1 Introduction

1.1 Overview

City Science has been commissioned by Cotswold District Council (CDC) to support the development of the Regulation 19 transport evidence base for the Cotswold Local Plan. For this work, the Gloucestershire Countywide Multi-Modal Model (GC3M), owned by Gloucestershire County Council, has been identified as the most appropriate tool given its geographic coverage. The GC3M will be used to assess the impacts of Local Plan land use on the transport network and to test potential transport interventions to inform the strategic transport assessment. Figure 1-1 illustrates the extent of the GC3M and highlights the Cotswold District area within its boundary.

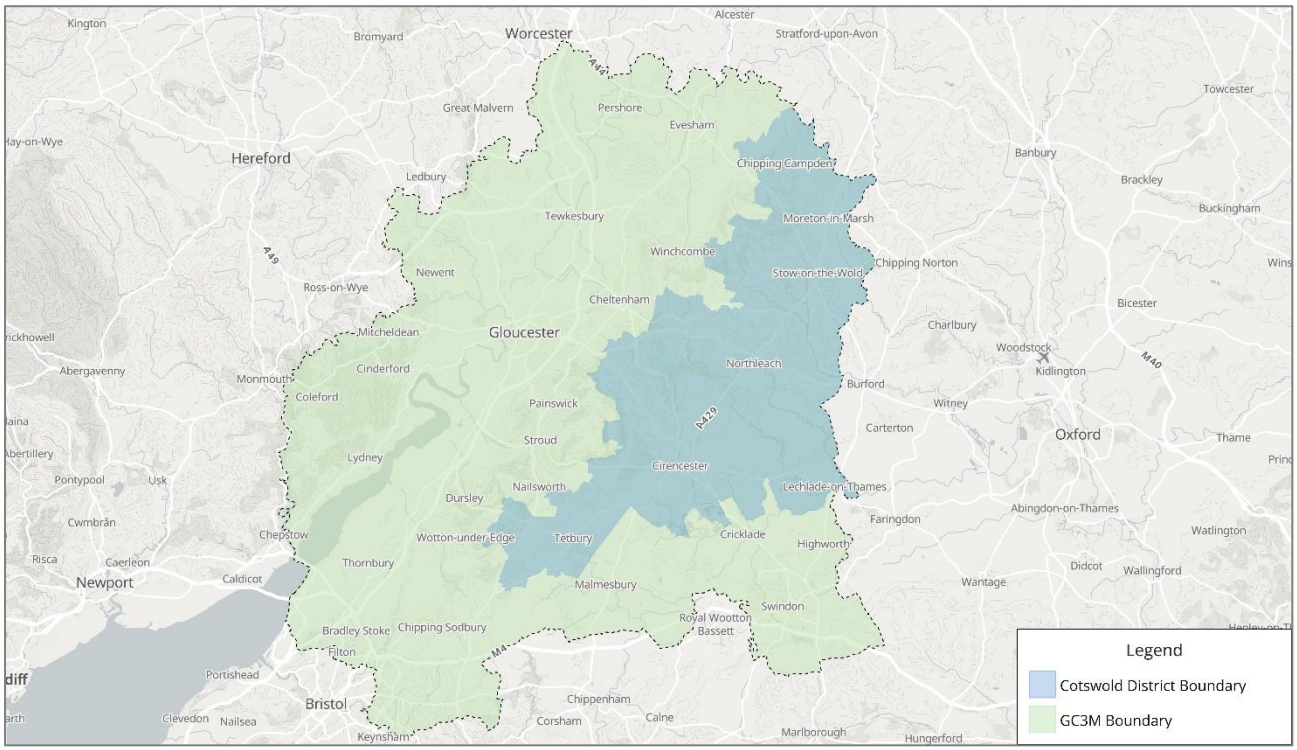

Figure 1-1: Extent of the GC3M and Cotswold District Boundary

1.2 Note Purpose

The purpose of this Technical Note is to set out the forecasting approach for the Cotswold local plan transport evidence base that will be undertaken by City Science. It has been prepared in advance of the forecasting work to give stakeholders a clear understanding of the planned methodology and to allow for any comments or agreed revisions before work begins.

This document provides an overview of the Gloucestershire County Multi-Modal Model (GC3M) to be used for the transport modelling of the Cotswold local plan transport evidence, with particular attention to forecasting considerations.

The note outlines how future-year modelling will be undertaken, covering:

- Selection of forecasting years
- Required model time periods
- Application of variable demand processes
- Preparation and use of an Uncertainty Log

- Development of a core scenario
- Development of a core minus scenario
- Development of the Preferred Spatial Option

1.3 Overview of Model

The GC3M is a strategic multi-modal model developed by AtkinsRéalis for Gloucestershire County Council. It is focused on the six Local Authority areas making up Gloucestershire (Cheltenham, Gloucester, Stroud, Cotswolds, Tewkesbury and the Forest of Dean). The model includes highway assignment in SATURN, and public transport and Variable Demand Models (VDMs) in VISUM.

1.3.1 GC3M Structure

The GC3M is a traditional four-stage model (trip generation, trip distribution, mode choice and assignment). Trip productions and attractions per model zone are segmented by trip purpose and person type. All demand modelling is conducted for a 24-hour neutral weekday

1.3.2 Demand Model

The VDM is a 24-hour logit-based model that determines both mode and destination choice. It does not include a time-period choice; instead, trips are allocated to time periods using fixed factors. Freight is represented by an origin–destination matrix in the base year, which can be growthed for future scenario years. The demand matrix captures all trips across all modes, including active travel modes.

1.3.3 Model Scenarios

The current base year of the model is 2019 and represents a neutral weekday (Monday to Thursday, 9th September to 17th October 2019). Future year forecast years have been built for 2031, 2041, 2046 and 2061. A present-day validation exercise has been undertaken to compare a November 2024 forecast (present) year against 2024 observed link counts and journey times.

1.3.4 Highways Network

Within the Area of Detailed Modelling and the rest of the Fully Modelled Area, the network and junctions are modelled in detail (e.g. simulation coding), including the representation of junction delay. Within external areas, links are coded using fixed speeds.

1.3.5 Public Transport Network

The public transport network consists of rail, bus and rail-based Park & Ride. The public transport model is timetable based and consists of a mix of services manually encoded and imported from General Transit Feed Specification datasets.

1.3.6 Modelled Time Periods

The GC3M highway model represents an average hour for the following time periods:

- AM peak hour - 08:00 to 09:00
- Inter peak average hour - 10:00 to 16:00
- PM peak hour - 17:00 to 18:00

The GC3M public transport model represents an average hour for the following time periods:

- AM average hour - 07:00 to 10:00
- Inter peak average hour - 10:00 to 16:00

PM average hour - 16:00 to 19:00

2 Forecasting Approach

2.1 Forecast Years

Future forecast year has been agreed with the Cotswold authorities and the Transport Working Group (TWG) prior to the commencement of forecasting work. The agreed forecast year is 2043, which represents the end of the plan period which is 15 years after assumed adoption in 2027.

The GC3M model already includes 2031, 2041, and 2046, so a new intermediate year will need to be created. Using 2043 has the added advantage of being consistent with the transport modelling forecast year for the Gloucester, Cheltenham and Tewkesbury Strategic Local Plan (SLP).

2.2 Model Time Periods

The main purpose of the future year modelling is to identify locations of stress within the network with the addition of local plan demand. As these will be identified at peak periods where there is additional demand on the network, this work will therefore make use of the GC3M modelled peak periods, namely:

- Highway
  - AM peak hour - 08:00 to 09:00
  - PM peak hour - 17:00 to 18:00
- Public Transport
  - AM average hour - 07:00 to 10:00
  - PM average hour - 16:00 to 19:00

2.3 Use of Variable Demand Modelling

The GC3M includes a Variable Demand Model (VDM) that assigns trip generation outputs to trip distribution and mode choice based on generalised travel costs. This allows both distribution and mode choice to adjust with forecast demand as future changes in demand or network conditions affect costs. For example, the VDM captures shifts in destination or mode to avoid congestion and enables reporting on changes in walking and cycling demand (though it does not assign routes for active modes).

The updated 2024 GC3M provides the baseline for assessing forecast Cotswold development scenarios. As such the 2024 demand matrix alterations and supply side updates will be incorporated into the forecast year models, which are currently developed from a 2019 GC3M VDM. On this basis, the core scenario VDM runs will be undertaken from the GC3M Foundation Case Scenario, as follows:

- GC3M Trip End Processing 2024-2043:
  - Derived from the difference between 2019-2043 and 2019-2024 to extract out the growth accounted for from the post-covid 2024 present year validation
  - Linear interpolation will be adopted if required to calculate growth between the available uncertainty log trajectory data and the available CTripEnd NTEM data sets (2021-2026, 2031-2036, 2041-2046)
- GC3M VDM run undertaken utilising:
  - GC3M Trip End Processing 2019-2043.

- Updated VDM parameter for 2043 (e.g. VOT and VOC)- based on GC3M spreadsheet "GC3M_Model Parameters_v0.9".
- NRTP22 growth - interpolated from the existing foundation case models.
- Fare *.tra file updated to represent real term growth to 2043- interpolated from the existing foundation case model.
- In summary the GC3M structure will remain consistent with the foundation case 2041 model with updates included for the change in forecast year (e.g. + 2 years) as well as the latest Uncertainty Log.

- Post VDM Adjustment:
  - Matrix growth derived from the GC3M VDM will then be applied to the 2024 models (AM/IP/PM) at a zonal level, using interpolation to account for the proportion of growth from 2024-2043 derived from the GC3M Trip End Processing and UL data.
  - Assignment undertaken utilising 2043 highway and PT networks - including 2024 present year updates and 2043 future changes.
  - Spatial strategies and sensitivities can then be tested incrementally from the 2043 core scenario.

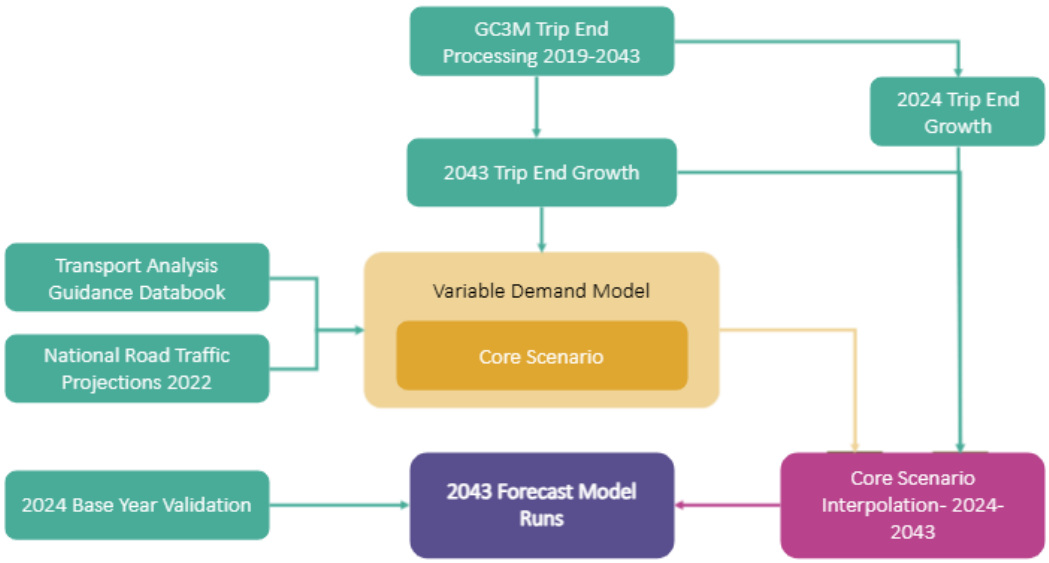

Figure 2-1: GC3M VDM Forecasting Methodology Overview

2.4 Forecasting Overview

Figure 2-2 below provides an overview of the Cotswold forecasting framework. These forecasts will form the foundation for the committed development and Cotswold spatial scenario trip generation, distribution, and modal split analysis.

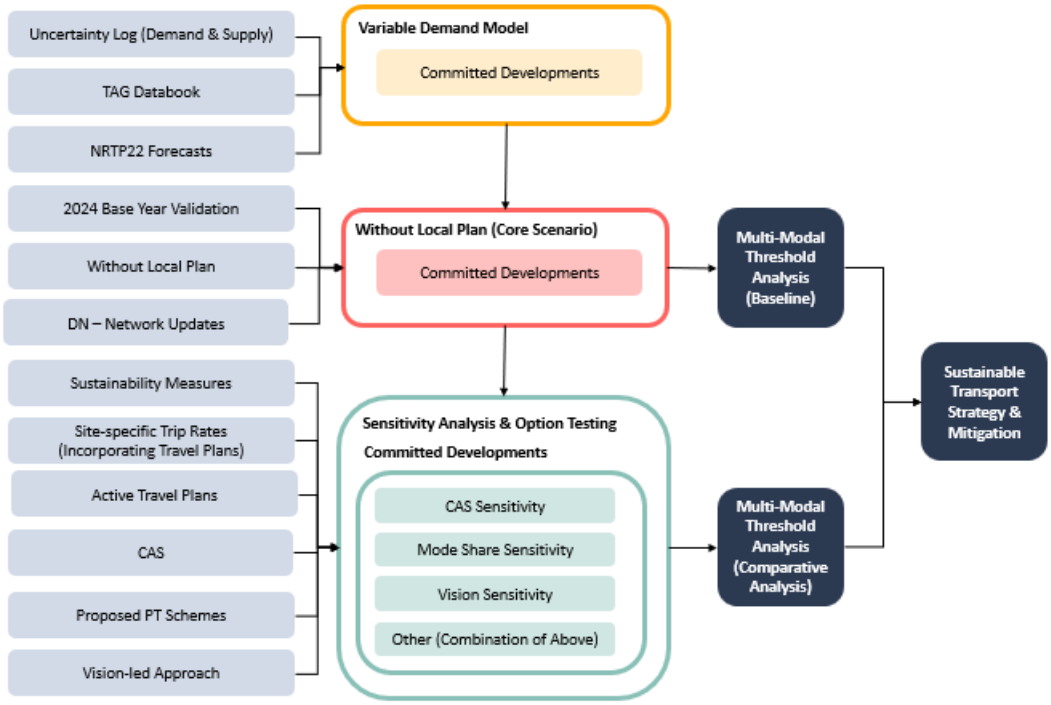

Figure 2-2: Forecasting Framework Overview

The development of the Without Local Plan (core) Scenario will be refined to incorporate assumptions that reflect local travel behaviour, particularly related to active travel and public transport.

These Without Local Plan (core) scenario model runs (see Chapter 3 for further details) will then feed into the scenario and sensitivity testing process. This will allow for testing some of the CAS, local uncertainty, Vision-led objectives, and non-core public transport schemes.

3 Without Local Plan Forecast Scenarios

This Chapter describes the approach taken to produce the Without Local Plan forecasts.

3.1 Uncertainty Log

The GC3M Uncertainty Log (version 2) has been prepared with input from the Local Authorities and AtkinsRealis to identify developments and transport schemes for inclusion in the Without Local Plan forecasts. In line with DfT TAG Unit M4, the core scenario reflects firm, funded policy commitments and published plans.

It includes all approved planning applications for residential and non-residential sites, detailing location (for zonal allocation), development quanta (dwellings or jobs), and predicted opening year. Where job numbers are unavailable, estimates are based on gross floor area and agreed look-up tables (e.g., Homes & Communities Agency). Large developments may be phased, and each entry is assigned a delivery likelihood rating (see Table 3-1 from DfT TAG Unit M4).

Probability of the Input	Status	Core Scenario Assumption
Near Certain: The outcome will happen or there is a high probability that it will happen.	• Intent announced by proponent to regulatory agencies. • Approved development proposals. • Projects under construction.	This should form part of the core scenario
More Than Likely: The outcome is likely to happen but there is some uncertainty.	• Submission of planning or consent application imminent. • Development application within the consent process.	This could form part of the core scenario
Reasonably Foreseeable: The outcome may happen, but there is significant uncertainty	• Identified within a development plan. • Not directly associated with the transport strategy/scheme but may occur if the strategy/scheme is implemented. • Development conditional upon the transport strategy/scheme proceeding. • A committed policy goal, subject to tests (e.g. of deliverability) whose outcomes are subject to significant uncertainty.	These should be excluded from the core scenario but may form part of the alternative scenarios
Hypothetical (H): There is considerable uncertainty whether the outcome will ever happen.	• Conjecture based upon currently available information. • Discussed on a conceptual basis. • One of several possible inputs in an initial consultation process. • A policy aspiration.	These should be excluded from the core scenario but may form part of the alternative scenarios

Table 3-1:Classification of Future Inputs (from DfT TAG Unit M4)

Uncertainty levels are influenced by factors such as planning status, political or commercial risks, policy impacts, and dependencies on other developments. Longer-term schemes typically carry greater uncertainty, so care is needed to avoid optimism bias. Determining these levels requires input from Local Authorities with local knowledge and experience.

In addition to demand (housing and employment developments), the Uncertainty Log records potential supply changes, including planned highway and public transport schemes. Like demand schemes, these are assigned a likelihood rating. Completed schemes are listed in Table 3-2, while Tables 3-3 to 3-6 summarise near-certain and more-likely highway, active mode, and public transport schemes for 2024–2043.

Highway Scheme Name
Elmbridge Transport Scheme, Gloucester
A417/A40 Barnwood Link
A40 Over Roundabout improvement (phase 2), Gloucester
Junction improvement A40 Longford roundabout, Gloucester
A38 Cross Key roundabout
West Cheltenham Transport Improvement P1 Arle Court
West Cheltenham Transport Improvement P2 (J11)
West Cheltenham Transport Improvement P3 Arle Court
West Cheltenham Transport Improvement P4 Arle Court
Arle Court Transport Hub (access improvements for all vehicles)
Twigworth Development Access (new roundabout on A38, and new roundabout within site)
Perrybrook Development Access (new roundabout on Court Road for site access)
Fiddington development A46/A438 mitigation
Innsworth Development Roundabout Improvement (new roundabout on A40)
Junction improvement A429 Cherry Tree junction, Cirencester
A46 / Kidnappers Lane, Cheltenham
M5 Gloucester Motorway Services
Land at Barnwood Link Road (Centre Severn – Barnwood)
Staverton crossroads junction (B4063 / B4634), Staverton
Highway improvement A435 corridor improvement, Bishops Cleeve
Highway improvement Thames Street / High Street, Lechlade on Thames
Junction improvement Highfield Hill including traffic calming, Lydney
Land west of Farm Lane, Shurdington. Site Access Junctions.
Parcel 3745, Land At Pirton Fields, Churchdown (new priority access junction)
Land At North Road West/Grovefield Way
M4 J16
M49 Avonmouth Junction
Land at Quedgeley Trading Estate
SA3 Land northeast of Draycott Cam - 3x site access junctions on Box Road, 1x site access junction on A4135

SA2 Land west of Stonehouse, site link road, and 3x new access points into development site

Table 3-2: Completed Highway Schemes (2019-2024)

Public Transport Scheme Name
Gloucester Transport Hub (includes new road layout, new junction access on Station Road, Gloucester, restricted access for Bruton Way)
Arle Court Bus Priority (Elmbridge Transport Scheme, Gloucester)
Cheltenham Transport Plan (new bus lanes)

Table 3-3: Completed Public Transport Schemes (2019-2024)

Highway Scheme Name	Probability
M5 J10 'all movements' access (including link road into Cyber Park)	More Than Likely
A38/A40 Coombe Hill Junction improvements	More Than Likely
A435 Cheltenham to Bishops Cleeve Cycleway Improvement Works, from Prince of Wales Stadium to Bishops Cleeve	More Than Likely
Gloucester to Cheltenham Cycle Route	More Than Likely
North West Cheltenham	Near Certain
West Cheltenham	Near Certain
Land At North Road West/Grovefield Way	Near Certain
Hunts Grove & Hunts Grove Extension - access points	Near Certain /More Than Likely
Land at Chesterton Farm, Cranhams Lane, GL7 6JP, Cirencester	Near Certain
A417 Missing Link	Near Certain
A46/Cheltenham Road Roundabout	Near Certain

Table 3-4: Future Core Scenario Highway Schemes (2024-2043)

Active Travel Scheme Name	UL Score
A38/A40 Coombe Hill Junction improvements	More Than Likely
A430 Llanthony Rd and St Ann Way (Southwest bypass) improvement, Gloucester)	Near Certain
Levelling Up Fund - Gloucestershire Sustainable Travel Corridor - 'Cycle Spine'	Near Certain / More Than Likely
Cheltenham Spa Railway Station Enhancements (includes cycle/pedestrian access onto A40 Landsdowne Road)	More Than Likely

Table 3-5: Future Core Scenario Active Mode Schemes (2024-2043)

Public Transport Scheme Name
A potential new station at Stonehouse Bristol Rd by Stroud District Council and Stonehouse Town Council
A new station just north of Standish Junction
A possible new bay platform at Cheltenham station
Extending the freight loop at Ashchurch for Tewkesbury south to create a third platform on the station

Midlands Rail Hub

Table 3-6: Future Potential Public Transport Schemes (2024-2043)

Table 3-7 shows the total number of dwellings per district as taken from the Uncertainty Log *(250911_GC3M_UncertaintyLogUpdate_v2.0).*

District	Total dwellings post 2019
Cheltenham	8,665
Cotswold	3,437
Forest of Dean	7,061
Gloucester	3,712
Stroud	16,257
Tewkesbury	15,147
Total	54,279

Table 3-7: Total dwellings post 2019 by district

The construction of an agreed and reliable Uncertainty Log is a key component of the future year modelling. Therefore, the final Uncertainty Log will be discussed in forthcoming TWG meetings.

3.2 Without Local Plan (Core) Scenario

A Without Local Plan core scenario will be built to test the central assumptions for future demand; it provides a common comparator against which to assess all projects and options against. Therefore, it is critical that it is built on published plans, reflects "firm and funded" government policy commitments, uses central projections of key demand drivers, is unbiased, is coherent and self-consistent, and is realistic and plausible.

The core scenario is not necessarily the most desirable scenario. It is one that reflects historic trends with regards to drivers of demand. It does not introduce fundamental shifts in the drivers of demand, or major technological, environmental or economic changes.

For the core scenario, growth will be unconstrained. For the purposes of the core scenario, those entries in the Uncertainty Log classed as "near certain" or "more than likely" will be used. This will apply to both the future demand and transport schemes identified in the Uncertainty Log. Additional trips will be calculated using the TEMPro Alternative Scenario functionality. The core scenario will use standard assumptions on growth and other trends, so will use national assumptions from the TAG Data Book regarding value of time, forecast fuel consumption and forecast non-fuel costs.

Heavy Good Vehicle demand will likely be uplifted from the 2019 base year to the proposed future year (2043) using the DfT National Road Traffic Projections 2022.

3.3 Alternative Scenarios

Whilst the Without Local Plan (core) Scenario is intended to form a sensible, consistent "common comparator", it is acknowledged that there are often significant and hard to quantify uncertainties associated with forecasting. If these uncertainties play out in practice, the forecasting should be able to show the viability of proposed mitigation. It is therefore important not to focus solely on the core scenario but to consider the wider "what if" scenarios.

The CAS are a set of seven pre-defined, cross-modal scenarios set out in DfT's TAG, used to explore national levels of uncertainties in transport forecasting and appraisal. These scenarios are designed to provide more depth than the standard High and Low Growth scenarios, and they consider factors like economic and demographic growth, regional imbalances, technological change and decarbonisation. The DfT's TAG Uncertainty Toolkit provides a description of each CAS, whilst the CAS Databook provides detailed assumptions and inputs for modelling each scenario. Each CAS alters various demand 'levers' within the model including trip generation (via TEMPro datasets), vehicle operating cost, value of time and car occupancy parameters. We recommend applying the specific CAS scenarios listed in Table 3-8.

Scenario	Narrative "This scenario captures a future where…."	Core Features or Components
High Economy	… productivity growth returns to its long-term trend, and people become richer than we currently expect. Migration, and population in general, increases above official forecasts.	**GDP:** 10% higher in 2050 relative to core assumptions **Population** - GB total reaches 77.7m by 2050 **Employment** - 12% higher in 2050 relative to core assumptions
Low Economy	… productivity growth fails to return to historic levels and inwards migration is subdued, causing low levels of total population growth.	**GDP:** 31% lower in 2050 relative to core assumptions Population - GB total reaches 64.6m by 2050 **Employment:** 7% lower in 2050 relative to core assumptions
Regional	…people leave London, the South East and the East of England in search of more affordable housing. As a result, there is lower employment and population growth in these regions relative to the rest of the country. Areas outside of the South increase their relative level of competitiveness through an increase in productivity.	**Population/ Households/ Employment:** Core redistributed, so that regions outside London, the South East and the East of England grow at least the growth rate of the whole country, if not already higher. London, the South East and the East of England are then adjusted downwards, so that the whole country's growth rate is maintained.
Behavioural Change	… people embrace new ways of working, shopping and travelling. Important behavioural trends which have emerged in recent years accelerate, in part because of the Covid-19 pandemic, which include: changes in the travel behaviour of young people; increased flexible working; and increased online shopping.	**Trip Rates:** Extrapolation of existing trip rate trends by purpose, meaning overall trips continue to fall, although some purposes do increase **Licence Holding:** Reduced rates among younger cohorts throughout forecast period Light Goods Vehicles, vans trips - increased, reflecting reductions in shopping trips and an increase in deliveries from online shopping.

Technology	.. road travel becomes far more attractive and accessible to road users because of a high take-up of connected autonomous vehicles (CAVs), which enter the fleet in the 2020s and make up to 50% of it by 2047.	**Trip Rates:** Elderly trips rates increase after 2031 **Licence Holding:** Rates increase after 2031 to over 92% by 2061, reflecting improved accessibility due to availability of CAVs **Electric Vehicles:** High uptake Value of time – perceived time cost of travel falls **Car Occupancy:** Reduced to account for zero occupancy (empty running) trips.
Vehicle-led Decarbonisation	… there is a high take up of electric and zero-emission vehicles (ZEVs). Tailpipe emissions fall. There is no intervention by government to increase electric vehicle costs, resulting in increasing road traffic.	**Electric Vehicles:** High uptake for both cars and freight, with no adjustment made to current costs **Public transport:** reduced as electric vehicles have a cost advantage
Mode-balanced Decarbonisation	… there is a high take up of electric and zero-emission vehicles (ZEVs). Tailpipe emissions fall. An unspecified intervention leads to electric vehicle costs being equalised with petrol and diesel costs, so that public transport modal share is maintained.	**Electric Vehicles:** High uptake for both cars and freight, with running costs (fuel and non-fuel) equalised to internal combustion engine vehicles. **PT:** Modal share higher than the core.

Table 3-8: Description of Common Analytical Scenario (Source TAG Uncertainty Toolkit)

A proportionate approach will be taken to sensitivity testing of national uncertainty - focusing on scenarios most relevant to the Local Plan context. While TAG is primarily designed for scheme appraisal and central government business cases, it is recognised that applying a forecast range can add value to Local Plan assessments. Of the CAS, those with the most relevance include Behavioural Change (e.g. increased flexible working and online shopping), and the two Decarbonisation Scenarios, which assess variations in electric vehicle uptake and the associated impact on public transport use. In line with, the core scenario VDM runs, CAS scenarios will be derived as follows:

- GC3M Trip End Processing 2024-2033/43:
  - CTripEnd NTEM CAS data sets will be adopted as an alternative data set to derive 2024, 2033 and 2043 sensitivity forecasts.
- GC3M VDM run undertaken utilising:
  - The core scenario runs with adjusted trip end forecasts, CAS NRTP22 growth assumptions and where required adjusted TAG parameters.
- Post VDM Adjustment:

- The relative change between NTEM core and CAS forecasts will be assessed and additional constraint factors will be applied to achieve the associated relative change to trip ends for AM, IP, PM modelled periods.

3.4 List of Scenarios (Without Local Plan)

Table 3-9 below outlines the proposed full list of future year scenarios without the local plan and the description and explanation of their purpose.

Scenario Name	Type	Description / Purpose
Without Local Plan (2033, 2043)	Core	Future Year comparator scenario as per standard DfT best practice including committed schemes and developments. This will be mot be constrained to the National Trip End Model. See section 3.2.
Behavioural Change (2043)	Sensitivity Test	To reflect national uncertainty regarding post covid trends regarding home working and shopping to provide a forecasting range with the core scenario. See section 3.3.

Table 3-9: Table of Future Year Scenarios without Local Plan

4 Preferred Spatial Option Forecasting Approach

4.1 Overview & Methodology

Chapters 2 and 3 outline the methodology for the Without Local Plan Core Scenario. The outputs from this model run will then feed into the Preferred Spatial Option testing, as shown in Figure 4-1.

As the Preferred Spatial Option includes a defined level of committed development, a Core Minus Scenario has been developed to isolate and assess the transport impacts of the proposed distribution of growth across the Cotswold area. To achieve this, the proposed Preferred Spatial Option allocations are applied to a 2043 Core Minus demand matrix. This 2043 Core Minus Scenario captures all forecasted growth between 2024 and 2043 except development within the study area. It includes:

- **Background Growth:** Across the external area and the wider Gloucestershire area will be derived from the 2043 Core scenario model
- **Cotswold Development Growth**: Will be set back to 2024 base year demand levels.

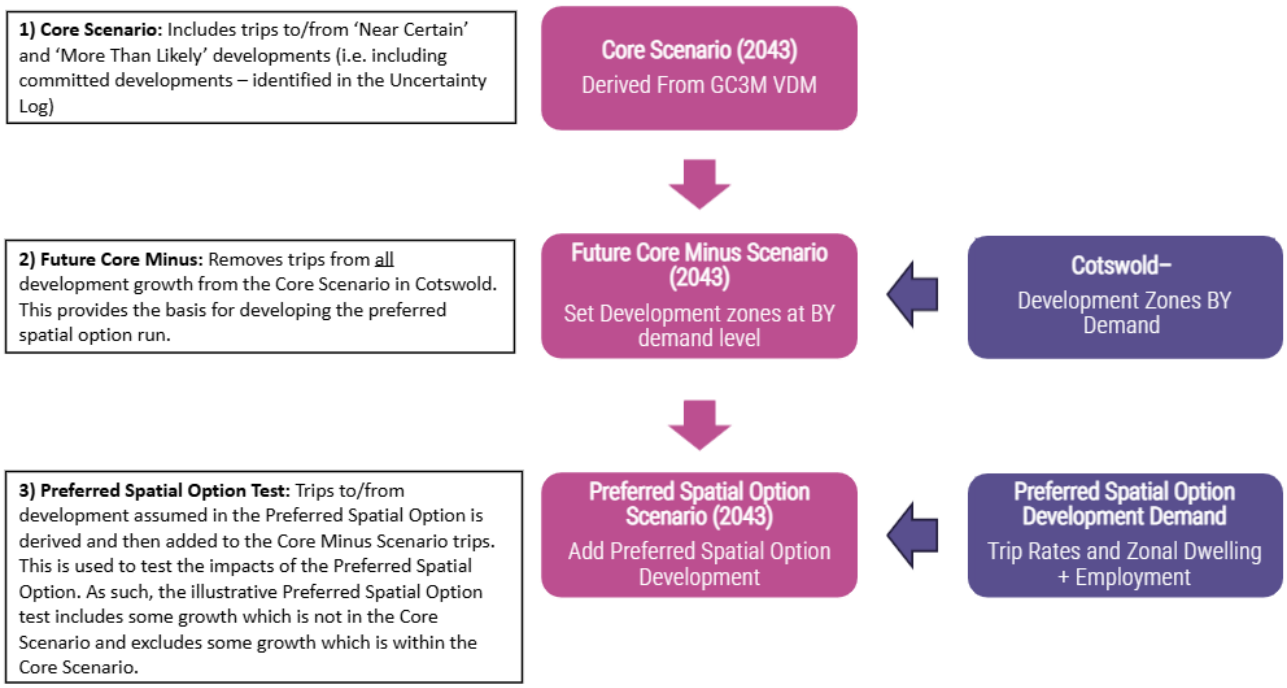

Figure 4-1: GC3M Preferred Spatial Option Forecasting Methodology Overview

Preferred Spatial Option developments will then be forecasted using site-specific trip rates to produce a Local Plan development matrix. The demand distributions for these sites will be taken from existing zones and adjacent zones from the Core Scenario model. Table 4-1 provides a summary of the Core Scenario, Future Core Minus and Preferred Spatial Option forecast model specifications.

Scenario	Background Growth	Cotswold COMMITTED development Growth	Local Plan Sites
Core (without local plan)	Yes	Yes, derived from GC3M UL	No
Future Core Minus	Yes	No	No
Preferred Spatial Option (PSO)	Yes	Yes	Yes, illustrative

Table 4-1: Future year growth specifications - Core Scenario, Future Core Minus and Preferred Spatial Option

5 Conclusion

5.1 Conclusion

This Technical Note describes the GC3M model, with a focus on issues relating to forecasting, and outlines the key aspects of the Without Local Plan forecast modelling process for the Transport Evidence Base for the Cotswold. It also highlights the areas that will require confirmation before modelling commences.

DRAFT

1 Overview

1.1 Introduction

This Technical Note provides an overview of the calculation and application of trip rates for the transport modelling of the Preferred Spatial Option (PSO) for the Regulation 19 submission transport evidence bases for the Strategic Local Plan (SLP) (Gloucester, Cheltenham and Tewkesbury) and Cotswold Local plan. It should be noted that the same trip rates and approach have been applied across these local plans except for business park trip rates, following feedback with National Highways.

Section 1 of this TN describes the broad application of the trip rates in relation to the variable demand model, internalisation, as well as detailing the residential and employment trip rates used.

Section 2 show the location and quantum of the residential and employment development forming the PSO

Section 3 provides a more detailed breakdown of how the residential and employment trip rates have been applied by geographic area for strategic sites across each local plan area.

Section 4 of this TN provides a comparison between the trip rates applied for PSO for SLP and Cotswold and other local comparator trip rates from other local plans and studies.

This TN should be read in conjunction with the following reports:

- SLP Spatial Option Assessment Technical Note and Appendices, the Forecasting Output Technical Note and the Vision and Validate Technical Note.

1.2 Application of the Variable Demand Model and V&V trip rates

Prior to the modelling of the PSO, the spatial option modelling stage was undertaken for the SLP, with the aim of informing the selection of the PSO. For the spatial option modelling, two sets of model runs were undertaken on each spatial option using the following two trip rates:

a) Standard trip rates – these represent a standard approach (akin to the more traditional predict and provide approach) and therefore a worst case regarding the number of generated car trips.
b) V&V trip rates – these represent a lower car trip rate, reflecting a vision and validate approach where broadly a 20% reduction in car mode share was assumed, corresponding to a shift to more sustainable modes of transport.

The application of the V&V trip rates for the spatial option modelling provided a suitable forecasting range, helping to show what could be achieved in line with a vision focused on more sustainable transport. This was instead of running the variable demand model for each spatial option test, given the number of model scenarios and time it would have taken.

For the PSO modelling (as well as for intervention testing) only the standard trip rates have been used alongside the application of the Gloucestershire Countywide Multi-Modal Model's (GC3M) calibrated Variable Demand Model (VDM). The GC3M's VDM allows for the redistribution of trips and shift to more sustainable modes. The shift away from car to more sustainable modes will only become apparent in the intervention testing.

1.3 Internalisation

For the modelling of the PSO, no internalisation reduction factor has been applied for the new development sites forming the PSO. This could therefore be considered a worst-case regarding traffic impacts.

1.4 Trip Rates - Residential

Table 1-1 shows peak hour vehicle residential trip rates, including 2-way totals, by direction and further split by vehicle type (Car, LGV, OGV), which were used for the PSO modelling for SLP and the Cotswold local plan. The trip rates are further categorised by the following three location types: Residential; Residential Isolated; and Village, reflecting the differing travel behaviour and car dependency associated with each location type.

Category	Period	Vehicles			Car		LGV		OGV	
		Arrivals	Departures	2-Way	Arrivals	Departures	Arrivals	Departures	Arrivals	Departures
Residential	AM (08:00 - 09:00)	0.120	0.313	**0.43**	0.109	0.289	0.009	0.023	0.002	0.001
	IP (Avg 10:00-16:00)	0.148	0.143	**0.29**	0.125	0.121	0.021	0.021	0.002	0.002
	PM (17:00 - 18:00)	0.293	0.145	**0.44**	0.263	0.130	0.029	0.014	0.001	0.001
Isolated Residential	AM (08:00 - 09:00)	0.124	0.349	**0.47**	0.113	0.326	0.010	0.022	0.001	0.001
	IP (Avg 10:00-16:00)	0.155	0.149	**0.30**	0.132	0.126	0.022	0.022	0.001	0.002
	PM (17:00 - 18:00)	0.309	0.164	**0.47**	0.268	0.143	0.040	0.020	0.001	0.001
Village	AM (08:00 - 09:00)	0.164	0.416	**0.58**	0.142	0.386	0.019	0.025	0.003	0.005
	IP (Avg 10:00-16:00)	0.159	0.153	**0.31**	0.137	0.131	0.021	0.021	0.001	0.001
	PM (17:00 - 18:00)	0.342	0.166	**0.51**	0.318	0.151	0.023	0.014	0.001	0.001

Table 1-1: Trip Rates (per dwelling per hour) by location category and mode

1.5 Trip Rates - Employment

Table 1-2 presents the peak hour vehicle employment trip rate, including 2-way totals, by direction and further split by vehicle type (Cat, LGV, OGV), covering the AM peak (08:00–09:00), inter-peak (average hourly), and PM peak (17:00–18:00) periods. Separate rates are provided for each employment land use category, Business Park (B1), Industrial Estate (B2), and Warehousing (B8), reflecting the differing travel patterns and shift structures associated with each use type. The employment land was provided by the local authorities in hectares; these were then converted for each site to Gross Floor Area using the conversion assumptions in GCC's GC3M uncertainty log.

In collaboration with National Highways (NH), separate business park TRICs datasets were developed for the Cotswolds and SLP studies to derive the AM and PM peak hour trip rates. The Cotswolds study utilised pre-COVID site selections (10 sites) to inform a robust assessment of the highway impacts associated with Business Park employment development. For the SLP study, which encompasses larger population centres, a small proportion of post-COVID survey data (3 sites) was incorporated to supplement the pre-COVID dataset.

Category	Period	Vehicles			Car		LGV		OGV	
		Arrivals	Departures	2-Way	Arrivals	Departures	Arrivals	Departures	Arrivals	Departures

Table 1-2: Employment Trip Rates (trips per 100sqm GFA) by location category and mode

DRAFT

2 Preferred Spatial Option

2.1 SLP

2.1.1 Residential Developments

The residential development sites are grouped into three location type categories, each with different trip rates, namely, Strategic Sites, Service Village Sites, and Rural Settlements.

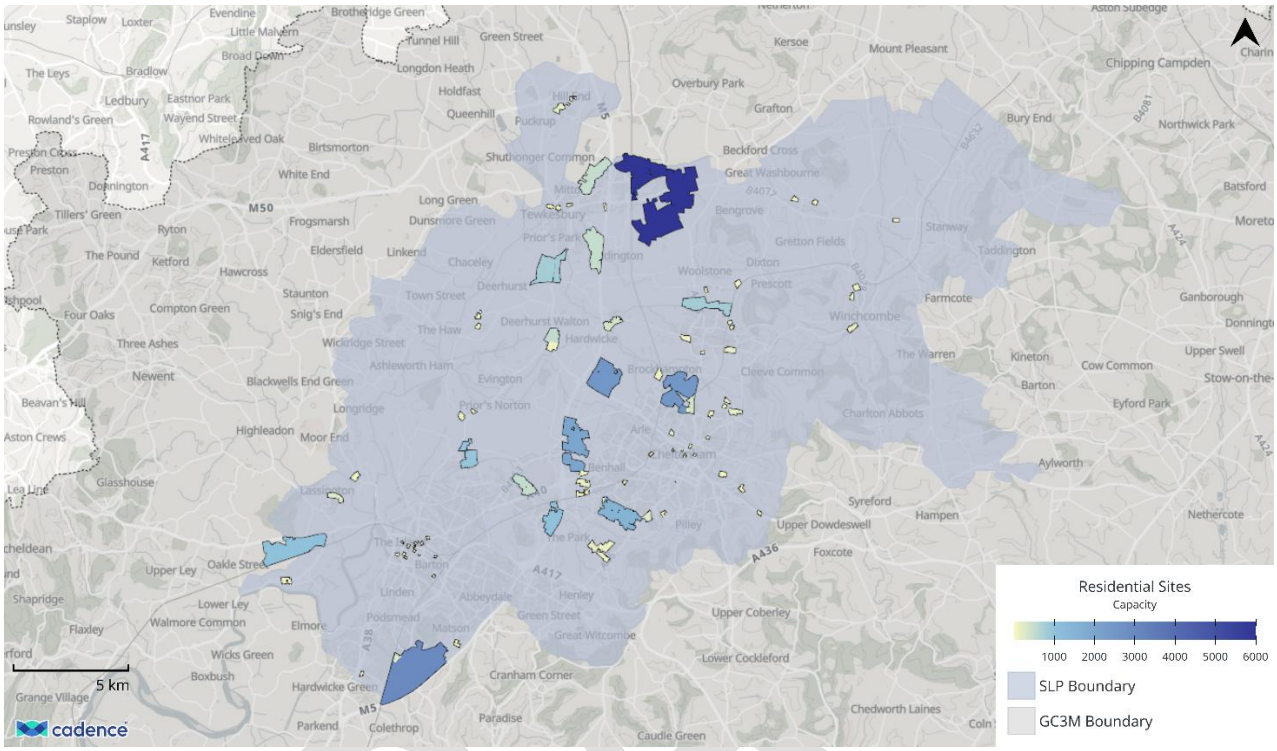

*Figure 2-2*Figure 2-1 shows the split in dwellings for the SLP PSO into the three different location types. Table 2-1 tabulates the residential development sites included in the PSO into each location type category, forming a total of 30,814 dwellings.

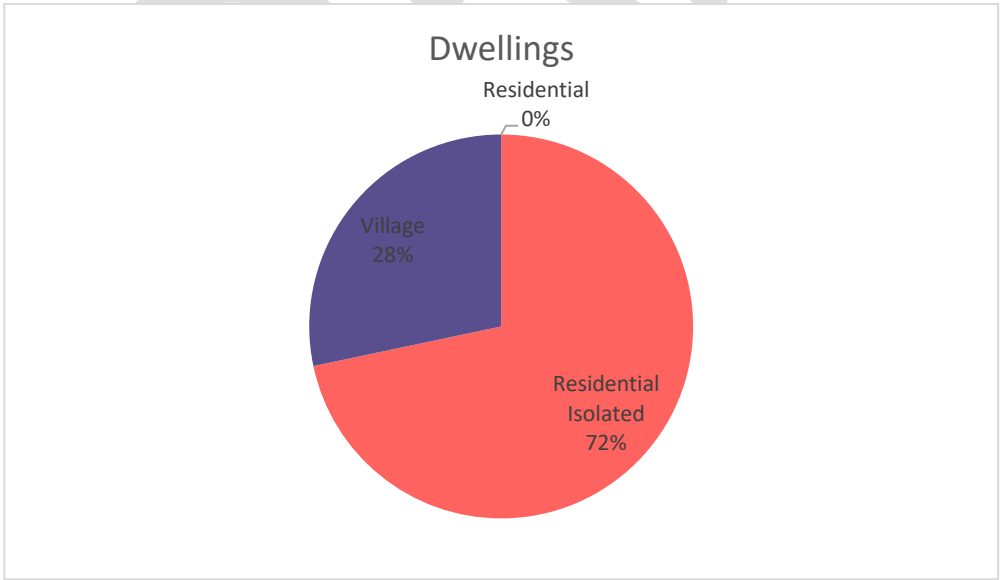

Figure 2-1: Dwellings by Location Type Trip Rate Category

Trip Rate	Dwellings
Residential	0

Residential Isolated	22,090
Village	8,724
Total	**30,814**

Table 2-1: Dwelling Totals by Location Type Trip Rate Category

Strategic Sites are large-scale allocated housing developments, with 500 dwellings or more, which are expected to generate significant levels of new travel demand. Service Village Sites comprise smaller allocations within established settlements that benefit from existing services and facilities, whilst Rural Settlement sites represent minor allocations in less accessible locations with limited onward connectivity.

Figure 2-2 show the location of the SLP residential development sites in the PSO by number of dwellings. Table 2-2 provides the breakdown of the residential development sites regarding number of dwellings for each location.

Given the scale of trip generation associated with large residential developments, this TN provides a more detailed analysis in section 3, of the trip generation for the Strategic Sites.

Table 2-6: List of Employment Sites in Cotswold PSO

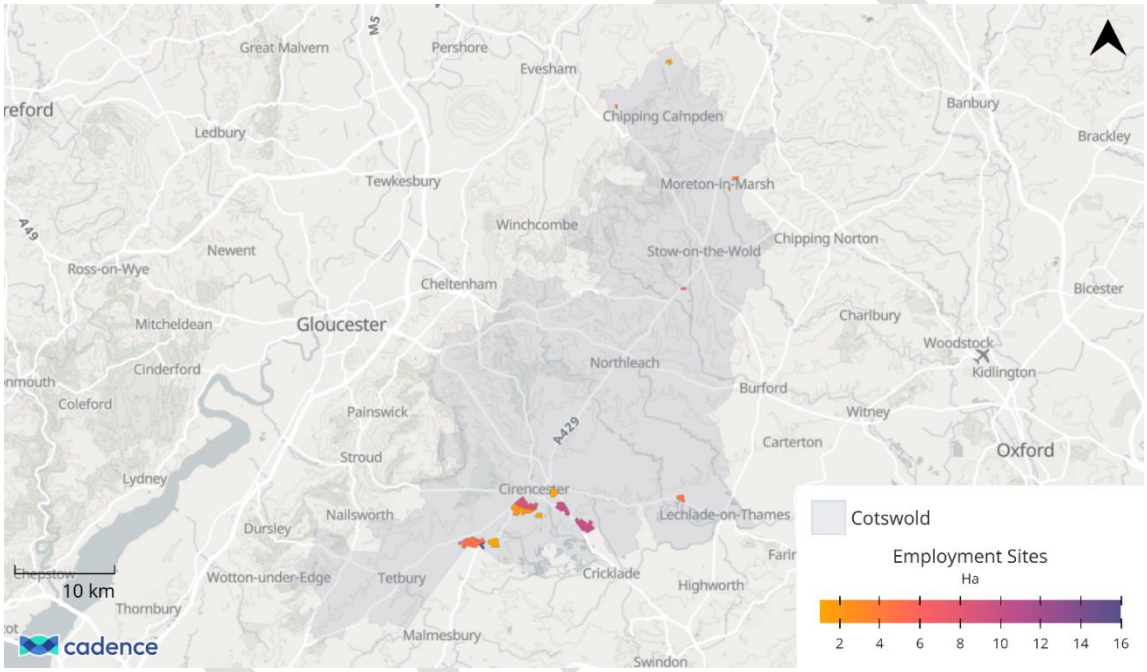

Figure 2-7: Cotswold PSO Employment Site Locations and Employment Hectares

3 Application of Trip Rates

Residential sites have been categorised into the location type categories shown in Table 3-1 for the purposes of allocating trip rates. The categorisation of sites into Residential, Residential Isolated and Village has been informed by a combination of spatial context, proximity to services and connectivity to the surrounding street network. The Department for Transport's Connectivity Tool was used for each development site to provide an indicative assessment of how well connected each location is to key services and facilities. It should be noted that the Connectivity Tool has been used for validation purposes only, to confirm that the categorisation applied to each site is reasonable. It should also be noted that following feedback from GCC and National Highways, only the residential isolated and village trip rate categories have been used for the PSO modelling.

