWP and presented large areas of arable land providing extensive potential habitat. The site if of low flood risk, is bounded by hedgerows which promotes predation and is surrounded by residential and commercial development. Therefore, the site was considered of high suitability for qualifying bird species.

Strategic site: Down Ampney - Land surrounding Down Ampney

- **Distance from Habitat Site:** This site is located 1.3km from the SSSI and 34.3km from the SPA and Ramsar site at the closest point
- **Size:** 135.4ha
- **Habitats present:** The site comprised of 13 small, medium and large arable fields, with a large residential development in between the fields. The wider area was characterised by arable fields and agricultural use with scattered residential development. Add fields were bounded by hedgerows and several belts of woodland are within the site.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Moderate – the site allocation being located less 1km of the CWP and presented large areas of arable land providing extensive potential habitat. The site if of low flood risk, is bounded by hedgerows which promotes predation and is surrounded by residential and commercial development. Therefore, the site was considered of high suitability for qualifying bird species.

R203A-C - Land to rear of the Knoll, Whelford Road



- **Distance from Habitat Site:** This site is located 2km from the SSSI and 42.5km from the SPA and Ramsar site at the closest point
- **Size:** 2.52ha
- **Habitats present:** The site comprised of 3 small fields, adjacent to a main road, wider arable fields and a residential neighbourhood. The site is bounded by hedgerows and trees. An airport and supporting infrastructure was located to the northwest.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Low - the site allocation is located within 2km of the CWP, however is of very low flood risk, is a relatively small area of land and experience high levels of disturbance due to the airport and surrounding residential and commercial development. Therefore, the site was considered of low suitability for qualifying bird species.

F53A - Land at Totterdown Hill, Horcott

- **Distance from Habitat Site:** This site is located adjacent to the SSSI and >45km from the SPA and Ramsar site at the closest point
- **Size:** 12.81ha
- **Habitats present:** The site comprised of 3 arable fields bounded by hedgerows and trees. The wider area is characterised by arable land and residential development. The site is located immediately adjacent to revivors which are part of the CWP SSSI.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** High - the site allocation is located immediately adjacent to the CWP and arable in nature. It is of very low flood risk and was considered of high suitability for qualifying bird species.

F20A - Land south-east of Fairford

- **Distance from Habitat Site:** This site is located adjacent SSSI and >45km from the SPA and Ramsar site at the closest point
- **Size:** 5.75ha
- **Habitats present:** The site comprised of 2 arable fields bounded by hedgerows and trees. The wider area is characterised by arable land and residential development. The site is located immediately adjacent to revivors which are part of the CWP SSSI.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** High - the site allocation is located immediately adjacent to the CWP and arable in nature. It is of very low flood risk and was considered of high suitability for qualifying bird species.

Strategic site: Fairford - Land north east of Fairford

- **Distance from Habitat Site:** This site is located adjacent SSSI and >45km from the SPA and Ramsar site at the closest point
- **Size:** 71.26ha
- **Habitats present:** The site comprised of eight medium and large arable field within a wider arable and residential area. The site is located immediately adjacent to revivors which are part of the CWP SSSI.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** High - the site allocation is located immediately adjacent to the CWP and arable in nature. It is of very low flood risk and was considered of high suitability for qualifying bird species.

F52 - Land west of Terminus Cottage and Station Cottage

- **Distance from Habitat Site:** This site is located 200m from the SSSI and >45km from the SPA and Ramsar site at the closest point
- **Size:** 1.486ha
- **Habitats present:** The site comprised of a small, grassed field within a wider residential area, bounded by hedgerows and trees. The site is located immediately adjacent to revivors which are part of the CWP SSSI.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Moderate – the site was located within 500m of the CWP and is characterized by relatively small, grassed field. It is of very low flood risk and is surrounded by residential land. There, it was considered of moderate suitability for qualifying bird species.

F39C - Land west of Terminus Cottage and Station Cottage

(image as above)

- **Distance from Habitat Site:** This site is located 200m from the SSSI and >45km from the SPA and Ramsar site at the closest point

- **Size:** 1.84ha
- **Habitats present:** The site comprised of a small, grassed field within a wider residential area, bounded by hedgerows and trees. The site is located immediately adjacent to revivors which are part of the CWP SSSI.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Moderate – the site was located within 500m of the CWP and is characterized by relatively small, grassed field. It is of very low flood risk and is surrounded by residential land. There, it was considered of moderate suitability for qualifying bird species.

R607 - Land north of London Road

- **Distance from Habitat Site:** This site is located 4.73km from the SSSI and 37km from the SPA and Ramsar site at the closest point
- **Size:** 1.06ha
- **Habitats present:** The site comprised of a small field, adjacent to a main road, arable land and residential neighbourhood.
- **Use of the site**: The site was used for agricultural use.

- **Habitat suitability:** Negligible - due to the small area of developed land and the disturbance surrounding the site, the site was considered of negligible suitability for qualifying bird species.

L19 - Land south of Butler's Court

- **Distance from Habitat Site:** This site is located 380m from the SSSI and >45km from the SPA and Ramsar site at the closest point
- **Size:** 0.954ha
- **Habitats present:** The site comprised of a small, grassed field, adjacent to a main road and residential neighbourhood.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Moderate – the site is located within 500m of the CWP and is characterized by a relatively small area of land. The site experience disturbance due surrounding residential and commercial development. Therefore, the site was considered of moderate suitability for qualifying bird species.

L33 - Land south of Ferrers Park

- **Distance from Habitat Site:** This site is located 1.57km from the SSSI and >45km from the SPA and Ramsar site at the closest point
- **Size:** 10.01ha
- **Habitats present:** The site comprised of a medium sized, grassed field, adjacent to a main road and residential neighbourhood.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Moderate – the site is located within 500m of the CWP and is characterized by a relatively small area of land. The site experience disturbance due surrounding residential and commercial development. Therefore, the site was considered of moderate suitability for qualifying bird species.

R591 - Former Godwin Pumps factory Springfield Road, Quenington

- **Distance from Habitat Site:** This site is located 9.85km from the SSSI and 30.5km from the SPA and Ramsar site at the closest point
- **Size:** 1.98ha
- **Habitats present:** The site comprised of a developed land.
- **Use of the site**: The site was used for commercial use.
- **Habitat suitability:** Negligible - due to the already developed land the site was considered of negligible suitability for qualifying bird species.

R670 - Glebe Farm Yard, Hatherop

- **Distance from Habitat Site:** This site is located 4.57km from the SSSI and >45km from the SPA and Ramsar site at the closest point
- **Size:** 1.44ha
- **Habitats present:** The site comprised of a developed land.
- **Use of the site**: The site was used for commercial use.
- **Habitat suitability:** Negligible - due to the already developed land the site was considered of negligible suitability for qualifying bird species.

T71A - Land north-west of Highfield Cottage

- **Distance from Habitat Site:** This site is located 11.20km from the SSSI and 19.81km from the SPA and Ramsar site at the closest point
- **Size:** 2.15ha
- **Habitats present:** The site comprised of a small, grassed field, adjacent to a residential neighbourhood. The site is bounded by hedgerows and trees and within a wider arable area.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Low - due to the relatively small area of land and the disturbance within the site due surrounding residential development, the site was considered of low suitability for qualifying bird species.

T31B - Land adjacent to Blind Lane

- **Distance from Habitat Site:** This site is located 12.57km from the SSSI and 20.11km from the SPA and Ramsar site at the closest point
- **Size:** 2.01ha
- **Habitats present:** The site comprised of a small, grassed field, adjacent to a residential neighbourhood. The site is bounded by hedgerows and treesand within a wider arable area.
- **Use of the site**: The site was used for agricultural use.
- **Habitat suitability:** Low - due to the relatively small area of land and the disturbance within the site due surrounding residential development, the site was considered of low suitability for qualifying bird species

Remaining site allocations:

E.35 It is acknowledged that birds do not move through the landscape in straight lines and may use a series of intermediate or stepping-stone habitats, such as the Cotswold Water Park, the Upper Thames floodplain and other smaller wetland features, during wider movements between inland areas and the Severn Estuary SPA and Ramsar site. However, all remaining site allocations are located more than

30 km to the north or north-east of the Severn Estuary and lie well beyond the cluster of identified stepping-stone habitats that could plausibly support functionally linked movements. These allocations are outside the broad spatial relationship between the Severn Estuary and the Cotswold Water Park SSSI and do not form part of a coherent network of wetlands or open habitats that could reasonably facilitate onward movement by SPA/Ramsar qualifying species.

E.36 As a result, while stepping-stone use is recognised in principle, the distance of these allocations from the designated site, combined with the absence of intervening stepping-stone habitats linking them to the Severn Estuary, means they are not considered to lie within a realistic movement pathway for functionally linked species.

E.37 Consequently, these site allocations are not considered to give rise to functionally linked effects and do not require further assessment in relation to the Severn Estuary SPA and Ramsar site.

E.38 The desk-based review of the site allocations identified that based on a precautionary approach, 14 site allocations have moderate and three site allocations have a high potential to support significant numbers of SPA and Ramsar qualifying bird species, either alone or cumulatively with other sites.

E.39 The sites identified above provides suitable offsite foraging habitat for qualifying bird species in the form of arable fields, which are common and widespread in the district. These site was not considered to support habitats or features notable value, rarity or which populations are likely to be dependent on in isolation the importance of this site for these species is likely to be low when compared with the extensive areas of habitat of greater suitability both within the district and the wider land areas surrounding these Habitat Sites. As a result, the potential for the loss of offsite habitat to adversely affect these species relates primarily to the cumulative effect of reducing the extent of feeding areas. Given the dependency of these species on offsite arable fields and grasslands, inclusion and implementation of appropriate safeguards and mitigation will be required in Local Plan to provide certainty that there will be no adverse effect on the integrity of the SPA and Ramsar site.

Loss of habitat

E.40 This assessment confirms that there is potential for Functional Linked Land (FLL) within Cotswold District in relation to the Severn Estuary SPA and Ramsar site. The Cotswold Water Park (CWP) SSSI represents the principal area of FLL within the District, providing extensive and well-connected wetland habitats capable of supporting foraging, roosting and resting functions for SPA/Ramsar qualifying bird species beyond the designated site boundary.

E.41 In addition to the CWP SSSI, a number of other sites across the district provide more limited but locally important habitat that may also be used by qualifying species, particularly during periods of high tide, disturbance, or seasonal movement. Collectively, these sites contribute to the wider network of functionally linked habitats associated with the Severn Estuary.

E.42 The assessment identifies that several site allocations are of medium to high value for SPA/Ramsar qualifying species. Accordingly, likely significant effects cannot be ruled out in the absence of mitigation. It is therefore concluded that appropriate mitigation measures are required for relevant allocations to avoid or reduce impacts on functionally linked habitats and to ensure no adverse effect on the integrity of the Severn Estuary SPA/Ramsar site, in accordance with the Habitats Regulations.

Mitigation – loss of habitat

E.43 To provide certainty that the loss of offsite functional habitat will not adversely affect the integrity of the Severn Estuary SPA and Ramsar site, it is recommended that the following safeguard measures are implemented at the project level:

- Wintering, migratory and breeding bird surveys are required for sites with high and moderate suitability to support these qualifying species to determine their individual and cumulative importance for these species and inform mitigation proposals.
- A commitment to mitigation is required within the Local Plan dependent on the findings of bird surveys. This will need to take into account the cumulative numbers of SPA birds affected by the allocations as they come forward for development. In the unlikely but possible event that cumulative numbers of SPA birds affected are likely to exceed thresholds of significance (i.e. >1% of the associated European Site), appropriate mitigation in the form of habitat creation and management in perpetuity, either on-site or offsite, or through the provision of strategic sites for these species elsewhere within the district, will be required. If required, mitigation will need to create and manage suitably located habitat which maximises feeding productivity for these SPA species, and such mitigatory habitat would need to be provided and be fully functional prior to development which would affect significant numbers of SPA birds. Due to the common and widespread nature of the habitats present within the site allocations it considered with certainty that mitigation can be successfully achieved through the creation of alternative habitat of equal or greater value should a significant number of qualifying birds be found to utilise the site. This

approach has been approved at recent Examination in Public for other coastal Local Authorities, including the North Essex Authorities.

Non-physical disturbance

E.44 This assessment has considered the potential for non-physical disturbance effects on Severn Estuary SPA and Ramsar qualifying bird species arising through the use of Functionally Linked Land (FLL) within the district, during both the construction and operational phases of development. Non-physical disturbance pathways include increases in human activity, noise, visual disturbance and artificial lighting, which may affect the suitability of supporting habitats used by qualifying species for foraging, resting and loafing.

E.45 It has been assumed that the effects of noise, vibration and light are most likely to be significant within a distance of 500 m. There is also evidence of 300 m being used as a distance up to which certain bird species can be disturbed by the effects of noise **[See reference** 81**]**; however, it has been assumed (on a precautionary basis) that the effects of noise, vibration and light pollution are capable of causing an adverse effect if development takes place within 500 m of a Habitats site, or in this case FLL which supports qualifying features of the SPA and Ramsar site that are sensitive to these disturbances.

E.46 The desk-based review also identified 17 site allocations within 2.5km of the Cotswold Water Park, as FLL of the SPA and Ramsar site, which may be impacted by the Local Plan via non-physical disturbances such as noise and light. These site allocations are those assessed as having moderate or high potential to be FLL, i.e.:

- Strategic site: Cirencester - Steadings southern extension.
- Strategic site: Cirencester - Land east of Kingshill Lane.
- Strategic site: Cirencester - Land south east of Cirencester and south of Preston.
- Strategic site – Cirencester.
- Strategic site: Siddington - Land south west of Siddington.
- SD15 – Siddington, Plummers Farm, east of Ashton Road.
- SD17 – Siddington, Land east of Siddington Road and west of Bluebell Drive.
- Strategic site: Driffield - Land south of Driffield.
- Strategic site: Down Ampney - Land surrounding Down Ampney.

- F53A - Land at Totterdown Hill, Horcott.
- F20A - Land south-east of Fairford.
- Strategic site: Fairford - Land north east of Fairford.
- F52 - Land west of Terminus Cottage and Station Cottage.
- F39C - Land west of Terminus Cottage and Station Cottage.
- L19 - Land south of Butler's Court.
- L33 - Land south of Ferrers Park.

E.47 The assessment confirms that areas of FLL within the district, including the Cotswold Water Park SSSI and other identified supporting habitats, may be utilised by SPA/Ramsar qualifying species outside the designated site boundary. Disturbance within these areas has the potential to result in temporary or sustained displacement, increased energy expenditure, or reduced habitat use, even where no direct physical habitat loss occurs.

E.48 During the construction phase, disturbance may arise from short-term increases in noise, visual activity and lighting, particularly where works coincide with sensitive overwintering or migratory periods. During the operational phase, longer-term effects may result from increased recreational pressure, regular human presence, traffic noise and permanent lighting associated with development. For site allocations identified as being of medium to high value for SPA/Ramsar qualifying species through functional linkage, likely significant effects from non-physical disturbance cannot be ruled out, either alone or in combination with other plans and projects, in the absence of mitigation.

E.49 It is therefore concluded that mitigation measures are required for relevant allocations to address both construction- and operational-phase non-physical disturbance impacts on functionally linked habitats.

Mitigation – non-physical disturbance

Appendix F

F.1 To provide certainty that non-physical disturbance will not adversely affect the integrity of the SPA and Ramsar Site, it is recommended that Local Plan policies relating to development near FLL (i.e. the above site allocations, plus windfall) contain a requirement to demonstrate that noise, vibration and light will be minimised, where the ecological surveys have identified that SPA/Ramsar bird species are present nearby.

Air Quality Assessment

F.2 The documents in this appendix are:

1. Introduction

1.1 The Cotswold Local Plan sets out the strategic planning framework to guide development within Cotswold District Council (CDC) over the plan period. The Plan identifies housing, employment and supporting infrastructure growth and establishes policies against which planning applications will be assessed. In accordance with the Conservation of Habitats and Species Regulations, the potential for development proposed within the Local Plan to result in adverse effects on European designated sites must be assessed through the Habitats Regulations Assessment (HRA) process.

1.2 CDC has commissioned this air quality assessment to inform the Appropriate Assessment of the HRA. The assessment focuses on the potential effects of traffic-related air pollutant emissions associated with development and forecast traffic growth on ecologically sensitive sites located within and adjacent to the Local Plan area.

1.3 The designated ecological sites considered within this assessment comprise three Special Areas of Conservation (SAC): Cotswold Beechwoods SAC, North Meadow and Clattinger Farm SAC and Rodborough Common SAC. These sites support habitats that are sensitive to atmospheric nitrogen enrichment and acidification, including dry grassland steppes, humid mesophile grassland and broad-leaved woodland. Many qualifying features are particularly sensitive to elevated concentrations of nitrogen oxides and ammonia, and to increased nitrogen deposition.

1.4 This assessment considers four key pollutants known to adversely affect sensitive ecosystems: ammonia (NH_3), oxides of nitrogen (NO_x), total nitrogen deposition and total acid deposition. Pollutant concentrations and deposition rates have been predicted at ecological receptor locations positioned along transects extending up to 200 metres from affected road links within the designated sites, consistent with established guidance for assessing traffic-related impacts on European sites.

1.5 The following scenarios have been modelled:

- Baseline Scenario: represents air quality conditions in the selected base year using verified traffic data and contemporary background pollutant concentrations;
- Future Baseline Scenario: represents the future assessment year using baseline traffic flows but applying projected vehicle emission factors and background pollutant concentrations from the future assessment year to account for anticipated improvements in the vehicle fleet;
- Do Minimum (DM): future assessment year including forecast traffic growth and committed development, but excluding development allocations proposed within the Cotswold Local Plan; and
- Do Something (DS): future assessment year including forecast traffic growth, committed development and the development allocations proposed within the Cotswold Local Plan.

1.6 The results of the modelling are assessed against established NO_x and NH_3 critical levels, and nitrogen and acid deposition critical loads, at ecological receptor locations within each designated site. The purpose of the assessment is to determine whether development proposed within the Cotswold Local Plan, alone or in combination with other plans and projects, could result in an adverse effect on the integrity of the designated sites and to inform the Appropriate Assessment of the HRA.

2. Policy Context

Clean Air Strategy

2.1 In 2019, the UK government released its Clean Air Strategy 2019 (Defra, 2019) as part of its 25 Year Environment Plan (Defra, 2018). The Strategy sets out measures to reduce emissions of ammonia (NH_3) from agriculture and oxides of nitrogen (NO_x) from combustion processes, including road transport. These measures aim to reduce nitrogen deposition to sensitive ecosystems and improve public health.

2.2 The Strategy recognises that nitrogen deposition remains a significant pressure on protected habitats, including SACs and supports actions to reduce emissions from transport and agricultural sources.

Environment Act

2.3 The Environment Act 2021 (HM Government, 2021) amends the Environment Act 1995 (HM Government, 1995). On 9th November 2021, the Act received Royal Assent after being first introduced to Parliament in January 2020 to address environmental protection and the delivery of the Government's 25 Year Environment Plan (Defra, 2018). It includes provisions to establish a post-Brexit set of statutory environmental principles to ensure environmental governance through an environmental watchdog, the Office for Environmental Protection (OEP).

2.4 The Secretary of State must publish a review report every five years (as a minimum and with yearly updates to Parliament). The 25 Year Environment Plan will be adopted as the first Environmental Improvement Plan (EIP) of the Environment Act 2021, with long-term legally binding targets being finalised by Defra[1].

Critical Levels

2.5 Annual mean critical levels of NO_x and NH_3 are summarised in Table 2-1. These critical levels are concentrations above which adverse effects on ecosystems may occur based on present knowledge. The critical level for NO_x is taken from the EU Ambient Air Quality Directive 2008/50/EU (EU Directives, 2008) which has also been set as the Air Quality Strategy (AQS) objective for the protection of vegetation and ecosystems and has been incorporated into English legislation.

2.6 The EU Directive (EU Directives, 2008) states that the sampling point to determine compliance should be sited more than 20 km away from agglomerations or more than 5 km away from other built-up areas, industrial installations or motorways or major roads with traffic counts of more than 50,000 vehicles per day, which means that a sampling point must be sited in such a way that is representative of an area of at least 1,000 km^2. Applying the critical level for NO_x to designated nature conservation sites that are located close to busy roads is therefore precautionary.

2.7 The critical levels for NH_3 have not been incorporated into legislation and are a recommendation made by the United Nations Economic Commission for Europe (UNECE) Executive Body for the Convention on Long-Range Transboundary Air Pollution (CLRTAP) (UNECE, 2013).

Table 2-1: Annual Mean Critical Levels (NO_x and NH_3)

Pollutant	Critical Level
Oxides of nitrogen (NO_x)	30 µg/m^3
Ammonia (NH_3)	3 µg/m^3 for higher plants 1 µg/m^3 for lichens and bryophytes

[1] https://www.gov.uk/government/news/update-on-progress-on-environmental-targets

Habitat Regulation Assessment

2.8 Although the UK has left the European Union, the requirement to undertake an HRA remains under the Conservation of Habitats and Species Regulations 2017 (as amended) (HM Government, 2017).

2.9 The HRA process applies the precautionary principle to European sites. Plans and projects may only be permitted where it can be ascertained that they will not adversely affect the integrity of a European site, either alone or in combination with other plans and projects.

2.10 The first stage of HRA is screening for Likely Significant Effects (LSE). Where LSEs cannot be ruled out, the assessment proceeds to Appropriate Assessment. Traffic-related air pollution is a recognised pathway of impact where development results in changes in traffic flows on roads within 200 metres of European sites, in accordance with Natural England guidance.

2.11 The Cotswold Local Plan proposes housing, employment and supporting development across settlements within the district. The dispersed spatial strategy may influence traffic flows on road links within or adjacent to designated ecological sites. As such, LSE relating to atmospheric nitrogen pollution cannot be excluded, and the SACs and Sites of Special Scientific Interest (SSSI) considered within this assessment are subject to Appropriate Assessment in respect of this impact pathway.

Cotswold District Local Plan (2011-2031)

2.12 The Cotswold District Local Plan was adopted on 3rd August 2018 and forms the statutory development plan for CDC (Cotswold District Council, 2018). The Plan covers the period 2011–2031 and sets out strategic and development management policies to guide development.

2.13 The Local Plan's vision supports the following priorities, which are set out in CDC's corporate strategy:

- Provide quality services at the lowest possible cost to Council Taxpayers.
- Protect and enhance the local environment whilst supporting economic growth.
- Champion issues which are important to local people.

2.14 Policy EN8 (Biodiversity and Geodiversity: Features Habitats and Species) confirms that development and will only be permitted where it can be demonstrated that there will be no adverse effect on habitats and internationally protected species. Policy EN9 (Biodiversity and Geodiversity: Designated Sites) seeks to conserve and enhance biodiversity and avoid harm to designated sites.

2.15 Policy DS1 (Development Strategy), Policy EN1 (Built, Natural and Historic Environment), Policy EN5 (Cotsowlds Area of Outstanding Natural Beauty) embed an ecosystems approach within plan-making and decision-taking, recognising the importance of natural capital and the benefits derived from internationally important habitats within CDC.

Regional and Transport Policy Context

2.16 CDC declared a climate emergency in July 2019 and made a commitment to reduce carbon emissions to net zero by 2045. Like many rural regions, CDC has high levels of transport-related carbon emissions, which are around 60% higher per person than England's average (Cotswold District Council, 2023).

2.17 CDC produced a Transport Decarbonisation Study to provide an evidence base to support the identification and development of a range of interventions that support decarbonisation and future revisions to the local plan (Cotswold District Council, 2023).

2.18 The study concluded that there is no single solution which will deliver net zero transport in CDC. CDC will continue to consider all options across all modes to ensure that progress is made towards reducing mileage primarily through encouraging low carbon transport choices and switching to zero emission fuels. Low carbon planning was identified as a priority opportunity for reducing transport carbon emissions at all place types within Cotswold District

2.19 The Cotswolds local transport strategy is managed by Gloucestershire County Council under their overarching Gloucestershire Local Transport Plan (LTP) (2020–2041) (Gloucestershire County Council, 2021). This is the strategic framework guiding transport improvements, environmental protection, and infrastructure development across the county. It prioritises sustainable travel, economic growth, and community wellbeing to reduce carbon emissions and adapt to climate change.

2.20 Key Policies of relevance to this assessment include:

- **LTP PD 0.1 - Reducing Transport Carbon Emissions & Adapting to Climate Change:** Focuses on minimising carbon emissions from transportation and preparing the network for extreme weather events.
- **LTP PD 0.2 - Local Environmental Protection:** Aims to mitigate traffic impacts on local communities, including reducing congestion and addressing nitrogen dioxide (NO_2) levels in designated Air Quality Management Areas (AQMAs).
- **LTP PD 0.4 – Integration with Land Use Planning and New Development:** Ensures that new housing and commercial developments are designed around sustainable travel options to minimise the burden on existing roads.

Cotswold District Council Air Quality Action Plan 2011

2.21 Under Part IV of the Environment Act 1995 (HM Government, 1995), local authorities are required to review and assess air quality within their jurisdictions and to prepare Air Quality Action plans (AQAPs) where AQMAs are declared.

2.22 CDC have adopted their AQAP (Cotswold District Council, 2011) to address exceedances of NO_2 objectives, primarily associated with road traffic emissions, or to ensure ongoing good air quality within the district. These plans and strategies include measures to encourage sustainable transport, reduce vehicle emissions, promote behavioural change, and integrate air quality considerations into spatial planning and infrastructure delivery.

2.23 The measures set out within the AQAP are relevant to the wider policy context of this assessment, as it aims to improve air quality across the region and support the reduction of road traffic emissions that may affect sensitive ecological receptors within designated sites.

Cotswolds National Landscape Management Plan (2025–2030)

2.24 The Cotswolds National Landscape (CNL) Management Plan (Cotswolds National Landscape, 2025) is a statutory plan, which sets out the vision, outcomes and policies for the management of the CNL for the period 2025-2030.

2.25 The plan contains a comprehensive summary of the key issues facing the CNL. The current 2025 to 2030 framework focuses on three interlinked priorities: mitigating the climate emergency, reversing nature's decline and the ecological crisis, and improving public health and societal well-being.

2.26 The strategy recognises the importance of addressing climate change and improving environmental quality across the district. CNL has declared a climate emergency and is working towards achieving net zero emissions by 2050 or sooner.

2.27 The strategy identifies transport emissions, domestic energy use and agricultural activities as key contributors to greenhouse gas emissions within CNL. In response, CDC aims to support initiatives that promote sustainable transport, encourage active travel and improve air quality across the district.

2.28 The strategy also highlights the role of planning policy, infrastructure investment and partnership working in delivering environmental improvements and supporting the transition to a low-carbon economy.

2.29 Development policies apply not only to projects within the Cotswolds National Landscape boundaries but also to its "setting". Proposals outside the boundary can be scrutinised if their scale, design, or nature negatively impact the scenic beauty of the CNL. Furthermore, any proposal must conserve and enhance the area's natural beauty. It must reflect local settlement patterns, building scales, and use local materials (such as Cotswold limestone).

Other Guidance Documents

2.30 Best practice and advice / guidance contained within documents from Natural England (Natural England, 2018), the Institute of Air Quality Management (IAQM) (IAQM, 2020), the Chartered Institute of Ecology and Environmental Management (CIEEM) (CIEEM, 2021) and National Highways (Design Manual for Roads and Bridges DMRB LA105) (DMRB, 2024) have been used to determine the methodology applied, and in the accompanying ecological interpretation of the results.

2.31 These documents provide guidance on the assessment of traffic-related air pollution effects on designated ecological sites and the interpretation of modelled nitrogen concentrations and deposition in relation to critical levels and critical loads.

3. Methodology

3.1 This section presents the information and methodology used to produce the outputs contained in this report in relation to air quality within CDC. The following sources of information and data have been used to form the basis of this air quality assessment:

- Department for Environment, Food and Rural Affairs (Defra)'s Air Quality Background Concentration Maps based on a 2021 base year (Defra, 2024);
- Defra's Vehicle Emissions Factors Toolkit (EFT) v14.1 (Defra, 2026);
- Emission rates as published in the Calculator for Road Emissions of Ammonia (CREAM) V2A tool (Air Quality Consultants, 2025);
- Modelled nitrogen and acid deposition data and ammonia background concentrations from the Air Pollution Information System (APIS, 2026); and
- Traffic count and speed data provided by City Science for 2024 and 2043.

3.2 The modelling assessment was conducted following methodology within Defra's LAQM.TG(22) Technical Guidance (Defra, 2025), and guidance contained within documents from Natural England (Natural England, 2018), the IAQM (IAQM, 2020) and the CIEEM (CIEEM, 2021).

Pollutants of Interest

3.3 The pollutants of interest with regard to sensitive ecosystems for which critical levels and critical loads exist and which are included in the air quality modelling and assessment of impacts on the SACs are NO_x, NH_3, and nitrogen and acid deposition. Modelling of these pollutants is undertaken to assess the air quality impacts of planned development in the Local Plan on the SACs alone and 'in combination' with those related to surrounding authorities.

3.4 Whilst emissions of NO_x from road vehicles are regulated according to Euro standards, emissions of NH_3 are not. This means that emissions of NH_3 from individual vehicle types are highly uncertain, particularly as measurements are rarely made (as this is not required for regulatory purposes). The uncertainty associated with the predicted nitrogen deposition rates from NH_3 is also greater than for NO_x, with the NH_3 derived nitrogen deposition rates representing an upper estimate.

3.5 There is currently no tool publicly available for the assessment of road traffic emissions of NH_3 from National Highways, Defra, Natural England, or other nature conservation bodies. However, there is evidence that exclusion of NH_3 from assessments leads to an underestimate of deposited nitrogen (Air Quality Consultants, 2025).

3.6 The methodology used to model ammonia concentrations from road traffic, using ADMS Roads (v5.1) (Cambridge Environmental Research Consultants, 2025), and the subsequent contribution to nitrogen deposition within the SACs (described below), is considered the most appropriate approach to adopt at this time. The methodology has been applied by AECOM in several Appropriate Assessments to inform HRAs including that for Tunbridge Wells Borough, Mid Sussex and Test Valley District Councils.

Nitrogen Oxides

3.7 Defra's EFT provides NO_x emissions rates for local authorities to use for Local Air Quality Management (LAQM) assessments. The EFT is also used for other purposes including Environmental Impact Assessments (EIAs) and HRAs. Version 14.1 of the EFT (Defra, 2026) includes consideration of the basic vehicle fleet mix for roads in England (excluding London) up to 2050. The basic vehicle fleet splits are based on data provided by DfT / Highways England (now National Highways) and the National Atmospheric Emissions Inventory (NAEI). The composition of Euro emission standards and distribution of vehicle sizes / weights in Version 14.1 of the EFT enables data to be used up to 2050; however, EFT v14.1 includes a note that it should be used with care beyond 2040, due to limitations relating to the supporting tools.

3.8 The Supporting LAQM tools provided by Defra, including the Background Mapping Data, NO_2 Adjustment for NO_x Sector Removal Tool and the NO_x to NO_2 Calculator, currently support assessment years between 2021 and 2040 inclusive. Consequently, where air quality assessments consider future assessment years beyond 2040, the emissions factors for 2040 represent the latest available data within the EFT framework. For the purposes of this assessment, the Local Plan future assessment year of 2043 has therefore been represented using EFT v14.1 emissions factors for 2040, consistent with Defra guidance. This approach is considered appropriate as the emissions projections within the EFT already incorporate anticipated improvements in vehicle emission standards and fleet turnover up to 2040. The use of 2040 emission factors for the 2043 assessment year is considered a reasonable and precautionary representation of future road traffic emissions as emissions are expected to further reduce between 2040 and 2043, making this approach worst case.

3.9 Detailed dispersion modelling of road traffic emissions of NO_x has been undertaken using the latest version of ADMS Roads (v5.1) (Cambridge Environmental Research Consultants, 2025), combined with the EFT v14.1 emission rates. The model has been used to predict annual mean NO_x concentrations at ecological receptor locations within the designated sites.

Ammonia

3.10 In February 2020, Air Quality Consultants developed and published the CREAM tool, '*in order to allow tentative predictions regarding trends in traffic-related ammonia emissions over time*'. The tool is based on remotely sensed pollutant measurements, published real-world fuel consumption data, and ambient measurements of ammonia recorded in Ashdown Forest (2014-2016).

3.11 The report that was published alongside the CREAM tool states that:

"*It should be recognised that these emissions factors remain uncertain. Using them to make future year predictions will clearly be an improvement on any assessment which omits ammonia. They are also considered to be more robust than the emissions factors contained in the EEA Guidebook, which risk significantly under-predicting ammonia emissions. The emissions factors contained in the CREAM model can be considered to provide the most robust estimate of traffic-related ammonia possible at the present time, but they may be updated in the future as more information becomes available*."

3.12 The CREAM tool was updated in February 2025 (CREAM v2A) (Air Quality Consultants, 2025) to cover a wider vehicle fleet and the latest ammonia emission factors. AECOM has applied these emission factors to estimate emissions in the SACs. As with the EFT, emissions for the 2043 assessment year have been represented using the latest available emission factors within the tool framework for 2040.

3.13 The latest version of ADMS Roads (v5.1) (Cambridge Environmental Research Consultants, 2025) has been employed to model the dispersion of emissions of NH_3 from road traffic, consistent with the approach for modelling emissions of NO_x.

Traffic Data and Fleet

3.14 Traffic data for the assessment were provided by the transport consultants and includes annual average daily traffic (AADT) flows, average speeds and the proportion of heavy-duty vehicles (HDVs) for each road link included in the study area. These road links were selected as those located within 200 m of designated ecological sites and therefore where road traffic emissions may influence air quality at sensitive ecological receptors.

Receptors

3.15 Pollutant concentrations and deposition rates have been modelled along defined transects within the SACs within 200 m of affected roads. This approach aligns with the National Highways DMRB guidance LA105 (DMRB, 2024) and Natural England guidance (Natural England, 2018). As noted in the guidance, the greatest impacts from changes in road traffic emissions will be at locations closest to the roadside nearest to emissions sources. Pollutant concentrations fall off away from the road edge to approximately background levels beyond 200 m. Consideration of the road network within 200 m of the SACs and SSSI is therefore considered robust as background

concentrations utilised in the assessment will account for all other sources that are not defined explicitly in the model.

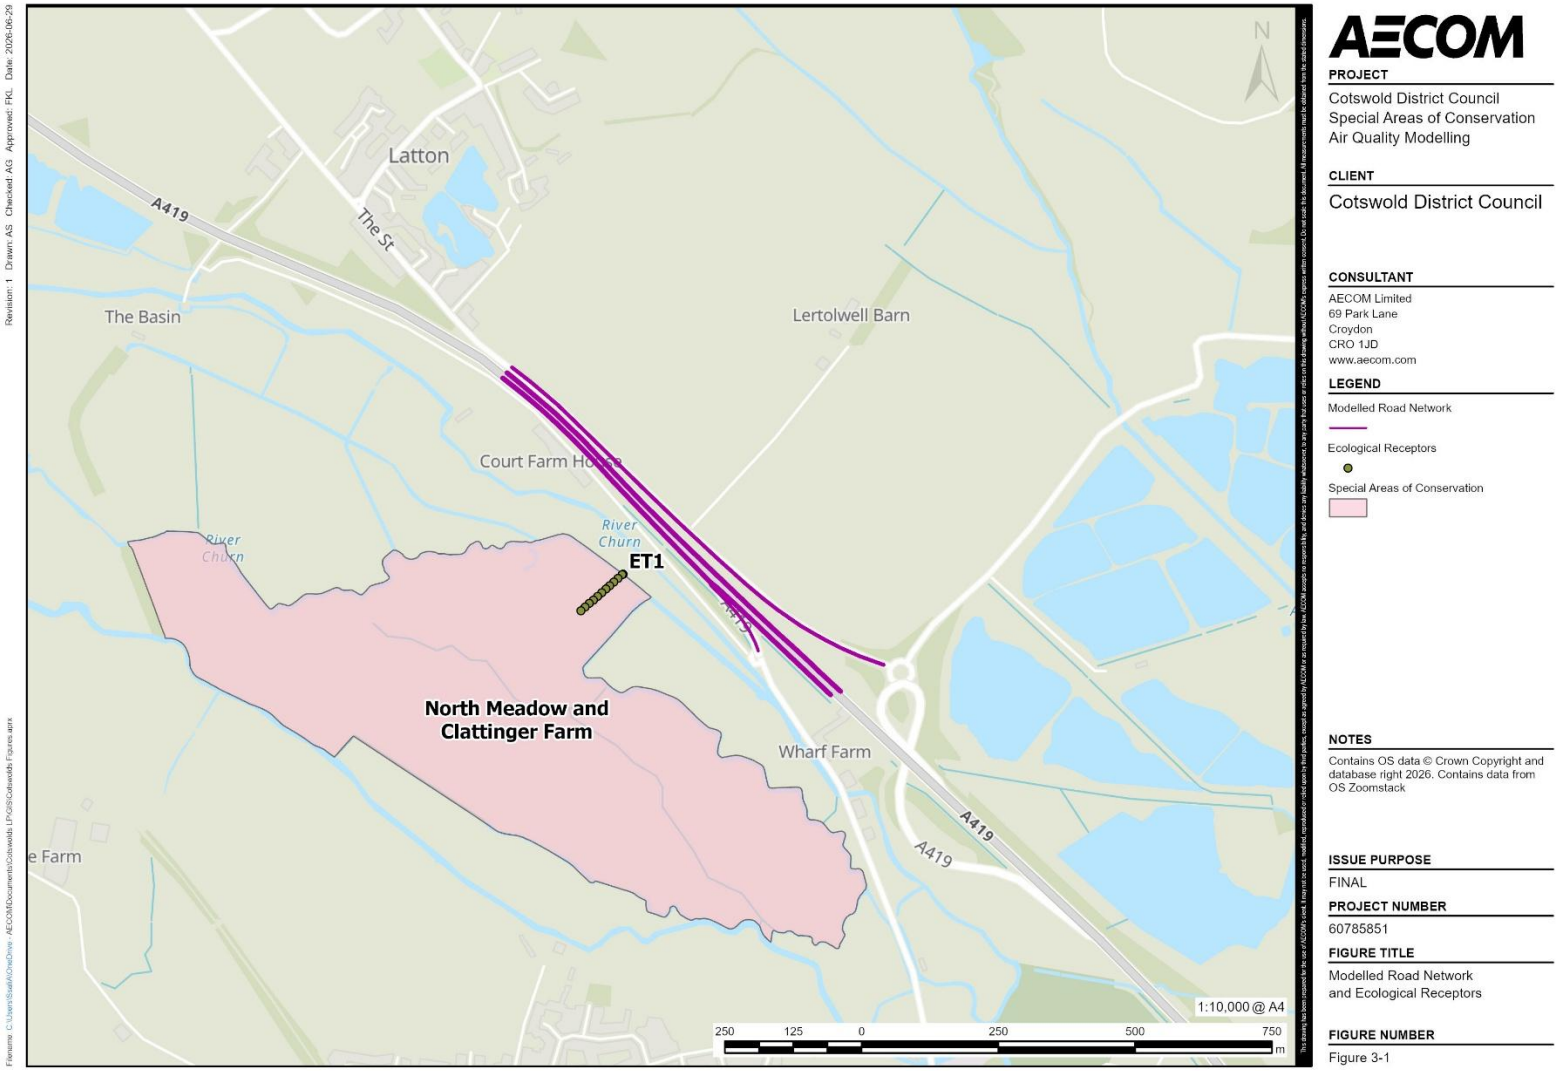
3.16 The transects are situated at key locations where the greatest impacts upon the SACs are likely to occur. The locations are presented in Figure 3-1 to Figure 3-5. The receptors are situated at the closest point to the road within the SACs up to 200 m from the roadside. Concentrations and deposition rates at all receptors are predicted at the ground surface (0m height), representing the worst-case potential location of nitrogen-sensitive habitats.

Model Setup

3.17 As detailed above, road traffic emissions of NO_x were derived using the latest version of Defra's EFT at the time of the assessment (v14.1), and associated guidance and tools (Defra, 2026). Road traffic emissions of NH_3 were derived using emission rates from CREAM v2A (Air Quality Consultants, 2025).

3.18 Detailed dispersion modelling was undertaken using the current version of ADMS-Roads (v5.1) to model concentrations of NO_x and NH_3 using the parameters in Table 3-1 for the following scenarios:

- Base (2024): 2024 AADT, 2024 emission factors (latest available year), 2024 vehicle fleet.
- Future Base (2043): 2024 AADT, 2040 emission factors (latest available year), 2040 projected vehicle fleet, and 2040 background concentrations (the latest projected year available from Defra);
- Do Minimum (2043): 2043 AADT without Local Plan but with all committed development, 2040 emission factors, 2040 projected vehicle fleet, and 2040 background concentrations; and
- Do Something (2043): 2043 AADT with Local Plan and all committed development using 2040 emission factors, 2040 projected vehicle fleet, and 2040 background concentrations.



3.19 To support the assessment of the potential impact of the planned development in the Local Plan scenarios, a 'future baseline' and future year 'do minimum' scenario were modelled. The 'do minimum' scenario includes the influence of development in neighbouring local authorities, whereas the 'future baseline' does not. This future baseline is a hypothetical scenario as it applies improvements in vehicle emissions standards to the baseline vehicle fleet without allowing for any traffic growth. However, such an approach enables the 'in combination' effect of development and traffic growth to be seen unobscured by improvements in emissions technology / performance.

3.20 The difference between the 'do something' and the 'do minimum' scenarios provides the impact of the planned development within the Local Development Plan, alone. The difference between the 'do something' and the 'future baseline' scenarios provides a thorough and precautionary assessment of the impact of the planned development within the Local Plan 'in combination', as the 'future baseline' accounts for no future growth.

Table 3-1: General ADMS-Roads Model Conditions

Variables	ADMS-Roads Model Input
Surface roughness at source	0.3 m
Surface roughness at Meteorological Site	0.3 m
Minimum Monin-Obukhov length for stable conditions	10 m
Terrain types	Flat
Receptor location	x, y coordinates determined by GIS, z = 0 m
Emissions	NO_x– Defra's EFT v14.1 NH_3 – CREAM v2A
Meteorological data	1 year (2024) hourly sequential data from Fairford
Receptors	Ecological transects
Model output	Long-term (annual) mean NO_x and NH_3 concentrations

Meteorological Data

3.21 One year (2024) of hourly sequential observation data from Fairford meteorological station, located approximately 12.0 km northwest of the nearest SAC and approximately 38.5 km southeast of the most distant SAC, has been used in this assessment. These data were chosen as the most suitable and representative data of local conditions in the baseline year.

3.22 Figure 3-6 shows that the dominant direction of wind was from the south-west, as is typical for the UK.

Figure 3-6: Wind Rose, Fairford Airport Meteorological Data, 2024

Background Data

3.23 Background concentrations of NO_2 and NO_x for 2024 and 2040 were extracted from Defra's 2021-based 1x1 km background maps (Defra, 2024). The background concentrations used correspond to the grid square within which the closest ecological transect point to the road is located. Contributions from explicitly modelled source sectors were removed from the NO_2 and NO_x background concentrations, in accordance with Defra guidance (Defra, 2025)[2]. 2040 is the latest year for which background maps are published and, as concentrations of NO_2 and NO_x

[2] The Defra background maps for NO_x concentrations are split into source sectors, such as in-square primary road emissions (those within the 1km square in question). When modelling roads, in order to prevent double-counting of emissions, it is necessary to use the Defra NO_2 adjustment for NO_x Sector Removal tool to remove the required amount of NO_x background concentration and convert to an appropriate background NO_2 concentration that does not contain explicitly modelled emissions.

are predicted to reduce further in the future, this is considered to be a worst-case representation of conditions in 2043.

3.24 The data presented in Table 3-2 show that the concentrations are predicted to decrease between 2024 and 2040.

Table 3-2: Defra Mapped Background Pollutant Concentrations

Transects	SAC/SSSI Name	Grid Square (X, Y)	Annual Mean Concentrations (µg/m³)			
			2024 NO_x	2024 NO_2	2040 NO_x	2040 NO_2
ET1	North Meadow and Clattinger Farm, SAC	409500, 194500	6.4	5.1	4.3	3.5
ET2	Rodborough Common SAC	385500, 203500	7.1	5.7	4.9	3.9
ET3	Rodborough Common SAC	385500, 203500	7.1	5.7	4.9	3.9
ET4	Cotswolds Beechwoods SAC	392500, 213500	6.4	5.1	4.4	3.5
ET5	Cotswolds Beechwoods SAC	391500, 211500	6.2	5.0	4.2	3.4
ET6	Cotswolds Beechwoods SAC	389500, 209500	6.2	5.0	4.2	3.4
ET7	Rodborough Common SAC	384500, 202500	6.7	5.4	4.6	3.7

Ecological Data

3.25 APIS provides 'a searchable database and information on pollutants and their impacts on habitats and species'. Areas within 200 m of the relevant roads within the Cotswold Beechwoods SAC are predominantly forest, whilst those within 200 m of relevant roads within North Meadow and Clattinger Farm SAC and Rodborough Common SAC are grassland. Data for forest or grassland habitat have been applied for each transect in the study area depending on the predominant habitat present at that receptor location. This includes critical loads of nitrogen and the average nitrogen and acid deposition rates to the habitat, as presented in Table 3-3.

3.26 Background concentrations of ammonia were also sourced from 5x5 km modelled maps available from APIS, whereas background concentrations of NO_x and NO_2 were sourced from Defra's latest 1x1 km maps, thereby accounting for all sources that are not explicitly defined in the model.

3.27 In order to create a robust and scientifically agreed projection for background nitrogen deposition trends in the UK, even allowing for growth, the JNCC commissioned the Nitrogen Futures project, which reported in 2020 (JNCC, 2020). The JNCC Nitrogen Futures project investigated whether a net improvement in nitrogen deposition (including expected development over the same period) was expected to occur to 2030 under a range of scenarios ranging from the most cautious scenario (Business As Usual, BAU, reflecting simply existing emission reduction commitments / measures already in place) to much more ambitious scenarios that would require varying amounts of additional, currently uncommitted, measures from the UK government and devolved administrations.

3.28 The report concluded that *'The scenario modelling predicts a substantial decrease in risk of impacts on sensitive vegetation by 2030, under the most likely future baseline [a scenario called '2030 NAPCP+DA (NECR NO_x)']. This is estimated to achieve the UK Government's Clean Air Strategy (CAS) target for England, defined as a 17% decrease in total reactive N deposition onto protected priority sensitive habitats, with a predicted 18.9% decrease [for England] from a 2016 base year'*. The report predicted a fall in nitrogen deposition by 2030 under every modelled scenario, including the most cautious (2030 BAU). For the BAU scenario, nitrogen deposition

was forecast to decrease between 2017 and 2030 from 277.1 kt N to 239.5 kt N (i.e. a reduction of 37.6 kt N).

3.29 In Annex 5 of the report, background nitrogen deposition at the Ashdown Forest SAC was discussed as a case study. The report predicted a 1-2 kgN/ha/yr reduction in background nitrogen deposition to low growing vegetation (i.e. the heathland interest feature) at the SAC between 2016 and 2030, depending on the scenario, and noted that *'The emission reductions predicted between the 2017 and 2030 baseline scenarios cover a range of sectors, including road transport, and so improvements are predicted to occur over the whole site, including the worst-affected roadside locations'*. This was the case under all modelled scenarios.

3.30 In summary, the Nitrogen Futures study forecast a minimum rate of improvement in background nitrogen of 0.07 kgN/ha/yr at Ashdown Forest, with other forecasts indicating a greater rate of reduction. In line with the forecast for Ashdown Forest and, therefore, taking a precautionary approach, this study applies a projected decrease in background nitrogen of 0.07 kgN/ha/yr each year. The corresponding decrease is also reflected in the total average acid deposition rate for nitrogen in the future scenarios (reduction of 0.005 keq/ha/yr N each year.).

3.31 Over the 18-year period from 2024 to 2040, this equates to a reduction in the APIS background nitrogen deposition rate presented in Table 3-3 (2024-2040) of 1.12 kgN/ha/yr for the 2040 model scenarios. This decrease is also reflected in the total average acid deposition rate for nitrogen in the 2040 scenarios (reduction of 0.08 keq/ha/yr N).

3.32 No other changes to the APIS data have been made from those presented in Table 3-3 below (2022-2024) for any modelled scenario. It is noted that from monitoring evidence, increases in vehicle numbers over time are more than offset by improvements in the emissions of the newer vehicles and the removal of older vehicles, leading to future reductions in emissions.

3.33 In 2018, the Court of Justice of the European Union (CJEU) ruled in cases C-293/17 and C-294/17 (often dubbed the Dutch Nitrogen cases). One aspect of that ruling concerned the extent to which autonomous measures (i.e. improvements in baseline nitrogen deposition that are not attributable to the Local Plan) can be taken into account in Appropriate Assessment. The CJEU ruled that it was legally compliant to take such autonomous measures into account provided the benefits were not 'uncertain' (paras. 130&132). Note that previous case law on the interpretation of the Habitats Directive has clarified that 'certain' does not mean absolute certainty but '*where no reasonable scientific doubt remains*'[3].

Table 3-3: APIS Data for Ecological Transects for 2022-2024

Transect	Background N Dep Rate kgN/ha/yr	Critical Load N Dep kgN/ha/yr	Background Acid Dep Rate keq/ha/yrN	Critical Load N Acid Dep MinCLMaxN keq/ha/yr	Background Ammonia (µg/m^3)
ET1_Grassland	14.21	10 – 20	1.05	4.856	1.64
ET2_Grassland	14.43	10 – 20	1.07	4.856	1.46
ET3_Grassland	14.43	10 – 20	1.07	4.856	1.46
ET4_Forest	24.80	10 – 15	1.82	11.042	1.40
ET5_Forest	24.34	10 – 15	1.78	11.042	1.33
ET6_Forest	23.72	10 - 15	1.75	11.042	1.34
ET7_Grassland	14.45	10 - 20	1.07	4.856	1.44

Note: Average nitrogen deposition rate (kgN/ha/yr) projected to decrease by 1.12 kgN/ha/yr from base year to future year (i.e. 0.07 x 16 years = 1.12 kgN/ha/yr). This results in a corresponding decrease in acid deposition of 0.08 keq/ha/yr N.

[3] Case C-239/04 Commission v Portugal [2006] ECR 10183, para. 24; Holohan et al vs. An Bord Pleanála (C-461/17), para. 33

Verification

3.34 Model verification is the process by which the performance of the model is assessed to identify any discrepancies between modelled and measured concentrations at air quality monitoring sites within the study area.

3.35 There are no appropriately located local air quality monitoring stations within the model domain with which to make a comparison between modelled and measured concentrations. Therefore, verification factors have been used based upon professional judgement and experience of similar projects. Verification factors of 1.5 for NO_x and 1.0 for NH_3 have been applied based on previous verification and validation of the EFT and CREAM tools, respectively.

Deposition Velocities

3.36 Deposition of nitrogen from road traffic-derived NH_3 and NO_2 was estimated using the Air Quality Technical Advisory Group (AQTAG) deposition velocities that are cited in the 2020 IAQM guidance (IAQM, 2020), as shown in Table 3-4. In this assessment, the most appropriate habitat type (forest or heathland/short vegetation) has been applied for each transect receptor based on APIS classifications and site knowledge. This ensures that the deposition velocities for NO_2 and NH_3 reflect the correct habitat, improving accuracy.

3.37 The modelling methodology does not account for any depletion of concentrations of NO_x, NO_2 or NH_3 following the deposition of nitrogen from these species. This therefore presents a precautionary assessment of the impacts of the Local Plan relative to the critical levels and loads.

Table 3-4: Nitrogen Deposition Velocities and Conversion Rates

Pollutant	Habitat	Nitrogen Deposition Conversion Rates	Deposition Velocity
NO_2	Forest	1 µg/m^3 NO_2 = 0.29 kgN/ha/yr	0.003 m/s
NO_2	Grassland	1 µg/m^3 NO_2 = 0.145 kgN/ha/yr	0.0015 m/s
NH_3	Forest	1 µg/m^3 NH_3 = 7.8 kgN/ha/yr	0.03 m/s
NH_3	Grassland	1 µg/m^3 NH_3 = 5.2 kgN/ha/yr	0.02 m/s

4. Results

4.1 The model results are set out in Table A-3, Table A-4, Table A-5 and Table A-6, in Annex A3. The impacts associated with these concentrations and deposition rates and the predicted changes brought about by the proposed Local Plan have been assessed by a qualified and experienced ecologist, taking into account the sensitivity of the ecological sites, as well as the wider range of factors influencing the condition of the habitats. Full details are set out and discussed within the HRA.

LUC Appropriate Assessment of air quality impacts

F.3 This appendix sets out the Appropriate Assessment of Air Quality (AQ) resulting from the Cotswold Local Plan on North Meadow and Clattinger SAC, Rodborough Common SAC and Cotswold Beechwoods SAC. This assessment draws on air pollutant modelling provided in Cotswold District Council SAC Air Quality Modelling (AECOM, 2026).

Methodology

F.4 In order to assess the potential impact of the AQ exceedances at these Habitats Sites, the method includes the following:

- Desktop assessment of the SAC habitats present in the affected areas, condition of habitats and vulnerability/sensitivity to the AQ pollutants;
- Calculation of the approximate area of the SAC which is potentially impacted by the exceedances.

F.5 This assessment is set out with reference to Natural England's standing advice for the assessment of air pollution and development **[See reference** 82**]**, as follows:

- Check if emissions will reach a protected site – set out in AECOM's report and referenced in this section.
- Check relevant 'critical loads' and 'critical levels' – set out in AECOM's report and referenced in this section.
- Check if agricultural developments can use an emissions reduction approach - not relevant in the case of the Local Plan.
- Consider the proposal in combination with other projects – set out in AECOM's report and referenced in this section.
- Complete a detailed air quality assessment – set out in this section. This stage includes: checking protected site details; considering whether total concentration of pollutants (predicted environmental contribution) will exceed critical loads, consideration of trends in background air quality, considering whether there will be an adverse effect alone or in combination, and what mitigation may be required.

F.6 A desktop assessment was conducted to determine whether sensitive qualifying features may exist within 200m of a road which has been identified to exceed the

screening criteria. Whilst National Vegetation Classification (NVC) survey data is not available for these SACs, a broad assessment of the qualifying habitats within each SAC was undertaken using the following data sources:

- Aerial photography (Google Earth);
- Natural England designated sites information; and
- Defra's MAGIC mapping.

F.7 The following Conservation Objective is standard for all SACs:

"Ensure that the integrity of the site is maintained or restored as appropriate, and ensure that the site contributes to achieving the Favourable Conservation Status of its Qualifying Features, by maintaining or restoring:

- The extent and distribution of qualifying natural habitats and habitats of qualifying species;
- The structure and function (including typical species) of qualifying natural habitats;
- The structure and function of the habitats of qualifying species;
- The supporting processes on which qualifying natural habitats and the habitats of qualifying species rely;
- The populations of qualifying species; and,
- The distribution of qualifying species within the site."

F.8 To provide additional information about each individual SAC, Site Improvement Plans (SIP) and other supplementary advice has been reviewed in the context of understanding whether air quality poses a potential threat to each Habitats Site meeting its Conservation Objectives. A review of the site condition has also been undertaken, based on available information from Natural England on the underlying SSSI Units, to better understand whether the site's ability to meet its Conservation Objectives has already been impacted by poor air quality.

Summary of relevant air quality data

F.9 The data provided by AECOM for nitrogen deposition and ammonia (see Table A-3 and A-4 in the Air Quality Modelling Report) is summarised below. There were no exceedences of the screening thresholds for nitrogen oxides or acid deposition. For each pollutant, data the furthest distance from the centre of the road ('Dist.') at which

there is an exceedance of AQ screening criteria (change in 1% of the critical load/level) is shown, and what the change in pollution is, as a % of the pollutants' critical load/level ('% CL').

F.10 Critical Loads (CL) are defined by United Nations Economic Commission for Europe (UNECE) **[See reference** 83**]** as "a quantitative estimate of exposure … below which significant harmful effects on specified sensitive elements of the environment do not occur according to present knowledge". The critical loads data on which exceedance calculations are based are derived from empirical or steady-state mass balance methods, which are used to define critical loads for the long term. Exceedance of critical loads is an indication that an ecosystem is at risk from potential harmful effects in the long-term. Therefore, exceedance is not a quantitative estimate of damage to the environment; it does not necessarily mean that harmful or adverse effects have already occurred or may be observed, but that there is a risk of damage in the long-term.

North Meadow and Clattinger Farm SAC

F.11 A419 (transect ET1):

- Nitrogen deposition: screening threshold (1% critical load) exceeded to 200m due to Local Plan alone, and 200m due to Local Plan in combination. Total concentration exceeds the critical load (10) at all points on the transect (100-200m from road).
- Ammonia: screening threshold not exceeded due to Local Plan alone, and in combination. Total concentration does not exceed the critical load (3) at any point on the transect (100-200m from road).

F.12 The assessment therefore considers impact of nitrogen deposition only, as ammonia levels remain below critical levels with the Local Plan in combination with other plans/projects. The nitrogen deposition exceedance of the screening criteria is due to the Local Plan alone (and in combination).

Rodborough Common SAC

F.13 Spine Road west (transect ET2):

- Nitrogen deposition: screening threshold not exceeded due to Local Plan alone, and only at roadside (0.04m) due to Local Plan in combination. Total concentration exceeds the critical load (10) at roadside.

- Ammonia: screening threshold is not exceeded due to the Local Plan alone, but is exceeded to 20m due to the Local Plan in combination. Total concentration exceeds the critical load (1) at all of these points on the transect (0-20m from road).

F.14 Spine Road east (transect ET3):

- Nitrogen deposition: screening threshold is not exceeded due to the Local Plan alone, but is exceeded to roadside (0.03m) due to Local Plan in combination. Total concentration exceeds the critical load (10) at roadside.
- Ammonia: screening threshold exceeded at roadside (0.03m) due to the Local Plan alone, and to 50m due to the Local Plan in combination. Total concentration exceeds the critical load (1) at all of these points on the transect.

F.15 A46 / Selsey Road (transect ET7):

- Nitrogen deposition: screening thresholds are not exceeded due to the Local Plan alone or in combination.
- Ammonia: screening thresholds are not exceeded due to the Local Plan alone or in combination.

F.16 The assessment therefore considers the two transects on the Rodborough Common Spine Road, but excludes the A46/Selsey Road transect. With the exception of one roadside transect point, these exceedances of the screening criteria are due to the Local Plan in combination.

Cotswold Beechwoods SAC

F.17 B4070 at Buckholt (transect ET4):

- Nitrogen deposition: screening thresholds are exceeded to 30m due to the Local Plan alone, and to 90m due to the Local Plan in combination. Total concentration exceeds the critical load (10) at all of these points on the transect.
- Ammonia: screening thresholds are exceeded to 40m due to the Local Plan alone, and to 110m due to the Local Plan in combination. Total concentration exceeds the critical load (1) at all of these points on the transect.

F.18 B4070 at Birdlip (transect ET5):

- Nitrogen deposition: screening thresholds are not exceeded due to the Local Plan alone, but are exceeded to 100m due to the Local Plan in combination. Total concentration exceeds the critical load (10) at all of these points on the transect (80-100m from road).

- Ammonia: screening thresholds are not exceeded due to the Local Plan alone, but are exceeded to 120m due to the Local Plan in combination. Total concentration exceeds the critical load (1) at all of these points on the transect (80-120m from road).

F.19 B4070 at Sheepscombe (transect ET6):

- Nitrogen deposition: screening thresholds are not exceeded due to the Local Plan alone, but are exceeded to 70m due to the Local Plan in combination. Total concentration exceeds the critical load (10) at all of these points on the transect (60-70m from road).
- Ammonia: screening thresholds are not exceeded due to the Local Plan alone, but are exceeded to 80m due to the Local Plan in combination. Total concentration exceeds the critical load (1) at all of these points on the transect (60-80m from road).

F.20 The assessment therefore considers the impacts at all three transects. The B4070 at Buckholt exceeds the screening criteria due to the Local Plan alone, but the other two are due to the Local Plan in combination only.

Assessment of Habitats Sites

North Meadow and Clattinger Farm SAC

F.21 Qualifying features of the SAC:

- 6510 Lowland hay meadows (*Alopecurus pratensis, Sanguisorba officinalis*)

F.22 SIP and supplementary advice for conservation objectives:

- Natural England's SIP (dated 21/11/2014) does not include air pollution as a pressure or threat to the site.

F.23 Site Condition Assessment:

- The potential for AQ exceedance of thresholds occurs within SSSI Unit 1, which lies within 200m of the A419. This unit is in 'unfavourable- declining' condition (assessed in 2025) due to hydrological impacts (flooding) and recreational pressures (trampling, nutrient enrichment and erosion), which impacts the vegetation community. Therefore, indicating no existing issues in relation to air pollution.

F.24 Habitat potentially impacted:

- The qualifying habitats for North Meadow and Clattinger Farm SAC is lowland hay meadows, which appears to be located within the part of the SAC which lies within the exceedance zone.
- The NVC community present within the SAC is MG4 *Alopecurus pratensis – Sanguisorba officinalis* characterised by species-rich swards containing frequent red fescue Festuca rubra, crested dog's-tail *Cynosurus cristatus*, meadow foxtail *Alopecurus pratensis,* great burnet *Sanguisorba officinalis*, meadowsweet *Filipendula ulmaria* and meadow buttercup *Ranunculus acris.* The site also supports over 90% of the surviving UK population of snakes-head fritillary Fritillaria meleagris plant which is Nationally Scarce.
- Although the SIP does not indicate air pollution as a particular threat to this SAC, the conservation status assessment for lowland hay meadows by JNCC (2018) ranks 'mixed air source pollution, air-borne pollutants (J03) as a 'high' pressure and threat, due to the nutrient nitrogen critical load for the habitat being exceeded across over 25% of the habitat area at a national level in the UK.

F.25 Area of SAC affected:

- The screening criteria for nitrogen deposition are exceeded to 200m from the road and the total concentration of nitrogen deposition is exceeded at all points on the transects. The SAC is 97.98m from the road, so the affected area is 97.98m-200m from the road.
- This area includes c.1.9ha, or c.1.8% of the total SAC area.
- Based on the desk study, this part of the SAC is likely to support the qualifying habitat (lowland hay meadows).

F.26 Ability to meet Conservation Objectives:

- Source attribute data from APIS demonstrates that the background trend in local contribution of vehicle emissions to air pollution between 2012-2018 (the years for which the data is available) has fallen, whilst local contributions of other sources such as agriculture, livestock and fertiliser application have risen. The nitrogen deposition expected as a result of the plan, 15.1 kgN/ha/yr, exceeds the CL of 10-20 kgN/ha/yr. However, the levels of NH3 concentration expected as a result of the plan, 2.0 µg/m3 do not exceed the CL of 3 µg/m3 for this habitat (due to absence of bryophytes/ lichens as part of the qualifying habitat composition, as per APIS CL data).
- The potential impacts associated with nitrogen deposition on neutral grasslands are as follows **[See reference** 84**]**:

- "Increases in proportion of productive grasses at expense of fine leaved grasses.
- Reduces species richness, especially among forbs.
- Possible reductions in productivity.
- Changes in species composition.
- Loss of rare or endangered species.
- Loss of annuals and forbs will have implications for sustainability, due to the short lived nature of the seed bank and the isolation of many of these small areas of grassland.
- Loss of floral diversity, especially forbs/ herbs can reduce nutritional quality, nutrient levels, for grazing animals and increased prevalence of more common species such as perennial ryegrass *Lolium perenne*, Timothy grass *Phleum pratense*, cocks-foot *Dactylis glomerata*, broad-leaved dock *Rumex obtusifolius*."

- This has potential to influence the extent, distribution, structure and function of the lowland hay meadow grassland and therefore, the ability for the site to meet its Conservation Objectives.

Conclusion:

Adverse effects on the integrity of North Meadow and Clattinger Farm SAC, due to nitrogen deposition, cannot be ruled out.

Rodborough Common SAC

F.27 Qualifying features of the SAC:

- 6210 Semi-natural dry grasslands and scrubland facies on calcareous substrates (*Festuco-Brometalia*) (important orchid sites)

F.28 SIP and supplementary advice for conservation objectives:

- Natural England's SIP (dated 06/05/2015) identifies that the site is at risk of 'air pollution impacts as a result of atmospheric nitrogen deposition', which could affect the calcareous grassland. The SIP sets out a measure for further investigation of the potential impacts of this. This indicates that nitrogen deposition is the key issue for NE at Rodborough Common.