Category	Description
Residential	Located within continuous urban built-up areas. Travel patterns and trip rates are lower compared to Residential Isolated and Village to reflect higher levels of accessibility and lower reliance on private vehicles.
Residential Isolated	Located within the vicinity of the main towns but are surrounded by mostly non-residential land uses. Travel patterns in these areas tend to differ from residential areas, as a greater reliance on private vehicles is expected with trip rates reflecting longer journeys. They tend to be located at the edge of urban areas with less access to public transport.
Village	Located within rural areas and are separated from the main urban areas and towns, with the land between villages and the main town being mostly undeveloped. Travel behaviour and trip rates differ from both Residential and Residential Isolated areas as access to services requires longer journeys. There is higher dependence on private car use.

Table 3-1: Trip Rate Categories

The following subsections describe each development site and outline the rationale for its categorisation as Residential, Residential Isolated or Village.

3.1 SLP

3.1.1 Residential Sites

Figure 3-1 displays how each of the residential PSO sites have been categorised. Sites classified as Residential are highlighted in yellow and are located within the continuous built-up area meaning that travel patterns and trip rates will reflect urban residential behaviour.

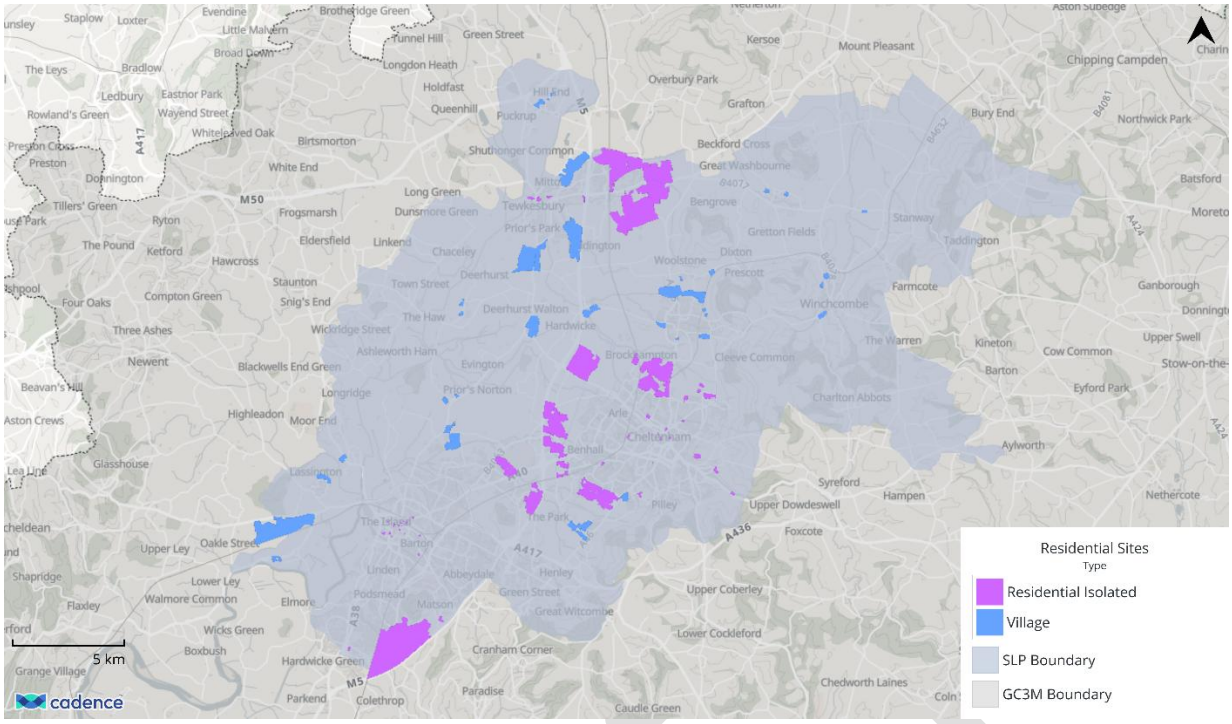

Figure 3-1: Residential PSO Sites by Trip Rate Category

This section presents a series of maps illustrating the inbound and outbound trips generated by the development sites shown in Figure 3-1 during the AM and PM peak periods. Arrivals or departures are represented by graduated circular symbols, with the size and colour intensity of each circle corresponding to the volume of trips generated. Lighter, smaller symbols indicate lower trip generation, while darker and larger symbols represent higher number of trips.

Figure 3-2 to Figure 3-5 illustrate the spatial distribution and magnitude of AM and PM peak arrivals and departures across the PSO residential development sites in the SLP region.

In the AM peak, higher departure trip volumes are concentrated at “Residential” and “Residential Isolated” sites within or adjacent to the main urban areas, particularly the large Tewkesbury Garden Community Site and several sites in the Cheltenham area. Although Village sites have higher trip rates, their smaller scale results in many cases in lower total arrivals and departures.

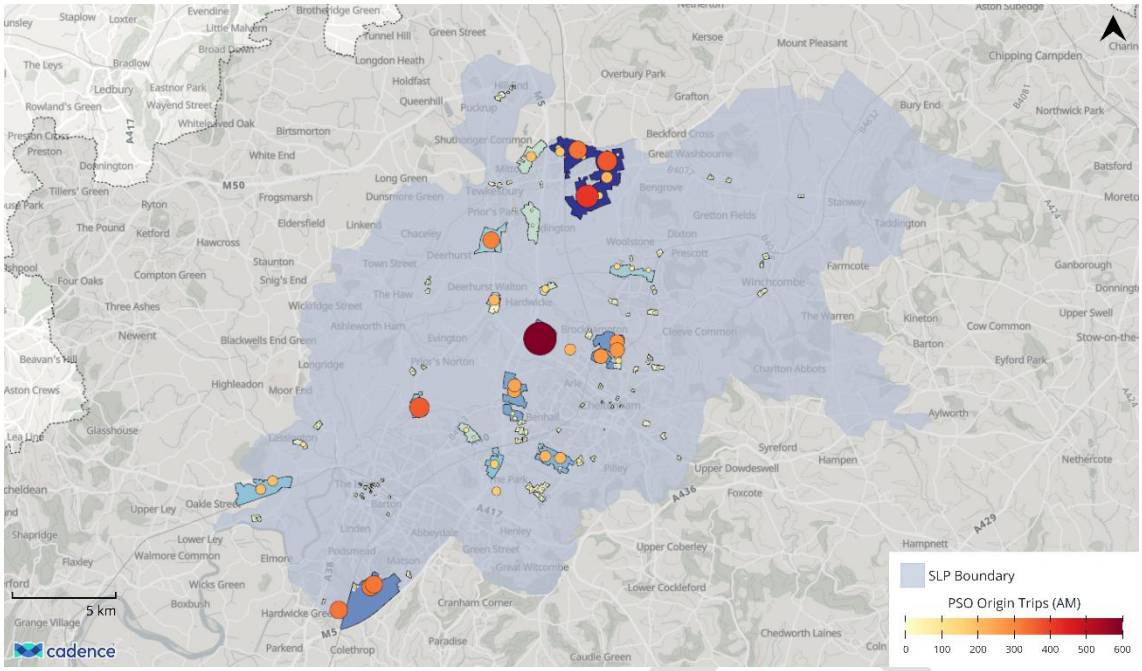

Figure 3-2: AM Departures for Residential Sites

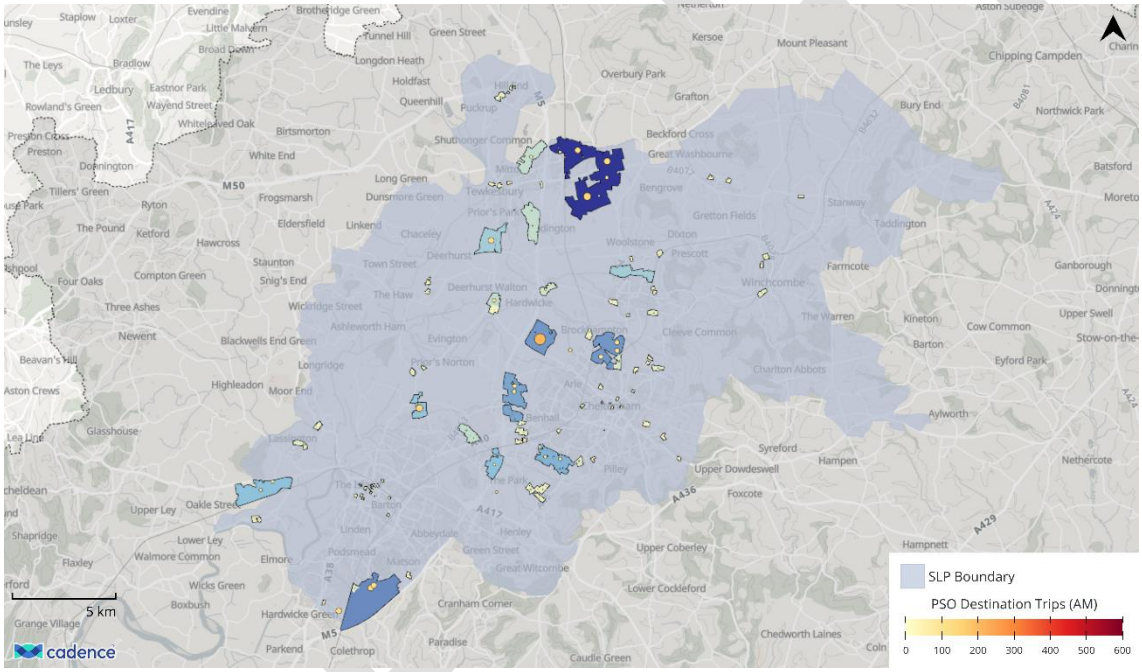

Figure 3-3: AM Arrivals for Residential Sites

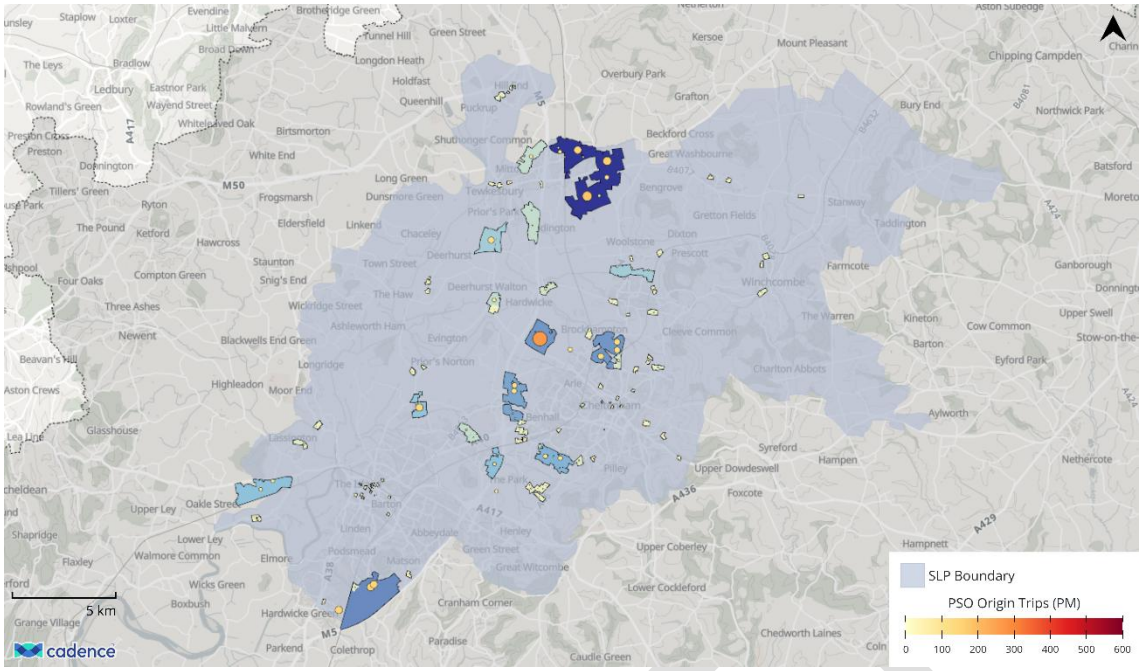

Figure 3-4: PM Departures for Residential Sites

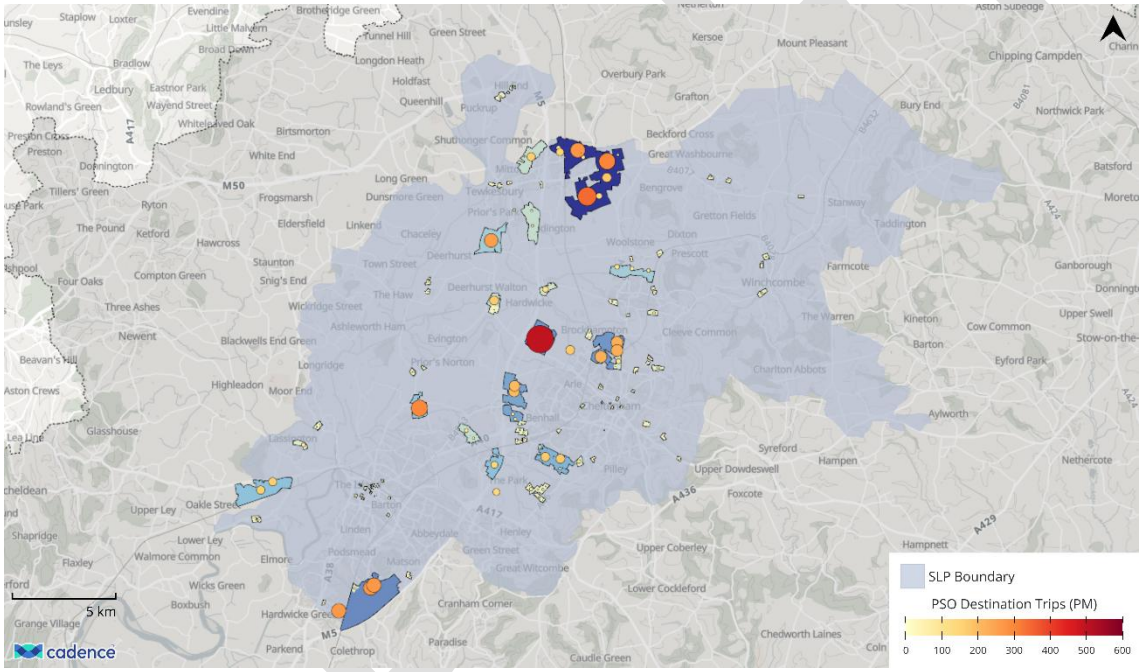

Figure 3-5: PM Arrivals for Residential Site

West Gloucester - Village

The West Gloucester site is located to the west of Gloucester and is physically separated from the main urban area by non-residential land uses. As shown in Figure 3-6**Error! Reference source not found.**, the site sits within a rural area and is not within the immediate vicinity of the built-up area of Gloucester. This separation from the urban area with limited development between the site and the city of Gloucester means that the West Gloucester site functions more as Village, reflecting its spatial separation from Gloucester's city and rural context. The classification is further supported by the DfT's Connectivity Tool, which indicated an employment overall connectivity score of 37. This score suggests a moderate level of accessibility, consistent with a village location where access to employment and other key services typically requires longer journeys compared to urban residential areas.

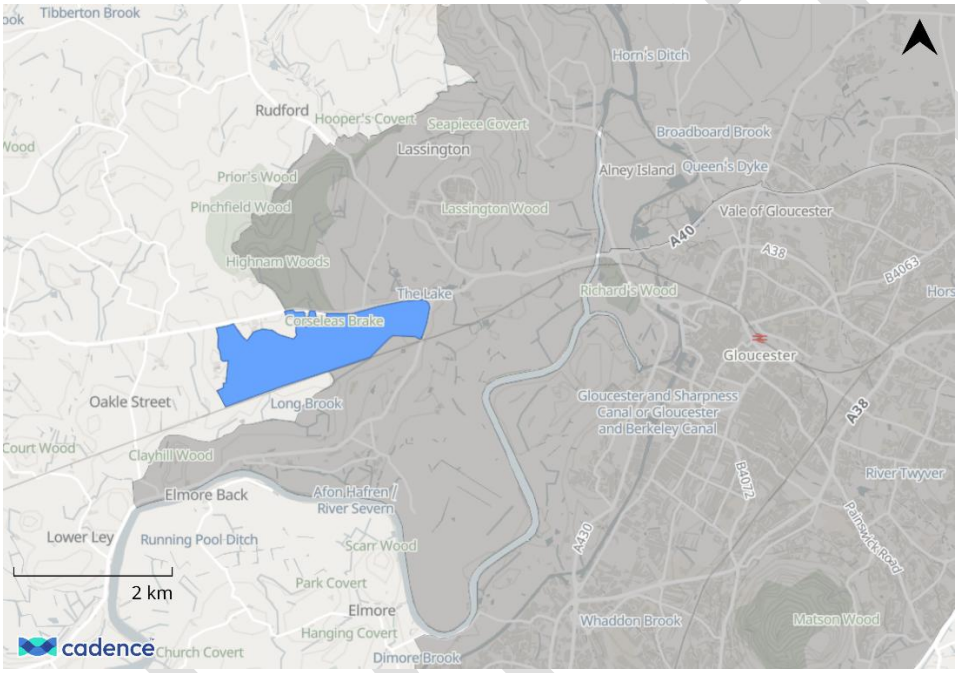

Figure 3-6: West Gloucester Site Location

Table 3-2 shows the arrival and departure car trips for the West Gloucester site for the PSO for each modelling period. The site consists of 1,000 dwellings.

Modelled Period	Arrivals			Departures		
	Car	LGV	OGV	Car	LGV	OGV
AM (08:00-09:00)	142	19	3	386	25	5
IP (Avg 10:00-16:00)	137	21	1	131	21	1
PM (17:00-18:00)	318	23	1	151	14	1

Table 3-2: West Gloucester Modelled Car Trips by Period

East of Churchdown – Residential Isolated

This site is located adjacent to the eastern edge of Churchdown as shown in Figure 3-7 and sits near the A40 corridor which provides a direct east-west connection between Gloucester and Cheltenham. Although nearby services and facilities are available, access is less immediate than for sites located within the core residential areas of Gloucester. The site has therefore been categorised as Residential Isolated. This classification is supported by DfT's Connectivity Tool, which indicated a connectivity score of 58, suggesting a moderate level of accessibility.

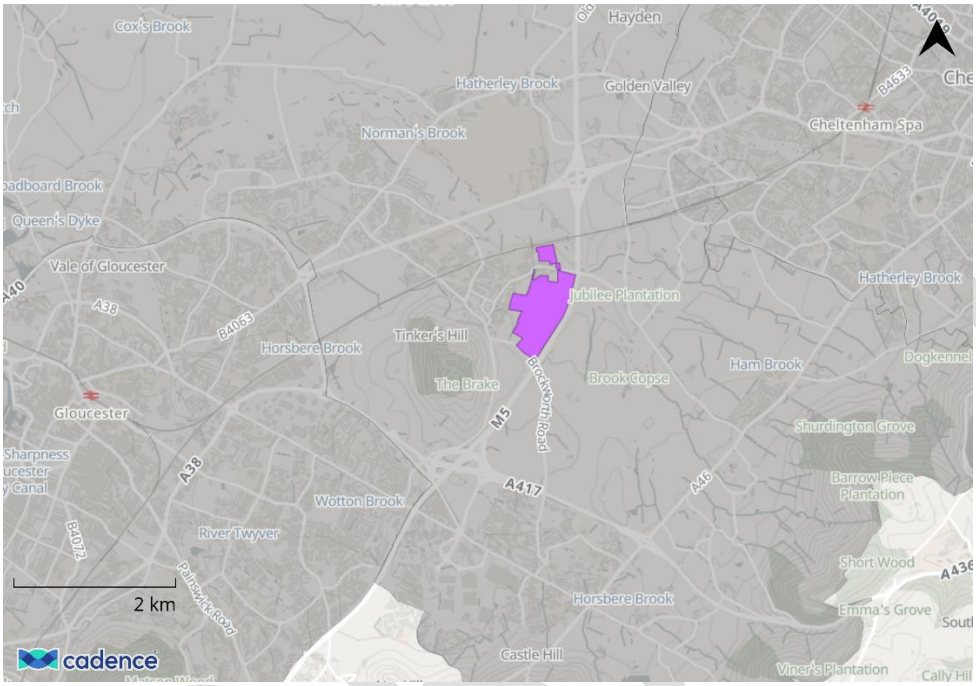

Figure 3-7: East of Churchdown Site Location

Table 3-3 shows the arrival and departure car trips for the East of Churchdown site for the PSO for each modelling period. The site consists of 1,000 dwellings.

Modelled Period	Arrivals			Departures		
	Car	LGV	OGV	Car	LGV	OGV
AM (08:00-09:00)	113	10	1	326	22	1
IP (Avg 10:00-16:00)	132	22	1	126	22	2
PM (17:00-18:00)	268	40	1	143	20	1

Table 3-3: East of Churchdown Modelled Car Trips by Period

North Churchdown – Residential Isolated

This site is located to the North of Churchdown sitting adjacent to the A40 corridor as shown in Figure 3-8. This location offers good access to the strategic road network. However, the North Churchdown site is not fully integrated within the built-up area of Churchdown or Gloucester

and has therefore been categorised as Residential Isolated reflecting its position on the edge of the urban area and its separation from continuous residential areas. The DfT's Connectivity Tool indicated an overall connectivity score of 63.

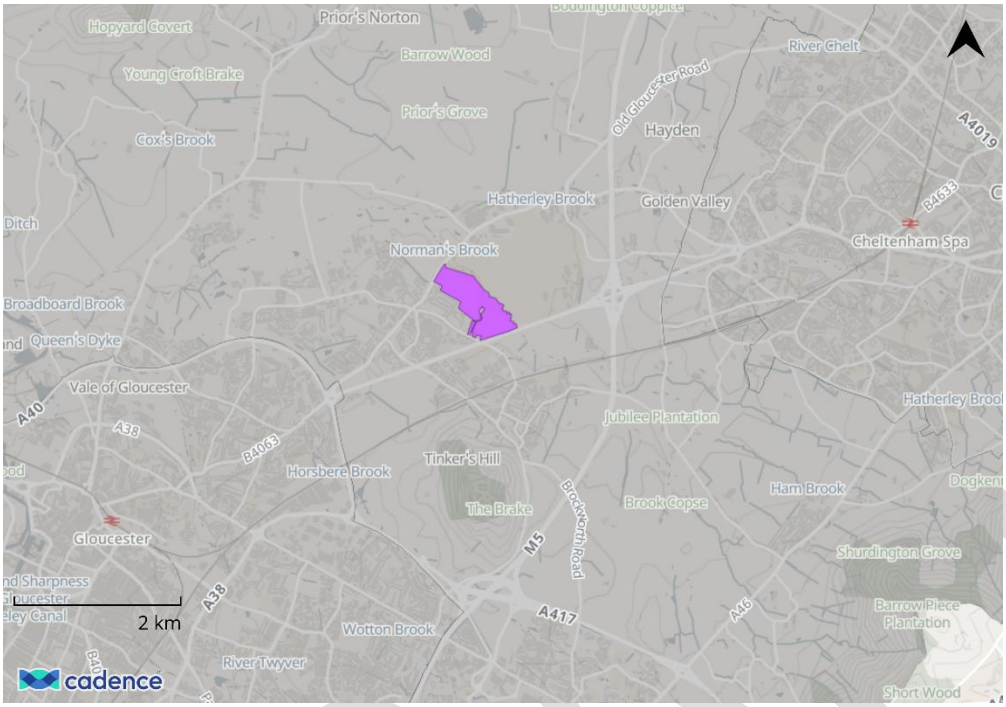

Figure 3-8: North Churchdown Site Location

The North Churchdown site consists of 500 dwellings. Table 3-4 shows car trip arrivals and departures for the PSO for each modelled period.

Modelled Period	Arrivals			Departures		
	Car	LGV	OGV	Car	LGV	OGV
AM (08:00-09:00)	57	5	1	163	11	1
IP (Avg 10:00-16:00)	66	11	1	63	11	1
PM (17:00-18:00)	134	20	1	72	10	1

Table 3-4: North Churchdown Modelled Car Trips by Period

South Cheltenham – Residential Isolated

This strategic site is located on the southern edge of Cheltenham, as shown in Figure 3-9. It benefits from proximity to the strategic road network including connections to the A46 and routes providing access towards the M5. However, its peripheral location results in a degree of functional isolation, including limited public transport access and limited immediate access to services compared to residential sites located within the main built-up area. Based on the above and the DfT's Connectivity tool that showed a score of 49, the site was categorised as Residential Isolated.

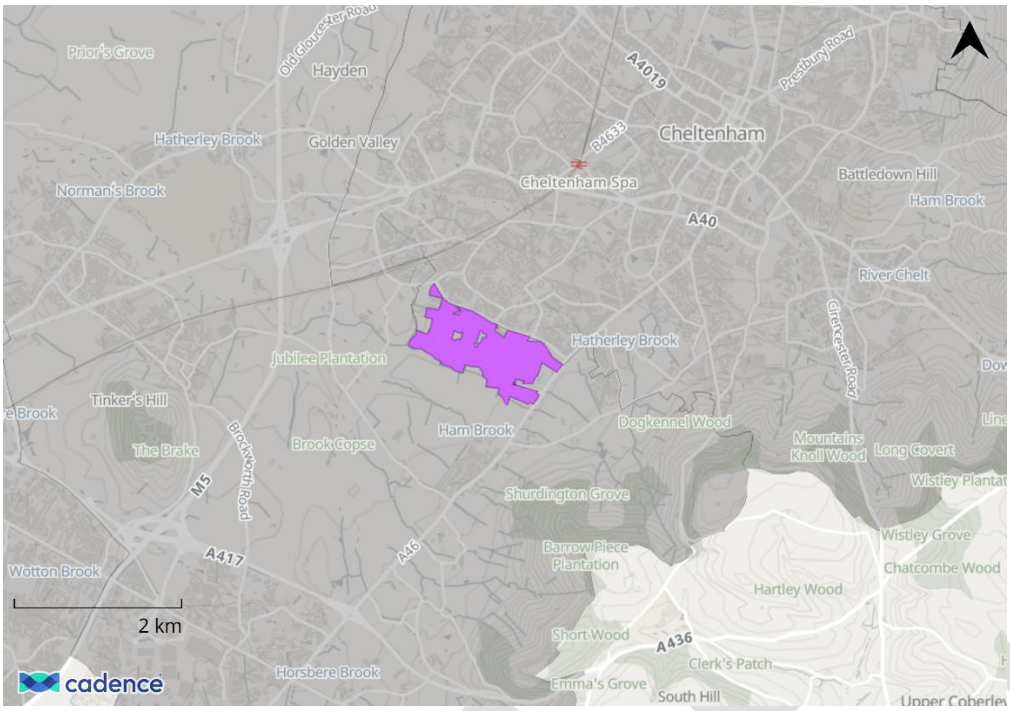

Figure 3-9: South Cheltenham Site Location

Table 3-5 shows car trip arrivals and departures for the PSO for each modelled period. The South Cheltenham site consists of 1,500 dwellings.

Modelled Period	Arrivals			Departures

IP (Avg 10:00-16:00)	198	33	2	189	33	3
PM (17:00-18:00)	402	60	2	215	30	2

Table 3-5: South Cheltenham Modelled Car Trips by Period

Land north of Bishops Cleeve – Village

The Land North of Bishop's Cleeve is located to the north of the village of Bishop's Cleeve and lies within a rural area. As shown in Figure 3-10, the surrounding land comprises agricultural and undeveloped areas, reflecting a Village category. This is supported by DfT's Connectivity tool that gave a score ranging between 36 meaning lower levels of accessibility to key services and amenities.

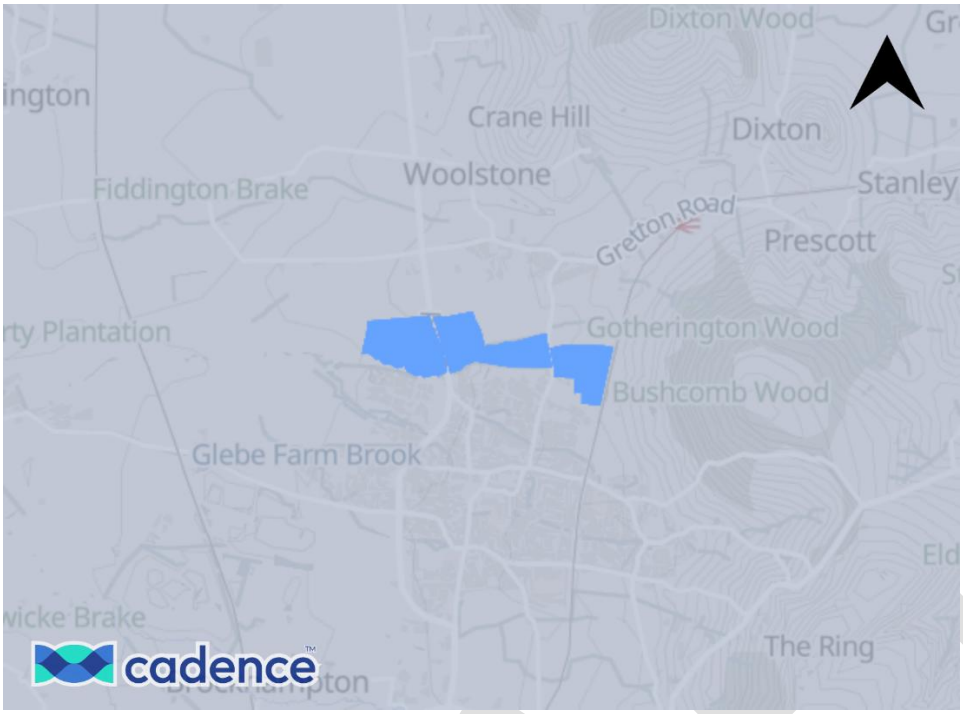

Figure 3-10: Land North of Bishop's Cleeve Site Location

The Land North of Bishop's Cleeve site consists of 800 dwellings. Table 3-6 shows car trip arrivals and departures for the PSO for each modelled period.

PM (17:00-18:00)	254	18	1	121	11	1

Table 3-6: Land North of Bishop's Cleeve Modelled Car Trips by Period

Land at Walton Cardiff – Village

This site is located adjacent to the village of Walton Cardiff and to the east of Wheatpieces, within a predominantly rural area as shown in Figure 3-11. The DfT's connectivity score was 44 justifying its category as a Village. While the village provides a limited range of local services, access to employment and other key amenities require longer journeys. As a result, travel patterns and trip rates at this site are expected to differ from those of Residential and Residential Isolated locations.

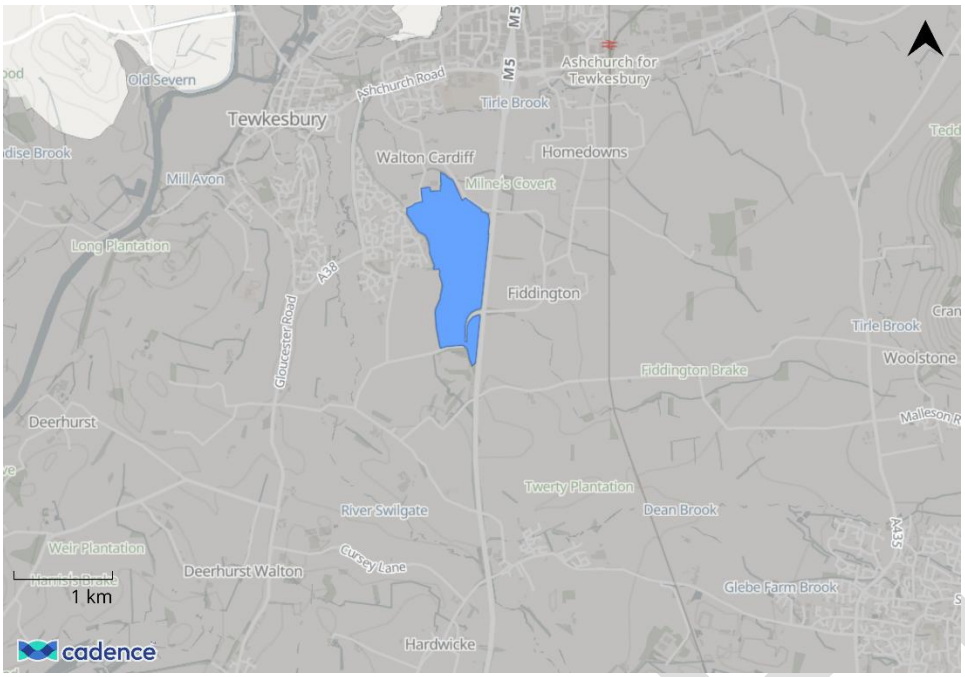

Figure 3-11: Land at Walton Cardiff Site Location

The Land at Walton Cardiff site consists of 500 dwellings. Table 3-7 shows car trip arrivals and departures for the PSO for each modelled period.

Modelled Period	Arrivals			Departures

IP (Avg 10:00-16:00)	69	11	1	66	11	1
PM (17:00-18:00)	159	12	1	76	7	1

Table 3-7: Land at Walton Cardiff Modelled Car Trips by Period

Tewkesbury Garden Communities – Residential Isolated

The Tewkesbury Garden Communities site is located to the north-east of Tewkesbury, positioned within and immediately adjacent to the existing settlement of Ashchurch for Tewkesbury. As shown in Figure 3-12, the site sits within a largely built-up area with residential development present on multiple sides, and benefits from reasonable proximity to the services of Tewkesbury town centre. The relatively contained and connected nature of these sites is consistent with a Residential Isolated classification due to its proximity to the Ashchurch for Tewksbury railway station. This classification is further supported by the DfT's Connectivity Tool, which indicated employment overall connectivity scores in the range of 44–53 for these sites, suggesting a good level of accessibility to employment and key services.

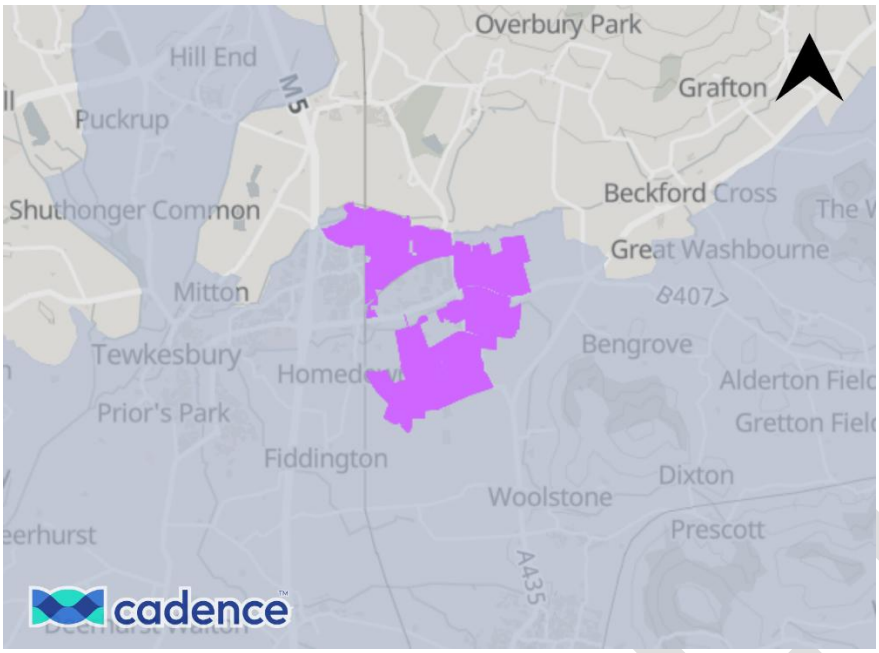

Figure 3-12: Tewkesbury Garden Communities Site Location

Table 3-8 shows car trip arrivals and departures for the PSO for each modelled period. The Tewkesbury Garden Communities site consists of 6,000 dwellings.

Modelled Period	Arrivals			Departures		
	Car	LGV	OGV	Car	LGV	OGV

IP (Avg 10:00-16:00)	792	132	6	756	132	12
PM (17:00-18:00)	1,608	240	6	858	120	6

Table 3-8: Residential Tewkesbury Garden Communities Modelled Car Trips by Period

Land at Whaddon – Residential Isolated

The land at Whaddon site, shown in Figure 3-13, is located on the south-eastern edge of Gloucester in the vicinity of Whaddon and Matson. The site occupies a peripheral position relative to the main urban area, adjoining existing development to the north and west whilst being bordered by areas of open land. The site benefits from access to the existing highway network, including connections to the A38 and M5, and is located within reasonable proximity of the employment, education, retail and leisure opportunities available within Gloucester.

Given its location on the edge of Gloucester, its proximity to urban services and facilities, and the presence of areas of undeveloped land surrounding parts of the site, it has been categorised as Residential Isolated. This is further supported by a DfT Connectivity Tool employment score of 55.

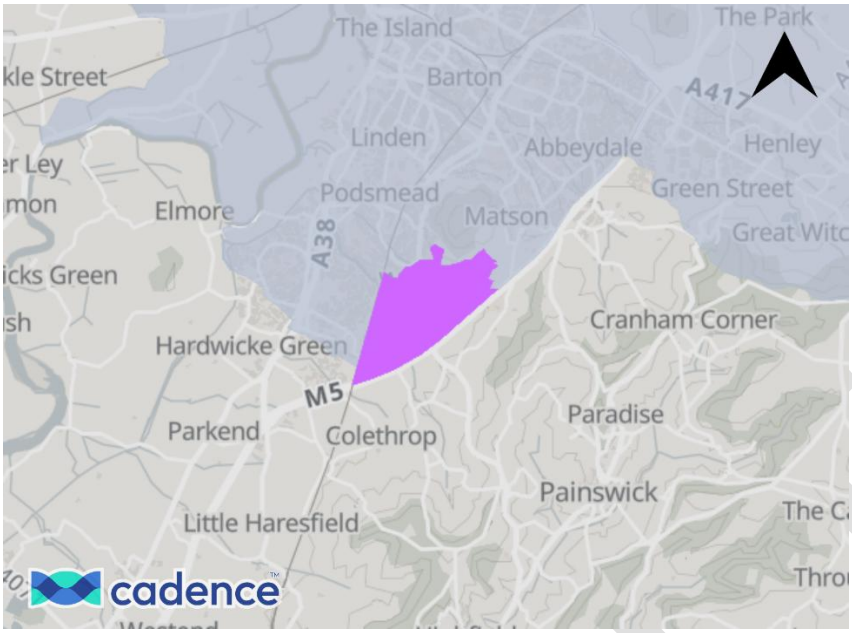

Figure 3-13: Land at Whaddon Site Location

Table 3-9 shows car trip arrivals and departures for the PSO for each modelled period. The Land at Whaddon site consists of 3,000 dwellings.

Modelled Period	Arrivals			Departures

PM (17:00-18:00)	804	120	3	429	60	3

Table 3-9: Whaddon Site Modelled Car Trips by Period

Land at Mitton – Village

The Land at Mitton site is located to the north-east of Tewkesbury, between the Mitton and Northway areas. As shown in Figure 3-14, the site is surrounded by open land to the north resulting in a physical separation from existing residential neighbourhoods. The site is adjacent to B4080 that provides great levels of accessibility towards Tewkesbury. The DfT'S connectivity tool indicated a connectivity score of 34. The site has been categorised as Village, reflecting its location and its separation from surrounding communities.

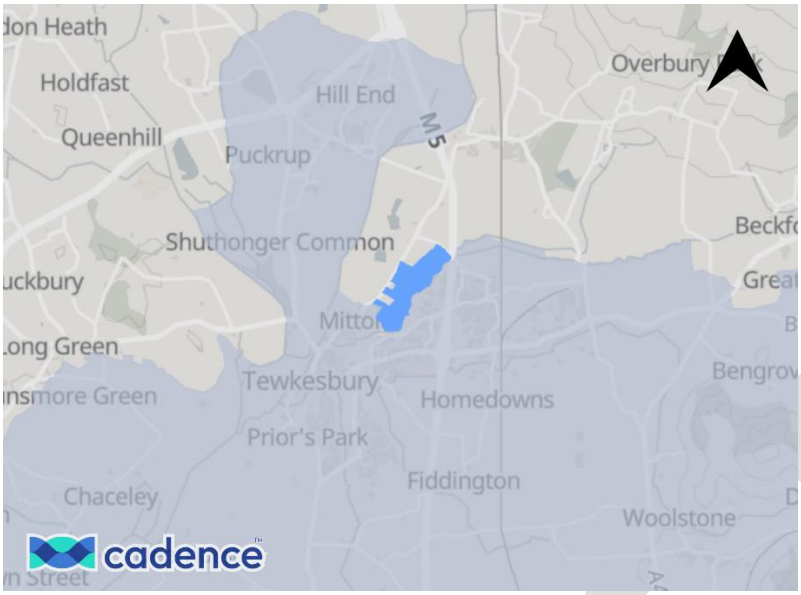

Figure 3-14: Land at Mitton Site Location

Table 3-10 shows car trip arrivals and departures for the PSO for each modelled period for the land at Mitton. The Land at Mitton site consists of 500 dwellings.

PM (17:00-18:00)	159	12	1	76	7	1

Table 3-10: Land at Mitton Modelled Car Trips by Period

Land east of Swindon Village – Residential Isolated

This site is located to the north of Cheltenham, adjacent to Wymans Brook and Cheltenham Racecourse Station. The DfT'S connectivity tool indicated a connectivity score slightly over 60 meaning that the site has good proximity to services and facilities within Cheltenham including employment, education and transport infrastructure. The site is integrated with the surrounding residential areas and is near Cheltenham Racecourse railway station and has therefore been categorised as Residential Isolated. The location of the Land east of Swindon Village site is presented in Figure 3-15.

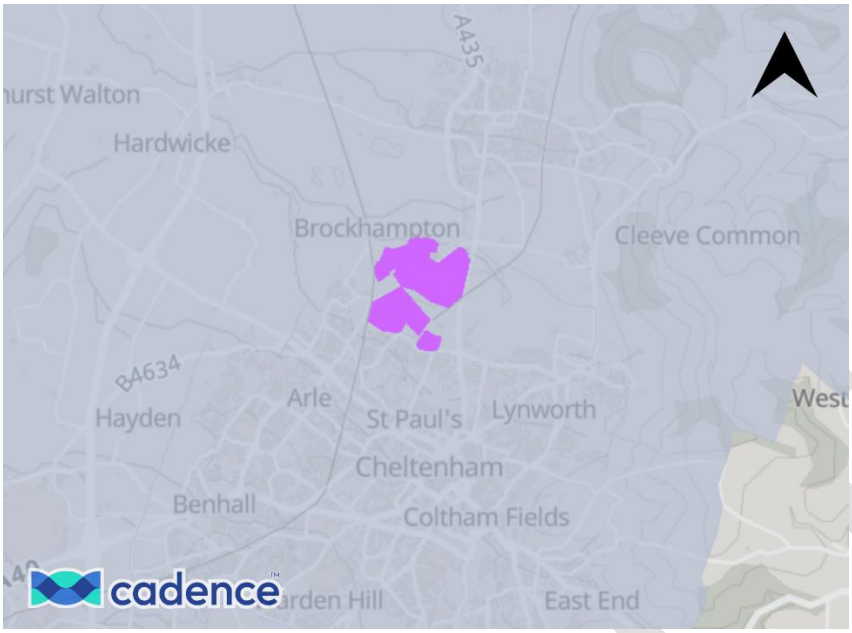

Figure 3-15: Land East of Swindon Village Site Location

Table 3-11 shows car trip arrivals and departures for the PSO for each modelled period. The Land east of Swindon Village site consists of 2,500 dwellings.

PM (17:00-18:00)	670	100	3	358	50	3

Table 3-11: Land East of Swindon Village Modelled Car Trips by Period

Safeguarded Land – Residential Isolated

The Safeguarded Land site is located to the west of Cheltenham, sitting outside the main built-up area of the town as shown in Figure 3-16. The site benefits from proximity to the M5, B4634 and B4063. However, it does not form part of the core residential network of Cheltenham and thus, it has been categorised as Residential Isolated. Its connectivity score is 49 as per the DfT's Connectivity Tool.

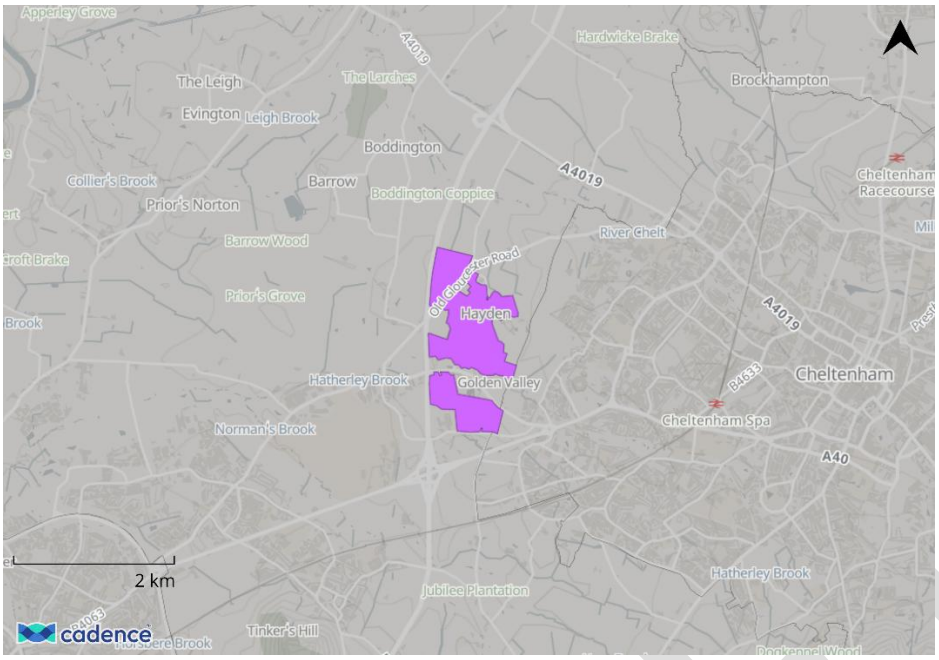

Figure 3-16: Safeguarded Land Site Location

Table 3-12 shows car trip arrivals and departures for the PSO for each modelled period. The Safeguarded Land site consists of 2,000 dwellings.

PM (17:00-18:00)	536	80	2	286	40	2

Table 3-12: Safeguarded Land Modelled Car Trips by Period

Land adjoining North West Cheltenham - Residential Isolated

This site is located to the north-west of Cheltenham, close to Uckington and Elmstone Hardwicke as shown in Figure 3-17. While it lies in relatively close proximity to Cheltenham, the site is physically separated from the town's continuous built-up area by areas of undeveloped land. The site nevertheless benefits from good accessibility to Cheltenham via strategic road infrastructure including the A4019. However, due to its separation from Cheltenham's urban residential network and the presence of surrounding undeveloped land, it has been categorised as Residential Isolated. The DfT's connectivity score was 49 justifying its category as a Residential Isolated location.

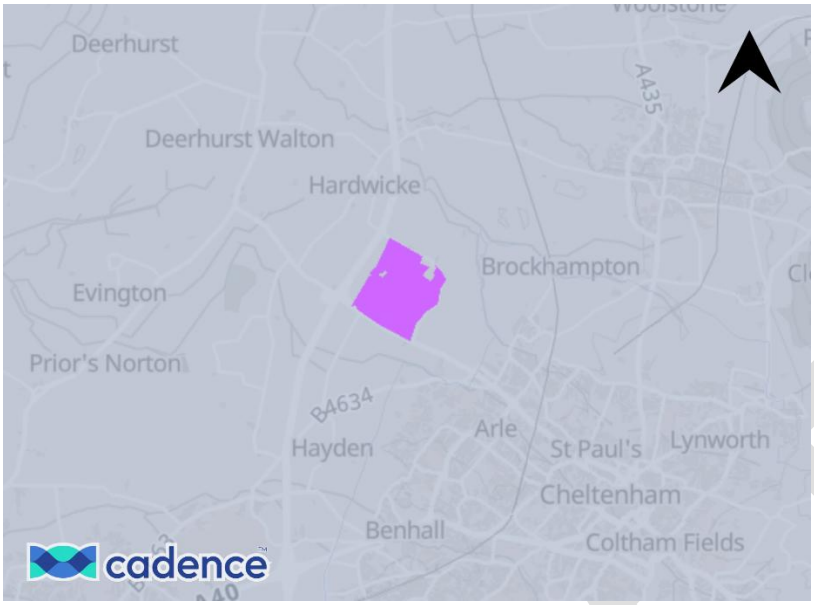

Figure 3-17: Land Adjoining North West Cheltenham Site Location

Table 3-13 shows car trip arrivals and departures for the PSO for each modelled period. The Land adjoining North West Cheltenham (North) site consists of 2,500-dwelling.

Table 3-13: Land Adjoining North West Cheltenham Modelled Car Trips by Period

Land south of Tewkesbury – Village

This site is located to the south of Tewkesbury, positioned on the edge of the town but clearly separated from the town's continuous built-up area as shown in Figure 3-18. The DfT's connectivity score ranges from 25 to 48 and thus, this site has been categorised as Village. The site benefits from proximity to the A38 and is surrounded by undeveloped land.

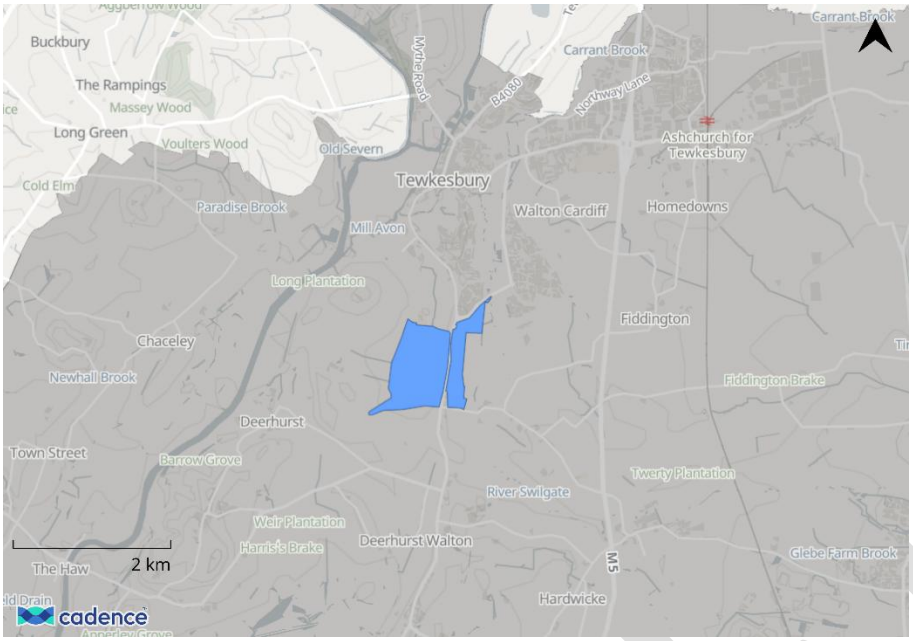

Figure 3-18: Land South of Tewkesbury Site Location

Table 3-14 shows car trip arrivals and departures for the PSO for each modelled period. The Land south of Tewkesbury site consists of 800 dwellings.

Table 3-14: Land South of Tewkesbury Modelled Car Trips by Period

East Twigworth - Village

The East Twigworth site is located to the north of Gloucester within a rural area and is clearly separate from the city's continuous built-up area. As shown in Figure 3-19, the site is surrounded by open and undeveloped land that forms a clear separation from the main urban area of Gloucester. The site has therefore been categorised as a Village. This is supported by the DfT's Connectivity tool that indicated an overall connectivity score of 39 indicating lower levels of connectivity and accessibility to key amenities when compared to sites categorised as Residential Isolated.

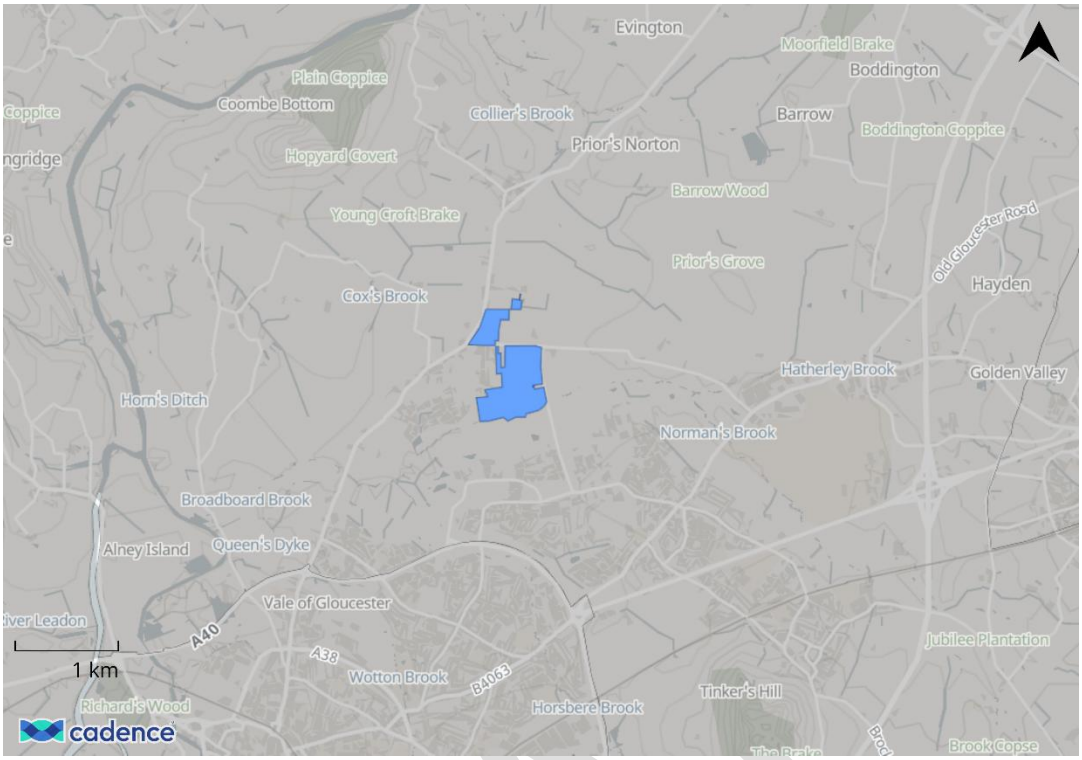

Figure 3-19: East Twigworth Site Location

Table 3-15 shows car trip arrivals and departures for the PSO for each modelled period. The East Twigworth site consists of 942 dwellings.

3.1.2 Employment Strategic sites

Table 3-16 summarises assumed distribution of employment type by Local Authority District based on information derived from the 2020 Gloucestershire Economic Needs Assessment (Strategic Planning Research Unit, 2020). Cheltenham and Gloucester are more office-focused, whilst Tewkesbury has a greater proportion of industrial and warehousing uses. These proportions are applied to each employment site to disaggregate total floorspace into B1 (Office), B2 (Industrial), and B8 (Warehouse) categories, which in turn inform the trip rate assumptions used in subsequent stages of the assessment.

Local Authority	Cheltenham	Gloucester	Tewkesbury	JCS Area
B1- Offices	60%	62%	24.7%	30%
B2 - Industrial	26%	9%	49.5%	40%
B8 - Warehouses	14%	29%	25.8%	50%

Table 3-16: Land Use Split by Local Authority District

Table 3-17 presents the resulting car trips generation for each PSO employment site during the AM peak (08:00–09:00), inter-peak (average hourly), and PM peak (17:00–18:00) periods, split by arrivals and departures.

DRAFT

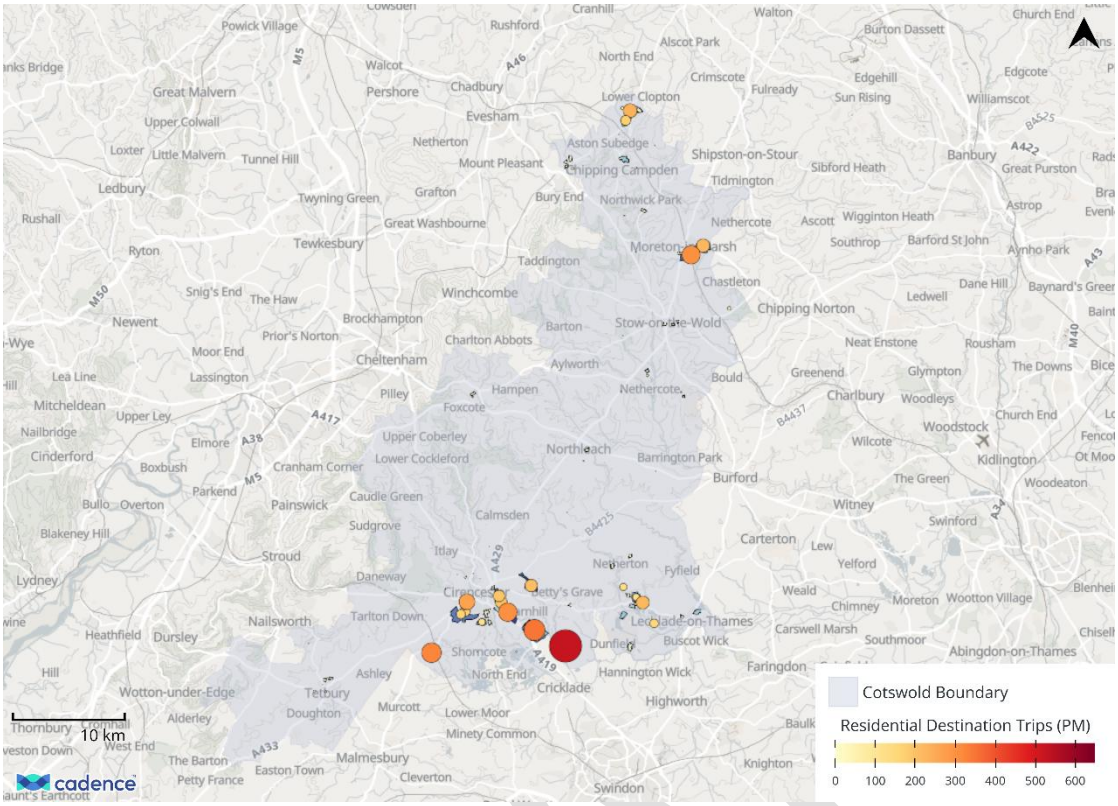

Figure 3-25: PM Arrivals for Residential Development Sites

Phase 2-f: Land at Chesterton Farm, Cranhams Lane, GL7 6JP – Residential Isolated

The Chesterton Farm site is located to the south-west of Cirencester, situated on the western edge of the town where development transitions into open agricultural land. As shown in Figure 3-26, the site adjoins the existing residential area of Chesterton but is bordered to the south and west by undeveloped farmland. Despite its edge-of-town position, the site benefits from proximity to the services and facilities of Cirencester and has reasonable connectivity to the surrounding street network. This is supported by the DfT's Connectivity Tool, which indicated a residential overall connectivity score of 59. Given that the site is located on the periphery of Cirencester and is bordered by predominantly non-residential land uses, the expected travel patterns are those of a Residential Isolated location.

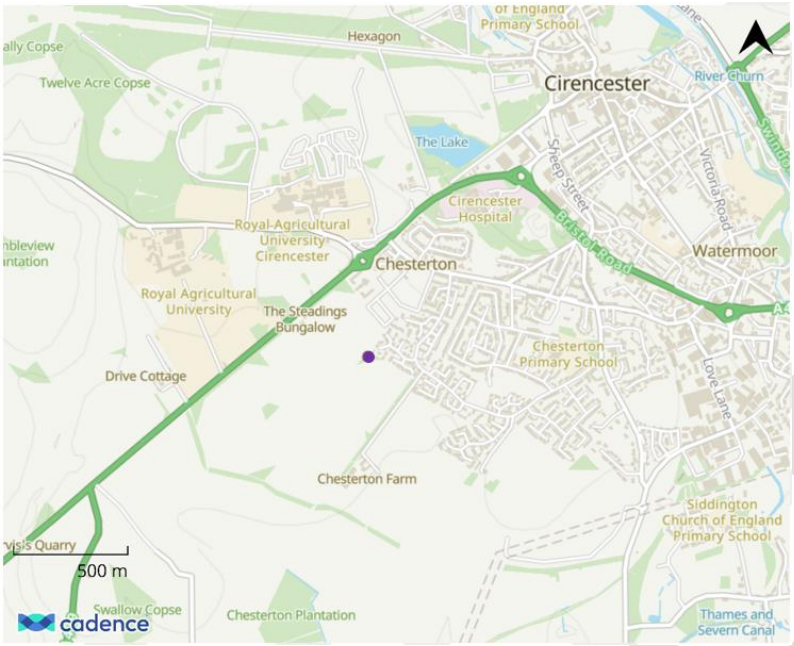

Figure 3-26: Phase 2-f: Land at Chesterton Farm, Cranhams Lane, GL7 6JP Site Location

Table 3-20 shows car trip arrivals and departures for the PSO for each modelled period. The Chesterton Farm Phase 2-f site consists of 549 dwellings.

IP (Avg 10:00-16:00)	72	12	1	69	12	1
PM (17:00-18:00)	147	22	1	79	11	1

Table 3-20: Phase 2-f: Land at Chesterton Farm, Cranhams Lane Modelled Car Trips by Period

Phase 3a-i: Land at Chesterton Farm, Cranhams Lane, GL7 6JP – Residential Isolated

Phase 3a-I, in Figure 3-27, forms a subsequent phase of the same wider Chesterton Farm residential development above. The site is located on the south-western edge of Cirencester, adjoining the existing residential area of Chesterton while remaining associated with the surrounding open land. The Chesterton Farm site has been categorised as Residential Isolated based on its south-west Cirencester location, moderate connectivity score of 59 from the DfT's Connectivity Tool, and reasonable access to the services and facilities of the town.

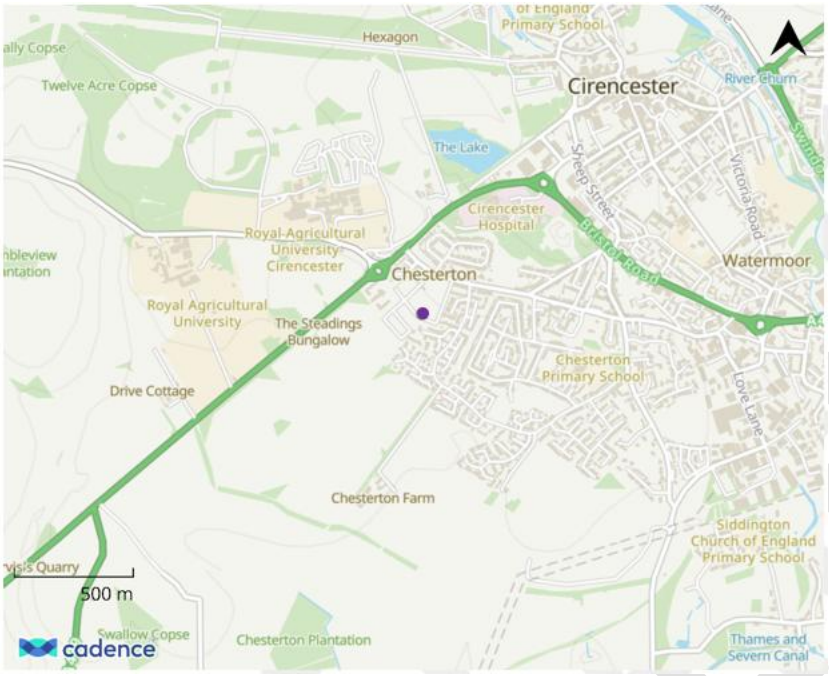

Figure 3-27: Phase 3a-i: Land at Chesterton Farm, Cranhams Lane, GL7 6JP Site Location

Table 3-21 shows car trip arrivals and departures for the PSO for each modelled period. The Phase 3a-i site consists of 982 dwellings.

Table 3-21: Phase 3a-i: Land at Chesterton Farm, Cranhams Lane Modelled Car Trips by Period

Land south-west of Preston between Cirencester Road (A419) and A419T - Village Location

The site is located to the south-east of Cirencester, as shown in Figure 3-28 within a predominantly rural setting and separated from the main urban area by areas of open land. While the site benefits from access to the A419 and A417, which provide connections to Cirencester and the wider strategic highway network, it is not directly integrated with the continuous built-up area of the town. The surrounding area is characterised by largely undeveloped land and rural uses, with access to a wide range of employment, education, retail and leisure facilities generally requiring travel to Cirencester or other nearby settlements and thus, the site has been categorised as Village. The DfT's Connectivity Tool indicated an overall employment connectivity score of 50. However, connectivity score does not determine site classification. The site remains physically separated from the main urban area and is located within a rural context, with travel patterns expected to be characterised by longer journey

lengths and a greater reliance on private vehicles than would typically be expected within a residential location.

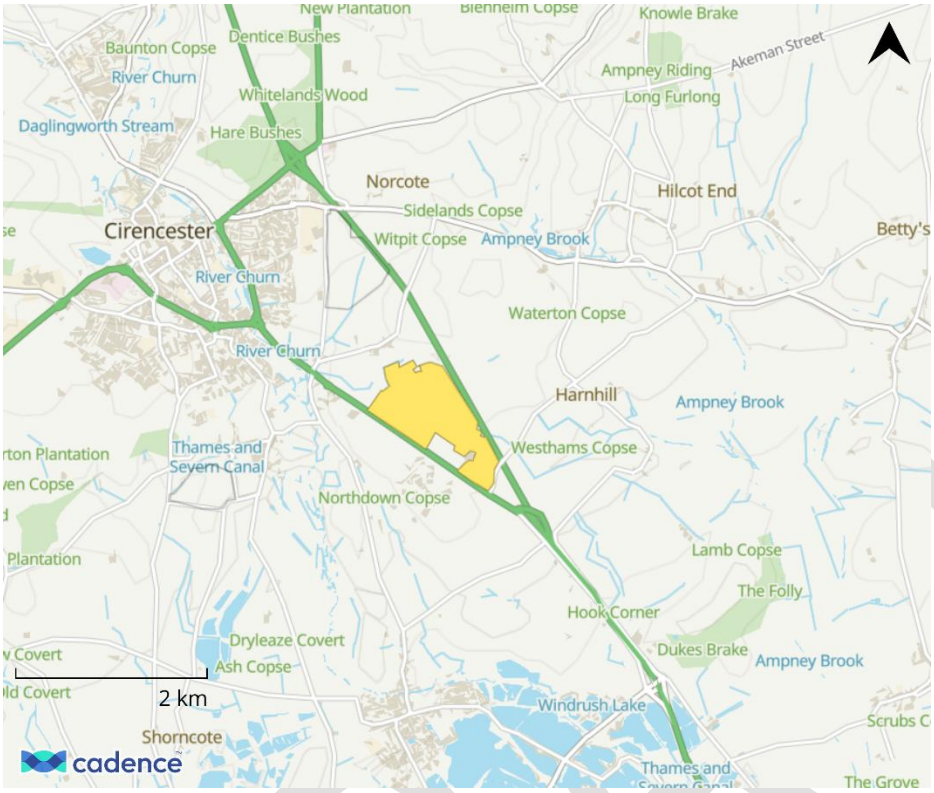

Figure 3-28: Land south-west of Preston between Cirencester Road (A419) and A419T Site Location

Table 3-22 shows car trip arrivals and departures for the PSO for each modelled period. The Land south-west of Preston between Cirencester Road (A419) and A419T site consists of 960 dwellings.

Table 3-22: Land south-west of Preston between Cirencester Road (A419) and A419T Modelled Car Trips by Period

Land east of Kingshill Lane - Village

The Land east of Kingshill Lane site is located to the east of Cirencester as shown in Figure 3-29. Although situated within the wider vicinity of Cirencester, the site is located within a predominantly rural area and is surrounded by open land. The site benefits from access to both the A419 and A417, which provide strategic connections to the wider road network. However, access to a full range of employment, education, retail and leisure opportunities is likely to

require longer journeys, reflecting travel patterns that are more characteristic of rural locations than sites located within the continuous urban area. The site has therefore been categorised as Village. The DfT's Connectivity Tool indicated an employment overall connectivity score of 50. However, connectivity score does not determine site classification. The site remains physically separated from the main urban area and is located within a rural context, with travel patterns expected to be characterised by longer journey lengths and a greater reliance on private vehicles than would typically be expected within a residential location.

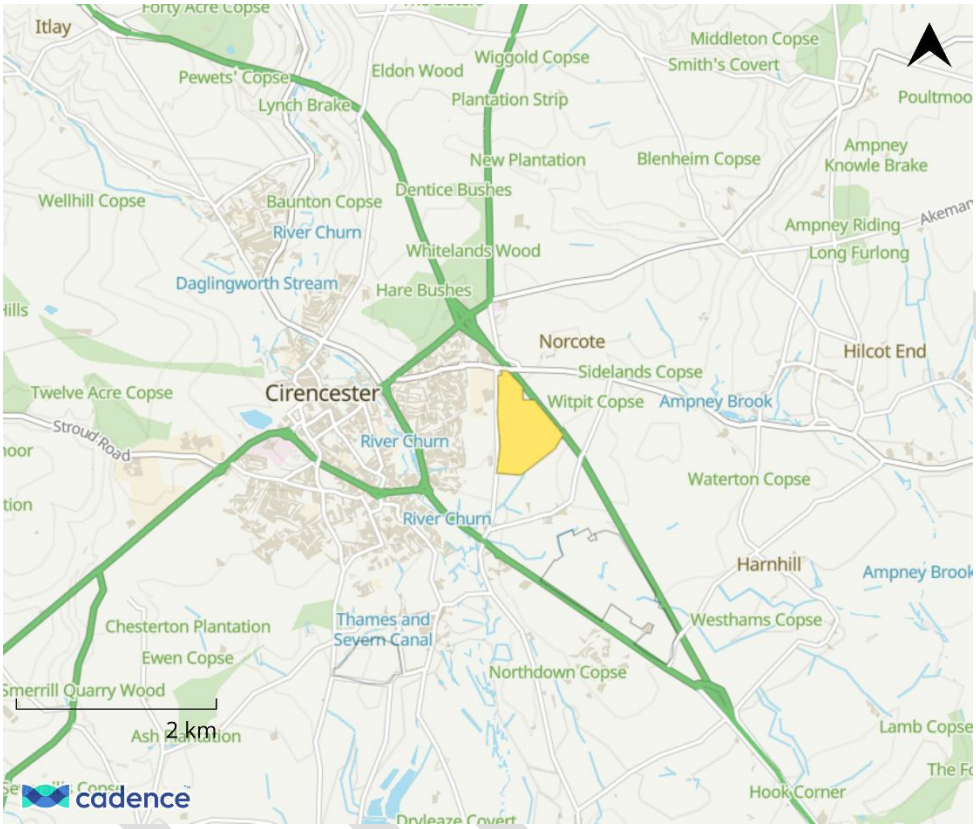

Figure 3-29: Land east of Kingshill Lane Site Location

Table 3-23 shows car trip arrivals and departures for the PSO for each modelled period. The Land east of Kingshill Lane site consists of 613 dwellings.

Modelled Period	Arrivals			Departures		
	Car	LGV	OGV	Car	LGV	OGV

IP (Avg 10:00-16:00)	84	13	1	80	13	1
PM (17:00-18:00)	195	14	1	93	9	1

Table 3-23: Land east of Kingshill Lane Modelled Car Trips by Period

Land south-west of Kemble - Village

This site is located to the south-west of Cirencester, adjacent to the village of Kemble and is surrounded by open and undeveloped land as shown in Figure 3-30. While Kemble railway station is in proximity and offers an important strategic rail connection, access to employment and key amenities and services remains limited within the immediate vicinity. The site has therefore been categorised as Village. The classification is further supported by the DfT's Connectivity Tool, which showed a score of 24. This score suggests a low level of accessibility, consistent with a village location where access to employment and other key services typically requires longer journeys compared to urban residential areas.

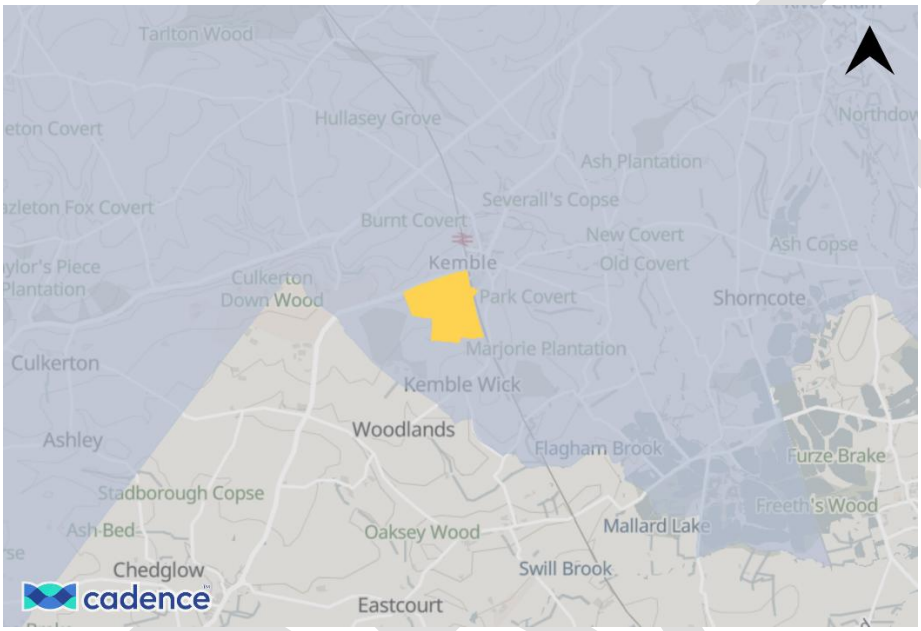

Figure 3-30: Land south-west of Kemble Site Location

Table 3-24 shows car trip arrivals and departures for the PSO for each modelled period. The Land south-west of Kemble site consists of 1,020 dwellings.

Modelled Period	Arrivals			Departures

PM (17:00-18:00)	324	23	1	154	14	1

Table 3-24: Land south-west of Kemble Modelled Car Trips by Period

Fire Service College (Site A) – Residential Isolated

The Fire Service College Site A, shown in Figure 3-31, is located on the eastern edge of Moreton-in-Marsh town. While the site lies adjacent to the urban area and benefits from access to the

services, facilities and railway station within Moreton-in-Marsh, it is situated on the periphery of the settlement and is bordered by predominantly rural and undeveloped land to the east and south. The site is therefore categorised as Residential Isolated. The classification is further supported by the DfT's Connectivity Tool, which showed a score of 42.

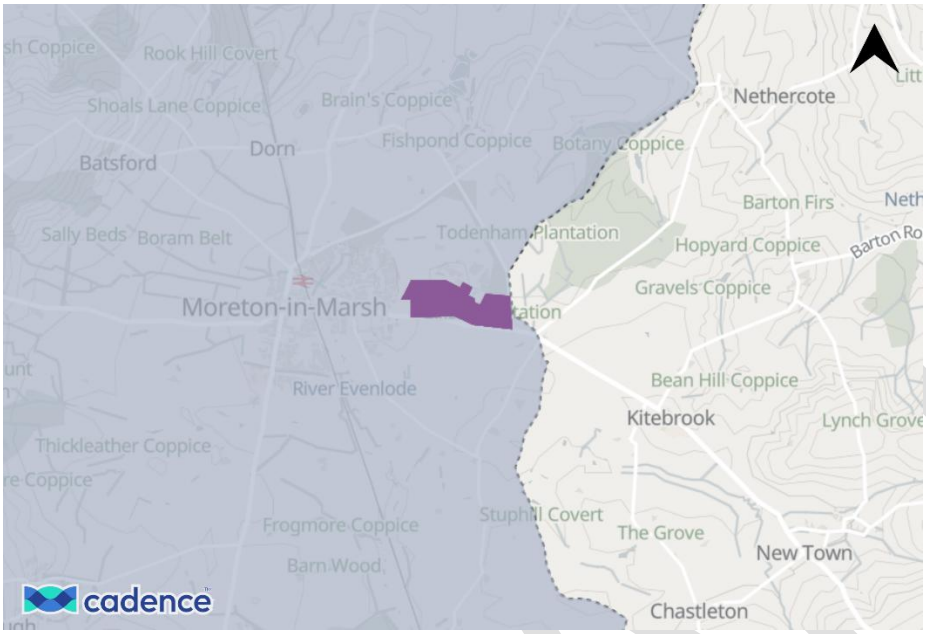

Figure 3-31: Fire Service College (Site A) Site Location

Table 3-25 shows car trip arrivals and departures for the PSO for each modelled period. The Fire Service College Site A consists of 833 dwellings.

AM (08:00-09:00)	94	8	1	272	18	1
IP (Avg 10:00-16:00)	110	18	1	105	18	2
PM (17:00-18:00)	223	33	1	119	17	1

Table 3-25: Fire Service College (Site A) Modelled Car Trips by Period

Ampney Crucis - Village

This site is located to the east of Cirencester, in the vicinity of Hilcot End, within a rural area surrounded by open land. The site is physically separated from the main urban area of Cirencester, with extensive undeveloped land lying between the site and the town, resulting in a distinct rural setting. Whilst the site benefits from access to the local road network and connections towards Cirencester and surrounding settlements, access to a full range of employment, education, retail and leisure facilities is likely to require travel beyond the immediate area.

As a result, the site is categorised as Village. The classification is further supported by the DfT's Connectivity Tool, which showed a score of 21.

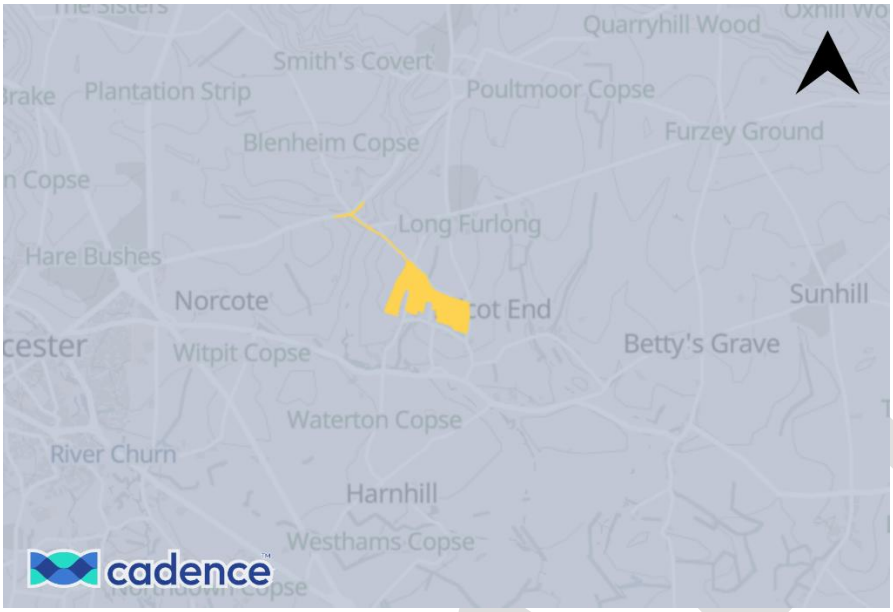

Figure 3-32: Ampney Crucis Site Location

Table 3-26 shows car trip arrivals and departures for the PSO for each modelled period. The Ampney Crucis site consists of 660 dwellings.

Modelled Period	Arrivals			Departures		
	Car	LGV	OGV	Car	LGV	OGV
AM (08:00-09:00)	94	13	2	255	17	3
IP (Avg 10:00-16:00)	90	14	1	86	14	1
PM (17:00-18:00)	210	15	1	100	9	1

Table 3-26: Land north of Clark's Lane and south of Old Canal Modelled Car Trips by Period

Mickleton – Village

This site is located in the vicinity of Mickleton, a rural village situated to the north of the Cotswolds. The site is surrounded predominantly by open land with development in the area generally comprising rural communities. Whilst Mickleton provides access to a limited range of local facilities and services, residents are likely to rely on nearby towns and larger settlements for a wider range of employment, retail, education and leisure opportunities.

Consequently, the Mickleton site is categorised as Village. The classification is further supported by the DfT's Connectivity Tool, which showed a score of 29.

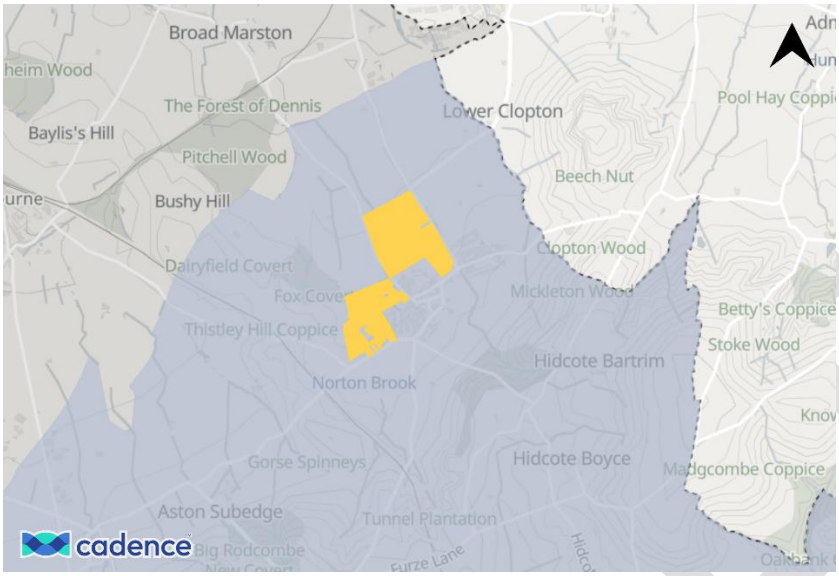

Figure 3-33: Mickleton site Location

Error! Reference source not found. shows car trip arrivals and departures for the PSO for each modelled period. The Mickleton site consists of 1,264 dwellings.

PM (17:00-18:00)	402	29	1	191	18	1

Table 3-27: Mickleton Modelled Car Trips by Period

Land south of Driffield – Village

The land south of Driffield is located in the wider Down Ampney and Cotswold Water Park area, surrounded by open land with limited development in the immediate vicinity. The site is physically separated from larger urban centres, resulting in a rural setting. Given its rural context, the surrounding undeveloped land, and the need for residents to travel further to access key services and facilities, the site has been categorised as Village. The DfT's Connectivity Tool showed a connectivity score of 22, also consistent with a village location.

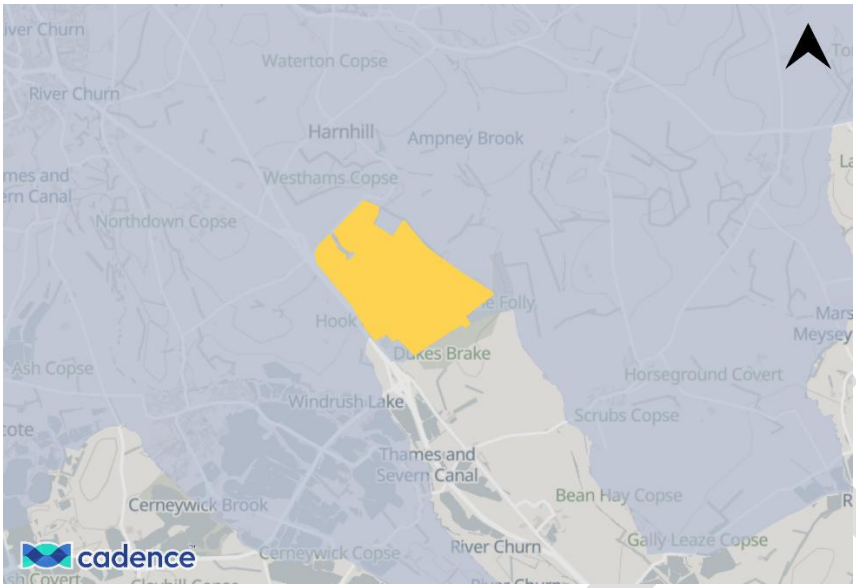

Figure 3-34: Land south of Driffield site Location

Error! Reference source not found. shows car trip arrivals and departures for the PSO for each modelled period. The land south of Driffield site consists of 1,090 dwellings.

Modelled Period	Arrivals			Departures

AM (08:00-09:00)	155	21	3	421	27	5
IP (Avg 10:00-16:00)	149	23	1	143	23	1
PM (17:00-18:00)	347	25	1	165	15	1

Table 3-28: Land south of Driffield Modelled Car Trips by Period

Land at Down Ampney – Village

The land at Down Ampney site is located in the vicinity of Down Ampney as shown in Figure 3-35**Error! Reference source not found.**, a rural village situated to the south-east of Cirencester. The site lies within a rural area and is physically separated from larger urban areas. Whilst the site benefits from connections to the local highway network, enabling access to Cirencester, Fairford and surrounding villages, access to a wider range of services and facilities requires travel to nearby towns and settlements.

The DfT's Connectivity Tool showed a connectivity score of 22, meaning low levels of accessibility to services and amenities, consistent with a village location. Consequently, the site has been categorised as Village.

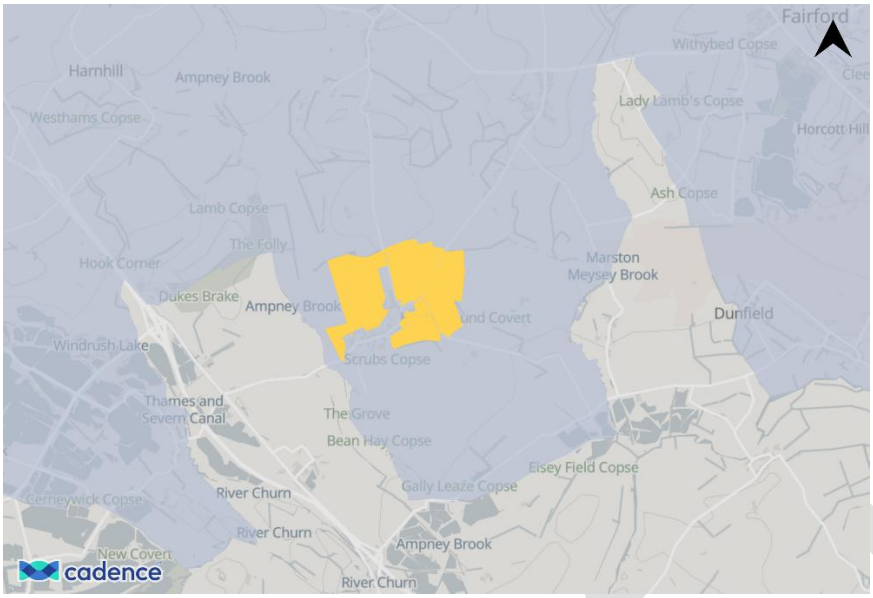

Figure 3-35: Land at Down Ampney site Location

Error! Reference source not found. shows car trip arrivals and departures for the PSO for each modelled period. The land at Down Ampney site consists of 1,660 dwellings.

IP (Avg 10:00-16:00)	227	35	2	217	35	2
PM (17:00-18:00)	528	38	2	251	23	2

Table 3-29: Land at Down Ampney Modelled Car Trips by Period

Land at Moreton-in-Marsh – Residential Isolated

The Land at Moreton-in-Marsh site, shown in Figure 3-36, is located on the eastern side of Moreton-in-Marsh and comprises a number of sites situated on the edge of the existing settlements. Whilst the site benefits from proximity to the town centre, local services, community facilities and Moreton-in-Marsh railway station, it is bordered to the east by predominantly rural land uses and open land.

The site is well positioned to access employment, education, retail and leisure opportunities within Moreton-in-Marsh. However, due to its location on the edge of the existing settlement, it is categorised as Residential Isolated. The DfT's Connectivity Tool showed a connectivity score of 45.

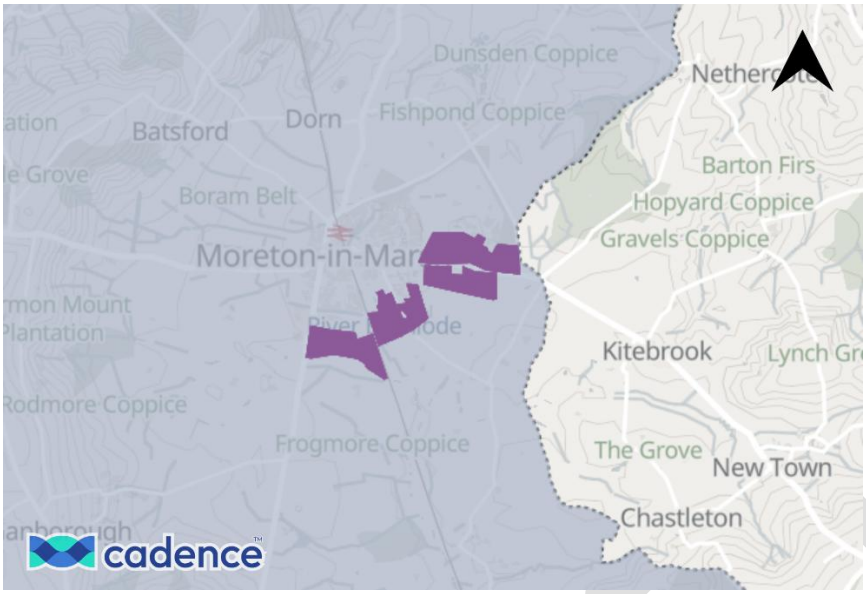

Figure 3-36: Land at Moreton in Marsh site Location

Error! Reference source not found. shows car trip arrivals and departures for the PSO for each modelled period. The land at Moreton in Marsh site consists of 1,129 dwellings.

Table 3-30: Land at Moreton in Marsh Modelled Car Trips by Period

3.2.2 Employment Strategic sites

Table 3-31 summarises the assumed employment land-use distribution for Cotswold. These proportions are applied consistently to each employment site to disaggregate the total floorspace into B1 (Office), B2 (Industrial), and B8 (Warehouse) categories. The resulting land-use split is then used to inform the trip rate assumptions applied in subsequent stages of the assessment. Industrial uses (B2) comprise the largest share of employment land use at 49.5%, followed by warehouses (B8) at 25.8%, and office uses (B1) at 24.7%.

Local Authority	Cotswold
B1- Offices	24.7%
B2 - Industrial	49.5%

B8 - Warehouses	25.8%

Table 3-31: Employment Land Use Split

Table 3-32 shows car trips generation for each PSO employment site for each modelled periods, split by arrivals and departures. Overall, the largest trip volumes are associated with the Land south of Cotswold Airport, Fosse Farm, the Cotswold Airport and the Land south-west of Preston between Cirencester Road (A419) and the A419T. Of these, Cotswold Airport and Land south-west of Preston are strategic employment sites, both of which record consistently high inbound trips during the AM peak and high outbound trips during the PM peak, reflecting their scale and strategic employment function.

DRAFT

4 Trip Rate Comparison and Justification

4.1 Trip Rate Comparison

WSP working on behalf of National Highways, provided local comparator peak hour vehicle trips per dwelling, on the 20th of April 2026. Table 4-1 and Table 4-2 show the comparison with the vehicle trips per dwelling for the three location types outlined in section 1 that were used for the PSO modelling, for the AM and PM peak hour respectively. The weighted average total vehicle trips per dwelling (AM 2-way vehicle trip rate is 0.51 for SLP and 0.54 for Cotswold) of the three location types used in the PSO modelling for the AM peak hour broadly falls in the middle of the range (i.e. 0.51 or 0.54 is approximately middle of the range 0.29-0.63) provided by National Highways, as can be seen in Table 4-1. The weighted average total vehicle trips per dwelling (PM 2-way vehicle trip rate is 0.48 for SLP and 0.50 for Cotswold) of the three location types used in the PSO modelling for the PM peak hour falls in the middle of the range (i.e. 0.48 or 0.50 is approximately middle of the range 0.36-0.62) provided by National Highways, as can be seen in Table 4-2.