- Additionally, supplementary advice from NE sets out more detail on the potential air quality impacts on the SAC, stating the following: “This habitat type is considered sensitive to changes in air quality. Exceedance of these critical values for air pollutants may modify the chemical status of its substrate, accelerating or damaging plant growth, altering its vegetation structure and composition and causing the loss of sensitive typical species associated with it.”
- The supplementary advice goes on to state that: “While the critical loads for Nitrogen and acidity are currently within the acceptable range and nitrogen oxides and sulphur dioxide are below the maximum acceptable limits for this habitat, ammonia levels are currently above the acceptable level for sensitive lichen containing habitat (Ave1.83µgNH3/m3 per year, limit set at 1µgNH3/m3 per year).”
- The relevant target is to “Restore as necessary, the concentrations and deposition of air pollutants to at or below the site-relevant Critical Load of Level values given for this feature of the site on the Air Pollution Information System (www.apis.ac.uk)”.

F.29 Site Condition Assessment:

- The potential for AQ exceedance of thresholds occurs within SSSI Units 1 and 2, which are both in ‘Favourable’ condition according to the last assessment undertaken in 2020. The condition assessment states that “Today Units 1-3 and the site overall is in Favourable Condition. Most of the management threats identified in the 2014 assessment are being tackled but remain i.e. a need for continued grazing intensity on all three units and the need for scrub clearance on all three units. In addition, Unit 1 has a condition threat of recreational impact on the plateau.” This indicates no existing issues directly in relation to air pollution, however the management required could be a result of contribution of air pollution impacts on vegetation communities. This theory is supported by the information from APIS on impacts of nitrogen pollution on calcareous grasslands which states in relation to modifying impacts from nitrogen deposition, that:
- “These systems require specific management to prevent natural succession to woodlands (Dierschke 1985). Grazing, mowing or harvesting can help to offset N enrichment, as losses from gaseous emissions or leaching of inorganic N are relatively small. Similarly grazing or mowing will help maintain a more open canopy structure keeping the robust grasses in check.
  - Grazing management: too low grazing intensity will exacerbate effects of N stimulated nitrophilous grass growth.
  - More frequent mowing or harvesting will help to remove N.

- These soils are P limited so changing P availability will increase the impact of N on growth, eutrophication effects via competition for other limiting resources, changing the balance between species and ecosystem stability."

F.30 Habitat potentially impacted:

- A broad assessment of the qualifying habitats within the SAC was taken using the desk based sources described in paragraph F.6.
- The qualifying habitats for Rodborough Common SAC is semi-natural dry grasslands and scrubland facies on calcareous substrates, which appears to be located within the part of the SAC which lies within the exceedance zone.
- The NVC community is CG5 *Bromus erectus – Brachypodium pinnatum* grassland.

F.31 Area of SAC affected:

- The exceedance of screening thresholds for nitrogen deposition is only at the roadside (0.03m), due to the Local Plan in combination. Roadside habitats (up to c.10m) typically contain degraded habitats i.e. lower value habitats, due to the general presence of the road and its associated salt spray, dust, runoff, and altered drainage or soils; in some cases road verges unofficial tracks may also be present. A localised increase in nitrogen deposition to 0.03m of the road will not have an adverse effect on the integrity of the SAC.
- The screening thresholds for ammonia are exceeded to 20m to the west and 50m to the east of the Spine Road, due to the Local Plan in combination. There is also an exceedance at the roadside, to the east, but this is to 0.03m and is discounted as for nitrogen deposition, above. The total concentration of ammonia exceeds the critical load for all points on the transect, therefore the affected area is up to 20m from the road to the west and up to 50m to the east.
- This area includes c.8.7ha, or 7.9% of the total SAC area.
- Based on the desk study, this part of the SAC is likely support the qualifying habitat (Semi-natural dry grasslands and scrubland facies on calcareous substrates).

F.32 Ability to meet Conservation Objectives:

- Despite source attribute data from APIS demonstrating that the background trend in local contribution of vehicle emissions to air pollution between 2012-2018 (the years for which the data is available) has fallen, local contributions of other sources such as agriculture, livestock and fertiliser application have risen. The nitrogen deposition expected as a result of the plan, up to a maximum of

17.4 kgN/ha/yr for ET3, exceeds the CL of 10-20 kgN/ha/yr. Additionally, the levels of NH3 concentration expected as a result of the plan, 2.2 ug/m3 also exceeds the CL of 1 ug/m3 (recognising this lower CL due to presence of bryophytes/lichens as part of qualifying habitat, as per APIS CL data). There is no background source information available for ammonia.

- The potential impacts associated with nitrogen deposition (including from ammonia) on calcareous grasslands are as follows:
  - "Reduces species richness and/or species diversity/changes species composition
  - Loss of subordinate vascular plants e.g. Thyme *Thymus*
  - Loss of rare or endangered species.
  - Loss of characteristic calcicolous mosses and lichens at risk from shading and N accumulation.
  - Increase in non-native calcifuge species
  - Increase in cat's ear plant *Hypochaeris radicata* (Carroll et al 1997). Negative effects on nitrogen fixing legumes.
  - Increased risk of drought effects.
  - Loss of annuals and forbs will have implications for recovery, due to the short lived nature of the seed bank (Bossuyt et al 2005)."
- This has potential to influence the extent, distribution, structure and function of the lowland hay meadow grassland and therefore, the ability for the site to meet its Conservation Objectives.

Conclusion:

Adverse effects on the integrity of Rodborough Common SAC, due to ammonia, cannot be ruled out.

Cotswold Beechwoods SAC

F.33 Qualifying features of the SAC:

- 9130 *Asperulo-Fagetum* beech forests; and
- 6210 Semi-natural dry grasslands and scrubland facies on calcareous substrates (*Festuco-Brometalia*) (important orchid sites).

F.34 SIP and supplementary advice for conservation objectives:

- Natural England's SIP (dated 30/03/2015) identifies that the site is at risk of 'air pollution impacts as a result of atmospheric nitrogen deposition', which could affect the beech forests and calcareous grassland. The SIP sets out a measure to control, reduce and ameliorate atmospheric nitrogen impacts. This indicates that nitrogen deposition is the key issue for NE at Chilterns Beechwoods.
- Additionally, supplementary advice from NE sets out more detail on the potential air quality impacts on the SAC, stating the following: "This habitat type is considered sensitive to changes in air quality. Exceedance of these critical values for air pollutants may modify the chemical status of its substrate, accelerating or damaging plant growth, altering its vegetation structure and composition and causing the loss of sensitive typical species associated with it."
- The supplementary advice goes on to state that: "Critical Loads and Levels are recognised thresholds below which such harmful effects on sensitive UK habitats will not occur to a significant level, according to current levels of scientific understanding. There are critical levels for ammonia (NH3), oxides of nitrogen (NOx) and sulphur dioxide (SO2), and critical loads for nutrient nitrogen deposition and acid deposition. Concentrations are currently within maximum limits set for this habitat."
- The relevant target is to "Maintain the concentrations and deposition of air pollutants at within the site-relevant Critical Load or Level values given for this feature of the site on the Air Pollution Information System(www.apis.ac.uk).".

F.35 Site Condition Assessment:

- The potential for AQ exceedance of thresholds occurs within SSSI Units 4 and 11, which are designated due to the presence of lowland beech woodland.
- Unit 4 was assessed in 2009 as being in 'Favourable' condition, with lack of veteran trees and open glades, structural diversity and increasing prevalence of sycamore being the only threat to condition.
- Unit 11 was assessed in 2019 as being in 'Unfavourable-Recovering' condition, with similar poor management, lack of veteran trees, and thus poor structural diversity and recreational pressure being the key issues.

F.36 Habitat potentially impacted:

- A broad assessment of the qualifying habitats within the SAC was taken using the desk based sources described in paragraph F.6.

- The qualifying habitats for Cotswold Beechwoods SAC, Asperulo-Fagetum beech forests, and non qualifying calcareous grassland habitat appears to be located within the parts of the SAC which lie within the exceedance zones.
- The NVC community for the beechwoods is likely to be either W12 *Fagus sylvatica – Mercurialis perennis* woodland, or W14 *Fagus sylvatica – Rubus fruticosus* woodland due to the calcareous soil characteristics.

F.37 Area of SAC affected:

- At Buckholt, the exceedance of screening criteria is to 30m due to the Local Plan alone and to 90 in combination, for nitrogen; and to 40m alone and 110m in combination, for ammonia. The total concentrations are exceeded at all transect points (which start at roadside).
- At Birdlip, the exceedance of screening criteria is to 100 in combination, for nitrogen; and to 120m in combination, for ammonia. The total concentrations are exceeded at all transect points (which start at 80m from the road).
- At Sheepscombe, the exceedance of screening criteria is to 70 in combination, for nitrogen; and to 80m in combination, for ammonia. The total concentrations are exceeded at all transect points (which start at 60m from the road).
- This area includes c.12.8ha (2.26% of the SAC), due to the Local Plan alone, and c.13.9ha (2.36% of the SAC), due to the Local Plan in combination.
- Based on the desk study, this part of the SAC is likely support the qualifying habitat (*Asperulo-Fagetum* beech forests and Semi-natural dry grasslands and scrubland facies on calcareous substrates).

F.38 Ability to meet Conservation Objectives:

- Despite source attribute data from APIS demonstrating that the background trend in local contribution of vehicle emissions to air pollution between 2012-2018 (the years for which the data is available) has fallen, local contributions of other sources such as agriculture, livestock and fertiliser application have risen. The nitrogen deposition expected as a result of the plan, up to a maximum of 30.1 kgN/ha/yr for ET4, far exceeds the CL of 10-20 kgN/ha/yr for the Local Plan alone. Additionally, the levels of NH3 concentration expected as a result of the plan, 2.1 µg/m3 also exceeds the CL of 1 ug/m3 (recognising this lower CL due to presence of bryophytes/lichens as part of qualifying habitat, as per APIS CL data). The CL for ET5 and ET6 in relation to nitrogen deposition and ammonia are also exceeded. There is no background source information available for ammonia.

- The potential impacts associated with nitrogen deposition (including ammonia) on beech woodlands are as follows:
- “Nitrogen deposition on forest ecosystems can lead to increased sensitivity to natural stress, impacts on roots, reduced species diversity of the ground vegetation, reduced growth, and an unbalanced nutritional status due to eutrophication and acidification (Erisman and de Wries 2000). Changes in forest ground flora have been clearly documented as a result of enhanced N deposition near farms (Pitcairn et al. 1998) and are also expected to occur in regions with high wet deposition of ammonium and nitrate.”
- Specific impacts on beech woodlands have been identified through research presented by APIS, with species specific responses to nitrogen deposition reported as follows:
  - “Destabilisation; faster growth, reduced investments in roots leading to increased risk of drought stress (Anders et al., 2002) and increased risk of uprooting. Damage to mature beech in the 1999 storm in Switzerland positively correlated with leaf Nitrogen (Meyer et al., 2008)
  - Winter desiccation; increased defoliation by leaf feeders; increased pathogen infection, though evidence is reported predominantly for beech.
  - Increase in bark lesions *Nectria coccinea* linked to sap feeding insect woolly beech scale, (beech bark disease) (Westling et al 1992)
  - Increase in canker *Nectria ditissima*, associated with reduced potassium (Fluckiger & Braun, 1988)
  - Reduction in shoot and stem growth worst on alkaline and acid soils (Fluckiger & Braun, 2011)
  - Increase in pathogenic fungi *Apiognomonia errabunda* and *Phomopsis spp* on both alkaline and acid soils (Fluckiger & Braun, 1999)
  - Increase in beech aphid *Phyllaphis fagi* (Fluckiger & Braun, 1998)
  - Increase in damage to beech nuts by *Cydia amplana* non sucking insect (Fluckiger & Braun, 2004)
  - Flowering patterns, seed and litterfall production (+) and decomposition (-) (Vanguelova and Pitman, 2009)
  - Lower mycelium density (Braun et al., 2010)”
- This has potential to influence the extent, distribution, structure and function of the lowland hay meadow grassland and therefore, the ability for the site to meet its Conservation Objectives.

Conclusion:

Adverse effects on the integrity of Cotswold Beechwoods SAC, due to nitrogen deposition and ammonia, cannot be ruled out.

Conclusions and next steps

F.39 The assessment of air quality impacts on qualifying features has enabled adverse effects on integrity to be ruled out in relation to the following:

- North Meadow & Clattinger Farm SAC:
  - Ammonia levels on the A419 transect remain below critical levels with the Local Plan and other 'in combination' sources of vehicle emissions.
- Rodborough Common SAC:
  - Screening thresholds (more than 1% change in critical load/level) not exceeded on the A46 / Selsey Road.
  - Nitrogen deposition effects on the two Spine Road transects have been ruled out as they are roadside only (0.03m) and habitats are likely to be degraded due to the presence of the road.

F.40 However, it has not been possible to rule out adverse effects on integrity at:

- North Meadow & Clattinger Farm SAC:
  - Nitrogen deposition, due to the Local Plan alone and in combination; near the A419.
- Rodborough Common SAC:
  - Ammonia, due to the Local Plan in combination, at both transects on the Spine Road.
- Cotswold Beechwoods SAC:
  - Nitrogen deposition and ammonia at all three transects on the B4070, due to the Local Plan alone at Buckholt and in combination at the other two transects.

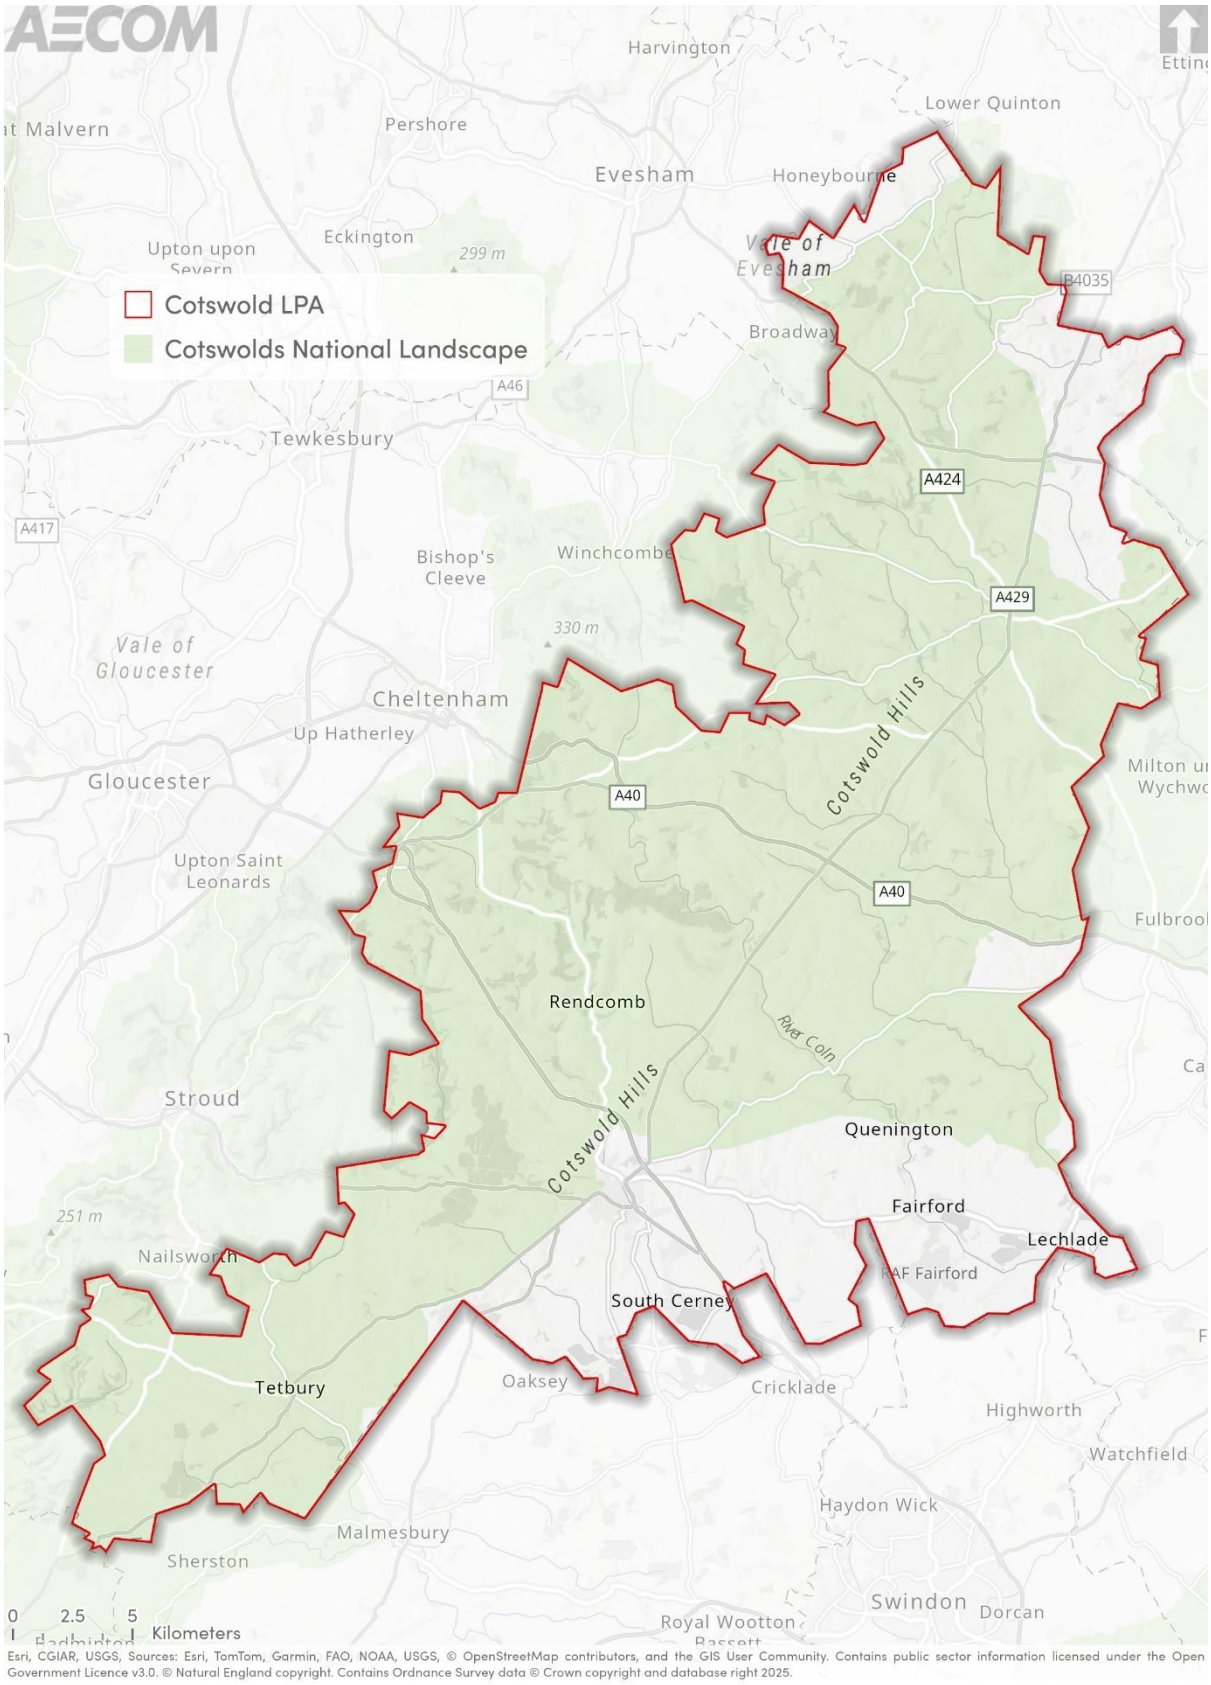
Appendix D Settlement-by-settlement discussion of sites 153

Non-Technical Summary

The Non-Technical Summary has been prepared separately as a stand-alone document accompanying the full IIA Report.

1. Introduction

1.1. Background



1.1.1 AECOM is commissioned to undertake an Integrated Impact Assessment (IIA), incorporating Strategic Environmental Assessment / Sustainability Appraisal, Health Impact Assessment, and Equalities Impact Assessment, in support of the emerging Cotswold District Local Plan 2026-2043 ("the Plan"), which is being prepared by Cotswold District Council (CDC).

1.1.2 This IIA Report is the latest document to be produced as part of the IIA process and accompanies the Regulation 19 consultation for the Plan, undertaken for a period of six weeks between 24th August 2026 and 5th October 2026.

1.1.3 Once adopted, the Plan will set the strategy for growth and change for the district up to 2043, allocate sites to deliver the strategy and establish policies against which planning applications will be determined.

1.1.4 The area covered by the Plan is shown in **Figure 1-1** and encompasses Cotswold District. The Cotswolds National Landscape (formerly Area of Outstanding Natural Beauty) overlaps with approximately 80% of the district.

Figure 1-1: Cotswold District

1.2. IIA explained

1.2.1 IIA fulfils the requirements for Sustainability Appraisal (SA) and discharges the duties for Equalities Impact Assessment (EqIA) and Health Impact Assessment (HIA).

1.2.2 IIA is a mechanism for considering and communicating the impacts of an emerging plan, and potential alternatives in terms of key sustainability issues. The aim of IIA is to inform and influence the plan-making process with a view to avoiding and mitigating negative impacts. Through this approach, the IIA for the Plan seeks to maximise its contribution to sustainable development and the quality of life of residents.

1.2.3 The approach is to fully integrate these components and issues to provide a single assessment process to inform the development of the Plan. A description of each of the various components is provided below.

Sustainability Appraisal (SA)

1.2.4 SA is undertaken to address the procedures prescribed by the Environmental Assessment of Plans and Programmes Regulations 2004. It also widens the scope of the assessment from focusing on environmental issues to further consider social and economic issues. SA is a legal requirement for Local Plans.

1.2.5 National Planning Policy Guidance (NPPG) states that the role of SA is *"…to promote sustainable development by assessing the extent to which the emerging plan, when judged against reasonable alternatives, will help to achieve relevant environmental, economic and social objectives*".

1.2.6 Two key procedural requirements of the Regulations are that:

- When deciding on 'the scope and level of detail of the information' which must be included in the Environmental Report (in this case, the IIA Report) there is a consultation with nationally designated authorities concerned with environmental issues; and
- A report (the 'IIA Report') is published for consultation alongside the Plan that presents an assessment of the Plan (i.e. discusses 'likely significant effects' that would result from plan implementation) and reasonable alternatives.

Equalities Impact Assessment (EqIA)

1.2.7 As a public sector organisation, Cotswold District Council has a duty under the Equality Act 2010 and the associated Public Sector Equality Duty (PSED) to ensure that the objectives and policy options within the district eliminate unlawful discrimination (direct and indirect), as well as advancing equality of opportunity and fostering good relations between those with protected characteristics and all others. An Equality Impact Assessment

(EqIA) is often used by public sector organisations to demonstrate how this duty has been met.

1.2.8 The Equality Act 2010 legally protects people from discrimination both in the workplace and in wider society. It replaces previous anti-discrimination laws which include the Sex Discrimination Act 1975, Race Relations Act 1976 and the Disability Discrimination Act 1995. The Act ensures that individuals with certain 'protected characteristics' are not indirectly or directly discriminated against. The protected characteristics include:

- **Age**: this refers to persons defined by either a particular age or a range of ages.
- **Disability**: a disabled person is defined as someone who has a physical or mental impairment that has a substantial and long-term adverse effect on his or her ability to carry out normal day-to-day activities.
- **Gender reassignment**: this refers to people who are proposing to undergo, are undergoing, or have undergone a process for the purpose of reassigning their gender identity.
- **Marriage and civil partnership**: marriage can be between a man and a woman or between two people of the same sex. Same-sex couples can also have a civil partnership. Civil partners must not be treated less favourably than married couples.
- **Pregnancy and maternity**: pregnancy is the condition of being pregnant or expecting a baby. Maternity refers to the period after the birth. In the non-work context, protection against maternity discrimination is for 26 weeks after giving birth.
- **Race**: the Equality Act 2010 defines race as encompassing colour, nationality (including citizenship) and ethnic or national origins.
- **Religion or belief**: religion means any religion a person follows. Belief means any religious or philosophical belief and includes those people who have no formal religion or belief.
- **Gender**: this refers to a man or to a woman or a group of people of the same sex, while gender refers to the wider social roles and relationships that structure men's and women's, boys' and girls' lives.
- **Sexual orientation**: a person's sexual orientation relates to their emotional, physical and / or sexual attraction and the expression of that attraction.
- **Socio-economic status**: a person's socio-economic status referring to combined economic and sociological measure of a person's work experience and economic and social position in relation to others, based on income, education, and occupation.

Health Impact Assessment (HIA)

1.2.9 There are numerous links between planning and health highlighted throughout the National Planning Policy Framework (December 2024) (hereafter referred to as 'the NPPF'). For example, Paragraph 96 of the NPPF states that the planning system can play an important role in facilitating social interaction and creating healthy, inclusive communities and the NPPG states that Local Planning Authorities should ensure that health and wellbeing, and health infrastructure are considered in Local Plans and in planning decision-making.

1.2.10 In this context, a Health Impact Assessment (HIA) is a tool used to identify and assess the potential impacts of a plan and inform decision-making.

1.3. IIA process

1.3.1 The IIA process to support the Cotswold District Local Plan 2026-2043 is undertaken in five stages. This IIA Report is concerned with **Stage 3**.

Stage 1: Scoping Report

- Establish the context and baseline for the IIA.
- Identify key sustainability issues for the Plan.
- Develop the IIA Framework of objectives and appraisal questions.

Stage 2: Interim IIA Report(s)

- Develop and refine alternatives (i.e., growth 'scenarios') for the Plan.
- Appraise the growth scenarios and identify likely significant environmental effects.
- Prepare Interim IIA Report(s) to accompany Regulation 18 consultation(s) on the Plan.

Stage 3: Consult on the Plan and IIA Report

- Appraise the policies and proposals within the draft Plan.
- Prepare the IIA Report to accompany Regulation 19 version of the Plan.
- Consult on the Plan.

Stage 4: IIA Report Addendum

- Submission and examination of the Plan.
- Appraisal of modifications.

Stage 5: IIA Adoption Statement

- Prepare the IIA Adoption Statement.
- Monitor the significant effects of the Plan.

1.4. This IIA Report

1.4.1 The Cotswold District Local Plan 2026-2043 is currently published under Regulation 19 of the Local Planning Regulations, such that representations can be made ahead of the plan being submitted to the Government and subjected to an Examination in Public (EiP) overseen by the Planning Inspectorate.

1.4.2 As such, this is the formally required IIA Report. It is published alongside the Plan in order to inform representations and subsequent plan finalisation as part of the EiP (see discussion of 'next steps' in **Part 3** of this Report).

1.4.3 **Chapter 2** of the IIA Report provides an overview of the Local Plan scope, with **Chapter 3** providing an overview of the IIA scope (Stage 1 of the IIA process). The remaining chapters in this IIA Report have been structured into three parts, as follows:

- **Part 1 (Chapters 4-7)** provides an overview of plan making and IIA to date, and an outline of the reasons for selecting the reasonable alternatives (i.e., the 'growth scenarios') dealt with through the IIA for the Plan. Part 1 also presents the appraisal of these growth scenarios, determining the likely significant environmental effects of the scenarios for each theme that has been scoped into the IIA process.
- **Part 2 (Chapters 8-9)** presents the appraisal findings at this current stage of plan making. Specifically, the appraisal of the Regulation 19 version of the Cotswold District Local Plan 2026-2043, including any recommendations or mitigation measures for consideration by plan makers tasked with finalising the Plan ready for submission; and
- **Part 3 (Chapters 10-11)** sets out the next steps for the IIA process and plan making.

2. The Local Plan scope

2.1. Introduction

2.1.1 The aim here is to introduce the context to plan preparation, including the plan area; the plan period; and the objectives that are in place to guide plan preparation.

2.2. The plan area

2.2.1 Cotswold District (see **Figure 1-1**) is located in the eastern part of Gloucestershire and covers a predominantly rural area characterised by villages, historic market towns and open countryside. Around 80% of the district lies within the Cotswolds National Landscape, which is a nationally designated landscape of significant environmental and scenic value. This has a strong influence on settlement patterns, landscape character, environmental protection and the capacity for new development.

2.2.2 The district shares boundaries with the Gloucestershire authorities of Cheltenham, Gloucester, Forest of Dean, Stroud and Tewkesbury, as well as West Oxfordshire, South Oxfordshire, Cherwell, Stratford on Avon, Wiltshire and Wychavon Districts. These neighbouring areas share several strategic planning matters with Cotswold District, including housing provision, transport connectivity, economic development, environmental assets and the protection of landscape character.

2.2.3 Ongoing discussions regarding Local Government Reorganisation in Gloucestershire may have implications for the governance and strategic planning context of the district in the medium to long term. The Ministry of Housing, Communities and Local Government is currently consulting on a number of proposals for unitary local government structures across Gloucestershire, which could result in changes to administrative boundaries, service delivery arrangements and strategic planning responsibilities affecting Cotswold district.

2.2.4 Cotswold District currently operates within a three-tier local authority structure. Gloucestershire County Council acts as the strategic authority, with responsibility for services including highways and transport, education, social care and minerals and waste planning. Cotswold District Council functions as the local planning authority, with responsibilities including development management and preparation of the Plan. A network of town and parish councils operates at the local level, representing communities across the district and playing an important role in neighbourhood planning, local service provision and community engagement.

2.2.5 The district benefits from its position within the wider regional context of central southern England and maintains strong functional relationships with surrounding urban centres, including Cheltenham and Gloucester to the

west, Oxford to the east and Swindon to the south. These centres provide significant employment opportunities and access to a wide range of retail, education, health and transport services. They play an important role in shaping commuting patterns, economic activity and service use for residents and businesses within Cotswold District.

2.2.6 A number of important strategic transport connections support the relationships between the Cotswolds and the surrounding urban centres, with the A40 providing an important east-west route linking Oxford with Cheltenham and Gloucester, the A417 forming a key connection between the M4 and M5 motorways via Cirencester, and the A429 providing a north-south route through the heart of the district. Rail accessibility is provided by the Cotswold Line, serving stations including Moreton-in-Marsh offering direct services to Oxford and London, complemented by the nearby line between Swindon and Gloucester with the station at Kemble in the Cotswold District.

2.3. The plan period

2.3.1 The plan period covers a 17-year period from 2026-2043, in light of NPPF paragraph 22 which states:

"*Local plans] should look ahead over a minimum 15-year period from adoption, to anticipate and respond to long-term requirements and opportunities. Where larger scale developments such as new settlements or significant extensions to existing villages and towns form part of the strategy for the area, policies should be set within a vision that looks further ahead…*"

2.4. Plan objectives

2.4.1 It is important to set plan objectives early in order to guide plan-making.

2.4.2 Also, the plan objectives are a key input to the IIA process, because of the requirement is to define, appraise and consult on reasonable alternatives taking account of *"the objectives… of the plan."*

2.4.3 The plan includes a spatial vision and set of strategic objectives. The spatial vision is as follows:

By 2043, Cotswold District will be a resilient, inclusive, and forward-looking rural district that has responded to the climate crisis and ecological emergency, conserved and enhanced the Cotswolds National Landscape, delivered sustainable communities, and enabled a vibrant, low-carbon economy. Development will have been guided by a Spatial Strategy that prioritises environmental stewardship, social equity, and economic vitality, while respecting the District's unique landscape, heritage, and character. The roles of the District's settlements will be reinforced, with Cirencester

continuing to function as the principal centre, supported by a network of market towns and villages that serve their rural hinterlands.

The Local Plan will have delivered a diverse range of housing, including a significant increase in socially rented and smaller and more affordable homes, enabling residents of all ages and backgrounds to live securely and sustainably. This will include homes that respond to the needs of an ageing population, support younger people and key workers to remain in the District, and provide a mix of sizes and tenures that improve affordability and maintain a balanced community. New development sites will have matured into thriving communities, offering high-quality homes, employment opportunities, and essential services, all supported by integrated infrastructure and sustainable transport networks.

The District will have transitioned to zero-carbon development, with new buildings and infrastructure designed to minimise energy and water use and maximise renewable energy generation. Biodiversity Net Gain will be embedded across all larger development, contributing to a richer natural environment and improved ecological resilience. Water resources will be carefully managed, with development responding to water stress, flood risk and the need to protect and enhance water quality.

The Local Plan will have helped to reduce transport emissions through investment in active travel infrastructure, public transport, and strategic growth focused around transport nodes and ensuring local services and facilities are close enough to access by walking, wheeling or cycling, and/ or other sustainable transport modes. Communities will be healthier, more connected, and better supported by local services, green spaces, and digital infrastructure.

Cotswold District will continue to be 'Green to the Core', with planning decisions consistently reflecting the long-term interests of people, place, and planet.'

2.4.4 The following strategic objectives will help deliver the spatial vision and guide development through the district over the plan period:

- **SO1: Ensure infrastructure and services support sustainable communities**
  - Help to deliver infrastructure, services, and facilities that meet the needs of residents and businesses.
  - Ensure the required infrastructure and services, as set out in the Infrastructure Delivery Plan, are delivered in a timely manner.
- **SO2: Respond to the climate crisis through adaptation and mitigation**
  - Require new housing development to be zero-carbon and climate-resilient.

  - Support the provision of renewable energy schemes and promote community owned renewables initiatives.
  - Locate development away from flood-prone areas, treat rainwater as a resource and promote water and energy efficiency.

- **SO3: Conserve and enhance the natural, built, and historic environment**
  - Preserve the high quality, local distinctiveness, and diversity of the natural and historic environment.
  - Support the sympathetic retrofit of historic buildings.
  - Conserve and enhance the distinct character of the Cotswolds National Landscape, open countryside and water quality.
  - Promote high-quality, sustainable design and green infrastructure that supports health and wellbeing and the Local Nature Recovery Strategy.
- **SO4: Deliver inclusive, healthy, and affordable housing**
  - Provide a diverse mix of housing types and tenures to meet the needs of all sections of the community, with a focus on socially rented homes and smaller and more affordable homes.
  - Ensure development supports positive health outcomes and embeds local health and wellbeing strategies.
- **SO5: Enable a vibrant, low-carbon local economy**
  - Support the transition to a low-carbon economy and promote local employment.
  - Encourage the vitality and viability of town and village centres as places that support a range of activities and uses such as shopping, leisure, cultural and community activities; as well as providing access to affordable homes.
  - Promote sustainable tourism.
  - Maintain Cirencester's role as a key employment and service centre.
- **SO6: Promote sustainable transport use and connectivity**
  - Reduce transport emissions by encouraging walking, cycling, wheeling and public transport and supporting the shift to electric vehicles, whilst recognising the rural nature of the area and that private vehicles will remain a necessity for some parts of the District.
  - Focus development at accessible locations where local services and facilities are close enough to access by walking, wheeling or cycling and where there are good public transport links such as access to the Expressbus network.
  - Create multimodal transport hubs to improve access to sustainable transport choices, aid health outcomes and reduce emissions and pollution.

3. The IIA scope

3.1. Introduction

3.1.1 The scope of the IIA refers to the breadth of sustainability issues and objectives that are taken into account as part of the assessment of reasonable alternatives and the emerging plan, i.e. when reaching conclusions on 'likely significant effects' (see discussion in **Chapter 1**). It does not refer to the scope of the plan (discussed in **Chapter 2**) or the scope of reasonable alternatives (discussed in **Part 1**).

3.1.2 The aim here is to introduce the reader to the broad scope of the IIA. It is important for the IIA scope to remain flexible, responding to the emerging plan and reasonable alternatives, and the latest evidence-base.

3.2. Consultation on the scope

3.2.1 The SEA Regulations require that: "*When deciding on the scope and level of detail of the information that must be included in the report, the responsible authority shall consult the consultation bodies*". In England, the consultation bodies are the Environment Agency, Historic England and Natural England. These authorities were consulted on the scope of the IIA in late 2020.

3.2.2 The responses (along with comments on how these have been considered and addressed through the IIA process) have informed the IIA process and are presented in **Appendix B** of this IIA Report.

3.2.3 In the time since scoping consultation was undertaken, it is acknowledged that the planning policy context and baseline has evolved, with this information a useful source of evidence for the IIA. In recognition of this, the planning policy context and baseline information initially included in the Scoping Report has been reviewed and updated (where appropriate) to inform the IIA, and is presented in **Appendix B**.

3.2.4 Drawing on the review of the sustainability context and baseline, the IIA Scoping stage identified a range of key sustainability issues that should be a particular focus of IIA (see **Appendix C**), ensuring it remains targeted on the most important issues. These issues were then translated into an IIA 'Framework' of objectives and appraisal questions. A short version with just the IIA objectives is provided in **Table 3-1**, while the full version, including supporting questions, is presented in **Appendix C**, reflecting the latest baseline and consultation responses received from the statutory bodies.

3.2.5 The IIA Framework provides a way in which the likely significant effects and sustainability implications of the Plan and alternatives can be identified and subsequently analysed based on a structured and consistent approach. The IIA Framework and the appraisal findings in this IIA Report have been

presented under twelve IIA themes, reflecting the range of information being considered through the IIA process.

3.2.6 The selected IIA themes incorporate the ‘topics’ suggested by Schedule 2(6) of the Environmental Assessment of Plans and Programmes Regulations. These were refined to reflect a broad understanding of the anticipated scope of plan effects.

Table 3-1: The IIA Framework of topics and objectives

Topic		Objectives
	Biodiversity	• Protect and enhance biodiversity.
	Climate Change (adaptation)	• Ensure adaptability to climate change that, where feasible, goes beyond simple limitation of negative effects.
	Climate Change (mitigation)	• Take an active role in achieving net zero carbon by 2050 if not before.
	Economy and Employment	• Achieve sustainable economic growth and opportunities for employment, including support for the rural economy. Support the resilience and vitality of town centres during transformation from the "traditional" retail-dominated high street to a more flexible and responsive model. • Encourage and support the development of sustainable tourism.
	Equalities	• Advance equality for all.
	Green Infrastructure and Natural Capital	• Conserve and enhance green infrastructure assets and networks and exploit its multi-functional benefits. • Deliver natural capital and enhance the provision of ecosystem services.
	Healthy and Vital Communities	• Contribute to the achievement of balanced and healthy communities and be responsive to the needs of different age groups in the district.

Topic	Objectives
 Historic Environment	• Deliver high quality and well-designed sustainable development that responds appropriately to its context. • Conserve and enhance the historic environment of the district.
 Housing	• Meet local need for housing by maintaining a sustainable level of supply and ensure that new housing is as sustainable as possible in terms of its location, construction materials and internal and external facilities.
 Landscape	• Conserve, restore and enhance the character of landscapes in the district.
 Land, Soil and Water Resources	• Promote sustainable waste management solutions that encourage the reduction, re-use and recycling of waste. • Support the efficient use of land. • Encourage the prudent use of natural resources. • Protect and enhance water quality and minimise water use.
 Transport and Air Quality	• Reduce the need to travel by private car, reduce traffic congestion and air pollution through improving travel choice by active encouragement of modal shift and facilitation of more sustainable forms of transport.

3.3. Integrating equalities and health

3.3.1 The IIA Framework incorporates an 'Equalities' theme and 'Healthy and Vital Communities' theme through which the likely significant effects of the Local Plan and alternatives will be identified. This is with a view to integrating equalities and health impact considerations through the IIA process to discharge the duties for EqIA and HIA.

3.3.2 Further points to note are:

- **EqIA** – the Equality Act 2010 (the Act) introduced a Public Sector Equality Duty, which covers the following protected characteristics: age, disability, gender re-assignment, marriage / civil partnership, pregnancy, maternity, ethnicity, religion/belief, sex and sexual orientation. Under the Duty the Council must, in the exercise of its functions, have due regard to the need to: eliminate unlawful discrimination, harassment and victimisation and other conduct prohibited by the Act; advance equality of opportunity between people who share a protected characteristic and those who do not; and foster good relations between people who share a protected characteristic and those who do not. EqIA is often used by public sector organisations to demonstrate how this duty has been met. However, there are no procedural requirements specific to EqIA over-and-above those relating to SA (or IIA), hence integrating EqIA simply involves ensuring that the IIA scope has a good focus on equality matters.
- **HIA** – addressing the determinants of good health is increasingly a focus of local plan-making, e.g. a recent study on Integrating Health into Local Plans identified five key themes: Healthy neighbourhood design; Healthy housing; Healthier food environments; Natural and sustainable environments; Healthy transport. HIA is a tool for integrating health-related considerations in local plan-making. As per EqIA, there are no procedural requirements specific to HIA over-and-above those for SA (or IIA), hence integrating HIA simply involves ensuring that the IIA scope has a good focus on health determinants.

Part 1: What has plan making / IIA involved up to this stage?

4. IIA work to date

4.1. Interim IIA Reports

4.1.1 Prior to the publication of the revised NPPF in December 2024, CDC had resolved to undertake a partial update of the adopted Local Plan rather than a full review. IIA work to date has been prepared in this context.

4.1.2 The first stage of the Partial Local Plan Update was to identify 'Issues and Options'. This was primarily to make the Local Plan 'green to the core' in response to the council's climate change emergency and ecological emergency declarations. Consultation took place between February and March 2022 under Regulation 18 of the Town and Country Planning (England) Regulations 2012. An Interim IIA Report was prepared to accompany the consultation, which appraised a number of alternative policy approaches that could be taken through the Local Plan relating to the following issues: biodiversity; zero-carbon development; carbon storage calculations; accessibility; renewable energy within and outside of the Cotswolds National Landscape; economy and employment second home ownership; and tourism.

4.1.3 Between February and March 2023, the Council consulted on two evidence documents to inform the Local Plan making process, specifically: Consultation on Non-Strategic Site Allocations Selection Methodology and Guidance for major development in the Cotswolds National Landscape.

4.1.4 In January 2024, as there would soon be less than five years remaining of the adopted Local Plan period, the Council decided to proactively begin the process of planning for development requirements beyond 2031 before a lack of a five-year housing land supply became an issue. The Council therefore approved the commencement of a Development Strategy and Site Allocations Plan (2026-41) which would be undertaken in parallel to the Partial Local Plan Update for strategic reasons.

4.1.5 In February to March 2024, the Council undertook consultations on both the 'Draft Policies' of the Partial Local Plan Update and 'Issues and Options' for the Development Strategy and Site Allocations Plan'. An updated Interim IIA Report (Feb 2024) accompanied this stage of plan making, appraising development strategy options to inform the preferred approach and evaluating the relative sustainability merits of promoting development at various broad locations in the vicinity of key settlements (following the points of the compass). The updated Interim IIA Report also assessed the proposed policy revisions.

4.1.6 In December 2024, the NPPF and NPPG introduced a new, mandatory 'standard methodology' (the standard method) for calculating the number of homes needed in each local planning authority area. As a result, the Council agreed to combine the Partial Local Plan Update and the

Development Strategy and Site Allocations Plan into a single, and comprehensive, full Plan. Given the plan period for the Plan needs to cover a minimum of 15 years from adoption (expected in 2027), the Local Plan period was extended up to 2043.

4.1.7 For Cotswold District, the revised standard method currently identifies a housing need of 1,054 dwellings per annum (dpa), which represents a significant increase of over 100% from the number which the Council was originally planning for (493 dpa) through the initial stages of plan making. This now equates to a total target of 17,918 homes for the new 17-year plan period up to 2043. This updated 1,054 figure is based on the standard methodology calculation provided by the MHCLG's recalculation of housing needs in December 2024.

4.1.8 The responses from the previous Regulation 18 consultations remain valid and have been taken into consideration. However, the significant increase to the number of homes for the district required the Council to rethink the proposed development strategy for delivering this scale of growth.

4.1.9 In light of the above, a third Interim IIA Report (November 2025) was produced which presented an appraisal of seven growth scenarios for the Plan with a view to identifying the broad spatial strategy for meeting housing needs and employment land requirements during the emerging plan period. This was for the benefit of those who made representations through the Preferred Options (Regulation 18) consultation, undertaken for a period of seven weeks between 14 November 2025 and 2 January 2026.

4.1.10 In response to the housing increase for the district, the Regulation 18 consultation was also accompanied by a 'Broad Location Study' which invited site submissions for strategic-scale growth in areas outside of the Cotswolds National Landscape.

4.2. Current stage of plan making

4.2.1 The Council have received correspondence from MHCLG confirming that they expect the district to meet their local housing need (LHN) and employment land requirements during the plan period, and plan making has since evolved to reflect this context.

4.2.2 In light of this, the growth scenarios tested in the Interim IIA Report accompanying the Preferred Options (Regulation 18) consultation in November 2025 have been revisited and updated to consider reasonable alternative 'growth scenarios' for meeting LHN and employment land requirements across the district at this stage of plan making.

4.2.3 This is discussed in **Chapter 5** of this IIA Report.

5. Defining growth scenarios

5.1. Introduction

5.1.1 Several formal consultations having been held to date. However, the aim here is not to relay the entire backstory, nor to provide an 'audit trail' of steps taken. Rather, the aim is to report work undertaken to examine **reasonable alternatives** (i.e., the 'growth scenarios') ahead of the current consultation. Specifically, the aim is to:

- explain the reasons for selecting the alternatives dealt with - as discussed within **Chapter 5** of this IIA Report (i.e., this chapter);
- present an appraisal of the growth scenarios considered at this stage of plan making - see **Chapter 6** of this IIA Report; and
- explain the Council's reasons for selecting the preferred approach - see **Chapter 7** of this IIA Report.

5.1.2 Presenting this information aligns with the requirement for the IIA Report to present an appraisal of reasonable alternatives and *"an outline of the reasons for selecting the alternatives dealt with"*.

Reasonable alternatives in relation to what?

5.1.3 The legal requirement is to examine reasonable alternative 'growth scenarios' taking account of *"the objectives and geographical scope of the plan"*, which suggests a need to focus on the **spatial strategy**, i.e. providing for a supply of land, including by **allocating sites** (NPPF para 69), to meet objectively assessed needs and wider plan objectives. The objective is to allocate a *package* of sites to meet needs and wider objectives, hence reasonable alternatives must be in the form of alternative *packages* of sites, in so far as possible.

5.1.4 Establishing a broad spatial strategy is also a central objective, specifically with respect to identifying the preferred approach for distributing housing and employment growth across the district during the plan period. Another consideration is that to be 'reasonable', alternatives must be meaningfully different to the extent that that they vary in terms of significant effects, where significance is defined in the context of the plan (taken as a whole).

What about other aspects of the plan?

5.1.5 As well as establishing a spatial strategy, allocating sites etc, the Local Plan must also establish policy on thematic district-wide issues, as well as site-specific policies. Broadly speaking, these can be described as development management (DM) policies. However, it is a challenge to define "reasonable" DM policy alternatives, and, in this case, none are identified following discussion with CDC officers additional to those which

have been considered during the earlier stages of plan making (and accompanying Interim IIA Reports).

5.2. Defining growth scenarios

5.2.1 As discussed, the requirement is to appraise and consult upon "*the plan and reasonable alternatives taking into account the objectives and geographical scope of the plan*". To reiterate, 'growth scenarios' equate to reasonable alternatives.

5.2.2 In order to provide for objectively assessed needs alongside delivering-on wider plan objectives, the broad spatial strategy for the Cotswold District Local Plan 2026-2043 is to focus major development outside of the Cotswolds National Landscape and at Principal Settlements (more focus) and Non-Principal Settlements (less focus), whilst also supporting opportunities to deliver mixed-use growth across sustainable urban extensions (minimum of 350 homes) or new settlements (minimum of 1,500 homes). The broad spatial strategy was agreed after considering the findings within the Interim IIA Report (see **Scenario 5**) and the responses to the Preferred Options (Regulation 18) consultation in November 2025.

5.2.3 In light of the above, the IIA has revisited and updated the growth scenarios considered at the Preferred Options (Regulation 18) consultation to consider the key alternatives that exist at this current stage of plan making. Namely, the consideration of the alternative approaches (i.e., key variable site options) for plan makers tasked with selecting the preferred approach for delivering the broad spatial strategy for the Plan.

5.2.4 Ultimately, the aim of **Chapter 5** is to present '*an outline of the reasons for selecting the alternatives dealt with*', in accordance with the Environmental Assessment of Plans and Programmes Regulations.

Top-down (strategic) factors

Housing context

5.2.5 For Cotswold District, the revised standard method identifies a housing need of 1,054 dwellings per annum (dpa), which represents an increase of over 100% from the number which the Council was originally planning for (493 dpa) through the initial stages of plan making and Regulation 18 consultations to date. As a result, LHN for the 17-year plan period is 17,918 homes.

5.2.6 It is important to be clear that providing for established needs, as far as is consistent with sustainable development, is a key aspect of local plan-making. As part of this, there is a need to plan for LHN provided by the NPPF and then identify a supply of land sufficient to deliver on the committed housing requirement.

5.2.7 At the Preferred Options (Regulation 18) Consultation stage of plan making, the growth scenarios tested through the IIA were framed in the context of planning for unmet need in light of the significant constraints to development across the district, as approximately 80% of the district is within the Cotswolds National Landscape. Whilst there is a strategic case for remaining open to unmet need, the findings of the Housing and Economic Land Availability Assessment (HELAA, July 2026) and Site Selection Topic Paper (July 2026) which accompany the evidence base for the Regulation 19 version of the Local Plan demonstrate that there are a number of potential pathways to meeting LHN. For this reason, the basis for the revised growth strategy options considered within this Regulation 19 IIA Report will be the delivery of LHN in the district, with lower growth scenarios ruled out at this stage.

5.2.8 Additionally, in accordance with national planning policy and guidance, a potential under-delivery necessitates the application of a buffer to the five-year housing land supply to provide flexibility and resilience in the event of delivery delays or site non-implementation. With the application of a 5% headroom, this would equate to the delivery of in the region of 18,814 homes over the 17-year plan period. Housing trajectory work has been completed to ensure that there is sufficient supply during the first part of the plan period to maintain a five-year housing land supply and in recognition of the fact that the strategic sites have longer lead-in times.

Employment context

5.2.9 The Employment Land Review (ELR) 2026 considers the current supply and residual employment needs across the district up to 2043 which need to be met through new allocations (once permissions and completions are taken in to account).

5.2.10 Specifically, the ELR outlines a need of 8.3ha for office, research, and development, and 60.2ha for industrial and warehousing development. This results in an overall need of 68.5h during the plan period. In order to meet this requirement, a further 32.7 ha is needed beyond known completions and commitments. Employment land will be delivered for a mix of office, research and development, and industrial uses.

5.2.11 The approach to meeting employment land requirements during the plan period focuses on safeguarding and expanding employment provision on existing sites and delivering mixed-use development across strategic site allocations. The integration of employment uses within strategic residential-led developments helps to create more self-contained communities, reduce the need to travel and maximise opportunities for active travel and public transport use.

Settlement role and function

5.2.12 In light of the increased LHN for the district, the Council have reconsidered (in broad terms) where is more/less suited to accommodating growth by

revisiting their settlement hierarchy. The refresh of the Council's Settlement Role and Function Study has considered the sustainability of the district's 49 largest settlements delivering growth, and whether the existing hierarchy remains 'fit for purpose'. The Study primarily focuses on the size of settlements, the employment role of settlements, and the community facilities and services they provide.

5.2.13 Principal and Non-Principal Settlements are defined as the most sustainable locations within the district for delivering growth and are the top two tiers within the settlement hierarchy for the Local Plan. Cirencester is classified as the district's 'main settlement' and is the largest town. Moreton-in-Marsh and Kemble are the only locations in the district (both Principal Settlements) with access to a train station. Honeybourne Station is approximately 4km to the west of Mickleton (also a Principal Settlement).

5.2.14 A total of 16 locations are defined as a Principal Settlement:

- Andoversford
- Blockley
- Bourton-on-the-Water
- Chipping Campden
- Cirencester
- Fairford
- Kemble
- Lechlade
- Mickleton
- Moreton-in-Marsh
- Northleach
- Siddington
- South Cerney
- Stow-on-the-Wold
- Tetbury
- Upper Rissington

5.2.15 A total of 18 locations have been defined as Non-Principal Settlements (including Village Clusters):

- Avening
- Bibury
- Bledington
- Bourton-on-the-Hill
- Broadwell
- Chedworth
- Didmarton
- Down Ampney
- Kempsford
- Longborough
- Meysey Hampton
- North Cerney
- Poulton
- Preston
- Sapperton
- Swell
- Willersey
- The village cluster of Coln St Aldwyns, Hatherop, and Quenington

Bottom-up factors

5.2.16 Having discussed 'top down' strategic factors with a bearing on defining growth scenarios, the next step is to give 'bottom up' consideration to detailed area and site-specific factors. In practice, this means discussing

the potential locations for development and what growth typologies are supported (e.g., large ‘strategic’ sites vs. smaller ‘non-strategic’ sites).

Site Selection Topic Paper

5.2.17 A total of 891 sites have been submitted to the Council as potential land for development, with further assessment required to confirm their suitability and deliverability. All submitted sites have gone through the Council’s site assessment and selection process, which applies a series of stages to progressively identify which sites should be rejected and which sites could potentially be recommended for a Local Plan allocation.

5.2.18 A comprehensive overview of the stages and the assessment findings can be found within the Site Selection Topic Paper published alongside the Regulation 19 Cotswold District Local Plan 2026-2043. A summary of the process is described below:

- **Stage 1:** Identification and initial assessment of sites through the HELAA. The HELAA provides a ‘long-list’ of sites which have potential to demonstrate suitability, availability and achievability for more detailed consideration from Stage 2 onwards. A total of 891 sites were assessed at Stage 1 with 328 identified as ‘deliverable / developable’ or ‘potentially deliverable / developable’ for further consideration at Stage 2. The HELAA for the emerging Cotswold District Local Plan is published alongside the Regulation 19 Local Plan and should be read in conjunction with this IIA Report and the Site Selection Topic Paper.
- **Stage 2:** An initial sift of sites which discounts sites based on a set of criteria informed by national policy and guidance (i.e., NPPF and Footnote 7 constraints) and the broad spatial strategy for the emerging Local Plan. The broad spatial strategy is to focus growth at Principal Settlements and Non-Principal Settlements and explore opportunities to deliver strategic growth via sustainable urban extensions or new settlements. The sifting criteria are presented by site category: strategic sites; non-strategic sites; and employment sites. This stage helped to ‘filter’ the ‘long-list’ assessed at Stage 1 and created a ‘shorter long-list’ for further consideration.
- **Stage 3:** Detailed but proportionate assessment of the constraints and opportunities for the sites taken forward for Stage 3, based on the available technical evidence base. Reflecting the assessment findings, sites are classified into one of three categories with respect to their potential suitability for a Local Plan allocation, as follows:
  - clear preferred site option (++);
  - marginal omission site option (-); or
  - clear omission site option (- -).

5.2.19 The detailed assessment findings for the strategic site options, non-strategic site options, and employment site options taken forward to Stage 3 of the process is presented in the Site Selection Topic Paper, with accompanying tables and maps showing the overall ratings and their location within the district. A summary of the findings is presented in **Appendix D** of this IIA Report.

Strategic Growth Opportunities

5.2.20 The supply of large numbers of new homes and employment land can often be best achieved through planning for larger scale development, such as new settlements or significant extensions to existing villages and towns. This is provided they are well located and designed and supported by the necessary infrastructure and facilities (including a genuine choice of transport modes).

5.2.21 In recognition of the significant constraint to delivering major development within the Cotswolds National Landscape, the Council has considered the potential constraints and opportunities for delivering strategic-scale growth outside of the Cotswolds National Landscape. This could be achieved through sustainable urban extensions to existing settlements (for a minimum of 350 homes), or through the creation of new settlements (for a minimum of 1,500 homes) recognising that developments of this size are generally capable of supporting the infrastructure, services, facilities, employment opportunities and stewardship arrangements necessary to create sustainable communities. These considerations formed part of the initial sift of potential sites within **Stage 2** of the Site Selection Topic Paper.

Opportunities for a potential 'new settlement'

5.2.22 Reflecting site availability across the district, there are large areas of land in locations outside of the Cotswolds National Landscape which could accommodate strategic scale growth during the plan period. This primarily includes locations which are within proximity to the main settlement of Cirencester (i.e., the largest settlement in the district). In particular, locations surrounding the villages of Driffield (approximately 4km to the south east) and Ampney Crucis (approximately 2.5km to the east).

5.2.23 Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for a potential new settlement, 'Land to the north of Ampney Crucis' (R583A) and 'Land north west of Harnhill, Driffield' (R691), are strategic-scale site options that have indicative capacities which fall short of the 1,500-home threshold for a 'new settlement'. The sites are not adjacent to an existing settlement and therefore cannot be considered as sustainable urban extensions.

5.2.24 Reflecting the above, the following sites (or clusters of sites) were taken forward to **Stage 3** of the site selection process for a potential 'new settlement' in the district, outside of the Cotswolds National Landscape and in proximity to Cirencester:

- ‘Land to the south of Ampney Crucis’.
- ‘Land east of Driffield’.
- ‘Land south of Driffield’; and
- ‘Land west of Driffield’.

Opportunities for potential ‘sustainable urban extensions’

5.2.25 Within the HELAA, of the sites classified as ‘potentially deliverable / developable’ or ‘deliverable / developable’ for a sustainable urban extension:

- ‘Land to the south west of Fairford (F53A and F53B)’ could deliver up to 420 homes reflecting the indicative site capacities within the HELAA. An outline planning application of 74 homes has come forward on Site F53A. Constraints to development across Site F53B limit further opportunities for expansion, given the adjacent SSSI and its associated Impact Risk Zones. On this basis, the sites are considered separately for potential non-strategic development during the plan period.
- ‘Land to the north, east and south of Moreton-in-Marsh’ is assessed as a potential sustainable urban extension. To the south east of the proposed sustainable urban extension, ‘Land at Coldicote Farm’ also has an indicative capacity which exceed 350 homes. As the site is not immediately adjacent to the town, development at this location would fall into the ‘new settlement’ category based on the site selection methodology. However, as the site would adjoin the sustainable urban extension at Moreton-in-Marsh if, in the longer term, ‘Land to the north, east, and south of Moreton-in-Marsh’ is taken forward as an allocation, it has been tested within the sustainable urban extension category.
- Cotswold Airport currently accommodates around 620 employees, alongside a substantial volume of visitors and customers, with aspirations for further growth. However, the site has since been confirmed as being unavailable for a Local Plan allocation.

5.2.26 Reflecting the above, the following sites (or clusters of sites) were taken forward to **Stage 3** of the site selection process for a potential sustainable urban extension:

- ‘Land north of Ampney Crucis’.
- ‘Land east of Ampney Crucis’.
- ‘Land east of Kingshill Lane, Cirencester’.
- ‘Steadings southern extension, Cirencester’.
- ‘Land south east of Cirencester and south of Preston’.

- ‘The Whiteway, Cirencester’.
- ‘Land east of Down Ampney’.
- ‘Land south of Down Ampney’.
- ‘Land surrounding Down Ampney’.
- ‘Land north east of Fairford’.
- ‘Land south west of Kemble’.
- ‘Cluster of sites to the west of Lechlade’.
- ‘Land to the north and west of Mickleton’.
- ‘Land to the north, east, and south of Moreton-in-Marsh’.
- ‘Land at Coldicote Farm, south of Moreton-in-Marsh.
- ‘Land south west of Siddington’.
- ‘Land north of South Cerney Airfield’; and
- ‘Cluster of sites to the north of Willersey’.

Arriving at the revised growth scenarios

5.2.27 The ‘top-down’ and ‘bottom-up’ factors discussed above require the IIA to revisit and refine the growth scenarios which have been considered to date. Sites which were categorised as either a ‘clear preferred site option’ or ‘marginal omission site option’ through the Site Selection Topic Paper have informed the revised growth scenarios considered through this Regulation 19 IIA Report.

5.2.28 The scenarios have been revised and updated in the context of the Council’s objective to meet LHN and employment land requirements over the 17-year plan period between 2026-2043, whilst also aligning with the broad spatial strategy which was established during the earlier stages of plan making. As a reminder, the broad spatial strategy for the Cotswold District Local Plan 2026-2043 is to focus major development outside of the Cotswolds National Landscape and at Principal Settlements (more focus) and Non-Principal Settlements (less focus), whilst also supporting opportunities for strategic growth across sustainable urban extensions (minimum of 350 homes) or new settlements (minimum of 1,500 homes).

5.2.29 All scenarios assume that any sustainable urban extensions or new settlements would come forward as mixed-use schemes, comprising primarily residential uses alongside community infrastructure and employment land. The scenarios vary in the scale of growth across variable strategic site options at this stage of plan making, reflecting differing assumptions regarding infrastructure delivery, environmental

constraints, and the relative suitability of each settlement to accommodate development during the plan period.

5.2.30 With respect to the non-strategic sites across the district, the 'marginal omission' sites identified through the Site Selection Topic Paper have not been considered through the revised growth scenarios as the focus has been on appraising the key variable strategic site options. This is due to the availability of larger sites (or clusters of sites) outside of the Cotswolds National Landscape and the opportunities afforded by planning for larger scale development in line with national policy and the broad spatial strategy for the emerging Local Plan. Regarding the 'marginal omission' sites:

- **Cirencester:** there are clusters of sites within the town centre which could potentially benefit from regeneration, including (listed by their HELAA reference): C52; C57; C70; C97; C101A; C101B; C106B; C149A; and C149B. The sites are mostly areas of brownfield land which provide existing uses, including car parks. Many of the sites are within or within the setting of a conservation area or listed buildings and therefore have sensitive heritage considerations which would need to be addressed through any redevelopment. The Local Plan's vision for the town centre is to regenerate and improve opportunity sites with a focus on sustainable growth, adaptable development, and active travel, whilst also respecting the town's unique heritage and character. This is likely to be best achieved via a coordinated approach which applies placemaking principles to achieve this vision.
- **Kemble:** whilst an allocation at K6A would support the regeneration of previously developed land, the site is within a Special Landscape Area.
- **Moreton-in-Marsh**: M22 is unlikely to contribute to housing supply in the first few years of the plan period, and M78 is considered for potential employment uses. Both sites also have landscape and flood risk sensitivities.
- **Siddington:** whilst SD6 and SD8 are relatively unconstrained, their location outside of the settlement boundary limits their overall suitability. SD21 is relatively contained within the settlement, but the heritage sensitivities also limit the overall suitability relative to the 'clear preferred' site options for the settlement.
- **Tetbury:** whilst T70 is within the Cotswolds National Landscape, the site has received permission in principle and a live application for up to eight homes on the site is pending (ref: 25/02572/FUL).
- **Preston:** whilst R281 adjoins the existing village (to the north east), the site has a limited relationship with the village core. The site is also located between two strategic site options to the north and to the south.
- **Quenington:** whilst R538 adjoins the Cotswolds National Landscape, the site has a low-medium sensitivity and aligns with the existing

settlement pattern. However, the capacity of the site limits its potential contribution to housing supply in a Non-Principal Settlement which is also a less-focus area for growth during the plan period.

5.2.31 All scenarios incorporate a consistent set of constants in relation to the distribution of growth across the district. These elements form the baseline position across all of the revised growth scenarios and comprise:

- **Known commitments:** reflecting the commitments up to 1st April 2026.
- **Saved allocations:** those which are rolled forward from the adopted Local Plan but have not yet been built-out (or partially built-out).
- **Windfalls:** no windfall figure for the first three years of the plan period, with the total calculated based on a 14-year period with a conservative estimate of the total applied.
- **Constant strategic allocations:** incorporating seven sustainable urban extensions adjoining Principal and Non-Principal Settlements, and one new settlement to the south of Driffield. All of the sites are identified as 'clear preferred' site options within the Site Selection Topic Paper. The sites have been comprehensively master planned with accompanying site development frameworks included in the Local Plan, reflecting engagement with site promoters, key stakeholders, and consideration of Regulation 18 consultation responses. An overview of the key elements of the strategic allocations is provided below.
  - **Cirencester - land to the south of the Steadings:** an extension to a 'saved allocation' from the adopted Local Plan, this site will deliver an additional 585 homes during the plan period at a location which adjoins the district's main settlement. The scheme will provide a new primary school and local centre, green infrastructure, and active travel links to Cirencester town centre. Additionally, the scheme will deliver highway upgrades the Kingshill Road/ London Road junction and Kingshill Road/ Cirencester Road junction. The site has the potential to deliver a further 815 homes beyond the plan period.
  - **Cirencester - land to the east of Kingshill Lane:** delivering 613 homes in a location which adjoins the district's main settlement, including a primary school, local centre providing day-to-day services, extensive green infrastructure corridors and open spaces, and active travel connections linking to Cirencester town centre. The scheme will also deliver highway upgrades to the A419 Stroud Road/ Trewsbury Road junction.
  - **Down Ampney - land to the north, east, and south of Down Ampney**: delivering 1,658 homes (a scale consistent with a new settlement) adjoining a settlement which is located on the A419 route south of Cirencester, with good access to the town. Down Ampney is also well connected to the wider route between Cheltenham and Swindon, that will see a major boost in 2027 with the A417 gap to the east of Cheltenham set to be completed.