Authority	Area Type	Housing Type	Arrivals	Departures	Total (2-way)

Table 4-2 Total Vehicles Trips in the PM Peak Hour per residential dwelling

4.2 Trip Rate Justification

When drawing a comparison between the trip rates used for the PSO modelling and those from elsewhere as shown in Table 4-1 and Table 4-2, the following should be noted which supports the justification of the trip rates used:

- No internalisation reduction factor has been applied for the SLP and Cotswold local plan vehicle trips per dwelling for the PSO modelling.
- Stroud and Worcestershire authorities comparators show the highest vehicle trips per dwelling in both Table 4-1 and Table 4-2, all come from 2021 reporting and are based on pre-pandemic trip rates. It is well known that residential car trip rates post pandemic have fallen, car driver trips fell by 6% between 2019 and 2024, with overall commuting trips down by 21% largely due to the rise of hybrid and home working (NTS-2024: Household car availability and trends in car trips (Chart 20), DfT). The surveys that inform the Cotswold and SLP trip rates are based on post pandemic data where lower car trip rates would be expected.
- The strategic transport modelling work for the transport evidence base for a local plan covers a large area and a significant number of development sites it therefore must be strategic and proportionate in nature, as opposed to a detailed transport assessment for individual developments site applications. Instead, a proportionate approach has been adopted using three trip rate categories by location type.
- The trip rates should be seen within the 'Vision & Validate' methodology, as outlined in the Vision & Validate Technical note (SLP, Cotswold) to a future based approach to integrated land use and transport planning. It is a relatively new requirement for the local plan making process, included in the December 2024 revision of the National Planning Policy Framework. It replaces traditional reactive approaches with one that is goal-led, policy-aligned, and focused on sustainable outcomes. At its core, it aims to identify transport solutions that deliver the future we want, rather than providing for a scenario based on how we have done things in the past.
- Trip rates for the West of Cheltenham developments were agreed with National Highways and Gloucestershire County Council to determine the capacity of the existing M5 J10 and local highway arrangements. The weighted average vehicle trips per dwelling for SLP are the same or within 0.01 of the equivalent West of Cheltenham vehicle trips across each peak hour and the Cotswold only deviates by 0.02 vehicle trips per dwelling.

4.3 Benchmarking

Error! Reference source not found.Table 4-3 below shows the comparison of the A46 WG TRICS derived Standard trip rates, broken down by location and a raw average, against a comparative range of trip rates which is broadly in line with existing planning applications. To enable a consistent assessment, the total vehicles and people metrics account for all observed movements within TRICS (e.g. some modes such as motorcycle, taxi and PSV trip rates are not included separately in the modelling assessment). The purpose of the table below is to provide a

comparative assessment between the TRICS analysis undertaken for existing planning applications within the study area and the TRICS derived standard trip rates. Note, for the purpose of modelling these standard trip rates are then adjusted using TEMPRO data for car passenger observations and some modes are excluded.

Location	Total Vehicles		Cyclist		Walk		PT		Total People	
	AM	PM	AM	PM	AM	PM	AM	PM	AM	PM
Residential Zone	0.40	0.44	0.02	0.02	0.17	0.09	0.04	0.04	0.85	0.84
Residential Zone Isolated	0.50	0.51	0.02	0.02	0.11	0.06	0.05	0.04	0.96	0.98
Village	0.57	0.48	0.02	0.01	0.11	0.09	0.05	0.04	1.11	0.85
Average	0.49	0.48	0.02	0.02	0.13	0.08	0.04	0.04	0.97	0.89
Estimated Lower Range	**0.46**	**0.47**	**0.01**	**0.01**	**0.01**	**0.05**	**0.01**	**0.01**	**0.86**	**0.79**
Estimated Upper Range	**0.57**	**0.63**	**0.03**	**0.04**	**0.27**	**0.18**	**0.03**	**0.03**	**1.04**	**0.97**

Table 4-3: Trip Rate (per hour per dwelling) A46 WG Benchmarking - TRICS

On average, trip rates across all modes fall within the estimated comparative ranges. The only minor exception is Public Transport (combined), which deviates slightly by 0.01 trips.

For Total Vehicles, the Residential Zone shows slightly lower trip rates than the estimated range, while the Village and Residential Zone Isolated locations fall within the expected range. In particular, the general Residential Zone, which represents areas with lower car generation, has slightly lower car trip rates than estimated. Overall, both the range of trip rates across location categories and the average total vehicle trip rates are broadly in line with expectations.

For Total People, average trip rates are within the estimated range. A small deviation of 0.01 trips was observed in the Residential Zone during the weekday morning peak (08:00-09:00). In some specific periods, slightly higher trip rates were recorded including:

- Residential Zone Isolated (average weekday afternoon peak (17:00-18:00))
- Village (average weekday morning peak (08:00-09:00))

These deviations are primarily related to vehicle occupant observations, which are in the majority car passengers. This is not considered significant, as the modelling process utilises TEMPRO data for Car passengers. Overall, the analysis indicates a good level of consistency between estimated ranges and observed values by location category.

Table 4-4 presents the average weekday morning (08:00-09:00) and afternoon (17:00-18:00) car driver trip rates from the TRICS assessment.

Data Source	Location	AM	PM
TRICS	Residential Zone	0.273	0.349
	Residential Zone Isolated	0.344	0.427
	Village	0.368	0.380
	Average	0.328	0.385

Table 4-4: Trip Rate (average period per dwelling) A4 WG Benchmarking - TRICS

4.4 Conclusion

Given what is outlined in sections 4.1, 4.2 and 4.3 above, it is considered that the trip rates used for the PSO modelling for SLP and Cotswold local plan are appropriate and proportionate given the strategic nature of the work. If, however stakeholders have concerns, it would be possible to undertake sensitivity testing using higher (or lower trip rates), it is acknowledged that there is a degree subjectivity in the selection of trip rates. Given the evidence described in this TN, it would not be expected that such sensitivity tests would materially change the conclusions of the PSO modelling results for SLP and Cotswold local plan and its resultant impact on the network nor the likely intervention requirements.

This intervention will increase the frequency of the bus from hourly to half-hourly and extend the times to 0730 to 1830 (to allow for work time commuting). In addition services would run a more limited service on saturday and sunday (at present there is no services. Given the level of current provision an additional vehicle would likely be needed.	£500,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Ac3	Active Travel route to join D7 (access to Down Ampney, Driffield Site and	City Science	An active travel route including cycling and walking to join onto intervention D7 to provide a route between all the major sites and Cirencester. This route is 2.1km long and would be formed through small bit of shared pathway on the A417 between Village Street and Waterton Farm (BAC25 footpath) 0.4km followed by 1.7km of upgraded footpath to shared space.	£1,000,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Ac4	Ampney Cruicis-Poulton-Fairford Active Travel Route	City Science	An active travel route providing a route to Poulton including Ampney St Peter. 3.4km predominantly upgraded bridleways, footpaths and tracks followed by 1.3km of quiet lane treatment, 1.6km of on road segregation followed by 3.2km of quiet lane treatment on Welsh Way. The whole route is 8.6km.	£4,000,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Ac5	Amney Cruicis 20mph zone	City Science	20mph within Ampney Cruicis including new residential streets, village street, school lane, butchers arm lane, allotment lane, and riding lane (from the northern edge of the site to ashbrook lane junction)	£100,000	Critical	LP: Local access	Cotswold: Ampney Cruicis
Ac6	Diversion of 77 through Village Street	City Science	Diversion of the 76/77 bus route through Ampney Crucis. This will provide bus services to fairford and additional services to circencester	£100,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Ac7	Segregated Active Travel Route on Access Road and B4425	City Science	Route along new access road and then extend and enhance segregated cycleway within road boundary,	£2,500,000	Critical	LP: Strategic (off-site)	Cotswold: Ampney Cruicis
Cir2	Spratsgate Lane/Somerfield Road active travel links	City Science	Package of active travel measure could include providing pedestrian footpaths for residents willing to walk into Cirencester, as well as a on-road segregated cycleway. Require active travel access points along Spratsgate Lane for Sites SD20 and C190	£1,400,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Cir3	Active travel access Swindon Road	City Science	Active travel access onto Swindon Road at the northeastern corner of Site R519 to give access to existing cycleway crossing the A419 and along Cricklade Road to town centre.	£200,000	Critical	LP: Local access	Cotswold: Cirencester
Cir4	Cricklade Road Cycleway Enhancement	City Science	Upgrade the cycleway from Preston Toll Bar along Cricklade Road by installing high-quality road surface throughout, introducing a designated on-road cycle lane, and implementing clear signage. Extend this cycleway improvements to the town centre, passing under the foot tunnel under the Bristol Road and joining Watermoor Way	£2,000,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester
Cir5	Watermoor Road road space reallocation	City Science	Reallocate road space along Watermoor Road to create a serrated cycleway, joining with Cycleway improvements in **Cir4** to provide active travel links for southern development sites into Cirencester.	£250,000	Critical	LP: Local access	Cotswold: Cirencester
Cir6	Internal active travel links for Site R650	City Science	Internal active links connecting Site R650 to Site R519 to benefit from active travel access towards town centre suggested in **Cir4** and **Cir5**.	£0	Critical	LP: Local access	Cotswold: Cirencester
Cir7	Active travel access on Kingshill Lane	City Science	Active travel access on western boundary of site directly opposite off road leading to Cirencester skate park.	£150,000	Critical	LP: Local access	Cotswold: Cirencester
Cir8	Queen Elizabeth Road/Beeches Road cycleway	City Science	On road cycleway connecting to existing east-west cycle route to link Sites R650 and R519 to town centre. Include on road cycleways along Queen Elizabeth Road and Beeches Road. Then a segregated cycle lane along London Road/Lewis Lane to access town centre.	£1,000,000	Critical	LP: Local access	Cotswold: Cirencester
Cir9	Pedestrianise Castle Street	City Science	Extend current pedestrian zone restrictions to on Crickade Road to cover Castle Street for more attractive placemaking in town centre. Reallocate road space to active travel infrastructure and green space. Divert East West traffic along Park Lane, Black Jack Street, Market Place and The Waterloo to reach London Road	£100,000	Important	LP: Strategic (off-site)	Cotswold: Cirencester
Cir10	Siddington Road Cycleway	City Science	Provision of an on-road cycleway connecting Sites SD23 and SD17 to town centre via Siddington Road. Cycleway would follow Siddington Road then turn onto Kingsmead Road to connect to existing cycleway underpass under Bristol Road. To be delivered along with **Cir5** to provide onwards cycle access to town centre.	£300,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir11	Extend London Road cycleway	City Science	Extend London Road cycleway next to Site C81B toward town centre with on-road cycle lane. Connect to existing active travel bridge over Swindon Road, creating a shared use path for pedestrians and cyclists. Rejoin cycleway to London Road and towards town centre with	£500,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Cir12	Enhancement to 882 bus service	City Science	Increase the frequency of the Stagecoach West 882 bus service to run once an hour to provide better public transport connectivity to Cirencester.	£400,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester
Cir14	Cirencester mobility hub	Cotswold DC	Development of a new or enhanced mobility hub integrating public transport, micromobility, cycle facilities, and shared mobility options	£1,000,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir15	Cirencester Park and Ride	Cotswold DC	Park and ride/stride provision to intercept car trips at the edge of town, with potential for targeted bus priority measures to improve reliability and attractiveness of services into Cirencester. Park and Rides tend to target cars coming from out of town. Given the placement of this it is unlikely to be used by sites within the local plan. It is will be important for reducing overal traffic levels which may help local plan traffic however at present the modelling does not suggest it is critical for the functioning of the network	£10,000,000	Important	LP: Strategic (off-site)	Cotswold: Cirencester
Cir16	Wayfinding improvements	Cotswold DC	Introduction of a coherent, high-quality wayfinding strategy to improve navigation, reinforce key destinations, and enhance the legibility of walking and cycling networks across the town.	£500,000	Important	LP: Strategic (off-site)	Cotswold: Cirencester
Cir17	East-West Pedestrian / Cycle route improvements	Cotswold DC	Strengthening east–west pedestrian and cycle connectivity across Cirencester, improving continuity, safety, and accessibility.	£500,000	Important	LP: Strategic (off-site)	Cotswold: Cirencester
Cir18	Tesco–Siddington Road Active Travel Link	Cotswold DC	Creation of a direct, safe walking and cycling route connecting Tesco to Siddington Road, improving local accessibility and reducing short car trips.	£250,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir19	Orchard Fields–Steadings Active Link	Cotswold DC	Establishment of a walking and cycling route through Orchard Fields connecting Siddington to The Steadings.	£375,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir20	Siddington–South Cerney active travel link	Cotswold DC	Development of a strategic active travel corridor utilising the disused railway line to provide a direct, segregated walking and cycling link between Siddington and South Cerney.	£1,100,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester
Cir21	Green Lane Quiet Road	Cotswold DC	Reclassification of Green Lane (off Clark's Lane) from highway use to a quiet lane with lower speed limits and appropriate signage to enable shared use road for walking and cycling.	£100,000	Essential	LP: Strategic (off-site)	Cotswold: Cirencester

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Cir22	Dower's Lane and A417 Underpass Roundabouts Active Travel		Model suggests that cycling along the Dower's Lane becomes unsuitable for most people from suitable for some people due to increased traffic volumes. Many surrounding roads are currently assessed to have low suitability for cycling however there are a few off-road routes nearby meaning some cycle routing may be happening. Mitigation is likely to involve speed limit treatment on Dower's Lane and a shared pathway/cyclops upgrade to the two roundabouts. There is limited suitability in the wider area for cycling so this is unlikely to be a critical mitigation	£250,000	Not Important	Proposed	Cotswold: Cirencester
Cir23	Spratsgate Lane AT Mitigation	City Science	At present the road has minimal segregated infrastructure (with the exception of the new roundabout that feeds into the development near the Wilkinson Road Junction). The change is traffic is significant enough that even with minimal interventions such as 20mph zones and traffic calming or non-segregated cycle lanes are unlikely to be sufficient to leave the road suitable for most people. At present this route lies on the National Route 45. Multiple options should be explored including providing segregated provision or through alternative routing for the key routes that may use this route. For example K10 intervention may	£1,400,000	Critical	Proposed	Cotswold: Cirencester
Cir24	On site provision of services	City Science	Site further from Cirencester Town centre require on site provision of essential services to reduce travel in to the town centre. This should include at a minimum a primary school, a community space, a retail offering (ideally a small convience store and service for last mile delivery such a RM parcel box and parcel collection (either within a retail offering or through an external parcel collection service).	£0	Critical	LP: On-site	Cotswold: Cirencester
Cir25	Kingshill Road/London Road mitigation	City Science	Targeted junction improvements to address capacity constraints and improve traffic flow.	£200,000	Critical	Proposed	Cotswold: Cirencester
Cir26	Kingshill Road/Cirencester Road mitigation	City Science	Corridor-based measures to alleviate congestion and improve travel into and Cirencester.	£250,000	Critical	Proposed	Cotswold: Cirencester
Cir27	Somerford Road/Chesterton Lane HW Mitigation	City Science	Upgrade intersection between somerford road and chesterton lane to be signalised. The modelling suggests that increased traffic on Chesterton road will lead to severe queueing on the Somerford road due to them being unable to merge	£250,000	Essential	Proposed	Cotswold: Cirencester
Cir28	Cirencester Road AT Flag	Ciry Science	Limit issues for active travel using speed limits (20mph) and soft segregation	£400,000	Critical	0	Cotswold: Cirencester
Cir29	B4425/A429 Stow Road mitigation	City Science	Signal Optimisation/ Increase cycle time (reduce amount of loss time for Cherytree Ln and increase green time B4425 and Stow Rd) Required to deal with harm to network	£10-50k	Critical	Proposed	Cotswold: Cirencester
Cir30	Cirencester-Swindon BRT	City Science	Implementation of BRT route prosed between Cirencester and Swindon. This is assumed to contain enough bus priority interventions to keep the journey times down and a service that is frequent a minimum of every fifteen minutes. In order to maximise the utility of thise route for the local plan it is assumed that this will be an express stopping service that would call at Swindon-Down Ampney-Driffield Junction- Preston-Kingshill Lane-Cirencester. This captures around 2300 dwellings in the local plan. Journey time between Swindon and Cirencester should be no longer than 50-60 minutes to provide a competitive journey time	£5,000,000	Critical	LP: Strategic (off-site)	Cotswold: Cirencester

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Cir31	Active travel connections with and through The Steadings	City Science	Connection of Cirencester to Kemble active travel route to the south side of The Steading site, with active connections through the site to allow onwards active travel to Cirencester.	£0	Critical	LP: Local access	Cotswold: Cirencester
Cir32	Enhanced or extended bus service between Site C187 via the Steadings to	City Science	Increase the frequency of existing bus routes or implementation of a new bus route to connect the new site south of the Steadings via The Steadings to Cirencester. Could include a bus gate to permit bus movements between the Steadings and site C187.	£150,000	Critical	BAU+	Cotswold: Cirencester
Cir33	Local transport corridor interchange hub in The Steadings	City Science	Implement a Local Transport Corridor Interchange Hub within The Steadings where bus service between The Steading and Cirencester will stop on site.	£0	Critical	LP: Strategic (off-site)	Cotswold: Cirencester
Cir34	20mph zones	City Science	Extended the 20mph zones to cover residential street and development sites. This follows the consultation currently out	£150,000	Essential	LP: On-site	Cotswold: Cirencester
Cir35	Active Travel Route from South Steadings to Tetbury Road Entrance of	City Science/ GCC	Route following the existing planned interconnection between the Steadings and South Steadings extension. Exiting on the southern access from the Steadings (assuming the roundabout has been designed with adequate segregation. Then 0.2km of shared pathway on the north bound side of the road. Given the likely low volumes of both pedestrians and cyclists a 3m shared pathway would be sufficient and can be delivered within the HW boundary	£100,000	Critical	LP: Local access	Cotswold: Cirencester
Cir36	A419 Swindon Road/Silver Street	City Science	Upgrade the junction to a signalised junction and add approach flares.	~0.5-1million	Critical	Proposed	Cotswold: Cirencester
Cir37	A429/Chesterton Ln Junction	City Science	Change the stages and phases (having an all A429 stage followed by a Chesterton ln stage, and more green time for Stroud lane approach)	£10-50k	Critical	Proposed	Cotswold: Cirencester
Cir38	A419 Stroud Road/Trewsbury Road	City Science	Upgrade the junction to a signalised junction and add approach flares.	~0.5-1million	Critical	Proposed	East of Cirencester
Cir39	A429 Watermoor Roundabout	City Science	Add approach arm flares to the roundabout and widen the eastbound approach arm.	£1-10million	Critical	Proposed	Cotswold: Cirencester

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Cir40	Stroud Road north of Tetbury Roundabout	City Science	Widen the road to two lanes to accommodate development access.	£1-10million	Critical	Proposed	Cotswold: Cirencester
Cir41	A419 Swindon Road\Cirencester Road	City Science	Widen the roundabout to provide two lanes between the roundabout and the Kingsmill Lane signalised junction.	£1-10million	Critical	Proposed	Cotswold: Cirencester
Cir42	A29 Swindon Road/Bristol Road Roundabout	City Science	Widen the roundabout.	£1-10million	Critical	Proposed	Cotswold: Cirencester
D1	On site provision of services	City Science	Site requires on-Site provision of key services such as retail and healthcare as there is currently only one small village shop in Down Ampney, with other retail and healthcare services located over 3km away.	£0	Critical	LP: On-site	Cotswold: Down Ampney
D2	Cricklade cycle route	City Science	Cycleway connecting Down Ampney and Cricklade to give sustainable access to retail services in Crickade. Route would follow Down Ampney Road and head south on Cirencester road, cross the A419 and continue down into Crickade.	£900,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney
D3	South Cerney cycle route	City Science	Cycleway connecting Down Ampney and Cricklade to give sustainable access to retail services in South Cerney. Route would follow Down Ampney Road west and cross the A419, before turning north onto Cerney Wick Lane and following north on to Station Road into the centre of South Cerney.	£1,750,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney
D4	Driffield Junction Development cycle route	City Science	Cycleway connecting Down Ampney to Driffield Junction Development via existing bridleway to the north of the development Site. Route meets the eastern boundary of the Driffield Junction Development Site, where, in conjunction with Option DJ3 it would benefit from onwards cycle access to Cirencester.	£1,500,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney
D6	Enhancements of 76 bus route	City Science	Increase the frequency of the Stagecoach West 76 bus service to run once an hour to provide better public transport connectivity to Cirencester.	£1,000,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney
D7	Down Ampney - Cirencester Greenway	Cotswold DC	Extended greenway linking Sites in Down Ampney to Cirencester. Route would extend up through the sites in Down Ampney, north along the PROW route (BDA1) and the west towards Driffield (Route BDD16). It would then connect with the sites at Driffield Junction Development, running directly through these sites and onwards to the existing bridleway running northeast from Harnhill and adjacent to the A419. It would cross the A417 at Witpit Lane and connect to the sites along Kingshill Lane. For there it would follow Cir8 into town centre.	£3,500,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
D9	20 mph zones	City Science	Introducing 20mph zones across Down Ampney including within development sites	£75,000	Essential	LP: Strategic (off-site)	Cotswold: Down Ampney
D10	Quiet Lane Treatment on Unnamed Road between Oak Road and	City Science	In order to limit the use of this not suitable single track road several measures are pursured: Speed limit Change from National Speed limit to 30mph - this change will ensure that suitabity level for active travel is improved as well as limit the perceived advantage of the route. Traffic calming measures including road marking and bumps. In addition formally designating this as a rural quiet lane with measures to ensure that traffic is kept beneath 1000 pcu a day. Finally in order to facilated passing more passing places to be implemented with	£500,000	Critical	LP: Strategic (off-site)	Cotswold: Down Ampney
DJ1	On site provision of services	City Science	Site requires on-Site provision of key services such as retail, education and healthcare as closest services are 2 miles away in South Cerney or Down Ampney.	£0	Critical	LP: On-site	Cotswold: Driffield Junction Development
DJ2	South Cerney active travel route	City Science	Provision of a segregated cycleway linking the western boundary of the Site to services in South Cerney for those who are able to cycle the distance. This could include active travel priority at A419/B4696 junction, then an onwards active travel route along the B4696 and Station Road into South Cerney. Alternatively could explore an active travel bridge over A419 connecting to and active trave route along Bow Wow Road directly into South Cerney. This assumed D3 is delivered	£200,000	Critical	LP: Strategic (off-site)	Cotswold: Driffield Junction Development
DJ3	Cirencester active travel route	City Science	Provision of a segregated cycleway connecting the Site to Cirencester via Cirencester Road for those able to cycle the distance. It is assumed that this should be delivered using a crossing of Cirencester Road which requires a change in the character of that road. GCC expressed support for this.	£5,500,000	Critical	LP: Strategic (off-site)	Cotswold: Driffield Junction Development
DJ5	Driffield Junction Development Village Mobility Hub	City Science	A smaller mobility hub providing bus services, EV charging and parcel drop off points.	£1,500,000	Critical	LP: Strategic (off-site)	Cotswold: Driffield Junction Development
DJ6	Charlham Lane access	City Science	Active travel access to Charlham Lane to facilitate onward active travel to Primary school and shop. Much of this is covered by D4 but this just ensures the access is secured in the masterplan	£0	Critical	LP: Local access	Cotswold: Driffield Junction Development
DJ8	Bridleway enhancement to Down Ampney (Wiltshire)	City Science	Enhancement of Bridleways through Wiltshire to high quality cycleway and walking route to Down Ampney	£750,000	Critical	LP: Strategic (off-site)	Cotswold: Driffield Junction Development
DJ9	Future Proofing for Post-Local Plan Growth	City Science	Ensuring that internal design accounts for future post-local growth particularly around the prevention of through-traffic	£0	Critical	LP: On-site	Cotswold: Driffield Junction Development

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
DJ10	B4696 Spine Rd Approach to Station Rd/Cerney Wick Ln Intersection	City Science	Upgrade Junction to a signalised Junction	£250,000	Critical	Proposed	Cotswold: Driffield Junction Development
Fa1	On-site provision of services	City Science	On-Site provision of key services such as retail and healthcare.	£0	Critical	LP: On-site	Cotswold: Fairford
Fa2	Southrop Road/London Road active travel route	City Science	Provision of a segregated active route linking Site F57C to the town centre via Southrop Road and London Road. Package of measures include ensuring filling in gaps in pedestrian infrastructure and ensuring continuous footpaths and adequate crossing facilities, as well as enabling a shared used road with a cycleway. Requires active travel access of the southern boundary of the large Site along Hatherop Road and active travel access of the northern boundary of the large Site south of Southrop road.	£0	Critical	LP: Local access	Cotswold: Fairford
Fa3	Hatherop Road active travel route	City Science	Provision of an active route connecting Site F57B to the town centre via Hatherop Road. Measures could include widening existing footpaths in some areas and, ensuing adequate crossing facilities and implementing shared used road with a cycleway. Requires active travel access to Site along northwestern boundary along Hatherop Road.	£2,000,000	Critical	LP: Local access	Cotswold: Fairford
Fa4	Trubshaw Way active travel access	City Science	Active travel access to Trubshaw Way for Site F20A for onward active travel to town centre.	£0	Critical	LP: On-site	Cotswold: Fairford
Fa5	Cinder Lane quiet road	City Science	Designation of Cinder Lane as a quiet road, to encourage active travel from Site F20A to the Town centre. Requires active travel access to Cinder Lane on northern boundary of Site. Includes surfacing upgrade.	£380,000	Critical	LP: Local access	Cotswold: Fairford
Fa6	Horcott Road active travel route	City Science	Improve active travel links along Horcott Road to encourage sustainable access from Site F53A to the town centre. This includes by widen footpaths and improving crossing over wide-mouth junctions heading to town centre, as well as introducing a cycleway. This could connect to existing the cycleway crossing Dilly's Bridge and connecting to Gas Lane, providing a more direct route to High Street.	£620,000	Critical	LP: Local access	Cotswold: Fairford
Fa7	E End active travel access	City Science	Provision of an active travel access from the western boundary of the Site F20A, enhancing the existing footpath the connects to E End	£0	Critical	LP: Local access	Cotswold: Fairford
Fa8	Leafield Road Crossing	City Science	Provision of pedestrian crossing connecting Site to the east of Leafield Road to the Primary School opposite.	£140,000	Critical	LP: Local access	Cotswold: Fairford

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Fa9	Leafield Road active travel route	City Science	Providing footpaths along Leafield road and a cycleway to enable active travel into town centre from Site F57A.	£0	Critical	LP: Local access	Cotswold: Fairford
Fa10	Enhancement to 76 bus service	City Science	Increase the frequency of the Stagecoach West 76 bus service to run once an hour to provide better public transport connectivity to Cirencester.	£350,000	Critical	LP: Strategic (off-site)	Cotswold: Fairford
Fa12	20mph zones	City Science	Introducing 20mph zones across Down Ampney including within development sites	£150,000	Critical	LP: On-site	Cotswold: Fairford
Fa13	Fairford-Lechlade AT Route	City Science	Segregated Cycleway on Park Street (0.3km) followed by quiet lane treatment (with physical calming measures) on Leafield Road (0.5km) followed by footway upgrade to shared space (0.4km), segregated route along Hatherop Lane (0.3km) and then again (shared) along to Slothop Road (2.2km) followed by enhanced of a bridleway (1.6km) finally quiet lane treatment on Hambidge Lane (2.7km). Cost is additional to Fa3	£800,000	Essential	LP: Strategic (off-site)	Cotswold: Fairford
K1	A429 Active travel route	City Science	The A429 is the single route currently connecting the K15 sites to Kemble centre. Provide a segregated cycleway along road to improve active travel access to key services and schools in Kemble centre, along with improved continuous footpaths.	£0	Critical	LP: Strategic (off-site)	Cotswold: Kemble
K2	Access to Old Vicarage Lane	City Science	Active travel access to the south of Old Vicarage Lane of the eastern boundary of Site K12 to allow onwards active travel access to centre of Kemble.	£0	Critical	LP: Local access	Cotswold: Kemble
K3	Church Road active travel	City Science	Improvements to active travel along Church Road for Site K12. This includes active travel access to site boundary on Church road, continuous footways and possible exploration of a quiet lane on Church Road with lower speed limits and signage to improve mixed use of road for cycling.	£250,000	Critical	LP: Local access	Cotswold: Kemble
K5	Improved A429 crossing facilities	City Science	Improved active travel crossing facilities to allow active travel access from Site K12 to access Station Road, for onwards access to Kemble Station.	£100,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
K6	Station Road active travel	City Science	Improved pedestrian footways and cycleways along Station Road to promote active travel access from Sites K12 to Kemble Station	£120,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
K8	Kemble station improvements	GCC (LTP)	Package of improvements including improving accessibility at the station with step free bridge, cycle parking etc.	£2,500,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
K21	Anti-Ratrunning Measures on Unnamed Road between A429 and A433	City Science	Minor alterations including speed interventions and no left turn into it from A429 and no right turn into it from A433 in order to stop traffic using to avoid A429/A433 junction	£10,000	Critical		Cotswold: Kemble
LP7	Stow-on-the-Wold Sheep Street/A429/High Street Mitigation	City Science	Change signal stages with indicative arrows at high street/Roman Rd Junctions. Signal optimisation at A429/B4068.	~£90-130k	Critical	Proposed	
LP8	Avening High Street AT Mitigation	City Science	Model suggests that Avening High Street becomes unsuitable to most people to cycle on after the local plan. Mixed traffic suitability could be restored if the speed limit is reduced to 20mph with a corresponding amount of traffic calming to ensure the design speed matches the new speed limit. The remainder of links surrounding this one are deemed unsuitable according to LTN1/20 before and after the local plan which means this stretch is unlikely to currently form part of a whole route however there are some non-road routes near by which this may cut off	£150,000	Critical	Proposed	Cotswold: Kemble
LP9	Coates AT Mitigation	City Science	Model suggests that cycling on the Trewsbury Road becomes unsuitable for most people due to increased traffic volumes. Caveat: At present all the surrounding rounds into Coates are current deemed to be unsuitable for most cyclists and this is unlikely to block a route. Solutions include implementing a one way system around coates to allow for cycle lanes and/or speed reductions.	£150,000	Essential	Proposed	Cotswold: Kemble
LP10	B4040/B4696	City Science	Signal Optimisation	£10-50k	Essential	Proposed	In Wiltshire
LP16	Willersey AT Flag	City Science	Willersey Leamington Road and Main Street because unsuitable for cycling due to increased traffic. 20mph speed limit would resolve this.	£10,000	Critical		North Cotswold
K10	Kemble - Cirencester cycleway	GCC (LTP)	Reuse of former rail route as a cycleway connecting Kemble and Cirencester for access to employment and education.	£2,000,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
K12	Kemble to Tetbury Service bus service	City Science	New bus service connecting town centre of Kemble, developments Sites and Tetbury, along A439, Oxleaze Road and A433. Modelling suggests 100-200 passengers a day	£400,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
K13	On site provision of services	City Science	Sites require on-site provision of key services such as retail and healthcare as there are minimal key services available in Kemble.	£0	Critical	LP: On-site	Cotswold: Kemble
K14	Windmill Road AT Mitigation	City Science	Flag identifies cycling may become unsuitable for most people as a result of increased traffic flow. At present the road is functionally not a full two-way street due to parking on the street. Mitigation could involve removing on street parking given most houses have drives to accommodate segregation	£160,000	Critical	Proposed	Cotswold: Kemble
K15	Kemble to Ewen Cycle Mitigation	City Science	Model suggests that local plan traffic will make Windmill Road, School Road to Ewen no longer 'suitable for most people'. Mitigation involves shared pathway and reduction to 40mph	£1,100,000	Essential	Proposed	Cotswold: Kemble
K20	20mph zones	City Science	Introducing 20mph zones across all streets in Kemble, including within the development sites.	£150,000	Critical	LP: Strategic (off-site)	Cotswold: Kemble
Mic2	Site Active Travel Connections and wider offsite improvements to car-free routes	City Science	Active Travel only connections to the public park to provide attractive active travel routes within Mickleton. At present the paths within the park are not sufficient for cycling and so upgrade of widths for a shared pathway or separate cycling routes would be required	£50,000	Critical	LP: Local access	Cotswold: Mickleton
Mic3	Long Marsdon Road Active Travel Connection	City Science	Cycleway and/or Shared Pathways along Long Marsdon Road to facilitate segregated access to National Cycleway 5 route featuring a fully car-free travel route to Stratford-Upon-Avon the distance being approximated 12-14km/ 7.5-8.5 mi within the distance that some may commute especially if coupled with targeted e-micromobility interventions.	£3,500,000	Important	LP: Strategic (off-site)	Cotswold: Mickleton
Mic5	Mickleton Local Centre and Services Hub	City Science	At present that are limited services within Mickleton itself. Providing a local hub including some GP services, Schools and Retail offerings and mobility hub	£0	Critical	LP: On-site	Cotswold: Mickleton
Mic6	Improved Bus Services Mickleton to Moreton-in-Marsh	City Science	Current services offer routes to Stratford-Upon-Avon, Chipping Campden and Moreton-In-Marsh. Frequency is approximately every one to two hours with early and late travel options available. No services exist to nearby Evesham. This intervention would look at improving frequency of the current offering whilst also adding connections to Evesham in line with new population. Nearby Warwickshire also has some sites nearby in REG18 so there is potential for collaboration.	£400,000	Critical	LP: Strategic (off-site)	Cotswold: Mickleton
Mic8	Mickleton to Ebrington Primary School AT Flag	City Science	Baker's Hill, Hidcote Road are expected to become unsuitable to cycle. Part of the route sits on the existing national 42 cycle route. Mitigations that could be effective at retaining the cycle routes suitability include: 20mph along the stretch with included enforcement however this is unlikely to be viable across such a long stretch of rural road therefore share pathway segregation utilising bridleway for some of it.	£2,000,000	Essential	Proposed	Cotswold: Mickleton

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Mic9	Mickleton to Willersey speed route treatment	GCC (20mph Speed Work)	Reduction of Willersey Speed Limit to 20mph and "route treatment" to Mickleton. Could be potentially extended into Mickleton.	£0	Important	LP: Strategic (off-site)	Cotswold: Mickleton
Mic11	20mph zones	City Science	Introducing 20mph zones across all streets in Mickleton, including within the development sites.	£150,000	Critical	LP: Strategic (off-site)	Cotswold: Mickleton
Mo1	Moreton-in-Marsh to Bourton-on-the-Water via Stow-on-the-Wold	City Science/GCC LCWIP	An LTN1/20 compliant route from Moreton-In-Marsh to Bourton-on-the-Water via Stow-in-the-Wold. This route can either be in the form of a segregated addition to the Fosse Road or along the routes identified in the GCC countywide LCWIP (Evenload Road-Chapel Street-Ex railway alignment). The latter was estimated to need ~1-2million to deliver and the latter is assumed	£2,000,000	Essential	Proposed	Cotswold: Moreton-In-Marsh
Mo2	Blenheim Meadow AT routes upgrade	City Science	Upgrading the traffic-free paths through Blenheim Meadow to be suitable for cycling. Current paths cycling is not allowed and there are key barriers along the route. Upgrading these including widening and removal of barriers/gates will allow the developments further away from the centre to use cycling to access the town centre and railway station.	£250,000	Critical	LP: Local access	Cotswold: Moreton-In-Marsh
Mo3	A44 Corridor Active Transport Route	City Science	From edge of Fire Service College Site to High Street roundabout on A44. A combination of measures including a shared pathway or pathway and cycleway up to the junction with Evenload Road where geometric constraint may need a different approach e.g. speed limit reductions or alternative routing.	£1,500,000	Critical	LP: Local access	Cotswold: Moreton-In-Marsh
Mo4	Southern Moreton greenway	City Science	Footpaths HMM8 and HMM18 to be upgraded to shared green way and options explored to facilitate onwards routing in a low traffic environment, possibly through allotments and through quiet East Street. Facilitating traffic free travel from southern sites to town services.	£1,000,000	Critical	LP: Local access	Cotswold: Moreton-In-Marsh
Mo5	Moreton-in-Marsh to Cheltenham BRT	WSP/GCC	BRT Route C09/C08 Moreton-in-Marsh to Cheltenham	£3,500,000	Essential	BAU+	Cotswold: Moreton-In-Marsh
Mo8	Moreton-in-Marsh Transport Hub, parking and road space reallocation	City Science/Moreton-in-Marsh Neighbourhood Plan	Moving the predominant parking away from the High street to free up capacity on the road for other uses including any road adjustments required and a higher focus on placemaking activities and improved Active Travel facilities. It could include utilisation of parking pricing to further dis-incentivise the use of private vehicles. Includes "Park and Stride" facilities.	£2,000,000	Critical	BAU+	Cotswold: Moreton-In-Marsh
Mo9	On-site services	City Science	On-Site provision of key services such as retail and healthcare.	£0	Critical	LP: On-site	Cotswold: Moreton-In-Marsh

Option ID	Short title	Source	Description	Indicative High Level Cost	Evaluation of Intervention Importance to Local Plan	Status	Growth Area/Strategic Site
Mo10	Moreton-in-Marsh New Road	GCC/CDC/WSP	South easten portion of the link road around Moreton-in-Marsh to the East in an attempt to move through traffic and some development traffic away from currently constrained double roundabout. In order to remain inline with the vision to not induce increased car use this should include a wider array of measures including the potential to be car capacity neutral by e.g. pedestrianising or semi-pedestrianising the high street.	???	Critical	Proposed	Cotswold: Moreton-In-Marsh
Mo12	Moreton-In-Marsh to Chipping Campden Greenway	City Science	A quiet street and infrastructure approach to delivering a car-lite route from Moreton-In-Marsh to Chipping Campden. This largely would be upgrades the current 442 national cycle route and could include closure/one-way/speed treatments on one leg of the triangle near Batsford, work on the crossing at station road and lanes or shared pathways along areas of the road that can facilitate it. Alternatively a route could be pursued through upgrading of Rights of Way footpaths along the railway line via Paxford - this route is flatter but may be harder to deliver. Also to note that it opens up railway access for Chipping Campden including sites being	£1,000,000	Essential	LP: Strategic (off-site)	Cotswold: Moreton-In-Marsh
Mo13	Moreton-In-Marsh to Shipston-on-Stour Cycleway	City Science	Greenway from Moreton-in-Marsh to Shipstone-on-the-Stour. This could utilise the verge to make a shared pathway along Todenham Street and joining to an upgraded Bridleway to Shipston-on-Stour. It should be noted that there may be grounds for cross-collaboration over the border with development along this route	£1,500,000	Essential	LP: Strategic (off-site)	Cotswold: Moreton-In-Marsh
Mo16	Evenlode Improvements	City Science	Currently part of the National 48 and the 442 cycle routes and all cyclists are expected to mix with general traffic. The high amount of additional traffic from developments along the route means that cycling is likely to become unsuitable for most people. It is likely that to remain suitable some form of segregation is likely to be required. There is a marginal possibility that limiting speed along the road to 20mph as well with measures to decrease or reroute traffic may retain the route as suitable for some people	£350,000	Critical	LP: Local access	Cotswold: Moreton-In-Marsh
Mo17	Moreton-in-Marsh Station Improvements	City Science	Upgrades to the facilities of the station in line with high patronage including better active travel connections.	£3,500,000	Critical	LP: Strategic (off-site)	Cotswold: Moreton-In-Marsh
Mo18	20 mph zones	City Science	Introducing 20mph zones across Moreton-in-Marsh (excluding A44 and A429)	£150,000	Critical	LP: Strategic (off-site)	Cotswold: Moreton-In-Marsh

Cotswold: Mickleton	1214
Cotswold: Fosse Farm	1152
Cotswold: Fairford	1094

Criteria	Red	R/A	Amber	A/G	Green
Impact	See figure below		See figure below		See figure below
Acceptability	Strong public opposition likely		Generally acceptable, with some concerns		Strong public and stakeholder support expected
Feasibility	Significant technical barriers; delivery is unlikely / very difficult		Technically feasible, but with identifiable constraints or engineering challenges		Technically straightforward with no significant feasibility constraints
Timeliness	Delivery unlikely to occur when needed		Can be delivered near to the time it is needed		Can be delivered before the intervention is needed
Capital cost	Very high capital cost (over 30m)		Moderate capital cost (£1m to £2 m)		Very low capital cost (under £75k)
Affordability	Funding highly unlikely (or low value for money)		Funding possible, subject to conditions		Funding highly likely or already identified
Alignment	Little/no alignment, potential conflicts		Broad alignment but limited or indirect contribution		Strong alignment and clear contribution to priorities

Cotswold Objectives

Meeting needs locally	Healthier & greener transport	Harmonious places	Safe & resilient networks	Attractive & viable public transport
Most day-to-day journeys are within walking and cycling distance.	Most last-mile deliveries by sustainable modes.	Existing built and natural environments are protected	Vision Zero for road safety within developments.	Public transport provides good connections to key services & opportunities
Close proximity to local services & facilities	Safe, attractive and inclusive access local services by sustainable modes of travel	Good air quality in developments & surrounding communities	People are not concerned over their personal safety in public places including on public transport	Journeys by public transport are reliable, inclusive & safe
Places reimagined for people and put the needs of people first.	Most car journeys are made in electric vehicles.	Convenient, safe & inclusive access to green spaces.		A high share of longer journeys are made by public transport
Full access to superfast internet and online services	Sustainable travel options are the natural choice for visitors	New transport infrastructure enhances the quality of the built environment and does not dominate the landscape.	Infrastructure & services within developments are resilient to extreme weather evens	Commercial viability of public transport is enabled through development densities.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WCAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

Contract

JBA Project Manager	Mike Williamson BSc MSc CGeog FRGS EADA

JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction via email dated 28 May 2026. The Client's representative for the contract was Joanne Corbett of Cotswold District Council. Laura Thompson-Jones and Freya Nation of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken between June and July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

1 Introduction

A Level 2 Strategic Flood Risk Assessment (SFRA) is required by Cotswold District Council (CDC) as all identified potential development sites cannot be allocated outside the areas of medium and high fluvial and / or surface water flood risk, as identified through the Level 1 SFRA (2026).

The Level 1 SFRA entailed the flood risk screening of 173 potential development site allocations across the Cotswold authority area. Of these, 34 were shown to be at medium or high flood risk from fluvial and or surface water sources yet considered important to the Council's new Local Plan. A Level 2 SFRA scoping study was undertaken in June 2026. As part of the scoping study, 22 sites were identified to require a detailed Level 2 SFRA assessment, with the remaining 12 sites identified to be at nominal risk. For these sites, a brief assessment of risk has been undertaken and included in a nominal risk report.

This Level 2 SFRA consists of the following documents:

- This main report introducing and summarising the Level 2 SFRA processes and methodologies,
- 22 detailed site assessment reports,
- A nominal risk report covering the 12 sites shown to be at nominal risk of flooding.

This Level 2 SFRA has been prepared with full consideration of the latest government and Environment Agency (EA) guidance on flood risk and planning policy, namely:

- National Planning Policy Framework (NPPF) 2025,
- Flood Risk and Coastal Change Planning Practice Guidance (FRCC-PPG) 2025,
- How to Prepare a Strategic Flood Risk Assessment guidance 2026,
- Strategic Flood Risk Assessments A Good Practice Guide 2021, and
- Flood Risk Assessments: Climate Change Allowances 2022.

1.1 SFRA future proofing

At the time of writing, this Level 2 SFRA has assessed and considered flood risk in the Cotswold authority area using available data at a specific point in time. The Level 2 SFRA has been future proofed as far as possible, though the reader should always confirm with the source organisation (CDC) that the latest information is being used when decisions concerning development and flood risk are being considered.

At the time of writing, the proposed reforms and further changes to the NPPF are ongoing. The consultation window closed on 10 March 2026. The draft consultation version contains amendments to the structure of the NPPF, in addition to additional changes to reflect the recent updates to the Flood Risk and Coastal Change Planning Practice Guidance (FRCC-PPG). The FRCC-PPG (September 2025), alongside the NPPF (February 2025), is referred

to throughout this SFRA, being the current primary development and flood risk policy and guidance available at the time of finalisation of this SFRA.

The EA's SFRA guidance states a review of an SFRA should be carried out when there are changes to:

- The predicted impacts of climate change on flood risk,
- Detailed flood modelling - such as from the EA or Lead Local Flood Authority (LLFA),
- The local plan or relevant local development documents,
- Local flood management schemes,
- Local flood risk management strategies, and
- National planning policy or guidance.

The SFRA should also be reviewed after a significant flood event. It is in an authority's interest to keep the SFRA as up to date as possible. Ideally, the SFRA should be kept as a 'live' entity and continually updated when new information becomes available. The EA requests for reports and maps to be published online and be easily updatable, when required.

2 Level 2 SFRA requirements

The aim of a Level 2 SFRA is to build on the findings of a Level 1 SFRA, focussing on identified sites or communities at high and medium flood risk that are considered important to Local Plan development. This allows the SFRA process to be time efficient using detailed modelling techniques only where they are required in the Level 2 assessment. These locations usually include significant development and / or regeneration areas that are at medium or high risk of flooding from main rivers, ordinary watercourses, the sea, or surface water whilst also accounting for the impacts of climate change. Flood risk data such as modelled flood extents, depths, velocities and hazards are used to assess the suitability of these areas for development. Appropriate mitigation techniques and sustainable site layouts can then be informed.

This detailed information should support further application of the sequential test, the sequential approach to development management, inform on whether sites can pass the exception test, where applicable, and allow for flood risk indicators to be produced for use in the Sustainability Appraisal of the Local Plan.

EA guidance states a Level 2 SFRA should:

- *"Be detailed enough for you to identify which development allocation sites have the least risk of flooding,*
- *Contain the information needed to apply the exception test, if relevant,*
- *Enable you to decide if development can be made safe without increasing flood risk elsewhere."*

It should allow the local planning authority to:

- *"Apply the sequential test by identifying the severity and variation in risk within medium and high flood risk areas,*
- *Establish whether proposed allocations or windfall sites, on which your local plan will rely, are capable of being made safe throughout their lifetime without increasing flood risk elsewhere,*
- *Apply the exception test, where relevant."*

A site-specific flood risk assessment (FRA) will be required at the planning application stage which will assess risk to each site in greater detail than this Level 2 SFRA. The Level 2 SFRA is a strategic assessment that is not intended to replace the requirements of a site-specific FRA.