- **Driffield - new settlement to the south of Driffield:** delivering 1,090 homes and approximately 10.9ha of new employment land during the plan period with the potential to deliver an additional 1,132 homes beyond the plan period. There are opportunities for effective cycling, walking and wheeling connections to Cirencester and with improved public transport. The new settlement will be located close to the Army Barracks at South Cerney that has recently been awarded significant investment. This will help to reduce the reported, relative isolation of the existing Army site, that will also benefit from the improved local facilities and connectivity.
- **Kemble - land to the south west of Kemble:** delivering 1,019 homes and approximately 8.6ha of new employment land in one of only two locations in the district which connects to the national rail network. Growth will be delivered in proximity to an established employment site at Cotswold Airport, which currently accommodates around 620 employees alongside visitors and customers, with aspirations for further growth.
- **Preston - land to the south of Preston:** delivering 1,368 homes within proximity to Cirencester. The design of the scheme will incorporate buffers between new and existing development to maintain settlement identity and distinctiveness. A new secondary school will be delivered as part of the scheme that will meet the needs of the new development in the area, complement that already provided in the town, but avoid negatively impacting existing schools.
- **Siddington - land to the south-west of Siddington:** delivering 372 homes within proximity to Cirencester, alongside a local centre for day-to-day services, extensive green infrastructure corridors and open spaces, and active travel connections linking to Cirencester town centre. The design of the scheme will incorporate buffers between new and existing development to maintain settlement identity and distinctiveness, and upgrade the intersection between Somerford Road and Chesterton Lane,
- **Fairford - land to the north east of Fairford:** delivering 1,141 homes, approximately 4.2ha of new employment land, and a new through road that will help to reduce traffic impacts in the settlement centre and provide a range of new services and facilities, including a primary school and infrastructure for retail. The through road will form a primary vehicle route linking the site parcels between Leafield Road and London Road (A417), relieving congestion and providing a direct route for east-west movements.

- **Non-strategic allocations:** incorporating sites within or adjoining Principal and Non-Principal Settlements across the district. In light of the LHN for the district and given that a significant supply of new homes will be brought forward via strategic sites which have longer lead-in times, all of the 'clear preferred site options' for non-strategic growth are proposed as Local Plan allocations and have therefore been applied as constants across the revised scenarios. Alongside the application of a 5% headroom and a stepped trajectory, this will ensure

confidence that housing supply can be met during the first few years of the plan period.

5.2.32 The variable strategic site options across the scenarios focus on the key choices which exist at this stage of plan making at three locations. The numbers have been informed by the Council's wider technical evidence base which is published alongside the Regulation 19 version of the Cotswold Local Plan 2026-2043.

- **Moreton-in-Marsh**: There are clusters of sites to the north, east, and south of the town which could deliver a sustainable urban extension during the plan period. A minimum of 3,500 homes would be required to deliver a full link road accompanying an extension to the northern, eastern and southern areas of the town. A minimum of 1,967 homes could deliver a partial link road accompanying an extension to the eastern and southern areas of the town, and up to 2,200 homes without incorporating any new areas of employment land. A maximum of 1,500 homes could be delivered as an urban extension to the northern, eastern and southern areas of the town without the requirement for strategic transport interventions (i.e., without a link road).

- **Mickleton**: A total of 1,238 homes could be delivered as a sustainable urban extension to the north and to the west of the village. A total of 731 homes could be delivered to the north of the village in recognition of the potentially significant landscape constraints to the west, which is within the setting of the Cotswolds National Landscape and a Special Landscape Area.

- **Ampney Crucis**: Whilst the village is not classified as either a Principal or Non-Principal Settlement, the village is surrounded by several sites to the north which could accommodate strategic-scale growth within proximity to Cirencester (i.e., the largest settlement in the district) and outside of the Cotswolds National Landscape (which covers approximately 80% of the district). A total of 516 homes could be delivered across three sites adjoining the north of the village, representing the full extent of development that could reasonably be delivered over the plan period. A lower figure of 350 homes is considered a more conservative estimate due to the on-site constraints and the viability of securing appropriate access and mitigation. The lower figure aligns with the Council's minimum requirement for a sustainable urban extension in the district.

5.2.33 In the context of the above, seven growth scenarios have been assessed through the IIA to inform the Council's preferred approach at this stage of plan making. Specifically, the scale of growth at key variable strategic site options (at Moreton-In-Marsh, Mickleton, and Ampney Crucis) to meet LHN and employment requirements and to deliver the broad spatial strategy.

5.2.34 It is acknowledged that theoretically there are several potential combinations which could be applied to the scenarios. The combinations which have been tested seek to avoid an under-delivery or over-delivery of homes, i.e., from applying lower growth or higher growth across all of the variable site options, whilst also reflecting the key choices for plan makers tasked with selecting the preferred approach for the Local Plan at this Regulation 19 stage of plan making. The scenarios are as follows:

- **Scenario 1:** Higher growth at Moreton-in-Marsh; higher growth at Mickleton; no growth at Ampney Crucis. The total housing supply through Scenario 1 is 20,112 homes, providing an approximate 12.2% headroom above LHN.
- **Scenario 2:** Medium-high growth at Moreton-in-Marsh; higher growth at Mickleton; no growth at Ampney Crucis. The total housing supply through Scenario 2 is 18,812 homes, providing an approximate 5.0% headroom above LHN.
- **Scenario 3**: Medium growth at Moreton-in-Marsh; higher growth at Mickleton; higher growth at Ampney Crucis. The total housing supply through Scenario 3 is 19,095 homes, providing an approximate 6.6% headroom above LHN.
- **Scenario 4**: Medium growth at Moreton-in-Marsh; higher growth at Mickleton; lower growth at Ampney Crucis. The total housing supply through Scenario 4 is 18,929 homes, providing an approximate 5.6% headroom above LHN.
- **Scenario 5**: Medium growth at Moreton-in-Marsh; lower growth at Mickleton; higher growth at Ampney Crucis. The total housing supply through Scenario 5 is 18,588 homes, providing an approximate 3.7% headroom above LHN.
- **Scenario 6**: Medium growth at Moreton-in-Marsh; lower growth at Mickleton; lower growth at Ampney Crucis. The total housing supply through Scenario 6 is 18,422 homes, providing an approximate 2.8% headroom above LHN; and
- **Scenario 7**: Lower growth at Moreton-in-Marsh; higher growth at Mickleton; lower growth at Ampney Crucis. The total housing supply through Scenario 7 is 18,462 homes, providing an approximate 3.0% headroom above LHN.

5.2.35 The housing supply for the component parts and variables for each growth scenario is presented in **Table 5-1** overleaf. These are correct as of July 2026, although it is recognised that the numbers for the ‘known commitments’ and ‘non-strategic allocations’ may be revised over the coming months given that there are site options with live planning applications. Updated housing completions for the 2026 to 2027 year may be available around May 2027, to inform the Plan before adoption.

Table 5-1 : The reasonable alternative growth scenarios

Supply component	Scenario 1	Scenario 2	Scenario 3	Scenario 4	Scenario 5	Scenario 6	Scenario 7
Constants							
Known Commitments	1,406	1,406	1,406	1,406	1,406	1,406	1,406

6. Appraising growth scenarios

6.1. Introduction

6.1.1 The growth scenarios presented in **Chapter 5** have been appraised. For each scenario, the appraisal identifies / evaluates 'likely significant effects' on the baseline, drawing on the IIA themes / objectives identified through scoping as a methodological Framework (see **Appendix C**).

6.2. Appraisal methodology

6.2.1 For each IIA theme, a commentary on the likely effects is presented, including significant effects. These range from major positive (++) / minor positive (+) to major negative (--) / minor negative (-) (see **Table 6-1**). Where both positive and negative effects are anticipated, mixed effects (+/-) are noted. Where no significant effects are anticipated neutral / no effects (0) are noted. Finally, where it is not possible to conclude on significance at this stage, uncertain effects (?) are noted. Scenarios are also ranked numerically reflecting their relative sustainability performance, with '1' the most favourable ranking and '6' the least favourable ranking.

Table 6-1: Significance key

Major negative --	**Minor negative** -	**Minor positive** +	**Major positive** ++	**Mixed effects** +/-	**Neutral effect** 0
(significant adverse effect)	(adverse effect of limited or uncertain significance)	(beneficial effect of limited or uncertain significance)	(significant beneficial effect)	(a combination of beneficial and adverse effects)	

6.2.2 Every effort is made to predict effects accurately; however, this is inherently challenging given the high-level nature of the scenarios under consideration. In light of this, there is a need to make considerable assumptions regarding how scenarios will be implemented 'on the ground' and what the effect on particular receptors will be. Where there is a need to rely on assumptions in order to reach a conclusion on a likely effect, this is made explicit in the appraisal text.

6.2.3 Where it is not possible to predict likely significant effects on the basis of reasonable assumptions, efforts are made to comment on the relative merits of the alternatives in more general terms and to indicate a rank of preference. This is helpful, as it enables a distinction to be made between the alternatives even where it is not possible to distinguish between them in terms of 'significant effects'.

6.2.4 Finally, it is important to note that effects are predicted taking into account the criteria presented within the Environmental Assessment of Plans and Programme Regulations (Schedules 1 and 2). For example, account is taken of the duration, frequency and reversibility of effects.

6.2.5 The appraisal findings are discussed below. The following information is presented:

- A detailed overview of the relative sustainability merits of each scenario, presented as a commentary of effects for each IIA theme;
- A summary of the appraisal findings (see **Table 6-2**), including the ranking of each scenario and identifying the likely significant environmental effects relating to each IIA theme; and
- Conclusions and recommendations at this stage of plan making.

Biodiversity

	**Scenario 1**	**Scenario 2**	**Scenario 3**	**Scenario 4**	**Scenario 5**	**Scenario 6**	**Scenario 7**
Rank	**6**	**4**	**5**	**3**	**2**	**1**	**7**
Significance	**+/-**	**+/-**	**+/-**	**+/-**	**+/-**	**+/-**	**--**

Appraisal

6.2.6 Effects on biodiversity are closely linked to the scale and location of growth proposed under each scenario, particularly in relation to proximity to the Cotswolds National Landscape, designated sites, and areas of relatively unconstrained land. The assessment therefore focuses on the extent to which development may result in habitat loss, fragmentation and disturbance, alongside opportunities for mitigation and enhancement through masterplanning and the provision of green infrastructure.

6.2.7 The key variables relate to the scale of growth proposed at Moreton-in-Marsh, Mickleton and Ampney Crucis, and the extent to which development is directed towards more or less sensitive locations.

6.2.8 At Moreton-in-Marsh, **Scenario 1** proposes the highest level of growth, extending the settlement to the north, east and south, and therefore resulting in the greatest extent of greenfield land take and associated habitat loss. While these areas are not subject to statutory ecological designations, they contain features of local importance. The eastern development area includes parcels of deciduous woodland, and the southern development area lies adjacent to areas of grassland and deciduous woodland, both of which may be sensitive to development. To the north, development would include and be adjacent to a more continuous belt of deciduous woodland running parallel to Todenham Road. The delivery of the northern parcel in combination with the link road and

development to the east and south has the potential to fragment this woodland feature, resulting in more pronounced effects in terms of habitat connectivity. However, the comprehensive nature of **Scenario 1**, including the delivery of a full link road, also presents greater opportunities for coordinated green infrastructure provision and biodiversity enhancement. **Scenarios 2 to 6** reduce the scale of growth and limit development to the south and east, thereby likely avoiding fragmentation of the northern woodland corridor along Todenham Road and resulting in a more contained pattern of land take. These scenarios also deliver a south-east link road, which provides opportunities for coordinated green infrastructure provision. **Scenario 7** further reduces growth overall, limiting direct impacts, although the absence of a link road may constrain opportunities to deliver coordinated mitigation and enhancement measures.

6.2.9 At Mickleton, the distinction between scenarios is primarily related to the overall extent of greenfield land loss. **Scenarios 1, 2, 3, 4 and 7** include growth to both the north and west of the settlement, resulting in a greater quantum of land take and associated habitat loss. While the majority of the land is not subject to ecological designations, the western parcel includes a small area of deciduous woodland identified as a priority habitat, which may be more sensitive to development. **Scenarios 5 and 6** focus growth to the north of the village, thereby reducing the overall extent of land taken and likely avoiding the loss of habitat in the west of the development area.

6.2.10 At Ampney Crucis, the distinction between scenarios relates to the intensity of development rather than the overall extent of land take, as the same parcels of land are assumed to be brought forward across all scenarios. As such, differences in effects are primarily related to the density and form of development rather than the overall site area affected. It is also worth noting that there are no designated habitats within the development areas. However, an area of deciduous woodland priority habitat is located to the north of the site and could be indirectly affected by development, particularly during construction. Scenarios incorporating higher growth (**Scenarios 3 and 5**) would result in increased development density, which may lead to greater disturbance and reduced opportunities to retain and enhance green infrastructure within the site. In contrast, **Scenarios 4, 6, and 7**, which assume a lower quantum of development, may allow greater flexibility in site layout, including the potential to provide a green infrastructure buffer along the northern boundary to help protect the woodland and support ecological connectivity. **Scenarios 1 and 2** avoid these effects entirely by not including growth at this location.

Conclusion

6.2.11 **Scenario 6** performs most favourably, as it reduces development in more sensitive locations while avoiding the northern parcel at Moreton-in-Marsh, thereby limiting habitat loss and avoiding fragmentation of the woodland corridor. **Scenario 5** also performs relatively well, reflecting reduced

growth at Mickleton and greater flexibility to avoid locally sensitive habitat features. **Scenario 4** performs moderately, whilst **Scenario 2** performs slightly more favourably than **Scenario 3** as it similarly avoids the northern parcel at Moreton-in-Marsh but does not include growth at Ampney Crucis, thereby avoiding potential indirect effects on the nearby priority woodland habitat. All of these scenarios also benefit from green infrastructure provision tied to the delivery of a link road.

6.2.12 **Scenario 1** performs relatively poorly due to the higher overall level of development, and the potential concentration of impacts within proximity to sensitive ecological receptors, especially in the northern parcel of Moreton-in-Marsh. Whilst the scenario benefits from avoiding development at Ampney Crucis and the associated potential indirect effects on the priority woodland habitat to the north of the village, this benefit is outweighed by the greater scale and extent of development proposed at Moreton-in-Marsh and Mickleton.

6.2.13 **Scenario 7** performs least favourably, as it retains higher levels of development at Mickleton and has the least potential for strategic infrastructure delivery, resulting in a more fragmented approach to mitigation and greater overall impacts.

Climate change adaptation

	Scenario 1	Scenario 2	Scenario 3	Scenario 4	Scenario 5	Scenario 6	Scenario 7
Rank	**6**	**3**	**5**	**4**	**2**	**1**	**7**
Significance	**+/-**	**+/-**	**+/-**	**+/-**	**+**	**+**	**--**

Appraisal

6.2.14 Effects on climate change adaptation are influenced by the location, scale and form of development, including flood risk, the capacity to incorporate sustainable drainage systems (SuDS), and the provision of green and blue infrastructure to manage heat and water. The assessment therefore considers the extent to which each scenario supports resilience to climate-related risks, including fluvial flooding, surface water flooding and overheating, with a focus on the key variable site options.

6.2.15 At Moreton-in-Marsh, all scenarios direct development to areas which are largely located outside Flood Zones 2 and 3. The exception is the southern development area, which includes areas of Flood Zones 2 and 3 and is present across all scenarios. Some areas of surface water flood risk are also present, primarily within the eastern development area, although these are common to all scenarios and therefore do not materially influence the comparative assessment. As such, there is limited variation between scenarios in terms of fluvial and surface water flood risk exposure. The main point of distinction, therefore, relates to the scale of development and

the delivery of infrastructure. **Scenario 1**, with the highest level of growth, provides the greatest opportunity to deliver coordinated drainage strategies and strategic green infrastructure, which can support water management and urban cooling. However, this also increases the extent of impermeable surfaces, runoff and exposure to climate-related risks, meaning these benefits are balanced by increased pressure. The larger scale of development may also result in greater cumulative flood risk management pressures, whilst the proposed road connection across the River Evenlode corridor introduces an additional climate resilience consideration (which is also relevant to **Scenarios 2 to 6**). **Scenarios 2 to 6** also provide opportunities for coordinated drainage strategies, strategic green infrastructure and flood risk management measures, although the reduced scale of development may limit opportunities for more comprehensive solutions. **Scenario 7** performs less favourably in this respect, as the absence of a link road and associated infrastructure reduces the opportunity for integrated, strategic approaches to climate resilience.

6.2.16 At Mickleton, the western development area is bordered by Norton Brook and therefore contains areas of Flood Zone 3. While development may be designed to avoid the functional floodplain, proximity to this area introduces a greater degree of flood risk and may constrain layout and reduce flexibility for adaptation measures. Higher growth scenarios (**Scenarios 1, 2, 3, 4 and 7**) therefore present a higher risk of development closer to the higher risk areas**.** Additionally**,** across all scenarios, higher levels of development increase the importance of effective SuDS and green infrastructure to manage runoff and reduce localised flood risk. Lower growth scenarios (**Scenarios 5 and 6**) provide greater flexibility to avoid the most sensitive areas and incorporate appropriate buffers, while higher growth scenarios are more likely to reduce this flexibility and increase pressure on drainage systems.

6.2.17 At Ampney Crucis, there is no variation in the spatial extent of development between scenarios, as the same parcels are assumed to come forward regardless of growth level. Flood maps also show that fluvial flood risk is low across the area, while there are some small areas of high surface water flood risk. As such, exposure to flood risk is consistent across all scenarios. Differences instead relate to development intensity, with higher density scenarios (**Scenarios 3 and 5**) potentially limiting the space available for green infrastructure and on-site drainage features, while lower density scenarios (**Scenarios 4, 6, and 7**) may allow greater flexibility for integrating adaptation measures. This also influences the ability to manage surface water runoff and provide cooling through landscaping, with lower intensity development generally offering better adaptation potential. **Scenarios 1 and 2** avoid these effects entirely at this location.

6.2.18 In addition to flood risk, all scenarios will contribute to localised heating effects associated with new development. Larger-scale and higher-density development is likely to increase the risk of urban heat island effects,

particularly where green infrastructure is limited. As such, higher growth scenarios are more likely to increase heat-related risks, while lower growth scenarios provide greater opportunity to incorporate mitigating features such as tree planting, shading and open space, although this is dependent on the type of development which is brought forward. Scenarios that incorporate comprehensive masterplanning and allow sufficient space for tree planting, open space and water features are also likely to perform more favourably in mitigating these effects. It is anticipated that all strategic site allocations will be accompanied by detailed design briefs in this respect.

Conclusion

6.2.19 **Scenario 6** performs most favourably, as it limits development in more sensitive locations while retaining the ability to deliver coordinated SuDS and green infrastructure at Moreton-in-Marsh. **Scenario 5** also performs relatively well, reflecting reduced growth at Mickleton and greater flexibility to avoid higher-risk areas.

6.2.20 **Scenario 2** performs moderately and more favourably than **Scenarios 3 and 4**, as it retains opportunities for coordinated adaptation measures and strategic green infrastructure at Moreton-in-Marsh whilst avoiding development at Ampney Crucis altogether. The concentration of a slightly greater proportion of development at Moreton-in-Marsh also helps support the delivery of strategic infrastructure and comprehensive masterplanning. **Scenario 4** performs slightly less favourably than **Scenario 2** due to the inclusion of growth at Ampney Crucis, although the lower development quantum allows greater flexibility for integrating adaptation measures. **Scenario 3** performs less favourably still due to the higher level of growth proposed at Ampney Crucis.

6.2.21 **Scenario 1** is less favourable due to high growth at Mickleton and the overall scale of development at Moreton-in-Marsh, increasing exposure to climate risks despite opportunities for coordinated mitigation.

6.2.22 **Scenario 7** performs least favourably, as is less likely to deliver the same level of strategic infrastructure as the other scenarios, particularly at Moreton-in-Marsh, which results in a more fragmented approach to adaptation measures. While the spatial distribution of development is similar to other scenarios, fewer opportunities to deliver coordinated infrastructure reduces the effectiveness of green infrastructure and SuDS at a strategic scale, leading to poorer overall outcomes.

Climate change mitigation

	Scenario 1	Scenario 2	Scenario 3	Scenario 4	Scenario 5	Scenario 6	Scenario 7
Rank	**1**	**2**	**6**	**4**	**5**	**3**	**7**
Significance	**+/-**	**+/-**	**+/-**	**+/-**	**+/-**	**+/-**	**--**

Appraisal

6.2.23 Effects on climate change mitigation are influenced by the location and scale of development, particularly in relation to access to jobs, services and sustainable transport. The assessment also considers the role of green infrastructure in supporting carbon sequestration and reducing emissions. The key issue is whether development is directed to locations that reduce reliance on private vehicles and support more sustainable patterns of travel.

6.2.24 At Moreton-in-Marsh, the settlement benefits from relatively good connectivity, including a railway station and access to a range of services and facilities. Directing growth to this location is likely to support more sustainable travel patterns and reduce reliance on private vehicles. **Scenario 1** performs most favourably, as it directs the highest level of growth to the most sustainable location. This makes efficient use of existing infrastructure and supports lower transport-related emissions. However, the increased scale of development would also result in higher overall emissions, particularly during construction and build-out phases. **Scenarios 2 to 6** also perform positively, although to a lesser extent due to the reduced scale of development. **Scenario 7** performs least well, as it includes the lowest level of growth at Moreton-in-Marsh and therefore makes limited use of this accessible location.

6.2.25 At Mickleton, all scenarios are likely to result in a relatively high level of car dependency. The settlement has limited services, and while Honeybourne railway station is relatively close (approximately 4 km), most journeys are likely to require access by car. **Scenarios 1, 2, 3, 4 and 7** include the highest level of growth and would therefore result in higher transport-related emissions. However, given Mickleton's relative accessibility in the context of the district, including its proximity to a railway station, these effects may be moderated to some extent. **Scenarios 5 and 6**, which reduce the scale of development, are likely to result in comparatively lower emissions.

6.2.26 At Ampney Crucis, the settlement is located close to Cirencester (approximately 3 km), which provides access to a wider range of services and employment opportunities. This may support shorter journeys, and additional growth within proximity to one of the most sustainable locations within the district. However, public transport accessibility is more limited

compared to Moreton-in-Marsh, and reliance on private vehicles is still likely. **Scenarios 3 and 5** include higher levels of growth at Ampney Crucis and would therefore result in higher overall emissions. **Scenarios 4, 6, and 7** reduce the level of development and are likely to result in comparatively lower impacts. **Scenarios 1 and 2** avoid development at this location, thereby avoiding associated emissions altogether.

6.2.27 Green infrastructure plays an important role in supporting climate change mitigation by contributing to carbon sequestration and promoting active travel. All scenarios would be expected to deliver a proportion of green infrastructure in line with national and local policy requirements. However, the extent and effectiveness of provision is influenced not only by the total quantum of development, but also by factors such as site layout, dwelling mix, design approach and the degree to which green infrastructure can be integrated with existing networks. **Scenarios 2 to 6** are assumed to deliver a similar level of development at Moreton-in-Marsh and would therefore provide broadly comparable opportunities for green infrastructure provision at this location. Differences between these scenarios instead relate to the distribution of growth at Mickleton and Ampney Crucis, which may influence the extent to which wider, connected green infrastructure networks can be achieved. Scenarios involving higher levels of development at a single location (particularly **Scenario 1**) may place greater pressure on land availability within sites, potentially limiting opportunities for more extensive or strategic green infrastructure provision. **Scenario 7**, while involving a lower quantum of development at Moreton-in-Marsh, is still assumed to come forward as a comprehensively master planned scheme and could therefore incorporate a significant level of green infrastructure. However, its reduced scale may limit opportunities to deliver coordinated green infrastructure compared to higher growth scenarios.

6.2.28 Finally, all scenarios provide opportunities to deliver energy-efficient development and low-carbon infrastructure. However, as these measures are assumed to apply consistently across all scenarios, they do not materially influence the comparative assessment. Although it is worth noting that higher levels of growth would result in a greater absolute number of homes being delivered to modern environmental and energy efficiency standards.

Conclusion

6.2.29 Overall, most scenarios are expected to result in mixed effects, reflecting a balance between increased emissions and opportunities to reduce them through location, design and the provision of supporting infrastructure.

6.2.30 **Scenario 1** performs most favourably overall, as it directs the highest level of growth to Moreton-in-Marsh, the most accessible settlement in the district, with a railway station and a wider range of services and facilities. This maximises opportunities for sustainable travel and mitigation, although higher total emissions would still arise from the overall scale of

development. **Scenario 2** also performs strongly, directing the second highest proportion of growth to Moreton-in-Marsh whilst avoiding development at Ampney Crucis, maximising opportunities for sustainable travel and the delivery of strategic low-carbon infrastructure in one of the district's most accessible locations.

6.2.31 **Scenario 6** also performs strongly, combining a focus on Moreton-in-Marsh with a lower overall quantum of development, helping to limit total emissions while still supporting relatively sustainable travel patterns and opportunities for coordinated green infrastructure provision.

6.2.32 **Scenarios 4, 5 and 3** perform moderately. While they include elements of growth at sustainable locations, they also introduce a more dispersed pattern of development across Mickleton and/or Ampney Crucis, increasing reliance on private vehicles. These effects are moderated to some extent by Mickleton's proximity to Honeybourne railway station.

6.2.33 **Scenario 7** performs least favourably. While the overall level of growth is lower, development is distributed across all three settlements, limiting the ability to maximise growth at one of the most accessible locations in the district and reducing the effectiveness of mitigation measures.

Economy and employment

€$ £¥	Scenario 1	Scenario 2	Scenario 3	Scenario 4	Scenario 5	Scenario 6	Scenario 7
Rank	**1**	**2**	**3**	**5**	**4**	**6**	**7**
Significance	**++**	**++**	**++**	**++**	**++**	**++**	**+/-**

Appraisal

6.2.34 Effects on the economy and employment are influenced by the scale and distribution of growth, particularly in relation to access to jobs, services and infrastructure. The assessment considers both the overall level of economic activity generated and whether growth is directed to locations that are well related to existing employment centres. Scenarios that deliver higher levels of development, particularly in accessible locations, are likely to generate stronger economic effects overall. All scenarios include strategic sites which, although primarily residential led, would be expected to come forward as mixed-use developments incorporating a proportion of employment land, thereby contributing to local job creation and economic activity. In this respect, employment land requirements are expected to be met through all scenarios.

6.2.35 At Moreton-in-Marsh, the settlement has an established role as a service centre, with a range of facilities, employment opportunities and a railway station, and is well placed to support additional growth, including access to wider employment opportunities. Directing development to this location is

likely to support the local economy, reinforce town centre vitality and provide opportunities for new employment provision. Larger-scale and more coordinated development would also create opportunities for strategic infrastructure investment, supporting job creation, improved services and increased activity within the town centre through developer contributions. However, the settlement has experienced significant recent growth, which may place pressure on infrastructure and services and could reduce the extent to which further development delivers additional economic benefits. **Scenario 1** performs most favourably, as it delivers the highest level of growth and makes the most effective use of this accessible location. **Scenarios 2 to 6** also perform well, although the economic benefits are more moderate, while **Scenario 7** performs least favourably as it limits growth at this key settlement and reduces its contribution to economic activity.

6.2.36 While Mickleton is classified as a Principal Settlement in district, the settlement has a limited economic role when compared with larger centres such as Cirencester and Moreton-in-Marsh. However, it benefits from reasonable access to employment opportunities both within and outside the district, including Chipping Campden (which functions as an important service and visitor destination) and the employment areas at Meon Vale to the north. The settlement also lies in proximity to Honeybourne railway station, providing access to wider employment opportunities. Higher growth scenarios (**Scenarios 1, 2, 3, 4 and 7**) would increase the population and support local services, whilst also providing labour supply to nearby employment centres. Nevertheless, the settlement remains relatively dependent on travel to access a wider range of jobs and services, meaning higher levels of development are likely to reinforce the existing patterns of out-commuting. **Scenarios 5 and 6**, which reduce growth, are more consistent with the existing role and function of the settlement and perform more favourably in this respect.

6.2.37 At Ampney Crucis, while the settlement falls within the lowest tier in the district's settlement hierarchy ('open countryside'), it benefits from reasonable access to Cirencester, which acts as a key employment and service centre. As with Mickleton, the scale of growth proposed would be relatively substantial in the context of the settlement. However, its proximity to Cirencester means that development is likely to support the district's wider economy by providing labour supply and supporting nearby services. The same development area is assumed across all scenarios, meaning differences relate to the scale of growth. Higher growth scenarios (**Scenarios 3 and 5**) would generate stronger economic benefits by reinforcing links with Cirencester's labour market and service base. **Scenarios 4, 6, and 7**, which assume a lower level of growth, would result in more limited economic effects. **Scenarios 1 and 2** do not include growth at this location and therefore do not contribute to this relationship.

Conclusion

6.2.38 The assessment identifies that all scenarios are likely to have positive effects on the economy and employment, reflecting the assumption that strategic sites will deliver mixed-use development incorporating employment provision, supporting job creation and economic activity across the district. Across all scenarios, strategic allocations are assumed to deliver mixed-use development, including employment land and community infrastructure. Scenarios that concentrate growth at Moreton-in-Marsh and make efficient use of its existing infrastructure are likely to perform most favourably in this regard.

6.2.39 Significant positive effects are identified for **Scenario 1**, and to a slightly lesser extent **Scenario 2**. This is primarily due to the scale of growth directed to the most economically advantageous locations. In **Scenario 1**, the concentration of the highest level of growth at Moreton-in-Marsh maximises opportunities for investment, labour supply and access to employment. **Scenario 2** also performs strongly through directing a substantial proportion of growth to Moreton-in-Marsh, supporting investment and economic activity whilst maintaining a strong relationship with the town's employment base.

6.2.40 **Scenarios 3 and 5** also perform positively, particularly through the inclusion of a higher level of growth at Ampney Crucis, which benefits from its proximity to Cirencester and strengthens links to the district's principal employment centre.

6.2.41 **Scenarios 4 and 6** similarly perform well and result in positive effects; however, the lower level of growth at Ampney Crucis results in comparatively fewer economic benefits. Whilst Mickleton also benefits from access to nearby employment opportunities and Honeybourne railway station, a proportion of these economic relationships are focused outside of the district, meaning they are likely to generate slightly fewer benefits for the district’s economy overall.

6.2.42 **Scenario 7** performs least favourably in comparative terms, as it limits growth at Moreton-in-Marsh and directs a greater proportion of development to locations with a more limited economic role. Nevertheless, it is still expected to result in positive effects overall, reflecting the continued delivery of mixed-use development and associated employment opportunities.

Equalities

	Scenario 1	Scenario 2	Scenario 3	Scenario 4	Scenario 5	Scenario 6	Scenario 7
Rank	**4**	**3**	**1**	**5**	**2**	**6**	**7**
Significance	**+**	**+**	**++**	**+**	**++**	**+**	**+/-**

Appraisal

6.2.43 Effects on equality are influenced by the distribution of growth in relation to access to services, housing, employment and infrastructure. The assessment considers the extent to which development supports access to opportunities for different groups, including those in more disadvantaged areas, and whether growth helps to address identified inequalities.

6.2.44 In this context, rural inaccessibility is an important factor influencing inequality across the district, and development that improves connectivity and access to services can help reduce disparities between more and less deprived areas. However, it is also noted that approximately 80% of the district falls within the Cotswolds National Landscape, which may limit opportunities for strategic-scale infrastructure and intervention.

6.2.45 All scenarios are expected to result in positive effects by meeting the Local Housing Need. This supports the delivery of new homes across the district, including affordable housing, and is likely to benefit those experiencing barriers to accessing suitable housing. However, the extent to which this results in positive equalities outcomes depends on the location, type, size, and design of development and access to services, rather than overall scale alone. As such, higher growth scenarios (**Scenarios 1 to 4**) may provide additional benefits in terms of housing provision, but these benefits are more strongly influenced by how well development is aligned with accessible locations and areas of identified need.

6.2.46 At Moreton-in-Marsh, the settlement benefits from a relatively strong range of services, facilities and transport connections, including a railway station. Directing growth to this location is likely to improve access to services and support inclusive communities. **Scenario 1** performs most favourably in this respect, as it delivers the highest level of growth and maximises access to services and infrastructure. **Scenarios 2 to 6** also perform well, although benefits are more moderate. **Scenario 7** performs less favourably, as it includes the lowest level of growth and therefore provides fewer opportunities to improve access to services and facilities.

6.2.47 At Mickleton, access to services and facilities is more limited than at larger settlements such as Moreton-in-Marsh. However, residents benefit from proximity to Chipping Campden, Honeybourne railway station and other nearby destinations, helping to provide access to a wider range of services and opportunities. According to the Index of Multiple Deprivation (IMD), the

settlement is also within one of the more deprived areas of the district in relation to barriers to housing and services. Higher levels of growth (**Scenarios 1, 2, 3, 4 and 7**) may provide some benefits in terms of supporting local services and increasing housing provision. However, these are unlikely to significantly reduce reliance on travel, although they may help to reduce journey lengths and improve access to nearby services and facilities. **Scenarios 5 and 6**, which reduce growth, result in more limited local benefits but are more proportionate to the settlement's role.

6.2.48 At Ampney Crucis, the settlement is located approximately 2.5km to the east of Cirencester and is identified by the IMD as being within one of the more deprived areas in terms of living environment and barriers to housing and services in the district. Growth at this location is likely to provide benefits by improving access to housing and supporting nearby services and employment opportunities. Scenarios with higher levels of development at Ampney Crucis (particularly **Scenarios 3 and 5**) provide the greatest opportunity to address identified inequalities, while lower growth scenarios (**Scenarios 4, 6, and 7**) deliver more limited benefits. **Scenarios 1 and 2** do not include growth at this location and therefore do not contribute to addressing inequalities in this area.

6.2.49 Across all scenarios, strategic allocations are expected to deliver supporting infrastructure, including green infrastructure and community facilities. This is important in equalities terms, as access to open space and local services supports health, wellbeing and quality of life. Scenarios that deliver growth at a sufficient scale and in accessible locations (particularly **Scenario 1**) are more likely to support coordinated provision of green infrastructure and community facilities. In contrast, scenarios with lower growth or reduced development at key locations (particularly **Scenario 7**) are likely to provide more limited opportunities for strategic infrastructure delivery, relying more on smaller, site-level provision.

Conclusion

6.2.50 **Scenario 3** performs most favourably, as it combines growth at Moreton-in-Marsh with higher levels of development at Ampney Crucis, helping to improve access to housing and services in a more disadvantaged area (reflecting IMD data) while maintaining good access to facilities and infrastructure. **Scenario 5** also performs well, as it also includes a higher level of development at Ampney Crucis albeit alongside reduced growth at Mickleton.

6.2.51 **Scenario 2** performs positively overall, directing relatively high growth to Moreton-in-Marsh and higher growth to Mickleton, thereby supporting housing delivery and access to services in accessible locations. Whilst it does not include development at Ampney Crucis, it continues to provide strong equalities benefits through growth at settlements with existing services, facilities and infrastructure. **Scenario 1** performs similarly, as it maximises growth at the most accessible settlement and supports the

delivery of housing and infrastructure. However, the scale of growth proposed under **Scenario 2** is likely to be more proportionate and may therefore be more effective in ensuring that new residents are able to access services and infrastructure without placing additional pressure on existing provision.

6.2.52 **Scenario 4** performs moderately, as it includes a higher level of development at Mickleton, which contributes to addressing housing need in a more deprived area. However, whilst the village benefits from proximity to Honeybourne railway station and nearby service centres such as Chipping Campden, limited public transport connectivity reduces the extent to which this development improves access to services and opportunities, particularly for residents without access to a private vehicle. The proposed development may nevertheless support improvements to local public transport and reduce journey lengths to nearby services and facilities, partially offsetting these limitations.

6.2.53 **Scenario 6** reduces development at both Ampney Crucis and Mickleton, limiting the extent to which identified inequalities are addressed. **Scenario 7** performs least favourably, as it delivers lower levels of growth at Moreton-in-Marsh and Ampney Crucis, reducing opportunities to improve access to services and address inequalities in more disadvantaged areas. While the scenario still provides some equalities benefits through additional housing provision, these are more limited overall compared to other scenarios.

Green Infrastructure and Natural Capital

	**Scenario 1**	**Scenario 2**	**Scenario 3**	**Scenario 4**	**Scenario 5**	**Scenario 6**	**Scenario 7**
Rank	**3**	**4**	**6**	**5**	**2**	**1**	**7**
Significance	**+/-**	**+/-**	**+/-**	**+/-**	**+/-**	**+/-**	**--**

Appraisal

6.2.54 Effects on green infrastructure and natural capital are influenced by the scale, location and form of development, particularly the extent of greenfield land take and the potential to deliver coordinated networks of open space, habitat and landscape features through the design of new development areas. The assessment therefore considers both the loss of natural assets and the opportunities to enhance green infrastructure through strategic masterplanning.

6.2.55 All development is assumed to deliver Biodiversity Net Gain in accordance with national policy; however, this does not fully offset the loss of natural capital associated with greenfield land take, particularly where impacts occur at a larger scale. It is recognised that due to the scale of growth required to meet housing and employment needs, and consideration of brownfield land availability across the district, greenfield land take is

inevitable. Nonetheless, it is also recognised that strategic-scale developments can provide significant opportunities for green infrastructure delivery, including open space, SuDS, habitat creation and ecological enhancement, and may achieve biodiversity improvements above the minimum requirements of national policy.

6.2.56 At Moreton-in-Marsh, all scenarios involve development on greenfield land, resulting in some loss of natural capital. However, as all scenarios comprise strategic-scale allocations, each provides opportunities to deliver coordinated and multifunctional green infrastructure through masterplanning. **Scenario 1** results in the greatest extent of land take, including development to the north, east and south of the settlement, increasing the potential loss of greenfield land and associated features, including areas of woodland habitat and land adjacent to grassland habitat. However, **Scenario 1** also provides the greatest opportunity for comprehensive green infrastructure provision due to its scale and the delivery of a full link road, which, as a linear feature, may facilitate the creation of green infrastructure corridors incorporating habitat connectivity, landscaping and active travel routes, while also helping to reduce traffic pressures within the town centre. **Scenarios 2 to 6** also provide opportunities for such corridors through partial delivery of the link road. **Scenario 7** results in the lowest level of land take but, in the absence of a link road, limits opportunities to deliver connected green infrastructure at a strategic scale, with more fragmented and site-level provision likely.

6.2.57 At Mickleton, higher growth scenarios (**Scenarios 1, 2, 3, 4 and 7**) would result in more intensive use of the land and greater pressure on existing natural capital, although the absence of extensive ecological designations limits the sensitivity of the site overall, especially in the northern parcel. However, there is a relatively small area of deciduous woodland within western parcel, which would be sensitive to development (from both direct and indirect effects). **Scenarios 5 and 6** reduce the scale of development and are therefore likely to result in less intensive impacts and allow greater flexibility for the retention and integration of green infrastructure.

6.2.58 At Ampney Crucis, differences also relate to the intensity of development. No priority habitats are present within the development area itself; however, an area of priority habitat is located to the north of the site. Higher growth scenarios (**Scenarios 3 and 5**) would increase pressure on natural capital and could give rise to indirect effects on the adjacent habitat, for example through increased recreational disturbance or edge effects. However, they may also provide greater opportunity to deliver coordinated and multifunctional green infrastructure, including open space and habitat connectivity at a meaningful scale. Lower growth scenarios (**Scenarios 4, 6, and 7**) may perform more favourably in this respect by allowing greater provision of green infrastructure buffers along the northern edge, helping to safeguard the adjacent priority habitat and strengthen ecological networks.

Scenarios 1 and 2 do not include development at this location and therefore avoid impacts on natural capital in this area.

Conclusion

6.2.59 Across all scenarios, the delivery of mixed-use strategic allocations provides opportunities to incorporate green infrastructure as part of masterplanning. Differences between scenarios relate less to the presence of green infrastructure, and more to the extent of coordination, connectivity and sensitivity to local constraints. Scenarios including delivery of the link road (**Scenarios 1 to 6**) provide opportunities to establish green corridors alongside infrastructure, supporting habitat connectivity, sustainable drainage and active travel, while also helping to reduce traffic pressures within Moreton-in-Marsh. **Scenario 7** performs least favourably in this respect, as the absence of a link road and more dispersed pattern of development limits the potential to deliver connected and multifunctional green infrastructure networks.

6.2.60 **Scenario 6** performs most favourably, as it reduces development at both Mickleton and Ampney Crucis, limiting pressure on natural capital within the smaller settlements while still allowing for green infrastructure delivery through the link road at Moreton-in-Marsh. **Scenario 5** performs similarly, as it retains the level of development at Moreton-in-Marsh, alongside reduced growth at Mickleton and increased growth at Ampney Crucis.

6.2.61 **Scenario 1** performs relatively well, as the delivery of a full link road provides the greatest opportunity to establish continuous green infrastructure corridors in Moreton-in-Marsh. However, this is balanced against the significant loss of natural capital associated with the overall scale of development and the presence of existing habitats across the development area. **Scenario 2** also performs well, reflecting the avoidance of impacts on natural capital at Ampney Crucis whilst retaining opportunities for coordinated green infrastructure provision associated with the link road at Moreton-in-Marsh.

6.2.62 **Scenario 4** performs moderately, while **Scenario 3** performs comparatively less favourably. In both cases, higher levels of development at Mickleton and/or Ampney Crucis increase pressure on natural capital, including areas with identified sensitivities, reducing the overall effectiveness of green infrastructure provision despite opportunities associated with link road delivery at Moreton-in-Marsh.

6.2.63 **Scenario 7** performs least favourably, as the absence of link road infrastructure limits opportunities to deliver connected green infrastructure corridors, and the more fragmented pattern of development reduces the potential for integrated and multifunctional network provision.

Healthy and Vital Communities

	Scenario 1	Scenario 2	Scenario 3	Scenario 4	Scenario 5	Scenario 6	Scenario 7
Rank	**5**	**2**	**6**	**3**	**4**	**1**	**7**
Significance	**+/-**	**+/-**	**+/-**	**+/-**	**+/-**	**+**	**-**

Appraisal

6.2.64 Effects on healthy and vital communities are influenced by the scale and distribution of growth, particularly in relation to access to services, community infrastructure, open space and opportunities for social interaction. The assessment also considers the extent to which development supports community cohesion and whether the scale of growth is appropriate to the role and character of each settlement. In particular, development that is proportionate to the size and function of settlements is more likely to support cohesive and resilient communities.

6.2.65 At Moreton-in-Marsh, the settlement benefits from a relatively strong range of services, facilities and transport links, including a railway station. This contributes to its classification as a Principal Settlement within the district, and a sustainable location for accommodating growth and supporting access to services, which are important for health and wellbeing. However, the settlement has already experienced significant levels of recent growth, and high level of additional development (particularly under **Scenario 1**) may place pressure on existing infrastructure, services and community facilities, with the potential for short-term adverse effects. While higher growth may support the delivery of more strategic infrastructure, including a full link road under **Scenario 1**, and improved access to services and public transport, the scale of development may affect community wellbeing if not appropriately coordinated. **Scenarios 2 to 6** also enable delivery of a south-eastern link road, and while still representing substantial growth, provide a more balanced scale of development that is likely to support its delivery alongside wider wellbeing benefits, including reducing traffic congestion within the town centre, improving air quality, and enhancing safety. In contrast, **Scenario 7** would deliver the least amount of growth at Moreton-in-Marsh across the scenarios. Whilst this may reduce pressure on services, this approach is less likely to deliver strategic infrastructure, meaning that existing issues such as congestion and associated impacts on health and wellbeing may persist or worsen over time.

6.2.66 Mickleton is one of the smaller Principal Settlements in the district, with a population of approximately 2,300 (2021 Census). Higher levels of growth (**Scenarios 1, 2, 3, 4 and 7**) would represent a substantial increase relative to its size. This has the potential to affect the character of the settlement and may place pressure on local services and facilities, which are limited in scope. While some growth may support local services and community

vitality, significant expansion may alter the sense of place and reduce community cohesion. **Scenarios 5 and 6**, which reduce the scale of development, are more proportionate to the size and function of the settlement and are therefore likely to perform more favourably in maintaining a balanced and cohesive community.

6.2.67 At Ampney Crucis, the settlement is defined as 'open countryside' in the settlement hierarchy, with a population of around 650 (2021 Census). As such, higher levels of growth (**Scenarios 3 and 5**) would represent a significant increase relative to its existing size and may affect the character and cohesion of the village. However, the settlement benefits from its proximity to Cirencester, providing access to a wider range of services and facilities. This is likely to support residents' access to healthcare, education and other essential services. **Scenarios 4, 6 and 7**, which assume lower levels of development, are more proportionate to the size of the settlement and are therefore more likely to maintain community cohesion, although growth is still relatively high compared to the existing population size. **Scenarios 1 and 2**, which do not include growth at Ampney Crucis, avoid effects on the settlement. It is worth also noting that due to the level of growth proposed through **Scenarios 3-7**, it is likely that they would result in a reclassification of the village within the settlement hierarchy.

6.2.68 Across all scenarios, the delivery of strategic allocations provides opportunities to incorporate community facilities, open space and green infrastructure as part of masterplanning. These elements are important for supporting health, wellbeing and social interaction. Scenarios that concentrate growth at Moreton-in-Marsh (particularly **Scenario 1**) are more likely to support coordinated infrastructure provision. However, very high levels of growth may place pressure on existing services if delivery is not timely, which, in-combination with recent growth patterns at Moreton-in-Marsh, may exacerbate existing issues. In contrast, **Scenario 7** limits growth at Moreton-in-Marsh but does not deliver a link road and is less likely to support the delivery of other strategic and supporting infrastructure, reducing opportunities to address existing issues such as congestion and associated impacts on community wellbeing.

Conclusion

6.2.69 **Scenario 6** performs most favourably, as it maintains a high enough level of development at Moreton-in-Marsh to secure the south eastern section of the link road, while reducing development at both Mickleton and Ampney Crucis. This supports community cohesion and limits pressure on services and infrastructure at smaller settlements, while still enabling the delivery of strategic infrastructure at Moreton-in-Marsh.

6.2.70 **Scenario 2** also performs well, as it supports delivery of the south-eastern link road at Moreton-in-Marsh whilst avoiding development at Ampney Crucis altogether, although growth at Mickleton remains relatively high.

6.2.71 **Scenario 4** performs moderately, as although it retains relatively high levels of growth at Mickleton, the lower level of development at Ampney Crucis is more proportionate to the size and function of the village and reduces pressure on community facilities and cohesion.

6.2.72 **Scenario 5** performs less favourably than **Scenarios 6, 2 and 4**, as the higher level of development at Ampney Crucis would represent a substantial increase relative to the size of the settlement and may affect community cohesion and local character. However, reduced growth at Mickleton results in a more balanced distribution of development across the district.

6.2.73 **Scenario 1** performs less favourably overall, as the significant scale of development at Moreton-in-Marsh and Mickleton is likely to place pressure on services, infrastructure and community facilities. While it enables the delivery of a full link road and supports access to services, the scale of growth may affect community wellbeing if not carefully managed.

6.2.74 **Scenario 3** performs less favourably still, as higher levels of development at both Mickleton and Ampney Crucis increase pressure on smaller settlements, with potential effects on community cohesion and local service capacity.

6.2.75 **Scenario 7** performs least favourably, as although it limits growth at Moreton-in-Marsh, it does not deliver a link road and is less likely to support the delivery of wider strategic infrastructure. At the same time, it retains relatively high levels of development at Mickleton, which may be disproportionate to its size and function, meaning existing issues such as congestion and associated impacts on health and wellbeing may persist or worsen.

Historic environment

	Scenario 1	Scenario 2	Scenario 3	Scenario 4	Scenario 5	Scenario 6	Scenario 7
Rank	**2**	**1**	**7**	**=4**	**=4**	**3**	**=4**
Significance	**+/-**	**+**	**--**	**-**	**-**	**+/-**	**-**

Appraisal

6.2.76 Effects on the historic environment are influenced by the location, scale and form of development, particularly in relation to the presence of heritage assets and the potential for impacts on their setting and significance. The assessment also considers the character of historic settlements and the extent to which new development may affect local townscape and sense of place. This is particularly important in the district, which has a highly sensitive historic environment baseline, reflecting the distinctive historic towns and villages of the Cotswolds, many of which are extensively

covered by conservation area designations and contain a high concentration of listed buildings.

6.2.77 At Moreton-in-Marsh, no designated heritage assets are located within the identified development areas. As such, direct impacts on designated assets are unlikely. However, the scale of growth (particularly under **Scenario 1**) would represent a substantial expansion of the settlement, which will affect its historic townscape and character including the setting of conservation areas on approach into the town. **Scenarios 2 to 6**, which reduce the level of growth and limit expansion to the south and east, are likely to result in more contained effects. **Scenario 7** further reduces the scale of development and is therefore likely to have the least effect on the character of the settlement, although all scenarios would require careful design to ensure integration with the existing built form.

6.2.78 At Mickleton, no designated heritage assets are located within the development areas. However, they do lie in proximity to the Mickleton Conservation Area, and the western part of the development area extends closer to the setting of the Cotswolds National Landscape, both of which contribute to the historic character of the settlement. Higher levels of growth (**Scenarios 1, 2, 3, 4 and 7**) would result in more substantial expansion and may result in greater effects on the setting of the Conservation Area and the historic character of the village. **Scenarios 5 and 6**, which reduce the scale of development, are likely to result in more limited effects and be more proportionate to the existing settlement form.

6.2.79 At Ampney Crucis, no designated heritage assets are located within the development areas. However, the sites lie close to the Ampney Crucis Conservation Area, and development has the potential to affect its setting. Given the small size of the settlement, higher levels of growth (particularly **Scenarios 3 and 5**) would represent a substantial increase relative to the existing village, with the potential for significant adverse effects on its historic character and the setting of the Conservation Area. **Scenarios 4, 6, and 7**, which assume a lower level of development, are likely to reduce these effects, although any development would need to be sensitively designed to preserve the setting of the Conservation Area. **Scenario 1** avoids these effects, as no strategic growth is proposed at this location.

6.2.80 Across all scenarios, the absence of designated heritage assets within the development sites limits the potential for direct effects. The main differences between scenarios relate to the scale of development and the extent to which this affects the setting and character of existing settlements. Scenarios that propose higher levels of growth at smaller settlements are more likely to result in changes to historic character that are less proportionate to the existing scale of development.

Conclusion

6.2.81 **Scenario 2** performs most favourably, as it avoids development at Ampney Crucis, thereby avoiding impacts on the most sensitive settlement in heritage terms. In addition, the reduced level of growth at Moreton-in-Marsh is likely to result in more contained effects on the historic townscape and character of the settlement when compared with **Scenario 1**.

6.2.82 **Scenario 1** also performs favourably, as it similarly avoids development at Ampney Crucis. However, the substantially higher level of growth proposed at Moreton-in-Marsh would represent a greater expansion of the settlement and has greater potential to affect its historic character and the setting of conservation areas on approaches into the town.

6.2.83 The other scenarios all include growth at Moreton-in-Marsh, Mickleton, and Ampney Crucis, with varying levels of growth. In this regard, **Scenario 6** performs most favourably, as it includes the lowest levels of growth at the two most sensitive settlements (Ampney Crucis and Mickleton), along with a moderate level of growth in Moreton-in-Marsh.

6.2.84 **Scenarios 4, 5 and 7** perform broadly equally, as each introduces higher levels of development at one of the two smaller settlements (Mickleton or Ampney Crucis), resulting in comparable effects on historic character and setting overall.

6.2.85 **Scenario 3** performs least favourably, as it combines high levels of development at both Mickleton and Ampney Crucis, increasing the potential for changes to the setting and character of both settlements.

Housing

	Scenario 1	Scenario 2	Scenario 3	Scenario 4	Scenario 5	Scenario 6	Scenario 7
Rank	**4**	**1**	**2**	**3**	**5**	**6**	**7**
Significance	**+**	**++**	**++**	**++**	**+**	**+**	**+**

Appraisal

6.2.86 Effects on housing are influenced by both the quantity and location of development, including the ability to meet identified needs, deliver affordable housing and provide housing in sustainable and accessible locations. The assessment also considers whether development can be supported by appropriate infrastructure and whether the distribution of growth is appropriate across the district.

6.2.87 All scenarios are expected to have positive effects, as they meet LHN and support the delivery of new homes across the district, including affordable housing. Scenarios that deliver higher overall levels of growth provide greater flexibility in the housing land supply and are more likely to improve

affordability outcomes. In particular, scenarios that achieve a 5% buffer above the LHN (**Scenarios 1 to 4**) provide greater resilience in the housing supply over the plan period. In contrast, lower growth scenarios provide less flexibility and may be more sensitive to changes in delivery assumptions over the plan period.

6.2.88 At Moreton-in-Marsh, the settlement is well connected, with access to services, employment opportunities and public transport, including a railway station. Directing growth to this location supports the delivery of housing in a sustainable and accessible location. However, the settlement has experienced significant recent growth, and the ability to accommodate further development is influenced by infrastructure capacity. However, it is expected that proposals will provide a package of new infrastructure. **Scenario 1** delivers the highest level of growth, which maximises housing supply but may place pressure on infrastructure and raise deliverability concerns. In contrast, **Scenario 7** limits growth at this location, which reduces pressure on services but potentially underutilises a sustainable and well-connected settlement. **Scenarios 3 to 6,** while still delivering a high level of housing, provide a relatively more balanced level of growth, which is likely to be more proportionate to the settlement's role and better aligned with infrastructure capacity.

6.2.89 At Mickleton, higher levels of growth (**Scenarios 1, 2, 3, 4 and 7**) would make a notable contribution to overall housing supply. While Mickleton is classified as a Principal Settlement, the town has a limited range of existing services and facilities. Therefore, Mickleton represents a relatively less sustainable location for accommodating significant levels of housing growth when compared with the district's larger settlements. The scale of development relative to the existing population would result in a significant expansion and may present challenges in delivering appropriate infrastructure and services to support new housing. **Scenarios 5 and 6** reduce the level of development at Mickleton, resulting in a comparatively more proportionate distribution of housing across the village. Nonetheless, strategic-scale development may provide opportunities to enhance local services, infrastructure and connectivity and improve the overall sustainability of the settlement.

6.2.90 At Ampney Crucis, the settlement benefits from its proximity to Cirencester, which provides access to a wide range of services, facilities and employment opportunities. Growth at this location can therefore contribute positively to housing delivery in a relatively sustainable location. Higher growth scenarios (**Scenarios 3 and 5**) deliver the greatest number of homes at this location, while lower growth scenarios (**Scenarios 4, 6, and 7**) provide a reduced but still meaningful contribution. However, as with Mickleton, the scale of development relative to the existing population would be significant and may require substantial infrastructure provision to support new communities. **Scenarios 1 and 2** do not include growth at

Ampney Crucis and therefore do not contribute to housing supply in this location.

6.2.91 Across all scenarios, strategic allocations are expected to deliver mixed-use schemes which increase the potential to provide affordable housing alongside market housing. Scenarios with higher total housing numbers (particularly **Scenarios 1 to 4**) are likely to provide the greatest opportunity to deliver affordable housing and secure infrastructure contributions. However, these benefits must be balanced against the ability of settlements to accommodate growth and the timely delivery of supporting infrastructure. This is relevant across all locations, as both high absolute growth (at Moreton-in-Marsh) and high relative growth (at Mickleton and Ampney Crucis) may present delivery challenges particularly over the short-term, due to the longer lead-in times for strategic development.

Conclusion

6.2.92 **Scenario 2** performs most favourably, as it delivers a high level of housing and achieves a 5% headroom above the LHN, providing flexibility in supply and strong opportunities to deliver affordable housing in sustainable locations.

6.2.93 **Scenario 3 and Scenario 4** also perform strongly, as both deliver a high level of housing and achieve a 5% headroom above the LHN, providing greater flexibility in supply and strong opportunities to deliver affordable housing.

6.2.94 **Scenario 1** also performs well, as it provides the highest overall level of housing. However, the scale of development may raise deliverability and supporting infrastructure concerns, which reduces its overall performance.

6.2.95 **Scenarios 5, 6 and 7** perform positively, as they meet the LHN and contribute to housing delivery across the district. However, they do not provide the same level of flexibility or resilience in housing supply as higher growth scenarios.

Landscape

	**Scenario 1**	**Scenario 2**	**Scenario 3**	**Scenario 4**	**Scenario 5**	**Scenario 6**	**Scenario 7**
Rank	**4**	**3**	**=6**	**5**	**2**	**1**	**=6**
Significance	**-/+**	**+/-**	**--**	**--**	**-/+**	**-/+**	**--**

Appraisal

6.2.96 Effects on landscape are influenced by the location, scale and form of development, particularly in relation to the Cotswolds National Landscape and locally designated Special Landscape Areas (SLAs). The assessment considers the extent to which development may affect the character, quality

and setting of these landscapes, as well as the character of settlements and their surrounding countryside.

6.2.97 The Cotswolds National Landscape covers approximately 80% of the district and represents a significant constraint to development. While all strategic allocations are located outside of the National Landscape, they are in close proximity and therefore have the potential to affect its setting. In addition, several sites relate to SLAs, which protect valued landscapes and, in some cases, provide an important buffer to the National Landscape. As such, all scenarios have the potential to result in landscape effects, with the magnitude dependent on the scale and location of development.

6.2.98 At Moreton-in-Marsh, development areas are located outside of the National Landscape but are associated with the Moreton-in-Marsh SLA. The southern development area, which is present in all scenarios, lies within the SLA, while the northern development area (included in **Scenario 1** only) is also located within the SLA. Development to the east (present in all scenarios) lies within the setting of the SLA. **Scenario 1**, which includes the highest level of growth and expansion to the north, east and south, is likely to result in the greatest impact on landscape character, including the loss of land within the SLA and a more substantial change to the settlement's rural edge. **Scenarios 3 to 6** reduce the scale of growth and avoid development to the north, thereby limiting effects. **Scenario 7** further reduces the scale of development and is likely to result in the least pronounced effects at this location. The relatively lower-lying topography of the area may help to reduce longer-distance visibility, although localised effects on landscape character are still expected.

6.2.99 At Mickleton, all scenarios include development to both the north and west of the settlement. However, the key distinction relates to the scale and distribution of development within this area. The western part of the development area lies adjacent to the Cotswolds National Landscape (to the south) and Norton Hall SLA (to the west), making it particularly sensitive. Higher growth scenarios (**Scenarios 1, 2, 3, 4 and 7**) are likely to require development closer to these sensitive areas and increase the overall extent and intensity of change, thereby increasing the potential for adverse effects on the setting of the National Landscape and the SLA, as well as the overall visual prominence of the settlement. Given this sensitivity, scenarios with maximum levels of development at Mickleton are considered to have the greatest landscape effects. In contrast, lower growth scenarios (**Scenarios 5 and 6**) may allow development to be located further from the most sensitive areas, reducing potential impacts, although some negative effects are likely to still occur. The relatively lower-lying topography of Mickleton may limit wider visibility to some extent, but potential effects on local views are likely to remain.

6.2.100 At Ampney Crucis, development areas are located outside of the National Landscape and are less closely associated with designated landscapes.

The lower-lying topography relative to the Cotswolds to the north may help to limit effects on the wider setting of the National Landscape. However, the rural character of the settlement means that any significant increase in built form is likely to result in changes to local landscape character and the settlement edge. Given the current population of approximately 650, even lower growth scenarios (**Scenarios 4, 6, and 7**) represent a substantial increase in scale, while higher growth scenarios (**Scenarios 3 and 5**) could result in development that approaches or exceeds a doubling of the settlement size. This would introduce a more urbanising influence and result in more noticeable effects on the character of the village and its rural setting. Lower growth scenarios (**Scenarios 4, 6, and 7**) would reduce the scale of this change, although some negative effects would remain. **Scenarios 1 and 2** avoid impacts at this location.

6.2.101 Across all scenarios, larger-scale development is more likely to result in adverse effects on landscape character, particularly in smaller, more rural settlements where change may appear more pronounced. While high-quality design and green infrastructure can reduce effects, they are unlikely to fully offset the influence of scale, particularly in relation to settlement expansion and landscape setting. Scenarios that combine higher levels of development at Mickleton with additional growth at other settlements are therefore considered to result in the greatest overall landscape effects.

Conclusion

6.2.102 **Scenarios 6 and 5** perform most favourably with regard to landscape effects, as both reduce the scale of development at the most sensitive settlement considered for strategic growth (Mickleton), limiting impacts on the National Landscape and SLA, although some localised effects remain.

6.2.103 **Scenario 2** performs relatively well, as it avoids development at Ampney Crucis and reduces the scale of growth at Moreton-in-Marsh compared to **Scenario 1**, thereby limiting effects on landscape character whilst retaining opportunities for coordinated masterplanning and mitigation.

6.2.104 Mixed effects are anticipated for **Scenario 1**. While it includes maximum growth at Mickleton and a high level of development at Moreton-in-Marsh, increasing pressure on the landscape in these settlements, it avoids development at Ampney Crucis and the associated effects on the rural character and settlement edge of the village.

6.2.105 **Scenario 4** performs moderately, as it includes lower levels of development at Ampney Crucis but also includes maximum growth at Mickleton. Whilst effects at Ampney Crucis are less pronounced than under the higher growth scenario, development would still represent a substantial increase in the scale of the village and result in some adverse landscape effects.

6.2.106 **Scenarios 3 and 7** perform least favourably. **Scenario 3** includes maximum growth at both Mickleton and Ampney Crucis, resulting in the greatest overall landscape effects at these two sensitive settlements.

Scenario 7 also includes maximum growth at Mickleton and, while it reduces development at Ampney Crucis, it provides less opportunity for coordinated mitigation at Moreton-in-Marsh due to a more fragmented pattern of development.

6.2.107 It is recognised that growth through all scenarios has the potential to impact the integrity of the Cotswolds National Landscape and Special Landscape Areas within the district. The various local design guidance documents prepared by the Council outline that it is important that new development, whilst respecting local character, develops a sense of place alongside individuality of design and identity of character, for new development areas. In addition, the Cotswolds National Landscape Management Plan contains a comprehensive summary of the key issues facing the Cotswolds National Landscape, and the management policies and actions needed to conserve and enhance this special place. The emerging development management policies in the Plan should aim to address the key challenges / threats / opportunities for the National Landscape to manage the potential cumulative and in-combination effects from additional growth.

Land, soils and water resources

	Scenario 1	Scenario 2	Scenario 3	Scenario 4	Scenario 5	Scenario 6	Scenario 7
Rank	**7**	**3**	**5**	**4**	**2**	**1**	**6**
Significance	**--**	**+/-**	**-**	**-**	**+/-**	**+/-**	**--**

Appraisal

6.2.108 Effects on land, soils and water resources are influenced by the scale and location of development, particularly in relation to the loss of agricultural land, impacts on water quality and availability, and the ability to manage runoff and drainage. The assessment considers the extent of greenfield land take, the quality of agricultural land affected, and the sensitivity of water environments.

6.2.109 The district is identified by the Environment Agency as being seriously water stressed, meaning that the availability of water resources is a key constraint to development. In addition, all development areas fall within Nitrate Vulnerable Zones, indicating sensitivity to water pollution. As such, all scenarios have the potential to result in adverse effects, particularly in relation to water demand and water quality.

6.2.110 At Moreton-in-Marsh, development areas are predominantly greenfield, with only limited previously developed land in the eastern development area (included in all scenarios). The northern and eastern areas are largely Grade 3a agricultural land, while the southern parcel includes a mix of Grade 2, 3a and 3b land. As such, development would result in the loss of best and most versatile (BMV) agricultural land in all scenarios, with

Scenario 1 resulting in the greatest loss due to the scale of development and inclusion of the northern and southern parcels. The southern development area also contains the River Evenlode, which increases the sensitivity of this location in relation to water quality and runoff. While all scenarios include this parcel, higher levels of development may increase the risk of adverse effects. However, the scale of development in **Scenario 1** may also provide greater opportunities to deliver coordinated SuDS and green infrastructure to manage runoff effectively. **Scenarios 2 to 6** reduce the scale of development and therefore limit land take, while **Scenario 7** further reduces impacts but may offer less opportunity for strategic mitigation.