2.1 Objectives

In accordance with the latest national planning policy and flood risk guidance, the requirements of CDC, and with consideration of the limitations stated in Chapter 5, the key objectives of this Level 2 SFRA are stated below. These objectives are met in the individual Level 2 SFRA site reports, where applicable.

- Assess present day flood risk from all sources (fluvial, surface water, groundwater, sewers, canals, and reservoirs),
- Assess the impacts of climate change on fluvial and surface water flood risk,
- Document residual risk, including locations potential defence breaches and culvert blockages, where applicable,
- Assess detailed modelled outputs including flood depths, velocities, and hazards, where information is available,
- Assess existing flood warnings and alerts and advise on required emergency planning procedures and safety of potential site access and escape routes in times of flood,
- Account for the potential cumulative impacts of development,
- Provide site-specific advice on mitigation options i.e. developable / non-developable areas; blue / green infrastructure and open spaces; maintenance of fluvial and / or surface water flow routes and topographic depressions; land raising and compensatory storage; advice on minimum finished floor levels; and appropriate SuDS techniques,
- Assess any catchment-wide or strategic solutions, e.g. upstream opportunity areas for flood management (storage solutions) to mitigate against the risk of flooding downstream and elsewhere using Natural Flood Management (NFM) and Working with Natural Processes (WwNP) datasets,
- Demonstrate whether the second part of the exception test (part b) can be passed for the potential development site allocations, where applicable,
- Provide recommendations for additional and future work requirements following on from or to supplement the Level 2 SFRA i.e. further fluvial or surface water modelling including for climate change, modelling of site layout / design options including provisions for safe access and escape routes, development optioneering (land raising, compensatory storage, flow routes / rates), groundwater assessments, drainage strategies, site-specific FRA requirements.

3 Available data and information

The data and information described in this chapter has been used in the Level 2 SFRA to assess the risk to each site.

3.1 EA models

The following local detailed EA flood models have been used within this assessment:

- Daglingworth 2016 model
- Thames (MRL to St Johns) 2014 model
- Churn (Baunton to Siddington) 2011 model

3.2 EA open data

Additional to the EA modelling information, the following datasets available from the EA's Open Data have been considered in the Level 2 SFRA:

- Most recent LIDAR digital terrain model (DTM) data
- Flood Map for Planning Flood Zones 2 and 3
- Flood Map for Planning Water Storage Areas (note: the potential storage areas at Baunton and Abbey Way and South of Abbey Way Bridge have been removed from the Cotswold Local Plan. However, these areas remain within the functional floodplain).
- Flood Map for Planning - Surface Water Spatial Planning Flood Extents for 3.3%, 1%, 0.1% and 1% Annual Exceedance Probability (AEP) present day events
- Flood Map for Planning - Surface Water Spatial Planning Flood Depths for 3.3%, 1%, 0.1% and 1% Annual Exceedance Probability (AEP) present day events
- Flood Map for Planning - Surface Water Spatial Planning Flood Extents for 3.3%, 1%, 0.1% and 1% Annual Exceedance Probability (AEP) climate change (2070s 'Upper End' allowance) events
- Flood Map for Planning - Surface Water Spatial Planning Flood Depths for 3.3%, 1%, 0.1% and 1% Annual Exceedance Probability (AEP) climate change (2070s 'Upper End' allowance) events
- Third generation Risk of Flooding from Surface Water (RoFSW) hazards for 3.3%, 1% and 0.1% AEP events
- Spatial Flood Defences
- Historic Flood Map
- Recorded Flood Outlines
- Flood Warning Areas
- Flood Alert Areas
- Reservoir Flood Map
- Working with Natural Processes:
    - Riparian Woodland Potential

- Wider Catchment Woodland Potential
- Floodplain Woodland Potential
- Floodplain Reconnection Potential
- Runoff Attenuation Features 3.3% AEP
- Runoff Attenuation Features 1% AEP.

3.3 Other datasets

Other datasets and information used include:

- JBA 5m Groundwater Emergence Map,
- Functional floodplain dataset - as updated through the Level 1 SFRA (2026),
- OS MasterMap Water Network
- OS OpenMap Local base mapping
- LLFA flood incident records
- Thames Water historic flood incidents record
- Severn Trent Water historic flood incidents record
- British Geological Survey (BGS) Geology 625k dataset

4 Methodology

This chapter presents the methodology used in each stage of the Level 2 SFRA. The site-specific reports contain further information.

4.1 Assessing fluvial flood risk

Flood risk from fluvial sources is assessed using the most recent version of the EA's Flood Map for Planning (downloaded May 2026), and the EA's detailed local models, namely the Daglingworth 2016, Thames (MRL to St Johns) 2014, and Churn (Baunton to Siddington) 2011 models.

4.1.1 Functional floodplain

The functional floodplain was updated through the Level 1 SFRA and is assessed at each site, where applicable. Note: the potential storage areas at Baunton and Abbey Way and South of Abbey Way Bridge have been removed from the Cotswold Local Plan. However, these areas remain within the functional floodplain.

4.1.2 Climate change

EA SFRA guidance states that the SFRA should assess the effects of climate change on all sources of flooding, including the functional floodplain, to help inform the sequential approach to development. For rivers, the central allowance for the 2080s is recommended for assessment in SFRAs, as stated in the EA's Climate Change Allowance Guidance.

Each EA model domain is located within the Gloucestershire and the Vale management catchment. The percentage uplift on peak flows for the central allowance (2080s) in this catchment is 26%. However, the modelled climate change allowance in each model includes for a 30% uplift for the 1% AEP event, which reflects the required uplift for the Cotswold management catchment. The modelled climate change outputs may therefore be underestimating future risk.

Table 4-1 lists the peak river flow allowances for each management catchment within Cotswold district. The modelled fluvial climate change outputs have been assessed against each potential site allocation, where applicable.

The potential impacts of climate change on the functional floodplain have also been assessed to produce a 'future functional floodplain' flood extent, as updated through the Level 1 SFRA.

Table 4-1: Peak river flow allowances for the management catchments within Cotswold district

Management Catchment	Allowance category	Total potential change (%) anticipated for '2020s' (2015 to 2039)	Total potential change (%) anticipated for '2050s' (2040 to 2069)	Total potential change (%) anticipated for '2080s' (2070 to 2125)
Cotswolds	Upper end	31	43	82
Cotswolds	Higher Central	17	21	43
Cotswolds	Central	11	13	30
Gloucestershire and the Vale	Upper end	33	43	84
Gloucestershire and the Vale	Higher Central	17	19	41
Gloucestershire and the Vale	Central	11	11	26
Avon Warwickshire	Upper end	22	31	59
Avon Warwickshire	Higher Central	12	14	32
Avon Warwickshire	Central	7	8	21
Severn Vale	Upper end	34	52	94
Severn Vale	Higher Central	20	28	53
Severn Vale	Central	14	19	37
Avon Bristol and North Somerset Streams	Upper end	27	38	71
Avon Bristol and North Somerset Streams	Higher Central	15	19	39
Avon Bristol and North Somerset Streams	Central	10	12	26

4.2 Assessing surface water flood risk

4.2.1 Extents

Surface water flood extents have been assessed using the EA's Flood Map for Planning Surface Water Spatial Planning Extents, published May 2026.

4.2.2 Depths and hazards

The Flood Map for Planning - Surface Water Spatial Planning Present Day Depths dataset has been used to assess surface water flood depths. Surface water flood hazards have been assessed using the EA's third generation RoFSW mapping, as no suitable hazard data was available at the time of undertaking this Level 2 SFRA.

4.2.3 Climate change

EA climate change guidance states that for SFRAs, the upper end allowance on peak rainfall for the 2070s should be modelled for the 3.3% and 1% AEP events. For Cotswold district, this entails the allowances as shown in Table 4-2

Table 4-2: Peak rainfall allowances for the management catchments within Cotswold district

Management Catchment	Allowance category	Total potential change (%) anticipated for '2070s' (2061 to 2125) 3.3% AEP	Total potential change (%) anticipated for '2070s' (2061 to 2125) 1% AEP
Cotswolds	Upper end	35	40
Gloucestershire	Upper end	35	40
Avon Warwickshire	Upper end	35	40
Severn Vale	Upper end	35	40
Avon Bristol and North Somerset Streams	Upper end	40	45

The EA released the Flood Map for Planning - Surface Water Spatial Planning Climate Change Extent and Depths datasets in May 2026, which includes the modelled 2070s upper end peak rainfall intensity allowances. This dataset has been used to assess the impact of climate change on surface water flooding to each site. The allowance for the 0.1% AEP event is not stated by the EA.

4.3 Residual risk

Paragraph 004 of the FRCC-PPG states the requirement in plan making to account for residual flood risks from flood risk management infrastructure. For this Level 2 SFRA, this involves the consideration of potential defence breach locations and blockage or failure of drainage assets, such as culverts.

For sites shown to be at residual risk, the FRCC-PPG includes the following information:

- Areas of residual risk should be included in the sequential approach to risk avoidance when sequential testing or through development management,
- Where avoidance is not shown to be feasible through appropriate sequential testing, flood resistance and resilience measures should be in place, including for

finished floor levels to be place above the design flood level plus a minimum of 600mm,

- Adequate flood warning and emergency plans should be available to site users. Residual risks will need to be safely managed to ensure people are not exposed to hazardous flooding. This includes the ability of residents and site users to safely access and escape a building during the design flood and to evacuate before an extreme flood event which is defined as the 0.1% AEP event with an allowance for climate change this event is not available in the EA models),
- The likelihood of defences keeping pace with climate change should be considered e.g. is funding available and what are the funding options (e.g. Community Infrastructure Levy, planning obligations / S106 agreements, or Partnership Funding). This should inform the nature of residual risk to be considered and whether new development can remain safe for its lifetime,
- Local planning authorities should use information on identified residual risk to state in strategic policies their preferred mitigation strategy for ensuring development will be safe throughout its lifetime in relation to urban form, risk management and where flood mitigation measures are likely to have wider sustainable design implications,
- A site-specific FRA will be required for all sites modelled to be at residual risk. the FRAs would need to show that appropriate emergency plans, evacuation procedures and flood response infrastructure are in place to manage the residual risk associated with an extreme flood event.

4.4 Assessing flood risk from reservoirs

The EA's SFRA guidance requests for the assessment of risk from reservoir dam failure using the EA's Reservoir Flood Map (RFM). This Level 2 SFRA assess potential reservoir flood risk in both a 'dry day' and 'wet day' scenario. The 'dry day' scenario shows the flood extents if a reservoir were to fail and release the water held when local rivers are at normal levels, whereas the 'wet day' assumes the local rivers have already overflowed their banks.

The RFM shows the credible worst-case scenarios from dam failure. If a site is shown to be at risk, the SFRA should assess if the design or maintenance of the reservoir would need improving. This will require contacting the reservoir owner(s) to ascertain the flood risk in more detail and whether the proposed development could affect the reservoir's risk designation, it's design category or how it is operated.

CDC may be required, as category 1 responders, to access more detailed information about reservoir risk and reservoir owners using the online Resilience Direct System.

4.5 Assessing flood risk from canals

The Thames and Severn Canal flows past several potential site allocations. Given canals are controlled and managed features, the risk of flooding from a canal is considered low. The recommendation therefore is for any sites located near to the Thames and Severn Canal and situated at a lower elevation, as identified in the site reports, to be subject to a

more detailed assessment at the FRA stage in consultation with the canal owner, the Cotswold Canals Trust.

4.6 Assessing risk from groundwater emergence

Susceptibility of areas to groundwater emergence is appraised using JBA's national 5m Groundwater Flood Map which is more robust than the BGS dataset. In creating this map, modelling was carried out to show how and where groundwater levels would rise following prolonged periods of rainfall, considering factors such as topography, groundwater recharge volumes and spatial variations in aquifer storage and transmission properties. The model outputs were validated against recorded groundwater levels for past flood events and checked against areas historically affected by groundwater flooding. The high-resolution maps make it easier for users to pinpoint and report risks from groundwater emergence.

4.7 Assessing risk from sewers

Thames Water provided their historic flood event register at the postcode district level. Severn Trent Water provided theirs at the unit postcode level. The site reports flag where a sewer flooding incident has occurred within the postcode district or unit. Developers should contact the relevant wastewater undertaker directly for more specific details at the FRA stage.

4.8 Assessing historic flood risk

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. Gloucestershire County Council LLFA historic flood records have also been considered. Details on historic flooding have been documented within the site-specific reports where applicable.

4.9 Access and escape routes and emergency planning

The EA's Flood Warning Areas and Flood Alert Areas have been reviewed and mapped against each potential site allocation. Potential access and escape routes have been documented for each site, identified where they are modelled to stay dry or experience non-hazardous to life flooding. Liaison with emergency planners and the local resilience forum may be required at the site-specific FRA stage.

4.10 Cumulative impacts

A joined-up approach should be adopted between developers at the FRA stage for any clusters of sites to ensure possible flood risk mitigation at one site does not increase risk to a neighbouring or downstream site as a result of loss of floodplain storage, the deflection or constriction of flood flow routes, or through inadequate management of surface water. Paragraph 049 of the FRCC-PPG states that site-specific flood risk assessments should assess cumulative impacts and demonstrate how mitigation measures have addressed

them. The site-specific reports recommend for any clusters of sites at significant risk to be combined into a wider drainage strategy and masterplanning process.

4.11 Working with Natural Processes

The EA's national Working with Natural Processes mapping dataset has been assessed as to whether there is any potential for NFM measures that could benefit potential site allocations. This includes for tree planting, enhancing floodplain connectivity and attenuation of runoff through gully blocking and other runoff attenuation features.

5 Limitations

This Level 2 SFRA has been prepared under limitations associated within the availability and quality of data. These limitations have been subject to consultation with Council officers, the EA, and the LLFA whereby alternative approaches have been agreed to enable the Level 2 SFRA to be prepared using available existing information. The limitations include the following:

- The latest available EA flood models are not up to date with the latest hydrology. Therefore, they may not be fully representative of current hydrological conditions. Model survey and digital terrain model data will also not be based on the latest information, given updates to the national LIDAR datasets in June 2026. The EA models used in the assessment are listed in Section 3.1. Any future SFRA update may look to update the EA models with the latest information that is available at the time, including up to date hydrology inputs, channel and bank survey, LIDAR terrain data, and using the latest modelling software to update and run the models. The local plan timetable and budget constraints meant the models could not be updated through this SFRA.
- The EA models do not include for the latest climate change allowances associated with the Gloucestershire and the Vale management catchment. Therefore, there may be a small underestimation in future risk in the modelled locations. The local plan timetable and budget constraints meant the models could not be updated through this SFRA.
- Several sites being assessed are at risk of flooding from rivers though a local detailed EA model is not available for a more robust assessment of the risk. Therefore, flood risk can only be assessed using the Flood Map for Planning which is based on the New National Model. Depth, hazard and velocity information is unavailable for assessment in these areas.
- The recently published Flood Map for Planning Surface Water Spatial Planning dataset does not include useable flood hazard information. Therefore, the third generation Risk of Flooding from Surface Water hazard mapping has been used as the best available information.

6 Level 2 sites screening assessment summary

34 potential development sites have been assessed through this Level 2 SFRA, as identified through the Level 1 SFRA sites screening assessment. 22 sites have been subject to detailed assessment whereby individual Level 2 site screening reports have been produced, detailing the site-specific assessments carried out through this Level 2 SFRA. 12 sites have been subject to a nominal flood risk assessment and included in a separate 'nominal risk' report. It is recommended that three of the 34 sites are not allocated, based on current flood risk information. The other 31 sites may be allocated. However, there are various requirements at the FRA stage to enable safe and sustainable development.

Table 6-1 summarises the outcomes from the Level 2 assessment at each site.

Table 6-1: Site assessment outcomes

Site reference / name	How has main risk been identified?	Summary of assessment	Main barriers to development	Can the site be allocated, based on current information?	Potential additional work at FRA stage
B56 - Land off Mallard Crescent	Flood Map for Planning	Nominal risk from surface water.	None	Yes	Drainage strategy
BK11 - Former Station Road Allotments	Flood Map for Planning	Nominal risk from surface water.	None	Yes	Drainage strategy
BK14A - The Limes, Station Road	Flood Map for Planning	Risk area from Blockley Brook should not be developed. Detailed modelling of Blockley Brook may be required	Absence of up to date model for Blockley Brook	Yes. Though risk from Blockley Brook must be confirmed at the FRA stage	Detailed modelling of Blockley Brook. Drainage strategy
C71 - Land adjacent 'Donside', off Barnway	Flood Map for Planning	EA Daglingworth 2016 model not appropriate to inform on risk. Safe access and escape may be challenging to achieve. Potential risk from ordinary watercourse	Achieving safe access and escape. Absence of up to date model for Daglingworth Stream	Yes. Though risk from Daglingworth Brook and ordinary watercourse, and safe access and escape routes must be confirmed at the FRA stage	Updated modelling of Daglingworth Stream and ordinary watercourse. Drainage strategy
CC10A - Forum, Magistrates Court, Police Station	Flood Map for Planning	Significant fluvial and surface water risk. Detailed drainage strategy required	Fluvial and surface water risk. Absence of detailed model of The Cam ordinary watercourse	Recommend against allocation	Detailed modelling of The Cam. Drainage strategy

Site reference / name	How has main risk been identified?	Summary of assessment	Main barriers to development	Can the site be allocated, based on current information?	Potential additional work at FRA stage
C164A - Land east of Kingshill Lane	Flood Map for Planning	Nominal risk from surface water. Potential risk from ordinary watercourses	Absence of modelling for ordinary watercourse	Yes. Though risk from ordinary watercourse and surface water must be confirmed at the FRA stage	Modelling of ordinary watercourse. Drainage strategy
C190 - Steadings southern extension, Cirencester	Flood Map for Planning	Nominal risk from surface water. Potential risk from ordinary watercourses	Absence of modelling for ordinary watercourses	Yes. This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Jo Corbett of Cotswold District Council. Laura Thompson-Jones of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken between June and July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Introduction

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan sites considered to be at nominal flood risk. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and read the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

This report summarises the risk from all sources of flood risk to each potential development site. There are 12 sites considered to be at nominal flood risk. 11 of the 12 sites are wholly within Flood Zone 1 of the Flood Map for Planning and are not shown to be at additional risk from rivers due to the impacts of climate change. A nominal area of site F20A, Land south-east of Fairford, is shown to be within Flood Zone 2 of the Flood Map for Planning. This area increases marginally when accounting for climate change.

None of the sites are recorded to have been shown to be at risk of flooding from reservoirs. Groundwater flood risk has been assessed using JBA's 5m Groundwater Emergence Map. Thames Water and Severn Trent Water's records of historic sewer flooding incidents have been aggregated by ward to provide an overview of sewer flood risk to each site.

Each site is at nominal risk from surface water, according to the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map. At the time of writing, the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation RoFSW hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information. Updated surface water hazard information should be confirmed at the site-specific FRA stage.

2 Site B56

Site summary	
Location	Land off Mallard Crescent
Existing site use	Paddock
Existing site vulnerability	Less vulnerable
Proposed site use	Residential
Proposed site vulnerability	More vulnerable
Site area	1.83 hectares

Figure 2-1: B56 Existing site location boundary

2.1 Surface water

The site is predominantly outside of the 0.1% AEP surface water event, based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (Figure 2-2). There is an area of ponding within the east of the site and a flow path along the eastern site boundary. Maximum flood depths within the site are between 0.3 and 0.6 m (Figure 2-3), although are mostly shallow, and hazard rating is very low in the medium risk event (Figure 2-4). The area of ponding within the east of the site should be incorporated into site design and be left as amenity green space.

Based on available information, safe access and escape routes should be available from Mallard Crescent to the north or Moor Lane to the south of the site.

Table 2-1: Existing surface water flood risk based on percentage area at risk using the Flood Map for Planning - Surface Water Spatial Planning Extent Present Day map

Less than 0.1% AEP event (%)	0.1% AEP event (%)	1% AEP event (%)	3.3% AEP event (%)

Figure 2-2: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

Figure 2-3: Flood Map for Planning - Surface Water Spatial Planning Depths (m) Present Day for the 1% AEP event

Figure 2-4: Third generation - Risk of Flooding from Surface Water map present day medium risk event surface water flood hazard[1]

2.1.1 Climate change

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change Extent map, onsite flood risk is not likely to increase significantly in the future.

2.2 Sewer flood risk

Thames Water provided their historic risk registers which were aggregated by ward. There are 37 recorded sewer flooding incidents that have occurred within the Bourton Village Ward within which the site is located.

2.3 Groundwater

Much of the site is in an area where there is a risk of groundwater flooding to both surface and subsurface assets (Figure 2-5). Groundwater conditions are likely therefore unsuited to infiltration SuDS.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

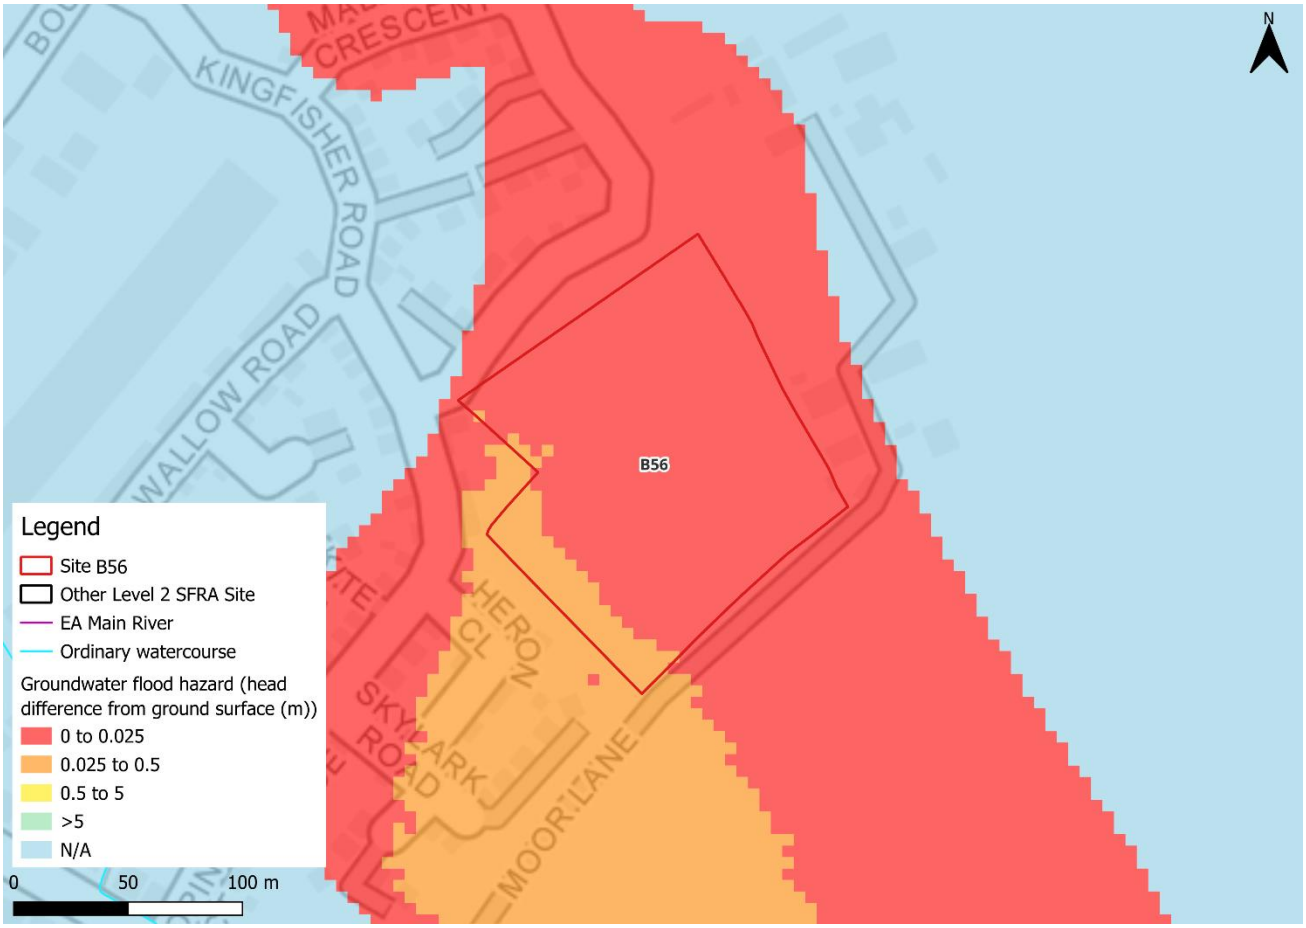

Figure 2-5: JBA 5m Groundwater Emergence Map

2.4 Summary and recommendations

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- The site is not required to pass the exception test as it is not located within Flood Zone 3a.
- The site is wholly within Flood Zone 1 and at no additional risk from climate change.
- There is no risk to the site from reservoir flooding.
- Development should be possible at this site given the low fluvial and nominal surface water flood risk to the site.
- Surface water risk is predominantly confined to the eastern site boundary, with largely shallow depths. Surface water flood hazard must be confirmed at the site-specific FRA stage.
- Onsite surface water flood risk is not likely to increase significantly in the future.
- Groundwater levels should be further investigated at the site-specific FRA stage through percolation testing in both wet and dry conditions.

- In line with LLFA guidance[2], the developer should aim to achieve greenfield runoff rates. The developer should also follow the National SuDS guidance.
- Safe access and escape routes appear to be achievable via Mallard Crescent to the north and Moor Lane to the south of the site.

2 Gloucestershire County Council LLFA Key Documents

3 Site C164A (Strategic extension to the east of Kingshill Lane)

Site summary	
Location	Land east of Kingshill Lane
Existing site use	Agriculture
Existing site vulnerability	Less vulnerable
Proposed site use	Mixed use
Proposed site vulnerability	More vulnerable
Site area	41.6 hectares

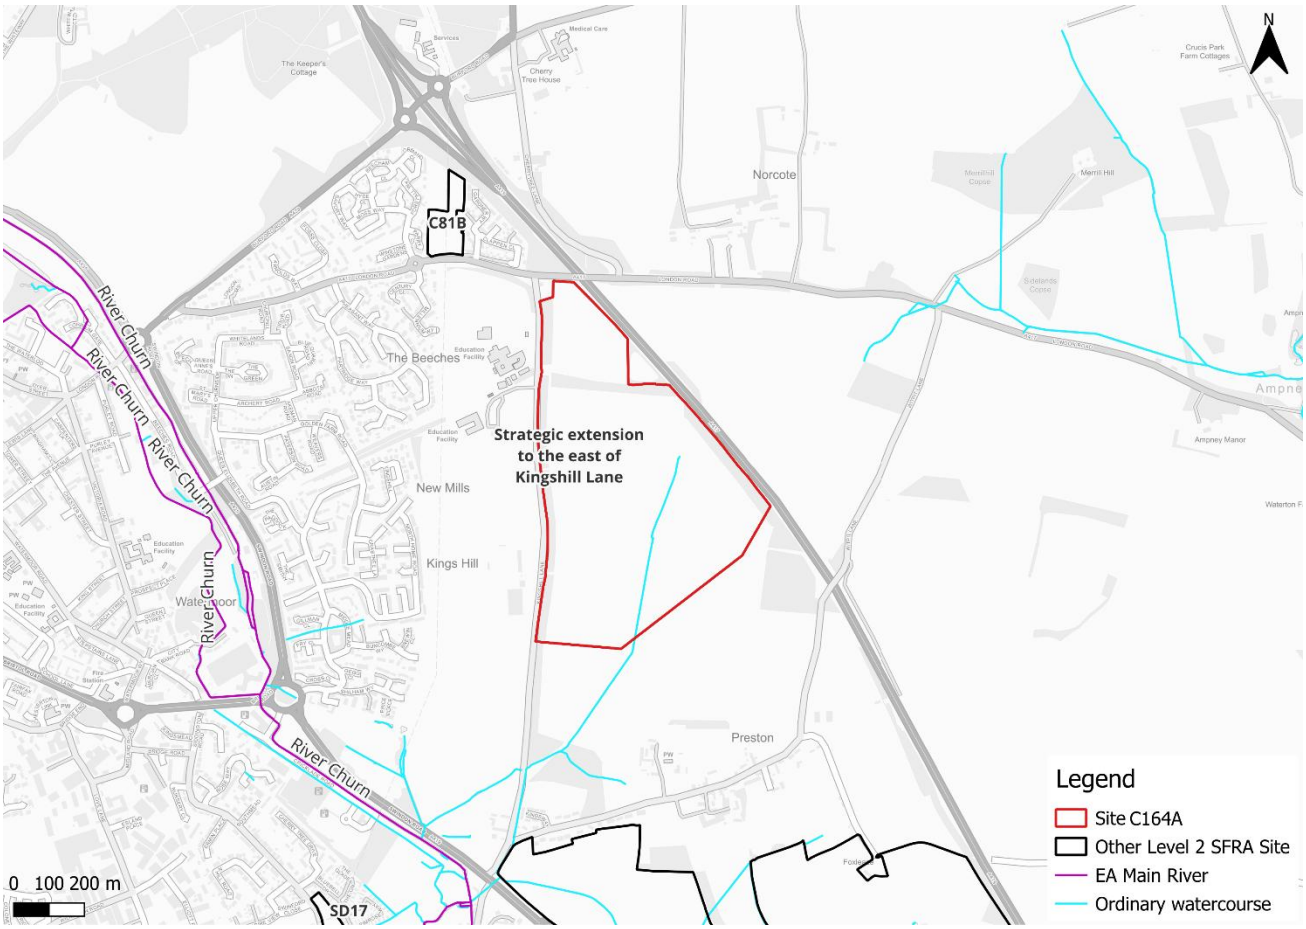

Figure 3-1: C164A Existing site location boundary

3.1 Surface water

The site is predominantly outside of the 0.1% AEP surface water event, based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (Figure 3-2). There is a flow path along a drainage ditch and areas of ponding within the southern half of the site. Maximum flood depths within the site are between 0.3 and 0.6 m (Figure 3-3), although are mostly shallow, and hazard rating (outside of the channel of the drainage ditch) is low to moderate in the medium risk event (Figure 3-4). The flow path along the drainage ditch in the southern half of the site should be incorporated into site design and be left as amenity green space.

Based on available information, safe access and escape routes should be available from Kingshill Lane to the west of the site.

Table 3-1: Existing surface water flood risk based on percentage area at risk using the Flood Map for Planning - Surface Water Spatial Planning Extent Present Day map

Less than 0.1% AEP event (%)	0.1% AEP event (%)	1% AEP event (%)	3.3% AEP event (%)
98	1	0.5	0.5

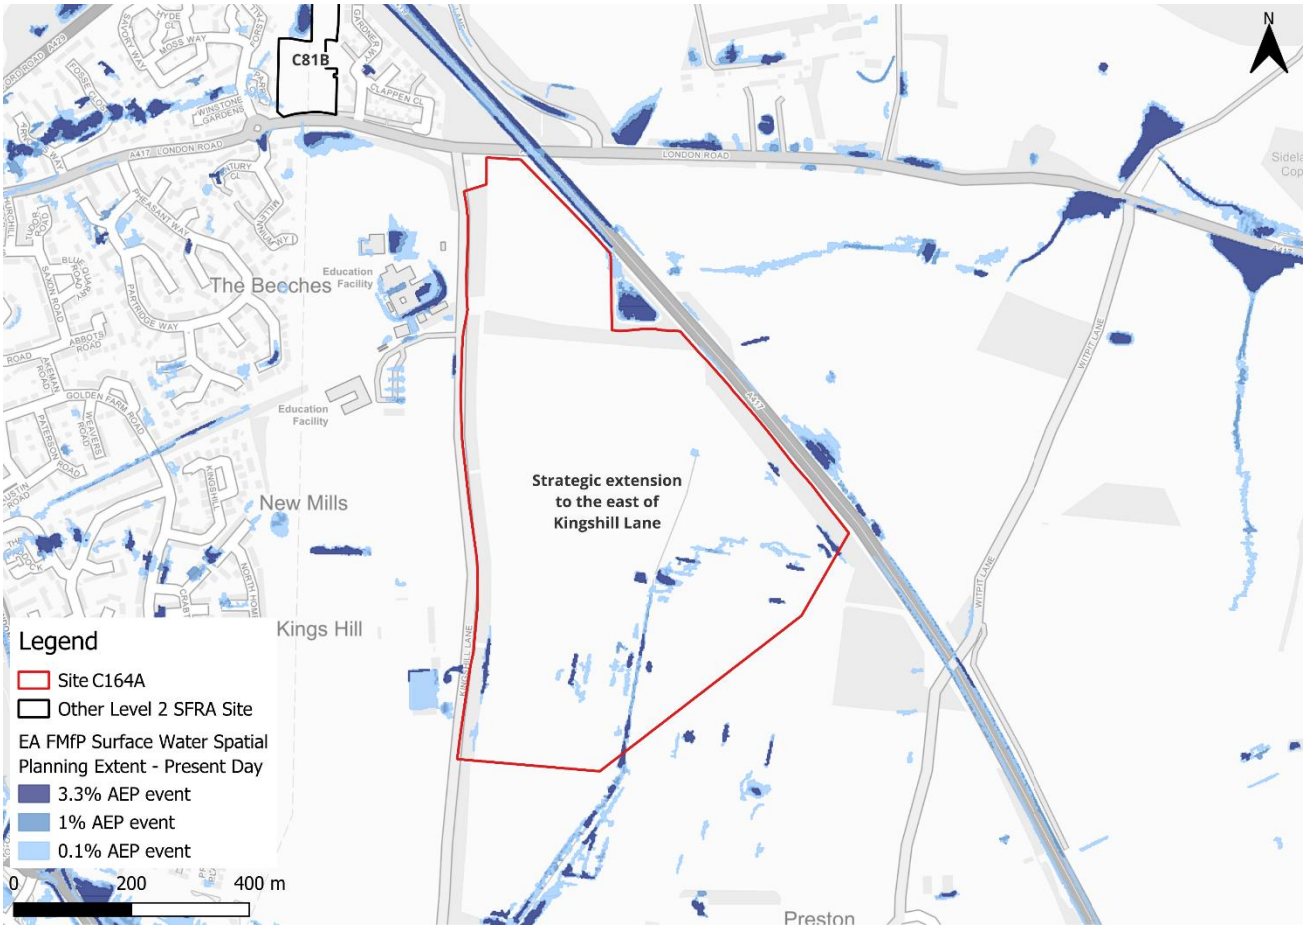

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

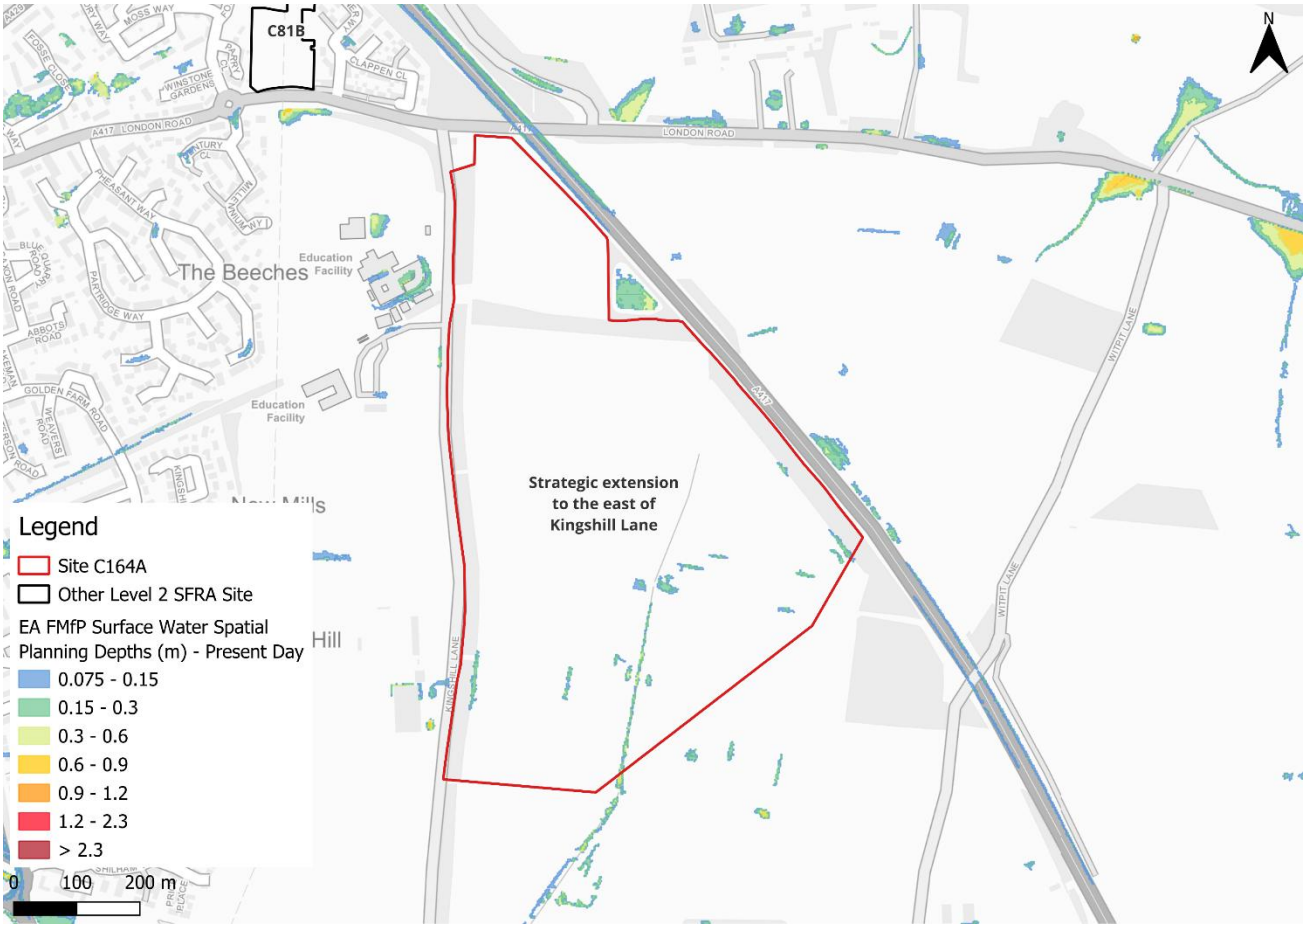

Figure 3-3: Flood Map for Planning - Surface Water Spatial Planning Depths (m) Present Day for the 1% AEP event

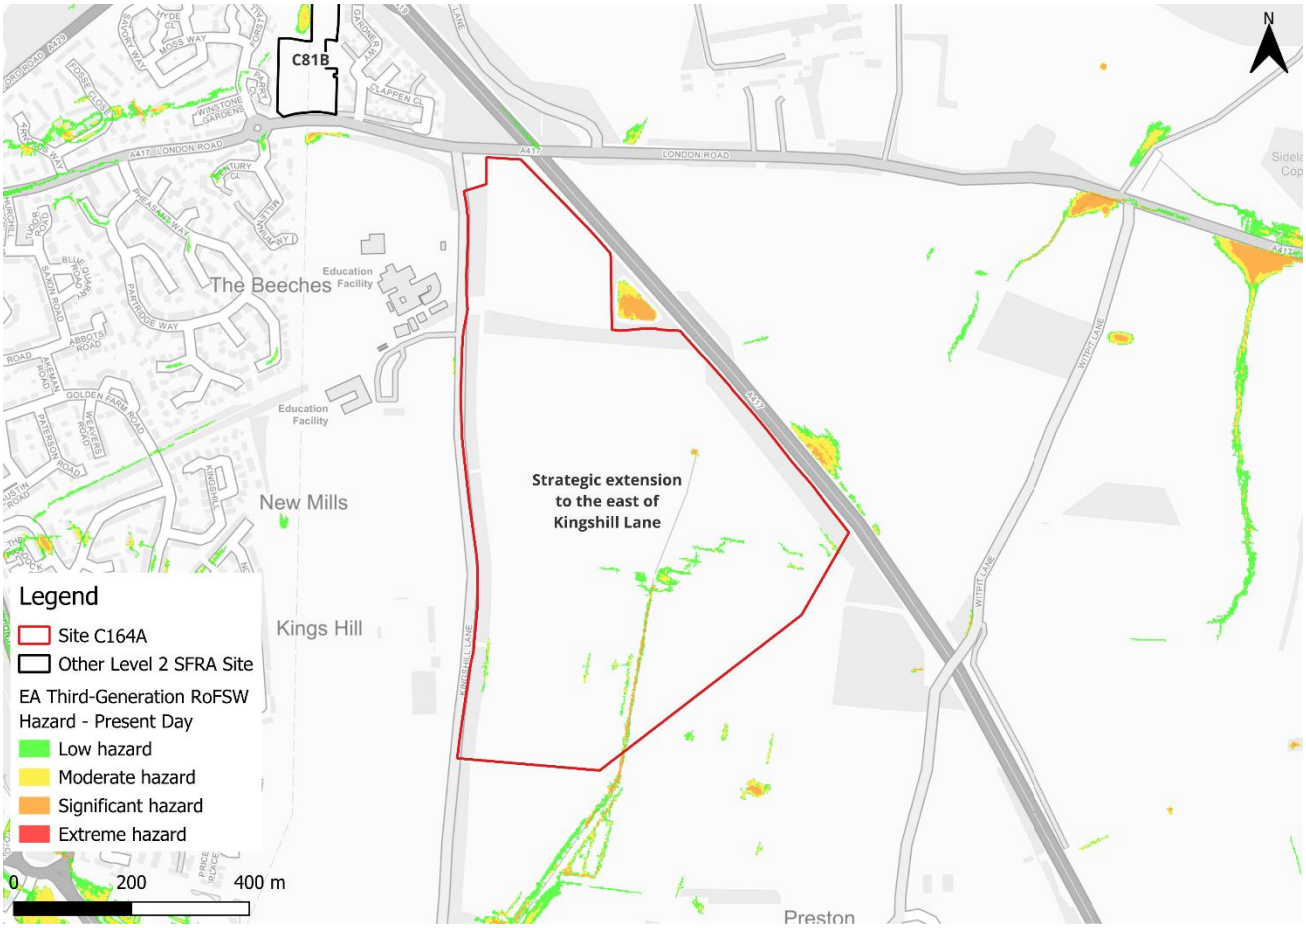

Figure 3-4: Third generation - Risk of Flooding from Surface Water map present day medium risk event surface water flood hazard[3]

3.1.1 Climate change

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change Extent map, onsite flood risk is not likely to increase significantly in the future.

3.2 Sewer flood risk

Thames Water provided their historic risk registers which were aggregated by ward. There have been no recorded sewer flooding incidents that have occurred within the Siddington & Cerney Rural Ward within which the site is located.

3 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

3.3 Groundwater

Much of the site is in an area where there no risk of groundwater flooding. The western side of the site is within an area where there is a risk of groundwater flooding to both surface and subsurface assets (Figure 3-5). Groundwater conditions are likely therefore unsuited to infiltration SuDS in the western side of the site.

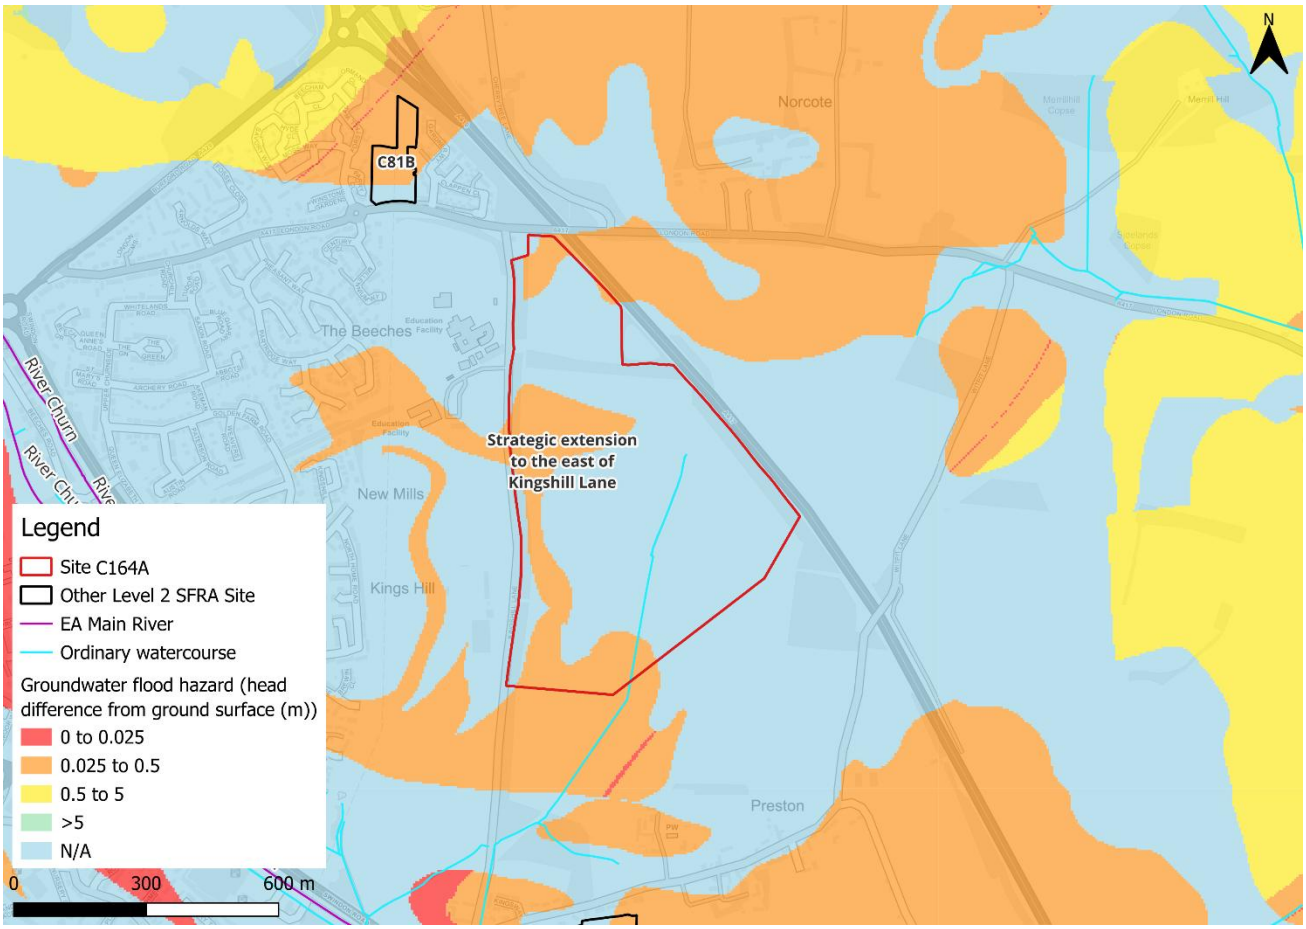

Figure 3-5: JBA 5m Groundwater Emergence Map

3.4 Summary and recommendations

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- The site is not required to pass the exception test as it is not located within Flood Zone 3a.
- The site is wholly within Flood Zone 1 and at no additional risk from climate change.
- There is no risk to the site from reservoir flooding.
- Development should be possible at this site given the low fluvial and nominal surface water flood risk to the site.
- Surface water risk is predominantly confined to the southern half of the site, with largely shallow depths. Surface water flood hazard must be confirmed at the site-specific FRA stage.
- Onsite surface water flood risk is not likely to increase significantly in the future.