6.2.111 At Mickleton, all development areas are greenfield and include high-quality agricultural land, with the northern parcel comprising largely Grade 2 land and the western parcel including areas of Grade 1 and 3b land. As such, development would result in the loss of BMV agricultural land. Norton Brook runs along the edge of the western parcel, increasing the sensitivity of this area in terms of water quality and runoff. Higher growth scenarios (**Scenarios 1, 2, 3, 4 and 7**) are more likely to increase pressure on this watercourse and result in greater loss of agricultural land. Lower growth scenarios (**Scenarios 5 and 6**) reduce the extent of these impacts and allow greater flexibility to avoid the most sensitive areas and incorporate mitigation measures.

6.2.112 At Ampney Crucis, development areas are also greenfield but are classified as Grade 3b agricultural land, which is of lower quality than that found at Mickleton and parts of Moreton-in-Marsh, and not considered to be BMV land. As such, the loss of agricultural land is less significant in comparative terms. However, all scenarios would still result in the permanent loss of undeveloped land. Higher growth scenarios (**Scenarios 3 and 5**) would increase the scale of land take and associated water demand, while lower growth scenarios (**Scenarios 4, 6 and 7**) would reduce these effects. **Scenarios 1 and 2** avoid impacts at this location.

6.2.113 Across all scenarios, larger-scale development provides increased opportunities to incorporate green infrastructure and SuDS to manage surface water runoff, reduce pollution risk and support water efficiency measures. However, higher levels of development also increase pressure on water resources and can result in greater land take. Conversely, lower levels of development reduce pressure on land and water resources but may limit opportunities for coordinated, strategic mitigation.

Conclusion

6.2.114 **Scenarios 6 and 5** perform most favourably, as they limit development at Mickleton, thereby limiting the loss of high-quality agricultural land and reducing pressure on sensitive water environments.

6.2.115 **Scenario 2** performs relatively well, as it avoids development at Ampney Crucis whilst delivering a medium-high level of development at Moreton-in-Marsh. This limits the loss of agricultural land and reduces pressure on water resources whilst retaining opportunities for coordinated mitigation measures.

6.2.116 **Scenarios 4 and 3** perform moderately, as both include higher levels of development at Mickleton, resulting in a potentially greater loss of BMV agricultural land and increased pressure on water resources. **Scenario 4** is more favourable than **Scenario 3** due to the lower level of growth at Ampney Crucis.

6.2.117 **Scenario 7** performs less favourably, as while it limits the overall level of development, it still includes high levels of growth at Mickleton and potentially limits opportunities for implementing coordinated mitigation measures at Moreton-in-Marsh.

6.2.118 **Scenario 1** performs least favourably, as it results in the greatest overall land take, including loss of BMV agricultural land at both Moreton-in-Marsh and Mickleton, and increases pressure on water resources.

Transport and Air Quality

	Scenario 1	Scenario 2	Scenario 3	Scenario 4	Scenario 5	Scenario 6	Scenario 7
Rank	6	1	5	3	4	2	7
Significance	+/-	++	+/-	+/-	+/-	++	--

Appraisal

6.2.119 Effects on transport and air quality are influenced by the scale and distribution of development, particularly in relation to access to services, employment and sustainable transport networks. The assessment considers the extent to which development supports walking, cycling and public transport use, reduces reliance on private vehicles and minimises traffic congestion and associated emissions.

6.2.120 At Moreton-in-Marsh, the settlement benefits from relatively strong transport connections, including a railway station and access to a range of services and facilities. This supports a greater potential for sustainable travel patterns and reduces reliance on the private car compared to more rural settlements. This is reflected in Government Connectivity Tool scores, which indicate accessibility in the range of 20 to 50 across the development areas (100 being the highest and 0 being the lowest), with the northern and southern parcels performing more strongly. **Scenario 1** includes development across the full extent of the site, including the northern and southern development areas, which performs most strongly in accessibility terms. This enables the most effective use of the settlement's sustainable

transport potential, although the scale of development may place increased pressure on existing transport infrastructure, including public transport services. **Scenarios 2 to 6** avoid development in the northern parcel and instead focus growth to the south and east, which results in a lower overall level of development at this settlement. This reduces pressure on the transport network but also limits the extent to which the most accessible areas of the settlement are utilised. While **Scenario 7** further reduces development at Moreton-in-Marsh, it does not include delivery of the link road, increasing transport pressure due to lack of strategic interventions and potentially exacerbating through-traffic within the town.

6.2.121 At Mickleton, accessibility to services, employment and public transport is more limited than at the larger settlements, reflected in its current connectivity scores, which typically fall within the 20 to 30 range. However, in the context of the wider district, the settlement performs relatively well and benefits from proximity to Honeybourne railway station (approximately 4 km to the west), which provides access to the rail network, albeit typically requiring car travel to get to the station. As such, while the settlement remains somewhat reliant on private vehicle use, it represents one of the more accessible locations in the district, which in turn may help to reduce journey lengths by private vehicles. Higher levels of growth (**Scenarios 1, 2, 3, 4 and 7**) would be expected to increase travel demand, including car-based trips, and place additional pressure on the local road network. However, this is consistent with patterns of growth across the district more generally, particularly outside settlements with direct rail access. Lower growth scenarios (**Scenarios 5 and 6**) reduce the scale of development and therefore limit these effects, although all scenarios would be expected to increase car use to some degree.

6.2.122 At Ampney Crucis, connectivity scores are broadly similar to Mickleton, with scores generally within the 20 to 30 range, although proximity to Cirencester provides access to a wider range of services and employment opportunities. This may support shorter journeys and some opportunities for active travel; however, access to public transport remains limited, and reliance on private vehicles is still likely. Higher growth scenarios (**Scenarios 3 and 5**) would result in increased traffic and associated emissions, while lower growth scenarios (**Scenarios 4, 6, and 7**) would reduce these effects. **Scenarios 1 and 2** avoid development at this location and therefore avoid associated transport impacts.

6.2.123 Across all scenarios, the distribution of development plays a key role in determining transport outcomes. Scenarios that concentrate growth at Moreton-in-Marsh make more efficient use of existing infrastructure and support more sustainable travel patterns. This hierarchy is reinforced by connectivity scores, which show Moreton-in-Marsh performing more favourably than Mickleton and Ampney Crucis. In addition, the provision of strategic infrastructure, particularly the link road, has the potential to help manage traffic flows, subject to detailed design and implementation.

Conversely, scenarios that direct a greater amount of growth to less accessible settlements are likely to increase reliance on private vehicles and result in higher emissions overall.

6.2.124 Regarding air quality, all scenarios are likely to result in some increase in emissions associated with additional traffic. However, effects are influenced by both the scale of development and the efficiency of the transport network. Scenarios that reduce congestion and support sustainable travel (**Scenarios 1 to 6**) are likely to perform more favourably, while those that increase reliance on private vehicles or lack supporting infrastructure, particularly **Scenario 7**, are likely to result in more adverse effects.

Conclusion

6.2.125 **Scenario 2** performs most favourably, as it directs a significant proportion of its growth to Moreton-in-Marsh, the most accessible settlement considered in the appraisal (as the only location with a railway station), whilst also directing growth to Mickleton, which benefits from proximity to Honeybourne railway station. The scenario avoids development at Ampney Crucis altogether and supports delivery of strategic transport infrastructure, helping to promote sustainable travel patterns and reduce reliance on private vehicles.

6.2.126 **Scenario 6** also performs strongly, as it limits development at Mickleton and Ampney Crucis, reducing reliance on private vehicles and associated emissions while maintaining moderate growth at Moreton-in-Marsh and supporting the delivery of strategic infrastructure.

6.2.127 **Scenario 4** also performs well, as it balances development across the district while limiting growth at Ampney Crucis compared to higher growth scenarios. While it includes increased development at Mickleton, this settlement performs relatively well in the context of the district, and the overall distribution supports access to infrastructure while managing transport impacts.

6.2.128 **Scenario 5** performs slightly less favourably, as higher levels of development at Ampney Crucis increase reliance on private vehicles and associated emissions, despite continued infrastructure provision at Moreton-in-Marsh.

6.2.129 **Scenario 3** performs comparatively less favourably, as higher levels of development at both Mickleton and Ampney Crucis increase overall travel demand and reliance on private vehicles, resulting in greater transport-related emissions.

6.2.130 **Scenario 1** performs less favourably, as the additional growth at Moreton-in-Marsh is largely in addition to, rather than instead of, development at less accessible settlements, resulting in increased overall travel demand despite the benefits associated with its location. While Moreton-in-Marsh

supports more sustainable travel patterns and enables delivery of a full link road, the increased overall scale of development may place additional pressure on the transport network, reducing the overall effectiveness of sustainable travel options.

6.2.131 **Scenario 7** performs least favourably, as it includes relatively high levels of development at Mickleton while limiting growth at Moreton-in-Marsh and does not deliver strategic transport infrastructure, including a link road. This results in greater reliance on private vehicles, increased congestion and higher transport-related emissions overall.

6.3. Summary of appraisal findings

6.3.1 The appraisal identifies that all scenarios are likely to result in a combination of positive, mixed and negative effects across the IIA topics. This reflects the inherent trade-offs associated with accommodating growth, particularly in a district characterised by a high-quality environmental baseline and a dispersed settlement pattern. While all scenarios meet LHN and employment land requirements and provide opportunities for economic growth, they differ in how effectively they balance environmental, social and economic objectives.

6.3.2 Significant positive effects are identified across several scenarios, although the drivers of these effects vary. Higher growth scenarios, particularly **Scenario 1** performs particularly strongly in relation to economic development and climate change mitigation through the concentration of growth at Moreton-in-Marsh, the district's most accessible settlement, and the delivery of a full link road which supports strategic infrastructure provision. **Scenario 2** also performs strongly across a range of topics, including housing, transport and air quality, and the historic environment, reflecting a more balanced level of growth at Moreton-in-Marsh with a south-eastern link road, whilst similarly avoiding growth at Ampney Crucis. **Scenarios 3, 4 and 5** also perform positively in several topics through their contribution to housing delivery, economic growth and the delivery of strategic infrastructure, including the south-eastern link road at Moreton-in-Marsh.

6.3.3 However, these positive effects are accompanied by trade-offs, particularly in relation to environmental topics. Scenarios which include higher levels of development at the smaller settlements (Mickleton and Ampney Crucis), introduce greater potential for adverse effects on biodiversity, landscape character, the historic environment and natural capital. This reflects both the sensitivity of these locations and the scale of development relative to the size and function of the settlements. These scenarios are also more likely to result in increased reliance on private vehicles, contributing to higher transport-related emissions.

6.3.4 Scenarios that reduce development at Mickleton and Ampney Crucis (particularly **Scenarios 1, 2, and 6**) perform more favourably in environmental terms by limiting impacts on sensitive receptors and reducing pressure on smaller settlements. This approach supports a more proportionate distribution of development and reduces the extent of landscape, biodiversity and land-use effects. However, lower growth scenarios also involve trade-offs, including reduced flexibility in housing supply, lower economic benefits and, in the case of the lowest growth scenarios (particularly **Scenario 7**), more limited opportunities to support strategic infrastructure and coordinated mitigation.

6.3.5 The appraisal also highlights an important distinction between the benefits of concentrating development in the most accessible location and the effects associated with overall scale and distribution of growth. While directing development to Moreton-in-Marsh supports sustainable travel and climate change mitigation, higher overall levels of growth (particularly where development is delivered alongside, rather than instead of, growth in less accessible settlements) can increase total travel demand and place additional pressure on infrastructure. This demonstrates that outcomes are influenced not only by where development is located, but also by the overall quantum of growth and its distribution.

6.3.6 Overall, the appraisal demonstrates that each scenario presents a different balance of sustainability effects. The key trade-offs relate to the scale of growth, the distribution of development between settlements, and the extent to which development can be delivered in a coordinated manner alongside infrastructure and mitigation measures.

6.3.7 A summary of the appraisal findings is provided in **Table 6-2**.

Table 6-2: Reasonable growth scenarios appraisal summary, including overall rankings and likely significant effects

7. The preferred approach

7.1.1 The preferred approach of the Cotswold District Local Plan 2026-2043 meets (and exceeds) LHN and employment land requirements through a spatial strategy focused on the district's most sustainable settlements, whilst avoiding significant growth within the Cotswolds National Landscape. This preferred approach aligns with **Scenario 2** tested through the IIA.

7.1.2 The preferred approach directs the majority of development to Cirencester and Principal Settlements, with most development coming forward through strategic-scale allocations capable of delivering supporting infrastructure, services and facilities alongside new development. Approximately 87% of proposed development is located at Cirencester and Principal Settlements, with 13% directed to Non-Principal Settlements. In addition, approximately 95% of proposed development is located outside of the Cotswolds National Landscape, with the limited development proposed within the designation restricted to smaller sites unless exceptional circumstances apply. Approximately 73% of development is directed to the south of the district, reflecting the concentration of services, employment opportunities and sustainable transport connections in and around Cirencester.

7.1.3 Strategic growth maximises opportunities to deliver infrastructure, including schools, local centres, community facilities, public transport improvements and cycling, walking and wheeling connections, whilst also supporting comprehensive masterplanning and coordinated delivery. As the majority of new development is proposed on strategic allocations that realistically, take some time before they are delivering housing at their optimum level, it is necessary to propose a 'stepped' housing trajectory. This essentially means the plan would support the delivery of different levels of housing in five-year periods, with less than the annualised need (for the whole Plan period) proposed for the first five years, and more, in the last five years. It is proposed that 400 homes would be delivered each year for the first five years (2026 to 2031), 1,050 per year for years six to ten (2031 to 2036), and 1,524 per year for years eleven to fifteen (2036 to 2043).

7.1.4 The preferred approach is underpinned by a broad spatial strategy that remained consistent across all of the reasonable alternatives assessed through the IIA process. This includes strategic allocations at Cirencester, Preston, Siddington, Down Ampney, Fairford, Kemble and the proposed new settlement at Driffield, together with a range of non-strategic allocations distributed across Principal and Non-Principal Settlements. The IIA reasonable alternatives assessment therefore focused on the principal variable elements of the strategy, namely the distribution and scale of development at Moreton-in-Marsh, Mickleton and Ampney Crucis. In this respect, the preferred approach aligns with **Scenario 2**, comprising medium-high growth at Moreton-in-Marsh, higher growth at Mickleton and no strategic growth at Ampney Crucis.

7.1.5 The preferred approach is also consistent with national policy relating to strategic-scale and mixed-use development. Paragraph 77(b) of the NPPF recognises that large numbers of homes can often be most effectively delivered through larger-scale developments, including significant urban extensions, and that such developments should support sustainable communities with access to services and employment opportunities. Paragraph 111(a) further supports an appropriate mix of uses within larger-scale developments in order to minimise the number and length of journeys required for employment, shopping, leisure, education and other day-to-day activities. The preferred approach reflects these principles through the allocation of comprehensively master planned mixed-use sites capable of delivering housing, employment land, schools, local centres, community facilities and green infrastructure in a coordinated manner.

7.1.6 A key component of the preferred approach is the allocation of 2,200 dwellings to the south and east of Moreton-in-Marsh, together with a comprehensive package of supporting infrastructure, including a new secondary school and a new road connecting the A429 and A44. This level of development is considered sufficient to support significant infrastructure delivery whilst avoiding the substantially larger scale of growth that would be required to facilitate a full link road around the settlement. Land is also safeguarded to support the delivery of additional development and the completion of the link road through a future plan-making process, should sufficient funding and growth requirements arise.

7.1.7 The preferred approach also includes a strategic allocation of 1,238 dwellings at Mickleton, together with associated infrastructure including a primary school, local centre, public transport improvements, open space and green infrastructure. Mickleton is relatively unconstrained in the district context, located outside the Cotswolds National Landscape and within proximity of Honeybourne railway station, Chipping Campden and employment opportunities at Meon Vale and Long Marston. The preferred approach therefore seeks to utilise one of the more sustainable locations in the north of the district whilst supporting its long-term sustainability.

7.1.8 The preferred approach does not include strategic growth at Ampney Crucis. Whilst the village was considered through the IIA reasonable alternatives appraisal, the preferred approach instead focuses strategic growth in settlements considered better able to accommodate significant development and supporting infrastructure. This approach helps to direct growth towards more sustainable locations whilst reducing potential impacts associated with substantial growth at a relatively small village.

7.1.9 Employment provision is focused alongside strategic housing growth at locations including Cirencester, Fairford, Kemble and Driffield, supporting a closer relationship between homes, jobs and services.

Part 2: What are the appraisal findings at this stage?

8. Introduction to the appraisal

8.1. Appraisal methodology

8.1.1 **Part 2** of this IIA Report presents an appraisal of the draft Plan against the IIA Framework, with the findings presented under each of the IIA themes.

8.1.2 The appraisal in **Part 2** has been prepared in accordance with the requirements of the Environmental Assessment of Plans and Programmes Regulations, assessing the likely significant effects of the Plan.

8.2. Policies included in the Regulation 19 version of the Local Plan

8.2.1 **Table 8-1** presents the policies in the Regulation 19 version of the Local Plan. In the following appraisal chapter these policies will be referred to by their reference (for example, 'CP1').

8.2.2 The draft Plan includes 'core policies' and 'development policies'. The **Core Policies** set out the strategic approach for the district, addressing the overall **Spatial Strategy** and key strategic matters such as housing, employment, infrastructure and environmental protection. The **Development Policies** provide more detailed criteria to guide decision-making and to support the delivery and implementation of the Core Policies when determining planning applications.

9. Appraisal of the Regulation 19 version of the Local Plan

9.1. Appraisal

9.1.1 The appraisal is presented below as a series of narrative discussions under the IIA framework. For each IIA theme, a commentary is presented on the spatial strategy and the Plan as a whole and concludes with a summary table of the likely significant effects (see **Table 9-1** to **Table 9-12**).

Biodiversity

Commentary on the spatial strategy

9.1.2 The spatial strategy set out in the Regulation 19 version of the Local Plan (hereafter referred to as 'the Plan') has important implications for biodiversity, particularly given the sensitive environmental context of the district, where large areas are subject to national landscape and ecological designations. The strategy seeks to balance the delivery of housing and employment growth with the need to protect and enhance ecological assets.

9.1.3 A strength of the spatial strategy is its use of a settlement hierarchy (**CP4**) to direct development towards the most sustainable locations in the district. By focusing the majority of growth in Principal and Non-Principal Settlements, the strategy is likely to reduce pressure on more remote and less disturbed areas of the countryside, which can be particularly important for protecting sensitive habitats and ecological networks. Concentrating development in locations with existing infrastructure and services also helps to limit the spread of incremental development across the wider rural area, which could otherwise lead to habitat fragmentation over time.

9.1.4 The allocation of development across a range of settlements, including both strategic allocations (**CP2**) and non-strategic allocations (**CP3**), provides a degree of flexibility and allows growth to be distributed across the district. This may help to avoid excessive pressure on single locations, particularly those with high environmental sensitivity. At the same time, the requirement for masterplanning and comprehensive site design offers opportunities to incorporate green infrastructure, habitat creation and ecological enhancements within larger sites, potentially delivering local biodiversity gains where implemented effectively. Nevertheless, due to the spatial constraints of the district, the distribution of allocated sites still has the potential to place development in proximity to sensitive ecological features in some locations. In this regard:

- 20 allocations are located within 10 km of an internationally designated site.

- all allocations are located within 5 km of a nationally designated biodiversity site (including six allocations which are located within approximately 100 m of a Site of Special Scientific Interest (SSSI)).
- eight allocations are located within 2 km of a Local Nature Reserve; and
- several allocations contain, or are adjacent to, priority habitats, ancient woodland, woodland identified in the National Forest Inventory, and habitats which may function as supporting habitat for protected species.

9.1.5 Whilst direct effects on these designations are unlikely, development has the potential to result in indirect effects including increased recreational pressure, habitat fragmentation, disturbance to species and impacts on ecological connectivity. However, **Policy CP60**, together with the allocation-specific concept frameworks and development templates, requires habitat retention and enhancement, ecological buffers, biodiversity net gain and green infrastructure corridors, providing a framework through which potential biodiversity effects can be avoided, reduced or mitigated.

9.1.6 The spatial strategy recognises the importance of environmental capacity, as set out in **CP4**. This allows for adjustments to the distribution of development where environmental constraints, including those relating to biodiversity, limit the capacity of settlements to accommodate growth. This is an important safeguard, as it provides a mechanism to avoid development in the most sensitive locations and redistribute growth to areas with lower ecological value or greater capacity to accommodate change. However, the effectiveness of this approach will depend on how these considerations are applied in practice and whether ecological constraints are given sufficient weight in decision-making. In particular, where sites are taken forward despite the presence of constraints, there remains potential for adverse effects which will need to be addressed through detailed design and mitigation. This is further considered in the 'commentary on the plan as a whole' section, below.

9.1.7 The area-based strategies (**CP7, 12 and 19**) promote the delivery of housing, employment and infrastructure together, which can support more sustainable patterns of development. However, the scale of growth proposed in some areas, particularly where multiple allocations are located in close proximity, raises the potential for cumulative effects on biodiversity, including increased recreational pressure, habitat fragmentation and changes to local hydrology. Whilst cumulative effects cannot be ruled out, particularly where multiple allocations are proposed in proximity to ecological receptors, the widespread incorporation of green infrastructure, ecological corridors and recreational mitigation measures should help to limit potential effects.

Commentary on the plan as a whole

9.1.8 A Habitats Regulations Assessment (HRA) has been undertaken and accompanies the Regulation 19 version of the Local Plan. HRA screening identified likely significant effects relation to physical damage and loss of habitat; non-physical disturbance; bird strike; air pollution from vehicle emissions and dust; recreation pressure; water quality from wastewater treatment and direct pollution; and water quantity. Whilst the subsequent Appropriate Assessment has ruled out some of these effects based on the mitigation measures provided in the Local Plan's policy framework, the HRA proposes additional policy recommendations for consideration by plan makers. It is anticipated that these measures will be incorporated into Plan, prior to submission.

9.1.9 Nonetheless, the Regulation 19 version of the Local Plan provides a strong and integrated framework for the conservation and enhancement of biodiversity, supported by a clear suite of policies covering designated sites, species protection, habitat networks and biodiversity net gain. Taken together, the policies move beyond a largely design-led approach and establish a more complete and robust basis for managing biodiversity impacts across the district. This is considered below.

9.1.10 A key strength of the Plan is the way biodiversity is embedded within wider sustainability and design policies. **CP1** promotes the provision of connected, accessible and multi-functional green spaces, alongside tree and hedgerow planting and measures to support nature recovery. This ensures that biodiversity considerations are built into the design of development from an early stage and are closely aligned with broader environmental outcomes. The requirement for Climate Change and Sustainability Statements further reinforces this approach by requiring applicants to demonstrate how biodiversity has been addressed in proportion to the scale of development.

9.1.11 This is strongly underpinned by **CP60**, which provides a clear and comprehensive framework for the protection of ecological assets. The policy applies the mitigation hierarchy, requiring avoidance, mitigation and compensation where impacts arise, and gives the highest level of protection to internationally designated sites, including SACs, SPAs and Ramsar sites. It also ensures protection for nationally and locally designated sites, priority habitats and protected species, with a clear expectation that development will be refused where significant harm cannot be adequately addressed. The inclusion of requirements for ecological surveys, biodiversity management measures and long-term maintenance significantly strengthens the effectiveness of the policy framework. The policy also includes specific mechanisms to address recreational pressures on Habitats Sites, requires biodiversity management and biosecurity measures where appropriate, and expects long-term maintenance arrangements to be secured through conditions or planning obligations.

9.1.12 **CP60** also introduces important safeguards for irreplaceable habitats, such as ancient woodland and veteran trees, making clear that their loss will only be permitted in exceptional circumstances. This is complemented by **DP10**, which provides additional protection for key landscape features that often form important components of ecological networks. Together, these policies ensure that both designated and non-designated assets are recognised and protected.

9.1.13 The Plan also maintains a strong focus on enhancement and connectivity. **CP70** requires development to contribute to multi-functional green and blue infrastructure networks, avoid fragmentation and improve connectivity, supported by long-term management arrangements. Similarly, **CP16, 17 and 23** support the role of linear corridors in strengthening ecological connectivity, while **CP18** promotes habitat creation and restoration at a landscape scale. **CP22** also contributes indirectly by limiting inappropriate development and helping to maintain the separation and openness of areas that can support ecological networks.

9.1.14 **CP61** also contributes positively by protecting designated Local Green Spaces from inappropriate development. Whilst primarily intended to safeguard valued community spaces, many of these sites also provide biodiversity value and support wider green infrastructure networks. **CP24** also includes site-specific requirements for the retention and enhancement of ecological features, including Key Wildlife Sites and existing vegetation, ensuring biodiversity considerations are embedded within these strategic locations. Supporting policies relating to rural land uses and development also help maintain habitat features within the wider countryside.

9.1.15 Design-led policies further reinforce biodiversity integration. **CP69 and 69a** require development to incorporate high-quality green spaces and biodiversity enhancements, while **CP68** promotes access to green spaces and connection with nature, recognising the wider benefits of biodiversity for communities. Together, these policies encourage development that contributes to both ecological quality and social value.

9.1.16 **CP30** includes safeguards to avoid harm to priority habitats and ecological networks, while encouraging appropriate siting in areas of lower ecological sensitivity.

9.1.17 Rural development policies also contribute positively to biodiversity outcomes. **DP8** requires the retention of hedgerows and the incorporation of measures to support wildlife, while **DP9** requires proposals to avoid harm to landscape features and ecological assets, including hedgerows and field margins. **DP7** provides additional protection by ensuring that ecological features such as bat roosts are not adversely affected.

9.1.18 The Plan is supported by **CP74**, which provides a mechanism to track delivery and respond where policy objectives are not being met. This is important in ensuring that biodiversity gains are achieved and maintained

over time. This is complemented by **CP71**, which requires the long-term management and maintenance of green spaces delivered through development, helping to secure biodiversity outcomes beyond the initial implementation stage.

Table 9-1: Effects summary table

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Improved ecological resilience.	Direct, long-term, positive.	None proposed.
Improved ecological connectivity through green infrastructure and habitat corridors.	Direct, long-term, positive.	None proposed.
Increased habitat provision and enhancement through green and blue infrastructure.	Direct and indirect, long-term, positive.	None proposed.
Delivery of biodiversity net gain and nature recovery measures.	Direct, long-term, positive.	None proposed.

Climate change adaptation

Commentary on the spatial strategy

9.1.19 The spatial strategy set out in the draft Plan has a significant role in shaping how the district responds to the impacts of climate change, particularly in relation to flood risk, water management, overheating and the resilience of communities and infrastructure.

9.1.20 A key positive aspect of the strategy is its reliance on a settlement hierarchy (**CP4**) to direct development towards locations with existing services, infrastructure and accessibility. By focusing growth in Principal and Non-Principal Settlements, the strategy can reduce the need for dispersed development in rural areas where infrastructure may be less resilient to climate pressures. This approach also supports the more efficient provision of climate adaptation measures, such as sustainable drainage systems, heat mitigation through urban greening, and resilient transport networks, as these are often more viable and effective when delivered at scale within larger or more centralised developments.

9.1.21 The emphasis on strategic allocations (**CP2**) and associated masterplanning requirements provides further opportunities to embed climate adaptation into development at an early stage. Larger sites allow for the coordinated integration of measures such as surface water management systems, green infrastructure, shading and cooling strategies,

and layout design that responds to topography and natural features. If implemented effectively, this approach can increase the overall resilience of new communities to climate risks.

9.1.22 The site assessment evidence indicates that climate risks have been identified and considered through the allocation process. Strategic allocations at Moreton-in-Marsh, Down Ampney, Mickleton and Siddington contain areas affected by flood risk, whilst several allocations are located within areas susceptible to groundwater flooding. In response, the strategic site concept frameworks incorporate measures such as sustainable drainage systems, strategic green infrastructure, floodplain management and the use of open space to accommodate flood risk. Several non-strategic allocations, including sites at Down Ampney, Siddington, Lechlade, Blockley and Chipping Campden, also include site-specific requirements relating to flood risk avoidance, sustainable drainage and water management measures.

9.1.23 The inclusion of the environmental capacity adjustment within **CP4** is also relevant to climate adaptation. This provides flexibility to direct development away from locations where environmental constraints would lead to unacceptable impacts, which may include areas vulnerable to flooding, water stress or other climate-related hazards. This mechanism has the potential to reduce exposure to climate risks. Where development is taken forward in areas with existing constraints, there remains potential for increased exposure to climate risks unless these are effectively mitigated. In this regard, Policies **CP63** and **CP64** provide an important policy framework through which flood risk, surface water management and wider climate resilience considerations can be addressed.

9.1.24 The distribution of development across the three strategy areas (**CP7, 12 and 19**) helps to spread growth across the district, which may reduce pressure on any single location. However, this also means that development will take place in a variety of contexts, some of which may be more vulnerable to climate impacts than others. For example, the delivery of a new settlement at Driffield and several large urban extensions may introduce challenges related to water management, flood risk and exposure to changing weather patterns, depending on site-specific conditions. While strategic sites offer greater scope for coordinated mitigation, they also represent a large-scale and long-term commitment, making it particularly important that adaptation measures are embedded from the outset. The concept frameworks for the strategic allocations include measures such as sustainable drainage systems, green infrastructure networks, multifunctional open space and habitat corridors, which should contribute positively to climate resilience over the lifetime of the Plan.

Commentary on the plan as a whole

9.1.25 The Plan sets out a clear and comprehensive approach to climate change adaptation, primarily through **CP1**, supported by a wider framework of

design, green infrastructure and environmental policies. Taken together, these policies establish a consistent expectation that development will be designed to be resilient to current and future climate impacts.

9.1.26 **CP1** is central to the Plan's approach to climate change. It requires development to demonstrate how proposals will adapt to and be resilient to the impacts of climate change, including through site layout, building design and supporting infrastructure. The policy includes specific requirements such as the implementation of the cooling hierarchy, ensuring buildings are designed to respond to overheating risks through natural ventilation and shading, and promoting the efficient use of natural resources, including water and soil. The requirement to incorporate sustainable drainage systems (SuDS) and water efficiency measures is particularly relevant in managing increased surface water runoff and water resource pressures.

9.1.27 The policy also emphasises the role of green and blue infrastructure, requiring development to promote connected, accessible and multi-functional green spaces, including tree and hedgerow planting. This is reinforced by **CP70**, which explicitly identifies the role of green and blue infrastructure in responding to climate change and managing flood risk, and requires a design-led approach that integrates these features from the earliest stages of development. The focus on multifunctionality, connectivity and long-term management supports a more systemic approach to climate resilience.

9.1.28 Design-related measures are further supported through **CP69 and 69a**, which require development to incorporate passive design strategies, efficient use of resources and resilience to environmental conditions. The policy's emphasis on long-term adaptability and building lifespan also contributes to ensuring that development remains suitable under changing climatic conditions.

9.1.29 Adaptation is also addressed through the treatment of existing buildings. **CP26** supports proposals that improve energy efficiency and adaptability to climate change, including retrofitting and the incorporation of low carbon heating systems. For both modern and traditional buildings, the policy promotes a 'whole house' approach and encourages interventions that respond to climate impacts, while recognising the constraints associated with heritage assets.

9.1.30 Water management and flood resilience are addressed in detail through **CP63, 64 and 65**. These policies require development to apply a sequential approach to site selection, avoid areas at highest risk of flooding and demonstrate resilience over the lifetime of the development, taking account of climate change allowances. The requirement for site-specific Flood Risk Assessments, integrated and multi-functional Sustainable Drainage Systems (SuDS), and the use of natural flood management techniques provides a robust framework for managing increased flood risk and surface water pressures. In addition, **CP64** requires efficient use of

water resources and sets clear water efficiency standards, while also safeguarding water quality and infrastructure capacity. Together, these policies significantly strengthen the Plan's ability to respond to future climate-related risks associated with flooding, water scarcity and water quality.

9.1.31 The role of natural systems in supporting climate resilience is also reinforced through **CP60** and **DP10**, which protect and enhance habitats, trees and other landscape features. These elements contribute to climate adaptation by supporting functions such as shading, cooling, water regulation and soil stability. The protection of these features helps to maintain the natural capacity of the environment to respond to climate pressures.

9.1.32 The Plan also recognises the importance of landscape and environmental assets in supporting resilience. While not directly framed as an adaptation policy, **CP16** supports the restoration and enhancement of the canal, which can contribute to water management, ecological resilience and sustainable movement patterns. Similarly, requirements within **CP24** for flood risk assessment and mitigation, particularly at Campden BRI, demonstrate that climate risks are considered in site-specific contexts.

9.1.33 The scale of growth proposed through the spatial strategy, including the provision of a housing supply buffer above the identified requirement, may place additional pressure on natural systems that support climate resilience, such as floodplains, green spaces and water resources. The loss or alteration of these features could reduce the natural capacity of the landscape to manage climate impacts.

9.1.34 Finally, the Plan includes clear implementation mechanisms, including the requirement for a Climate Change and Sustainability Statement under **CP1** and the use of monitoring and review through **CP74**. This provides a structured framework to ensure that adaptation measures are addressed consistently and can be monitored over time.

Table 9-2: Effects summary table

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Improved resilience to flood risk and climate-related hazards.	Direct, long-term, positive.	None proposed.
Increased use of sustainable drainage systems and water management measures.	Direct, long-term, positive.	None proposed.
Enhanced climate resilience through green and blue infrastructure.	Direct and indirect, long-term, positive.	None proposed.
Increased resilience of communities, buildings and infrastructure to future climate change.	Direct, long-term, positive.	None proposed.

Climate change mitigation

Commentary on the spatial strategy

9.1.35 The spatial strategy set out in the Plan plays an important role in influencing greenhouse gas emissions across the district, particularly through the location, scale and form of development, and the extent to which this supports more sustainable patterns of living. The overall approach reflects a clear intention to reduce emissions, although the outcomes will depend on how effectively spatial decisions reduce reliance on high-carbon activities, particularly travel.

9.1.36 The use of the settlement hierarchy (**CP4**) is effective for concentrating development in locations with the best access to services, jobs and public transport. By focusing the majority of growth in Principal and Non-Principal Settlements, the strategy supports shorter travel distances and increases the potential for walking, cycling and public transport use, which are critical for reducing transport-related emissions. This is particularly important in a largely rural district where car dependency can otherwise be high. Locating development in more connected settlements also makes it more feasible to provide infrastructure such as public transport services, active travel routes and low-carbon energy systems.

9.1.37 Whilst the settlement hierarchy generally directs growth towards the district's most sustainable locations, opportunities to support significant modal shift are constrained by the relatively limited rail network serving the district. In this context, the concentration of growth at Kemble and Moreton-in-Marsh is notable, as these settlements are served by rail stations. In addition, the strategic and non-strategic allocations at Mickleton will deliver homes located in proximity to Honeybourne railway station. Collectively, this represents that around 36% of new allocations are proposed either within settlements served by rail infrastructure or in locations with reasonable access to rail services. This should help support the use of more sustainable travel modes and reduce transport-related greenhouse gas emissions, although this will also depend on the quality of onward public transport and active travel connections.

9.1.38 The delivery of housing and employment through strategic allocations (**CP2 and 5**) provides further opportunities to support climate change mitigation. Larger sites allow for comprehensive masterplanning, which can incorporate compact layouts, mixed uses and integrated infrastructure. This can help reduce the need to travel and support more efficient patterns of development. The concept frameworks for the strategic allocations also include measures intended to reduce reliance on private car travel. For example, the strategic allocations at Steadings Southern Extension, Cirencester South East, Down Ampney and Driffield incorporate mobility hubs, active travel connections and public transport infrastructure, whilst the allocations at Kemble and Moreton-in-Marsh include active travel links

to rail stations and local centres. These measures should help support modal shift and reduce transport-related greenhouse gas emissions.

9.1.39 The requirement for infrastructure delivery (**CP6**) provides a mechanism to support climate mitigation by ensuring that development is accompanied by the necessary infrastructure, including transport and utilities. However, there is also the potential for investment in road infrastructure as part of supporting growth, particularly the proposed link road at the strategic allocation at Moreton-in-Marsh, which could reinforce car travel if not delivered alongside the active travel, public transport and mobility measures envisaged within the allocation. This highlights the importance of ensuring that infrastructure provision prioritises sustainable modes and low-carbon solutions in order to support the overall objectives of the strategy.

Commentary on the plan as a whole

9.1.40 The Plan establishes a comprehensive and detailed framework for climate change mitigation, with a clear focus on reducing greenhouse gas emissions across new development, existing buildings and the transport system. This is primarily delivered through a combination of climate, energy and transport policies, which together promote a transition to a net-zero carbon district and support the Plan's 'green to the core' ambitions.

9.1.41 **CP1** sets the overarching requirement that development must demonstrate how it will support an overall reduction in greenhouse gas emissions. The policy includes a wide range of mitigation measures that must be incorporated into development proposals. These include reducing the need to travel, promoting public transport and active travel, and providing electric vehicle charging infrastructure, all of which directly address transport-related emissions. The policy also promotes sustainable design and construction, the re-use of materials, and a 'circular economy' approach, alongside the use of materials with low embodied carbon. In addition, it requires development to contribute to the expansion of renewable and low carbon energy generation, ensuring that mitigation is embedded across design, construction and operation.

9.1.42 A key strength of the Plan is the introduction of a detailed and specific framework for building performance through **CP27**. This policy requires all new dwellings to be net zero carbon in operation, supported by requirements relating to low energy design, low carbon heating and on-site renewable energy generation. It includes quantified standards for space heating demand and energy use intensity, the requirement for development to be constructed without connection to the gas grid, and the expectation that renewable energy generation will match or exceed predicted energy demand where feasible. This provides a clear and measurable approach to reducing operational carbon emissions from new development.

9.1.43 The Plan also supports mitigation through policies relating to renewable and low carbon energy. **CP28** supports proposals that contribute to

meeting the district's electricity demand from renewable sources and enable further deployment of renewable energy. This is complemented by more specific policies such as **CP29 and 30**, which set out criteria for different types of renewable energy development, and **CP31** which supports locally-led initiatives. **CP32** further strengthens this approach by supporting the delivery of genuinely low carbon heat networks and setting clear standards for their design and operation, helping to address emissions associated with heating and supporting the transition away from fossil fuel-based systems. Together, these policies provide a broad and supportive framework for increasing renewable energy generation across the district.

9.1.44 Mitigation is also addressed through the treatment of existing buildings. **CP26** supports the retrofitting of buildings to improve energy efficiency, the use of low carbon heating systems, and the incorporation of micro-renewables. The policy applies the energy hierarchy, prioritising the reduction of energy demand, followed by efficiency improvements and renewable generation. It also recognises that the re-use of existing buildings can be more sustainable than demolition and rebuild, including in relation to embodied carbon.

9.1.45 Transport-related emissions are addressed through a comprehensive set of policies. **CP33**, together with **CP34 to 39**, place a clear emphasis on prioritising walking, cycling and public transport, reducing reliance on private vehicles, and supporting the transition to electric and low emission vehicles. These policies require development to be located in accessible locations, incorporate active travel infrastructure, provide public transport connectivity, and support shared mobility schemes. This is consistent with the requirements of **CP1** and provides a strong basis for reducing transport-related emissions over the plan period.

9.1.46 Infrastructure and movement corridors are also protected and enhanced in ways that support low-carbon travel. For example, **CP23** safeguards the potential restoration of a rail link, while **CP16** supports the restoration of the Thames and Severn Canal, which may provide opportunities for sustainable movement and recreation. Although not explicitly framed as mitigation policies, these provisions may support a shift towards more sustainable modes of travel.

9.1.47 In addition, the Plan recognises the role of natural assets in supporting climate change mitigation. For example, **DP10** requires the protection and enhancement of trees, woodlands and hedgerows, including ancient and veteran trees. These features contribute to carbon sequestration and help offset emissions, while also supporting wider environmental benefits. The encouragement of new tree planting, including woodland creation informed by local strategies, provides a complementary contribution to reducing the overall carbon footprint of development.

Table 9-3: Effects summary table

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Reduced greenhouse gas emissions from new development.	Direct, long-term, positive.	None proposed.
Increased use of sustainable and active travel modes.	Direct and indirect, long-term, positive.	None proposed.
Increased deployment of renewable and low carbon energy.	Direct, long-term, positive.	None proposed.
Improved energy efficiency and net zero carbon building performance.	Direct, long-term, positive.	None proposed.
Enhanced carbon sequestration through protection and enhancement of natural assets.	Direct and indirect, long-term, positive.	None proposed.

Economy and employment

Commentary on the spatial strategy

9.1.48 The spatial strategy set out in the Plan plays a central role in shaping the distribution, accessibility and sustainability of employment opportunities across the district. It seeks to align the delivery of housing, jobs and infrastructure in a way that supports economic growth while maintaining the character of the area and ensuring that development is well-related to existing settlements and services.

9.1.49 By directing the majority of growth towards Principal and Non-Principal Settlements (**CP4**), the strategy focuses employment development in locations with the strongest existing service base, transport connectivity and labour market accessibility. This approach supports more sustainable commuting patterns and increases the potential for people to live closer to their place of work, helping to reduce travel distances and support local economies.

9.1.50 The provision of employment land through the spatial strategy is a particularly important aspect of the Plan. The Plan will deliver approximately 32 ha of new employment land, exceeding the identified requirement of approximately 29 ha over the plan period. This provides confidence that sufficient land is available to support forecast economic growth. The approach does not rely on standalone employment allocations; rather, employment growth is primarily delivered through mixed-use strategic allocations alongside the safeguarding and enhancement of existing employment sites across the district (**CP2 and CP5**), which presents clear opportunities to support self-contained and mixed communities. The distribution of employment land across the three strategy areas (**CP7, 12 and 19**) also helps to ensure that economic growth is not overly concentrated in a single location, but instead supports a more balanced pattern of development.

9.1.51 New employment allocations are distributed across a number of strategic sites, including approximately 8 ha at Cirencester and Surrounding Villages, 11 ha at Driffield, 4 ha at Fairford, and 9 ha at Kemble. This distribution broadly aligns employment growth with the main locations for housing growth, creating opportunities to reduce commuting distances and support more self-contained communities.

9.1.52 The concept frameworks for the strategic allocations demonstrate how employment uses will be integrated alongside housing, services and infrastructure. For example, the strategic allocations at Cirencester, Driffield and Fairford include mixed-use development, local centres and active travel connections intended to improve access to employment opportunities. Similarly, the employment provision at Kemble takes advantage of its proximity to the established business and aviation-related activities associated with Cotswold Airport, whilst the allocation at Mickleton will benefit from its proximity to Honeybourne and the wider employment market of north Cotswold settlements. These measures should help improve accessibility to employment opportunities and support local economic resilience.

9.1.53 The strategy also allows for additional employment development through windfalls and Neighbourhood Development Plans, providing flexibility to respond to changing economic conditions. This is important in supporting small-scale and rural businesses, which form a key part of the local economy.

9.1.54 The requirement for infrastructure delivery (**CP6**) supports the spatial strategy by ensuring that employment development is accompanied by the necessary infrastructure, including transport and utilities. This is key to ensuring that employment sites are attractive, accessible and viable.

Commentary on the plan as a whole

9.1.55 The Plan sets out a positive approach to supporting economic growth and employment, combining town centre regeneration, protection of key economic assets, provision of employment land, tourism development and support for the rural economy.

9.1.56 A key element of the Plan's approach is the promotion of vibrant and viable centres, particularly through **CP10** and **CP51**. These policies support a range of mixed-use development, including retail, leisure, cultural and office uses, alongside residential development. The focus on regeneration opportunity sites, diversification of uses and enhancement of town centres is likely to strengthen economic activity, footfall and employment opportunities, particularly in Principal and Non-Principal Settlements.

9.1.57 The Plan also identifies and supports the role of strategic economic assets and institutions. **CP11, CP24, and CP25** support the growth and long-term development of key sites such as the Royal Agricultural University, Campden BRI and the Fire Service College. These policies enable

expansion of education, research, training and business uses, which is likely to contribute to high-value employment sectors, skills development and innovation. The requirement for comprehensive masterplanning also supports coordinated and sustainable growth at these locations.

9.1.58 In addition, **CP15** safeguards an important employment site and supports aviation-related development and diversification, helping to maintain and enhance its economic role and resilience.

9.1.59 The Plan provides strong support for employment development more broadly through **CP46**, which provides positive support for new employment development, including the expansion of existing employment sites and the delivery of new employment opportunities in appropriate locations. It also supports small-scale employment development in rural areas, subject to appropriate criteria, including viability and scale. The policy promotes employment growth in professional, technical, 'green' and knowledge-based sectors, and supports sustainable working practices, which aligns with wider economic and environmental objectives.

9.1.60 This is complemented by **CP47**, which establishes a clear presumption in favour of retaining existing employment land and floorspace. The policy requires robust justification for any loss of employment land, including evidence of non-viability and marketing. This helps to ensure that existing employment capacity is protected, supporting long-term economic stability.

9.1.61 The Plan also supports the visitor economy, which is a significant component of the district's economic profile. **CP49 and 50** support the development of tourist facilities, attractions and accommodation, where proposals demonstrate economic benefits and are compatible with environmental constraints. This is reinforced by **CP17** and **18**, which support leisure and recreation uses. In addition, **CP53 to 59** relating to the historic environment play an important supporting role, helping to conserve and enhance heritage assets and conservation areas which form a key part of the district's visitor offer and overall economic appeal. Together, these policies promote a sustainable tourism sector, supporting local businesses and employment opportunities.

9.1.62 Support for the rural economy is provided through **DP6** and related policies, which enable diversification of agricultural and land-based businesses. This is further supported by **DP7**, which enables the re-use of existing buildings for alternative economic uses, and **DP8**, which supports the ongoing viability of land-based industries. **DP3** also contributes by supporting essential on-site accommodation where required for rural enterprises. **DP9** provides additional support for rural economic activity, recognising equestrian uses as part of the local economy where developed in a sustainable and appropriately scaled manner. The emphasis on re-use of existing buildings and support for low carbon rural enterprises provides opportunities for economic growth in rural areas, while maintaining environmental quality.

9.1.63 Infrastructure and connectivity are also recognised as essential to economic growth. **CP8, CP13, and CP20** support the delivery of strategic infrastructure across the three strategy areas, whilst **CP9, CP14, and CP21** safeguard land required for future infrastructure schemes. **CP20** further strengthens this approach by identifying specific infrastructure requirements, including strategic road and sustainable transport improvements, to support planned growth and economic activity. In addition, **CP37** supports improved connectivity and accessibility to employment opportunities, which can enhance labour market mobility and support business growth. **CP23** also safeguards longer-term opportunities for rail connectivity, which may support economic linkages and accessibility over time.

9.1.64 The Plan also recognises the importance of digital connectivity in supporting modern economic activity. **CP73** requires development to provide high quality and future-proofed telecommunications infrastructure, ensuring that residents and businesses have access to high-speed digital networks. This is particularly important for supporting home working, digital businesses and rural economic growth.

Table 9-4: Effects summary table

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Increased employment opportunities across the district.	Direct, long-term, positive.	None proposed.
Delivery of employment land to support economic growth.	Direct, long-term, positive.	None proposed.
Improved alignment of housing and employment growth.	Direct and indirect, long-term, positive.	None proposed.
Support for town centres, tourism and the rural economy.	Direct and indirect, long-term, positive.	None proposed.
Improved infrastructure and connectivity to support business growth.	Direct, long-term, positive.	None proposed.

Equalities

Commentary on the spatial strategy

9.1.65 The spatial strategy plays a role in shaping how different groups across the district are able to access housing, services, jobs and everyday opportunities.

9.1.66 A central element of the strategy is the settlement hierarchy (**CP4**), which directs most development towards Principal and Non-Principal Settlements. These locations already benefit from a broader mix of services, employment opportunities and transport links, meaning that new development is more likely to be well connected. This is particularly important for people who may not be able to rely on private vehicles, as it

supports easier access to essential services such as healthcare, education and retail. By reinforcing these locations as the main focus for growth, the strategy has the potential to improve everyday accessibility for a wide range of residents.

9.1.67 At the same time, the strategy includes a significant number of non-strategic allocations across smaller settlements (**CP3**). This reflects an intention to support communities across the district rather than concentrating all development in a small number of locations. In some cases, this can help sustain local facilities and maintain the viability of smaller settlements. However, the level of accessibility in these locations is more variable, and in areas with limited services or transport connections, residents may still need to travel further to meet their daily needs. This may be more challenging for certain groups, particularly where access to transport is constrained. This introduces some variability in outcomes for different communities depending on location.

9.1.68 The larger strategic allocations (**CP2**) play an important role in shaping equalities outcomes. Sites such as the urban extensions and the proposed new settlement at Driffield provide opportunities to deliver new infrastructure, community facilities and local services alongside housing growth. If these developments are planned and delivered effectively, they can help create places where people are better able to access services locally. Their scale also increases the likelihood of securing integrated provision, although this will depend on delivery and design quality.

9.1.69 The spatial strategy also aligns housing growth with employment provision through **CP5** and the Area Strategies (**CP7, 12 and 19**). In principle, this creates opportunities for people to live closer to jobs, which can reduce travel times and improve access to employment.

9.1.70 Infrastructure delivery is identified as a key component of the strategy through **CP6**, which supports the provision of transport, services and facilities alongside new development. This has a direct bearing on equalities outcomes, as the timing and location of infrastructure will influence how easily people can access services.

Commentary on the plan as a whole

9.1.71 The Plan provides a broad framework that supports equalities and social inclusion, primarily through policies relating to access to services, inclusive design, housing provision and community infrastructure. While equalities is not addressed through a single standalone policy, it is embedded across a range of policy areas, particularly housing, transport and health.

9.1.72 A key component of the Plan's approach is ensuring that development is supported by appropriate infrastructure and services. **CP6** requires development to provide the necessary infrastructure to meet the needs arising from new development, supported by the Council's 'infrastructure-first' ambition. This includes social, community and service infrastructure,

which is critical to ensuring that new and existing communities have equitable access to facilities and services.

9.1.73 **CP52** also contributes positively to equalities by requiring new local centres within strategic allocations to provide access to services and facilities close to where people live. This may particularly benefit groups with more limited mobility or reduced access to private vehicles by improving access to shops, childcare, community facilities and other day-to-day services.

9.1.74 Accessibility is further supported through a strong focus on sustainable and inclusive transport. **CP33** prioritises walking, cycling and public transport, and requires development to integrate with existing networks and provide accessible and inclusive movement infrastructure. This is reinforced by **CP34**, which requires development to be located close to services and to demonstrate how sustainable travel opportunities have been maximised, and by **CP35**, which promotes safe and accessible routes for all users. These policies explicitly recognise the needs of people with disabilities and those with mobility needs, supporting more equitable access to employment, services and community facilities.

9.1.75 Access to services and facilities is further supported through policies such as **CP37**, which seeks to ensure that development is well connected to services, and **CP16**, which promotes improved access to recreational routes and public spaces. Digital connectivity is also addressed through **CP73**, which supports access to high quality digital infrastructure, helping to reduce inequalities related to connectivity and access to services. **CP8** and **CP20** also support the delivery of new education infrastructure, improving access to primary and secondary education and reducing the need for longer distance travel to schools.

9.1.76 Design also plays an important role in addressing equalities. **CP36** requires development to be inclusive, safe and accessible, and to provide appropriate infrastructure for different users, including pedestrians, cyclists and those using micromobility. The policy emphasises connectivity, safety and usability of the public realm, which are important factors in creating environments that can be used by a wide range of people. This is complemented by **CP69 and 69a**, which require early community engagement, comprehensive masterplanning and design coding for larger sites, helping to ensure that the needs of different groups are considered from the outset of the design process.

9.1.77 The Plan includes a strong framework for addressing housing needs across different groups, which is central to equalities. **CP41** requires a proportion of dwellings to meet accessible and adaptable standards (M4(2)) and wheelchair user standards (M4(3)), directly addressing the needs of people with mobility impairments.

9.1.78 This is complemented by **CP42**, which requires development to deliver a significant proportion of affordable housing and prioritises rented tenures,

helping to address housing affordability and access for lower income groups. **DP1** further supports the provision of affordable housing in rural areas, ensuring that local needs can be met where opportunities arise.

9.1.79 The Plan also provides targeted support for specific groups with particular housing needs. **CP44** supports accommodation for older people, people with disabilities and those requiring care or support, with requirements relating to accessibility, location and design. **CP45** identifies preferred sites and sets out a clear approach to meeting the needs of Traveller communities. Together, these policies provide a structured and inclusive approach to meeting a wide range of housing needs.

9.1.80 Health and wellbeing are also closely linked to equalities. **CP68** requires development to demonstrate how it contributes to reducing health inequalities, supports access to open space, and promotes inclusive and active environments. The requirement for Health Impact Assessments on larger developments provides a mechanism to consider how different groups may be affected by development.

Table 9-5: Effects summary table

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Improved access to housing, services and employment opportunities.	Direct, long-term, positive.	None proposed.
Improved accessibility through inclusive and sustainable transport provision.	Direct, long-term, positive.	None proposed.
Increased provision of affordable, accessible and specialist housing.	Direct, long-term, positive.	None proposed.
Improved access to community infrastructure, facilities and digital connectivity.	Direct and indirect, long-term, positive.	None proposed.
Support for health, wellbeing and social inclusion.	Direct and indirect, long-term, positive.	None proposed.

Green infrastructure and natural capital

Commentary on the spatial strategy

9.1.81 The spatial strategy influences how green infrastructure and natural features are retained, enhanced and connected across the district, mainly through where development is directed and how growth is distributed between settlements.

9.1.82 A key feature is the focus on directing development to Principal and Non-Principal Settlements (**CP4**). This helps limit more widespread encroachment into the countryside and increases the opportunity to plan larger, more connected areas of green infrastructure within fewer locations. In these areas, there is greater scope to design green spaces, drainage

features and routes in a more coordinated way, rather than relying on smaller, isolated interventions.

9.1.83 Consequently, as major growth is primarily concentrated outside of the Cotswolds National Landscape, which covers approximately 80% of the district, the spatial strategy also safeguards green infrastructure networks across the nationally protected landscape.

9.1.84 Strategic allocations (**CP2**) on larger sites, including the main urban extensions and the proposed new settlement at Driffield, provide opportunities to incorporate multi-functional green infrastructure as part of a comprehensive layout, such as open space networks and integrated drainage. These sites can make a meaningful contribution to the overall green infrastructure network if designed well. However, they will also involve the loss of existing land and features, meaning outcomes will depend on how effectively new provision replaces or improves what is currently there. The concept frameworks for the strategic allocations incorporate extensive green infrastructure networks, strategic open space, active travel routes and sustainable drainage measures. In doing so, they provide opportunities to support a number of the priorities identified within the Cotswold Green Infrastructure Strategy, including improved access to natural greenspace, delivery of strategic walking and cycling connections, strengthened ecological networks and the incorporation of multifunctional green infrastructure within new development.

9.1.85 The strategy also spreads some growth across smaller settlements through non-strategic allocations (**CP3**). While individually modest, these sites may result in the gradual loss of local green features over time. Their contribution to green infrastructure is likely to be more limited in scale, and there is a greater risk that provision will be site-specific rather than part of a wider network, unless this is addressed through design and connectivity. However, the Cotswold Green Infrastructure Strategy identifies opportunities to improve the connectivity of green infrastructure networks, active travel routes and accessible natural greenspace across the district, particularly within and around the principal settlements. The development templates for non-strategic allocations require consideration of site-specific green infrastructure assets and connections, creating opportunities for individual developments to contribute towards the wider objectives and aspirations of the Green Infrastructure Strategy.

9.1.86 The delivery of supporting infrastructure (**CP6**) is relevant, as it can help ensure that green infrastructure is planned alongside other elements of development.

Commentary on the plan as a whole

9.1.87 The Plan provides a strong approach to green infrastructure and natural capital, with a clear focus on how natural features and spaces contribute to the quality, resilience and functioning of places.

9.1.88 A key strength of the Plan is the way green infrastructure is treated as an essential part of development, rather than something added at the end of the design process. **CP70** requires developers to plan green and blue infrastructure from the outset, ensuring it is properly integrated into the layout and structure of development. This includes creating spaces that serve more than one purpose, such as providing areas for recreation, managing surface water, supporting active travel and improving environmental quality. The focus on accessibility and usability ensures that green spaces are not only provided, but are also well-used and valued by local communities.

9.1.89 The Plan also reflects the idea of natural capital, recognising that natural features and systems provide measurable benefits over time. Policies such as **CP1**, **CP69 and 69a** require development to include features such as tree planting, green spaces and sustainable drainage systems. These elements contribute to a range of functions, including reducing flood risk, storing carbon, improving air quality and helping to regulate temperature, making places more resilient to climate change. This is further supported by **DP10**, which protects and enhances key natural assets that contribute to carbon storage, urban cooling and wider ecosystem services.

9.1.90 Another important aspect of the Plan is its focus on linking green spaces together. **CP70** expects development to connect into wider green infrastructure networks, rather than creating isolated spaces. This is supported by policies such as **CP16** and **CP23**, which protect and enhance key corridors across the district. These corridors not only support wildlife movement, but also provide routes for walking, cycling and recreation, making them important parts of the wider green infrastructure network. **CP60** further reinforces this approach by requiring development to contribute to ecological networks and habitat connectivity, supporting the wider functioning of natural systems.

9.1.91 The Plan also makes use of larger-scale opportunities to strengthen natural capital. **CP18**, for example, supports the reuse of former mineral sites in a way that provides recreation, landscape improvement and environmental benefits. In rural areas, policies such as **DP8** encourage the retention of features like hedgerows, which contribute to soil health, water management and landscape quality, as well as supporting wildlife. **CP22** also provides an important strategic role by limiting inappropriate development and maintaining openness, helping to protect wider landscape structure and green infrastructure continuity.

9.1.92 Long-term management is another important feature of the Plan. **CP70** and **CP71** require clear arrangements for maintaining green infrastructure over time, including funding and responsibility for upkeep. This helps ensure that green spaces continue to function properly and deliver benefits in the future, rather than declining after they are first created. **CP24 and CP25** also supports this approach by requiring comprehensive

masterplanning in their respective Special Policy Areas, along with **CP69** which requires masterplans for major developments.

9.1.93 The link between green infrastructure and people's health and wellbeing is also clearly recognised. **CP68** promotes access to green space and opportunities for recreation, highlighting the role that natural environments play in supporting both physical and mental health. This reinforces the idea that green infrastructure is a key part of creating healthy and liveable places. This is further complemented by **CP61**, which protects areas of particular importance to local communities, ensuring continued access to valued green spaces as part of the wider network.

Table 9-6:Effects summary table

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Enhanced green and blue infrastructure networks.	Direct, long-term, positive.	None proposed.
Improved natural capital and ecosystem services.	Direct and indirect, long-term, positive.	None proposed.
Increased access to green spaces and recreational opportunities.	Direct, long-term, positive.	None proposed.
Improved connectivity between green infrastructure assets.	Direct, long-term, positive.	None proposed.
Long-term enhancement and management of green infrastructure resources.	Direct, long-term, positive.	None proposed.

Healthy and vital communities

Commentary on the spatial strategy

9.1.94 The spatial strategy has a direct influence on how communities develop and function across the district, particularly in terms of access to services, opportunities for everyday activity and overall quality of life. By shaping where growth takes place, it affects how easily people can meet their daily needs and how connected communities are.

9.1.95 The focus on directing development to Principal and Non-Principal Settlements (**CP4**) helps ensure that a large proportion of new housing is located in places where services and facilities are already available. This supports more convenient access to healthcare, education, shops and employment, and creates better conditions for walking and cycling as part of everyday life. Concentrating growth in these areas also increases the likelihood that services remain viable and can expand to meet future demand.

9.1.96 The proposed use of strategic allocations (**CP2**) introduces opportunities to shape new communities in a more coordinated way. Larger sites, including urban extensions and the proposed new settlement, are capable of

accommodating open space, community facilities and supporting infrastructure within their design. Where these elements are delivered alongside housing, they can create environments that support both physical activity and social interaction. However, the scale of growth proposed at some strategic locations will represent a substantial increase relative to the size of existing communities, such as Moreton-in-Marsh, Mickleton, Kemble, and Down Ampney. Whilst this creates opportunities to secure new services, facilities and infrastructure, it also highlights the importance of ensuring that supporting infrastructure is delivered in step with development and that new growth is successfully integrated with existing communities.

9.1.97 The proposed new settlement at Driffield (**CP2 and CP12**) offers the chance to establish a new community with its own services and facilities, both within the current plan period and extending beyond the plan period, which could reduce reliance on other settlements.

9.1.98 Smaller sites delivered through **CP3** play a more modest but still relevant role. By bringing development to a range of villages, the strategy helps to support population levels and maintain local facilities where they exist. This can be particularly important in rural areas, although in locations with limited services, residents may still need to travel further for day-to-day needs, which can affect overall accessibility.

9.1.99 Infrastructure provision under **CP6** is closely linked to these outcomes. The availability of community facilities, open space and transport connections will influence whether new development supports healthy and well-connected communities.

Commentary on the plan as a whole

9.1.100 The Plan sets out a comprehensive framework for supporting healthy and vital communities, drawing together policies relating to health and wellbeing, housing, infrastructure, movement, green infrastructure and design. Taken together, these policies promote environments that support physical health, mental wellbeing, social interaction and access to services, while seeking to ensure that communities are well-served and sustainable over the long term.

9.1.101 A central component of the Plan's approach is **CP68**, which explicitly requires development to demonstrate how it will reduce health inequalities, promote healthier lifestyles and support wellbeing. The requirement for Health Impact Assessments (HIAs) on larger developments provides a clear mechanism to assess how proposals respond to local health needs and address inequalities. The policy also promotes access to green space, opportunities for physical activity, and the provision of community infrastructure, all of which are directly linked to improved health outcomes.

9.1.102 **CP52** further supports healthy and vital communities by requiring the provision of new local centres within the strategic allocations. These

centres are expected to provide a range of services and facilities, including convenience retail, community uses and, where appropriate, health services, childcare provision and flexible workspace. The policy therefore supports the creation of more self-contained communities and improves access to everyday services within walking and cycling distance of new homes.

9.1.103 This approach is supported by a strong emphasis on active and sustainable travel, which plays a key role in supporting healthy lifestyles. **CP33** prioritises walking, cycling and public transport, while **CP35** requires development to be planned around safe and accessible active travel networks. These policies are reinforced by **CP34** and **CP37**, which seek to ensure that development is well connected to services and reduces reliance on private vehicles. **CP38 and 39** further support this approach by prioritising cycle infrastructure, accessible parking and provision for low emission transport, helping to create more inclusive and healthier movement environments.

9.1.104 Design is also a key factor in shaping healthy communities. **CP36, CP69, and 69a** require development to create safe, inclusive and high-quality environments, with a clear emphasis on public spaces, accessibility, social interaction and long-term adaptability. These policies encourage layouts that support active lifestyles, community cohesion and a sense of place, all of which contribute to wellbeing.

9.1.105 The Plan also places significant emphasis on green and blue infrastructure. **CP70** requires development to incorporate accessible and multifunctional green spaces, while **CP71** ensures that such spaces are properly managed and maintained over the long term. These policies support access to natural environments, recreation and biodiversity, which are closely linked to both physical and mental health. Additional support is provided through **CP1**, which promotes green infrastructure and connected open spaces. This is further supported by **CP61**, which protects areas of particular importance to local communities, helping to ensure continued access to valued open spaces.

9.1.106 Access to services and community facilities is addressed through **CP6** and **CP72**. These policies require development to provide or contribute to infrastructure such as community facilities, open spaces and services, ensuring that population growth is supported by appropriate provision. **CP72** also includes safeguards to prevent unnecessary loss of community facilities, helping to maintain social networks and community cohesion.

9.1.107 **CP8** and **CP20** support the delivery of significant new education infrastructure, including new primary and secondary schools at Cirencester, Moreton-in-Marsh and Mickleton. This will help ensure that community infrastructure keeps pace with planned growth, improve access to education for existing and future residents, and contribute to the creation of sustainable and well-served communities.