- Groundwater levels should be further investigated at the site-specific FRA stage through percolation testing in both wet and dry conditions.
- In line with LLFA guidance[4], the developer should aim to achieve greenfield runoff rates. The developer should also follow the National SuDS guidance.
- Safe access and escape routes appear to be achievable via Kingshill Lane to the west of the site.

4 Gloucestershire County Council LLFA Key Documents

4 Site C190 (Strategic extension to the south of The Steadings)

Site summary	
Location	Steadings southern extension, Cirencester
Existing site use	Agriculture
Existing site vulnerability	Less vulnerable
Proposed site use	Mixed use
Proposed site vulnerability	More vulnerable
Site area	116.6 hectares

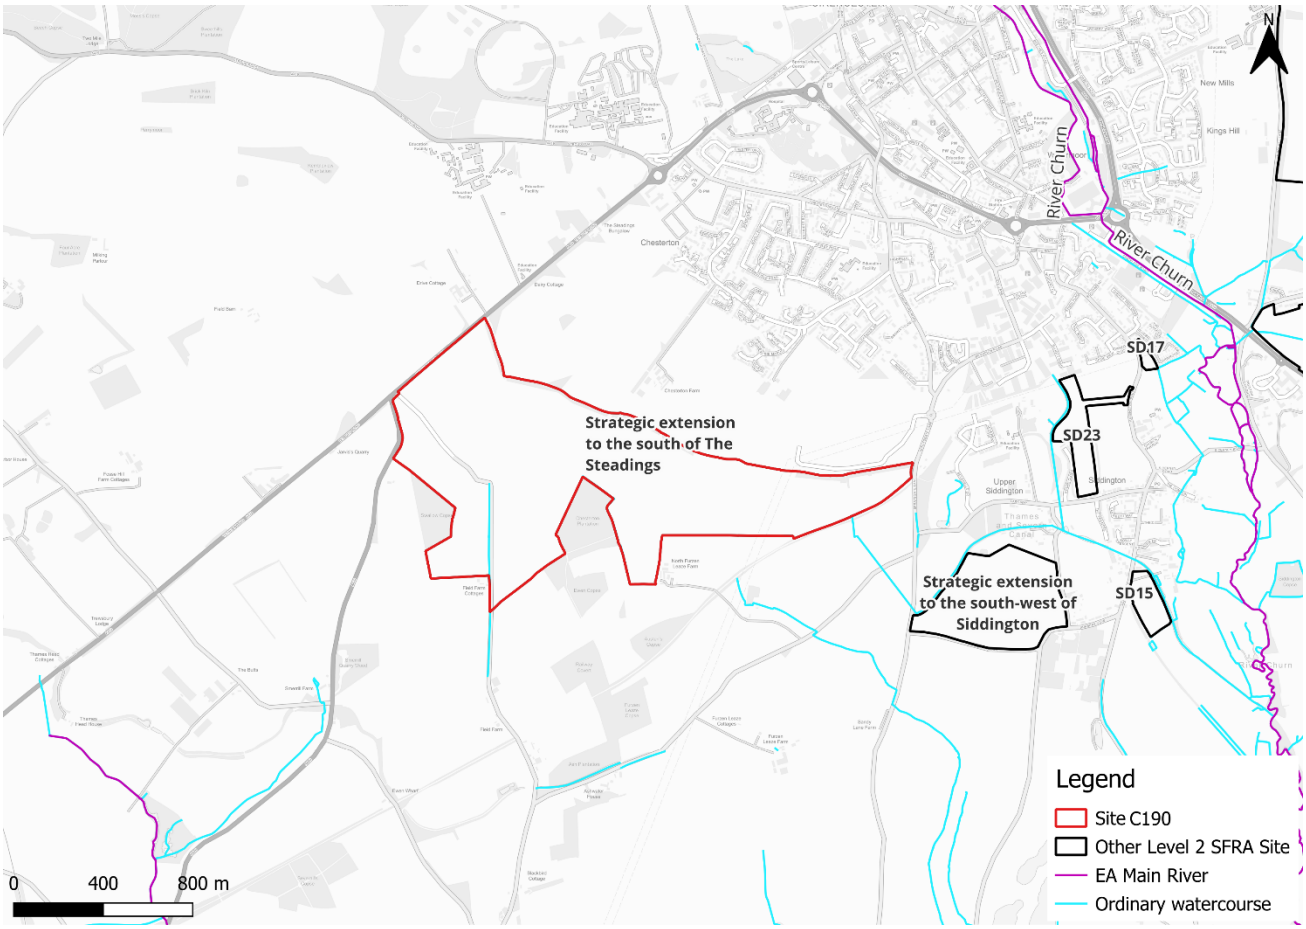

Figure 4-1: C190 Existing site location boundary

4.1 Surface water

The site is predominantly outside of the 0.1% AEP surface water event, based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (Figure 4-2). There are small areas of ponding across the site as well as a short flow path along part of the southern side boundary and through part the eastern side of the site. Maximum flood depths within the site are between 0.9 and 1.2 m, within the flow path through the eastern side of the site (Figure 4-3), although site-wide, depths are mostly shallow, and hazard rating is predominantly very low in the medium risk event (Figure 4-4). The flow path within the east of the site should be incorporated into site design and be left as amenity green space.

Based on available information, safe access and escape routes should be available from Tetbury Road to the northwest, Spratsgate Lane to the east or the track to the south of the site.

Table 4-1: Existing surface water flood risk based on percentage area at risk using the Flood Map for Planning - Surface Water Spatial Planning Extent Present Day map

Less than 0.1% AEP event (%)	0.1% AEP event (%)	1% AEP event (%)	3.3% AEP event (%)
98	1	0.5	0.5

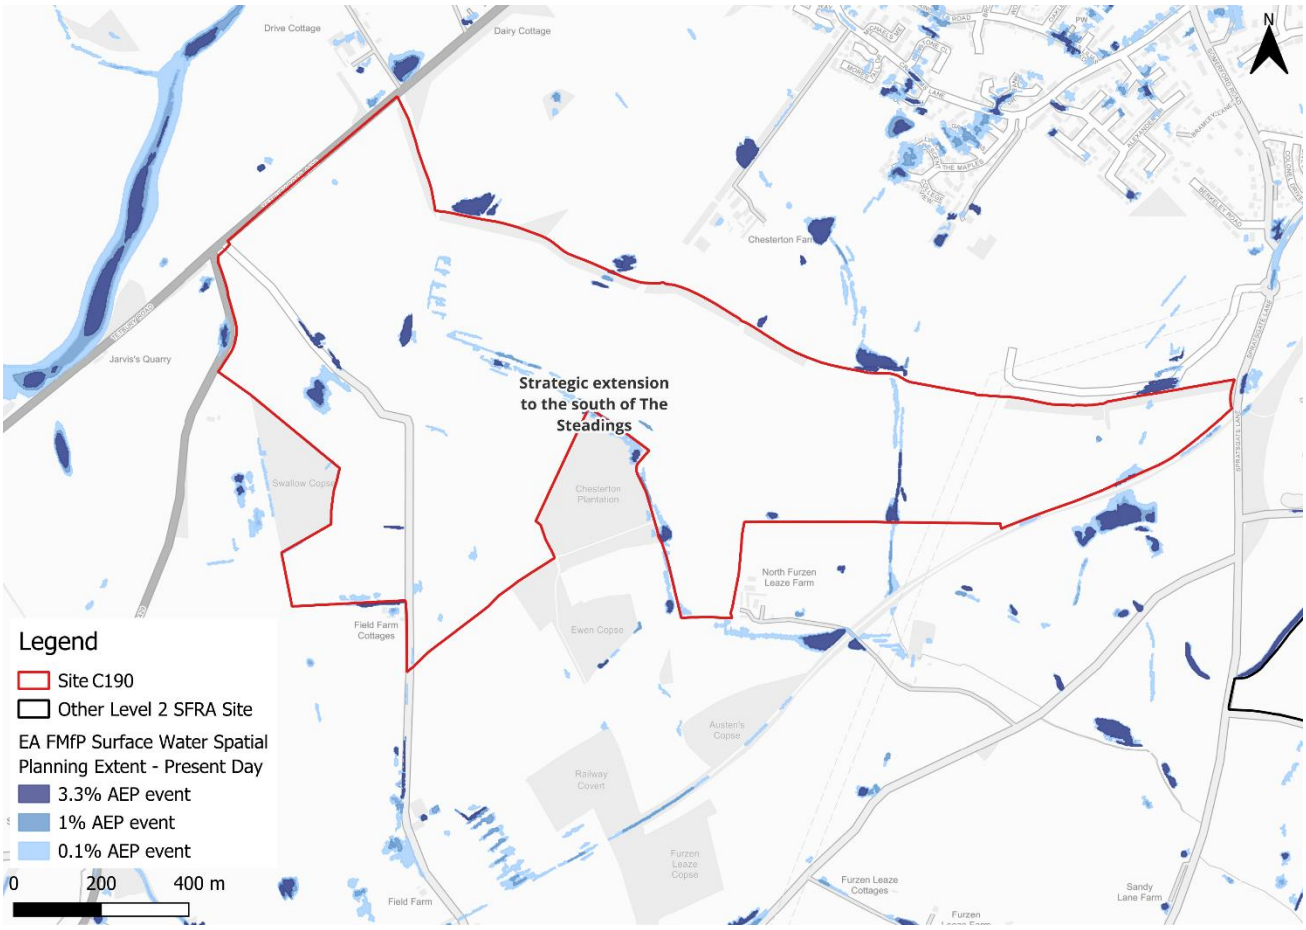

Figure 4-2: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

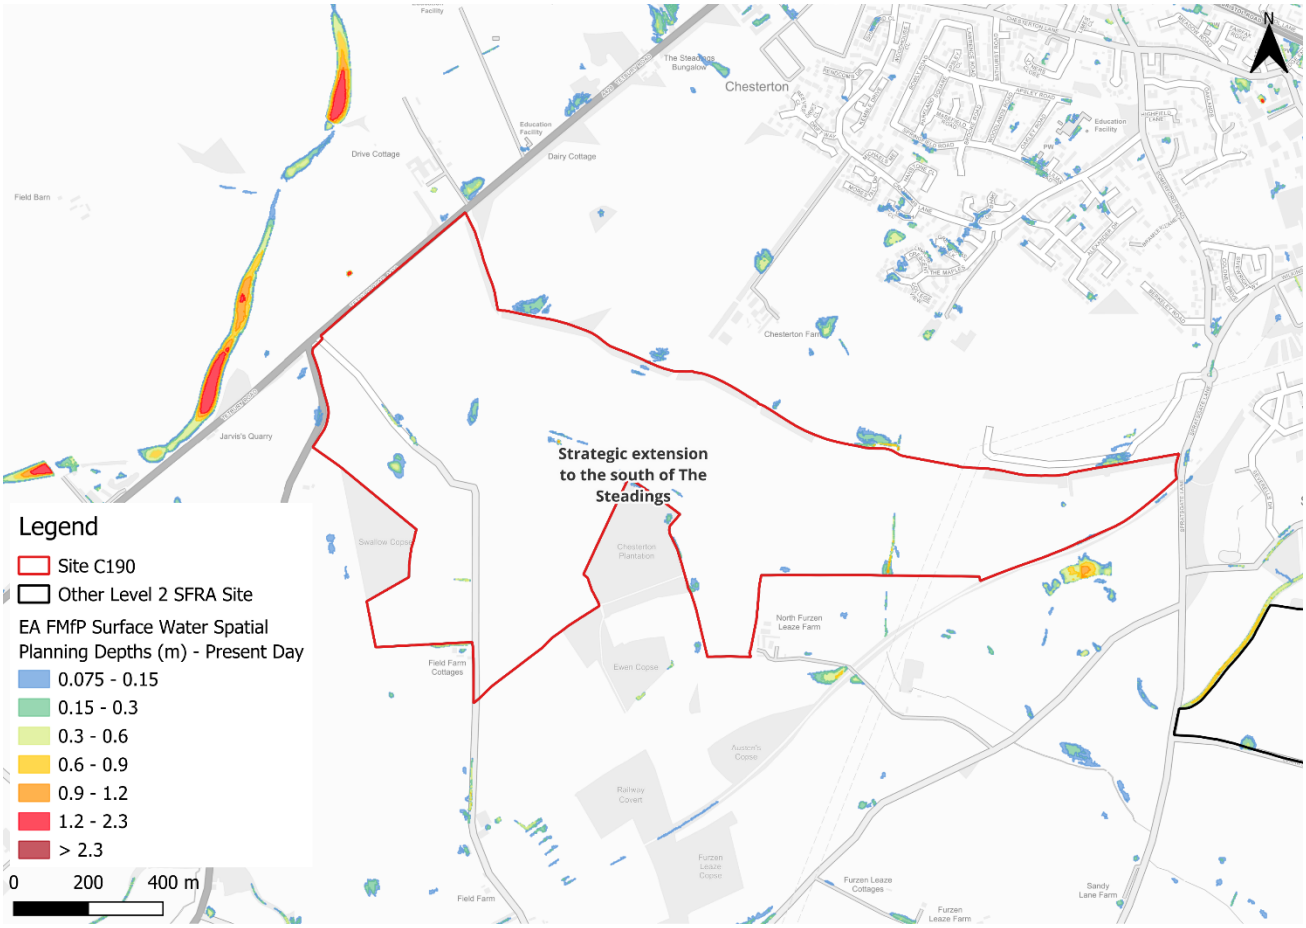

Figure 4-3: Flood Map for Planning - Surface Water Spatial Planning Depths (m) Present Day for the 1% AEP event

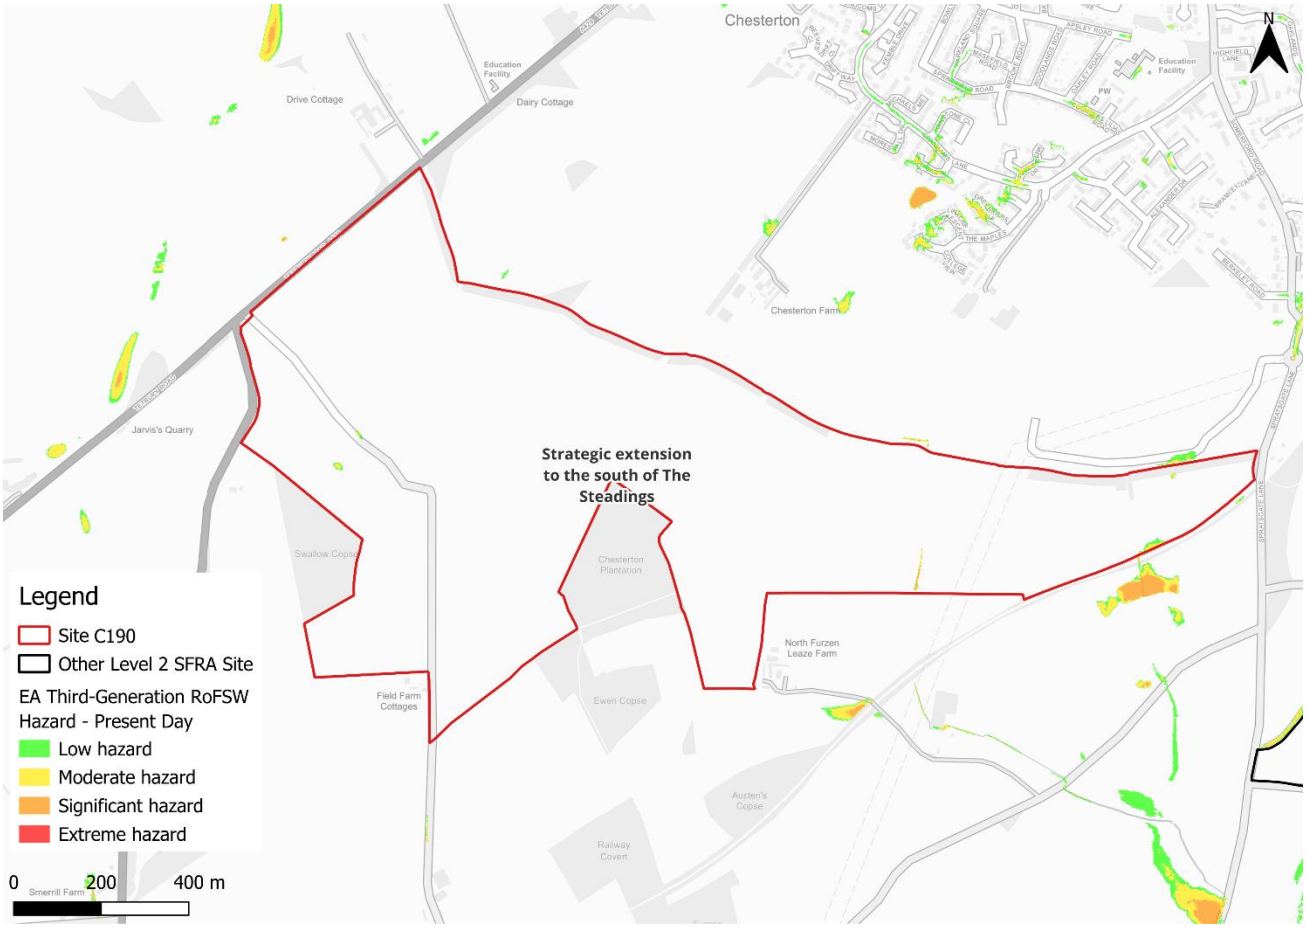

Figure 4-4: Third generation - Risk of Flooding from Surface Water map present day medium risk event surface water flood hazard[5]

4.1.1 Climate change

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change Extent map, onsite flood risk is not likely to increase significantly in the future.

4.2 Sewer flood risk

Thames Water provided their historic risk registers which were aggregated by ward. The site is located within four wards. There have been six recorded sewer flooding incidents in Kemble Ward within which the southwestern side of the site is located. There have been no recorded sewer flooding incidents that have occurred within Four Acres, Chesterton or Siddington & Cerney Rural Ward which the remainder of the site lies within.

5 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

4.3 Groundwater

Much of the site is in an area where there is a risk of groundwater flooding to both surface and subsurface assets (Figure 4-5). Groundwater conditions are likely therefore unsuited to infiltration SuDS.

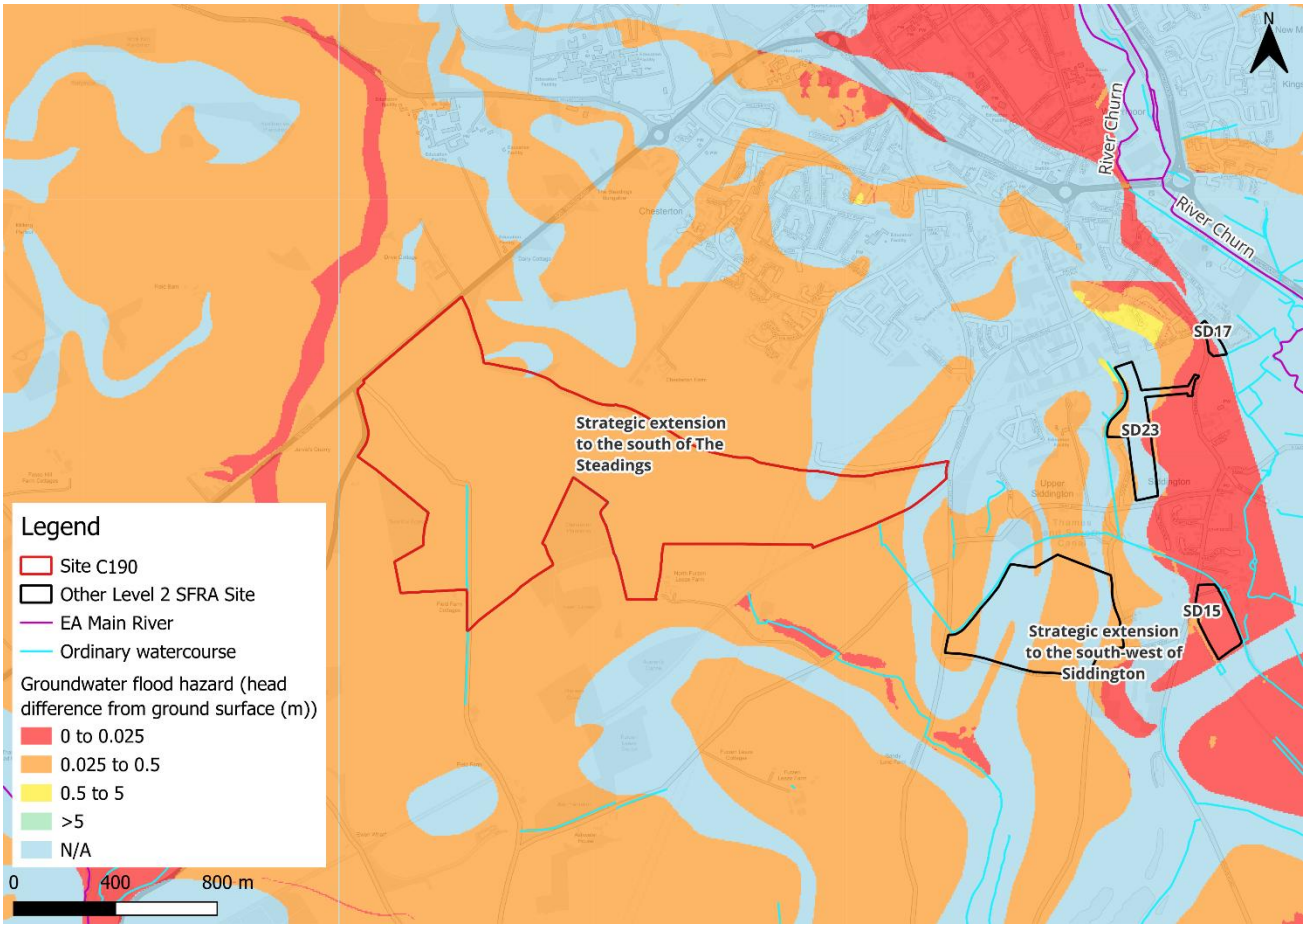

Figure 4-5: JBA 5m Groundwater Emergence Map

4.4 Summary and recommendations

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- The site is not required to pass the exception test as it is not located within Flood Zone 3a.
- The site is wholly within Flood Zone 1 and at no additional risk from climate change.
- There is no risk to the site from reservoir flooding.
- Development should be possible at this site given the low fluvial and nominal surface water flood risk to the site.
- Surface water risk is sparse across the site, with largely shallow depths. Surface water flood hazard must be confirmed at the site-specific FRA stage.
- Onsite surface water flood risk is not likely to increase significantly in the future.

- Groundwater levels should be further investigated at the site-specific FRA stage through percolation testing in both wet and dry conditions.
- In line with LLFA guidance[6], the developer should aim to achieve greenfield runoff rates. The developer should also follow the National SuDS guidance.
- Safe access and escape routes appear to be achievable via Tetbury Road to the northwest, Spratsgate Lane to the east or the track to the south of the site.

6 Gloucestershire County Council LLFA Key Documents

5 Site CC68

Site summary	
Location	Land at Aston Road
Existing site use	Agriculture
Existing site vulnerability	Less vulnerable
Proposed site use	Residential
Proposed site vulnerability	More vulnerable
Site area	13.0 hectares

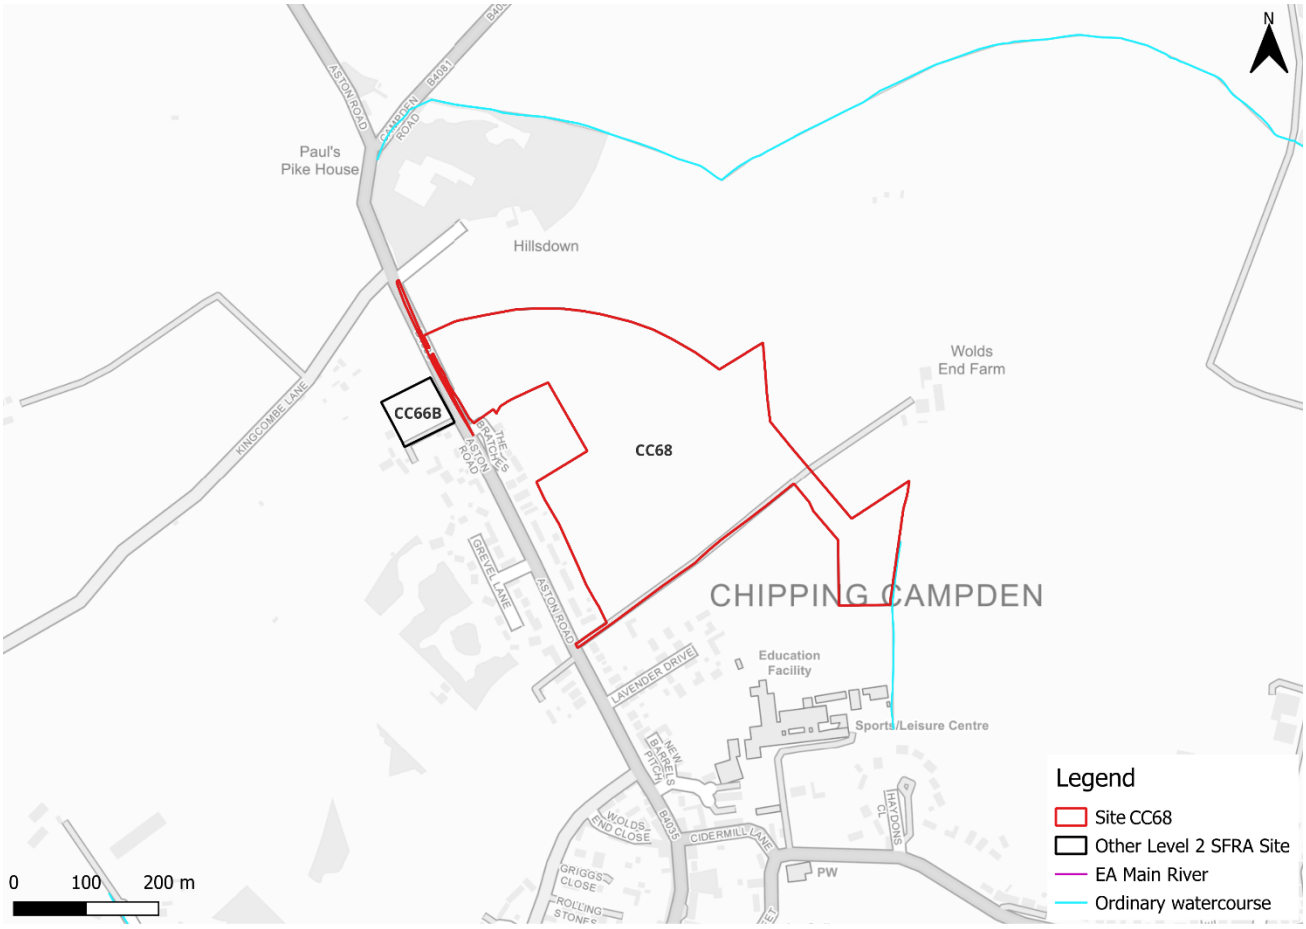

Figure 5-1: CC68 Existing site location boundary

5.1 Surface water

The site is predominantly outside of the 0.1% AEP surface water event, based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (Figure 5-2). There are two areas of ponding within the site. One along the western site boundary and one along the southeastern site boundary. Maximum flood depths within the site are between 0.15 and 0.3m (Figure 5-3) and hazard rating is very low in the medium risk event (Figure 5-4). Both areas of ponding should be incorporated into site design and be left as amenity green space.

Based on available information, safe access and escape routes should be available from Aston Road to the west of the site.

Table 5-1: Existing surface water flood risk based on percentage area at risk using the Flood Map for Planning - Surface Water Spatial Planning Extent Present Day map

Less than 0.1% AEP event (%)	0.1% AEP event (%)	1% AEP event (%)	3.3% AEP event (%)
98	0.5	0.5	1

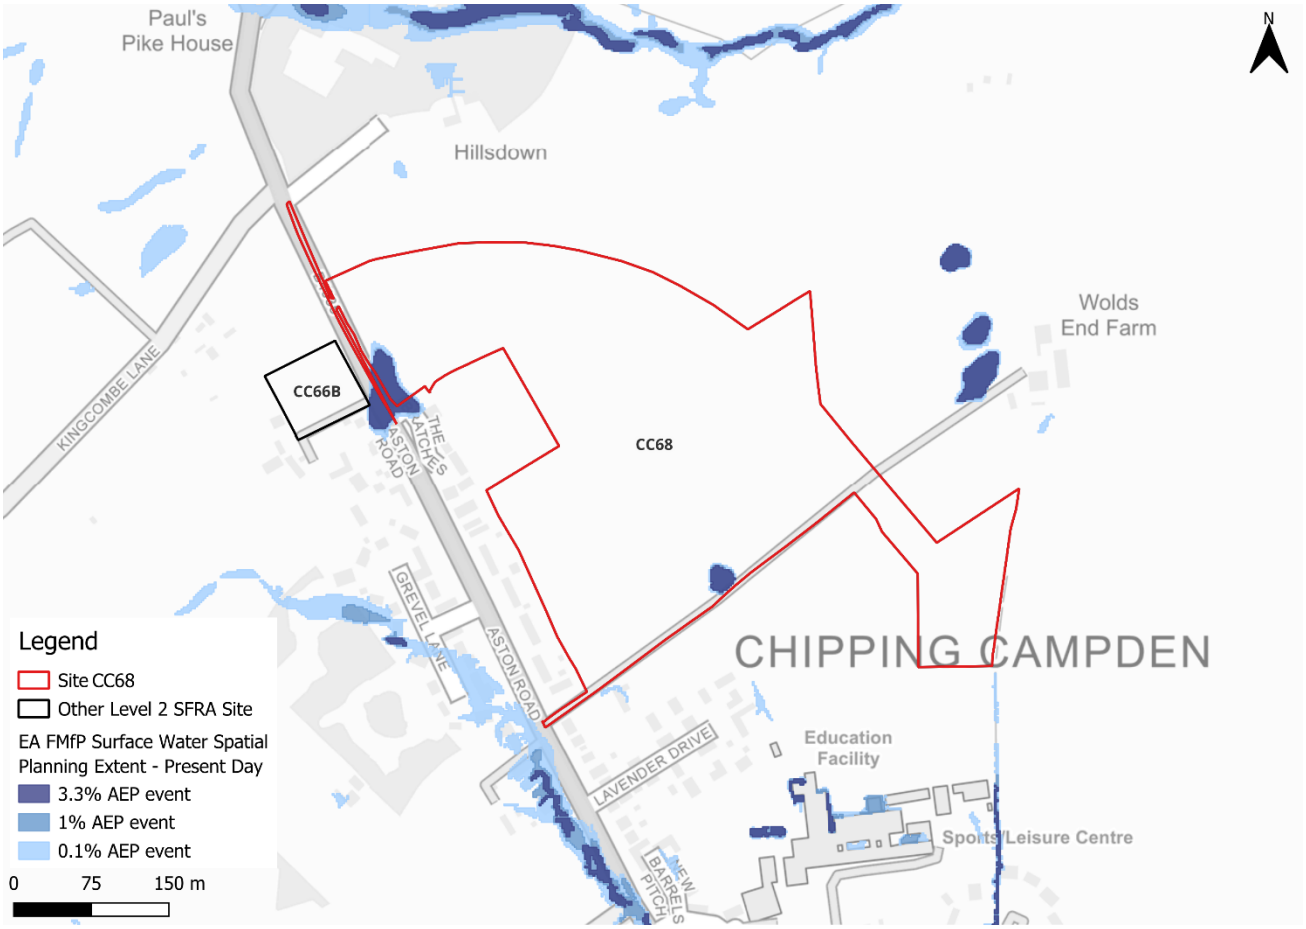

Figure 5-2: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

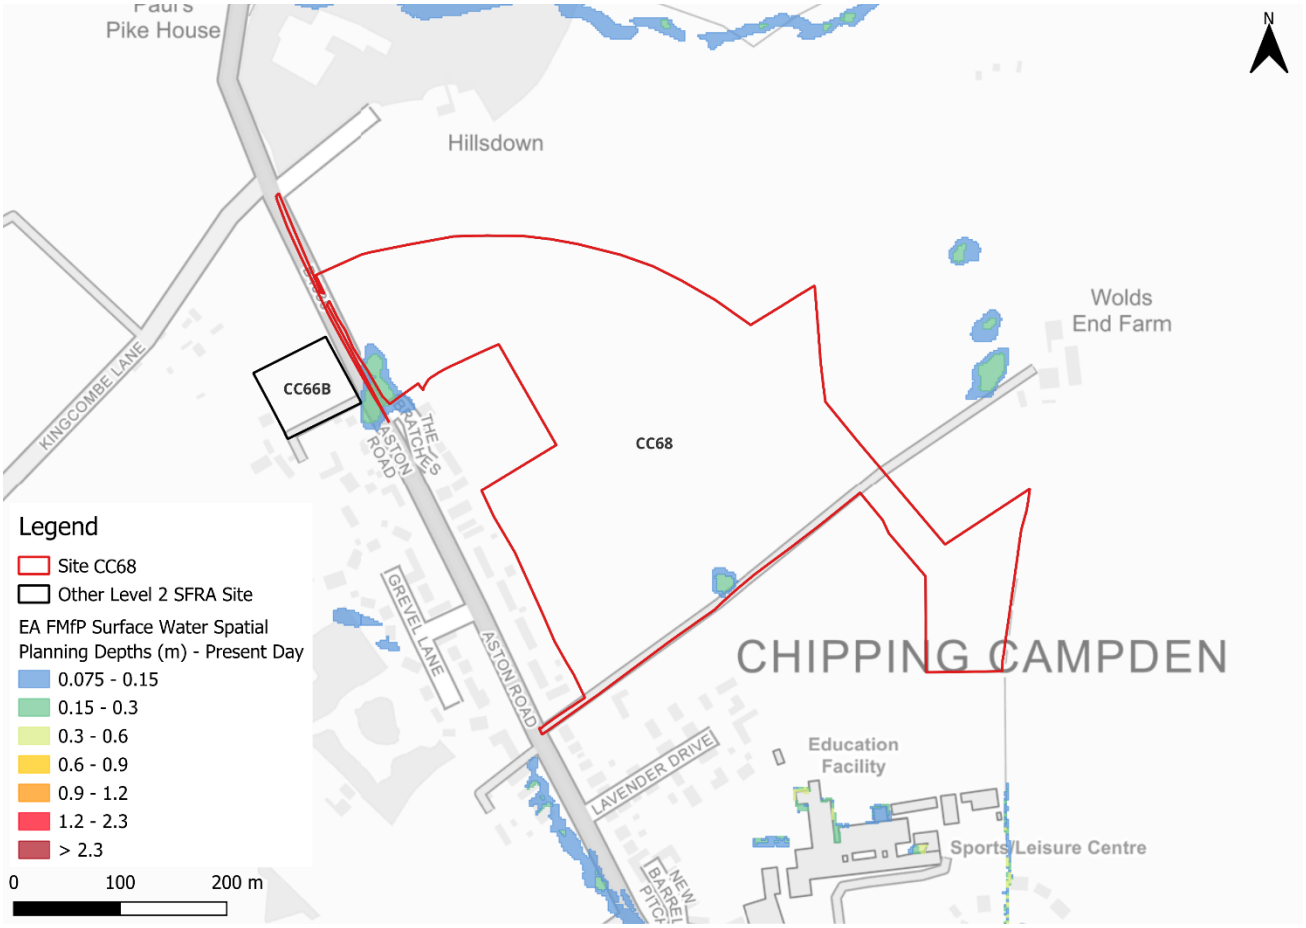

Figure 5-3: Flood Map for Planning - Surface Water Spatial Planning Depths (m) Present Day for the 1% AEP event

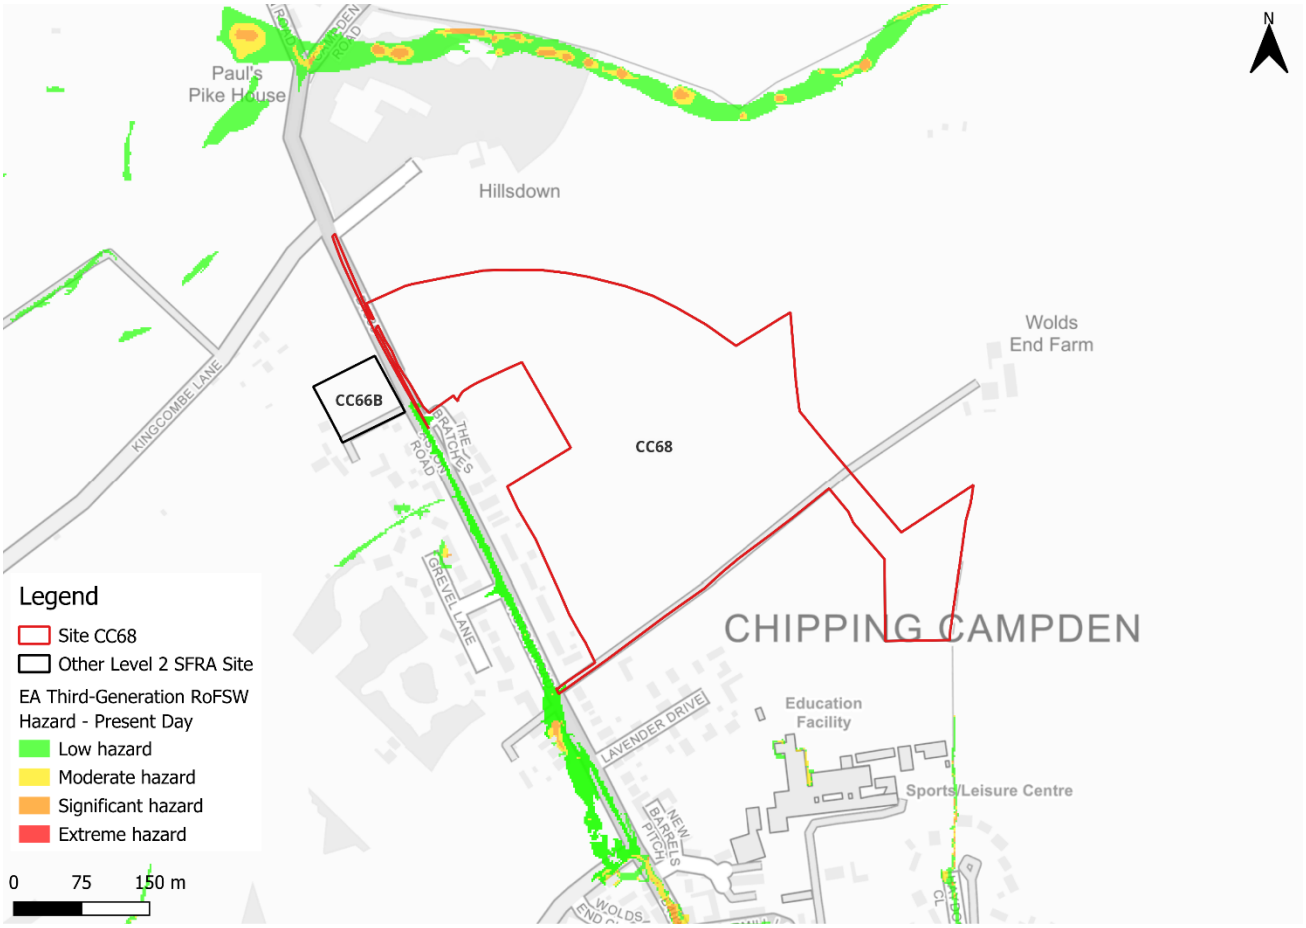

Figure 5-4: Third generation - Risk of Flooding from Surface Water map present day medium risk event surface water flood hazard[7]

5.1.1 Climate change

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change Extent map, onsite flood risk is not likely to increase significantly in the future.

5.2 Sewer flood risk

Severn Trent Water provided their historic risk registers which were aggregated by ward. There have been 22 recorded sewer flooding incidents that have occurred within the Campden & Vale Ward within which the site is located.

5.3 Groundwater

The entire site is within an area where there is no risk of groundwater flooding. Groundwater conditions are therefore suited to infiltration SuDS.

7 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

5.4 Summary and recommendations

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- The site is not required to pass the exception test as it is not located within Flood Zone 3a.
- The site is wholly within Flood Zone 1 and at no additional risk from climate change.
- There is no risk to the site from reservoir flooding.
- Development should be possible at this site given the low fluvial and nominal surface water flood risk to the site.
- Surface water risk is confined to the western and southeastern site boundaries. Surface water flood hazard must be confirmed at the site-specific FRA stage.
- Onsite surface water flood risk is not likely to increase significantly in the future.
- In line with LLFA guidance[8], the developer should aim to achieve greenfield runoff rates. The developer should also follow the National SuDS guidance.
- Safe access and escape routes appear to be achievable via Aston Road to the west of the site.

8 Gloucestershire County Council LLFA Key Documents

6 Site F20A

Site summary	
Location	Land south-east of Fairford
Existing site use	Agriculture
Existing site vulnerability	Less vulnerable
Proposed site use	Residential
Proposed site vulnerability	More vulnerable
Site area	5.76 hectares

Figure 6-1: F20A Existing site location boundary

6.1 Fluvial

The site lies almost entirely within Flood Zone 1 of the EA's Flood Map for Planning - Flood Zones. Flood Zone 2 (medium risk event) shows flooding from the River Coln slightly encroaches into the southeastern corner of the site, as shown (Figure 6-2). The Flood Map for Planning - Flood Zones plus Climate Change dataset (Figure 6-3), indicates that flooding extends marginally further into the site when considering climate change. Built development should avoid the areas at risk of fluvial flooding. Safe access and escape via East End are likely to be achievable.