9.1.108 Housing provision also plays an important role in supporting healthy and vital communities. **CP41** requires a mix of dwelling types and includes provisions for accessible and adaptable homes, while **CP42** ensures that housing is delivered to meet identified needs, particularly for those unable to access market housing. **CP44** and **CP45** support the needs of specific groups, contributing to more inclusive communities. **DP2** also supports locally-driven housing solutions, helping to strengthen community cohesion and deliver housing that reflects local needs. **CP50**, plays an important role in managing the impacts of tourism on local communities. These policies seek to ensure that housing is not lost to short-term or holiday use where it would undermine the availability of homes for permanent residents, helping to maintain balanced and sustainable communities.

9.1.109 The Plan also supports the role of centres and local environments in community life. **CP10** and **CP51** promote mixed-use development and accessible services, supporting vibrant centres that provide opportunities for social interaction, services and leisure. Similarly, policies such as **CP16** and **CP17** support improved access to recreational spaces, while **CP18 and CP61** promotes outdoor recreation and access to the natural environment, respectively. **CP23** also safeguards opportunities for improved connectivity, which may enhance access to services and support community interaction over time. In addition, **CP53 to 59** relating to the historic environment contribute to the character, identity and distinctiveness of places, which are important to community wellbeing and sense of place.

9.1.110 The provision of infrastructure and connectivity also underpins the delivery of healthy communities. **CP8, CP13, and CP20** support the delivery of strategic infrastructure, whilst **CP9, CP14, and CP21** safeguard land required for future infrastructure schemes. These are complemented by **CP73** which supports digital connectivity, improving access to services, employment and social networks. **CP63 and 64** also contribute by ensuring that development is resilient to flooding and water-related risks, helping to protect communities and maintain safe living conditions over the long term. **CP31** further supports community resilience by encouraging locally-led initiatives that can deliver social and community benefits alongside energy generation.

9.1.111 **CP74** provides a mechanism to track delivery and respond where objectives are not being met, helping to ensure that communities remain well-served over time.

Table 9-7: Effects summary table

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Improved access to services, facilities and community infrastructure.	Direct, long-term, positive.	None proposed.

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Support for healthier lifestyles through active travel and access to green space.	Direct and indirect, long-term, positive.	None proposed.
Increased delivery of inclusive and accessible housing.	Direct, long-term, positive.	None proposed.
Enhanced community cohesion and social wellbeing.	Direct and indirect, long-term, positive.	None proposed.
Creation of healthy, attractive and well-connected places.	Direct, long-term, positive.	None proposed.

Historic environment

Commentary on the spatial strategy

9.1.112 The spatial strategy has a strong influence on how the historic environment is experienced, protected and managed across the district, particularly given the high concentration of heritage assets, including conservation areas, listed buildings and historic landscapes.

9.1.113 An important part of the strategy is the concentration of growth within Principal and Non-Principal Settlements (**CP4**). Many of these settlements have well-defined historic cores. This is reflected in the site assessment evidence, which identifies that 27 allocations are located within 500 m of a conservation area and nine allocations are located within or directly adjacent to a conservation area. Development in these locations has the potential to affect the significance, character and setting of heritage assets through changes to townscape, key views and settlement form.

9.1.114 In addition to conservation areas, heritage sensitivities associated with designated assets are also widespread across the allocations. In particular:

- five allocations are located within 500 m of a Grade I listed building;
- nine allocations are located within 500 m of a Grade II* listed building;
- 32 allocations are located within 500 m of a Grade II listed building; and
- 14 allocations are located within 500 m of a Scheduled Monument, including the strategic allocations at Steadings Southern Extension, Moreton-in-Marsh, and Down Ampney.

9.1.115 Potential effects relate principally to changes in the setting of heritage assets, impacts on the historic relationship between settlements and their surrounding landscapes, and effects on archaeological remains. One allocation, Steadings Southern Extension, contains the Settlement South East of Chesterton Farm Scheduled Monument within its development boundary. Whilst this represents a notable heritage sensitivity, the concept framework specifically seeks to conserve and enhance the setting of the

Scheduled Monument through the use of green infrastructure, open space and landscape-led design measures, helping to ensure that the monument remains a key feature within the wider site.

9.1.116 The proposed use of strategic allocations (**CP2**), particularly urban extensions, introduces both risks and opportunities for the historic environment. Large-scale development on the edges of settlements can affect the setting of historic towns and villages, including important views and the relationship between built form and surrounding countryside. However, the concept frameworks demonstrate that heritage considerations have informed the design of the strategic allocations. For example, the Cirencester South East and Steadings Southern Extension allocations incorporate substantial green infrastructure buffers and areas of open space to manage the transition between new development and the historic settlement edge. At Fairford and Down Ampney, the concept frameworks seek to respect the historic settlement pattern through the retention of landscape buffers and green corridors, whilst the Kemble allocation incorporates green infrastructure and landscape-led design measures intended to protect the setting of nearby heritage assets and maintain settlement identity. Similarly, the Moreton-in-Marsh framework incorporates strategic open space and landscape buffers which help to safeguard the setting of the historic market town and nearby heritage assets.

9.1.117 Smaller sites brought forward through **CP3** are less likely to result in large-scale change individually, but their cumulative impact is relevant. Development within or adjacent to smaller settlements, many of which have historic character, may lead to incremental change over time, particularly where sites are closely related to conservation areas or historic edges. These effects are typically more localised but can gradually alter the character of settlements if not well managed. Several non-strategic allocations are located within or adjacent to conservation areas and in proximity to listed buildings. The accompanying development templates identify these sensitivities and include requirements relating to heritage-led design, the protection of key views, archaeological investigation where necessary, landscaping measures and the conservation of heritage asset settings.

9.1.118 The role of the area strategies (**CP7, 12 and 19**) in aligning housing, employment and infrastructure supports a more coordinated approach to development, which can help in managing impacts on the historic environment. The coordinated delivery of growth also presents opportunities to secure strategic landscape and green infrastructure measures that help maintain the setting of historic settlements and heritage assets.

9.1.119 The spatial strategy recognises the constraints posed by the historic environment, particularly through the environmental capacity considerations within **CP4**, which allow for adjustments where development would cause

unacceptable harm. This provides an important safeguard, helping to direct growth away from the most sensitive areas where necessary.

Commentary on the plan as a whole

9.1.120 The Plan provides a robust framework for the conservation and enhancement of the historic environment, supported by a combination of dedicated heritage policies and cross-cutting design, regeneration and infrastructure policies. These collectively seek to ensure that development respects, protects and where possible enhances heritage assets and their settings, while enabling appropriate and sensitive change.

9.1.121 The primary policy framework for heritage protection is set out in **CP53** to **CP59**, which aligns closely with national policy. **CP53** establishes an overarching approach to the historic environment, requiring development to conserve heritage assets and their settings in a manner proportionate to their significance. Great weight is given to conservation, with harm only permitted where there is a clear and convincing justification and where any public benefits outweigh that harm. This establishes a strong protective framework, particularly for assets of the highest significance.

9.1.122 The policy framework also includes specific safeguards for different heritage asset types. **CP54** provides detailed protection for listed buildings and their settings, requiring proposals to preserve architectural and historic significance, retain important features and ensure that alterations, extensions and changes of use sustain the significance of the asset. The policy also supports the sensitive retrofitting of listed buildings where this can be achieved without unacceptable harm. **CP55** and **CP56** similarly require development affecting Conservation Areas and non-designated heritage assets to preserve or enhance their significance, character and appearance, ensuring that locally distinctive historic places and features are appropriately considered and protected. In addition, **CP58** provides protection for Registered Parks and Gardens, requiring development to conserve their significance, landscape setting and important views.

9.1.123 **CP57** further strengthens the heritage framework by requiring archaeological assessment and, where necessary, field evaluation where development may affect archaeological assets. The policy establishes a strong presumption in favour of preserving scheduled monuments and other important archaeological remains in situ, helping to protect features of archaeological significance across the district.

9.1.124 The Plan also positively supports the re-use and long-term conservation of heritage assets. **CP59** encourages the sensitive conversion of historic buildings where this would secure their future, while ensuring that their significance is sustained. This approach is reinforced by **CP26**, which supports the sensitive retrofitting of traditional buildings, provided that their significance is not harmed. This is further complemented by **DP7**, which

supports the reuse of existing rural buildings in a way that respects their character and setting, helping to secure their long-term viability.

9.1.125 Beyond the core heritage policies, the Plan integrates the historic environment into place-making and regeneration strategies. For example, **CP10** promotes development that is sensitive to the character and spatial qualities of the historic town centre, including references to the Roman Wall and urban grain. Similarly, **CP11** requires development to respect the parkland character and built heritage of the site, while **CP24** includes requirements to enhance the setting of key sites. **CP51** also contributes by requiring development to enhance the character and heritage of centres, supporting their continued vitality while safeguarding historic significance. These policies demonstrate a commitment to using heritage as a driver for high-quality place-making.

9.1.126 Historic transport and cultural assets are also recognised. **CP16** and **CP23** require development to respect, improve and enhance historic routes and associated features, safeguarding their cultural and historic value. These policies support the preservation of historic infrastructure while enabling appropriate use and access. **CP22** also contributes indirectly by maintaining openness and preventing inappropriate development in areas where the historic landscape setting of settlements and heritage assets is particularly sensitive. This is further reinforced by **CP62**, which requires development to conserve landscape character, important views and the setting of natural and built landmark features. This is particularly important in the Cotswolds, where the historic environment is closely tied to landscape character, and helps ensure that the wider setting and historic landscape context of heritage assets are appropriately protected.

9.1.127 Design policies further reinforce heritage protection. **CP69** requires proposals to respond to context, local history and cultural identity, ensuring that new development is informed by its historic surroundings. The requirement for masterplanning, design codes and design review for major development and strategic allocations, through **CP69a**, provides additional safeguards to ensure that heritage considerations are addressed from the earliest stages. **CP73** also includes safeguards to minimise impacts on heritage assets and their settings, ensuring that modern infrastructure is carefully integrated within historic environments.

Table 9-8: Effects summary table

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Conservation and enhancement of heritage assets and their settings.	Direct, long-term, positive.	None proposed.
Protection of the character and appearance of historic settlements.	Direct and indirect, long-term, positive.	None proposed.
Heritage-led design and place-making.	Direct, long-term, positive.	None proposed.

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Potential effects on the setting and significance of heritage assets from new development.	Direct and indirect, long-term, negative.	Mitigation provided through Plan policies and site-specific requirements.

Housing

Commentary on the spatial strategy

9.1.128 The spatial strategy provides the overall framework for how housing growth will be delivered across the district, setting out both the scale of provision and its geographical distribution. It establishes a clear approach based on a combination of strategic allocations, smaller sites and windfall development, which together meet housing needs.

9.1.129 A clear strength of the strategy is that it plans not only to meet but to exceed the identified housing requirement by incorporating an approximate 5% buffer above LHN (**CP2**), allowing for flexibility and contingency over the plan period. This reduces the risk of under-delivery and helps ensure that housing needs can be met even where some sites come forward more slowly than expected (i.e., due to the longer lead in times associated with strategic allocations). It also supports a stable supply of land, which is important for maintaining delivery over the long term.

9.1.130 The overall distribution of housing is guided by the settlement hierarchy (**CP4**), which directs most growth towards Principal and Non-Principal Settlements as these settlements are better served by infrastructure, services and employment opportunities. In particular, significant proportions of the district's housing growth are directed to Cirencester, Driffield, Moreton-in-Marsh, Fairford, Kemble and Mickleton through the strategic allocations, alongside smaller allocations within a range of Principal and Non-Principal Settlements.

9.1.131 The proposed use of strategic allocations (**CP2**) forms the backbone of housing supply, delivering a large proportion of new homes through a relatively small number of sites. The largest allocations are focused at Driffield, Moreton-in-Marsh, Cirencester, Fairford, Kemble and Mickleton, allowing for a more planned and coordinated form of growth where infrastructure, community facilities and environmental mitigation can be considered comprehensively. Strategic sites also provide opportunities for longer-term delivery, including future growth beyond the plan period, which supports continuity in housing supply.

9.1.132 The strategy also seeks to address identified Gypsy and Traveller accommodation needs through **CP45**. The Council's assessment of the strategic allocations concluded that only the strategic allocations at Steadings Southern Extension and Driffield could reasonably accommodate Gypsy and Traveller provision during the plan period whilst also retaining

sufficient capacity to support ongoing housing delivery beyond the plan period. The inclusion of Gypsy and Traveller pitches within these larger strategic allocations therefore supports the delivery of identified accommodation needs alongside wider housing growth, helping to promote inclusive and mixed communities.

9.1.133 Alongside this, non-strategic allocations (**CP3**) play a complementary role by providing smaller-scale development opportunities across a wider range of settlements. This helps to maintain a spread of housing development across the district, which can support rural communities and local services. It also introduces flexibility, allowing housing delivery to come forward from a variety of sources rather than relying solely on large sites.

9.1.134 The spatial strategy is further supported by the area-based strategies (**CP7, 12 and 19**), which set out how housing growth will be delivered in different parts of the district. These strategies align housing with employment and infrastructure, helping to ensure that development is better coordinated and more balanced. The requirement for infrastructure delivery (**CP6**) is an important part of the strategy, as it seeks to ensure that housing growth is supported by the necessary facilities and services. This is critical to making housing developments successful and sustainable.

Commentary on the plan as a whole

9.1.135 The Plan provides a strong and comprehensive framework for housing provision, addressing the delivery of sufficient, high-quality, affordable and inclusive housing, supported by infrastructure and aligned with wider sustainability objectives.

9.1.136 A key strength of the Plan is its focus on meeting a wide range of housing needs. **CP41** requires development to provide an appropriate mix of dwelling sizes informed by evidence, alongside clear requirements for accessible and adaptable homes (M4(2)) and wheelchair user dwellings (M4(3)). This contributes to the delivery of housing that is suitable for older people and those with mobility impairments, supporting long-term adaptability of the housing stock.

9.1.137 **CP43** supports the delivery of self-build and custom-build housing through requirements on larger sites, helping to diversify housing supply and expand housing choice.

9.1.138 The Plan also supports specialist and supported housing provision through **CP44**, which addresses the needs of groups including older people, people with disabilities and those requiring care. The policy emphasises accessibility, integration with services and community connectivity, helping to ensure that housing contributes to inclusive and balanced communities. **CP45** further strengthens this approach by identifying sites and setting out a clear framework for meeting the accommodation needs of Traveller communities, ensuring that provision is planned and delivered in a structured and sustainable way.

9.1.139 The provision of affordable housing is a central component of the housing framework. **CP42** requires a substantial proportion of new development to deliver affordable housing, with a strong emphasis on rented tenures, reflecting identified needs. This is supported by **DP1** and **DP2**, which provide additional delivery mechanisms, particularly in rural areas. Together, these policies are likely to make a significant contribution to improving housing affordability and access across the district.

9.1.140 The Plan also includes targeted measures to help maintain a sustainable supply and balance of housing through **CP50**, which includes safeguards to prevent the loss of existing dwellings to visitor accommodation where it would undermine housing supply, and by **CP49**, which requires proposals to be compatible with local communities and environmental constraints. Together, these policies help to manage the pressures of tourism on housing availability.

9.1.141 Housing provision in rural areas is further supported through **DP3**, which enables housing where there is an essential need linked to rural enterprises, while maintaining appropriate controls. **DP4** ensures that existing restrictions are only lifted where justified, helping to protect housing intended to meet specific local needs. **DP5** also contributes by allowing the renewal of housing stock where appropriate, ensuring that replacement homes remain proportionate in scale and location, supporting the maintenance and improvement of existing dwellings without resulting in unsustainable expansion.

9.1.142 The Plan also promotes high-quality and sustainable housing development. **CP1** requires housing proposals to incorporate measures relating to energy efficiency, climate resilience, sustainable construction and green infrastructure, contributing to improved living conditions and long-term sustainability. This is complemented by provisions encouraging access to active travel and green space.

9.1.143 Delivery of housing is closely linked to infrastructure provision. **CP6** ensures that new housing is supported by the necessary social, physical and service infrastructure, helping to create sustainable and well-functioning communities. Similarly, **CP8, CP13 and CP20** support the delivery of strategic infrastructure required to underpin housing growth, whilst **CP9, CP14 and CP21** safeguard land required for future infrastructure schemes. The Plan also supports the integration of housing within mixed-use and regeneration contexts.

Table 9-9: Effects summary table

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Meeting housing needs across the district.	Direct, long-term, positive.	None proposed.

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Increased provision of affordable housing.	Direct, long-term, positive.	None proposed.
Increased provision of accessible and specialist housing.	Direct, long-term, positive.	None proposed.
Improved housing choice and tenure mix.	Direct, long-term, positive.	None proposed.
Improved housing supply to meet identified needs.	Direct, long-term, positive.	None proposed.

Landscape

Commentary on the spatial strategy

9.1.144 The spatial strategy has a direct influence on the character and appearance of the district's landscapes, particularly through the scale and location of development and how it is distributed between settlements and the countryside. As the Cotswolds National Landscape covers approximately 80% of the district, and given the designation of Special Landscape Areas locally, these considerations have been a key factor in shaping the spatial strategy for the Plan.

9.1.145 The approach to growth reflects the need to balance development requirements with the protection of valued landscapes. In this regard, the focus for strategic-scale growth has been on sites located outside of the Cotswolds National Landscape, reflecting national policy which affords the highest level of protection to nationally designated landscapes. For non-strategic allocations, the focus has similarly been on directing growth towards Principal and Non-Principal Settlements located outside of the National Landscape where possible. However, it is recognised that communities within the National Landscape also require opportunities for growth to support their vitality and long-term sustainability. As a result, development within the National Landscape has generally been directed towards locations identified through the Council's Landscape Sensitivity Assessment as being capable of accommodating development, taking account of landscape sensitivity and opportunities for mitigation. In some cases, allocations have also been supported by wider planning considerations, including community infrastructure benefits and settlement sustainability considerations.

9.1.146 This approach is reflected in the allocation strategy, although landscape designations and sensitivities remain a notable consideration across a number of allocations. In particular:

- 16 non-strategic allocations are located within the Cotswolds National Landscape;

- a further 14 allocations are located within 2 km of the Cotswolds National Landscape, comprising seven strategic allocations and eight non-strategic allocations; and
- 18 allocations overlap with a Special Landscape Area, comprising two strategic allocations and 16 non-strategic allocations.

9.1.147 Development in these locations has the potential to affect landscape character, settlement setting, important views and the relationship between settlements and the surrounding countryside, increasing the importance of careful site design and landscape mitigation.

9.1.148 The Landscape Sensitivity Assessment also demonstrates several of the allocations are located within landscapes of medium-high or high sensitivity, including strategic allocations at Driffield, Fairford, and Kemble (see the Landscape Sensitivity Assessment). In response, the concept frameworks incorporate measures such as structural planting, landscape buffers, green infrastructure corridors, retention of existing vegetation and the use of open space to soften settlement edges and maintain key views. For example, the Steadings Southern Extension allocation incorporates substantial green infrastructure and open space along sensitive boundaries, whilst the Kemble and Fairford allocations utilise landscape-led design principles to assist integration with the surrounding landscape. At Moreton-in-Marsh and Mickleton, landscape buffers and strategic open space are incorporated to help protect settlement setting and reduce visual impacts. These measures should help to reduce potential adverse effects on landscape character and visual amenity.

9.1.149 The proposed new settlement at Driffield (**CP2** and **CP12**) also represents a significant landscape change. As a new area of built development, it will inevitably alter the existing character of the landscape at a local scale. While there is scope to design the settlement in a way that responds to its surroundings, including through layout and landscape structure, it will still represent a substantial change to currently undeveloped land. However, the concept framework incorporates strategic green infrastructure corridors, open space networks and structural landscaping intended to help integrate the development into the surrounding landscape and maintain connectivity with existing landscape features.

9.1.150 Smaller sites delivered through **CP3** are less likely to result in major change individually, but their cumulative impact is important. Development across multiple villages and edge-of-settlement locations can gradually alter the pattern and form of settlements, particularly where development extends into open land or affects the distinction between settlements and the countryside. The accompanying development templates for the non-strategic sites identify landscape sensitivities and include requirements relating to landscape buffers, structural planting, protection of key views and context-sensitive design.

9.1.151 The spatial strategy does include an important safeguard through the environmental capacity approach within **CP4**, which allows for adjustments where development would result in unacceptable harm, including to landscape character. This provides a mechanism to take account of landscape sensitivity when distributing growth.

Commentary on the plan as a whole

9.1.152 The Plan is prepared within a highly sensitive landscape context, with much of the district falling within the Cotswolds National Landscape, placing significant emphasis on the need to conserve and enhance landscape character, scenic quality and sense of place. Overall, the Plan provides a strong framework for landscape protection and enhancement, although some policies supporting development introduce potential for localised adverse effects.

9.1.153 **CP62** provides a clear overarching framework, requiring development to conserve landscape character, important views, and the setting of natural and built features, including the historic significance of landscapes. The policy also requires development to respond to the Cotswold Landscape Character Assessment, protect settlement separation, avoid unacceptable visual intrusion into the countryside and, for major developments, be supported by Landscape and Visual Impact Assessments.

9.1.154 A key strength of the Plan is the way landscape considerations are embedded across multiple policies, rather than being addressed solely through **CP62** as single policy. For example, **CP22** explicitly requires development to conserve openness, landscape character and separation, while also recognising the area's designation within the National Landscape.

9.1.155 The Plan also includes clear safeguards for development within sensitive landscapes. **CP28** and **CP29** require proposals affecting the National Landscape to demonstrate that benefits outweigh harm, and direct development away from areas of high landscape sensitivity. Likewise, **CP30** proposes locating larger-scale solar schemes in areas of lower landscape sensitivity, helping to manage cumulative landscape effects.

9.1.156 The Plan supports landscape enhancement and restoration, particularly through policies relating to green infrastructure and environmental assets. **CP70** requires development to adopt a design-led approach, integrating landscape features such as trees, hedgerows, watercourses and habitats into proposals. It also promotes connectivity, biodiversity net gain and long-term management, all of which contribute to improved landscape quality and resilience. This is reinforced by **CP71**, which ensures the long-term stewardship of accessible green spaces. **CP60** further strengthens this by requiring protection and enhancement of habitats and ecological networks, recognising the essential role that biodiversity plays in defining landscape character and function. **DP10** further strengthens this approach by

protecting key landscape features and promoting new planting, which contributes to the conservation of landscape character and the delivery of wider environmental benefits.

9.1.157 Landscape character is also protected through rural development policies, which emphasise sensitive siting, design and integration with existing features. For example, **DP6** and **DP8** require proposals to integrate with existing buildings, avoid skyline locations and minimise visual impacts, while also protecting National Landscape character. Similarly, **DP9** requires schemes to demonstrate that they do not result in adverse cumulative landscape impacts. **DP11** also contributes by protecting the district's dark night skies, which form an important component of landscape character and tranquillity, particularly within rural areas and the Cotswolds National Landscape.

9.1.158 Policies focused on the reuse of existing buildings, such as **DP7** and **DP5**, also contribute positively by encouraging the reuse and adaptation of existing structures, thereby reducing the need for new built form in the countryside and helping to maintain landscape character.

9.1.159 In addition, the Plan recognises the importance of distinct landscape features and corridors. **CP16** and **CP23** require development to respect and enhance their historic and landscape character, while **CP18** supports after-uses that reinforce local landscape identity and sense of place. **CP17** also supports leisure and recreation uses where appropriate, which can enhance the function and value of river corridors within the landscape. **CP65** further supports this by requiring development to protect the form, function and setting of watercourses, including the provision of buffer zones and avoidance of culverting, helping to maintain their role as key landscape features and corridors. **CP61** contributes at a more local scale by protecting areas of particular importance to communities, helping to maintain the character and distinctiveness of settlements and their surroundings.

9.1.160 The relationship between landscape and the historic and built environment is also clearly recognised. **CP53 to 59** ensure that development conserves heritage assets and their settings, which are key components of the Cotswold landscape. Similarly, **CP51** and **CP10** contribute to the protection of townscape character, ensuring that development within settlements reflects local form, grain and historic context. Design policies such as **CP69 and 69a** further reinforce this by requiring development to respond to local character and identity, including both townscape and landscape considerations.

9.1.161 **CP72** supports the provision of open spaces and community facilities which form part of the wider townscape and local landscape structure, while **CP73** requires infrastructure to minimise visual impacts, helping to protect skylines, views and landscape character.

9.1.162 **CP74** provides a mechanism to track the effectiveness of the policy framework and respond where landscape objectives are not being achieved.

Table 9-10: Effects summary table

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Protection and enhancement of landscape character through landscape-led design, green infrastructure and mitigation measures.	Direct, long-term, positive.	None proposed.
Potential landscape effects associated with development within and in proximity to the Cotswolds National Landscape and Special Landscape Areas.	Direct and indirect, long-term, negative.	Mitigation provided through Plan policies, concept frameworks and development templates.
Improved integration of development into the landscape through buffers, planting, open space and green infrastructure.	Direct, long-term, positive.	None proposed.

Land, soil and water resources

Commentary on the spatial strategy

9.1.163 The spatial strategy influences how land is used, soils are managed and water resources are affected, primarily through the location and scale of development. These effects are closely linked to the balance between concentrating growth and distributing it across the district.

9.1.164 Focusing development within Principal and Non-Principal Settlements (**CP4**) helps to make more efficient use of land, particularly where development takes place within or on the edge of existing built-up areas. This can reduce the need for more dispersed development across the countryside, which would otherwise lead to a greater overall loss of undeveloped land. At the same time, in light of the limited brownfield availability across the district, much of the planned growth is on greenfield sites, meaning that land take and soil loss is unavoidable.

9.1.165 The proposed delivery of strategic allocations (**CP2**) provides opportunities to plan development more carefully, including how land is used and how water is managed across a site. However, these locations will still involve the permanent loss of agricultural land and soil resources, particularly where sites are currently in active use. In this regard:

- 40 allocations overlap with Agricultural Land Classification (ALC) Grades 1-3 agricultural land, although this does not distinguish between Grade 3a (best and most versatile land) or Grade 3b land;

- 16 allocations are located within a Groundwater Source Protection Zone, including the strategic allocations at Down Ampney, Driffield, Kemble, Cirencester South East, Kingshill Lane, Fairford, Siddington, and Steadings Southern Extension;
- six allocations are located within 500 m of a historic landfill site; and
- three allocations are located within 250 m of a safeguarded waste site.

9.1.166 These constraints indicate the potential for adverse effects on agricultural land resources, soil quality and groundwater resources if development is not appropriately designed and managed.

9.1.167 The concept frameworks for the strategic and non-strategic allocations incorporate measures intended to respond to many of these constraints. For example, the strategic allocations at Driffield, Steadings Southern Extension, Fairford and Moreton-in-Marsh incorporate substantial areas of green infrastructure, sustainable drainage systems, strategic open space and multifunctional green space. Similarly, allocations located within Groundwater Source Protection Zones include requirements relating to sustainable drainage, surface water management and the protection of water quality. These measures should help to reduce risks to soil functions, improve water management and limit adverse effects on groundwater resources.

9.1.168 The role of infrastructure delivery (**CP6**) is also relevant, particularly in relation to water resources. Infrastructure such as drainage systems and utilities will influence how water is managed across the district. This is important given that many Principal and Non-Principal Settlements are within proximity to a main river or watercourse and areas of flood risk.

Commentary on the plan as a whole

9.1.169 The Plan provides a generally positive framework for the sustainable management of land, soil and water resources, within the constraints of the district. It achieves this by promoting efficient use of natural resources, protection of water environments and sustainable land management, while recognising the potential for some localised adverse effects associated with development pressures and inevitable loss of agricultural land.

9.1.170 A key strength of the Plan is the integration of resource efficiency and water management within climate policy. **CP1** explicitly requires development to promote the efficient use of natural resources, including water and soil, and to incorporate measures such as SuDS and water efficiency in buildings. This supports the sustainable management of water resources, helps to reduce runoff and flood risk, and contributes to the protection of soil structure and function. The inclusion of waste reduction and circular economy principles also promotes efficient land use and minimisation of resource consumption.

9.1.171 Water environments are further supported through policies relating to key watercourses and assets. **CP16** requires development to respect, enhance and restore the canal and its historic route, including its biodiversity and hydrological function. Similarly, **CP17** allows increased recreational use only where there is environmental capacity, implicitly recognising constraints relating to water quality and ecological sensitivity. **CP65** strengthens this approach by requiring development to protect the function, morphology and setting of watercourses, including buffer zones and avoidance of culverting, helping to maintain natural hydrological processes and water quality.

9.1.172 **CP18** provides a particularly positive approach to land and water resource management in former mineral extraction areas. It requires development to deliver biodiversity net gain, landscape enhancement and safe public access, while ensuring that proposals are consistent with approved restoration and aftercare schemes. This contributes to the beneficial after-use of previously disturbed land and supports long-term environmental enhancement.

9.1.173 The Plan also promotes the efficient use of land and materials, particularly through **CP26**, which encourages the reuse and retrofit of existing buildings rather than demolition and rebuild. This helps to reduce land take, minimise waste and limit the loss of embodied resources. The requirement to consider embodied carbon and the circular economy further supports more sustainable use of materials and land resources.

9.1.174 Agricultural land and rural resource management are addressed through **DP8**, which requires proposals to demonstrate a functional need, minimise environmental impacts and incorporate mitigation and enhancement measures such as retention of hedgerows and provision for wildlife. These provisions help protect soil quality, agricultural productivity and ecological functions. This is complemented by **CP60**, which promotes the protection of habitats and ecological networks that depend on healthy soil and water systems, and by **CP62**, which supports the conservation of natural landforms and soil-based landscape features.

9.1.175 A comprehensive framework for managing water resources is provided through **CP63 and CP64**. These policies require development to demonstrate adequate water supply and wastewater capacity, achieve high standards of water efficiency, protect water quality and incorporate SuDS. They also promote the use of natural flood management techniques and require a sequential approach to development in flood-prone areas. Together, these policies play a central role in managing water resources and reducing pressures on both surface and groundwater systems. **CP66** further supports this by preventing contamination of soil and water resources and requiring remediation where necessary.

9.1.176 **CP74** provides a mechanism to track environmental outcomes and respond where objectives relating to resource management are not being achieved.

Table 9-11: Effects summary table

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Improved management of water resources through water efficiency measures, SuDS and water quality protections.	Direct, long-term, positive.	None proposed.
Protection and enhancement of groundwater and water environments.	Direct and indirect, long-term, positive.	None proposed.
Loss of agricultural land and soil resources through development.	Direct, permanent, negative.	Mitigation provided through Plan policies and site-specific requirements.
Increased pressure on water resources from planned growth.	Indirect, long-term, negative.	Mitigation provided through water efficiency and water management policies.

Transport and air quality

Commentary on the spatial strategy

9.1.177 The spatial strategy has a clear influence on travel patterns, levels of traffic and associated air quality, mainly through the location of development and how well it connects people to jobs, services and transport networks.

9.1.178 The focus on directing growth to Principal and Non-Principal Settlements (**CP4**) supports more efficient travel patterns. These locations are generally better served by facilities and, where available, public transport, making it more realistic for people to walk, cycle or use public transport for day-to-day journeys. Concentrating development in these areas reduces the need for longer-distance travel and can help limit increases in traffic and emissions.

9.1.179 The proposed strategic allocations (**CP2**) provide opportunities to plan movement in a more coordinated way. Larger sites can be designed with integrated walking and cycling routes, links to existing networks and provision for public transport, which may help to reduce reliance on private vehicles over time.

9.1.180 The spatial distribution of growth also provides opportunities to make use of the district's rail infrastructure. Settlements served by rail stations, including Moreton-in-Marsh and Kemble, along with Mickleton, which is in proximity of Honeybourne rail station, are a focus for planned growth over the Plan period. Collectively, this represents that around 36% of new allocations are proposed either within settlements served by rail infrastructure or in locations with reasonable access to rail services. The concept frameworks for the strategic allocations at Kemble, Moreton-in-Marsh and Mickleton include active travel links and connections to local

centres and transport infrastructure, which should help support more sustainable travel patterns and reduce reliance on private car use. Additionally, the delivery of a link road to the south and east of Moreton-in-Marsh will help to alleviate traffic through the town.

9.1.181 The distribution of development across smaller settlements through **CP3** contributes to dispersed growth. In these locations, access to services and public transport is often more limited, meaning that residents are more likely to rely on private vehicles for everyday travel. While the scale of individual sites is relatively small, their cumulative effect may increase traffic levels and have a localised impact on air quality.

9.1.182 The alignment of housing and employment growth within the area strategies (**CP7, 12 and 19**) helps to support more balanced communities, where some journeys can be made more locally.

9.1.183 The requirement for infrastructure delivery (**CP6**) is an important part of the strategy, as it provides a mechanism to deliver transport improvements alongside growth. This may include new routes, services or enhancements to existing infrastructure. At the same time, supporting growth may also involve investment in road infrastructure, which could reinforce car use if not balanced with sustainable transport measures.

Commentary on the plan as a whole

9.1.184 The Plan provides a strong and comprehensive framework to promote sustainable transport, reduce reliance on the private car and improve air quality, although the delivery of planned growth and associated infrastructure introduces potential for localised adverse effects.

9.1.185 A key strength of the Plan is the prioritisation of sustainable transport modes. **CP33** and **CP34** require development to prioritise walking, cycling and public transport, supported by integrated networks, improved infrastructure and contributions to sustainable travel measures. These are reinforced by **CP35**, which promotes the creation of safe, direct and attractive walking and cycling routes, including connections to schools and key services. Collectively, these policies provide a strong framework for encouraging modal shift away from the private car, with positive implications for reducing traffic congestion and improving air quality.

9.1.186 The Plan also places significant emphasis on public transport provision and accessibility. **CP37** requires development to incorporate viable and frequent public transport services, with clear accessibility standards (for example, proximity to stops and service levels). The requirement for mobility hubs, bus service enhancements and integrated shared transport options in **CP33** further supports a transition to more sustainable travel behaviours.

9.1.187 In addition, **CP39** and provisions within **CP1** promote the uptake of electric vehicles (EVs) and low-emission transport, including charging infrastructure

and support for alternative mobility options such as electric bikes. This is likely to contribute to improvements in local air quality over time, particularly in areas currently affected by vehicle emissions. **CP38** further supports this by prioritising cycle infrastructure, managing parking provision and promoting electric vehicle charging, which can influence travel behaviour and reduce reliance on private vehicles.

9.1.188 The Plan adopts a holistic and design-led approach to transport, integrating movement with place-making. **CP36** and **CP69** require development to create well-connected, safe and attractive environments that encourage active travel and reduce car dependency. **CP36** is particularly important in shaping how streets and public spaces function, requiring layouts that prioritise walking, cycling and inclusive movement, which can significantly influence travel behaviour and reduce reliance on private vehicles. **CP68** further strengthens this approach by promoting development that supports active lifestyles and reduces health inequalities, linking transport planning directly to air quality and health outcomes.

9.1.189 **CP66** complements this approach by requiring development to avoid unacceptable risks arising from pollution, contaminated land, noise, vibration, dust, odour and impacts on air, land and water resources. The policy also requires investigation and remediation where contamination is present, helping to protect both environmental quality and human health.

9.1.190 Infrastructure delivery is also a key component. **CP6, 8, 13 and 20** support the delivery of strategic transport infrastructure, including cycle links, transport hubs, public transport improvements and new road infrastructure where required. These policies help ensure that transport capacity and connectivity are aligned with development, reducing the risk of unmanaged congestion and associated air quality issues. **CP9, CP14 and CP21** further supports this by protecting land required for future transport schemes, although the implementation of such infrastructure may result in localised increases in traffic and associated emissions depending on scheme design and function.

9.1.191 The Plan also supports the reuse and enhancement of existing transport corridors, such as through **CP23** and **CP16**, which can provide sustainable transport and recreational routes, further reducing reliance on car travel. **CP11** and other strategic site policies also require proposals to demonstrate sustainable access and connectivity, ensuring that major trip-generating uses are integrated with sustainable transport networks.

9.1.192 Despite these strengths, the scale of development proposed within the Plan will inevitably lead to increased traffic generation, particularly in rural areas or locations where public transport provision may be more limited. While policies seek to mitigate these impacts through transport assessments, travel plans and sustainable infrastructure, some increase in vehicle trips and associated emissions is likely, particularly in the short to medium term.

9.1.193 Strategic infrastructure policies also include provision for new and upgraded road infrastructure, which, while necessary to support growth, may encourage continued car use in some locations and potentially offset gains from sustainable transport measures. In addition, rural development policies may give rise to car-dependent travel patterns, reflecting the dispersed nature of some settlements. Development associated with certain uses, such as employment sites or aviation-related activities at **CP15**, may also contribute to increased traffic and emissions, although these effects are expected to be managed through transport and environmental policy requirements. Policies supporting employment development, such as **CP46**, may also influence travel patterns and trip generation, particularly where employment sites are located outside of the most accessible locations. However, the policy includes support for sustainable travel and working practices, which may help to mitigate associated transport and air quality impacts.

9.1.194 However, these adverse effects are clearly mitigated by the overarching policy framework, which requires a strong focus on mode shift, integrated transport planning, EV uptake and accessibility to sustainable travel options. **CP67** further reinforces this by requiring development to minimise air pollution and protect air quality, including through mitigation measures where deterioration may otherwise occur. The emphasis on early infrastructure provision, masterplanning and long-term monitoring (**CP74**) further supports effective implementation.

Table 9-12: Effects summary table

Likely significant effect	Effect dimensions	Recommendations / mitigation measures
Increased use of sustainable and active travel modes.	Direct, long-term, positive.	None proposed.
Improved accessibility to public transport and sustainable transport infrastructure.	Direct, long-term, positive.	None proposed.
Improved air quality through reduced reliance on private vehicles and increased uptake of low-emission transport.	Direct and indirect, long-term, mixed.	None proposed.
Increased traffic generation associated with planned growth, particularly in rural areas.	Direct, long-term, negative.	Mitigation provided through sustainable transport, accessibility and air quality policies.

Cumulative and in-combination effects

9.1.195 Cumulative and in-combination effects refer to the combined impacts of multiple policies, proposals, or developments:

- Cumulative effects arise when several policies or developments affect the same environmental receptor or issue over time; and
- In-combination effects occur when the Plan's impacts interact with those from other plans or projects, potentially leading to greater overall effects.

Cumulative Effects

9.1.196 The Plan introduces a number of allocations which have the potential to give rise to cumulative effects, particularly in relation to transport, landscape, biodiversity, water resources and settlement character.

9.1.197 Cumulative effects arise from the concentration of development within and around Cirencester. The presence of multiple strategic allocations and associated infrastructure proposals within the same broad area has the potential to result in combined pressures on local transport networks, increased demand on water and wastewater infrastructure, and incremental changes to landscape and townscape character.

9.1.198 Cumulative effects may also occur in settlements that have already experienced recent growth, such as Moreton-in-Marsh. Additional allocations, when considered alongside existing planning commitments and recent development patterns, may lead to further incremental changes in settlement form, increased traffic levels and additional pressure on local infrastructure. Over time, this may result in more noticeable changes to character and environmental conditions.

9.1.199 Longer-term growth trajectories represent a further source of cumulative effects. Strategic locations such as Driffield and The Steadings may act as focal points for development beyond the plan period, and while the Plan defines growth within a fixed timeframe, there remains the potential for continued expansion in these areas. This could result in gradual but substantial changes to landscape character, land use patterns and infrastructure demand over time.

9.1.200 The spatial distribution of development may also give rise to cumulative effects. In particular, the concentration of growth in settlements outside the Cotswolds National Landscape, while consistent with environmental constraints, may result in disproportionate expansion in certain locations. This has the potential to alter the scale, form and character of those settlements incrementally, particularly where growth significantly exceeds historic development patterns.

9.1.201 At a district-wide level, the overall scale of development proposed is likely to result in incremental loss of greenfield land, soil sealing and increased

pressure on water resources. While such effects may be limited at the individual site level, their cumulative impact over time may become more noticeable, particularly where multiple developments occur within the same landscape, catchment or infrastructure network.

In-Combination Effects

9.1.202 In-combination effects are likely to arise through the interaction of the CLP with neighbouring plans, cross-boundary development patterns and wider strategic systems, including transport and environmental networks.

9.1.203 A key in-combination issue relates to cross-boundary transport patterns. Growth in settlements such as Mickleton may interact with development in neighbouring authorities, including Honeybourne in Wychavon District, particularly in relation to access to rail services and shared transport infrastructure. The combined effect of development across administrative boundaries may result in increased traffic flows and associated air quality impacts along key routes, particularly where infrastructure serves a wider functional area.

9.1.204 In-combination effects may also arise in relation to ecological receptors, particularly Site of Special Scientific Interest (SSSIs) and other sensitive habitats. Where multiple allocations fall within Impact Risk Zones, such as around Fairford, the combined effects of development may include increased recreational pressure, habitat fragmentation or changes to hydrological conditions. These impacts may arise not only from development within the Plan area, but also from pressures generated by surrounding authorities and wider environmental systems.

9.1.205 There is also potential for interaction with wider infrastructure systems, particularly transport and water networks, which extend beyond the administrative boundary. Development proposed within the Plan may place additional demand on shared infrastructure, and this demand may combine with growth from neighbouring areas, resulting in pressures that are greater than those associated with the CLP alone.

9.1.206 At a broader strategic level, Local Government Reorganisation across Gloucestershire may also give rise to in-combination effects. Changes in governance structures, spatial planning responsibilities and infrastructure delivery mechanisms may influence how development is coordinated across the area. While the impact of this remains uncertain, there is potential for effects relating to the alignment of growth strategies, infrastructure provision and environmental management.

9.2. Summary of the appraisal findings

Biodiversity

9.2.1 The Plan is expected to have **positive effects for biodiversity** through the protection and enhancement of ecological assets, the delivery of biodiversity net gain, and the strengthening of green infrastructure and ecological networks. Whilst development has the potential to affect sensitive ecological receptors, the policy framework provides a robust basis for avoiding, reducing and mitigating adverse effects. Overall, the Plan is expected to support improved ecological resilience and nature recovery across the district.

Climate change adaptation

9.2.2 The Plan is expected to have **positive effects for climate change adaptation** through a strong framework of policies relating to flood risk, water management, sustainable drainage, climate-resilient design and green and blue infrastructure. Whilst a number of allocations are affected by climate-related constraints, including flood risk and groundwater flooding, the Plan incorporates a range of site-specific and policy-based measures intended to avoid, reduce and mitigate these risks. Overall, the Plan is expected to improve the resilience of communities, development and infrastructure to the effects of climate change over the long term.

Climate change mitigation

9.2.3 The Plan is expected to have **positive effects for climate change mitigation** through a comprehensive framework of policies promoting net zero carbon development, renewable and low carbon energy, sustainable transport and active travel. The spatial strategy supports this approach by directing growth towards the district's most sustainable settlements, including locations with access to the rail network, whilst strategic allocations incorporate measures designed to reduce reliance on private car travel. Overall, the Plan is expected to contribute to a long-term reduction in greenhouse gas emissions across the district.

Economy and employment

9.2.4 The Plan is expected to have **positive effects for economy and employment** through the delivery of employment land, support for key economic sectors, protection of existing employment sites and investment in infrastructure and connectivity. The spatial strategy aligns housing and employment growth across the district, helping to support sustainable economic development, improve access to jobs and strengthen local communities. Overall, the Plan is expected to support long-term economic growth, business resilience and employment opportunities across the district.

Equalities

9.2.5 The Plan is expected to have **positive effects for equalities** through a strong focus on inclusive design, accessibility, community infrastructure and the delivery of affordable, accessible and specialist housing. Policies relating to sustainable transport, access to services, digital connectivity and health and wellbeing further support equitable outcomes for different groups across the district. Overall, the Plan is expected to promote social inclusion and improve access to housing, services and opportunities for all residents, including those with protected characteristics.

Green infrastructure and natural capital

9.2.6 The Plan is expected to have **positive effects for green infrastructure and natural capital** through the protection, enhancement and long-term management of green and blue infrastructure assets. The strategic allocations, policy framework and supporting concept frameworks provide significant opportunities to strengthen green infrastructure networks, improve access to natural greenspace, deliver multifunctional environmental benefits and enhance ecosystem services. Overall, the Plan is expected to contribute positively to the quality, resilience and connectivity of the district's natural assets.

Healthy and vital communities

9.2.7 The Plan is expected to have **positive effects for healthy and vital communities** through the delivery of housing, infrastructure, community facilities and accessible green spaces in sustainable locations. A strong emphasis on inclusive design, active travel, health and wellbeing, and access to services will help support healthier lifestyles and community cohesion. Whilst some settlements will accommodate significant levels of growth relative to their existing size, the Plan seeks to ensure that development is supported by the timely delivery of infrastructure and community facilities. Overall, the Plan is expected to contribute to the creation of well-connected, inclusive and resilient communities across the district.

Historic environment

9.2.8 The Plan is expected to result in **mixed, but predominantly positive, effects on the historic environment.** Whilst a significant number of allocations are located in proximity to heritage assets, conservation areas and scheduled monuments, creating potential for adverse effects on their significance and setting, the Plan includes a robust framework of heritage, design and place-making policies alongside site-specific mitigation measures. These provide a strong basis for avoiding, reducing and mitigating adverse effects, whilst also creating opportunities for heritage-led regeneration and the long-term conservation of the district's historic environment.

Housing

9.2.9 The Plan is expected to have **positive effects for housing** through meeting LHN and providing a headroom which allows for flexibility and contingency over the plan period. This reduces the risk of under-delivery and helps ensure that housing needs can be met even where some sites come forward more slowly than expected (i.e., due to the longer lead in times associated with strategic allocations). It also supports a stable supply of land, which is important for maintaining delivery over the long term. More broadly, policy support for affordable housing, accessible and adaptable homes, specialist accommodation, and Gypsy and Traveller provision will help meet a diverse range of housing needs. Overall, the Plan is expected to improve housing choice, affordability and availability, contributing to the creation of sustainable and inclusive communities.

Landscape

9.2.10 The Plan is expected to result in **mixed effects for landscape**. Whilst the spatial strategy has sought to direct major growth away from the most sensitive landscapes where possible, a number of allocations are located within or in proximity to the Cotswolds National Landscape and Special Landscape Areas, and development will inevitably result in landscape change in some locations. However, the Plan incorporates a strong framework of landscape, design and green infrastructure policies, together with site-specific mitigation measures, which should help to conserve landscape character, protect important views and integrate development into its surroundings.

Land, soil and water resources

9.2.11 The Plan is expected to result in **mixed effects for land, soil and water resources.** Whilst it includes a strong framework for the sustainable management of water resources, water quality, drainage and resource efficiency, a significant proportion of development will take place on greenfield land, including land classified as Grades 1–3 agricultural land. Growth also has the potential to increase pressure on water resources and groundwater systems. However, the Plan incorporates comprehensive measures relating to water efficiency, sustainable drainage, groundwater protection and pollution prevention, which should help to avoid, reduce and mitigate adverse effects.

Transport and air quality

9.2.12 The Plan is expected to result in **mixed, but predominantly positive, effects on transport and air quality**. The spatial strategy directs growth towards the district's most sustainable settlements and incorporates opportunities to support active travel, public transport use and access to the rail network. Whilst planned growth will inevitably generate additional traffic and may increase reliance on private vehicles in some rural locations, the

Plan includes a comprehensive framework of policies promoting sustainable transport, modal shift, public transport, electric vehicle infrastructure and air quality improvement. Together, these measures should help to minimise adverse effects and support more sustainable travel patterns over the long term.

9.3. Recommendations at this stage of plan making

9.3.1 The IIA has not identified any significant issues which require amendments to the spatial strategy or policy framework at this stage of plan preparation. However, careful implementation of the Plan will be important, particularly in relation to landscape, heritage, biodiversity, transport and infrastructure delivery. The effectiveness of mitigation measures should therefore be monitored through the Plan's monitoring framework and reviewed where necessary.

Part 3: What are the next steps?

10. Plan Finalisation

10.1. Consultation on the Regulation 19 version of the Local Plan

10.1.1 The IIA has informed the preparation of the Regulation 19 Local Plan and the development of its spatial strategy, allocations and policy framework.

10.1.2 Consultation responses received on the Regulation 19 Local Plan and accompanying IIA Report will be reviewed by the Council and considered by plan makers tasked with finalising the Plan.

10.2. Submission, examination and adoption

10.2.1 Following the consultation period, the Council will consider the representations received and determine whether the Plan remains suitable for submission for independent examination. The Plan, together with the IIA Report and other supporting evidence, will then be submitted to the Secretary of State for independent examination.

10.2.2 During the examination process, the Inspector will consider the soundness and legal compliance of the Plan, taking account of representations received and the findings of the IIA. Where modifications are required, these will be subject to further consultation and, where necessary, additional appraisal before the Plan is adopted.

11. Monitoring

11.1.1 The Environmental Assessment of Plans and Programmes Regulations (2004) require the significant environmental effects of implementing the Plan to be monitored. Monitoring helps to identify any unforeseen adverse effects arising from implementation of the Plan and enables appropriate remedial action to be taken where necessary.

11.1.2 The Plan contains a comprehensive monitoring framework which includes a range of indicators relating to housing delivery, employment growth, biodiversity, climate change, infrastructure provision, heritage, transport and other sustainability objectives. The monitoring framework therefore provides an important mechanism for tracking many of the environmental, social and economic effects identified through this IIA.

11.1.3 In particular, monitoring should focus on the key sustainability issues identified through the appraisal process, including:

- delivery of housing and employment development;
- provision of affordable housing and specialist accommodation;
- biodiversity net gain and habitat enhancement;
- delivery and long-term management of green infrastructure;
- greenhouse gas emissions, renewable energy generation and net zero carbon development;
- transport mode share, active travel uptake and air quality;
- impacts on the historic environment;
- impacts on the Cotswolds National Landscape and other valued landscapes;
- flood risk, water quality and water resource management; and
- provision of infrastructure, services and community facilities.

11.1.4 Particular attention should be given to monitoring potential adverse or mixed effects identified through the IIA, including landscape change associated with development within or close to the Cotswolds National Landscape, effects on heritage assets and their settings, the loss of agricultural land, pressures on water resources and the transport impacts associated with planned growth.

11.1.5 Where monitoring identifies significant unforeseen adverse effects, or where the Plan is not performing as anticipated, the Council should consider whether additional mitigation measures, policy interventions or a review of the Plan are required.

Appendix A : Regulatory requirements

As discussed in Section 1, Schedule 2 of the Environmental Assessment of Plans Regulations 2004 explains the information that must be contained in the IIA Report. **Table A-1** links the structure of this report to an interpretation of Schedule 2, whilst **Table A-2** explains this interpretation (N.B. this current report is an IIA Report, as opposed to an SA Report). **Table A-3** then presents a discussion of more how the information in this IIA Report reflects the requirements for the IIA Report.

Table A-1: Questions answered by this IIA Report, in-line with an interpretation of regulatory requirements

Questions answered	As per regulations… the IIA Report must include…
Introduction	
What's the plan seeking to achieve?	• An outline of the contents, main objectives of the plan and relationship with other relevant plans and programmes
What's the IIA scope? (supported by the IIA Scoping Report)	
What's the sustainability 'context'?	• Relevant environmental protection objectives, established at international or national level • Any existing environmental problems which are relevant to the plan including those relating to any areas of a particular environmental importance
What's the sustainability 'baseline'?	• Relevant aspects of the current state of the environment and the likely evolution thereof without implementation of the plan • The environmental characteristics of areas likely to be significantly affected • Any existing environmental problems which are relevant to the plan including those relating to any areas of a particular environmental importance
What are the key issues and objectives that should be a focus?	• Key environmental problems / issues and objectives that should be a focus of (i.e. provide a 'framework' for) assessment

Questions answered	As per regulations… the IIA Report must include…
Part 1	
What has plan-making / IIA involved up to this point?	• Outline reasons for selecting the alternatives dealt with (and thus an explanation of the 'reasonableness' of the approach) • The likely significant effects associated with alternatives • Outline reasons for selecting the preferred approach in-light of alternatives assessment / a description of how environmental objectives and considerations are reflected in the draft plan
Part 2	
What are the IIA findings at this current stage?	• The likely significant effects associated with the draft plan • The measures envisaged to prevent, reduce and offset any significant adverse effects of implementing the draft plan
Part 3	
What happens next?	• A description of the monitoring measures envisaged

Table A-2: Interpreting Schedule 2 and linking the interpretation to the report structure

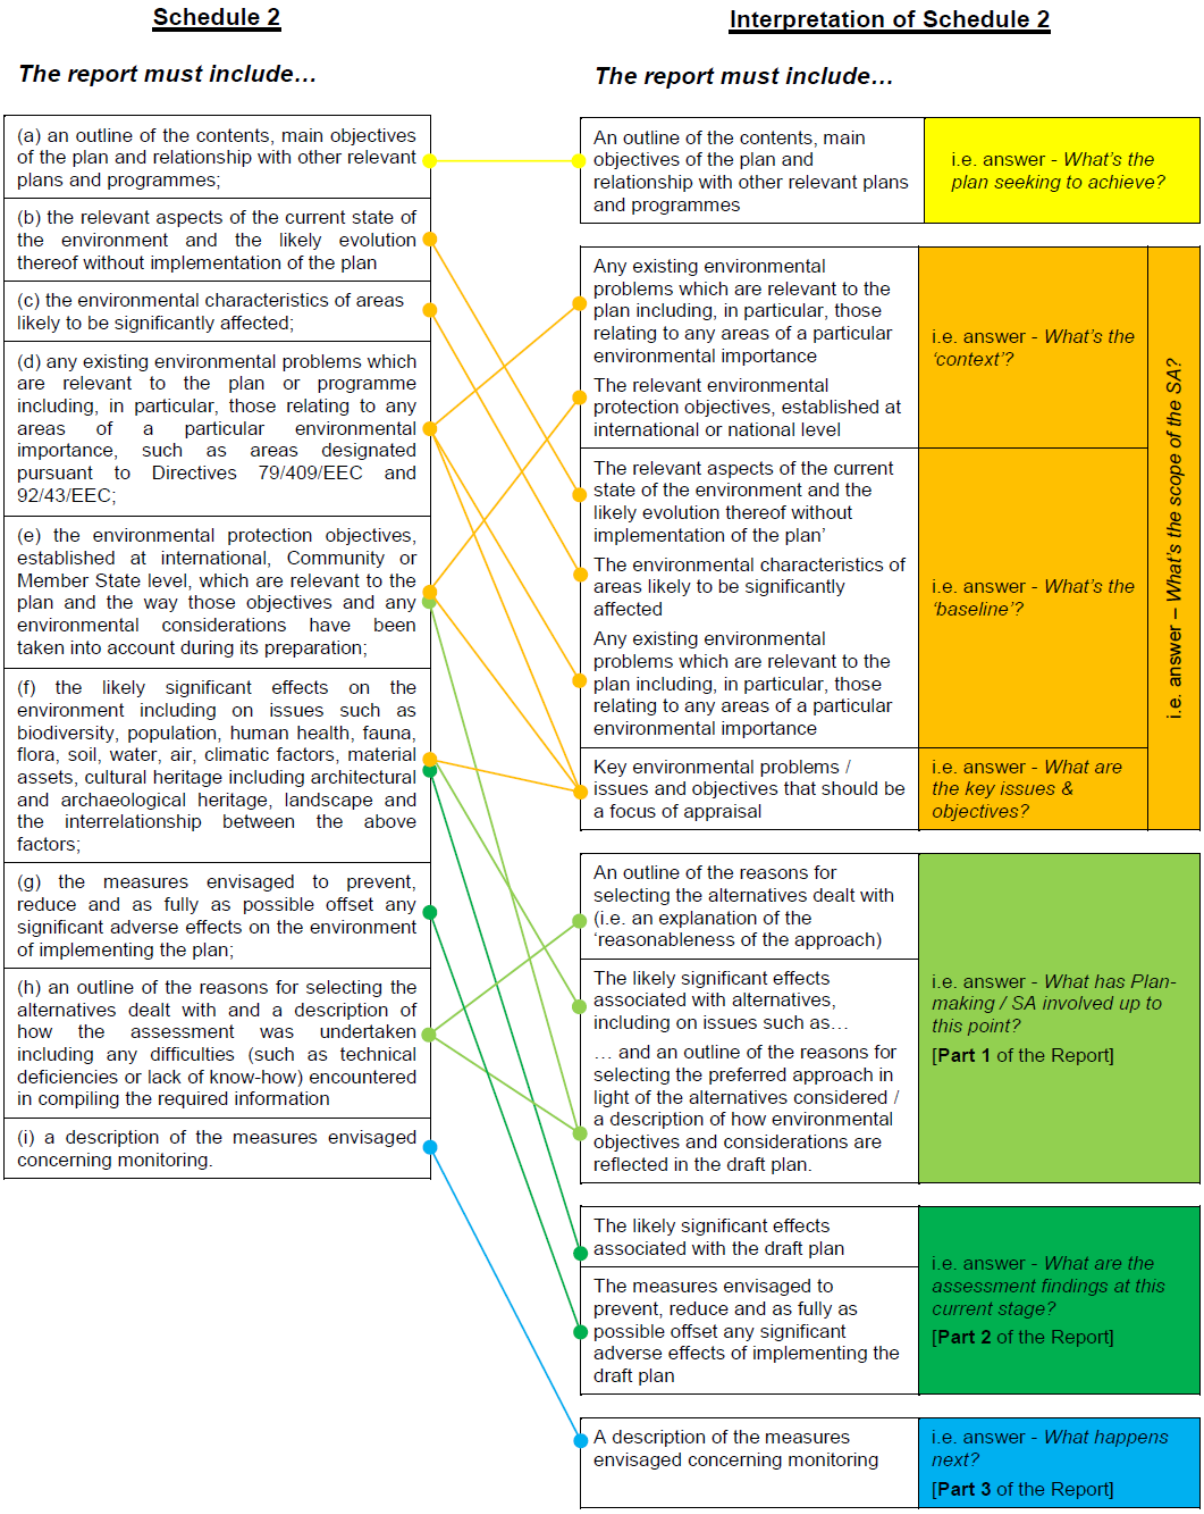

Table A-3: Checklist of how and where (within this report) regulatory requirements are reflected

Regulatory requirement	Information presented in this report
Schedule 2 of the regulations lists the information to be provided within the SA (or in this case, IIA) Report:	
• An outline of the contents, main objectives of the plan or programme, and relationship with other relevant plans and programmes;	**Chapter 1 and Chapter 2** presents this information.
• The relevant aspects of the current state of the environment and the likely evolution thereof without implementation of the plan or programme; • The environmental characteristics of areas likely to be significantly affected; • … environmental problems which are relevant… …areas of a particular environmental importance…;	These matters were considered in detail at the scoping stage, which included consultation on a Scoping Report. The outcome of scoping was an 'IIA framework', which is presented within **Chapter 3, Appendix B and C**. The IIA scope – in terms of key sustainability issues and objectives, including accounting for evolution of the baseline without the plan – is then discussed within the appraisal chapters as appropriate, i.e. in light of the options and proposals that are a focus of the appraisal.
• The environmental protection objectives, established at international, community or national level, which are relevant to the plan or programme and the way those objectives and any environmental, considerations have been taken into account during its preparation;	The Scoping Report presented a detailed context review and explained how key messages from this (and baseline review) fed into the 'IIA framework', which is presented within **Chapter 3, Appendix B and C**. Also, information on the SA scope is presented as part of appraisal work in **Chapter 6 and 9**. With regards to explaining *"how… considerations have been taken into account"*, **Chapter 7** explains reasons for supporting the preferred option, i.e. how/why the preferred option is justified in-light of alternatives appraisal.
• The likely significant effects on the environment, including on issues such as biodiversity, population, human health, fauna, flora, soil, water, air,	**Chapter 6** presents alternatives appraisal findings in respect of reasonable growth scenarios, whilst **Chapter 9** presents an appraisal of the

Regulatory requirement	Information presented in this report
climatic factors, material assets, cultural heritage including architectural and archaeological heritage, landscape and the interrelationship between the above factors.	Local Plan as a whole. All appraisal work naturally involved giving consideration to the IIA scope and the various effect characteristics.
• The measures envisaged to prevent, reduce and as fully as possible offset any significant adverse effects on the environment of implementing the plan…	**Chapter 9** presents recommendations and flags potential elements that can be a focus of further work if required ahead of Local Plan finalisation.
• An outline of the reasons for selecting the alternatives dealt with, and a description of how the assessment was undertaken including any difficulties (such as technical deficiencies or lack of know-how) encountered in compiling the required information;	**Chapter 4 and Chapter 5** deal with 'reasons for selecting the alternatives dealt with', with an explanation of reasons for focusing on growth scenarios / certain growth scenarios. **Chapter 7** explains 'reasons for supporting the preferred approach', i.e. explains how/why the preferred approach is justified in-light of the alternatives / scenarios appraisal. Methodology is discussed at various places, ahead of presenting appraisal findings.
• … measures envisaged concerning monitoring;	**Chapter 10** presents this information.
• a non-technical summary… under the above headings	The NTS is a separate document.
The SA Report must be published alongside the draft plan, in-line with the following regulations:	
• Authorities… and the public, shall be given an early and effective opportunity within appropriate time frames to express their opinion on the draft plan or programme and the accompanying environmental report before the adoption of the plan…	This IIA Report is published alongside the Regulation 19 version of the Local Plan in order to inform the consultation and then subsequent plan finalisation.
The SA Report must be taken into account, alongside consultation responses, when finalising the plan.	

Regulatory requirement	Information presented in this report
• The environmental report prepared pursuant to Article 5 [and] the opinions expressed pursuant to Article 6… shall be taken into account during the preparation of the plan… and before its adoption or submission to the legislative procedure.	This IIA Report will be taken into account when finalising the plan for publication (see **Chapter 10**).

Appendix B Scoping information review (baseline and policy update)

B.1 Updated baseline

The baseline information is presented under each IIA topic in **Table B.1** below and has been proportionately updated to reflect the scope of the plan and potential effects.

Table B.1 Baseline information

IIA topic area	Summary of the key messages arising from the baseline
Economy and Employment	• Reduction in the number of people of working age living within the district. • The perceived loss of employment land to residential-led development. • Businesses face skill and labour shortages due to the high cost of living in the area, the affordability of housing, and comparatively low median wages. • The district imports labour (leading to net in-migration) to support its growth and experiences problems recruiting suitably skilled staff. • Limited offer in terms of large modern office space due to historic buildings and high-quality natural environment. • Competitive disadvantage compared to larger surrounding towns such as Swindon, Cheltenham, Tewkesbury and Gloucester.
Tourism (linked to Economy and Employment)	• Limited range of public transport options to key destinations, with limited parking exacerbating traffic. • Poor road signage and road maintenance in some areas. • Concentration of tourism in honeypot destinations with little to offer younger people and families. • Balancing of needs between visitors and residents to avoid conflict and retain a sense of place. • Potential environmental damage e.g. erosion caused by increased visitor numbers.
Healthy and Vital Communities	• Review of the settlement hierarchy across the district in light of the proposed level of growth to deliver LHN and employment land requirements.

IIA topic area	Summary of the key messages arising from the baseline
Transport and Air Quality	• The district is a net importer of its workforce, although a significant number of commuter journeys go inside and outside of the district. • A high proportion of the district's residents travel to work as the driver of a car or van. A lower-than-average proportion of residents travel to work as a passenger in a car, on a bike, or by public transport. • A significantly higher than average proportion of the district's working population work at home. However, much of the district has limited internet access. • The proportion of the population that own three or four or more cars is higher than average. Transport pollution (i.e., nitrogen dioxide levels) continue to be at risk of exceeding the national air quality standard. • Rural inaccessibility and connectivity is a contributor to inequalities across the district. • The district has very few electric vehicle charging points.
Biodiversity	• Recreational pressure on international sites, and the decline in the condition of some nationally and locally important sites for biodiversity. • Small and isolated parcels of priority habitat that cause fragmentation of ecological networks. • Delivering net gains for nature through new development areas, aligning with targets and indicators within the Environment Improvement Plan (2025).
Green Infrastructure and Natural Capital	• The need for more natural open spaces and open spaces including cycle/pedestrian links, play spaces and natural open spaces. • Recent work for the update to the Green Infrastructure Strategy has highlighted that the district has a deficit of open spaces based the ANGSt Standards. • The natural environment provides multiple benefits for humans, but the benefits are not officially measured by loss or gain.
Climate Change	• The age and larger size of the district's existing housing stock is likely to be a contributing reason for it having higher than average domestic gas and electricity consumption and lower than average energy efficiency ratings. • The district's environment reduces its potential for strategic renewable energy interventions. • The district continues to be at risk from fluvial, surface and groundwater flooding.

IIA topic area	Summary of the key messages arising from the baseline
Historic Environment	• Preserving the historic character and distinctiveness of the district's settlements, given their rich heritage resource which is internationally renowned, and how most of the Principal and Non-Principal Settlements contain designated conservation areas and listed buildings.
Landscape	• 80% of Cotswold District is within the Cotswolds National Landscape, limiting opportunities for major development within this area. Growth will likely be concentrated outside of the National Landscape which may significantly alter character of settlements across the district due to their potential increases in size. • Special Landscape Areas (SLA) cover the district, incorporating areas within and outside of the National Landscape boundaries. The interplay between the built and natural environment will be an essential local consideration for new development areas, particularly in locations within the setting of SLA.
Land, Soil, and Water Resources	• Best and Most Versatile Land for agricultural purposes is prevalent across the district, with challenge for strategic scale growth likely to be delivered on greenfield land given limited brownfield site availability. • The district has several groundwater source protection zones. A large proportion of the district is also covered by Nitrate Vulnerable Zones. • Many of the Principal and Non-Principal Settlements across the district (i.e., locations where growth is likely to be directed) are within proximity to a main river or ordinary watercourse. • Cotswold is part of the 'SWOX', a Water Resource Zone in the Thames area, an area which is classed as '*seriously water stressed*'.

B.2 Updated policy context

The IIA must consider the relationships between the emerging Plan and other relevant plans, policies or strategies (PPS) and environmental objectives. The tables below show the key PPS which have informed plan making and the IIA.

Appendix C : Key sustainability issues and IIA framework

C.1 Key sustainability issues

The key sustainability issues are set out under each IIA topic in **Table C.1** below. These have been revised in light of the updated baseline and policy context for the district presented in **Appendix B**, and responses received from statutory bodies.

Table C.1 Key sustainability issues

IIA topic	Key sustainability issues
Healthy and Vital Communities	• An aging population needs good accessibility to services and facilities and suitable housing to enable them to live independently for longer and avoid social isolation. • With a lower than average economically active population, the district has to import a significant part of its workforce from elsewhere, increasing commuting journeys. • Fewer younger people reduces the viability of some services and facilities. • Services, facilities, employment opportunities and jobs are needed that are accessible to all sections of the community. • Living environment improvements are needed to improve the health of people in lower social and economic status groups. • Measures are needed to improve the district's health and wellbeing, such as promoting active travel and physical activity and to decrease car use and providing employment opportunities in traditional and emerging sectors.
Housing	• Household size – new housing developments need to meet the needs of the increasing number of smaller households. • House size - flats and terraced houses utilise less energy and they can be built in higher densities meaning that less land is required. • Significant over-delivery - continuing to deliver significantly more housing than is required is stressing the district's infrastructure. It inflates the calculation of future housing need and ultimately leads the district to a

IIA topic	Key sustainability issues
	position where it is no longer able to meet its housing needs, constraining its ability to deliver plan-led development. • Affordability – many younger people cannot afford to live in the district. People working in the district are often unable to live close to their jobs. These problems increase car journeys and social isolation. • Affordable housing - even 'affordable housing' can still be unaffordable to the people who need it because affordability relates to the market value of housing • Second home ownership - multiple home ownership reduces the amount of available housing stock that could otherwise contribute towards meeting the district's housing need.
Economy and Employment	• Very few locations in Cotswold District offer positive viability thresholds for new employment development. The district's established employment sites therefore play a critical role in meeting the district's economic and business needs. Protection of such sites and support for their potential intensification is needed to attract new businesses and ensure that existing businesses are retained and have the opportunity to grow. • An ageing population will have an impact on the economically active age group. This, combined with difficulties in attracting workers due to median wages below the national average; and the high cost of living and the affordability of housing is a key issue for the district. • Need for improved broadband connectivity, particularly in rural areas to support rural economy and reduce the need to travel. • Need to compete with larger surrounding towns such as Swindon, Cheltenham, Tewkesbury and Gloucester; and focus on its highly skilled workforce and attractive high-quality environment to live and work. • Ensuring that town centres retain their important role as community hubs through ensuring that they are resilient, flexible and adaptable to change.
Transport and Air Quality	• Poor accessibility leaves many people isolated from friends and family, key services, and their place of employment. • The district has a reliance on private car use. • Public transport is not currently a realistic alternative mode of transport in many parts of the district.

IIA topic	Key sustainability issues
	• Households owning numerous cars reinforces the reliance on accessing services and facilities by car. • The infrastructure is not currently in place to support electric vehicles and move away from fossil fuels. • Poor air quality is a risk to public health and has other environmental impacts.
Biodiversity	• Recreational pressures on Internationally Important Sites and other sites known for biodiversity interest. • Declining Biodiversity habitats and species globally, nationally and locally. • Fragmentation of habitats, small habitat pockets, lack of connectivity between sites and the limited ability to create new and larger sites for biodiversity. • Lack of understanding of key biodiversity issues at a development industry level. • Need to consider climate change adaptation and mitigation for biodiversity. • Biodiversity at a local level needs to take into consideration a specific site, but also how that site sits, and connects to other biodiversity features in the area.
Green Infrastructure and Natural Capital	• The need to further integrate the multifunctional benefits of GI and the role it has to play in addressing issues relating to climate change, the environment as a whole, as well as health and wellbeing. This includes the role GI has in contributing to healthier communities through the design of homes, their location and the grey and green infrastructure required to support them. • A key issue related to Green Infrastructure is the long-term management of public open spaces. As a result, the Council has been involved in the “Fairer management of public open space within residential developments” project. • Green infrastructure at a local level needs to take into consideration a specific site, but how that site also sits, and connects to other GI in the area. • Mapping natural capital enables a better understanding of its role and where it can be enhanced to deliver multiple benefits. • Natural capital mapping prepared by the Gloucestershire Local Nature Partnership provides useful information which is not currently referred to in the local plan. Underpins a number of policy areas.
Climate Change	• Climate change is likely to exacerbate health risks and inequalities associated with building overheating, indoor air pollution, flood damage, and water and biological contamination in the indoor environment.

IIA topic	Key sustainability issues
	Disruptions to daily life related to climate change can mean lost work and school days and may harm trade, transportation, agriculture, energy production, and tourism. Severe weather events can delay planting and harvesting, cause power outages, cause travel disruption, and otherwise make it difficult for people to go about their daily business, all of which will have an effect on the economy. • Parts of the district are more susceptible to the impacts of climate change, most notably areas with higher flood risk. • The reasons for the district's reducing carbon footprint are not understood and need to be investigated.
Historic Environment	• Ensuring that heritage assets are managed and maintained appropriately • How to manage change which protects and enhances the historic environment for future generations, while meeting the needs of current occupiers and users, for example the move from retail uses. • Using the historic environment as an "inspiration" for the design of new developments. • Relatively few non-ecclesiastical listed buildings are deemed to be at risk; however, it is still crucial that these are addressed (churches and scheduled monuments). • The need to consider the impacts of climate change on the historic environment. • Within the Council there is an increase in interest regarding how the historic environment can deliver on the climate change agenda.
Landscape	• The threats to the Cotswolds National Landscape and Special Landscape Areas associated with new development areas, climate change, and longer-term land management practices. • Finding the right balance between the need for more renewable energy provision and the existing landscape character. • Increased pressure on Public Rights of Way and National Trails as a result of tourism. • To ensure that development is designed and sensitively located to respect the Cotswold District's landscape and built heritage. • Making sure that the landscape is also valued for its multifunctional role including health and wellbeing as part of Green Infrastructure.

IIA topic	Key sustainability issues
Land, Soil, and Water Resources	• Best and Most Versatile Land for agricultural purposes is prevalent across the district, with challenge for strategic scale growth likely to be delivered on greenfield land given limited brownfield site availability. • Many of the Principal and Non-Principal Settlements across the district (i.e., locations where growth is likely to be directed) are within proximity to a main river or ordinary watercourse. • Increase in population growth may require infrastructure upgrades to enable development, to accommodate higher flows and/or to prevent a WFD deterioration • The development of each site could have an impact, particularly in relation to biodiversity and water quality, and where Good Ecological Status (GES) has not been reached. - run-off from increased development may worsen water quality. • Thames Water's (and other companies) ability to maintain a continuous supply to customer demands especially during hot, dry weather. • Increase in water demand adds pressure to existing supply infrastructures and upgrades will be required, combined with the uncertainty over the impact of climate change.

C.2 IIA Framework

Table C.2: IIA Framework

Topic		Objectives	Appraisal questions: Will the option / proposal help to…
	Biodiversity	• Protect and enhance biodiversity.	• protect and enhance semi-natural habitats, priority habitats and the habitats of priority species? • reduce habitat fragmentation and support nature networks and landscape scale enhancements? • provide net gain? • increase public awareness of biodiversity? • secure long-term management of biodiversity and sites? • protect and enhance features of geodiversity interest?
	Climate Change (adaptation)	• Ensure adaptability to climate change that, where feasible, goes beyond simple limitation of negative effects.	• reduce vulnerability to climate change impacts? • reduce flood risk, manage run-off sustainably and ensure the direct or indirect risk of flooding on site or downstream of the site is not increased by the development? • ensure that development takes place in accordance with the Strategic Flood Risk Assessment, Water Cycle Study and sequential test for flood risk, taking into account the likely effects of climate change?
	Climate Change (mitigation)	• Take an active role in achieving net zero carbon by 2050 if not before.	• encourage measures to reduce carbon emissions? • encourage / enable improvements to the energy efficiency of the district's existing building stock? • increase energy efficiency and reduce greenhouse gas emissions? • increase the generation and use of renewable energy? • address the negative impact of climate change, go beyond mitigation to achieve carbon neutral development?

Topic	Objectives	Appraisal questions: Will the option / proposal help to…
		• minimise the need to travel by unsustainable means? • adjust to future needs through being flexible and adaptive to the effects of climate change (heat, drought, extreme weather)? • ensure that development takes place in accordance with the Strategic Flood Risk Assessment, Water Cycle Study and sequential test for flood risk, taking into account the likely effects of climate change?
€ $ £ ¥ Economy and Employment	• Achieve sustainable economic growth and opportunities for employment, including support for the rural economy. Support the resilience and vitality of town centres during transformation from the “traditional” retail-dominated high street to a more flexible and responsive model.	• encourage the retention and / or growth of existing businesses? • provide accessible jobs? • provide live / work units and workspace for locally appropriate businesses? • provide sites for business and employment within communities? • encourage the use of local services and purchasing of local products? • ensure housing is delivered which can attract workers? • contribute to supporting the rural economy particularly though retaining or increasing the number of people employed in agriculture and tourism? • support the roll out of high-speed broadband? • contribute to a low carbon economy? • encourage larger businesses to locate in the district? • encourage a range of jobs and premises and in particular increase the number of people employed in emerging economic sectors? • support vitality and viability of existing town centres by helping them to be more flexible and responsive to change?
	• Encourage and support the development of sustainable tourism.	• seek to avoid environmental damage e.g. erosion caused by increased visitor numbers? • support the visitor economy?

Topic		Objectives	Appraisal questions: Will the option / proposal help to…
	Equalities	• Advance equality for all.	• Promote access for all including those with and without shared protected characteristics? • Provide opportunities to foster good relations between groups?
	Green Infrastructure and Natural Capital	• Conserve and enhance green infrastructure assets and networks and exploit its multi-functional benefits.	• deliver the Council's GI Strategy? • maximise multiple benefits provided by GI? • link and enhance existing GI assets and networks?
		• Deliver natural capital and enhance the provision of ecosystem services.	• take a natural capital approach to growth by providing a strategic framework for delivery of growth to… – identify the most beneficial locations for tree planting? – assess how development projects can best contribute to natural capital locally? – identify blue / green infrastructure opportunities?
	Healthy and Vital Communities	• Contribute to the achievement of balanced and healthy communities and be responsive to the needs of different age groups in the district.	• enable and encourage younger people to live and work in the district? • enable older people to live close to facilities, services and other people? • tackle social and functional isolation by making provision for interaction such as safe and accessible spaces, parks, community hubs? • provide essential community services and facilities including healthcare, Green Infrastructure and allotments? • enable "lifetime homes"? • increase physical activity, reduce obesity and improve mental health and wellbeing through the design and layout of schemes, provision of facilities for sport and recreation?

Topic	Objectives	Appraisal questions: Will the option / proposal help to…
		• improve access to the countryside for recreation? • provide mixed use, mixed housing type and mixed tenure developments? • enable access to further education / training opportunities?
 Historic Environment	• Deliver high quality and well-designed sustainable development that responds appropriately to its context.	• be sustainably and sympathetically designed having regard to its context? • respond appropriately to its context though being supported by a detailed characterisation study?
	• Conserve and enhance the historic environment of the district.	• conserve and enhance the historic environment? • protect the historic settlement pattern and distinctive character of the towns and villages of the district? • ensure beneficial use and long-term management of heritage assets? • ensure that historic environment is used as a key driver and focus for inward investment regeneration and redevelopment, particularly within our historic market towns? • increase public awareness of the historic environment?
 Housing	• Meet local need for housing by maintaining a sustainable level of supply and ensure that new housing is as sustainable as possible in terms of its location,	• improve housing affordability? • provide sufficient affordable housing for those who need it? • be appropriately located having regard to facilities, services and environmental quality? • reduce the number of second homes delivered on new developments? • provide energy efficient homes? • provide housing that is designed and constructed sustainably, using where feasible recycled or recovered materials?

Topic	Objectives	Appraisal questions: Will the option / proposal help to…
	construction materials and internal and external facilities.	• retrofit sustainable infrastructure, where possible? • provide good garden / light standards?
Landscape	• Conserve, restore and enhance the character of landscapes in the district.	• conserve, restore and enhance the landscape (character, appearance and quality) of the district, including landscape assets, trees, setting of settlements? • maintain the tranquillity of the district, including the protection and promotion of Dark Skies? • support the integrity of the Cotswolds National Landscape in line with the vision and objectives of the latest published management strategy? • safeguard the integrity of Special Landscape Areas across the district?
Land, Soil and Water Resources	• Promote sustainable waste management solutions that encourage the reduction, re-use and recycling of waste.	• enable and promote reuse, recycling and reduction of waste generated in the district? • encourage local community recycling. reuse and minimisation of waste in new developments?
	• Support the efficient use of land.	• avoid development on the best and most versatile agricultural land? • increase the percentage of development on previously developed land? • promote remediation of contaminated land?
	• Encourage the prudent use of natural resources.	• avoid sterilisation of identified mineral resource areas?

Topic	Objectives	Appraisal questions: Will the option / proposal help to…
	• Protect and enhance water quality and minimise water use.	• protect groundwater and surface water quality? • ensure that development is supported by adequate water supply and drainage? • reduce per capita water consumption through the use of rainwater recycling, grey water reuse or other methods?
 Transport and Air Quality	• Reduce the need to travel by private car, reduce traffic congestion and air pollution through improving travel choice by active encouragement of modal shift and facilitation of more sustainable forms of transport.	• reduce the need to travel? • encourage modal shift, particularly in respect of journeys to work, through walking, cycling and use of public transport? • promote sustainable and active travel for all residents including the needs of specific groups and the infrastructure required to support that? • prevent the exacerbation of air pollution in areas susceptible to poor air quality?

Appendix D Settlement-by-settlement discussion of sites

Main Settlement

Cirencester

Land to the north of the A429, which bisects the central section of the market town, is within the Cotswolds National Landscape. The Town Centre, framed by the A429 ring road, is a designated Conservation Area which contains several Scheduled Monuments and Grade I Listed Buildings. There is a Special Landscape Area to the north east and to the south west of the town, and Cirencester Park Historic Park and Garden extends to the west of the town (north of the A419).

Land to the south east of the town is comparatively less constrained, with key constraints including areas of Flood Zone 2 and Flood Zone 3 (associated with the River Churn and the Thames and Severn Canal), Conservation Areas in the villages of Driffield, Harnhill, and Preston, and Groundwater Source Protection Zones. On this basis, the following sites (or clusters of sites) have been taken forward to Stage 3 of the site selection process for a potential sustainable urban extension:

- ‘Land east of Kingshill Lane, Cirencester’ (C164A).
- ‘Steadings southern extension, Cirencester’ (C190).
- ‘The Whiteway, Cirencester’ (C132).

Within the HELAA, of the sites which are classified as ‘potentially deliverable / developable’ or ‘deliverable / developable’ for non-strategic scale development at Cirencester:

- Two of these sites have planning permission, specifically C39 and C80.
- Two of these sites are lower than the threshold of five homes reflecting their indicative capacities or are not within or adjacent to Cirencester and therefore represent an unsustainable location for growth, specifically C168 and C172D.
- C178 is within the Cotswold National Landscape and has a ‘high’ sensitivity. The indicative capacity for the site is close to the threshold for a sustainable urban extension, which would constitute major development within the National Landscape.

Reflecting the above, the following non-strategic site options have been considered in detail through Stage 3 of the site selection process, specifically: C52, C57, C70, C71, C79A, C81B, C97, C101A, C101B, C106B, C111, C149A, C149B; and R614 (for employment).

Principal Settlements

Andoversford

The village is wholly located within the Cotswolds National Landscape. Land to the north west of the village is a Scheduled Monument (Roman small town at Wycomb), which overlaps with an area of Deciduous Woodland Priority Habitat. There are corridors of Flood Zone 2 and Flood Zone 3 passing through the village, associated with the River Coln (and its tributaries).

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Andoversford, R231 is not located adjacent to the settlement. An allocation at this location would result in isolated development, approximately 1.5km to the west of the village, contrary to the broad spatial strategy for the emerging Local Plan.

Reflecting the above, only one non-strategic site option has been considered in detail through Stage 3 of the site selection process, specifically: A2.

Blockley

The village is wholly located within the Cotswolds National Landscape. Most of the village itself is a designated Conservation Area (with associated Grade II and Grade II* Listed Buildings). An area of land to the north east of the village is within Flood Zone 3, which connects to Blockley Brook.

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Blockley:

- R33A, R33B, and R501 are not located adjacent to the settlement and allocating these locations would result in isolated development, approximately 3km to the east of the village, contrary to the broad spatial strategy for the emerging Local Plan. R33B and R501 are adjacent sites, outside but within the setting of the Cotswolds National Landscape. All three sites are within a Special Landscape Area.
- R585 is approximately 1km to the north of the village within an industrial centre. Whilst the site is primarily brownfield land, development at this location would be isolated from the village, contrary to the broad spatial strategy for the

emerging Local Plan. Additionally, approximately 30% of the site contains deciduous woodland priority habitat, and 'Sedgecombe Wood' is an ancient, replanted woodland directly to the north of the site.

- R610 and R688 are located approximately 2km to the north east of the village. Allocating these locations would result in isolated development outside of the village boundaries, contrary to the broad spatial strategy for the emerging Local Plan. R610 is within the Cotswold National Landscape, with R688 adjacent to, and within the setting of the National Landscape. R688 is within a Special Landscape Area.

Reflecting the above, the following non-strategic site options have been considered in detail through Stage 3 of the site selection process, specifically: BK8A, BK8B, BK11, BK14A, R533, R663, R69, and RUR_E16.

Bourton-on-the-Water

The village is wholly located within the Cotswolds National Landscape and is often referred to as "the Venice of the Cotswolds". Much of the southern section of the village is a designated Conservation Area, which borders two Scheduled Monuments to the east and west. The Scheduled Monument to the east overlaps with Greystones Farm Nature Reserve, which connects to Salmonsbury Meadows Site of Special Scientific Interest (SSSI). Most of the land to the east of the village, and land passing through the southern section of the village (from the west), is within Flood Zone 3. The areas broadly follow the corridor of the River Windrush (and its tributaries), and the lakes to the north of Nethercote. Several established footpaths pass through the village from the surrounding countryside, including Windrush Way. Macmillan Way, and the Heart of England Way.

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Bourton-on-the-Water:

- B32 has planning permission for phased redevelopment of residential and retirement housing but is not yet built out. The site is considered deliverable during the first five years of the plan period.

- B57 is entirely covered by Priority Habitat and is subject to extensive flood risk constraints, with the majority of the site located within Flood Zone 3. Whilst the site adjoins an existing employment area, the extent of environmental constraints would make development difficult to accommodate without unacceptable impacts.

Reflecting the above, only one non-strategic site option has been considered in detail through Stage 3 of the site selection process, specifically: B56.

Chipping Campden

The village is wholly located within the Cotswolds National Landscape and often referred to as the “jewel in the crown” of the Cotswolds. Most of the central section of the village is a designated Conservation Area, which includes the High Street where almost all of the buildings are either Grade II, Grade II*, or Grade I Listed. Land to the east of the Conservation Area comprises Campden House Historic Park and Garden. Most of the undeveloped land to the north, east, and south east of the village comprises Grade I or Grade 2 Agricultural Land, which is some of the best and most versatile agricultural land within the country. Several established footpaths pass through the market town and connect to the surrounding countryside, including Cotswold Way, Monarch’s Wat, and the Heart of England Way.

Within the HELAA, of the sites which are classified as ‘potentially deliverable / developable’ or ‘deliverable / developable’ for non-strategic scale development at Chipping Campden, CC59 has planning permission for five dwellings but is not yet built out. The site is considered deliverable during the first five years of the plan period.

Reflecting the above, the following non-strategic site options have been considered in detail through Stage 3 of the site selection process, specifically: CC10A, CC66B, CC68, CC71, and CC74 (western section of the site).

Fairford

Most of the northern half of the town is a designated Conservation area, containing Grade I, Grade II, and Grade II* Listed Buildings. Land to the north of the town is within a Special Landscape Area, encompassing Fairford Park estate. The River Coln (and areas of Flood Zone 2 and Flood Zone 3) passes through the Special Landscape Area and the town, continuing to the south east where it forms the southern border of the Whelford Meadows SSSI and Cotswold Water Park SSSI. The SSSIs comprise a series of lakes which extend northward from the River Coln to the A417. Land to the south of the town is also within the boundary of the Cotswold Water Park SSSI, which extends to RAF Fairford. The south of the town also comprises areas of Grade 2 and Grade 3a ‘best and most versatile’ agricultural land. The town is not within the Cotswolds National Landscape.

Additionally, Land to the north east and to the west of Fairford is comparatively less constrained, with key constraints including the setting of the Special Landscape Area, SSSI Impact Risk Zones, and Groundwater Source Protection Zones.

Reflecting the above, the following sites (or clusters of sites) have been taken forward to Stage 3 of the site selection process for a potential sustainable urban extension: ‘Land north east of Fairford’ (F57A, F57B, F57C).

Within the HELAA, of the sites classified as ‘potentially deliverable / developable’ or ‘deliverable / developable’ for a sustainable urban extension, ‘Land to the south west of Fairford (F53A and F53B)’ could deliver up to 420 homes reflecting the indicative site capacities within the HELAA. An outline planning application of 74 homes has come forward on Site F53A. Constraints to development across Site F53B limit further opportunities for expansion, given the adjacent SSSI and its associated Impact Risk Zones. On this basis, the sites are considered separately for potential non-strategic development during the plan period.

Within the HELAA, the following ‘potentially deliverable / developable’ or ‘deliverable / developable’ for non-strategic scale development at Fairford have been considered in detail through Stage 3 of the site selection process, specifically: F20A, F39C, F45, F52, F53A, F53B, F56A, and F56B.

Kemble

A Special Landscape Area encompasses the town and the surrounding land to the north, east, south east, and north west. Most of the town is a designated Conservation Area. There are areas of Flood Zone 2 and Flood Zone 3 to the north east and north west, following the corridor of the River Thames (and its tributaries). The Kemble Railway Cuttings SSSI is also located to the north west of the town, with areas of Deciduous Woodland Priority Habitat to the north east of the town surrounding the dismantled railway. Kemble Railway Station is at the north western extent of the town, and Cotswold Airport is approximately 1.5km to the west of the town (via the A429). The town is not within the Cotswolds National Landscape.

Land to the south west of the town is comparatively less constrained, albeit located within the setting of the Special Landscape Area. There are isolated areas of Deciduous Woodland Priority Habitat (including Kemble Wood), SSSI Impact Risk Zones associated with Kemble Railway Cuttings, and areas within Groundwater Source Protection Zones.

Within the HELAA, of the sites classified as 'potentially deliverable / developable' or 'deliverable / developable' for a sustainable urban extension, Cotswold Airport (K7A and K7B) currently accommodates around 620 employees, alongside a substantial volume of visitors and customers, with aspirations for further growth. However, the site has since been confirmed as being unavailable for a local plan allocation. The following sites (or clusters of sites) have been taken forward to Stage 3 of the site selection process for a potential sustainable urban extension: 'Land south west of Kemble' (K9, K12, K15, K16).

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Kemble, R542 is located approximately 1km to the east of the town. Allocating this site would result in isolated development outside of the town, contrary to the broad spatial strategy for the emerging Local Plan.

Reflecting the above, the following non-strategic site options have been considered in detail through Stage 3 of the site selection process, specifically: K1A, K3, and K6A.

Lechlade-on-Thames

Located toward the south eastern boundary of the district, Lechlade borders the neighbouring authorities of West Oxfordshire, Swindon, and the Vale of White Horse. The River Thames passes along the southern boundary of the town, with areas of Flood Zone 2 and Flood Zone 3 encompassing most of the undeveloped areas to the east, south east, and south west of the town. These areas are also underlain by Grade 2 agricultural land, which is some of the best and most versatile agricultural land within the country. Cotswold Water Park SSSI extends to the north of the town, and the 'Multi-period settlement, cemetery, and ceremonial complex west of Lechlade' Scheduled Monument is located to the north west of the town. The southern section of the town is a designated Conservation Area, containing all of the town's Grade I and Grade II Listed Buildings. The town is not within the Cotswolds National Landscape.

In terms of strategic opportunities, R683 and R684 are located approximately 1km to the west of the town. The combined capacities of these sites would not exceed the minimum threshold of 1,500 homes required to constitute as a 'new settlement'. Reflecting the above, the following sites (or clusters of sites) have been taken forward to Stage 3 of the site selection process for a potential sustainable urban extension: 'Cluster of sites to the west of Lechlade, within proximity to Lechlade Garden Centre' (L34, L37, L43).

Within the HELAA, the following sites classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Lechlade have been considered in detail through Stage 3 of the site selection process, specifically: L13, L14, L16A, L26, L32, L33, and L35A.

Mickleton

Land to the east, south east, south, and south west of the village is within the Cotswolds National Landscape. The central and southern section of the village is a designated Conservation Area, with the Grade II Listed 'Kiftsgate Court' Historic Park and Garden also to the south east. Land to the north of the village is relatively unconstrainted, although it is classified as Grade 2 (very good quality) 'best and most versatile' land for agricultural uses. To the west, areas of Flood Zone 2 and Flood Zone 3 broadly follow the corridor of Norton Brook, with a Special Landscape Area covering land to the west of the Brook (including Thistley Hill). The Heart of England Way passes through the village.

Reflecting the above, the following sites (or clusters of sites) have been taken forward to Stage 3 of the site selection process for a potential sustainable urban extension: 'Land to the north and west of Mickleton' (MK1AB, MK3, MK16, MK17, MK21, MK22, MK23, MK12A, MK18, MK19, MK20B).

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Mickleton, MK12B has received planning permission for a residential development and is not yet built out. The site is considered deliverable within the first five years of the plan period.

Reflecting the above, the following non-strategic site options have been considered in detail through Stage 3 of the site selection process, specifically: MK1C, MK2B, MK2C, MK7, MK11A and MK11C.

Moreton-in-Marsh

The Cotswolds National Landscape encompasses land to the south west, west, and north west of the town. Land to the north and to the south of the town is within a Special Landscape Area, with these areas also including the 'Roman small town at Dorn' Scheduled Monument (to the north) and Grade 2 Agricultural Land (to the south). The western section of the town, west of Moreton-in-Marsh Railway Station and including the built-up areas surrounding the A429 and A44, is a designated Conservation Area. The Conservation Area contains the majority of the town's Grade II and Grade II* Listed Buildings, with the 'Batsford Camp

(adjacent to Queen Victoria's Garden)' Scheduled Monument marking the Conservation Area's northern extent. Corridors of Flood Zone 2 and Flood Zone 3 follow the River Evenlode (and its tributaries) to the south of the town.

Land to the east of the town is comparatively unconstrained, although it is within the setting of the Special Landscape Areas to the north and to the south. There is also an interconnected network of Deciduous Woodland Priority Habitat surrounding the Fire Service College (north of the A44 and south of Todenham Road).

Within the HELAA, of the sites classified as 'potentially deliverable / developable' or 'deliverable / developable' for a sustainable urban extension, 'Land to the north, east and south of Moreton-in-Marsh' and 'Land to the south and east of Moreton-in-Marsh are assessed as a potential sustainable urban extension. To the south east of these potential sustainable urban extensions, 'Land at Coldicote Farm' (M83) also has an indicative capacity which exceed 350 homes. As the site is not immediately adjacent to the town, development at this location would fall into the 'new settlement' category based on the site selection methodology. However, as the site would adjoin the sustainable urban extension at Moreton-in-Marsh if either 'Land to the north, east, and south of Moreton-in-Marsh' or 'Land to the south and east of Moreton-in-Marsh' is taken forward as an allocation, it has been tested within the sustainable urban extension category for completeness.

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Moreton-in-Marsh, M71A and M28B have received planning permission for residential development but are not yet fully built out. The sites are considered deliverable within the first five years of the plan period. Additionally, M70 is subject to a pending application for residential development (ref. 25/04041/OUT) and is therefore not available for employment development. It is anticipated that M70 and M71A will form part of the land to the south and east of Moreton-in-Marsh if this sustainable urban extension is taken forward as a Local Plan allocation.

Reflecting the above, the following non-strategic site options have been considered in detail through Stage 3 of the site selection process, specifically: M11, M22, M74A (eastern section of M74 considered through HELAA), and M78 (for employment).

Northleach

The village is wholly within the Cotswolds National Landscape, with several public rights of way connecting the village with the surrounding countryside. This includes the Diamond Way, Monarch's Way, and Fosse Way. Most of the village is a designated Conservation Area, including Grade I, Grade II, and Grade II* Listed Buildings. Areas of Flood Zone 2 and Flood Zone 3 follow the corridor of the River Leach, through the western section of the village before extending alongside its southern boundary.

Reflecting the above, only one site has been classified as 'potentially deliverable / developable' within Northleach, specifically: N14B. In July 2026, the Council resolved to grant planning permission for 50 homes on the site. On this basis, **no site options within Northleach have been assessed in detail through Stage 3 of the site selection process.**

Siddington

Located approximately 750m to the south of Cirencester, key constraints surrounding Siddington include areas of Grade 2 agricultural land (to the west), areas of Flood Zone 2 and Flood Zone 3 (to the east) associated with the River Churn and the Thames and Severn Canal, and areas of Deciduous Woodland Priority Habitat and the Cotswold Water Park SSSI (to the south). Areas to the south east, south, and south west of the village overlap with a Groundwater Source Protection Zone. The village is outside of the Cotswolds National Landscape.

There are several opportunity sites for development around Siddington, particularly to the north and to the south. A key consideration for the site selection process is the extent to which growth may reduce the openness between Siddington and Cirencester and increase likeliness of coalescence.

Reflecting the above, the following sites (or clusters of sites) have been taken forward to Stage 3 of the site selection process for a potential sustainable urban extension:

- 'Land south west of Siddington' (SD20).
- 'Land north of South Cerney Airfield' (SD24).

Reflecting the above, the following non-strategic site options have been considered in detail through Stage 3 of the site selection process, specifically: SD3A, SD5, SD6, SD8, SD9A, SD9B, SD9C, SD11B, SD15, SD17, SD21, SD22, and SD23.

South Cerney

Located towards the southern extent of the district and sharing a boundary with Wiltshire, South Cerney is surrounded by the Cotswold Water Park SSSI to the east, south, and to the west. Land to the west is also primarily underlain by Grade 2 (Very Good) Agricultural Land and areas of Flood Zone 2 and Flood Zone 3 associated with the River Churn and the Water Park. The northern section of the village is a designated Conservation Area, containing most of the village's Grade I and Grade II Listed Buildings. 'South Cerney Castle' Scheduled Monument is located adjacent to the northern boundary of the Conservation Area. The village is outside of the Cotswolds National Landscape.

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at South Cerney:

- R556, R600, and R645 are not located adjacent to the settlement and allocating these locations would result in isolated development, approximately 1.5km to the north east of the village, contrary to the broad spatial strategy for the emerging Local Plan.

- R601, SC20, and SC21 are located between 250-750m to the north of the village, alongside South Cerney Road and adjacent to South Cerney Airfield (to the east). Allocating these locations would deliver growth in comparatively isolated locations outside of the existing core of the village, contrary to the broad spatial strategy.
- R673 and RUR_E12 are located approximately 1.5km and 600m to the south east of the village, respectively. Both sites contain areas of Flood Zone 2 or Flood Zone 3 and are adjacent to the Cotswold Water Park SSSI. In light of this, the sites are excluded from further assessment.
- SC36 and SC37 are adjacent to the north of the village, to the east and west of South Cerney Road. The Study of Land Surrounding Settlements (July 2026) concludes that SC36 has a 'medium-high' sensitivity, and SC37 has a 'high' sensitivity. Additionally, SC32 is adjacent to the western edge of the village and is also concluded as having a 'medium-high' sensitivity. The justification for these sensitivity ratings outlines:
  - SC32: The site forms part of the western rural edge of South Cerney, contributing to the green and open setting of the village and maintaining a distinct transition between settlement and countryside.
  - SC36: Development would represent encroachment into a rural landscape, although this is tempered by the level of enclosure and adjacent permanent boundary created by the railway embankment. The setting of the listed buildings within and adjacent to the parcel would likely restrict the scale of any development.
  - SC37: The site occupies a visually and physically prominent position on the north-western edge of South Cerney. The undulating landform rising to the west increases visibility, where open views across the site and surrounding countryside are available. The parcel reads clearly as open countryside forming part of the rural setting and western transition of the village.

Reflecting the above, **no site options within South Cerney have been assessed in detail through Stage 3 of the site selection process**.

Stow-on-the-Wold

Located approximately 250m above sea level, Stow-on-the-Wold is the highest town in the district. Wholly within the Cotswolds National Landscape, the town is at a junction between several public rights of way, including Gloucestershire Way, Monarch's Way, Macmillan Way, and the Heart of England Way. Most of the central and south eastern sections of the town are a designated Conservation Area, with the Grade II* Listed 'Abbotswood' Historic Park and Garden encompassing land to the west of the town.

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Stow-on-the-Wold:

- S14A has planning permission for residential development but is not yet built out. The site is considered deliverable during the first five years of the plan period.
- There is a cluster of four sites adjacent to the northern boundary of the town, all of which have received a 'medium-high' sensitivity rating within the Study of Land Surrounding Settlements (July 2026). The justification for these sensitivity ratings outlines:
  - S51: Due to its elevated position, rural approach setting, and role in defining the northern edge of Stow-on-the-Wold, the site exhibits the characteristic features of the High Wold Plateau, including open fields, stone walls, and far-reaching views that are strongly representative of the Cotswold landscape.
  - S65A / S65B: Reflecting their elevated position, open westerly views, and role in defining the north-western edge of Stow-on-the-Wold, the sites form part of a visually prominent approach, contributing to special qualities of scenic beauty, settlement containment, and the historic character of the High Wold plateau.
  - S66: This is due to its elevated and open character, traditional field pattern, and clear physical and visual separation from the existing settlement. The site occupies part of the High Wold Plateau and contributes strongly to the rural, expansive setting that defines Stow-on-the-Wold's northern approach.

Reflecting the above, the following non-strategic site options have been considered in detail through Stage 3 of the site selection process, specifically: S14B, S55B, and S68.

Tetbury

Tetbury is wholly within the Cotswolds National Landscape. Land to the north and to the west of the town is primarily underlain by areas of Grade 2 (Very Good) Agricultural Land. Veizey's Quarry SSSI is approximately 400m to the north west of the town. From a heritage perspective, the southern half of the town is a designated Conservation Area, containing the majority of the town's Grade I, Grade II, and Grade II* Listed Buildings. 'Tetbury Camp' Scheduled Monument forms the southern extent of the Conservation Area. Areas of Flood Zone 2 and Flood Zone 3 broadly follow the corridor of the River Avon, along the eastern, southern and western boundaries of the town.

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Tetbury, the following are classified as having a 'medium-high' or 'high' sensitivity within the Study of Land Surrounding Settlements (July 2026), with the justifications as follows:

- T45: Reflecting its sloping topography, open visual relationship with the western countryside, and role in defining the town's green edge. The site forms part of the rural setting of Tetbury, where open land, riparian vegetation, and the floodplain create a natural transition between built form and the wider lowland landscape. Although the site is

physically enclosed by development on two sides, its exposed slope, ecological value, and visual prominence contribute to its overall sensitivity.

- T52: Reflecting its pastoral landscape character, sloping topography, and role as part of the undeveloped eastern approach to Tetbury. The site lies within the Cotswolds National Landscape, where open farmland, hedgerows, and mature trees define the transition between the town and its rural setting. Although new residential development is present to the north, the site remains visually and perceptually separate, maintaining a strong rural identity and contributing to the sense of openness on approach from Cirencester Road.
- T74: Discounted during Stage 1 of the Study of Land Surrounding Settlements due to the following four factors: its location on a prominent ridgeline, escarpment or high ground; falls within clear views from public vantage points; would extend the settlement in an uncharacteristic direction or weaken form; and would not be attached / adjacent to existing development.

Reflecting the above, the following non-strategic site options have been considered in detail through Stage 3 of the site selection process, specifically: T31B, T49, T57, T70, T71A, and T76.

Upper Rissington

The whole of the village is within the boundaries of the Cotswolds National Landscape. There are several areas of Deciduous Woodland Priority Habitat to the north, east, and west of the village. RAF Little Rissington Airfield encompasses land to the south.

Within the HELAA, of the sites which are classified as ‘potentially deliverable / developable’ or ‘deliverable / developable’ for non-strategic scale development at Upper Rissington, UR4A and UR4B were excluded at Stage 1 of the Study of Land Surrounding Settlements (July 2026) due to the following factors: located on prominent ridgelines, escarpments, or high ground; falls within clear views from public vantage points; and introduce a significant area of built form into a rural or visually sensitive landscape.

Reflecting the above, only one non-strategic site option has been considered in detail through Stage 3 of the site selection process, specifically: UR1A.

Non-Principal Settlements

Avening

The whole of the village is within the boundary of the Cotswolds National Landscape. Areas of Flood Zone 2 and Flood Zone 3 follow the corridors of the watercourses which pass through the village and extend to the north, east, and south west. Most of the village is a designated Conservation Area, split into two sections covering the western and south eastern sections.

Within the HELAA, none of the available site options within Avening are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Avening due to their 'high' landscape sensitivity. Specifically, the Study of Land Surrounding Settlements (July 2026) notes that Avening is highly sensitive to change due to its location within a steep-sided valley landscape, its strong historic character and its position within the Cotswolds National Landscape. The surrounding valley sides are particularly sensitive as they provide the essential landscape setting to the village and create the characteristic sense of enclosure. Development on these slopes would be highly visible and could detract from the wooded and pastoral backdrop that defines the settlement. The village is also sensitive to development that would contribute to the coalescence of built form along the valley floor or result in the erosion of the distinct settlement pattern that has evolved in response to the valley landform.

Reflecting the above, **no site options within Avening have been assessed in detail through Stage 3 of the site selection process.**

Bibury

Bibury is entirely within the Cotswolds National Landscape, with most of the village a designated Conservation Area. There are three Grade I and two Grade II* Listed Buildings within the Conservation Area, with the 'Bibury Roman villa near Bibury Mill' Scheduled Monument marking its eastern boundary. The River Coln passes through the centre of the village (east to west), with areas of Flood Zone 2 and Flood Zone 3 surrounding the river corridor.

The Study of Land Surrounding Settlements (July 2026) states that Bibury is highly sensitive to change due to the exceptional quality of its historic and landscape setting within the River Coln valley and the Cotswolds National Landscape. The strong relationship between the settlement, the river corridor and the enclosing valley sides forms an essential component of the village's character and scenic value. The valley sides surrounding the settlement are particularly sensitive as they provide the visual and physical setting to the village and allow views across and along the valley. Development on elevated land or upper valley slopes would be visually prominent and would risk eroding the contained and secluded character of the settlement. Additionally, land closely associated with the Conservation Area, the river corridor and the historic core of the village is also highly sensitive due to the contribution these areas make to the significance, character and appearance of Bibury.

Reflecting these sensitivities, none of the available site options within and adjacent to Bibury are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Bibury. Whilst R677 is the only site afforded a 'medium' sensitivity within the Study, the site is not adjacent to the village and would add to the ribbon development along the B4425. The location of R677 outside of the village is contrary to the broad spatial strategy for the emerging Local Plan.

Reflecting the above, **no site options within Bibury have been assessed in detail through Stage 3 of the site selection process.**

Bledington

Bledington is located towards the eastern boundary of the district, within proximity to the neighbouring authority of West Oxfordshire. The whole of the village is within the Cotswolds National Landscape. Most of the land surrounding the village is within Flood Zone 2 and Flood Zone 3, following the corridors of the Bledington Brook, Westcote Brook, and Cornwell Brook. The brooks are tributaries of the River Evenlode, which passes to the east of the village. Land to the north of Church Lane is designated as a Conservation Area and contains most of the village's Grade II Listed Buildings. The village is approximately 1km to the west of Kingham Railway Station, located in West Oxfordshire.

Within the HELAA, all of the four available site options within Bledington are classified as 'not deliverable / developable'. In light of this, **no site options within Bledington have been assessed in detail through Stage 3 of the site selection process.**

Bourton-on-the-Hill

The whole of the village is within the boundaries of the Cotswolds National Landscape, with most of the village also a designated Conservation Area. The Grade I Listed 'Church of St Peter' and the Grade II* Listed 'Bourton House' are within the Conservation Area, along with the 'Tithe Barn, Bourton House' Scheduled Monument (at its eastern boundary). With regard to local ecological assets, there are areas of Deciduous Woodland Priority Habitat to the north, south west, and west of the village. 'Bourton Woods' is an area of Ancient Replanted Woodland to the north west of the village, between the A44 and B4479.

The Study of Land Surrounding Settlements (July 2026) states that Bourton-on-the-Hill is highly sensitive to change due to its elevated position on the Farmed Slopes and its strong visual relationship with the surrounding landscape. The village itself is highly visible from parts of the surrounding vale and benefits from extensive outward views. Development on exposed edges or prominent slopes would have the potential to alter the character of the settlement and affect its relationship with the wider landscape.

Reflecting the above, only one site has been classified as 'potentially deliverable / developable' within Bourton-on-the-Hill and has been considered in detail through Stage 3 of the site selection process, specifically: R83.

Broadwell

Along with the village itself, land to the north, south, and west of the village is within the Cotswolds National Landscape. Most of the village is a designated Conservation Area, containing clusters of Grade II Listed Buildings, three Grade II* Listed and one Grade I Listed Buildings. 'Broadwell Roman villa' Scheduled Monument is located approximately 250m to the north west of the village.

The Study of Land Surrounding Settlements (July 2026) states that Broadwell exhibits generally high landscape sensitivity due to the strong relationship between the settlement, the River Evenlode, the extensive village green and the surrounding agricultural landscape. Land to the east of the village is comparatively less constrained, albeit within the setting of the National Landscape.

Reflecting the above, the following non-strategic site options classified as 'potentially deliverable / developable' within the HELAA have been considered in detail through Stage 3 of the site selection process, specifically: R89, R90, and R682.

Chedworth

Chedworth is wholly within the Cotswolds National Landscape and most of the village is a designated Conservation Area. There are several areas of Deciduous Woodland Priority Habitat within and surrounding the village (including the Stony Furlong Railway Cutting SSSI), with larger areas of interconnected and ancient woodland approximately 500m to the north of the village (including Burfords Grove and Chedworth Woods). There is a corridor of land to the east of the village within Flood Zone 2 and Flood Zone 3, associated with a tributary of the River Coln.

The Study of Land Surrounding Settlements (July 2026) states that Chedworth is highly sensitive to change due to the strong relationship between the settlement, the valley landform, the surrounding High Wold landscape and its exceptional historic environment. The valley sides surrounding the village are particularly sensitive as they form the immediate setting of the settlement and contribute to views into and out of the village. Development on these slopes would be prominent and could erode the intimate and secluded character of the valley landscape. Limited opportunities may exist for small-scale development closely related to the existing built framework of the village where proposals can be accommodated without harming the landscape setting, historic character or wider National Landscape.

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Chedworth:

- R505 and R534 are excluded at Stage 1 of the Study of Land Surrounding Settlements due to the following factors: would not be attached / adjacent to existing development; would introduce a significant area of built form into a rural or visually sensitive landscape; would extend settlement in an uncharacteristic direction or weaken form; and for R534, falls within clear views from public vantage points.

- R98 has ‘medium to high’ sensitivity to development. The site occupies an open and transitional position on the northern edge of Chedworth and forms part of the rural setting of the village within the Cotswolds National Landscape. Although influenced by existing recreational uses and adjacent residential development, the site retains an open and semi-rural character that contributes positively to the settlement edge and wider landscape setting.

Reflecting the above, only one non-strategic site option has been considered in detail through Stage 3 of the site selection process, specifically: R504.

Didmarton

Located towards the south western boundary of the district, adjacent to Wiltshire, Didmarton is wholly within the Cotswolds National Landscape. There is a corridor of land to the east of the village which is within Flood Zone 2 and Flood Zone 3, associated with Joyce’s Pool (a source of the River Avon). Most of the village is a designated Conservation Area, with land to the south west comprising the Grade I Listed ‘Badminton House’ Historic Park and Garden.

The Study of Land Surrounding Settlements (July 2026) states that the undeveloped countryside surrounding Didmarton plays an important role in maintaining the settlement's rural character, preserving views and preventing the erosion of its distinct identity. Limited opportunities may exist for small-scale development where proposals are well related to the existing built form, avoid visually prominent locations and retain the characteristic landscape structure of the area.

Within the HELAA, of the sites which are classified as ‘potentially deliverable / developable’ or ‘deliverable / developable’ for non-strategic scale development at Didmarton:

- R437 has a medium-high sensitivity. The site occupies a sensitive edge-of-settlement location on the western approach into Didmarton where the village transitions into the surrounding open countryside. Whilst the site contains existing barns and areas of hardstanding, it nevertheless retains a relatively open and semi-rural character due to the mature vegetation, open western aspect and relationship with the wider rural landscape.

- R439 has a medium-high sensitivity. The site forms part of the pastoral landscape on the southern edge of Didmarton and contributes positively to the rural setting of the village within the Cotswolds National Landscape. Although physically adjacent to existing residential development, the site remains visually and spatially associated with the wider countryside beyond the established ribbon pattern of development along The Street.

- R440 has a medium-high sensitivity. The site occupies a sensitive position on the northern edge of Didmarton where the existing settlement transitions into the surrounding rural landscape. Although the site is closely associated with

adjacent residential development and existing settlement form, it nevertheless contributes positively to the open character and historic setting of the village edge within the Cotswolds National Landscape.

Whilst R436 is the only site afforded a 'medium-low' sensitivity within the Study, the indicative capacity of the site within the HELAA is below the minimum threshold of five dwellings and has been excluded at Stage 1 of the site selection process. Reflecting the above, **no site options within Didmarton have been assessed in detail through Stage 3 of the site selection process.**

Down Ampney

Most of the undeveloped areas surrounding the village is either Grade 1, Grade 2, or Grade 3a Agricultural Land, which is some of the best and most versatile agricultural land in the country. Land to the south of the village is within a Minerals Safeguarding Area at the former RAF Down Ampney Airfield. The southern extent of the village is a designated Conservation Area, containing Grade I and Grade II listed buildings, with land to the south east of the village comprising the Settlement at Bean Hay Copse Scheduled Monument. To the west, areas of Flood Zone 2 and Flood Zone 3 comprise the undeveloped areas of land between the village and Ampney Brook. The village is not within the Cotswolds National Landscape.

The Study of Land Surrounding Settlements (July 2026) states that the landscape surrounding the village is generally large scale, relatively open agricultural land and strongly defines the rural character of the area. On this basis, the following sites (or clusters of sites) have been taken forward to Stage 3 of the site selection process for a potential sustainable urban extension:

- 'Land east of Down Ampney' (DA20B).
- 'Land south of Down Ampney' (DA17B).
- 'Land surrounding Down Ampney' (DA5, DA17A, DA20A, DA21, DA22A, DA32).

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Down Ampney:

- DA4A has a medium to high sensitivity. The site occupies a transitional position between the built edge of Down Ampney and the wider countryside. Its open and level form, combined with the presence of PRoW Footpaths 3 and 4, gives the land an accessible and visually sensitive character. The open southern boundary provides views across adjoining farmland, contributing to the perception of rural openness around the settlement. Although the site's use for flower cultivation and its proximity to residential development reduce susceptibility in part, it still plays an important role in maintaining the rural edge and visual connection between the village and its countryside setting. The PRoW

are particularly influential, creating frequent viewpoints across the land and strengthening recreational and perceptual sensitivity

- DA8 has planning permission for residential development but is not yet fully built out. The site is considered deliverable within the first five years of the plan period.
- DA16A has significant flood risk constraints which, together with landscape, heritage and locational constraints, substantially reduce its suitability for employment development. The site's rural location and limited accessibility make it less attractive than alternative employment opportunities in more accessible locations.

Reflecting the above, the following non-strategic site options have been considered in detail through Stage 3 of the site selection process, specifically: DA4, DA5D, and DA7.

Kempsford

Kempsford is a village located toward the south eastern boundary of the district, adjacent to the neighbouring authority of Swindon. Land to the north of the village primarily comprises RAF Fairford. Land to the south and to the west is within Flood Zone 2 and Flood Zone 3, following the corridor of the River Thames. From a heritage perspective, the village core is a designated Conservation Area. Key features of the Conservation Area include a corridor of Deciduous Woodland Priority Habitat alongside the River Thames, and a cluster of Grade II Listed Buildings surrounding the Grade I Listed 'Church of St Mary the Virgin (toward the eastern boundary of the village). 'Sites near Manor Ham Barn' Scheduled Monument sits approximately 750m to the west of the village. The village is outside of the Cotswolds National Landscape.

The Study of Land Surrounding Settlements (July 2026) states that the village is characterised by a strong historic core centred on St Mary's Church, Kempsford Manor and a collection of traditional limestone buildings. Development extends along the principal routes through the village, creating a predominantly linear settlement pattern with occasional clusters of more recent residential development. The open and relatively flat nature of the landscape means that development on the settlement edge can be visible across a wide area and has the potential to affect the rural character of the floodplain. The village's historic core, church, mature trees and river corridor form key components of local character and are particularly sensitive.

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Kempsford:

- R202 and R202A have a 'medium-high' to 'high' sensitivity. Whilst parts of the site are associated with existing agricultural and equestrian activity, the overall site extends beyond the established settlement edge and forms part of the wider rural landscape surrounding the village. Historic character and setting are particularly important

considerations. The site adjoins the Kempsford Conservation Area and contributes to the setting of both Church of St Mary the Virgin and Manor Farm Barns. The open agricultural character, paddocks and fields form part of the wider rural setting within which these heritage assets are experienced. Over 50% of the site areas are within Flood Zone 2 or Flood Zone 3, adding further sensitivities to development.

Reflecting the above, the following non-strategic site options (all to the north of the village) have been considered in detail through Stage 3 of the site selection process, specifically: R203A, R203B, R203C.

Longborough

The village is wholly within the Cotswolds National Landscape. To the north east, a corridor of land within Flood Zone 2 and Flood Zone 3 broadly follows a watercourse towards Moreton-in-Marsh (for approximately 2km) before connecting to the River Evenlode. There are areas of Deciduous Woodland Priority Habitat to the south and to the south west of the village, including Horsington Plantation and Humble Bee Coppice which forms a green ring and natural buffer between Longborough and the neighbouring village of Donnington (to the south east). Within the village core, land surrounding High Street, The Folly, and Charlesway is a designated Conservation Area which is primarily lined with Grade II Listed Buildings. The Grade I Listed 'Church of St James' is toward the northern extent of the Conservation Area (and village).

The Study of Land Surrounding Settlements (July 2026) states that Longborough exhibits generally high landscape sensitivity owing to its elevated position, strong relationship with the surrounding landform and visibility within the wider landscape. The surrounding landscape displays many characteristic Cotswold features including rolling topography, dry stone walls, mature hedgerows, scattered woodland and historic field patterns. These elements contribute to landscape distinctiveness. R577 is the only site classified as having a 'medium-low' sensitivity but is designated as an Established Employment Site in the adopted Local Plan and is in active use as employment units (known as The Sitch). The Local Plan evidence base finds this site should continue to be protected for employment use and is therefore unsuitable for redevelopment.

Within the HELAA, none of the sites are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Longborough. R560 and R561 have planning permission for 9 and 14 homes respectively, and the developments are complete. The sites forms part of the 'known commitments' total for the emerging Local Plan. Additionally, R229C and R457 are classified as having a 'high' landscape sensitivity to development

Reflecting the above, **no site options within Longborough have been assessed in detail through Stage 3 of the site selection process.**

Meysey Hampton

Located to the south of the A417, and approximately 2.5km to the west of Fairford, Meysey Hamton is at the border between the Cotswold District and the neighbouring authority of Wiltshire. The village core is a designated Conservation Area containing clusters of Grade II Listed Buildings. There are two Grade II* Listed Buildings in the village, specifically: the Church of St Mary the Virgin (toward the western village boundary), and Villars Farmhouse (toward the south western village boundary). There are areas of Deciduous Woodland Priority Habitat to the south west and south east of the village, with corridors of Flood Zone 2 and Flood Zone 3 approximately 750m to the east and west (respectively). The village is not within the Cotswolds National Landscape.

There are **no available sites for residential development within or adjacent to Meysey Hampton** after reviewing the site submissions from the various 'call for sites' exercises completed by the Council to date. The only available site, R516, is approximately 2.5km to the north of the village and has permission for change of use from a former mushroom composting facility to provide Class B2 vehicle workshop. The site is not currently built out but is considered deliverable within the first five years of the plan period.

North Cerney

Wholly within the Cotswolds National Landscape, North Cerney is broadly linear in its character and extends to the north east from the A435 and River Churn. Land surrounding the River Churn is within Flood Zone 2 and Flood Zone 3, encompassing areas to the south and to the north west of the village. The southern half of the village is a designated Conservation Area, including clusters of Grade II Listed Buildings and the Grade I Listed 'Church of All Saints' (to the south west of the A435 and River Churn). The road and the river splits the Conservation Area into two sections. Areas of Deciduous Woodland Priority Habitat follow the river corridor and surround Cerney House, a Grade II Listed Building to the south west of the village and the Church of All Saints.

Within the HELAA, the two available site options within North Cerney (R262 and R263) are classified as 'not deliverable / developable'. In light of this, **no site options within North Cerney have been assessed in detail through Stage 3 of the site selection process.**

Poulton

Poulton is located along the A417 towards the southern boundary of the district. A tributary of Ampney Brook flows to the south west and to the west of the village, with a corridor of land surrounding the watercourse within Flood Zone 2 and Flood Zone 3. Most of the village is a designated Conservation Area, containing clusters of Grade II Listed Buildings (along London Road and Cricklade Street). The Grade I listed 'The Manor House and Gatepiers' stands in the village core, and 'Ranbury Ring' Scheduled Monument is approximately 750m to the west.

Land to the north east and south east of the village is comparatively unconstrained, albeit within the setting of the Conservation Area and comprising areas of open countryside. There are isolated areas of Deciduous Woodland Priority Habitat, and the village

is outside of the Cotswolds National Landscape. The Study of Land Surrounding Settlements (July 2026) states that whilst some opportunities may exist for limited and well-contained development, proposals should respect the settlement's rural setting, maintain characteristic landscape features and avoid visually prominent locations.

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Poulton:

- R606 has been classified as having a 'medium-high' sensitivity. The site forms part of the open northern approach to Poulton, contributing to the rural setting and character of the village. Its gently rising topography, arable land use, and open northern views reinforce its role as a transitional space between built form and countryside. Although the site is influenced by adjacent residential properties, it remains predominantly rural and undeveloped, with strong visual and physical connections to the wider landscape to the north and east.
- R512 is located approximately 500m from the southern settlement edge of Poulton (via Cricklade Street), and approximately 1km to the south of the village centre. Allocating this site would result in isolated development outside of the village, contrary to the broad spatial strategy for the emerging Local Plan.

Reflecting the above, the following non-strategic site options have been considered in detail through Stage 3 of the site selection process, specifically: R467, R468, R509, R517, and R607.

Preston

Preston is approximately 750m to the east of Cirencester and is a broadly linear village in character extending north eastward from the A419. The village has a functional relationship with Cirencester in this respect. The village core is a designated Conservation Area, centred around the Grade II* Listed 'Church of All Saints'. Land to the west of the village is within Flood Zone 2 and Flood Zone 3, following the corridor of the River Churn which extends to the south towards Siddington.

Land to the north, east, and south of the village is comparatively unconstrained, albeit within the setting of the Conservation Area and comprising areas of open countryside. There are isolated areas of Deciduous Woodland Priority Habitat, and the village is outside of the Cotswolds National Landscape. The Study of Land Surrounding Settlements (July 2026) states that the settlement remains relatively compact and linear in form, with development generally confined to the road corridor. Specifically, Preston exhibits generally moderate-high landscape sensitivity arising from its small scale, historic character and strong relationship with the surrounding agricultural landscape.

The following sites (or clusters of sites) have been taken forward to Stage 3 of the site selection process for a potential sustainable urban extension: 'Land south east of Cirencester and south of Preston' (R519, R650).

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Preston, R531 is detached from the existing settlement and is currently in active employment use.

Reflecting the above, the following non-strategic site options have been considered in detail through Stage 3 of the site selection process, specifically: R281, R282B, R521, and R637.

Sapperton

Sapperton is located along the western boundary of the district, adjacent to the neighbouring authority of Stroud. The village is wholly within the Cotswolds National Landscape and is a designated Conservation Area. Land to the north and west of the village comprises a corridor of Deciduous Woodland Priority Habitat and Ancient Woodland which surrounds the River Frome. Daneway Banks SSSI is approximately 750m to the north west of the village, albeit within the neighbouring authority area. Land to the east is within the Grade I Listed 'Cirencester Park' Historic Park and Garden.

The Study of Land Surrounding Settlements (July 2026) states that Sapperton exhibits high landscape sensitivity due to the combination of its historic character, distinctive topography and location within the Cotswolds National Landscape. The High Wold Valley landscape is particularly sensitive to development due to its enclosed character, steep valley sides, extensive woodland cover and strong sense of tranquillity. Development has the potential to interrupt the secluded character of the valley and affect important views along and across the landscape. In light of this, all of the 'potentially deliverable / developable' sites within Sapperton (R660, R661, and R662) have been classified as having a 'medium-high' or 'high' sensitivity to development.

In light of the above, **no site options within Sapperton have been assessed in detail through Stage 3 of the site selection process.**

Swell

Comprising two distinct communities within Upper Swell and Lower Swell, the villages are approximately 1.5km to the west of Stow-on-the-Wold (via the B4077 and B4068, respectively) and entirely within the boundaries of the Cotswolds National Landscape. Land between Stow-on-the-Wold and the villages forms the Grade II* Listed 'Abbotswood' Historic Park and Garden. The River Dikler flows to the east of the villages, with a corridor of land adjoining the watercourse within Flood Zone 2 and Flood Zone 3. Both villages are designated Conservation Areas.

There are **no available sites for residential development within or adjacent to Upper Swell or Lower Swell** after reviewing the site submissions from the various 'call for sites' exercises completed by the Council to date.

Willersey

Land to the east and to the south east of the village is within the Cotswolds National Landscape, with land to the south west within the neighbouring authority area of Wychavon. Most of the village within the National Landscape is also designated as a Conservation Area, containing several Grade II Listed Buildings and the Grade I Listed 'Church of St Peter'.

The Study of Land Surrounding Settlements (July 2026) states that the southern part of the village is a more sensitive landscape consisting of smaller fields and hedges with more trees and occasional blocks of woodland. Land to the north, north east, and north west of the village is comparatively unconstrainted, albeit within the setting of the National Landscape. A corridor of land within Flood Zone 2 and Flood Zone 3 follows the watercourse to the west of the village and forms the boundary between Cotswold District and Wychavon District.

The following sites (or clusters of sites) have been taken forward to Stage 3 of the site selection process for a potential sustainable urban extension: 'Cluster of sites to the north of Willersey' (W7B, W7B2).

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at Willersey:

- W7A1 has full planning permission for residential development but is not yet built out. The site is considered deliverable within the first five years of the plan period.
- W7A2 and W7C have a resolution to grant permission for 60 homes, and W8B has a resolution to grant permission for 30 homes.
- W8A1, W8A2, and W8C are classified as having a 'medium to high' sensitivity within the Study of Land Surrounding Settlements (July 2026).

Reflecting the above, the following non-strategic site options have been considered in detail through Stage 3 of the site selection process, specifically: W4B and W11.

The village cluster of Coln St Aldwyns, Hatherop, and Quenington

Coln St Aldwyns and Hatherop are within the boundaries of the Cotswolds National Landscape, with Quenington directly to the south and within its setting. The River Coln meanders between the villages, with a corridor of land adjacent to the watercourse within Flood Zone 2 and Flood Zone 3. Most of the land between the villages forms part of the Grade II Listed 'Hatherop Castle' Historic Park and Garden, with the villages themselves containing designated Conservation Areas. There are areas of Deciduous Woodland Priority Habitat (including some areas of Ancient Woodland) to the west of Coln St Aldwyns, to the north of Hatherop, and to the north of Quenington.

The Study of Land Surrounding Settlements (July 2026) states that Coln St Aldwyns, Hatherop and Quenington exhibit generally high landscape sensitivity due to their location within the Coln Valley and the strong relationship between the settlements, the river corridor and the surrounding agricultural landscape. The River Coln and associated floodplain, meadows, watercourses and riparian vegetation form key components of local character and are particularly sensitive to change. Development which adversely affects these features could diminish the distinctive valley character and setting of the settlements. The undeveloped countryside between and surrounding the settlements plays an important role in maintaining their separate identities and preventing the perception of coalescence within the valley.

Within the HELAA, of the sites which are classified as 'potentially deliverable / developable' or 'deliverable / developable' for non-strategic scale development at the village cluster of Coln St Aldwyns, Hatherop, and Quenington:

- R123, R608, and R609 in Coln St Aldwyns are excluded at Stage 1 of the Study of Land Surrounding Settlements due to the following factors: adjacent to / within designated heritage features; falls within clear views from public vantage points; introduce a significant area of built form into a rural or visually sensitive landscape; located on prominent ridgelines, escarpments or high ground (for R123); and would extend settlement in an uncharacteristic direction or weaken form (for R123 and R608).

- R681 in Quenington is also excluded at Stage 1 due to the factors listed above for the three Coln St Aldwyns sites. This is the only available site option in Quenington which is within the Cotswolds National Landscape.

Reflecting the above, the following non-strategic site options have been considered in detail through Stage 3 of the site selection process, specifically: Quenington (R538 and R591) and Hatherop (R670).

Appendix 2 – Stage 1 Assessments (Initial Sieve)

Appendix 3 – Stage 2 Assessments (Detailed)

1. Introduction

1.1 This report supports the preparation of the Cotswold District Local Plan (2026-43). It identifies, reviews and assesses land with potential to accommodate Gypsy and Traveller pitches within the District over the plan period.

1.2 The report should be read alongside the Gloucestershire Gypsy and Traveller Accommodation Needs Assessment (RRR, 2026) (the GTANA), which establishes the level of need for Traveller pitches in the District.

1.3 This report primarily assesses whether sufficient suitable, available and achievable sites exist to meet identified accommodation needs, in accordance with national planning policy. It identifies a supply of sites that are potentially deliverable within five years and, developable over a longer time horizon. In doing so, it provides an evidence base to inform future Local Plan site allocations and policy decisions relating to Traveller accommodation.

1.4 The assessment draws on a range of site sources, including Call for Sites submissions, existing and historic Traveller sites, planning application data, and publicly owned land. Each site has been subject to a proportionate appraisal of its availability, suitability and achievability, considering relevant planning constraints, infrastructure considerations and the requirements of national policy.

1.5 The findings of this report do not in themselves allocate sites for development or grant planning permission. Rather, they identify reasonable options for consideration through the plan-making process. Any future allocation of sites or decisions on planning applications should have regard to other material considerations, including more detailed site-specific evidence.

1.6 The study relates specifically to the provision of Gypsy and Traveller accommodation. Land for general housing and economic development is assessed separately through the Cotswold District Housing and Economic Land Availability Assessment (HELAA) (AECOM, 2026).