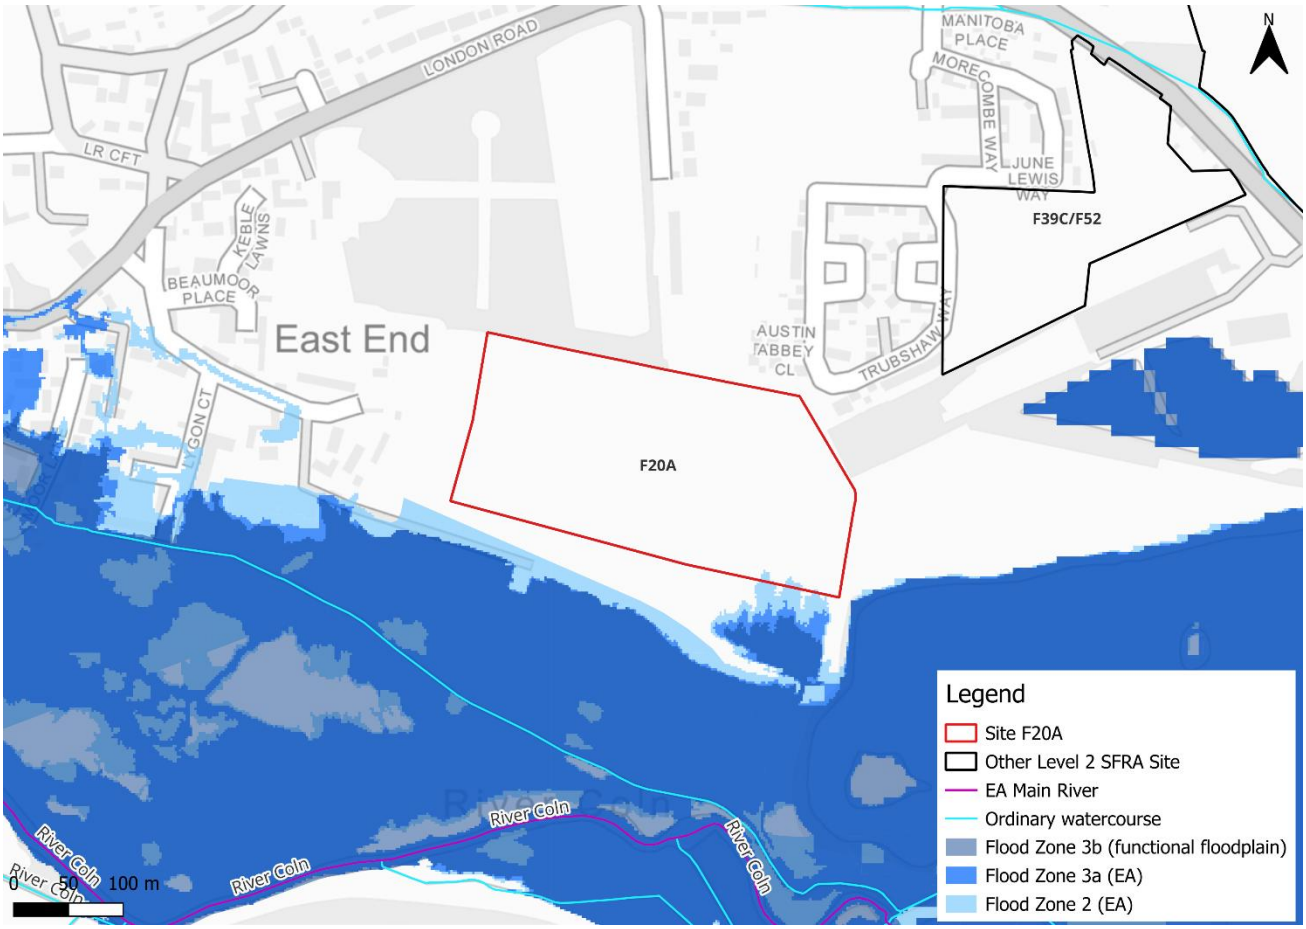

Figure 6-2: Flood Map for Planning - Flood Zones

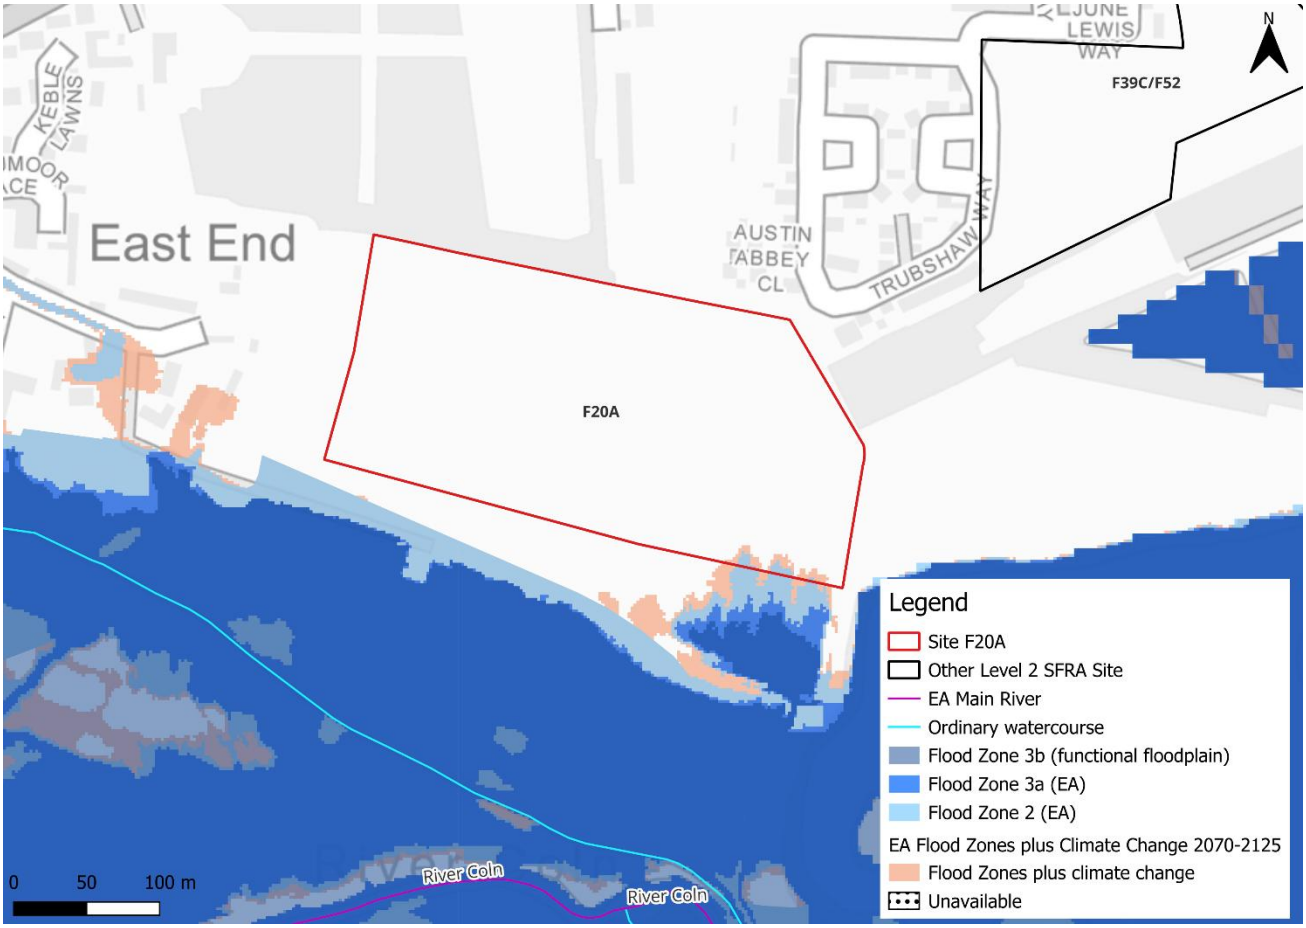

Figure 6-3: Flood Map for Planning - Flood Zones plus Climate Change

6.2 Surface water

The site is predominantly outside of the 0.1% AEP surface water event, based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (Figure 6-4). There is an area of ponding within the north of the site during the 1% and 0.1% AEP events. Maximum flood depths within the site are between 0.075 and 0.15m (Figure 6-5) and hazard rating is very low (Figure 6-6). The area of ponding within the north of the site should be incorporated into site design and be left as amenity green space. Mapping indicates a flow path along East End, west of the site, during the medium and low risk events.

Based on available information, safe access and escape routes should be achievable via Cinder Lane to the north of the site.

Table 6-1: Existing surface water flood risk based on percentage area at risk using the Flood Map for Planning - Surface Water Spatial Planning Extent Present Day map

Less than 0.1% AEP event (%)	0.1% AEP event (%)	1% AEP event (%)	3.3% AEP event (%)
99	0.5	0.5	0

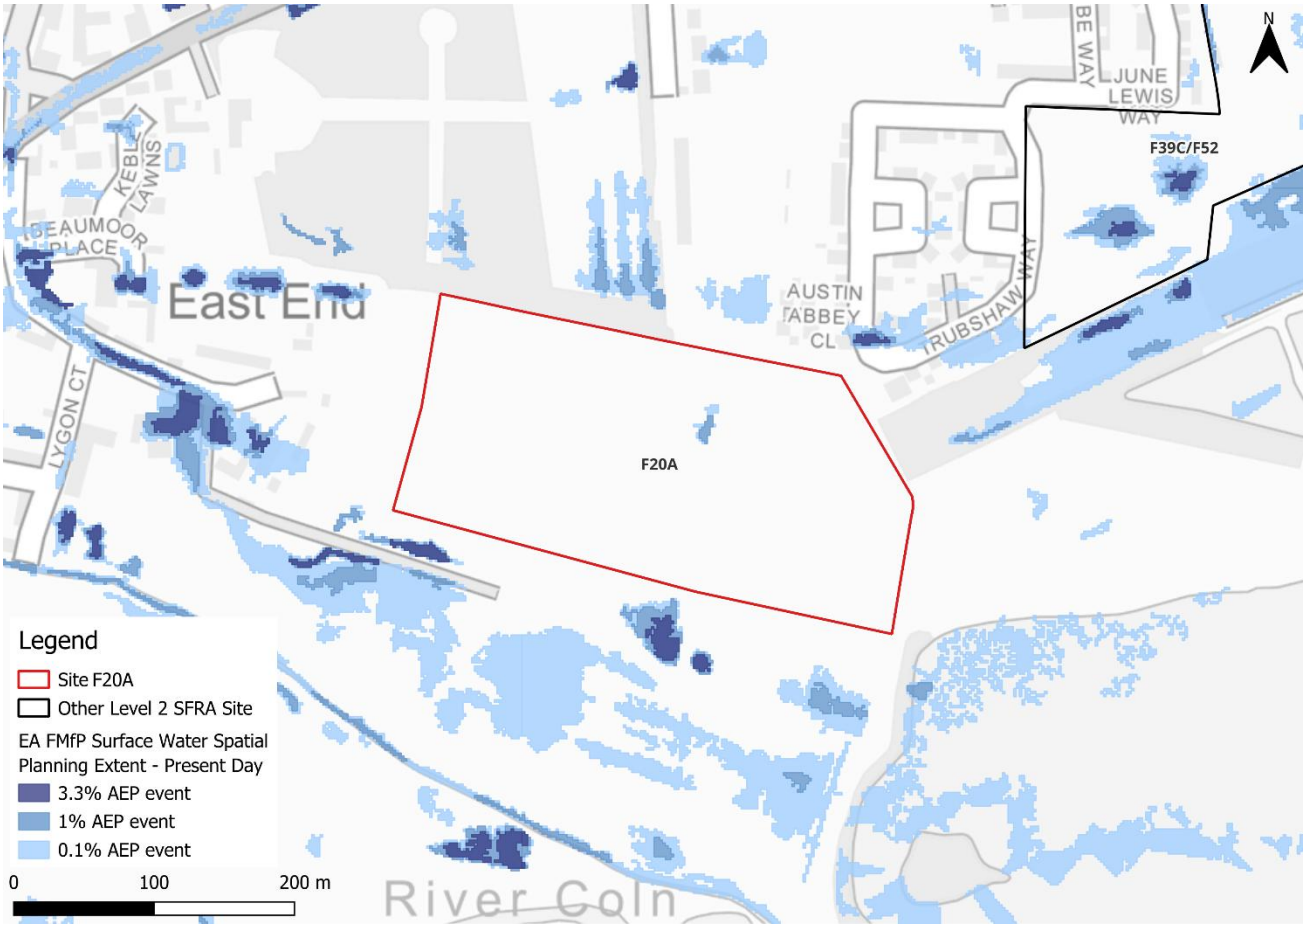

Figure 6-4: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

Figure 6-5: Flood Map for Planning - Surface Water Spatial Planning Depths (m) Present Day for the 1% AEP event

Figure 6-6: Third generation - Risk of Flooding from Surface Water map present day medium risk event surface water flood hazard[9]

6.2.1 Climate change

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change Extent map, onsite flood risk is not likely to increase significantly in the future.

6.3 Sewer flood risk

Thames Water provided their historic risk registers which were aggregated by ward. There have been five recorded sewer flooding incidents that have occurred within the Lechlade, Kempsford & Fairford South Ward within which the site is located.

6.4 Groundwater

Much of the site is in an area where there is a risk of groundwater flooding to both surface and subsurface assets (Figure 6-7). Groundwater conditions are likely therefore unsuited to infiltration SuDS.

9 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Figure 6-7: JBA 5m Groundwater Emergence Map

6.5 Summary and recommendations

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- The site is not required to pass the exception test as it is not located within Flood Zone 3a.
- Development should avoid the area of Flood Zone within the south of the site.
- There is no risk to the site from reservoir flooding.
- Development should be possible at this site given the low fluvial and nominal surface water flood risk to the site.
- Surface water risk is confined to an area of ponding in the north of the site, with largely shallow depths. Surface water flood hazard must be confirmed at the site-specific FRA stage.
- Onsite surface water flood risk is not likely to increase significantly in the future.
- Groundwater levels should be further investigated at the site-specific FRA stage through percolation testing in both wet and dry conditions.
- In line with LLFA guidance[10], the developer should aim to achieve greenfield runoff rates. The developer should also follow the National SuDS guidance.

10 Gloucestershire County Council LLFA Key Documents

- Safe access and escape routes appear to be achievable via Cinder Lane to the north of the site.

7 Site MK7

Site summary	
Location	Land between Summerville Ltd. And Stratford Road
Existing site use	Agriculture
Existing site vulnerability	Less vulnerable
Proposed site use	Residential
Proposed site vulnerability	More vulnerable
Site area	2.11 hectares

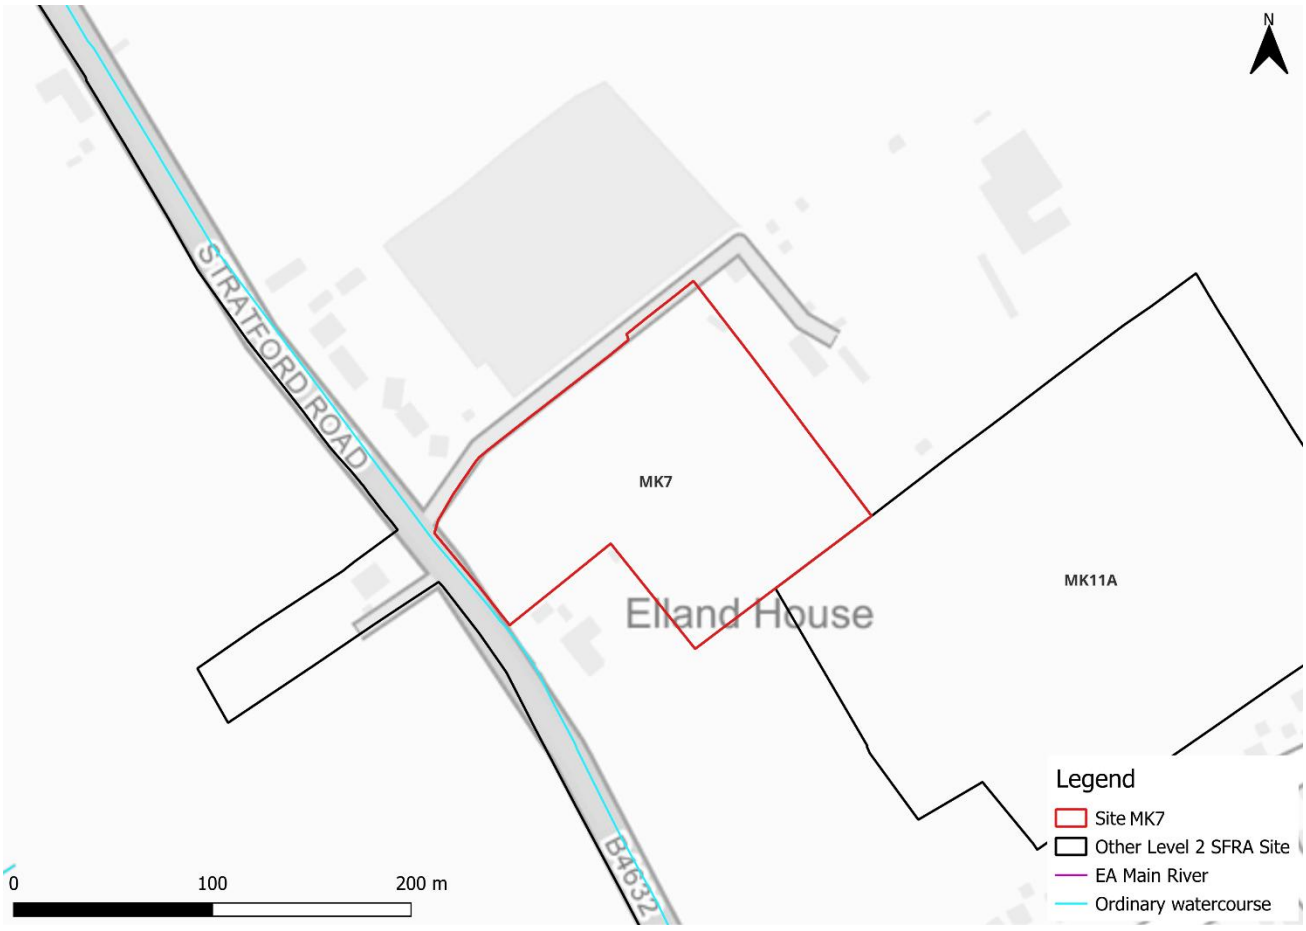

Figure 7-1: MK7 Existing site location boundary

7.1 Surface water

The site is predominantly outside of the 0.1% AEP surface water event, based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (Figure 7-2). There are two areas of ponding within the site. One along the northwestern site boundary and one which encroaches over the southwestern site boundary. Maximum flood depths within the site are between 0.075 and 0.15m (Figure 7-3) and hazard rating is very low in the medium risk event (Figure 7-4). The areas of ponding within should be incorporated into site design and be left as amenity green space.

Based on available information, safe access and escape routes should be available from Stratford Road to the southwest of the site.

Table 7-1: Existing surface water flood risk based on percentage area at risk using the Flood Map for Planning - Surface Water Spatial Planning Extent Present Day map

Less than 0.1% AEP event (%)	0.1% AEP event (%)	1% AEP event (%)	3.3% AEP event (%)
97	1	1	1

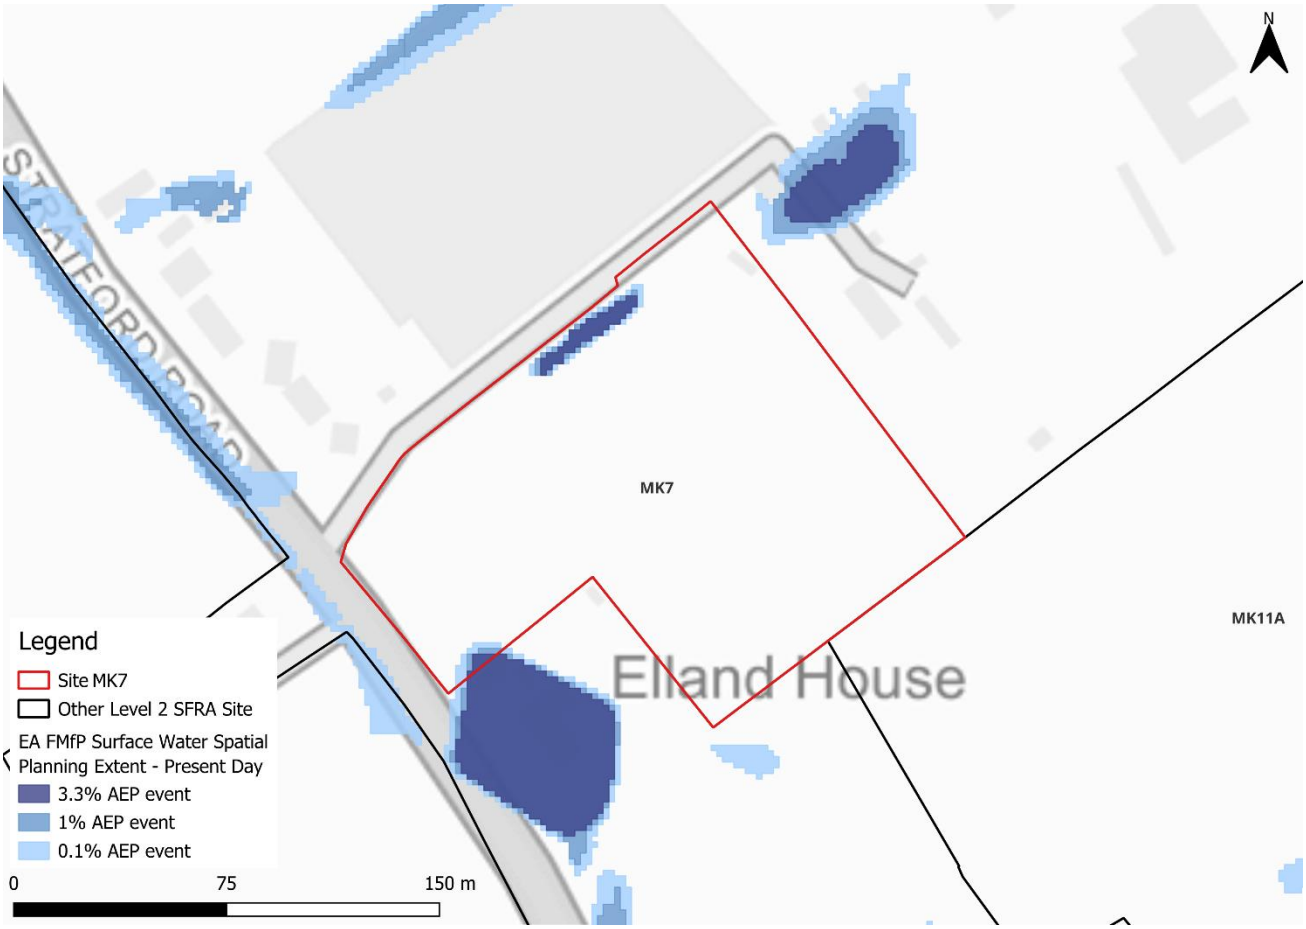

Figure 7-2: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

Figure 7-3: Flood Map for Planning - Surface Water Spatial Planning Depths (m) Present Day for the 1% AEP event

Figure 7-4: Third generation - Risk of Flooding from Surface Water map present day medium risk event surface water flood hazard[11]

7.1.1 Climate change

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change Extent map, onsite flood risk is not likely to increase significantly in the future.

7.2 Sewer flood risk

Severn Trent Water provided their historic risk registers which were aggregated by ward. There have been 22 recorded sewer flooding incidents that have occurred within the Campden & Vale Ward within which the site is located.

7.3 Groundwater

The entire site is within an area where there is no risk of groundwater flooding. Groundwater conditions are therefore suited to infiltration SuDS.

11 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

7.4 Summary and recommendations

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- The site is not required to pass the exception test as it is not located within Flood Zone 3a.
- The site is wholly within Flood Zone 1 and at no additional risk from climate change.
- There is no risk to the site from reservoir flooding.
- Development should be possible at this site given the low fluvial and nominal surface water flood risk to the site.
- Surface water risk is confined to two areas of shallow surface water ponding. Surface water flood hazard must be confirmed at the site-specific FRA stage.
- Onsite surface water flood risk is not likely to increase significantly in the future.
- In line with LLFA guidance[12], the developer should aim to achieve greenfield runoff rates. The developer should also follow the National SuDS guidance.
- Safe access and escape routes appear to be achievable via Stratford Road to the southwest of the site.

12 Gloucestershire County Council LLFA Key Documents

8 Site R203ABC

Site summary	
Location	Land to the rear of the Knoll, Whelford Road
Existing site use	Agriculture
Existing site vulnerability	Less vulnerable
Proposed site use	Residential
Proposed site vulnerability	More vulnerable
Site area	9.21 hectares

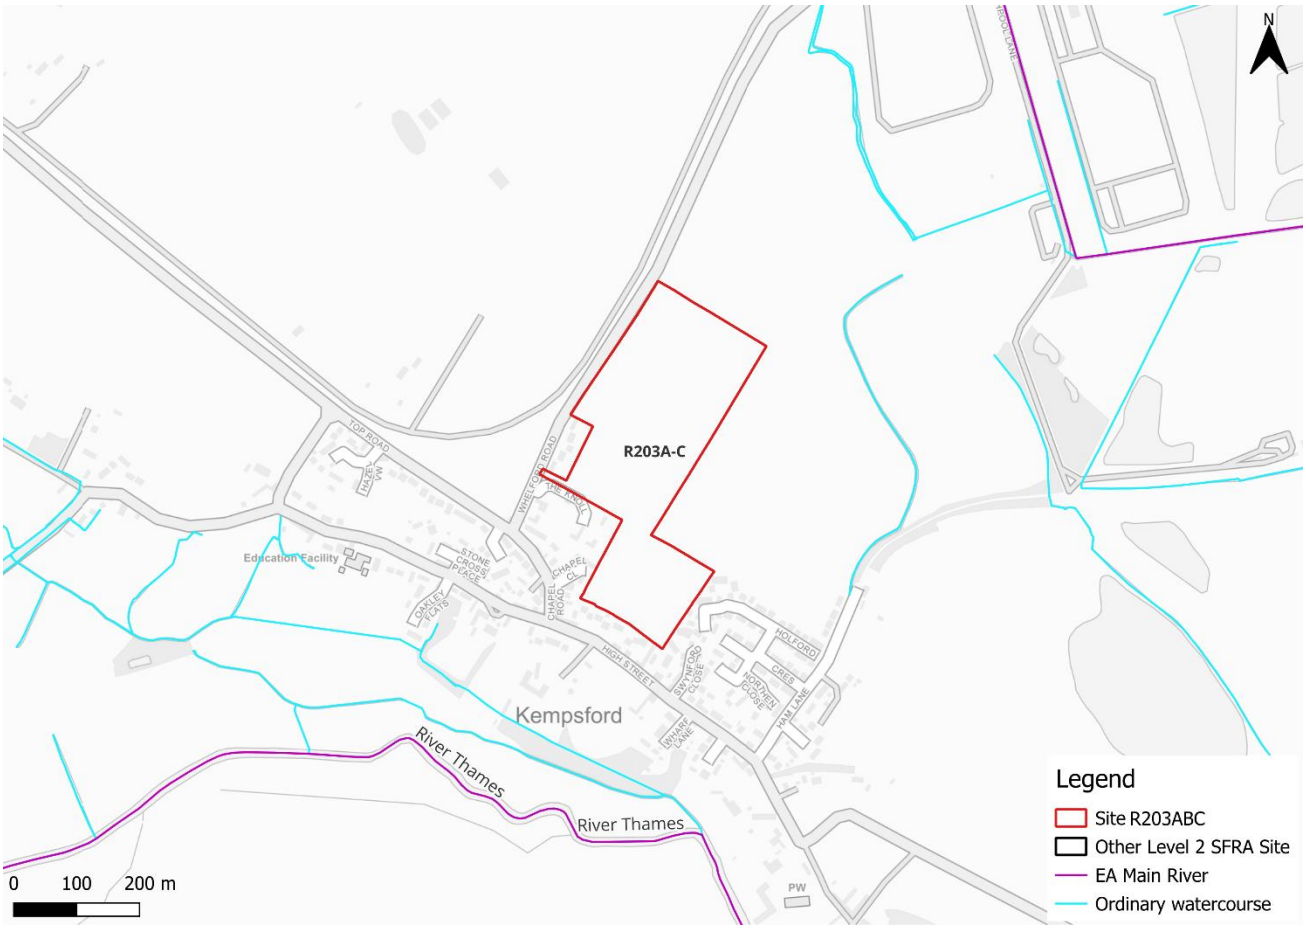

Figure 8-1: R203ABC Existing site location boundary

8.1 Surface water

The site is predominantly outside of the 0.1% AEP surface water event, based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (Figure 8-2). There are two areas of ponding in the southeastern corner of the site in the high risk event. In the low risk event several other areas of ponding form. During the medium risk (1% AEP) event, maximum flood depths within the site are between 0.075 and 0.15 m (Figure 8-3) and hazard rating is low to very low (Figure 8-4). The areas of ponding within the site should be incorporated into site design and be left as amenity green space.

Based on available information, safe access and escape routes should be available from Whelford Road to the northwest or The Knoll to the southwest of the site.

Table 8-1: Existing surface water flood risk based on percentage area at risk using the Flood Map for Planning - Surface Water Spatial Planning Extent Present Day map

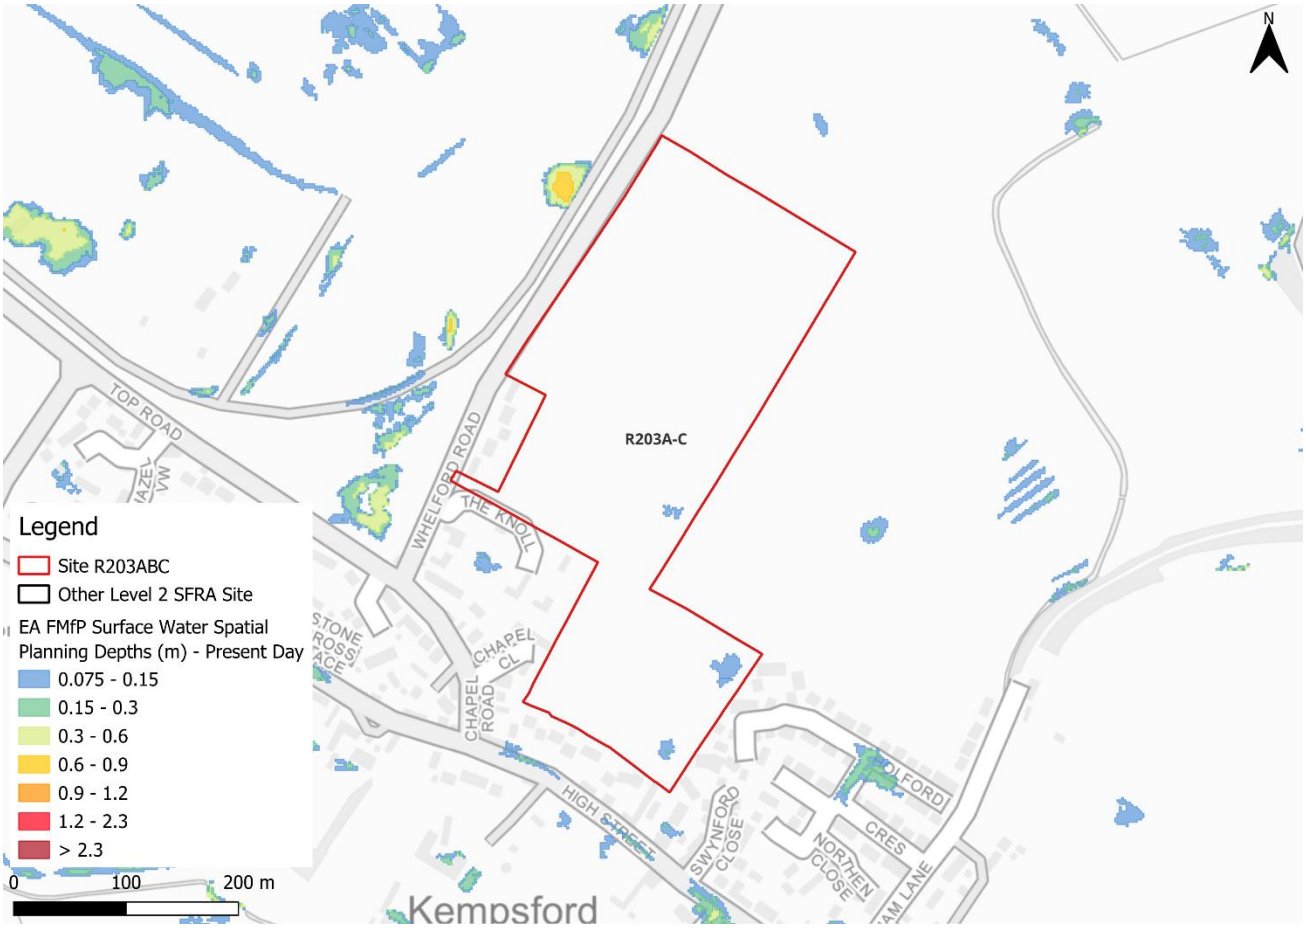

Figure 8-3: Flood Map for Planning - Surface Water Spatial Planning Depths (m) Present Day for the 1% AEP event

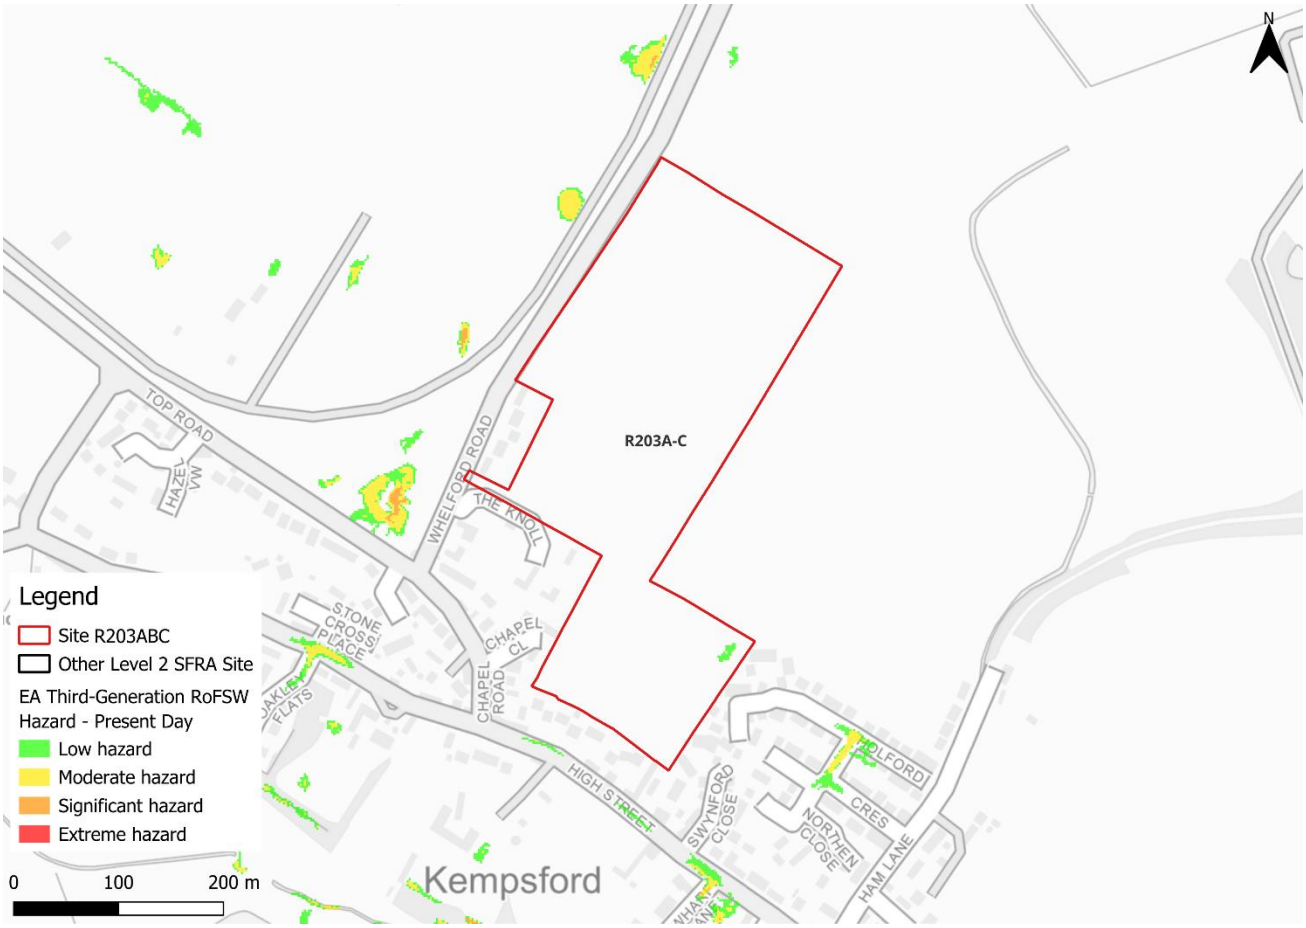

Figure 8-4: Third generation - Risk of Flooding from Surface Water map present day medium risk event surface water flood hazard[13]

8.1.1 Climate change

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change Extent map, onsite flood risk is not likely to increase significantly in the future.

8.2 Sewer flood risk

Thames Water provided their historic risk registers which were aggregated by ward. There have been five recorded sewer flooding incidents that have occurred within the Lechlade, Kempsford & Fairford South Ward within which the site is located.

8.3 Groundwater

Much of the site is in an area where there is a risk of groundwater flooding to both surface and subsurface assets (Figure 8-5). Groundwater conditions are likely therefore unsuited to infiltration SuDS.

13 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Figure 8-5: JBA 5m Groundwater Emergence Map

8.4 Summary and recommendations

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- The site is not required to pass the exception test as it is not located within Flood Zone 3a.
- The site is wholly within Flood Zone 1 and at no additional risk from climate change.
- There is no risk to the site from reservoir flooding.
- Development should be possible at this site given the low fluvial and nominal surface water flood risk to the site.
- Surface water risk is predominantly confined to the southeast of the site. Surface water flood hazard must be confirmed at the site-specific FRA stage.
- Onsite surface water flood risk is not likely to increase significantly in the future.
- Groundwater levels should be further investigated at the site-specific FRA stage through percolation testing in both wet and dry conditions.
- In line with LLFA guidance[14], the developer should aim to achieve greenfield runoff rates. The developer should also follow the National SuDS guidance.

14 Gloucestershire County Council LLFA Key Documents

- Safe access and escape routes appear to be achievable via Whelford Road to the northwest and The Knoll to the southwest of the site.

9 Site R591

Site summary	
Location	Former Godwin Pumps factory, Springfield Road, GL7 5BX
Existing site use	Industrial / brownfield
Existing site vulnerability	Less vulnerable
Proposed site use	Residential
Proposed site vulnerability	More vulnerable
Site area	1.98 hectares

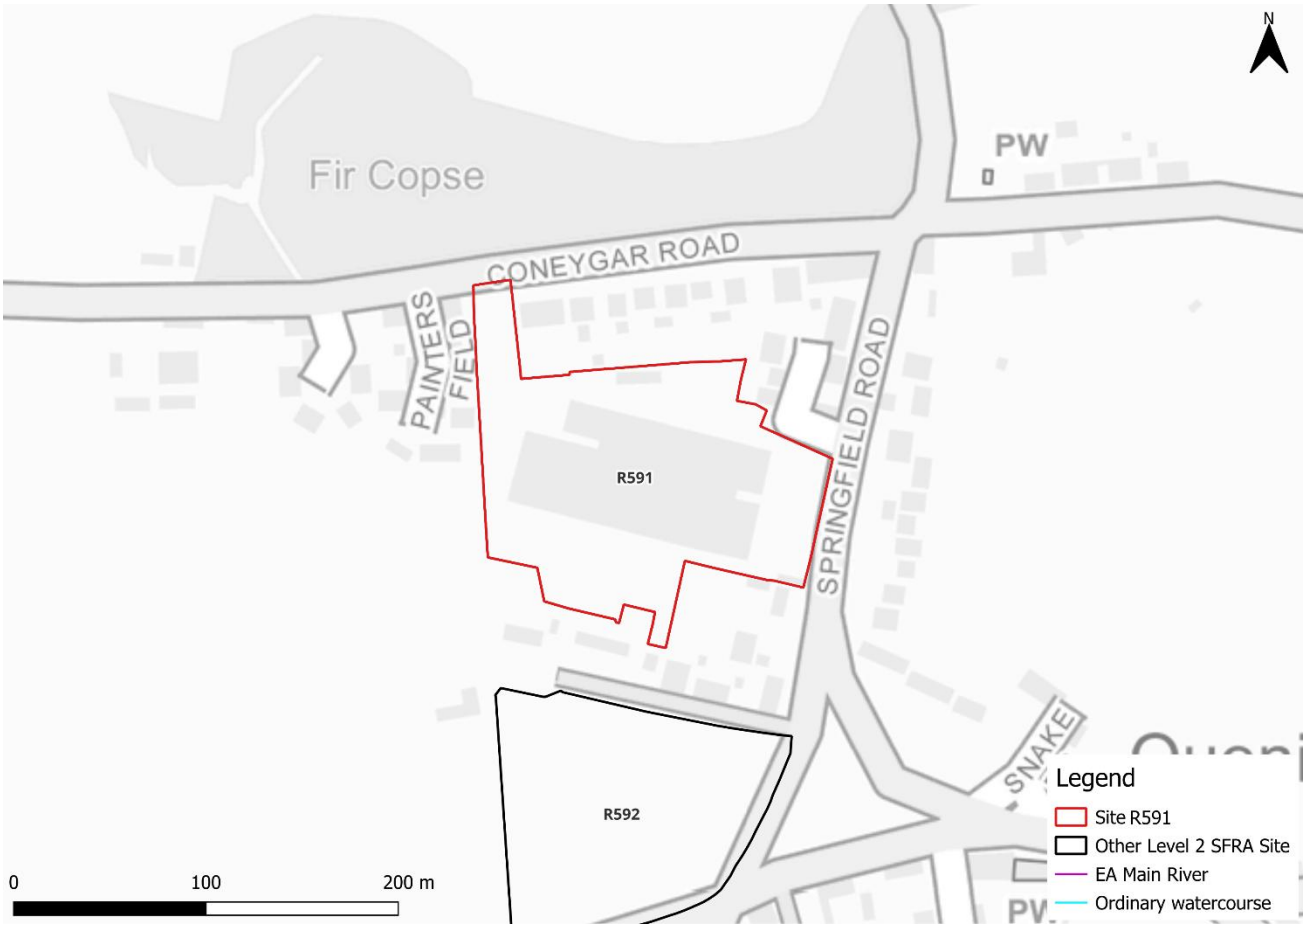

Figure 9-1: R591 Existing site location boundary

9.1 Surface water

The site is predominantly outside of the 0.1% AEP surface water event, based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (Figure 9-2). In the 1% AEP event, there is an area of ponding, constrained by existing development, in the western side of the site. In the 0.1% AEP event, an additional area of ponding forms on the southern side of the existing building. Maximum flood depths within the site are between 0.075 and 0.15 m (Figure 9-3), and hazard rating is very low in the medium risk event (Figure 9-4). The areas of ponding within the west of the site should be incorporated into site design and be left as amenity green space.

Based on available information, safe access and escape routes should be available from Coneygar Road to the north or Springfield Road to the east of the site.

Table 9-1: Existing surface water flood risk based on percentage area at risk using the Flood Map for Planning - Surface Water Spatial Planning Extent Present Day map

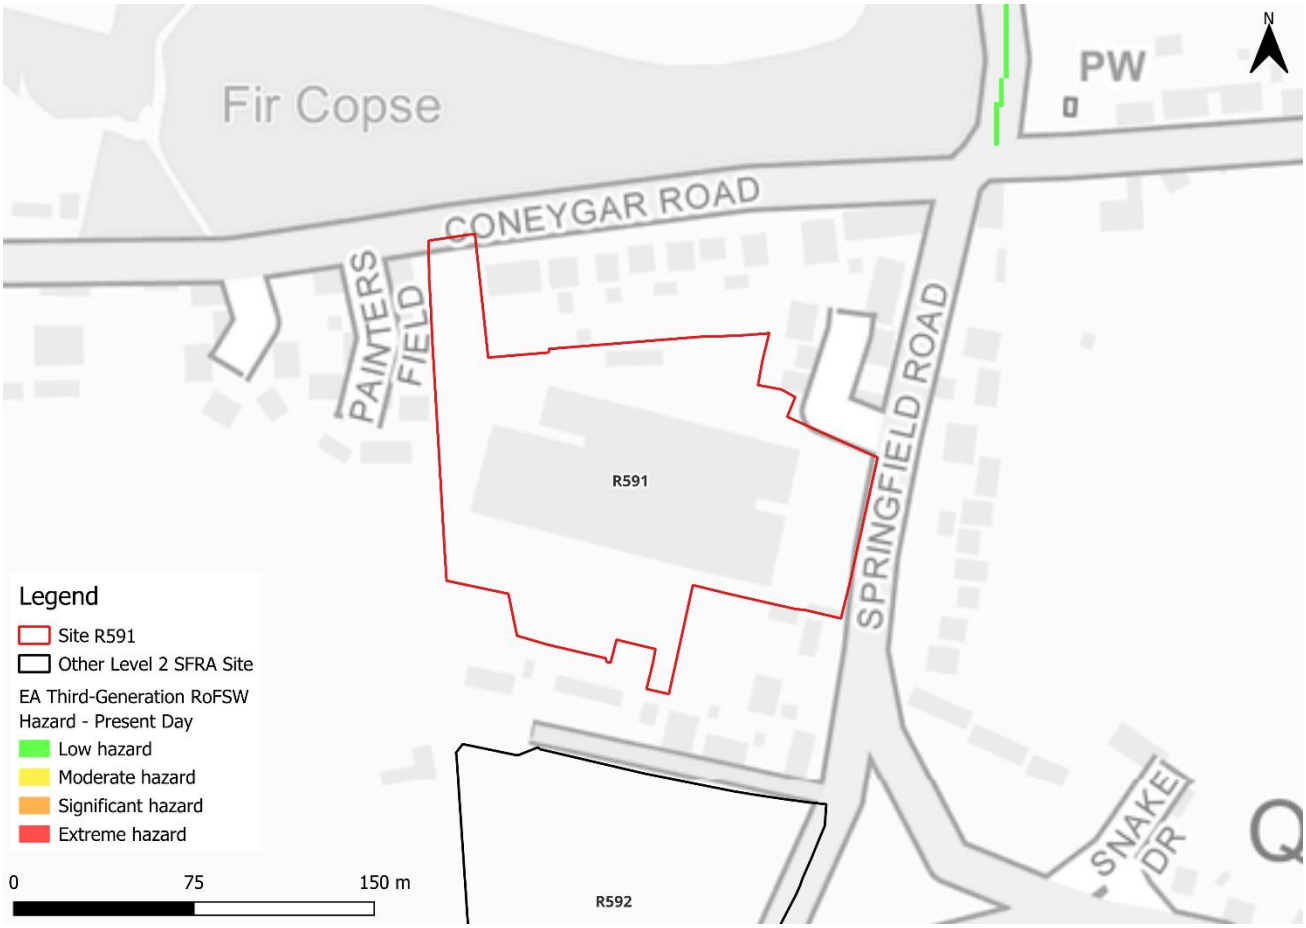

Figure 9-4: Third generation - Risk of Flooding from Surface Water map present day medium risk event surface water flood hazard[15]

9.1.1 Climate change

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change Extent map, onsite flood risk is not likely to increase significantly in the future.

9.2 Sewer flood risk

Thames Water provided their historic risk registers which were aggregated by ward. There have been 63 recorded sewer flooding incidents that have occurred within the Coln Valley Ward within which the site is located.

9.3 Groundwater

The entire site is within an area where there is little risk of groundwater flooding. Groundwater conditions are therefore suited to infiltration SuDS.

15 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

9.4 Summary and recommendations

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- The site is not required to pass the exception test as it is not located within Flood Zone 3a.
- The site is wholly within Flood Zone 1 and at no additional risk from climate change.
- There is no risk to the site from reservoir flooding.
- Development should be possible at this site given the low fluvial and nominal surface water flood risk to the site.
- Surface water risk is predominantly confined to the western side of the site, confined by existing development, with shallow depths. Surface water flood hazard must be confirmed at the site-specific FRA stage.
- Onsite surface water flood risk is not likely to increase significantly in the future.
- In line with LLFA guidance[16], the developer should aim to achieve greenfield runoff rates. The developer should also follow the National SuDS guidance.
- Safe access and escape routes appear to be achievable via Coneygar Road to the north or Springfield Road to the east of the site.