2. The need for Traveller accommodation

2.1 The GTANA identifies the level of need for additional Gypsy and Traveller pitches in Cotswold District over the period 2026–2043. The assessment provides the most up-to-date evidence of accommodation needs and forms the basis for establishing the District's pitch targets.

2.2 The identified need is set out in Table 1 below.

Table 1: Traveller pitch needs in Cotswold District for the period 2026-2043

Assessment Period	Need (pitches)
2026-2031	12
2031-2036	8
2036-2041	8
2041-2043	4
Total 2026-43	**32**

2.3 The GTANA requirement of 32 pitches represents a residual need figure. In deriving this requirement, the GTANA has already taken account of existing sources of supply, including vacant pitches on existing authorised sites and pitches benefitting from extant planning permission. The purpose of this study is therefore to identify sufficient additional deliverable and developable sites capable of meeting the residual requirement and maintaining an adequate supply of Traveller accommodation throughout the Plan period.

2.4 The GTANA applies the definition of Gypsies and Travellers contained within Annex 1 of the Planning Policy for Traveller Sites (MHCLG, December 2024) (the PPTS). The identified need therefore relates to households that fall within the national planning definition and should be used as the basis for setting pitch targets through the Local Plan.

2.5 The need identified in the GTANA informs the Council's approach to identifying a supply of specific deliverable and developable sites through the Local Plan. This includes the requirement to provide a five-year supply of deliverable sites and to identify developable sites, or broad locations for growth, for years 6-10 and, where possible, for years 11-15.

2.6 No requirement for Travelling Showpeople plots was identified for Cotswold District over the plan period.

2.7 In addition to permanent residential pitch requirements, the Gloucestershire GTANA considered the need for transit accommodation within Cotswold District. No unmet requirement for dedicated transit provision was identified during the plan period. Consequently, this report focuses on the identification of permanent residential pitches required to meet evidenced accommodation needs.

3. Why prepare the study?

3.1 National planning policy requires local planning authorities to assess and meet the development needs of their area, including the accommodation needs of Gypsies and Travellers (collectively referred to as Travellers for the purpose of this report). The National Planning Policy Framework (December 2024) (the NPPF) makes clear that the housing needs of different groups within the community, including Travellers, should be understood and reflected in planning policies. This includes the size, type and tenure of housing needed for Travellers.

3.2 The NPPF also requires authorities to maintain a clear understanding of the land available in their area and to identify a sufficient supply of suitable sites to meet identified needs. This includes considering the availability, suitability and achievability of land, consistent with the approach taken in housing and economic land availability assessments. These principles apply equally to the provision of Traveller sites.

3.3 The PPTS sets out specific national policy requirements for Traveller accommodation. Policy B includes the need for local planning authorities to produce policies in their Local Plan that:

- identify and update annually a supply of specific deliverable sites sufficient to provide five years' worth of pitches against locally identified targets
- identify a supply of developable sites or broad locations for growth for the medium and longer term
- encourage joint development plans across authorities to share targets and increase flexibility where local planning constraints exist, and
- relate pitch numbers to size and location of a settlement's population and density; and protect local amenity and environment.

3.4 National policy requires local planning authorities to identify and maintain a supply of deliverable and developable Traveller sites, supported by fair criteria-

based policies where needs are identified. Site provision should promote sustainable development, provide access to services and facilities, support integration with local communities, and avoid unacceptable environmental impacts. Particular regard should be given to avoiding domination of nearby settled communities, protecting the Green Belt, and ensuring that sites are located in appropriate and sustainable locations. National policy also recognises the importance of meeting the accommodation needs of Travelling Showpeople and enabling mixed residential and business uses where appropriate.

3.5 In this context, this study provides a robust and proportionate assessment of potential Traveller sites in Cotswold District. Its purpose is to identify deliverable and developable sites capable of meeting identified accommodation needs over the plan period, supporting a plan-led approach to provision and reducing reliance on ad hoc decision-making through the development management process.

4. Methodology

4.1 The methodology is set out in detail in Appendix 1.

Overview

4.2 This study establishes a robust and proportionate methodology to identify and assess land with potential to accommodate Gypsy and Traveller pitches within Cotswold District. The methodology has been designed to ensure that the assessment is consistent with national policy and guidance, while reflecting the specific characteristics, constraints and settlement pattern of the District.

4.3 The approach aligns with:

- the Planning Practice Guidance on Housing and Economic Land Availability Assessment (PPG, last updated November 2025)
- the NPPF (December 2024), and
- the PPTS (December 2024).

4.4 It applies these principles in a locally specific way to ensure that site assessments are realistic, transparent and capable of withstanding scrutiny.

Site identification

4.5 A comprehensive and proactive approach has been used to identify a wide range of potential sites. Sources include:

- Existing HELAA sites that have been promoted for Traveller use (including strategic sites)
- Review of previously assessed sites
- One Public Estate Land
- Call for Sites submissions (including historic and recent exercises)
- Existing authorised, temporary and tolerated Traveller sites, including opportunities for extension, intensification and regularisation where appropriate.

4.6 This ensures that all reasonable options for meeting Traveller accommodation needs have been considered.

Assessment framework

4.7 All sites have been assessed using a policy-on approach, meaning that relevant planning policy constraints and designations have been considered from the outset. This reflects current PPG guidance and ensures that the assessment identifies sites that are realistically capable of development.

4.8 Each site has been appraised against three core criteria:

Availability

- whether the site is currently available or has a reasonable prospect of being available, and
- land ownership, developer/landowner intentions, and any known legal or operational constraints.

Suitability

- the appropriateness of the site for Traveller development, including:
  - national and local planning policy
  - accessibility to services, facilities and the road network
  - environmental constraints (including flood risk, heritage, biodiversity and landscape)
  - the Cotswolds National Landscape and its setting
  - potential impacts on residential amenity

- the character of the surrounding area, and
- the relationship between the scale of proposed Traveller site and the nearest settled community, including whether the site would dominate the character, appearance or population of the settlement.

- Site assessments also consider the economic, social and environmental sustainability of each location, including access to schools, healthcare facilities, community services, employment opportunities, public transport, environmental quality and flood risk. The assessment also considers the potential for peaceful and integrated co-existence with the settled community, the capacity of local infrastructure and services, and the extent to which traditional Traveller lifestyles may contribute to sustainable patterns of development.

Achievability

- the likelihood that the site could be delivered within the relevant timeframe, including:
  - physical and infrastructure constraints
  - viability considerations (where known)
  - market interest and demand from the Traveller community (where known), and
  - planning history and delivery track record.

Staged assessment process

4.9 The methodology follows a clear and proportionate staged process.

Stage 1: Initial sieve (high-level review) (Appendix 2)

4.10 A longlist of sites is initially sifted on the following basis to create a shortlist of sites to be assessed in Stage two. The shortlist can be found in the report, Table 3.

4.11 A desktop assessment is undertaken to filter out sites that are:

- clearly unsuitable (e.g. severe flood risk, significant environmental, heritage or safety constraints, or unsafe access)
- unavailable, or
- not achievable.

4.12 This ensures that further detailed assessment focuses only on realistic site options to be assessed in Stage two.

Stage 2: Detailed site assessment (Appendix 3)

4.13 The remaining sites from Stage 1 are subject to a more detailed appraisal in Stage 2, including:

- site visits (where necessary)
- assessment of site-specific constraints and opportunities, including sustainability, infrastructure capacity and integration with the settled community
- consideration of potential capacity (number of pitches), and
- review of planning history and deliverability factors, assessment of site-specific constraints and opportunities, including sustainability, infrastructure capacity and integration with the settled community.

4.14 Professional judgement is applied to determine whether constraints could reasonably be mitigated.

Stage 3: Categorisation and outcomes in Appendix 3

4.15 Following detailed assessment, sites are categorised as:

- **Deliverable** – suitable, available and achievable within five years
- **Developable** – suitable and with a reasonable prospect of coming forward in the medium to longer term, or
- **Not currently deliverable or developable** – where constraints are such that development is unlikely to be appropriate.

Local considerations specific to Cotswold District

4.16 In applying this methodology, particular regard has been given to the distinctive characteristics of Cotswold District, including:

- the extensive coverage of the Cotswolds National Landscape
- the rural settlement pattern and relative accessibility of services
- landscape sensitivity and heritage considerations, and
- the need to balance provision of Traveller sites with protection of the District's high-quality environment.

4.17 These factors are integral to the assessment of site suitability and ensure that the methodology reflects local circumstances.

4.18 No sites identified through this assessment are located within the Green Belt. Consequently, Policy E of the PPTS has not influenced the assessment outcomes.

Limitations and role of the study

4.19 This assessment is a proportionate high-level appraisal intended to inform plan-making. It does not represent a detailed design or planning application assessment.

4.20 The identification of a site as deliverable or developable:

- does not imply that planning permission will be granted, and
- does not in itself allocate the site for development.

4.21 Further detailed assessment will be required through the Local Plan process and, where relevant, through the determination of planning applications.

5. Assessment of sites

Existing Traveller sites

5.1 This section establishes the baseline position for the provision of Traveller pitches within Cotswold District. It identifies all known authorised and unauthorised sites and provides an overview of the number, type and distribution of existing pitches at the base date of the assessment.

5.2 Understanding the existing supply of Traveller pitches is an important component of the evidence base. It:

- identifies sites that may benefit from policy protection,
- provides a starting point for assessing future requirements,
- enables the identification of any vacant or under-utilised pitches, and
- informs consideration of whether existing sites have potential to contribute further to meeting identified needs, including through intensification, expansion or regularisation.

5.3 The baseline includes:

- local authority permanent sites,
- permanent authorised private sites (with planning permission),
- temporary authorised sites, where relevant, and
- tolerated or unauthorised sites, where these are known to be in ongoing use.

5.4 Table 2 summarises the existing provision of Traveller pitches in the District, including locations and pitch capacity.

Table 2: Existing Traveller sites in Cotswold District

Ref	Address	Site capacity (pitches)
Permanent local authority sites		
GT-001	Culkerton, Oaksey Road	4
Permanent private authorised sites		
GT-002/004	Coberley, Land adjacent to Cirencester Road, Seven Springs (Site 1)	2
GT-003	Coberley, Land adjacent to Cirencester Road, Seven Springs (Site 2 – 'the Norris site')	2
GT-012	South Cerney, Four Acres, Shorncote	32
GT-013	South Cerney, Quarry Farm, Cricklade Road	2
GT-014	South Cerney, Land off Cricklade Road, GL7 5QE	3
GT-015	South Cerney, Oakfields, Cricklade Road, GL7 5QE (Site 1)	5
GT-017	South Cerney, Oakfields, Cricklade Road, GL7 5QE (Site 2)	5
Temporary authorised private sites		
None		
Tolerated sites		
GT-005	Coln St Dennis, Hollow Fosse, Fosse Cross	8

5.5 In total, there are currently 55 permanent Traveller pitches either occupied or benefiting from planning permission across 8 authorised sites within the District. This figure includes 10 pitches at the Oakfields sites (GT-015 and GT-017) which have planning permission but are not yet completed. These sites form part of the existing authorised supply and are separately recognised within the GTANA as committed pitch supply.

5.6 Including long-term tolerated provision, the total rises to 63 pitches on 9 sites. The majority of authorised provision (93%) is delivered through permanent private sites, with only 7% provided on the single local authority site at Culkerton. There are no temporary authorised sites in the District.

5.7 Provision is characterised by a relatively large number of small-scale private sites, typically accommodating between 1 and 5 pitches, alongside one strategically significant larger site at Four Acres, South Cerney, which provides 32 pitches.

5.8 There is also a long-term tolerated site at Hollow Fosse, Coln St Dennis, comprising 8 pitches.

5.9 The spatial distribution of sites shows a degree of clustering in the south of the District, particularly in the South Cerney area and around Seven Springs/Coberley. This reflects the pattern of historic permissions and site availability, as well as the extent of the Cotswolds National Landscape.

5.10 The capacity figures presented reflect the number of pitches with planning permission (or known to be in use in the case of tolerated sites) at the base date. The extent to which these pitches contribute towards meeting identified need will depend on factors such as vacancy, occupancy and deliverability, which are assessed in Appendix 3.

5.11 Overall, the existing provision is characterised by a reliance on private sites, a concentration of pitches in a limited number of locations, and a mix of small-scale developments alongside a single large site. This has implications for the future spatial distribution of Traveller provision and the role of existing sites in meeting identified needs.

5.12 Existing authorised Traveller sites make an important contribution towards meeting accommodation needs within Cotswold District and provide a significant proportion of the available pitch supply. Retention of these sites will be important to maintaining the existing supply of pitches and reducing the need for additional site allocations.

5.13 Given the limited opportunities identified for new Traveller site provision, the continued retention of existing authorised Traveller sites is essential to maintaining the District's supply of Traveller accommodation. The Local Plan should therefore include a policy that safeguards existing authorised sites from redevelopment or alternative uses that would result in the loss of authorised pitches unless suitable replacement provision is secured.

5.14 The Local Plan should also support, in principle, proposals for the appropriate intensification, extension or regularisation of existing Traveller sites where these would not give rise to unacceptable impacts on landscape, heritage assets, residential amenity, highway safety, infrastructure capacity or the character of the surrounding area.

Findings of Stage 1 Assessment

5.15 A total of 47 sites were considered through the Stage 1 assessment process, drawing on a range of sources including previously assessed sites, HELAA sites, One Public Estate land, existing Traveller sites and strategic development locations. Of these, 29 sites were discounted at Stage 1 and were not taken forward for further consideration due to a combination of constraints relating to availability, flood risk, landscape and heritage sensitivities, physical limitations, access issues, site size or existing commitments to alternative uses.

5.16 Eighteen sites were progressed to Stage 2 for detailed assessment. These comprised existing authorised and tolerated Traveller sites, sites with potential for intensification, extension or regularisation, and several 'new' sites, including two strategic development locations.

Findings of Stage 2 Assessment

5.17 The 18 sites taken forward from the Stage 1 assessment were subject to detailed appraisal against a range of planning, environmental and deliverability criteria. These included planning history, site suitability, access arrangements, proximity to services and facilities, landscape and visual impacts, heritage and ecological constraints, flood risk, availability and deliverability.

5.18 The assessment confirmed that a number of existing authorised and tolerated Traveller sites continue to play an important role in meeting accommodation needs across the District. However, the majority of these sites were not considered capable of accommodating additional pitches due to a combination of physical, environmental and operational constraints. In many cases, sites were fully occupied and opportunities for expansion or intensification were constrained by factors such as landscape sensitivity, ecological designations, flood risk, access limitations, neighbouring land uses or the need to safeguard the character of the surrounding area.

5.19 A number of other sites were found to be unsuitable, unavailable or undeliverable for future Traveller accommodation. Some sites had benefited

from previous planning permissions that had subsequently lapsed, whilst others had reverted to alternative uses or were no longer available due to changes in ownership circumstances. Several sites were also constrained by significant issues relating to highway access, flood risk, heritage and ecological considerations, or legal and land ownership matters which would prevent or significantly restrict their delivery as Traveller sites.

5.20 Notwithstanding these constraints, the assessment identified a small number of sites that have the potential to contribute towards future Traveller pitch provision during the plan period. These comprise sites with extant planning permission, opportunities for expansion of existing Traveller sites, and larger strategic locations where Traveller accommodation could be incorporated through the masterplanning process. The most significant opportunities were identified within the South Cerney area, together with the strategic development locations at Land south of Driffield and Land south of The Steadings.

5.21 Overall, the Stage 2 assessment demonstrates that opportunities for additional Traveller pitch provision are relatively limited. Whilst many existing sites continue to provide valuable accommodation, few have scope for further growth and a number of potential sites are affected by constraints that limit their suitability, availability or deliverability. Consequently, the future supply of Traveller pitches is largely dependent on a small number of existing commitments, expansion opportunities and strategic site allocations.

Vacant pitches on existing sites

5.22 In addition to sites identified through the assessment process, the GTANA identifies a supply of 5 Traveller pitches arising from existing vacant pitches and households expected to vacate pitches during the plan period. These are to be delivered throughout the 2026-43 Plan period.

Windfall allowance

5.23 The Planning Policy for Traveller Sites (MHCLG, 2024) (PPTS) requires local planning authorities to identify and maintain a supply of deliverable and developable sites to meet identified accommodation needs. In addition to specific site allocations and existing commitments, it is appropriate to consider whether a windfall allowance should contribute towards the overall supply of Traveller pitches.

5.24 Windfall sites are sites which have not been specifically identified in the development plan process but subsequently come forward for development. National policy allows windfall allowances to be included where there is compelling evidence that such sites have consistently become available and will continue to provide a reliable source of supply.

5.25 There is clear evidence that windfall Traveller sites have contributed significantly towards pitch delivery in Cotswold District during the period covered by the adopted Local Plan 2011-2031. Table 3 identifies that since 2011, four windfall Traveller sites have been granted permission and completed, delivering a total of nine pitches. Collectively, these equate to an average delivery rate of approximately 0.6 pitches per annum over the 15-years period since the beginning of the Plan period, or 0.9 pitches per annum over the 10-year period since the completion of the first windfall site.

Table 3: Completed windfall Traveller pitches (2011-26)

Ref	Address	Site capacity (pitches)	Year completed
Permanent private authorised sites			
GT-002/004	Coberley, Land adjacent to Cirencester Road, Seven Springs (Site 1)	2	2016/17
GT-003	Coberley, Land adjacent to Cirencester Road, Seven Springs (Site 2 – 'the Norris site')	2	2017/18
GT-013	South Cerney, Quarry Farm, Cricklade Road	2	2016/17
GT-014	South Cerney, Land off Cricklade Road, GL7 5QE	3	2025/26
	Total	**9**	

5.26 In addition, Table 4 shows there are currently two further windfall sites with planning permission that have yet to be completed, which are set to provide an additional 10 pitches. However, these pitches already form part of the committed supply identified in the Gloucestershire Gypsy and Traveller Accommodation Needs Assessment (RRR, 2026) (GTANA) and are therefore not included within the windfall allowance to avoid double counting.

Table 4: Committed windfall Traveller pitches

Ref	Address	Site capacity (pitches)	Year granted permission
GT-015	Oakfields, Cricklade Road, Cirencester, GL7 5QE (Site 1)	5	2025/26
GT-017	Oakfields, Cricklade Road, Cirencester, GL7 5QE (Site 2)	5	2026/27
	Total	**10**	

5.27 The historic evidence also demonstrates that windfall permissions have been granted throughout the period covered by the adopted Local Plan, including permissions and completions in 2016/17, 2017/18, 2025/26 and 2026/27. This indicates an ongoing and continuing source of supply rather than a one-off occurrence and provides compelling evidence that suitable windfall sites are likely to continue coming forward during the emerging Local Plan period.

5.28 The Council has historically taken a positive and proactive approach towards Traveller accommodation proposals through the development management process. This approach is reflected in Policy H7 of the adopted Local Plan 2011-2031, which established a sequential approach that expressly supports the intensification and extension of existing Traveller sites and, where necessary, the provision of new sites. The emerging Local Plan continues this approach through Core Policy 41, which supports windfall Traveller sites that meet an identified need and accord with the policy's locational and environmental criteria.

5.29 The evidence demonstrates that Traveller windfall sites continue to come forward within the District, particularly through the expansion of existing sites and the development of previously unidentified parcels of land in locations where there is an established Traveller presence. It is therefore reasonable to conclude that additional windfall pitches are likely to come forward during the Plan period.

5.30 However, a cautious approach has been taken in establishing a windfall allowance. The allowance excludes:

- pitches already identified within the GTANA supply through vacant pitches and extant permissions,
- pitches proposed through Local Plan allocations, and
- sites currently subject to planning applications or otherwise known to be committed.

5.31 Having regard to the historic delivery of nine completed windfall pitches, the Council's positive approach to Traveller site provision, and the continuing prospect of additional windfall proposals coming forward, a windfall allowance of five pitches over the period 2026-2043 is considered realistic and justified. This represents a delivery rate significantly below historic performance and therefore provides a robust and conservative estimate of future supply.

5.32 For five-year supply purposes, this equates to an allowance of two windfall pitches during the periods 2026-2031 and 2028-2033. Given the established pattern of windfall delivery in the District and the continued support for suitable windfall proposals through Local Plan policy, there is compelling evidence that this level of delivery is achievable.

6. Traveller Site Supply for Local Plan Period (2026-43)

6.1 This section brings together the various sources of Traveller pitch land supply to provide a total figure.

6.2 Taken together, there is a potential supply of 57 Traveller pitches across the Plan period. This comprises vacant pitches on existing sites, extant planning permissions, proposed Local Plan allocations and provision associated with strategic development locations. A summary of the identified supply is provided in Table 5.

Table 5: Existing and Future Sources of Traveller Pitch Supply

Site	Pitches	Timescale
Existing supply already accounted for within the GTANA		
Vacant pitches on existing sites		
Households on sites expected to leave the area	2	6-10 years
Households on sites expected to move into housing	1	11-15 years
GT-012: Four Acres, Shorncote, near South Cerney	2	0-5 years
Sites with extant planning permission yet to be completed		
GT-015: Oakfields, Cricklade Road, Cirencester, GL7 5QE (Site 1)	5	0-5 years
GT-017: Oakfields, Cricklade Road, Cirencester, GL7 5QE (Site 2)	5	0-5 years
Sub-total	**15**	
Additional supply identified through this assessment		
Sites suitable for allocation in the Local Plan		
GT-013: Quarry Farm, Cricklade Road, South Cerney	9	6-10 years
GT-016: Oakfields, Cricklade Road, GL7 5QE (Site 3)	8	6-10 years
GT-018: Strategic site at Land south of Driffield	10	6-10 years
GT-019: Strategic site at Land south of The Steadings	10	6-10 years
Windfall allowance		
Windfalls	2	0-5 years
Windfalls	2	6-10 years
Windfalls	1	11-15 years
Sub-total	**42**	

6.3 The 15 pitches arising from vacant pitches and extant permissions are already accounted for within the GTANA need calculation and therefore should not be counted again when assessing the ability of allocations to meet the residual requirement for 32 pitches.

7. Five-Year Supply of Deliverable Traveller Sites

Five-Year Supply (2026-31)

7.1 Policy B of the PPTS requires local planning authorities to identify and maintain a supply of specific deliverable sites sufficient to provide five years' worth of sites against locally identified targets.

7.2 The GTANA identifies a residual need for 12 additional pitches in the five year period from 2026-31, having already accounted for vacant pitches on existing sites (5 pitches) and the two sites with extant planning permission yet to be completed (10 pitches). There are currently no further identified 'deliverable' sites in 0-5 years that can count towards meeting the residual identified need for the 5 year period. However, Section 5 justifies the inclusion of a windfall allowance of 2 pitches for the 5-year period. The position as of July 2026 is summarised in Table 6.

Table 6: Five year land supply of Traveller pitches (2026-31)

Item	Pitches
Residual need 2026-31	12
Deliverable supply	2
Surplus / deficit	-10

7.3 As of July 2026, the District does not currently demonstrate a five-year supply of deliverable Traveller sites against the identified requirement. However, the Council expects the position to improve significantly prior to Local Plan adoption as additional sites progress through the planning process. The anticipated position at adoption is set out below.

Five-Year Supply (2028-33)

7.4 The Local Plan will also need to identify a 5 year supply of Traveller sites at the point of adoption of the Local Plan, which is anticipated to be in early 2028, and maintain this throughout the Plan period. A five year supply will therefore need to be demonstrated for the period 2028-33.

7.5 Prior to April 2028, it is anticipated that the 9 potential pitches at GT-013 can be regularised and the 8 potential pitches at GT-016, which are currently the subject of a planning application, can gain planning permission by 2028. Section 5 also provides justification for the inclusion of a windfall allowance of 2 pitches for the 5-year period. The anticipated position at April 2028 is summarised in Table 7.

7.6 The Council considers there to be a reasonable prospect that GT-013 and GT-016 will contribute towards the five-year supply position at the anticipated point of Local Plan adoption. GT-013 comprises an existing Traveller site with clear potential for regularisation and expansion, whilst GT-016 is currently the

subject of a planning application. Both sites are available, capable of accommodating Traveller pitches, and there are no known constraints that would prevent delivery within the anticipated timeframe. Accordingly, the Council considers that both sites have a realistic prospect of contributing towards the supply of deliverable Traveller pitches between 2028 and 2033.

Table 7: Anticipated five year land supply of Traveller pitches (2028-33)

Item	Pitches
Residual need 2026-31	10*
Deliverable supply	19
Surplus / deficit	9

*Figure extrapolated from the GTANA[1]

7.7 The identified deliverable supply exceeds the five-year requirement by 9 pitches and therefore demonstrates a five-year supply of deliverable Traveller sites at the anticipated point of adoption of the 2026-43 Local Plan.

8. Summary and Recommendations

8.1 This study has identified and assessed potential Gypsy and Traveller sites capable of contributing towards meeting the accommodation needs identified in the Gloucestershire Gypsy and Traveller Accommodation Needs Assessment (RRR, 2026) (GTANA) for the period 2026-2043. The GTANA identifies a residual requirement for 32 additional Traveller pitches within Cotswold District over the Plan period.

8.2 A total of 47 sites were considered through the assessment process, drawing on a range of sources including existing Traveller sites, previously assessed sites, Call for Sites submissions, HELAA sites, One Public Estate land and strategic development locations. Of these, 18 sites were taken forward for detailed assessment. The assessment confirms that existing authorised and tolerated Traveller sites continue to make an important contribution towards meeting accommodation needs within the District. However, opportunities for intensification or expansion are generally limited due to landscape, environmental, highway, operational and other site-specific constraints.

[1] The 2028-33 need figure is calculated by taking the remaining three years of the 2026-31 requirement (7 pitches) and the first two years of the 2031-36 requirement (3 pitches), resulting in a total requirement of 10 pitches.

8.3 The assessment identified a limited number of realistic opportunities capable of contributing towards future Traveller pitch provision. These include existing vacant pitches, sites with extant planning permission, opportunities for regularisation and expansion at existing sites, and provision that could be incorporated within strategic development locations through the masterplanning process.

8.4 The GTANA already takes account of five vacant pitches and ten pitches benefitting from extant planning permission. In addition, this assessment identifies four sites that are suitable for allocation through the Local Plan, capable of delivering a further 37 pitches during the Plan period. A cautious windfall allowance of five pitches is also justified based on historic delivery trends and the Council's positive approach to supporting appropriate Traveller site proposals.

8.5 Taken together, these sources provide a potential supply of 57 pitches across the Plan period. Whilst 15 of these pitches are already accounted for within the GTANA need calculation, the remaining supply exceeds the identified residual requirement of 32 pitches and provides flexibility to respond to changing circumstances, delivery delays and future accommodation needs.

8.6 The assessment demonstrates that, as of July 2026, the District does not currently have a five-year supply of deliverable Traveller sites. Against a residual requirement of 12 pitches for the period 2026-2031, the identified deliverable supply comprises only the justified windfall allowance of two pitches, resulting in a deficit of 10 pitches. However, the assessment identifies a sufficient supply of developable sites to meet the District's identified Traveller accommodation needs over the wider Plan period and provides a clear strategy for future provision through Local Plan allocations and windfall opportunities.

Recommendations

8.7 It is recommended that the Local Plan:

- safeguards existing authorised Traveller sites from redevelopment or alternative uses that would result in the loss of authorised pitches unless suitable replacement provision is secured,
- supports the appropriate intensification, extension or regularisation of existing Traveller sites where this can be achieved without unacceptable impacts on landscape, heritage, biodiversity, residential amenity, highway safety or infrastructure capacity,

- recognises vacant pitches and extant planning permissions as contributing towards the District's identified supply of Traveller accommodation,
- allocates the following sites for Traveller accommodation:
  - GT-013: Quarry Farm, Cricklade Road, South Cerney
  - GT-016: Oakfields, Cricklade Road, GL7 5QE (Site 3)
  - GT-018: Land south of Driffield
  - GT-019: Land south of The Steadings
- secures Traveller pitch provision through the masterplanning of strategic development locations where appropriate,
- supports suitable windfall Traveller site proposals that accord with Local Plan policy and contribute towards meeting identified accommodation needs, and
- monitors Traveller accommodation need, permissions, pitch delivery and the five-year supply position through the Authority Monitoring Report to ensure that an adequate supply of pitches is maintained throughout the Plan period.

8.8 Subject to these recommendations, the Council is well placed to meet the identified accommodation needs of Gypsies and Travellers through a plan-led approach that provides sufficient pitch capacity to meet identified needs over the period to 2043, and that there is a five-year supply of Traveller pitches on the anticipated date of adoption of the 2026-43 Local Plan, whilst ensuring that future development is directed to suitable and sustainable locations and respects the environmental, landscape and heritage qualities of the District.

1. Introduction

The Planning Policy for Traveller Sites (MHCLG, December 2024) (PPTS) requires Local Authorities to identify and update annually:

- A supply of specific deliverable sites sufficient to provide five years' worth of sites against their locally set targets, and
- A supply of specific, developable sites or broad locations for growth, for years six to ten and, where possible, for years 11-15.

To be considered deliverable, sites should be available now, offer a suitable location for development now, and be achievable with a realistic prospect that development will be delivered on the site within five years and in particular that development of the site is viable. Sites with planning permission should be considered deliverable until permission expires, unless there is clear evidence that schemes will not be implemented within five years, for example, they will not be viable, there is no longer a demand for the type of units or sites have long term phasing plans.

To be considered developable, sites should be in a suitable location for Traveller site development and there should be a reasonable prospect that the site is available and could be viably developed at the point envisaged.

The Cotswold GTANA (RRR, 2026) identifies the level of need to be 20 additional Gypsy and Traveller (Traveller) pitches in Cotswold District over the period 2025–2043, with figures extrapolated for the 2026-2043 plan period.

The next stage in this process is to identify sites to meet need in the context of the above requirements. The Cotswold Gypsy and Traveller Site Assessment Study is a nuanced approach to site selection. This relates to both the type and location of sites, as well as their suitability and deliverability. To reflect this, the methodology is a stepped approach targeted at providing a realistic and deliverable list of potential sites for Traveller pitch provision.

The PPTS specifies that no sites should be identified for Traveller use that would not be appropriate for ordinary residential dwellings. As a result, and in the absence of a published Practice Guidance for a Gypsy and Traveller HELAA, this methodology has been based on the methodology set out in the HELAA: Practice Guidance (November 2025) published by CLG. It has also been informed by the National Planning Policy Framework (December 2024) (NPPF), Planning Policy for Traveller Sites (PPTS) and the CLG Designing Gypsy and Traveller Sites Good Practice Guide (this was cancelled by the government in August 2015, but was only a guidance document not policy, therefore is still useful guidance for the design of Traveller sites.

2. Methodology

The Cotswold Gypsy and Traveller Site Assessment Study will draw on the existing sites identified through the Cotswold District Housing and Economic Land Availability Assessment (HELAA). This is a comprehensive assessment of land across the district and includes sites from various different sources, as set out below.

i. Existing HELAA sites

Conduct a review of sites assessed in the HELAA that have been promoted for Traveller use. This includes:

Sites in the planning process:

- Land allocated in the Local Plan or with planning permission for housing, employment or other land uses which are no longer required for those purposes,
- Land with unimplemented/outstanding planning permissions, including sites with planning permission for Traveller accommodation, and
- Planning permissions for housing, including Traveller accommodation, that are under construction.
- Include live applications for Traveller pitches.
- Strategic sites that have capacity to include additional traveller pitches.

Sites not currently in the planning process:

- Vacant and derelict land,
- Surplus public sector land,
- Urban extensions, and
- Sites in rural settlements and rural exception sites.

ii. Review of previously assessed sites

Review all previously assessed sites in *Appendix 2: Short list of sites*, from the *Gypsy & Traveller Identification of Potential Sites (December 2017)*.

iii. One Public Estate Land

Review all One Public Estate Land sites – Ruston Planning produced a 'Action Plan for joint working by Gloucestershire authorities / One Public Estate Gloucestershire to increase accommodation provision for Travelling Communities'. This provided a joint Gloucestershire-

wide assessment of all One Public Estate Land to identify any land suitable for Traveller pitches. The One Public Estate sites were identified using a detailed site assessment.

iv. Call for sites

To inform this process, targeted Gypsy, Traveller and Travelling Showpeople 'Call for Sites' have been undertaken at each stage of Local Plan consultation since 2020 for the Cotswold District Local Plan (2026 to 2043). This has built on previous Call for Sites campaigns undertaken prior to 2020. The Call for Sites campaigns have invited landowners, agents and members of the community to submit sites for consideration of their potential to provide for permanent accommodation for Traveller communities.

v. Existing authorised, temporary and tolerated Traveller sites

The following sites will be considered through the process:

- Land that is used and unauthorised for Traveller accommodation but tolerated,
- Land that is used and unauthorised for Traveller accommodation but not tolerated,
- Possible extensions to existing sites that are authorised/temporarily authorised for Traveller accommodation, and land that accommodates caravans but is not restricted for use by Travellers only.
- This review will also consider opportunities for the extension, intensification or regularisation of existing Traveller sites, where appropriate.

3. Stage Assessment process

The methodology follows a clear staged process:

i. Stage one – desktop work

Sites from the Appendix 2: Longlist should be initially sifted on the following basis to create a shortlist of sites to be assessed in Stage two. The shortlist can be found in the report, Table 3:

Site size

The PPTS does not provide any guidance and the now withdrawn 'Designing Gypsy and Traveller Sites Good Practice Guide' (DCLG, 2008) also declines to offer any suggestions on a minimum area, instead stating that:

"There is no one ideal size of site or number of pitches although experience of site managers and residents alike suggest that a maximum of 15 pitches is conducive to providing a

comfortable environment which is easy to manage. However, smaller sites of 3-4 pitches can also be successful, particularly where designed for one extended family."

The guidance adds that a pitch should be able to accommodate "two touring caravans, two parking spaces and private amenities." In accordance with the 2008 guidance, it is often suggested that 0.2 ha has been used as a minimum size threshold as this can accommodate about 4 pitches and in those examples, any sites below this size threshold would not be considered for assessment.

However, such is the need for pitches within the District, sites potentially capable of accommodating a single residential pitch should be considered at this stage. Sites of over 0.05 ha will therefore be considered initially.

Given that sites might be found within a portion of a larger site, no upper limit is set. There is no one size fits all with some Travellers preferring smaller sites whilst others maybe seeking larger sites to allow extended family groups to live together. Any identified public land would be assessed considering land availability and optimum land usage balanced against future use.

Absolute constraints

The following designations are considered unsurmountable constraints and sites in these areas are therefore excluded from the search:

- Ancient Woodland
- Common Land
- Flood Zone 3b
- Health and Safety Executive Inner Zones
- International and national ecological designations, together with local ecological sites where significant adverse impacts could not reasonably be mitigated
- Open Access Land
- Mineral Safeguarded Sites
- Nationally Registered Parks and Gardens
- National Trust Inalienable Land
- Registered Battlefields
- Regionally Important Geological Sites
- Scheduled Monuments
- Working mineral sites

- Infrastructure / explosive safeguarding areas (E.g. gas pipeline / oil pipeline safeguarding area; Explosive safeguarding area)
- Designated cordon sanitaires

Other constraints

- For the initial sift of land, other constraints such as the Green Belt or National Landscape are not initially screened out given the level of need. This is supported by Policy E of the PPTS, which states that Traveller sites in the Green Belt constitute inappropriate development unless one of the exceptions identified in Chapter 13 of the NPPF applies.
- Sites in flood zone 2 and 3a are considered in the event of no land being available in flood zone 1.
- Whilst not being ruled out initially, listed buildings, Conservation areas, other heritage designations and non-designated heritage assets are considered at sites sifting stage.
- Planning appeal decisions will be a key indicator at this stage.

Locational sustainability

The PPTS anticipates that Traveller sites may be in rural locations, and gives a wider consideration of sustainably than just being in walking distance to services. However, sites should be situated in a suitable location in terms of access to local amenities, services and facilities, as referenced in Policy B paragraph 13 of the PPTS. In considering sustainability, regard will also be had to traditional Traveller lifestyles, including circumstances where people live and work from the same location, thereby reducing the need to travel. The assessment will consider whether sites provide reasonable access to education, healthcare, welfare services and employment opportunities, whilst recognising that Traveller sites are often located in rural locations and may not perform against the same accessibility measures commonly applied to conventional residential development. The assessment therefore considers the capacity of local infrastructure and services and whether development would place undue pressure on existing provision.

Site assessments must be realistic and should be 'policy on'. The Cotswold Local Plan does not say anything on the issue in H7. Importantly, nothing in any of these policies talks about needing to be within walking distance of services or immediately adjacent to settlements.

Further to this it should also be borne in mind that Policy D of PPTS states:

.15. If there is a lack of affordable land to meet local traveller needs, local planning authorities in rural areas, where viable and practical, should consider allocating and releasing sites solely for affordable traveller sites. This may include using a rural exception site policy for traveller

sites that should also be used to manage applications. A rural exception site policy enables small sites to be used, specifically for affordable traveller sites, in small rural communities, that would not normally be used for traveller sites. Rural exception sites should only be used for affordable traveller sites in perpetuity. A rural exception site policy should seek to address the needs of the local community by accommodating households who are either current residents or have an existing family or employment connection, whilst also ensuring that rural areas continue to develop as sustainable, mixed, inclusive communities.

As such, potential sites in rural locations will be retained on a longlist and may be considered for Rural Exception Site use in future.

ii. Stage two – detailed site assessment

Once sites have been initially sifted, a more detailed approach should be undertaken. Assessing the sites in Table 3 of the report, using the site proformas in chapter 4. The detailed site assessments will include / take account of:

- Sustainability Appraisal
- Habitats Regulation Assessment
- Whether the site is deliverable / available
- Appropriate levels of services (including consideration of off grid developments)
- Potential to promote peaceful and integrated co-existence between the Traveller site and the settled community
- Advice of the Highway Authority
- The capacity of local infrastructure and services, including whether development would place undue pressure on existing provision
- Site visit to consider other planning issues (e.g. landscape impact and other site specific constraints)
- Where relevant, consideration of whether the site could appropriately accommodate mixed residential and business uses.

iii. Stage three - Categorisation and outcomes

Following detailed assessment, sites are categorised as and the assessment commentary can be found at the end of each proforma:

- Deliverable – suitable, available and achievable within five years
- Developable – suitable and with a reasonable prospect of coming forward in the medium to longer term, or

- Not currently deliverable or developable – where constraints are such that development is unlikely to be appropriate or achievable within the plan period.

4. Site Survey

5. Assessment Parameters

Site information	
Site area	No size limit. Established through electronically mapping each site.
Current and past land use **Character of surrounding area** **Surrounding uses** **Planning status**	Desk based research and field survey work.
Relevant planning history	Desk based research to establish any significant planning history associated with the sites.
Physical constraints	Desk based research and field survey work to establish both physical and policy constraints to the future development of the site for GTTS.
Are there any factors listed below that might limit development?	
Green Belt	The assessment will be prepared having regard to the purposes of the Green Belt, and the approach in the NPPF to grey belt. No site will be initially sifted out due to the Green Belt issues.
Flood Zone	Technical Guidance to the NPPF classifies caravans, mobile homes and park homes intended for permanent residential use as being "highly vulnerable". However, sites which are in flood zones 2 and 3 will not be initially sifted out due to the shortage of sites generally. Once the availability of land has been established the sequential test can be applied, followed by looking at the exception test is necessary.
Contamination **Air quality** **Noise pollution**	Sites should not be located within Air Quality Management Areas or on unstable or contaminated land which cannot be mitigated. Sites assessed as having a negative impact on air quality and noise which cannot be mitigated will be found unsuitable.
Landscape designations	Impact on local designations such as special landscape areas will be assessed. Sites within the National Landscape may be acceptable in principle, but conserving landscape, wildlife and cultural heritage are important considerations.
Historic environment	Sites which impact upon heritage assets will be considered unsuitable, unless the harm is less than substantial and there are wider public benefits which outweigh any harm.

Appendix 1 – Cotswold Gypsy and Traveller Site Assessment Methodology

Ecology	Impacts on designated biodiversity sites, protected species, priority habitats and ecological networks will be assessed. Sites which would result in significant adverse ecological effects that cannot be avoided or adequately mitigated will be found unsuitable.
Topography	Sites will be assessed as unsuitable if the topography of the site is steeply sloping or deemed a physical constraint on development.
Other	
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads and motorways	To be assessed through desk based research and field survey work.
Accessibility and frequency of public transport services, including buses and trains Pedestrian and cycle links	Sites should not be located immediately adjacent to major transport corridors unless noise, safety and air quality can be mitigated. Transit sites/temporary stopping places and Travelling Showpeople sites should be located very close to main transport routes.
Please provide details of nearby services and facilities available to the site:	
Primary school **Secondary school** **GP surgery and other health services** **Local shops/post office** **Access to key local services and facilities**	To be assessed through desk based research and field survey work. The purpose of this section is for information, sites will not necessarily be excluded due to distance to services. Planning Policy for Travellers sites does not require sites to be able to access services by sustainable means. • Ideally, sites should: • Provide reasonable access to local services, including health and welfare services and employment, and ensure that children can attend school on a regular basis; and • Provide access to water, electricity, drainage & sanitation, with electricity and sewerage for permanent sites, including considerations of renewables.
Please provide your initial assessment of the site:	
Suitability	A site is suitable for a Gypsy, Traveller and Travelling Showpeople site if it offers a suitable location for development. The following factors should be considered in the assessment of a site's suitability: • Policy constraints • Physical problems or limitations • Potential impacts, including the effect upon landscape features and conservation • Environmental conditions which would be experienced by prospective residents

	• Potential for peaceful and integrated co-existence between Traveller sites and the settled community
Availability	A site is considered available for development if it is available now or there is a reasonable prospect that the site will be available at the point envisaged. There should be confidence that there are no legal or ownership problems, such as multiple ownerships, ransom strips, tenancies or operational requirements of landowners. The land should be controlled by a developer who has expressed an intention to develop, or the landowner has expressed an intention to sell. Where problems have been identified then an assessment will need to be made of when they can realistically be overcome.
Achievability	A site is considered achievable where there is a realistic or reasonable prospect that a Gypsy and Traveller pitch or Traveller plot could be viable developed at the point envisaged. This is essentially a judgement about the economic viability of a site. It will be affected by: • Market factors • Cost factors • Delivery factors
Overcoming constraints	Where constraints have been identified, the assessment should consider what action would be needed to remove them. Actions might include the need for investment in new infrastructure, dealing with fragmented land ownerships, environmental improvement or a need to amend planning policy which is constraining development.

Appendix 2: Stage 1 Assessments (Initial Sieve)

Site Ref	Source	Site Name	Size (Ha)	Summary	Conclusion
Ampney Crucis					
CDC3	Site identified in 2014 report	Land at Durncourt Cottages	0.1	Publicly owned land, the site is small and has a public right of way running along the western boundary, which reduces the developable area. The neighbouring properties on either side appear to have rights of way over the land to gain access to garages and back gardens, which reduces the developable area further still. The site is also overlooked by the adjoining properties. The site is too small to accommodate a Traveller pitch and it would be unsuitable even if it were large enough.	Not currently deliverable or developable
Andoversford					
A1	Site identified in 2014 report	Land adjacent to Andoversford Sewage Treatment Works	0.4	Most of the site is in Flood Zone 3b. It is also wooded. Being directly adjacent to a sewage treatment works, there is also likely to be an airborne particle odour constraint, which would further make this site unsuitable.	Not currently deliverable or developable
A6	Site identified in 2014 report	The Old Station House, Station Road	0.1	The site is garden land with poor access. It is within the built up area of Andoversford. Notwithstanding the site's already small size, there are also two large trees with Tree Protection Orders in the middle making the developable area even smaller - too small and unsuitable for a Traveller pitch.	Not currently deliverable or developable
Ashley					
GT-001	Authorised permanent site	Oaksey Road, Culkerton	0.3	See Stage 2 assessment (Appendix 3).	Progress to Stage 2 assessment
Avening					
CDC4	Site identified in 2014 report	Land at Sunground	0.2	This site has now been developed for 14 dwellings (ref: 19/04221/FUL) and is no longer available for Traveller pitch use.	Not currently deliverable or developable
Broadwell					
CDC14	Site identified in 2014 report	Verges and footpath at Wheat Close	0.1	Publicly owned land, although it cannot accommodate a Traveller pitch due to its linear shape.	Not currently deliverable or developable

Appendix 2: Stage 1 Assessments (Initial Sieve)

Site Ref	Source	Site Name	Size (Ha)	Summary	Conclusion
Chipping Campden					
CC68 and CC69	Site identified in 2014 report	Land at Aston Road	48.2	This site has been divided into CC68 and CC69. • CC68 - Part of CC68 is allocated in the 2011-31 Local Plan with an indicative capacity of 36 dwellings. A larger part of this site had planning permission for 76 dwellings (ref: 18/04768/OUT), although this has now lapsed. The whole site was subject to an EIA Screening Opinion for residential development of up to 150 dwellings, a new medical surgery, a new car/coach park and associated access and infrastructure (ref: 25/03689/SCR), which concluded no EIA was required. • CC69 - No planning applications have been made on this site. The site is located within the Cotswolds National Landscape and has 'High' sensitivity to development. CC68 is also being actively promoted for alternative uses.	Not currently deliverable or developable
CDC10	Site identified in 2014 report	Verges at Littleworth	0.1	Publicly owned land, which comprises a circular island in the centre of the road at the end of a quiet residential cul-de-sac. It is surrounded by housing on all sides, which face directly onto the island. The site is urban in character and is unsuitable for Traveller pitch use.	Not currently deliverable or developable
CDC15	Site identified in 2014 report	Land at Berrington Road	0.2	Publicly owned land, which comprises six smaller individual plots, which are separated from each other. They are currently used for car parking. The plots are surrounded by housing. Notwithstanding that the split nature of the site that makes it unsuitable for use as a Traveller pitch, the site is also highly overlooked and the car parking is needed to serve the surrounding housing.	Not currently deliverable or developable
GR136678	One Public Estate Site Assessment	Land on the north east side of Aston Road Chipping Campden	48.47	Gloucestershire County Council has not confirmed this site to be available for Traveller meaning there is no reasonable prospect for development.	Not currently deliverable or developable
Cirencester					

Appendix 2: Stage 1 Assessments (Initial Sieve)

Site Ref	Source	Site Name	Size (Ha)	Summary	Conclusion
C111	Site identified in 2014 report	Site at The Cranhams, Cranhams Lane	2.5	The site comprises 'The Cranhams', which is a Listed Building, and its domestic curtilage. It also incorporates an enclosed field in agricultural use to the south. The west of the site contains a pond and some scrub land, which are likely to have biodiversity value and where Great Crested Newts have been identified. The site is adjacent to a Scheduled Monument to the south, which is excluded from the developed area of the strategic planning permission at The Steadings (ref: 16/00054/OUT). Furthermore, the site forms the setting of the Listed Building and maintains views into the open countryside further to the south. The site's development as Traveller pitches would have a significant and unacceptable impact on the setting of the Listed Building. In the context of the The Steadings has an important function in providing a green swathe that links the existing built up area with the countryside to the south. The site's development would therefore have a negative impact on the wider landscape, particularly from the Public Right of Way at western and southern boundaries.	Not currently deliverable or developable
C143	Site identified in 2014 report	Playing field off Trinity Road	0.4	Publicly owned land, which is currently in active use as a playing field and is not available.	Not currently deliverable or developable
CDC1	Site identified in 2014 report	Picnic area between Old Cricklade Road and A419 Cricklade	1.6	Publicly owned land, although the whole of the site is located in Flood Zone 3b.	Not currently deliverable or developable
CDC13	Site identified in 2014 report	Verges on Beeches Estate	0.0	Publicly owned land, which comprises two grassed verges in a residential area, which are separated from each other. Both verges have overlooking issues and are unsuitable.	Not currently deliverable or developable
GT-019	Strategic site proposed in 2026-43 Local Plan	Land south of The Steadings (strategic extension of Cirencester)	117	See Stage 2 assessment (Appendix 3).	Progress to Stage 2 assessment
Coberley					

Appendix 2: Stage 1 Assessments (Initial Sieve)

Site Ref	Source	Site Name	Size (Ha)	Summary	Conclusion
GT-002 and GT-004	Authorised permanent site	Land adjacent to Cirencester Road, Seven Springs (Site 1)	0.3	See Stage 2 assessment (Appendix 3).	Progress to Stage 2 assessment
GT-003	Authorised permanent site	Land adjacent to Cirencester Road, Seven Springs (Site 2)	0.6	See Stage 2 assessment (Appendix 3).	Progress to Stage 2 assessment
Coln St Dennis

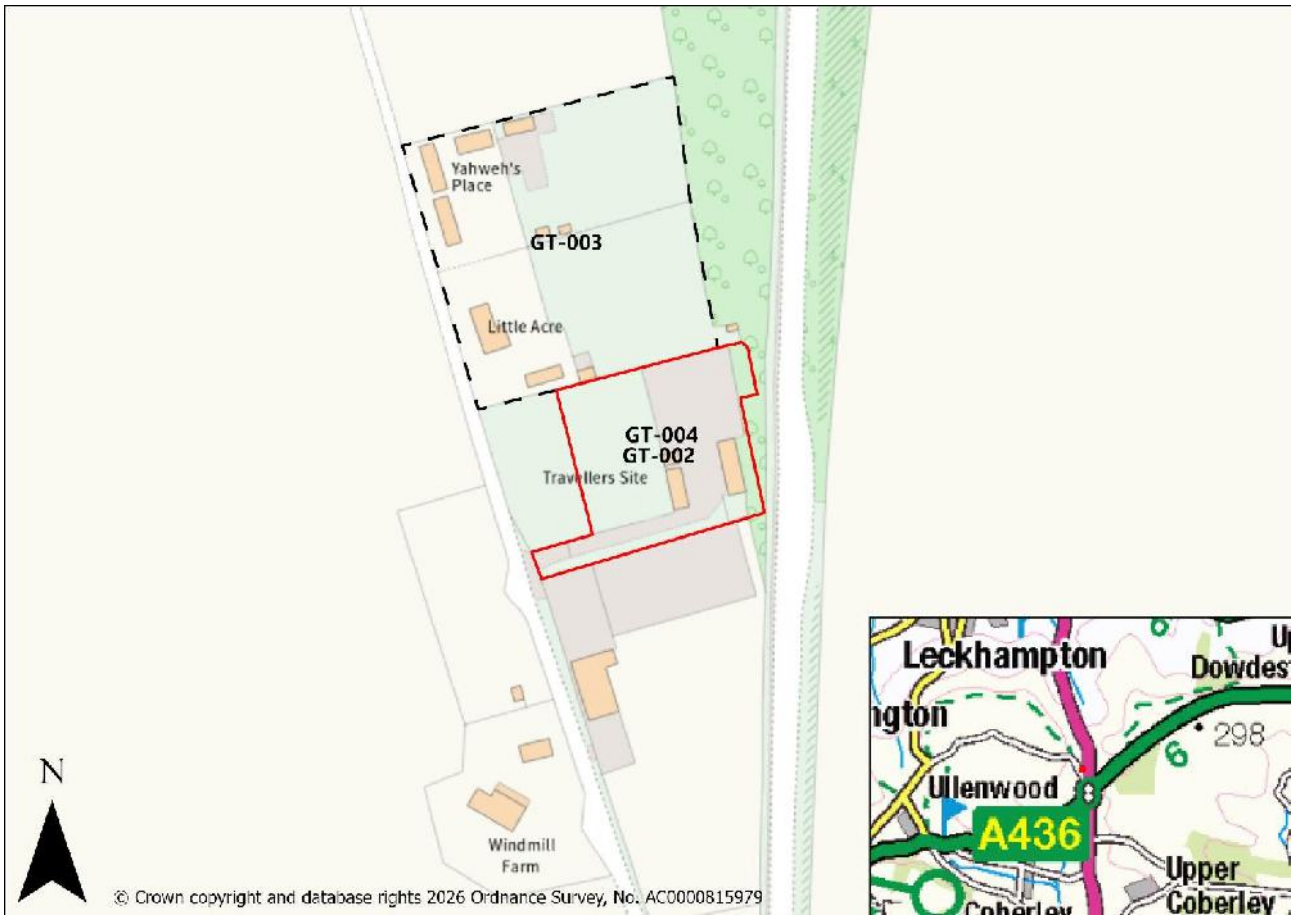
SC21	Site identified in 2014 report	Land east of Cirencester Road	8.8	Publicly owned land but is not available for Traveller use.	Not currently deliverable or developable

Appendix 2: Stage 1 Assessments (Initial Sieve)

Site Ref	Source	Site Name	Size (Ha)	Summary	Conclusion
GR147610	One Public Estate Site Assessment	Land at South Cerney	8.77	Gloucestershire County Council has not confirmed this site to be available for Traveller use meaning there is no reasonable prospect for development.	Not currently deliverable or developable
Stow-on-the-Wold					
S22B	Site identified in 2014 report	Land east of King George's Field	5.44	The site is unsuitable for Traveller pitch use. Its development would have a significant adverse impact on the character and appearance of the Cotswolds National Landscape and the setting of Stow-on-the-Wold.	Not currently deliverable or developable
S56	Site identified in 2014 report	Victoria House, Sheep Street	0.0	The site is located in the centre of Stow-on-the-Wold and is occupied by several buildings, which are located in the Conservation area. It is therefore unsuitable as a Traveller pitch.	Not currently deliverable or developable
CDC12	Site identified in 2014 report	Land at King Georges Field	0.1	Publicly owned land, which is two road-side verges within a residential estate. The verges are well overlooked by the surrounding properties and are unsuitable for use as Traveller pitches.	Not currently deliverable or developable
Tetbury					
T68	Site identified in 2014 report	Land adjacent to Brookside Cottage	0.2	The site is elevated in a sensitive part of the Conservation Area and is unsuitable for Traveller pitch use.	Not currently deliverable or developable
Willersey					
CDC11	Site identified in 2014 report	Land at Ley Orchard	0.2	Publicly owned land, which is a public green surrounded by with pedestrian access and residential properties. Any development of Traveller pitches would take away the amenity of the green for residents and is therefore unsuitable for Traveller pitch use.	Not currently deliverable or developable
W7A1 / W7A2 / W7C	Site identified in 2014 report	Land north of B4632 and east of employment estate	5.0	Mixed use (residential and employment) allocation in the Cotswold District Local Plan (2011-31). Planning application for 60 homes pending consideration on part of the site (ref: 25/02687/FUL) and planning permission granted for employment development on other part of site (ref: 22/03534/FUL).	Not currently deliverable or developable

Appendix 3: Stage 2 Assessments (Detailed)



Site Information	
Site reference	GT-001
Site name / address	Oaksey Road, Culkerton
	
Parish	Ashley
Grid reference	**Easting:** 394311 **Northing:** 195508
Site area (ha)	0.26
Current and past land use	**Current:** Existing permanent Traveller site (4 pitches) **Past:** n/a
Relevant planning policy	Policy H7 – Gypsies and Traveller Site Policy EN5: National Landscape Policy SA1/SA2/SA3: South Cotswold Strategy Delivery Sub-area
Relevant planning history	No recent planning history
Character of the surrounding area	The site is located on the northern side of Oaksey Road within a densely wooded area known as Newbarn Covert. New Barn is located south of Oaksey Road approximately 40m south-west of the site.
Surrounding land uses	The site is surrounded by farmland and woodland in all directions.

Physical constraints	Woodland surrounding the site.
Are there any factors listed below that might limit development?	
Green Belt	No
Flooding (i.e. Flood Zone 2 or 3)	The site is in Flood Zone 1.
Contamination, Air quality, Noise	No
Landscape designations (e.g. National Landscape, Special Landscape Area)	Cotswolds National Landscape.
Historic environment (e.g. Scheduled Monuments, Listed Building, Conservation Area, buried archaeology)	No
Ecology (e.g. wildlife designations, protected species or habitats, etc.)	Surrounded by woodland, which is a priority habitat.
Topography	The site gently slopes from north (122.9m AOD) to south (122.0m AOD).
Cordon Sanitaire	N/A
Other	N/A
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads	The site currently has access to a minor road at the southern boundary of the site.
Public transport services, including buses and trains	The closest bus stop is in Culkerton less than 1.5km away, running the 882 (Gloucester – Tetbury) and C60 (Cirencester – Wotton-under-edge).
Pedestrian and cycle links	N/A
How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
The site has direct access to a minor road suitable	
Please provide details of nearby services and facilities available to the site:	
Primary school	The closest school to the site is Rodmarton Primary School which is approximately 2.5km north of the site within Rodmarton Village. Cudwell C of E Primary School is approximately 2.8km south of the site within Crudwell village.
Secondary school	The Sir William Romney School in Tetbury is approximately 5.5km from the site.

Appendix 3: Stage 2 Assessments (Detailed)

GP surgery and other health services	There are 3 GP surgeries within approximately 5km from the site, located in Tetbury and Kemble.
Local shops/post office	There are 4 post offices within 5km of the site. Tetbury has a high street of shops, a pharmacy and Tesco Superstore supermarket, approximately 5km from the site.
Other key local services and facilities	The closest public house is The Potting Shed Pub located in Crudwell, approximately 2.8km southeast of the site. St James's Church is located approximately 1.38km south-west of the site.
Water supply, drainage, electricity, gas	
Please provide your initial assessment of the site:	
Suitable	This is an authorised permanent Traveller site. The County Council has confirmed the site is fully occupied. However, there is no potential to expand or intensify uses within the existing site. Expansion would inevitably lead to harm to the surrounding woodland, which is a priority habitat. This would impact on biodiversity and could also potentially reduce the existing screening.
Available	The site is currently fully occupied and there are no vacant pitches.
Achievable	It is not likely the anymore pitches could be achievable on this site within 5 years. As the site has no vacant pitches or potential for expansion or intensification.
Conclusion	Not currently deliverable or developable
Likely timescale	N/A
How could the identified constraints be overcome?	N/A

Appendix 3: Stage 2 Assessments (Detailed)

Site area (ha)	0.28
Current and past land use	**Current:** Part existing Traveller site (2 pitches), part greenfield land **Past:** Agriculture
Relevant planning policy	Policy EN5: National Landscape Policies SA1/SA2/SA3: South Cotswold Strategy Delivery Sub-area
Relevant planning history	18/04875/FUL - Gypsy pitch: stationing of caravans, additional hard-standing pitch, utility/day-room and day-room for existing pitch - Refused (14 Mar 2019); Allowed on appeal (05 Sep 2022) 17/03441/FUL - The use of land for the stationing of caravans for residential purposes for 1 no. gypsy pitch together with the formation of additional hard standing and utility/

	dayrooms ancillary to that use. Formation of a dayroom for an existing gypsy pitch. Refused 16/02140/FUL - Removal of Conditions 2 (temporary use and occupancy) and 3 (restoration of site) of planning permission - 12/04857/FUL to allow permanent retention of the site - Planning permission granted 12/04857/FUL - Formation of residential caravan site for one gypsy family with two caravans, including one static caravan/mobile home on existing equestrian site to create mixed use site - Planning permission granted on Appeal (Appeal A: APP/F1610/C/12/2190154, Appeal B: APP/F1610/C/12/2190155, Appeal C: APP/F1610/C/13/2191310, and Appeal D: APP/F1610/A/13/2192673 – all dated 7 August 2013).
Character of the surrounding area	The surrounding area reads as a working rural landscape. Open fields to the west and north, and woodland to the east between the site and the A435. Movement is via minor rural road to the west with limited pedestrian infrastructure and a Major A road to east.
Surrounding land uses	The site sits within a rural context surrounded by agricultural land on the east, south and west. A Traveller site adjoins the north of the site.
Physical constraints	The A435 is a is physical constraint to the east of the site, with a hedgerow acting as natural buffer between.
Are there any factors listed below that might limit development?	
Green Belt	N/A
Flooding (i.e. Flood Zone 2 or 3)	The site is in Flood Zone 1.
Contamination, Air quality, Noise	N/A
Landscape designations (e.g. National Landscape, Special Landscape Area)	Cotswolds National Landscape.
Historic environment (e.g. Scheduled Monuments, Listed Building, Conservation Area, buried archaeology)	N/A
Ecology (e.g. wildlife designations, protected species or habitats, etc.)	Near woodland, which is a priority habitat.
Topography	The site has a 10m slope, sloping from north to south.
Cordon Sanitaire	N/A

Other	N/A
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads	Vehicle access from Cotswolds Way to the west of the site.
Public transport services, including buses and trains	Bus stop less than 1km, running the 51 (Swindon – Cirencester) and C51 (Winchcombe - Cirencester).
Pedestrian and cycle links	No pedestrian paving along access road.
How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
Suitable	
Please provide details of nearby services and facilities available to the site:	
Primary school	There is primary school 1km away in Coberly and multiple primary schools less than 5km away in Cheltenham.
Secondary school	There are 3 secondary schools within approximately 5km of the site, the closest being Balcarras School less than 3km from the site in Cheltenham.
GP surgery and other health services	The closest GP surgery is approximately 3.5km away in Cheltenham, there are 8 other GP surgeries within approximately 5km of the site in Cheltenham.
Local shops/post office	In Cheltenham there is a high street shops, pharmacy and supermarket less than 5 km from the site.
Other key local services and facilities	The closest facilities and services are in Cheltenham approximately 5km north of the site.
Water supply, drainage, electricity, gas	N/A
Please provide your initial assessment of the site:	
Suitable	Part of this site is authorised for two permanent Traveller pitches. This permission was granted on appeal in 2022. The appeal site was split in four parts. The applications for Traveller pitches on parts A, B and C were dismissed and only part D was allowed. The appeal decision indicates that Traveller pitches on all other parts of the site would cause significant harm to the Cotswolds National Landscape and that only on plot D would the benefits outweigh the harm. The site has no potential to expand or for an intensification of Traveller pitches within the existing permitted site.
Available	The site is currently fully occupied and there are no available pitches.
Achievable	It is not likely the anymore pitches could be achievable on this site within 5 years. Existing permanent Traveller site with no

	vacant pitches or potential for expansion or intensification. In line with the Inspector's comments on the appeal referenced above, Traveller pitches on parts A, B and C would cause significant harm to the National Landscape.
Conclusion	Not currently deliverable or developable
Likely timescale	N/A
How could the identified constraints be overcome?	N/A

Appendix 3: Stage 2 Assessments (Detailed)

Site Information	
Site reference	GT-003
Site name / address	Coberly (Site 2), Land adjacent to Cirencester Road, Seven Springs
	
Parish	Coberly
Grid reference	**Easting:** 396783 **Northing:** 217545
Site area (ha)	0.6
Current and past land use	**Current:** Permanent Traveller pitch (2 pitches) **Past:** Agricultural
Relevant planning policy	Policy EN5: National Landscape Policies SA1/SA2/SA3: South Cotswold Strategy Delivery Sub-area
Relevant planning history	19/02819/FUL, 20/01743/COMPLY: A single-storey day-room / store was permitted in 2019 and its materials approved in 2020. 17/03352/FUL, 18/02694/FUL.: Applications in 2017 and 2018 progressively lifted the original time-limited conditions, resulting in full, permanent planning permission for the gypsy & Traveller residential use on the site. In March 2016 a revised scheme was approved which included the substitution of a mobile home for a touring caravan and the reconfiguration of the site layout with an extended area of hard standing for parking. It was considered that the scheme would

	not pose any further landscape impact compared to the extant scheme provided the mitigation planting was fully implemented (15/04432/FUL). Permission was granted in 2014 (14/02614/FUL) for the change of use from agricultural to mixed use for keeping horses and for Traveller residential purposes for a temporary three-year period. While there was a landscape objection to this scheme it was considered at the time that the benefit of a new gypsy site would outweigh the landscape harm.
Character of the surrounding area	The surrounding area reads as a working rural landscape. Open fields to the west and north, with a belt of woodland between the site boundary and the A435. Movement is via minor rural road to the west with limited pedestrian infrastructure and a Major A road to east.
Surrounding land uses	The site sits within a rural context surrounded by agricultural land on the west, north and east. A Traveller site adjoins the south of the site.
Physical constraints	The A435 is a physical constraint to the east of the site, with a hedgerow acting as natural buffer between.
Are there any factors listed below that might limit development?	
Green Belt	N/A
Flooding (i.e. Flood Zone 2 or 3)	Within Flood Zone 1.
Contamination, Air quality, Noise	N/A
Landscape designations (e.g. National Landscape, Special Landscape Area)	Within the Cotswolds National Landscape.
Historic environment (e.g. Scheduled Monuments, Listed Building, Conservation Area, buried archaeology)	
Ecology (e.g. wildlife designations, protected species or habitats, etc.)	Near woodland, which is a priority habitat.
Topography	The site has a 10m slope, sloping from north to south.
Cordon Sanitaire	N/A
Other	N/A
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads	Vehicle access from Cotswold Way minor road to the west.

Public transport services, including buses and trains	Bus stop less than 1km, running the 51 (Swindon – Cirencester) and C51 (Winchcombe - Cirencester).
Pedestrian and cycle links	No pedestrian paving along access road.
How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
Suitable	
Please provide details of nearby services and facilities available to the site:	
Primary school	There is primary school 1km away in Coberly and multiple primary schools less than 5km away in Cheltenham.

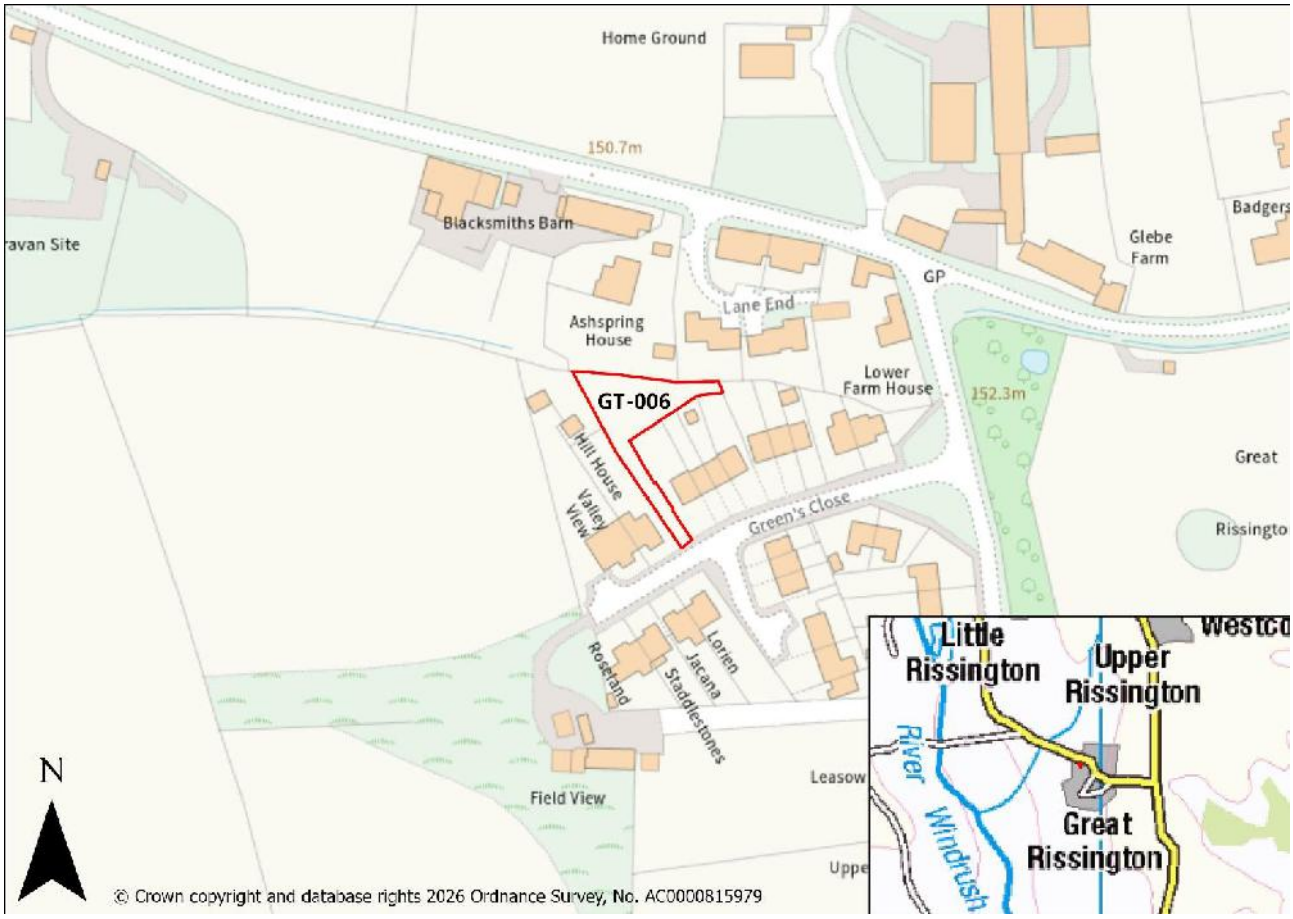
GP surgery and other health services	The closest GP surgery is approximately 3.5km away in Cheltenham, there are 8 other GP surgeries within approximately 5km of the site in Cheltenham.
Local shops/post office	In Cheltenham there is a high street shops, pharmacy and supermarket less than 5 km from the site.
Other key local services and facilities	The closest facilities and services are in Cheltenham approximately 5km north of the site.
Water supply, drainage, electricity, gas	N/A
Please provide your initial assessment of the site:	
Suitable	Although the GT-003 pitch has permanent planning permission (secured in 2017–18) and a small day-room/store approved in 2019-20, the fundamental landscape considerations identified by the 2013 appeal decisions on the adjoining land continue to apply. The site occupies an elevated, sloping position within the Cotswolds National Landscape, next to a priority woodland, immediately adjacent to the Cotswold Way, and is prominent in long-distance views across the valley. Consequently, while the existing pitches are now lawful, any proposal for additional Traveller pitches or further built development would still be likely to cause unacceptable harm to the National Landscape and face strong policy and appeal-level resistance. Intensification or expansion would therefore be unsuitable.
Available	The site is currently fully occupied and there are no vacant pitches.
Achievable	It is not likely the anymore pitches could be achievable on this site within 5 years. Existing permanent Traveller site with no vacant pitches or potential for expansion or intensification.

Appendix 3: Stage 2 Assessments (Detailed)

Conclusion	Not currently deliverable or developable
Likely timescale	N/A
How could the identified constraints be overcome?	N/A

Appendix 3: Stage 2 Assessments (Detailed)



Site Information	
Site reference	GT-005
Site name / address	Hollow Fosse, Fosse Cross
	
Parish	Coln St Dennis
Grid reference	**Easting:** 406108 **Northing:** 208314
Site area (ha)	0.88
Current and past land use	**Current:** Existing tolerated Traveller site (8 pitches) on highway land **Past:** Highway land
Relevant planning policy	Policy EN5: National Landscape Policies SA1/SA2/SA3: South Cotswold Strategy Delivery Sub-area
Relevant planning history	No relevant planning history
Character of the surrounding area	The surrounding area reads as a working rural landscape. Open fields surrounding the site, with a small area of woodland creating an immediate barrier around the site. Movement is via a Major A429 Fosse Way road to north-west with no pedestrian infrastructure.
Surrounding land uses	The site sits within a rural context surrounded by agricultural land on all sides.

Appendix 3: Stage 2 Assessments (Detailed)

Physical constraints	The A429 is a physical constraint to the north-west of the site, with a hedgerow acting as natural buffer between. The site is constrained on all sides by a priority habitat (deciduous woodland).
Are there any factors listed below that might limit development?	
Green Belt	N/A
Flooding (i.e. Flood Zone 2 or 3)	Flood Zone 1
Contamination, Air quality, Noise	N/A
Landscape designations (e.g. National Landscape, Special Landscape Area)	Cotswolds National Landscape, and a SSSI (Barnsley Warren) is located around 500 metres to the west of the site.
Historic environment (e.g. Scheduled Monuments, Listed Building, Conservation Area, buried archaeology)	There is Grade II listed milestone on the A429 adjacent to the site and two scheduled monuments are located around 750 meters to the north-east of the site.
Ecology (e.g. wildlife designations, protected species or habitats, etc.)	Surrounded by woodland, which is a priority habitat
Topography	Flat
Cordon Sanitaire	N/A
Other	N/A
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads	Vehicle access from A429 to the north-west of the site.
Public transport services, including buses and trains	Bus stop less than 1km, running the 2 services.
Pedestrian and cycle links	No pedestrian paving along access road
How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
Suitable	
Please provide details of nearby services and facilities available to the site:	
Primary school	There are 2 primary schools within approximately 5km of the site, the closest (St Andrew's CE Primary School) is approximately 3km from the site.
Secondary school	Closest secondary school (Cirencester Kingshill School) is approximately 6.5km from the site.
GP surgery and other health services	The Rendcomb GP surgery within approximately 4km of the site.

Local shops/post office	In Cirencester there is a high street shops, pharmacy and supermarket less than 7km from the site.
Other key local services and facilities	The closest facilities and services are in Cirencester approximately 5km south of the site.
Water supply, drainage, electricity, gas	It is thought that the site does not have access to services. The occupants have received some gas bottle (welfare) support.
Please provide your initial assessment of the site:	
Suitable	This has been a tolerated Traveller site since at least 2006, and potentially for a longer period. Opportunities to regularise the site have been explored; however, the land forms part of the public highway. Should the highway be formally stopped up, ownership of the land would revert to the former landowner. There is no certainty that the landowner would support the continued use of the site for Traveller accommodation, which could ultimately worsen the position of existing occupants. As the site is located on highway land, regularisation through a planning application or a Certificate of Lawful Existing Use or Development would not provide a practical or effective solution. Consequently, no clear mechanism has been identified through which the site could be formally regularised. The site is also located in an isolated position within the Cotswolds National Landscape, with nearby ecological and heritage constraints adding further complexity to any attempt at regularisation. There is also limited utility or service provision. Notwithstanding these issues, the site continues to operate as a long-established tolerated Traveller site.
Available	The site is highway land and is not available for permanent Traveller pitches.
Achievable	It is not likely the anymore pitches could be achievable on this site within 5 years. Regularisation is not possible. The site remains a long-term tolerated Traveller site.
Conclusion	**Not currently deliverable or developable**
Likely timescale	N/A
How could the identified constraints be overcome?	N/A

Appendix 3: Stage 2 Assessments (Detailed)

Site Information	
Site reference	GT-006
Site name / address	Land to the rear of Greens Close, Great Rissington
	
Parish	Great Rissington
Grid reference	**Easting:** 419715 **Northing:** 217541
Site area (ha)	0.06
Current and past land use	**Current:** Greenfield **Past:** Greenfield
Relevant planning policy	Policy EN5: National Landscape Policy EN11: Conservation Areas Policy SA1/SA2/SA3: Mid Cotswold Strategy Delivery Sub-area
Relevant planning history	No planning history
Character of the surrounding area	The site is located within a modest modern residential development of 2-5 storey houses, within which a Travellers' site may seem incongruent. There are likely to be residential amenity issues from the adjoining properties.
Surrounding land uses	Residential
Physical constraints	The access point is too narrow to accommodate large vehicles such as caravans and trailers. The access point also slopes into

	the site and there is an electricity mast at the entrance, which would make turning very challenging. There is also a brook that runs along the northern boundary of the site could pose a surface water flood risk.
Are there any factors listed below that might limit development?	
Green Belt	No
Flooding (i.e. Flood Zone 2 or 3)	Flood Zone 1
Contamination, Air quality, Noise	No
Landscape designations (e.g. National Landscape, Special Landscape Area)	Within Cotswolds National Landscape.
Historic environment (e.g. Scheduled Monuments, Listed Building, Conservation Area, buried archaeology)	Adjacent to the Great Rissington Conservation Area.
Ecology (e.g. wildlife designations, protected species or habitats, etc.)	No major ecology constraints
Topography	The site gently slopes from the site access in the south (153.3m AOD) to the north (152.7m AOD).
Cordon Sanitaire	No
Other	N/A
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads	Gloucestershire County Highways have previously identified that a safe access cannot be achieved for Traveller use due to a lack of inter-visibility at the access and the narrow access width, which cannot be widened to accommodate pedestrians and vehicles passing.
Public transport services, including buses and trains	There is an 802 bus that connects Bourton-on-the-Water, Little Rissington, Upper Rissington less than 100m from the site.
Pedestrian and cycle links	N/A
How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
The access point is narrow from Green Close and unsuitable for large vehicle access.	
Please provide details of nearby services and facilities available to the site:	
Primary school	The Rissington Primary School is in Great Rissington and is approximately 350m from the site.

Appendix 3: Stage 2 Assessments (Detailed)

Secondary school	The Cotswolds School is less than 2km from the site in Bourton-on-the-Water.
GP surgery and other health services	The Moore Health Centre is less than 2km from the site in Bourton-on-the-Water.
Local shops/post office	There is a local supermarket less than 2km from the site on Mitchell Way, Upper Rissington. Bourton-on-the-Water has a selection of high street shops, two supermarkets and a pharmacy with 5km of the site.
Other key local services and facilities	The Lamb Inn public house is located approximately 260m southeast of the site. Great Rissington Cricket Club is located approximately 560m southeast of the site. St John the Baptist Church is located approximately 415m south-west of the site.
Water supply, drainage, electricity, gas	No information available
Please provide your initial assessment of the site:	
Suitable	Gloucestershire County Highways have identified that a safe access cannot be achieved for Traveller use due to a lack of inter-visibility at the access and the narrow access width, which cannot be widened to accommodate pedestrians and vehicles passing. The site is located within a modest modern residential development, within which a Travellers' site may seem incongruent. There are likely to be residential amenity issues from the adjoining properties. Despite being partially screened, the site's development could have a detrimental impact on the National Landscape and the Conservation Area. The scale of the impact would be dependent on the details of the development. There is sufficient access to local services and facilities with schools, GP surgery and shops all within driving a short driving or bus journey from the site. The works needed to level the site to enable a Traveller pitch to be provided would impact upon the viability of such a development. Furthermore, the Traveller pitch would need to be located a sufficient distance from site boundaries for fire safety. As a result, there may be insufficient space to safely manoeuvre vehicles on the site.
Available	The land is owned by Cotswold District Council, although has not been made available. However, there has been no interest from the Traveller community, which calls into question the site's viability for Traveller use.
Achievable	It is not likely the anymore pitches could be achievable on this site within 5 years. Due to unsuitable access, location within the

	settlement, impact on the National Landscape and Conservation area, and lack of interest from the traveller community.
Conclusion	**Not currently deliverable or developable**
Likely timescale	N/A
How could the identified constraints be overcome?	N/A

Character of the surrounding area	The surrounding area reads as a working rural landscape. Open fields to the east and north. Movement is via minor rural road to the south with limited pedestrian infrastructure.
Surrounding land uses	The site sits within a rural context surrounded by agricultural land on all sides, with hedgerow boundaries. To the west is a residence and large garden.
Physical constraints	The site is relatively flat from the sloping ground north of the boundary.
Are there any factors listed below that might limit development?	
Green Belt	N/A
Flooding (i.e. Flood Zone 2 or 3)	Within Flood Zone 1.
Contamination, Air quality, Noise	N/A
Landscape designations (e.g. National Landscape, Special Landscape Area)	Within Cotswolds National Landscape.
Historic environment (e.g. Scheduled Monuments, Listed Building, Conservation Area, buried archaeology)	Icomb Conservation Area lies approximately 100m east of the site. Multiple Grade II listed buildings in Icomb, including grade II listed buildings on the western side of the Conservation Area.
Ecology (e.g. wildlife designations, protected species or habitats, etc.)	The site is grassland and a hedgerow running alongside the site.
Topography	Moderate slope across the site 10m fall south to south-east.
Cordon Sanitaire	N/A
Other	N/A
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads	Vehicle access from the minor rural road to the south.
Public transport services, including buses and trains	Bus stop in Icomb village less than 1km, running the V9 bus service Lower Oddington to Chipping Norton.
Pedestrian and cycle links	No pedestrian paving along access road.
How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
Suitable	

Appendix 3: Stage 2 Assessments (Detailed)

Please provide details of nearby services and facilities available to the site:	
Primary school	There are 4 primary schools within approximately 5km of the site. The closest is The Rissington School, located approximately 3.5km south of the site, in Upper Rissington.
Secondary school	The Cotswold School is the closest secondary school to the site, located within Bourton-on-the-Water, 5km south-west of the site.
GP surgery and other health services	There are 2 GP surgeries located in Bourton-on-the-Water, approximately 5km west of the site.
Local shops/post office	In Stow-on-the-Wold there is a high street shops, pharmacy and supermarket less than 5 km from the site.
Other key local services and facilities	The closest facilities and services are located in Stow-on-the-Wold approximately 5km north of the site.
Water supply, drainage, electricity, gas	N/A
Please provide your initial assessment of the site:	
Suitable	The site does not have potential to expand, particularly given the sensitive location in the Cotswolds National Landscape. The site entrance is along a very rural lane, which leads into the Conservation Area and the existing access already adds some urbanising effect and further expansion would exacerbate that. The sloping nature of the site increases its prominence and there are potentially wider views. Expansion of the existing Gypsy provision at this site would be harmful to the National Landscape and potentially harmful to the Conservation Area.
Available	The site had an application to change the use to C3 residential unit won at appeal in July 2018.
Achievable	It is not likely the anymore pitches could be achievable on this site within 5 years. The application for a permanent residence was accepted at appeal. There is no indication the site is suitable or available to come forward as a potential Traveller site.
Conclusion	**Not currently deliverable or developable**:
Likely timescale	N/A
How could the identified constraints be overcome?	N/A

Refused 10/00891/CLEUD - Certificate of Lawful Existing Use or Development under Section 191 of the Town and Country Planning Act 1990 for the use of yard as salvage/scrap metal and associated items store in association with use of building as vehicle repair workshop & store (B2 + B8 use). Refused

	10/00890/CLEUD - Certificate of Lawful Existing Use or Development under Section 191 of the Town and Country Planning Act 1990 for the use of land to station residential accommodation. Refused
Character of the surrounding area	The site lies on the rural outskirts of Fairford, surrounded chiefly by open farmland and rough grassland. Built development is minimal: just two small single-storey dwellings and minor hardstanding areas within 100 m. The prevailing character is therefore agricultural and undeveloped countryside with a very low density, edge-of-village feel.
Surrounding land uses	The site sits within a rural context surrounded by agricultural land on all sides.
Physical constraints	Constrained by lakes to the north and east of the site, a minor road to the south, and a hedgerow followed by agricultural land to the west.
Are there any factors listed below that might limit development?	
Green Belt	N/A
Flooding (i.e. Flood Zone 2 or 3)	The entire site is in Flood Zone 2 and/or 3.
Contamination, Air quality, Noise	N/A
Landscape designations (e.g. National Landscape, Special Landscape Area)	The site is adjacent to Cotswold Water Park SSSI to the north and east.
Historic environment (e.g. Scheduled Monuments, Listed Building, Conservation Area, buried archaeology)	
Ecology (e.g. wildlife designations, protected species or habitats, etc.)	The site is adjacent to Cotswold Water Park SSSI and a Floodplain wetland mosaic.
Topography	N/A
Cordon Sanitaire	N/A
Other	N/A
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads	Vehicle access from minor road to the South.
Public transport services, including buses and trains	Bus stop less than 1km, running the 76 bus service.
Pedestrian and cycle links	No pedestrian paving along access road.

Appendix 3: Stage 2 Assessments (Detailed)

How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
Suitable	
Please provide details of nearby services and facilities available to the site:	
Primary school	There are 4 primary schools within 5km of the site. The closest primary school is Kempsford CE Primary School is approximately 3km south-west from the site.
Secondary school	There is 1 secondary school (Farmor's School) within 3.5km north-west of the site.
GP surgery and other health services	There are 2 GP surgeries within 5km of the site, the closest is Hilary Cottage Surgery less than 3km from the site.
Local shops/post office	In Fairford there is a high street shops, pharmacy and supermarket less than 3km from the site.
Other key local services and facilities	The closest facilities and services are in Fairford approximately 3km north-west of the site.
Water supply, drainage, electricity, gas	N/A
Please provide your initial assessment of the site:	
Suitable	Given the high flood risk in this location, there is no potential to expand the site or allocate it for permanent Traveller pitches. Further expansion would likely to lead to harm to biodiversity interests in the vicinity (i.e. the priority habitats and the adjoining Site of Special Scientific Interest).
Available	The site was previously a tolerated Traveller site, although the availability for permanent use is unknown.
Achievable	It is not likely the anymore pitches could be achievable on this site within 5 years. This is a former tolerated Traveller site, which has fallen out of use. Given the site's flooding and other constraints, it is unsuitable for permanent Traveller pitches.
Conclusion	**Not currently deliverable or developable**:
Likely timescale	N/A
How could the identified constraints be overcome?	N/A

Appendix 3: Stage 2 Assessments (Detailed)

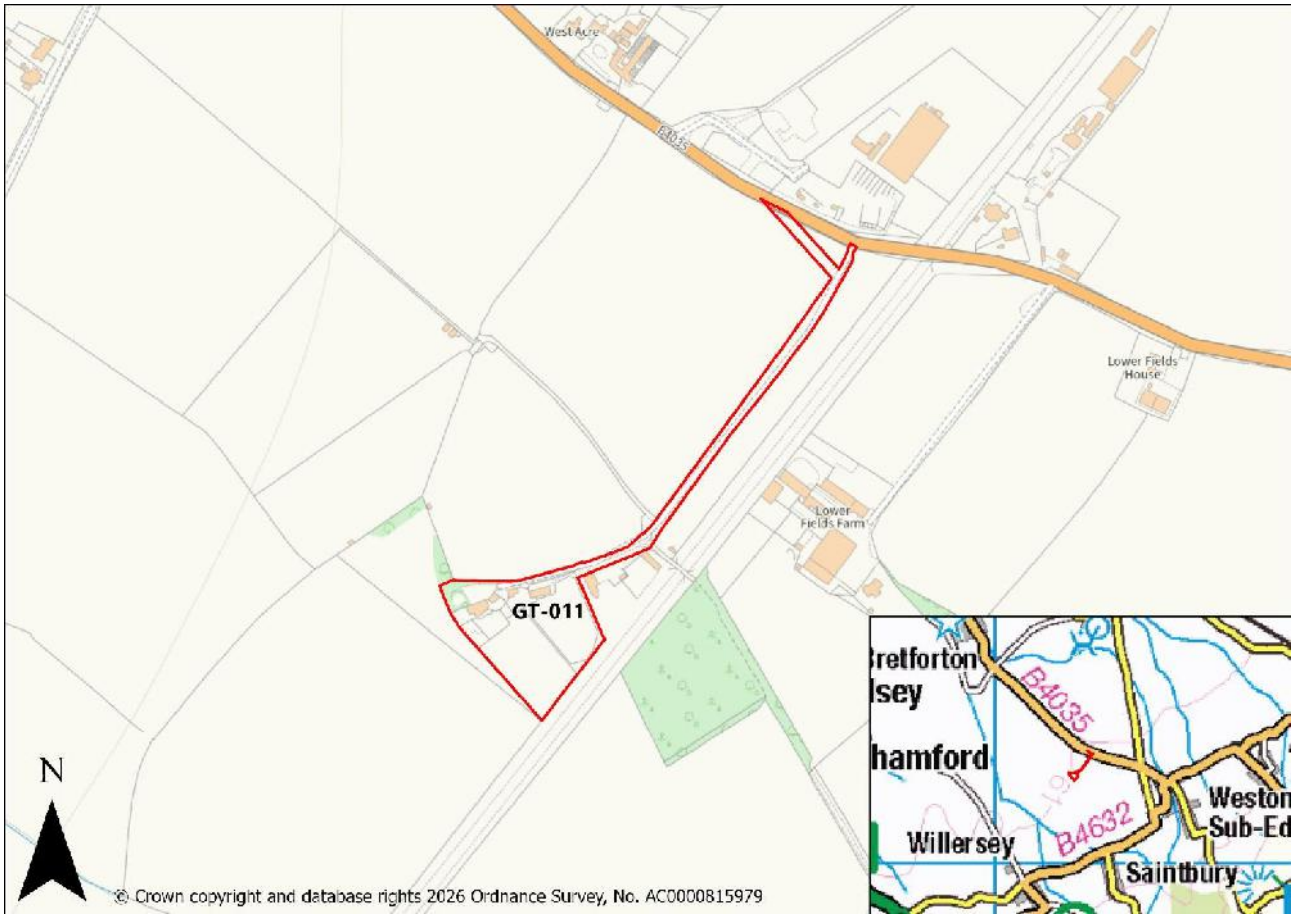
Withdrawn 23/01543/FUL – Conversion of a barn to form one dwelling with associated works. Permitted

	22/03763/FUL – Change of use of land from equestrian to residential caravan site with the retention of one mobile home and three additional Traveller pitches (part-retrospective). Permitted 14/02189/FUL - Four residential plots for residential Travellers at caravan site. Permitted (temporary permission for 3 years, valid until 12/03/2018).
Character of the surrounding area	The surrounding area reads as a working rural landscape. Open fields surrounding the site, and two residential farmhouses and farm buildings to the North. Movement is via minor rural road (Roman Road) to the west with limited pedestrian infrastructure.
Surrounding land uses	The site sits within a rural context surrounded by agricultural land on the west, north and east.
Physical constraints	The minor rural road to the west is a physical constraint, with a hedgerow acting as natural buffer between.
Are there any factors listed below that might limit development?	
Green Belt	N/A
Flooding (i.e. Flood Zone 2 or 3)	Within Flood Zone 1
Contamination, Air quality, Noise	N/A
Landscape designations (e.g. National Landscape, Special Landscape Area)	Within Cotswolds National Landscape
Historic environment (e.g. Scheduled Monuments, Listed Building, Conservation Area, buried archaeology)	N/A
Ecology (e.g. wildlife designations, protected species or habitats, etc.)	The site is grassland and a hedgerows running alongside the site.
Topography	There is a 10m slope, sloping from north to south.
Cordon Sanitaire	N/A
Other	N/A
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads	Suitable vehicle access from the A429 to the west.
Public transport services, including buses and trains	Bus stop less than 50m, running the 5 different bus services.
Pedestrian and cycle links	No pedestrian paving along access road

Appendix 3: Stage 2 Assessments (Detailed)

How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
Suitable	
Please provide details of nearby services and facilities available to the site:	
Primary school	There are 4 primary schools within 5km of the site. The closest school is Swell CE Primary School approximately 2km north of the site.
Secondary school	The closest school to the site is the Cotswold School 2.7km south-west of the site.
GP surgery and other health services	There are 2 GP surgeries within 5km of the site.
Local shops/post office	In Bourton-on-the-Water and Stow-on-the-Wold there is a high street shops, pharmacy and supermarket less than 2 km from the site.
Other key local services and facilities	The closest facilities and services are in Bourton-on-the-Water approximately 5km south-west of the site.
Water supply, drainage, electricity, gas	N/A
Please provide your initial assessment of the site:	
Suitable	The site has had planning permission for Traveller pitches, and was allocated in the 2011-31 Local Plan. The site access has been widened to be suitable for large vehicles associated with this site. It is considered to continue to be suitable.
Available	The site has been sold to the owner of a nearby farm. It is no longer available for Traveller pitches, and the former planning permission has lapsed.
Achievable	It is not likely the anymore pitches could be achievable on this site within 5 years. As the site is no longer available for development.
Conclusion	**Not currently deliverable or developable**
Likely timescale	N/A
How could the identified constraints be overcome?	N/A

Appendix 3: Stage 2 Assessments (Detailed)



Site Information	
Site reference	GT-010
Site name / address	Welsh Way, Sunhill, near Meysey Hampton
	
Parish	Maiseyhampton
Grid reference	**Easting:** 411695 **Northing:** 203056
Site area (ha)	6.53
Current and past land use	**Current:** Vehicle workshop **Past:** Vacant former mushroom composting plant
Relevant planning policy	Policies SA1/SA2/SA3: South Cotswold Strategy Delivery Sub-area
Relevant planning history	24/00260/FUL 1 – Change of use of former mushroom-composting facility to a Class B2 vehicle workshop with ancillary office and storage (approx. 1.64 ha of the western part of the site). Permitted 22/00887/FUL 2 – Proposed "exceptional-quality" mixed-use redevelopment (20 homes plus commercial space) with solar-thermal and PV array across the whole site. Refused 20/01883/FUL 3 – Demolition of part of a building and retention of the remainder for Class B8 storage of equipment, machinery and vehicles (northeastern 0.81 ha). Granted

	16/00906/FUL - Change of use for 15 Traveller accommodation pitches. Refused
Character of the surrounding area	The immediate setting feels open and sparsely built-up with a distinctly countryside character owing to the minimal urban influence. The site itself is however very well screened from view on the south, west and east due to the established vegetation from its previous industrial use.
Surrounding land uses	The immediate setting is predominantly agricultural countryside: about three-quarters of the land within the closest buffer consists of working arable fields, with the rest split between rough fallow ground and unmanaged natural grassland. No residential, commercial or industrial uses are present, so the overall character remains open, undeveloped and rural.
Physical constraints	The minor rural road to the north-east is a physical constraint. To the west a disused nursery.
Are there any factors listed below that might limit development?	
Green Belt	N/A
Flooding (i.e. Flood Zone 2 or 3)	Within Flood Zone 1.
Contamination, Air quality, Noise	N/A
Landscape designations (e.g. National Landscape, Special Landscape Area)	N/A
Historic environment (e.g. Scheduled Monuments, Listed Building, Conservation Area, buried archaeology)	N/A
Ecology (e.g. wildlife designations, protected species or habitats, etc.)	Woodland within the site, a protected habitat
Topography	N/A
Cordon Sanitaire	N/A
Other	N/A
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads	Vehicle access from Welsh Way to the west of the site.
Public transport services, including buses and trains	Bus stop over 1km away, running the 77 bus service.
Pedestrian and cycle links	No pedestrian paving along access road.

Appendix 3: Stage 2 Assessments (Detailed)

How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
Suitable	
Please provide details of nearby services and facilities available to the site:	
Primary school	There are 6 primary schools within 5km of the site. The closest school (Meysey Hampton C of E Primary) is 3km from the site.
Secondary school	There is 1 secondary school (Farmor's School) approximately 3.7km from the site.
GP surgery and other health services	There are 1 GP surgery approximately 4.5km of the site in Fairford.
Local shops/post office	In Fairford there are high street shops, a pharmacy and a supermarket less than 5 km from the site.
Other key local services and facilities	Fairford has 4 public houses, 4 churches, and a hospital approximately 4km from the site.
Water supply, drainage, electricity, gas	N/A
Please provide your initial assessment of the site:	
Suitable	The refusal reasons for the application for 15 Traveller pitches included that the proposed development would have dominated the nearest settlement, which is Sunhill. The site is remote from services and facilities and has limited opportunities for sustainable travel, and a previous application for Traveller pitches was refused, in part because the development was considered to dominate the nearby settlement of Sunhill. Consequently, the site is not considered a suitable, available or achievable option for Traveller accommodation at the present time.
Available	Availability for Traveller pitches has not been reconfirmed, with the site being made available for alternative uses.
Achievable	It is not likely the anymore pitches could be achievable on this site within 5 years. Due a historic refusal of an application for traveller site.
Conclusion	**Not currently deliverable or developable**
Likely timescale	N/A
How could the identified constraints be overcome?	N/A

Character of the surrounding area	Open countryside. It is characterised by agricultural land, equestrian activity and a scattering of dwellings converted from farming operations.
Surrounding land uses	The immediate setting is predominantly agricultural countryside. There are industrial uses to the north, separated by the B4035.
Physical constraints	The site has some agricultural associated buildings to the east of the site followed by some woodland area to the east and south. A

	PRoW runs alongside the access track to the site. Largely unconstrained.
Are there any factors listed below that might limit development?	
Green Belt	N/A
Flooding (i.e. Flood Zone 2 or 3)	Within Flood Zone 1.
Contamination, Air quality, Noise	N/A
Landscape designations (e.g. National Landscape, Special Landscape Area)	N/A
Historic environment (e.g. Scheduled Monuments, Listed Building, Conservation Area, buried archaeology)	N/A
Ecology (e.g. wildlife designations, protected species or habitats, etc.)	The site is on grassland and there are hedgerows adjacent to the site.
Topography	N/A
Cordon Sanitaire	N/A
Other	N/A
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads	Vehicle access from B4035 to the north-east of the site.
Public transport services, including buses and trains	Bus stop over 1km away, running the 6 bus services.
Pedestrian and cycle links	No pedestrian paving along access road.
How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
Suitable	
Please provide details of nearby services and facilities available to the site:	
Primary school	There are 9 primary schools within 5km of the site. The nearest primary school is Willersey C of E Primary 1.6 km from the site.
Secondary school	There is 1 secondary school (Chipping Campden School) 4.4 km from the site.
GP surgery and other health services	There is 1 GP surgery within 5km of the site in Chipping Campden.
Local shops/post office	In Honeybourne there is a small supermarket less than 3 km from the site.

Appendix 3: Stage 2 Assessments (Detailed)

Other key local services and facilities	Chipping Campden has public houses, a pharmacy and places of worship approximately 4.5km from the site.
Water supply, drainage, electricity, gas	Not known
Please provide your initial assessment of the site:	
Suitable	The physical character of the site itself remains largely as described in 2017: it is well screened by hedgerows but would benefit from supplementary planting along the public right of way that doubles as the access track. The site is in a remote location with limited access to services and facilities. That access, however, is still the decisive constraint. Weston Road carries the national speed limit and the humped-back bridge continues to limit visibility to about 65 m, far short of the 215 m stopping-sight distance required by Gloucestershire County Council's 2025 Standing Advice for 60 mph rural roads. No works have been undertaken to lower the speed limit, re-profile the bridge or provide signal-controlled priority. In the absence of such mitigation, the Highway Authority's position of non-support is expected to remain.
Available	The site is available for different uses, including Traveller pitches.
Achievable	It is not likely the anymore pitches could be achievable on this site within 5 years. Due to a lack of suitable access to the site and lack of support from the Highway's Authority.
Conclusion	**Not currently deliverable or developable**
Likely timescale	N/A
How could the identified constraints be overcome?	N/A

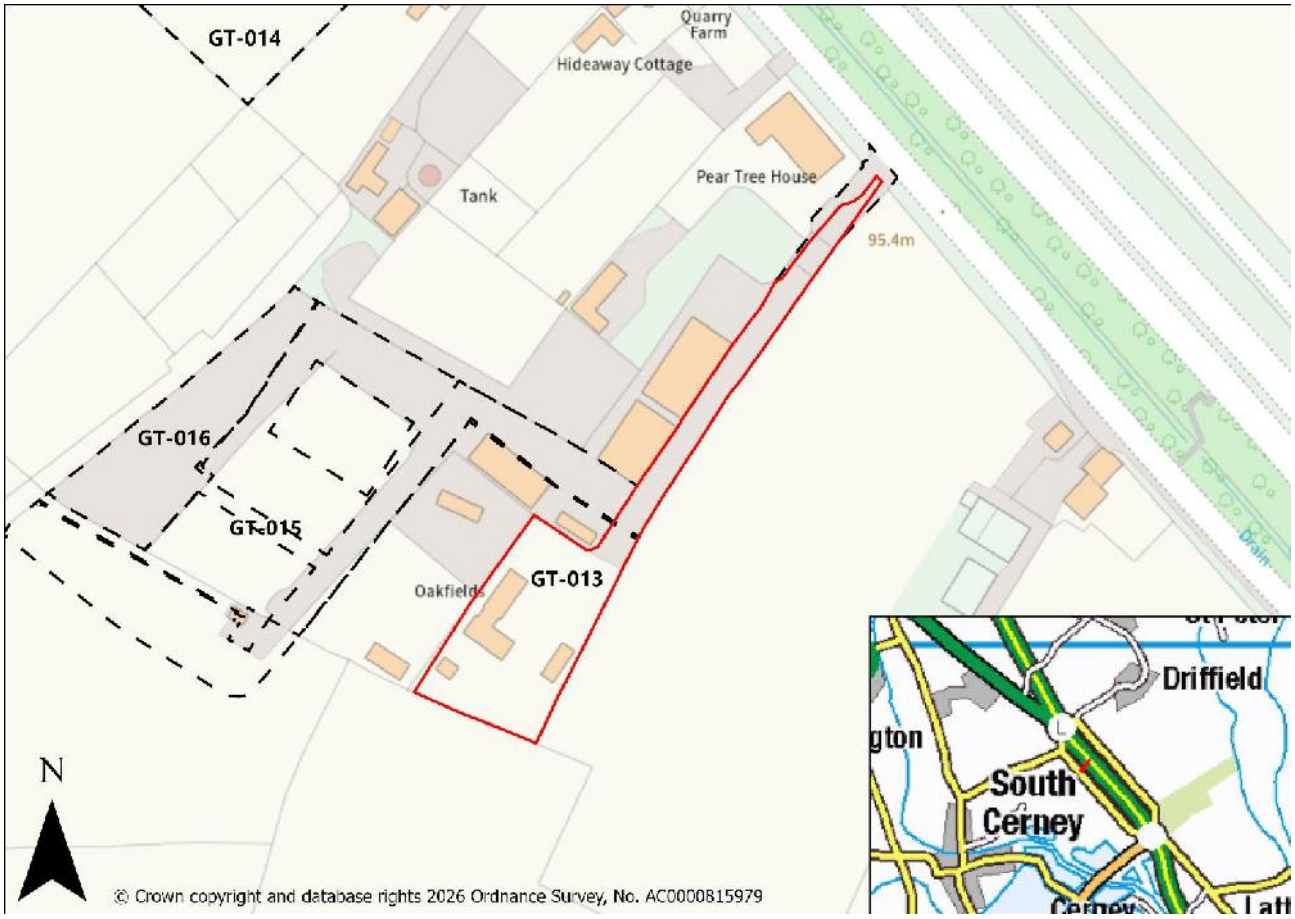
Relevant planning history	07/01339/FUL - Retention of an extension to a residential gypsy caravan site, comprising 11 additional pitches, access road, amenity units, and landscaping - Planning permission granted 04/02815/FUL - Variation of condition 2 of permission 03/00981/FUL to increase pitch numbers from 17 up to 21 and retention of ancillary outbuildings - Planning permission granted

	03/00981/FUL - Residential gypsy caravan site; access road; 17 hardstandings and temporary cesspools plus low level lighting - Planning permission granted
Character of the surrounding area	The surrounding area reads as a working rural landscape with utility and mineral sites. Open fields to the north and woodland to the west. Movement is via minor rural road to the north with limited pedestrian infrastructure. A water recycling centre is directly adjacent to the eastern boundary of the site. The Cotswold Lakes SSSI lies approximately 175m south of the site.
Surrounding land uses	The site sits within a rural context. To the east, a sewage treatment works introduces utility operations with associated vehicle movements and potential odour/noise sources. To the south, the land is greenfield in agricultural use with hedgerow boundaries. To the west, a woodland block provides enclosure, beyond which lies a quarry potential HGV haul route. To the north, open agricultural land continues the rural setting.
Physical constraints	The site is enclosed by a woodland to the west. On the East of the site a Sewage treatment works and a small area of flood risk 2 and 3 are constraints.
Are there any factors listed below that might limit development?	
Green Belt	N/A
Flooding (i.e. Flood Zone 2 or 3)	Small area of flood risk 2 and 3 on the East of the site.
Contamination, Air quality, Noise	N/A
Landscape designations (e.g. National Landscape, Special Landscape Area)	Cotswold Lakes SSSI 175m south of the site.
Historic environment (e.g. Scheduled Monuments, Listed Building, Conservation Area, buried archaeology)	N/A
Ecology (e.g. wildlife designations, protected species or habitats, etc.)	The site is surrounded by Floodplain wetland mosaic and CFGM, woodland and, Heathland and shrub.
Topography	Flat topography.
Cordon Sanitaire	N/A
Other	N/A
How easy is it to access the site in the ways listed below?	

Appendix 3: Stage 2 Assessments (Detailed)



Vehicle access, including main roads	Vehicle access via Ewen Road already used by existing caravans on site.
Public transport services, including buses and trains	Bus stop less than 1km from the site, running the 51-bus route to Swindon.
Pedestrian and cycle links	No pavement along Ewen Road for pedestrians to walk safely.
How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
Suitable	
Please provide details of nearby services and facilities available to the site:	
Primary school	There are 8 primary schools within approximately 5km of the site. The closest primary school is Ann Edwards C of E Primary School, which is located approximately 1.31km east of the site within South Cerney.
Secondary school	The closest secondary schools are Deer Park School and Kingshill Secondary School approximately 5km north of the site in Cirencester.
GP surgery and other health services	The closest GP surgery is located within South Cerney and is approximately 1.6km east of the site. There is also health centres located in Kemble, Cirencester and Cricklade.
Local shops/post office	The closest supermarket is located on high street in South Cerney less than 2km from the site.
Other key local services and facilities	There are several public houses within South Cerney located approximately 1.4km east of the Site. All Saints' Church is located approximately 700m south-west of the site. Fenton's Community Centre is located approximately 2km east of the site in South Cerney.
Water supply, drainage, electricity, gas	N/A
Please provide your initial assessment of the site:	
Suitable	This is an authorised permanent Traveller site. However, there is no potential to expand and provide further Traveller pitches outside the extent of the existing site boundary, or intensify pitches within the site. Expansion would likely lead to harm to biodiversity interests in the vicinity (there are both priority habitats and Local Wildlife Sites near Four Acres). There are also other constraining adjacent land uses such as the sewage works.
Available	As of June 2026, there are 2 vacant pitches at this site.

Appendix 3: Stage 2 Assessments (Detailed)

Achievable	It is not likely the anymore pitches could be achievable on this site within 5 years. Existing permanent Traveller site with no vacant pitches or potential for expansion or intensification.
Conclusion	**Not currently deliverable or developable**
Likely timescale	N/A
How could the identified constraints be overcome?	N/A

Other	N/A
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads	Vehicle access from Cirencester Road to the north-east of the site.
Public transport services, including buses and trains	Bus stop over 1km away, running the 51 bus service.
Pedestrian and cycle links	No pedestrian paving along access road.
How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
Suitable	
Please provide details of nearby services and facilities available to the site:	
Primary school	There are 8 primary schools within 5km of the site. Ann Edwards CE Primary School is the closest to the site approximately 2.5km to the south-west.
Secondary school	There is 1 secondary school (Cirencester Kingshill School) within 5km of the site in Cirencester.

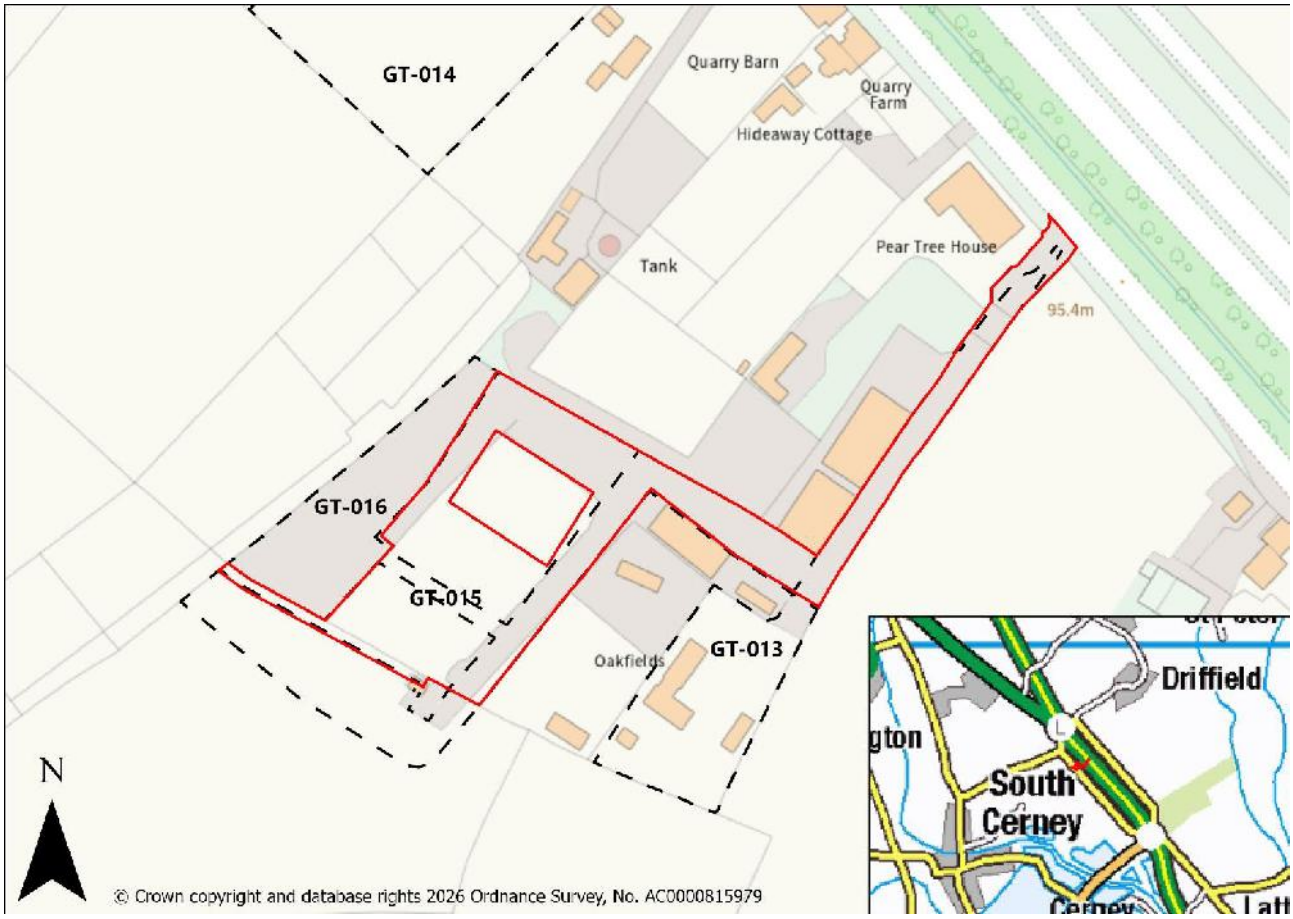
Appendix 3: Stage 2 Assessments (Detailed)

GP surgery and other health services	There are 4 GP surgeries within 5km of the site. The closest is South Cerney Surgery 2km west of the site.
Local shops/post office	In Cirencester and South Cerney there are high street shops, pharmacies and supermarkets less than 5 km from the site.
Other key local services and facilities	The closest facilities and services are in South Cerney approximately 2km south-west of the site.
Water supply, drainage, electricity, gas	Not known.
Please provide your initial assessment of the site:	
Suitable	This is an authorised permanent Traveller site. However, there are no vacant pitches, and there is no potential for expansion or intensification.
Available	The site is currently fully occupied and there are no available pitches.
Achievable	It is not likely the anymore pitches could be achievable on this site within 5 years. Existing permanent Traveller site with no vacant pitches or potential for expansion or intensification.
Conclusion	**Not currently deliverable or developable**
Likely timescale	N/A
How could the identified constraints be overcome?	N/A

Appendix 3: Stage 2 Assessments (Detailed)

Site Information	
Site reference	GT-014
Site name / address	Land off Cricklade Road, GL7 5QE
	
Parish	South Cerney
Grid reference	**Easting:** 406499 **Northing:** 198485
Site area (ha)	0.9
Current and past land use	**Current:** Existing permanent Gypsy and Traveller site (3 pitches) with further unauthorised development (9 pitches believed to have commenced without planning permission) **Past:** Agricultural
Relevant planning policy	Policy SP5: Cotswold Lakes (Mineral Extraction after use) Policies SA1/SA2/SA3: South Cotswold Strategy Delivery Sub-area
Relevant planning history	21/04539/FUL – Full application for change of use to 3 Gypsy & Traveller pitches with day rooms, mobile homes, touring caravans and hard-standing. Permitted 20/04505/FUL – Agricultural development to widen existing access on the site's western edge. Permitted

Appendix 3: Stage 2 Assessments (Detailed)



Character of the surrounding area	The site sits outside of the village of South Cerney, in the rural fringe that includes nurseries, stables and open farmland. The Cirencester Road and A419 to the north are a dominated feature.
Surrounding land uses	The site is enveloped mainly by open arable farmland, with a small line of low-density village housing immediately to the north of Lowerfields.
Physical constraints	The site is free from major statutory or environmental constraints.
Are there any factors listed below that might limit development?	
Green Belt	N/A
Flooding (i.e. Flood Zone 2 or 3)	Within Flood Zone 1.
Contamination, Air quality, Noise	N/A
Landscape designations (e.g. National Landscape, Special Landscape Area)	N/A
Historic environment (e.g. Scheduled Monuments, Listed Building, Conservation Area, buried archaeology)	N/A
Ecology (e.g. wildlife designations, protected species or habitats, etc.)	Hedgerows run adjacent to the site.
Topography	N/A
Cordon Sanitaire	N/A
Other	N/A
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads	Vehicle access from Cirencester road to the north-east of the site.
Public transport services, including buses and trains	Bus stop over 1km away, running the 51 bus service.
Pedestrian and cycle links	No pedestrian paving along access road.
How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
Suitable	
Please provide details of nearby services and facilities available to the site:	
Primary school	There are 8 primary schools within 5km of the site. Ann Edwards CE Primary School is the closest to the site approximately 2.5km to the south-west.

Appendix 3: Stage 2 Assessments (Detailed)

Secondary school	There is 1 secondary school (Cirencester Kingshill School) within 5km of the site in Cirencester.
GP surgery and other health services	There are 4 GP surgeries within 5km of the site. The closest is South Cerney Surgery 2km west of the site.
Local shops/post office	In Cirencester and South Cerney there are high street shops, pharmacies and supermarkets less than 5 km from the site.
Other key local services and facilities	The closest facilities and services are in South Cerney approximately 2km south-west of the site.
Water supply, drainage, electricity, gas	N/A
Please provide your initial assessment of the site:	
Suitable	The site is free of all major statutory constraints. Three Traveller pitches have already been completed. The site has potential to accommodate a further 9 pitches and is suitable for allocation in the Local Plan. The plot fronts directly onto the A419, benefiting from an already-approved widened access and a bus stop within 1km, which together offer safe vehicular and public-transport connectivity. Overall, the absence of environmental barriers, the flat topography, established access, and positive planning precedent collectively confirm the site's strong suitability for further Traveller-site expansion.
Available	Freehold owner actively progressing current permission indicates willingness/ability, with potential for a further 9 pitches on this site.
Achievable	The site is likely achievable within the relevant timescale. The Existing permanent Traveller site with potential for expansion or intensification. Flat, unconstrained land and established access make a further 9 pitches technically and financially deliverable. It is suitable for allocation in the Local Plan.
Conclusion	**Developable**
Likely timescale	6-10 years
How could the identified constraints be overcome?	A planning application needs to be submitted for the unauthorised Traveller pitches.

Appendix 3: Stage 2 Assessments (Detailed)

Site Information	
Site reference	GT-015

Local shops/post office	In Cirencester and South Cerney there are high street shops, pharmacies and supermarkets less than 5 km from the site.

Other key local services and facilities	The closest facilities and services are in South Cerney approximately 2km south-west of the site.
Water supply, drainage, electricity, gas	N/A
Please provide your initial assessment of the site:	
Suitable	The site has planning permission for 5 Traveller pitches, and has been demonstrated to be a suitable location for Traveller pitches. It has good road access from the A419, and no overriding environmental constraints.
Available	Site has permission for the development of 5 residential mobile homes.
Achievable	The site is likely achievable within the relevant timescale. Permitted permanent Traveller site with no potential for expansion or intensification. Given the existing planning consent, clear freehold ownership and absence of major technical constraints.
Conclusion	**Deliverable:** the site is realistically deliverable for the permitted 5 pitches.
Likely timescale	0-5 years
How could the identified constraints be overcome?	N/A

Appendix 3: Stage 2 Assessments (Detailed)

Local shops/post office	In Cirencester and South Cerney there are high street shops, pharmacies and supermarkets less than 5 km from the site.
Other key local services and facilities	The closest facilities and services are in South Cerney approximately 2km south-west of the site.
Water supply, drainage, electricity, gas	N/A
Please provide your initial assessment of the site:	
Suitable	The neighbouring sites have been granted planning permission for Traveller pitches, and this area been demonstrated to be a suitable location for Traveller pitches. The site, being a previously developed rural parcel with existing and consented Gypsy/Traveller use, good road access from the A419, and no overriding environmental constraints, is well-suited in principle for the further provision of Traveller pitches subject to compliance with landscaping, biodiversity and amenity conditions already secured by recent permissions.
Available	Site is pending permission for development of 8 pitches with car parking, hardstanding and associated works.
Achievable	The site is likely achievable within the relevant timescale. Given the pending planning application, clear freehold ownership and absence of major technical constraints.
Conclusion	**Developable:** the site is realistically developable for a further 8 pitches and is suitable for allocation in the Local Plan.
Likely timescale	6-10 years
How could the identified constraints be overcome?	Planning application in progress

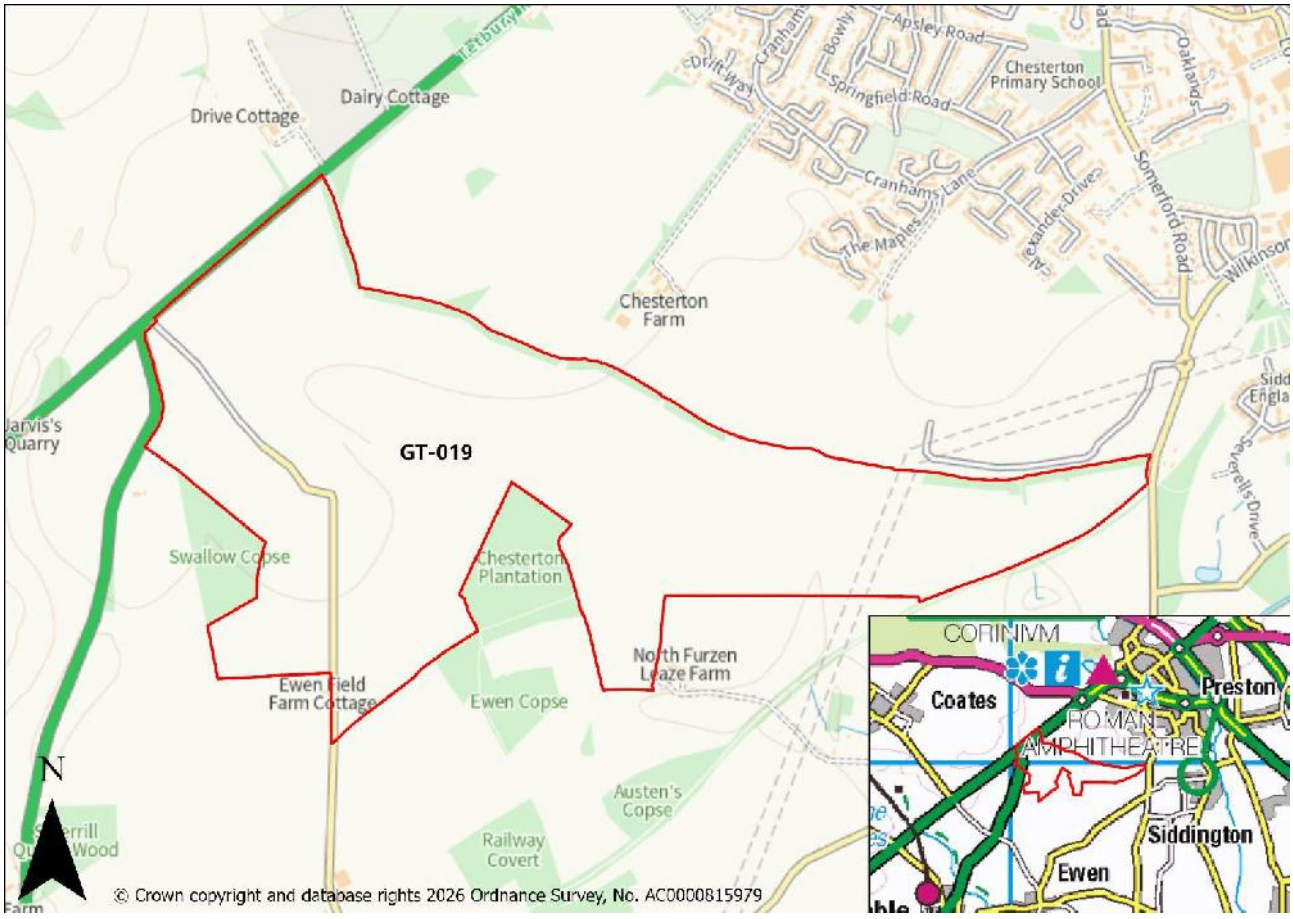
Other key local services and facilities	The closest facilities and services are in South Cerney approximately 2km south-west of the site.
Water supply, drainage, electricity, gas	N/A
Please provide your initial assessment of the site:	
Suitable	The site has planning permission for 5 Traveller pitches, and has been demonstrated to be a suitable location for Traveller pitches.
Available	The land is in private freehold ownership with no current evidence of sale or promotion, meaning any further Traveller-pitch expansion would rely on first securing the owner's agreement.
Achievable	The delivery of Traveller pitches at Quarry Farm is achievable, as recent permissions demonstrate the council's willingness to grant residential-mobile-home uses on the site, and no significant physical or infrastructure constraints appear to hinder timely delivery once ownership agreement and detailed design are secured.
Conclusion	**Deliverable**: Permitted permanent Traveller site with no potential for expansion or intensification.
Likely timescale	0-5 years
How could the identified constraints be overcome?	

Appendix 3: Stage 2 Assessments (Detailed)



Site Information	
Site reference	GT-018
Site name / address	Land south of Driffield
	
Parish	Driffield
Grid reference	**Easting:** 406776 **Northing:** 198474
Site area (ha)	199
Current and past land use	**Current:** Greenfield (Agricultural) - This is one of only two potential strategic development locations in the District with the potential to accommodate development beyond the current Local Plan period. As the remaining strategic allocations are required to meet identified housing and other development needs, the scale of this site and the availability of land beyond the plan period provide an opportunity to consider alternative uses, including Gypsy and Traveller accommodation. The site has therefore been assessed for its suitability and potential to deliver Traveller pitches. **Past:** Greenfield
Relevant planning policy	Policy SP5: Cotswold Lakes (Mineral Extraction after use) Policies SA1/SA2/SA3: South Cotswold Strategy Delivery Sub-area
Relevant planning history	No recent planning history

Appendix 3: Stage 2 Assessments (Detailed)

Character of the surrounding area	The site lies to the south of the village of Driffield and north-east of the A419. It sits within a rural landscape context.
Surrounding land uses	The site is surrounded by open fields for agricultural use, with Driffield made up residential properties to the north-east, and an industrial site to the south-east.
Physical constraints	A PRoW looping through the middle of the site.
Are there any factors listed below that might limit development?	
Green Belt	N/A
Flooding (i.e. Flood Zone 2 or 3)	Small area of Flood Zone 2 and 3 in the south-east of the site.
Contamination, Air quality, Noise	N/A
Landscape designations (e.g. National Landscape, Special Landscape Area)	N/A
Historic environment (e.g. Scheduled Monuments, Listed Building, Conservation Area, buried archaeology)	N/A
Ecology (e.g. wildlife designations, protected species or habitats, etc.)	Patches of woodland within the site, which are priority habitats.
Topography	N/A
Cordon Sanitaire	N/A
Other	N/A
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads	Vehicle access from Cirencester Road to the west of the site.
Public transport services, including buses and trains	Bus stop over 1km away, running the 51 bus service.
Pedestrian and cycle links	No pedestrian paving along access road.
How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
Suitable	
Please provide details of nearby services and facilities available to the site:	
Primary school	There are 8 primary schools within 5km of the site. Ann Edwards CE Primary School is the closest to the site approximately 2.5km to the south-west.

Secondary school	There is 1 secondary school (Cirencester Kingshill School) within 5km of the site in Cirencester.
GP surgery and other health services	There are 4 GP surgeries within 5km of the site. The closest is South Cerney Surgery 2km west of the site.
Local shops/post office	In Cirencester and South Cerney there are high street shops, pharmacies and supermarkets less than 5 km from the site.
Other key local services and facilities	The closest facilities and services are in South Cerney approximately 2km south-west of the site.
Water supply, drainage, electricity, gas	N/A
Please provide your initial assessment of the site:	
Suitable	The site forms part of a wider strategic site and offers ample flat land with direct A-class road access and reasonable proximity to schools, health care and shops.
Available	Available for strategic growth.
Achievable	The site is likely achievable within the relevant timescale. Due to its flat topography, relatively unconstrained land and established access.
Conclusion	**Developable**: for a 10 pitch Traveller site
Likely timescale	6-10 years
How could the identified constraints be overcome?	The site should be masterplanned as part of the strategic site.

Appendix 3: Stage 2 Assessments (Detailed)

Site Information	
Site reference	GT-019
Site name / address	Land south of The Steadings
	
Parish	Cirencester, Kemble and Siddington
Grid reference	**Easting:** 400666 **Northing:** 200591
Site area (ha)	117
Current and past land use	**Current:** Agricultural: This is one of only two potential strategic development locations in the District with the potential to accommodate development beyond the current Local Plan period. As the remaining strategic allocations are required to meet identified housing and other development needs, the scale of this site and the availability of land beyond the plan period provide an opportunity to consider alternative uses, including Gypsy and Traveller accommodation. The site has therefore been assessed for its suitability and potential to deliver Traveller pitches. **Past:** Agricultural
Relevant planning policy	S2: Strategic Site – South of Chesterton DS2: Cirencester Development Boundary SA1/SA2/SA3: South Cotswold Strategy Delivery Sub-area

Relevant planning history	No planning history
Character of the surrounding area	The land immediately around the site is dominated by open arable farmland with small patches of unmanaged natural vegetation. Land to the north of the site has outline planning permission for a mixed-use development, including up to 2,350 homes.
Surrounding land uses	Surrounded by agricultural land
Physical constraints	A protected scheduled monument in the eastern portion, a strategic 400 kV overhead line corridor on the eastern edge, four PRoWs cutting through the site, scattered medium-risk surface-water flow paths, localised TPO trees along the northern edge of the site and a moderate radon classification.
Are there any factors listed below that might limit development?	
Green Belt	N/A
Flooding (i.e. Flood Zone 2 or 3)	Flood Zone 1. A few small areas of surface water flooding across the site.
Contamination, Air quality, Noise	N/A
Landscape designations (e.g. National Landscape, Special Landscape Area)	N/A
Historic environment (e.g. Scheduled Monuments, Listed Building, Conservation Area, buried archaeology)	Scheduled Monument: Settlement SE of Chesterton Farm.
Ecology (e.g. wildlife designations, protected species or habitats, etc.)	There is a small portion of woodland which is a priority habitat within the site and on the edges of the site there are multiple small portions of woodland.
Topography	N/A
Cordon Sanitaire	N/A
Other	N/A
How easy is it to access the site in the ways listed below?	
Vehicle access, including main roads	Tetbury Road (A433) - a classified single-carriageway route linking Cirencester town centre to Tetbury. It runs along the site's north-west boundary and provides the obvious point of access for any future development.
Public transport services, including buses and trains	Bus stop less than 1km away, running the 4 bus services.
Pedestrian and cycle links	No pedestrian paving along access road.

Appendix 3: Stage 2 Assessments (Detailed)

How suitable are the roads around the site for the proposed use? For example, could large vehicles and equipment used by Travelling Showpeople be accommodated?	
Suitable	
Please provide details of nearby services and facilities available to the site:	
Primary school	There are 9 primary schools within 5km of the site. Siddington CE Primary School is 0.45km from the site.
Secondary school	There are 2 secondary schools within 5km of the site. Cirencester Deer Park School is 0.95km from the site.
GP surgery and other health services	There are 4 GP surgeries within 5km of the site, in Cirencester and Kemble.
Local shops/post office	In Cirencester there are high street shops, a pharmacy and a supermarket less than 5 km from the site.
Other key local services and facilities	In Cirencester there are key local services and facilities less than 5 km from the site.
Water supply, drainage, electricity, gas	N/A
Please provide your initial assessment of the site:	
Suitable	The site's flat terrain, good accessibility and absence of flood risk make it technically capable of accommodating Traveller pitches, although careful layout would be needed to avoid the scheduled monument in the east and the 400 kV overhead-line easement along the eastern boundary.
Available	Available for strategic growth. The land is held in a single freehold ownership and, with no existing tenancies recorded on the title, is readily available for promotion or disposal subject only to the heritage and utility constraints identified.
Achievable	The site is likely achievable within the relevant timescale. With flat topography, good highway access via Tetbury Road, manageable heritage and utility constraints, and no known legal or ownership impediments.
Conclusion	**Developable:** for a 10 pitch Traveller site subject to appropriate mitigation of the scheduled-monument area and overhead-line easements.
Likely timescale	6-10 years
How could the identified constraints be overcome?	The site should be masterplanned as part of the strategic site.