13 Site SD20 (Strategic extension to the south-west of Siddington)

Site summary	
Location	Land north of Clark's Lane and south of Old Canal
Existing site use	Agriculture
Existing site vulnerability	Less vulnerable
Proposed site use	Residential
Proposed site vulnerability	More vulnerable
Site area	21.7 hectares

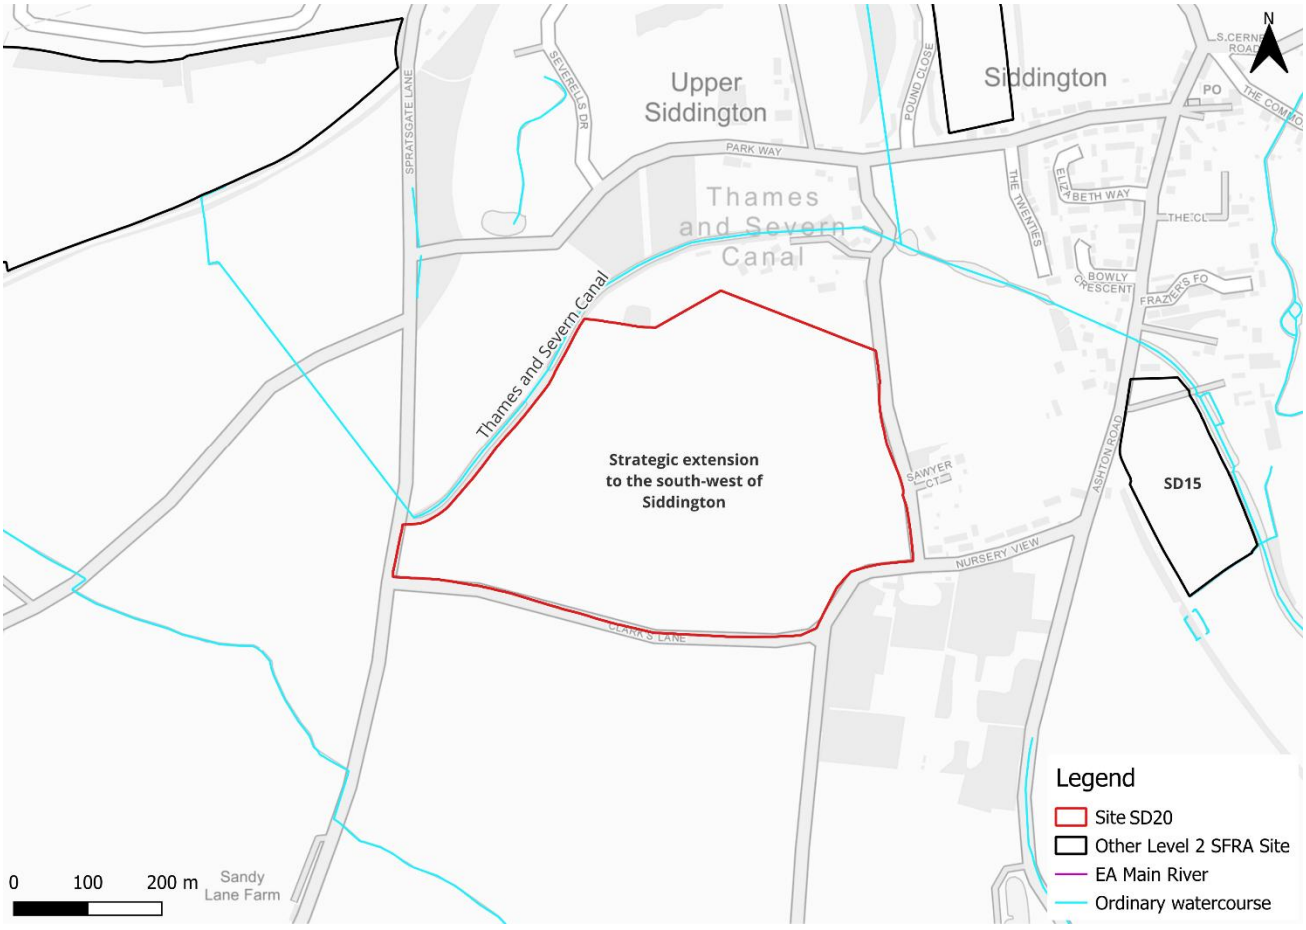

Figure 13-1: SD20 Existing site location boundary

13.1 Surface water

The site is predominantly outside of the 0.1% AEP surface water event, based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (Figure 13-2). Mapping indicates a surface water flow path along the course of the old canal which runs beside the northwestern site boundary. There is an area of ponding along the southern boundary of the site in the high risk event. In the medium risk event, this ponding expands and a flow path begins to form in the low risk event. Maximum flood depths within the site are between 0.3 and 0.6 m (Figure 13-3), although are mostly shallow, and hazard rating is low to moderate in the medium risk event (Figure 13-4). The area of ponding along the southern boundary and the flow path within the south of the site should be incorporated into site design and be left as amenity green space.

Based on available information, safe access and escape routes should be available from Clark's Lane to the south, Spratsgate Lane to the west or the unnamed road to the east of the site.

Table 13-1: Existing surface water flood risk based on percentage area at risk using the Flood Map for Planning - Surface Water Spatial Planning Extent Present Day map

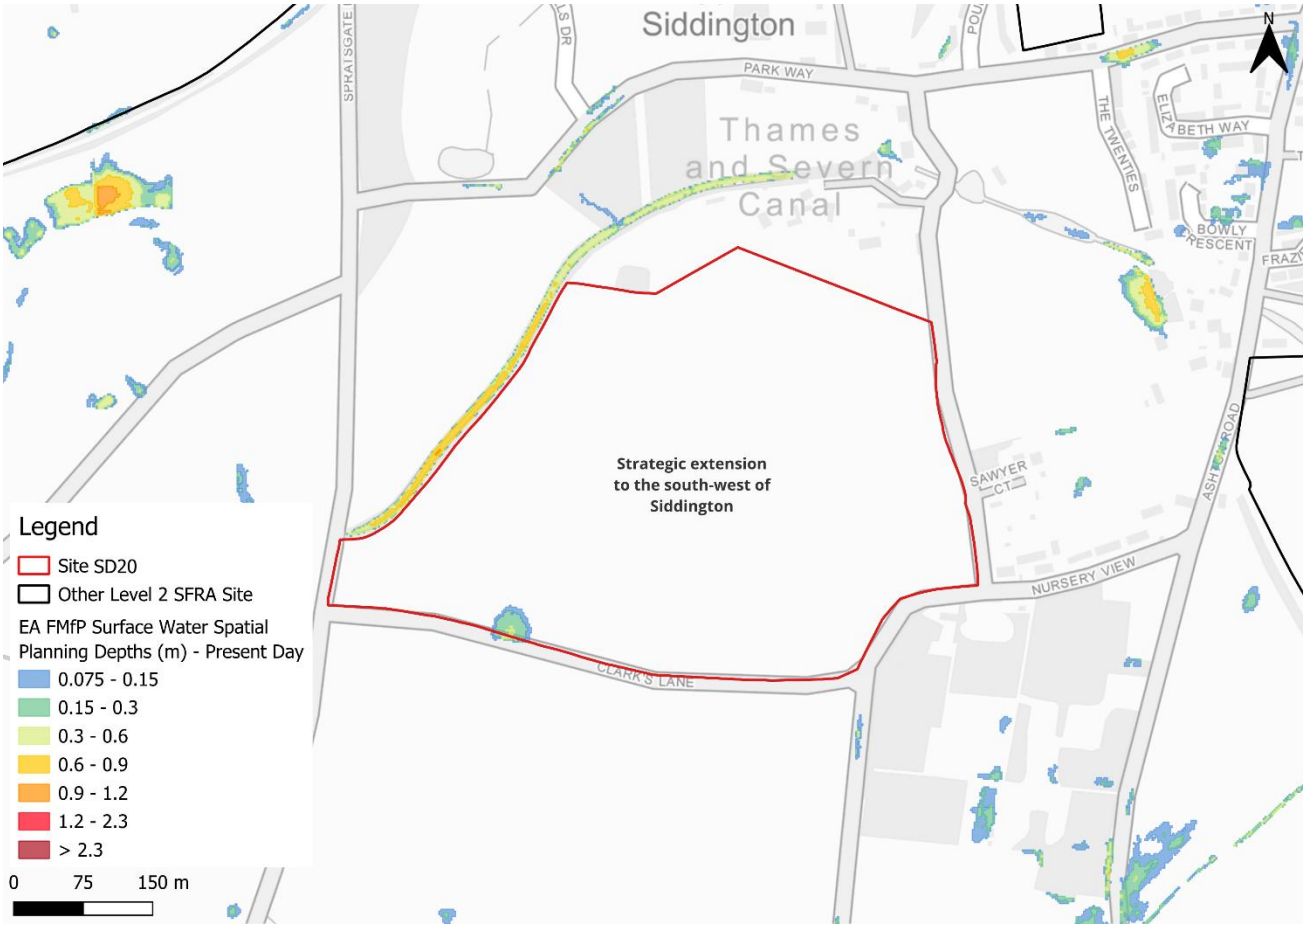

Figure 13-3: Flood Map for Planning - Surface Water Spatial Planning Depths (m) Present Day for the 1% AEP event

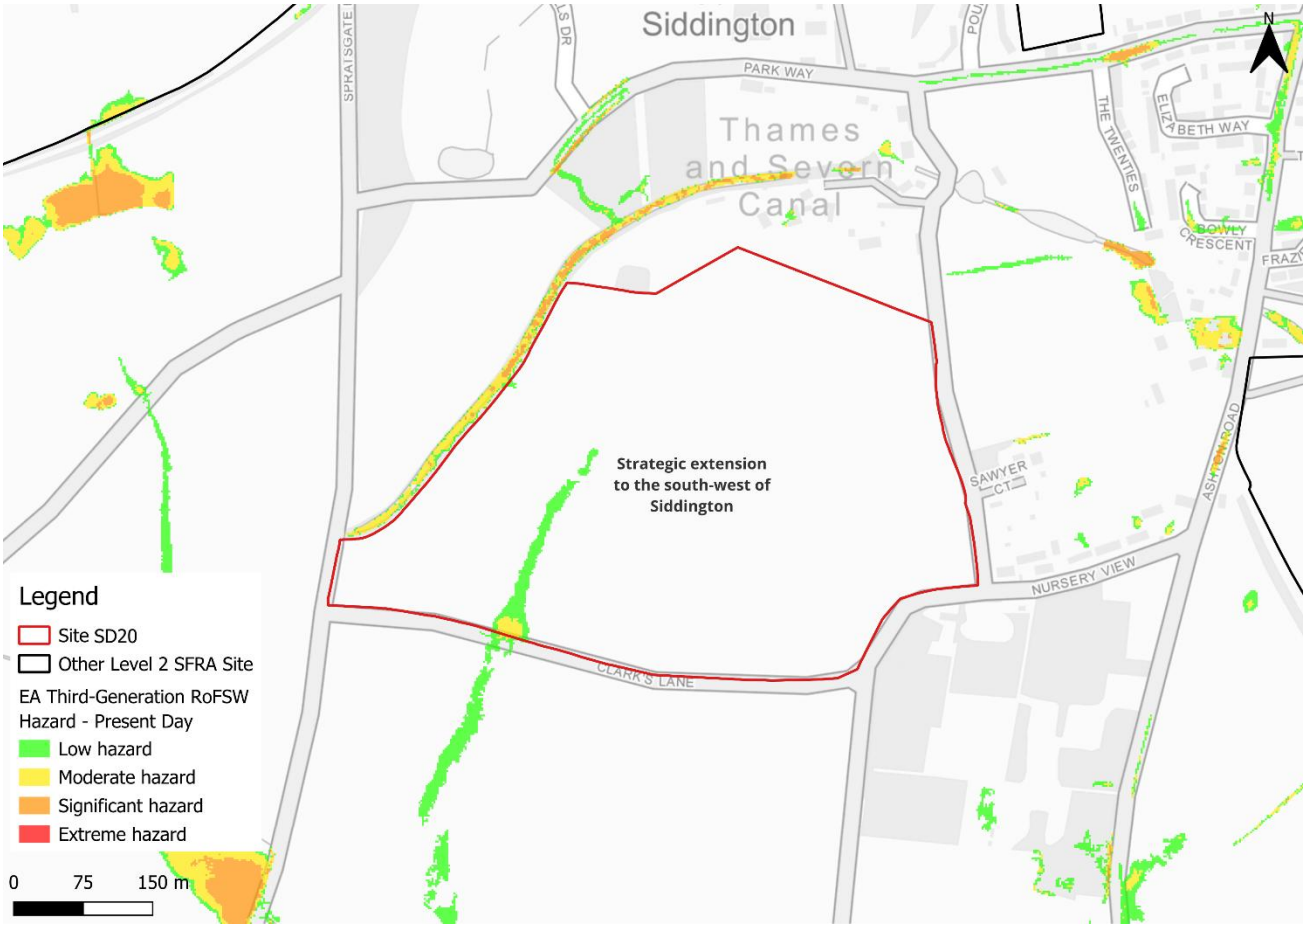

Figure 13-4: Third generation - Risk of Flooding from Surface Water map present day medium risk event surface water flood hazard[23]

13.1.1 Climate change

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change Extent map, onsite flood risk is not likely to increase significantly in the future.

13.2 Sewer flood risk

Thames Water provided their historic risk registers which were aggregated by ward. There have been no recorded sewer flooding incidents that have occurred within the Siddington & Cerney Rural Ward within which the site is located.

13.3 Groundwater

Much of the site is in an area where there is a risk of groundwater flooding to both surface and subsurface assets (Figure 13-5). Groundwater conditions are likely therefore unsuited to infiltration SuDS.

23 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

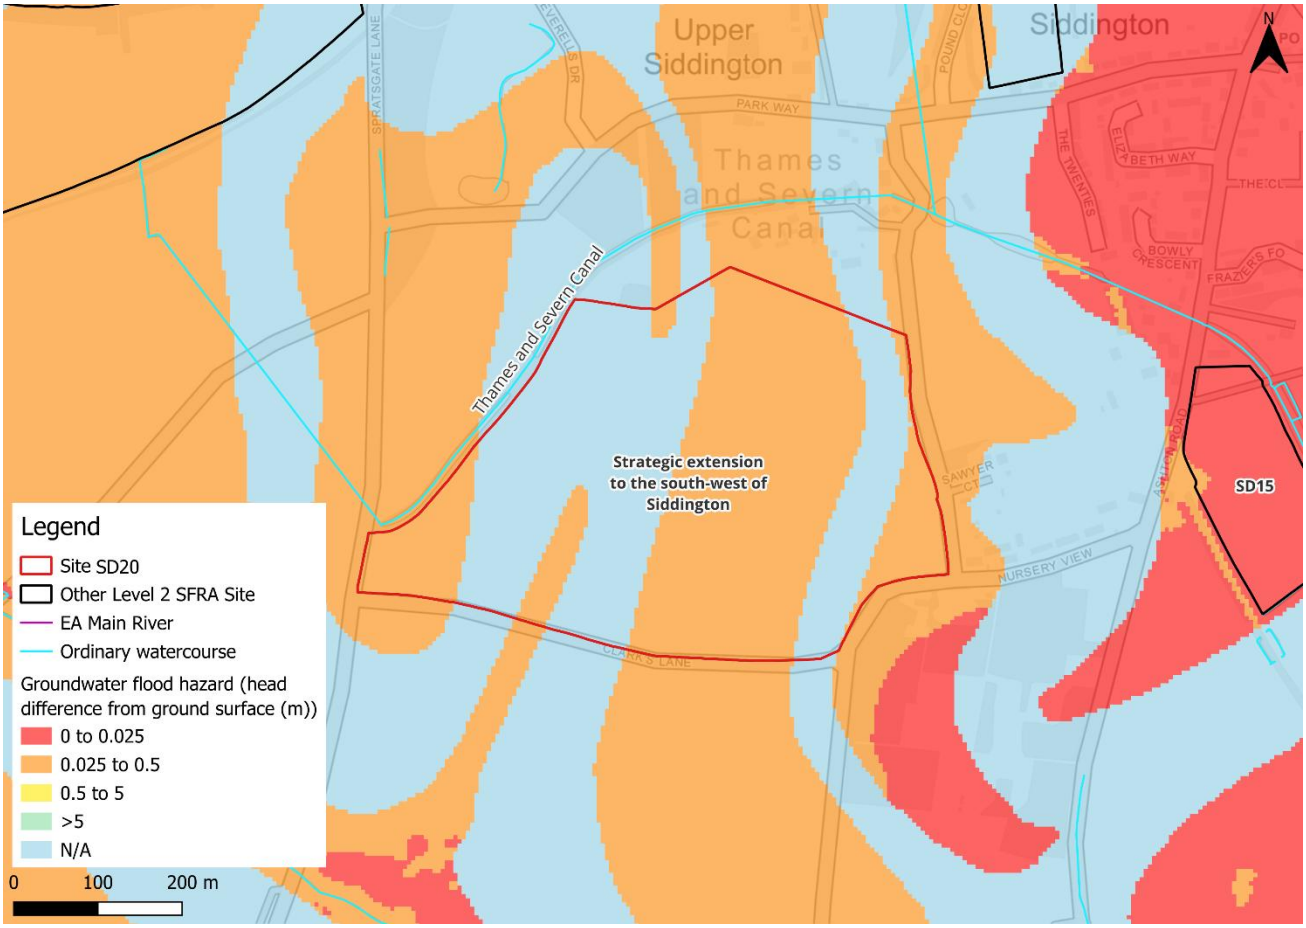

Figure 13-5: JBA 5m Groundwater Emergence Map

13.4 Summary and recommendations

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- The site is not required to pass the exception test as it is not located within Flood Zone 3a.
- The site is wholly within Flood Zone 1 and at no additional risk from climate change.
- There is no risk to the site from reservoir flooding.
- Development should be possible at this site given the low fluvial and nominal surface water flood risk to the site.
- Surface water risk is predominantly confined to an area of ponding along the southern site boundary, with largely shallow depths. Surface water flood hazard must be confirmed at the site-specific FRA stage.
- Onsite surface water flood risk is not likely to increase significantly in the future.
- Groundwater levels should be further investigated at the site-specific FRA stage through percolation testing in both wet and dry conditions.

- In line with LLFA guidance[24], the developer should aim to achieve greenfield runoff rates. The developer should also follow the National SuDS guidance.
- Safe access and escape routes appear to be achievable via Clark's Lane to the south, Spratsgate Lane to the west or the unnamed road to the east of the site.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WGAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

Contract

JBA Project Manager	Mike Williamson
Address	Phoenix House, Lakeside Drive, Centre Park, Warrington, WA1 1RX
JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Joanne Corbett of Cotswold District Council. Laura Thompson of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken in July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site C71. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site C71

- Location: Land adjacent ‘Donside’, off Barnway
- Existing site use: Wooded greenspace
- Existing site use vulnerability: Water compatible
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 0.33
- Watercourse: Gloucester Road Bypass Channel (Daglingworth Stream)
- Environment Agency (EA) flood model: Daglingworth Stream 2016 model
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of fluvial flood depths, velocities and hazards
    - Assessment of surface water flood extent, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

Figure 1-3: Topography

The topography of the site slopes gently from west to east towards the floodplain of Daglingworth Stream.

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the percentage areas of the site within each flood zone are stated in Table 2-1 and can be viewed on Figure 2-1. The Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

The site is partially within the functional floodplain due to risk from Daglingworth Stream and the Gloucester Road Bypass Channel though the majority of the site is within Flood Zone 1 and therefore at low risk from rivers and the sea. The functional floodplain in this location is based on the EA's New National Model (NNM) dataset 'Rivers and Sea 3.3% defended flood risk extents - present day'. The ordinary watercourse to the south of the site is unmodelled.

Table 2-1: Present day flood risk based on percentage area of site at risk

Flood Zone 1 (% area)	Flood Zone 2 (% area)	Flood Zone 3a (% area)	Flood Zone 3b (% area)
96	1	2	1

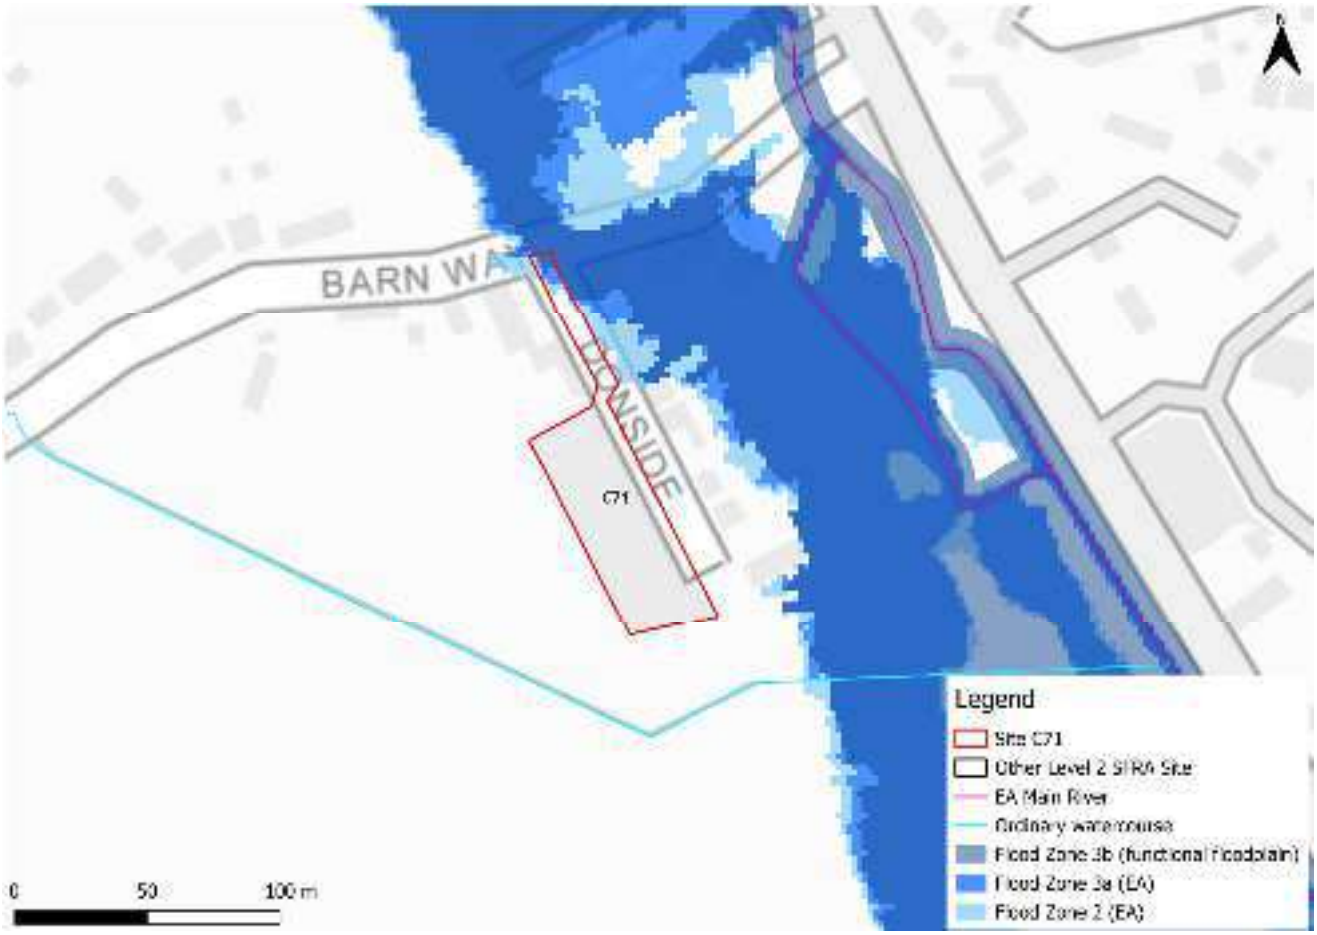

Figure 2-1: Present day risk

2.1.2 Daglingworth Stream 2016 model outputs

The Daglingworth Stream 2016 model is a 1D model and therefore does not contain any velocity or hazard information. Present day risk to the site comes from the Gloucester Road Bypass Channel of Daglingworth Stream. However, the detailed modelling shows that the site is not at risk from the 1% AEP undefended event. Figure 2-2 shows the modelled flood depths for the 1% AEP undefended event which is the event Flood Zone 3 of the Flood Map for Planning would normally represent. However, the Flood Map for Planning in this location is based on the NNM, not the outputs from the Daglingworth Stream 2016 model. The NNM does not contain depth or hazard data. The Daglingworth Stream 2016 model will require updating to robustly inform on risk to the site.

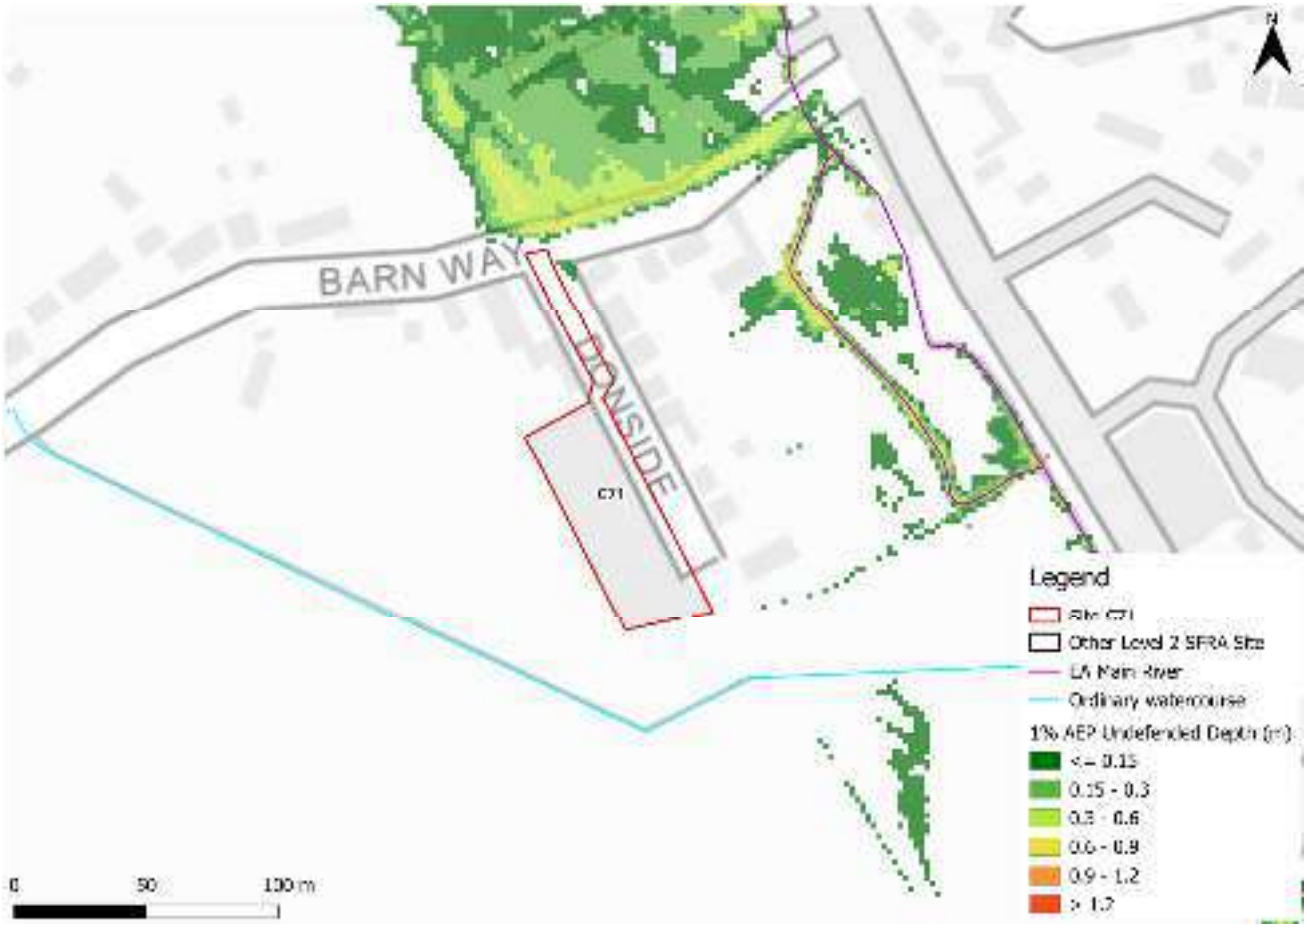

Figure 2-2: Flood depths for the 1% AEP undefended flood event

2.2 Impacts from climate change

2.2.1 Daglingworth Stream 2016 model outputs

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Gloucestershire and the Vale Management Catchment. The central allowance within this catchment is 26% on peak flows (Table 2-2). The impacts of climate change on flood risk are included in the model for

the 1% AEP undefended event using 30% on peak flows rather than the current central allowance of 26%.

Table 2-2: Modelled climate change allowances for peak river flows within the Gloucestershire and the Vale Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	11	17	33
2050s	11	19	43
2080s	26	41	84

Figure 2-3 shows the modelled flood depths for the 1% AEP undefended event plus the central allowance for peak river flows. There is risk to the access road on Barn Way with some significant flood depths apparent. However, it is likely that this model does not provide a up to date representation of flood risk along this watercourse.

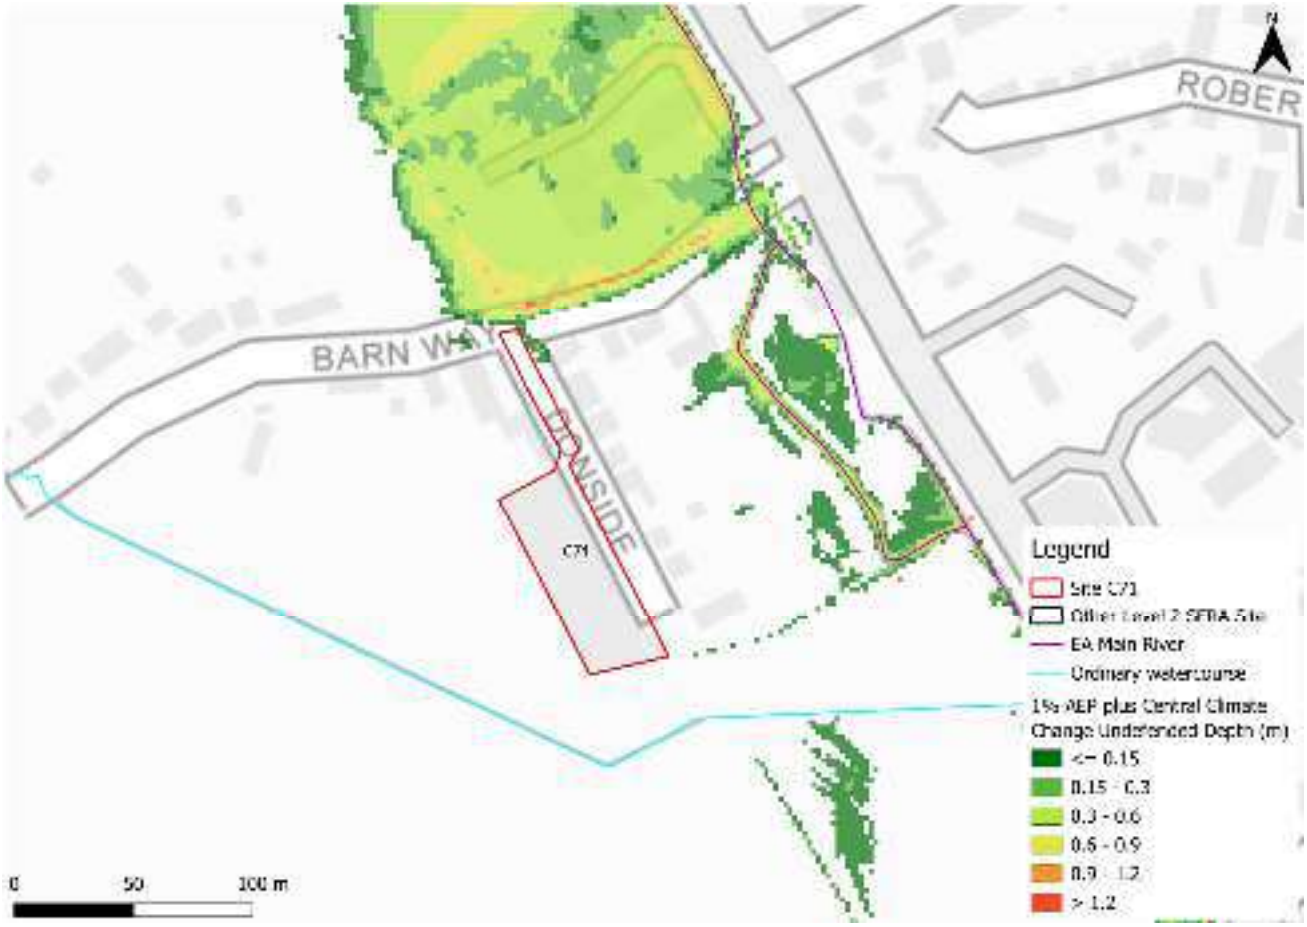

Figure 2-3: Flood depths for the 1% AEP undefended flood event plus central climate change allowance for the 2080s epoch

2.2.2 Flood Map for Planning - Flood Zones plus Climate Change

Figure 2-4 shows the Flood Map for Planning - Flood Zones plus Climate Change dataset which includes the central allowance for the 2080s epoch. This represents the impact of climate change on Flood Zone 3a and Flood Zone 2 combined. This shows a greater extent of flooding than the modelled event. This is due to the Flood Map for Planning outputs being based on the NNM and not the outputs from the Daglingworth Stream 2016 model, and also the fact that the Flood Zones plus Climate Change dataset also includes the larger 0.1% AEP event.

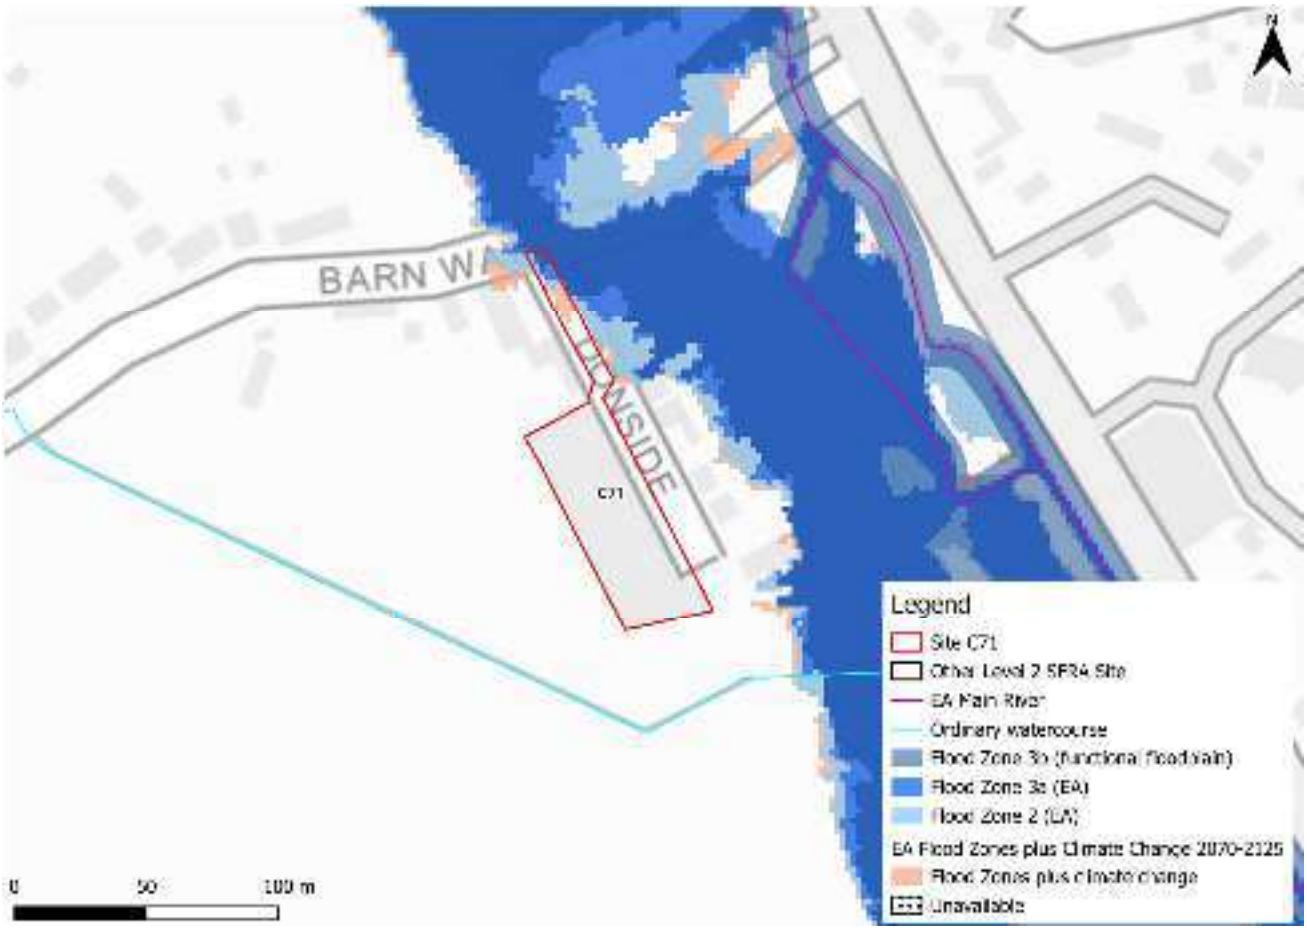

Figure 2-4: EA Flood Zones plus Climate Change

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been two recorded flooding incidents within the Stratton Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-5 shows that the site and wider area could benefit from riparian and floodplain tree planting. Tree planting can help to slow the flow to benefit areas downstream. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

Figure 2-5: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warnings and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The site and the adjacent floodplains are partially located within a FAA, namely the 'River Churn and its tributaries' FAA.

Figure 2-6: Flood warnings and alerts

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes could be challenging to achieve during a flood event, from the likely route of Barn Way. However, flood depths and hazards will need to be modelled to fully inform on safe access and escape routes (Figure 2-7).

Figure 2-7: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The vast majority of the site is located within Flood Zone 1 and therefore at low risk from rivers. However, there may be challenges achieving safe access and escape via Barn Way.
  - The Daglingworth Stream 2016 model is out of date and the EA's NNM is considered to be the most up to date information on fluvial risk to the site and surrounding area. The NNM does not contain depth or hazard information, therefore risk cannot be robustly defined at this stage.
  - The Flood Map for Planning shows the site could be at additional risk from climate change.
  - Risk from the unmodelled ordinary watercourse must be quantified through appropriate investigations and potential modelling, in consultation with the LLFA.

- Mitigation:
  - It is not appropriate at this stage to advise on potential mitigations, given the absence of sufficiently robust and up to date flood risk information. An updated model for Daglingworth Stream must be developed to robustly define risk to the site and the surrounding area.
  - EA flood warnings and alerts should continue to be in place to ensure early evacuation of site users before an extreme flood event occurs.
- Access and escape:
  - Based on current information, safe access and escape routes will be challenging to achieve. Updated modelling must be carried out to inform on access and escape routes.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents Present Day maps (May 2026), the site is predominantly at low risk of surface water flooding as shown in Table 3-1 and Figure 3-1 and also the depth map in Figure 3-2.

Safe access and escape routes are achievable via Barn Way, when considering surface water risk only.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning Extents Present Day datasets

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
99	1	0	0

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

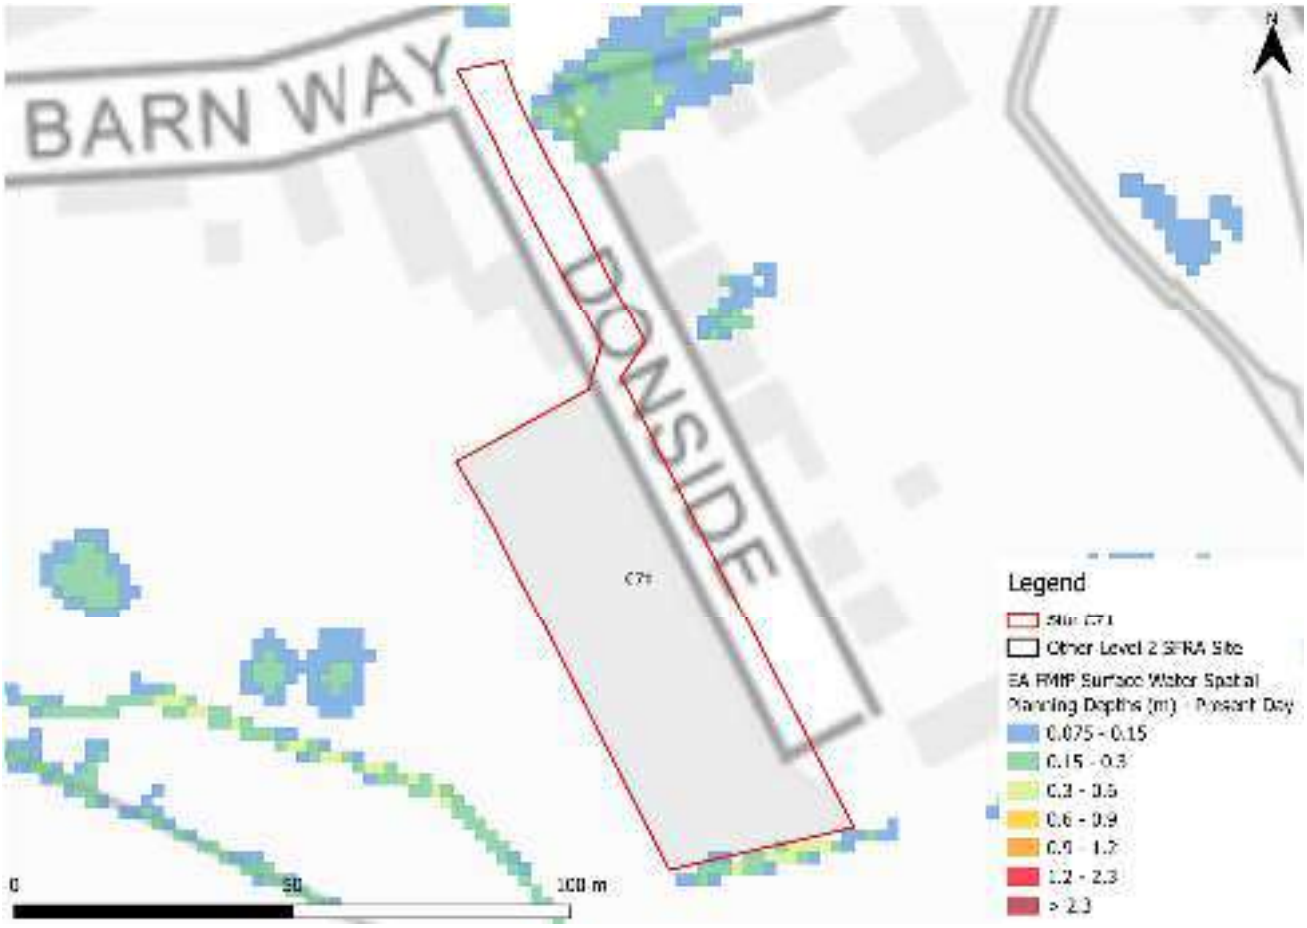

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 0.1% AEP event flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows there to be a low flood hazard at the access point on Barn Way (Figure 3-3). There are minor differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping. However, updated surface water hazard information should be confirmed at the site-specific FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

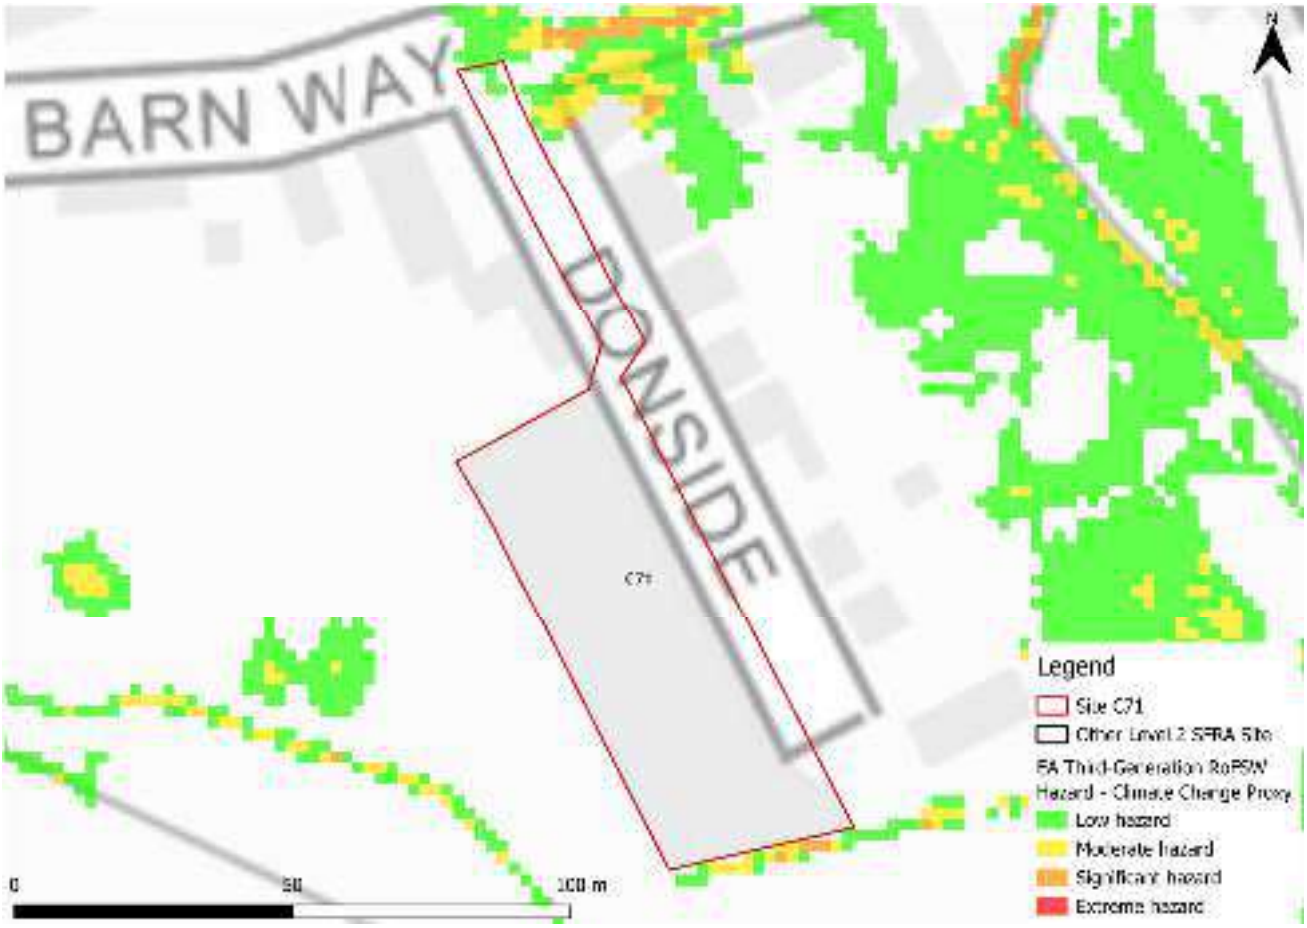

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day low risk surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Climate Change

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Gloucestershire and the Vale management catchment are shown in

Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Gloucestershire and the Vale Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. The site is not shown to be at significant additional risk from surface water climate change. However, there is an area of ponding within the site in the 0.1% AEP plus climate change event. Flood depths are shallow, not exceeding 0.3m (Figure 3-5).

Safe access and escape routes would likely remain achievable via Barn Way.

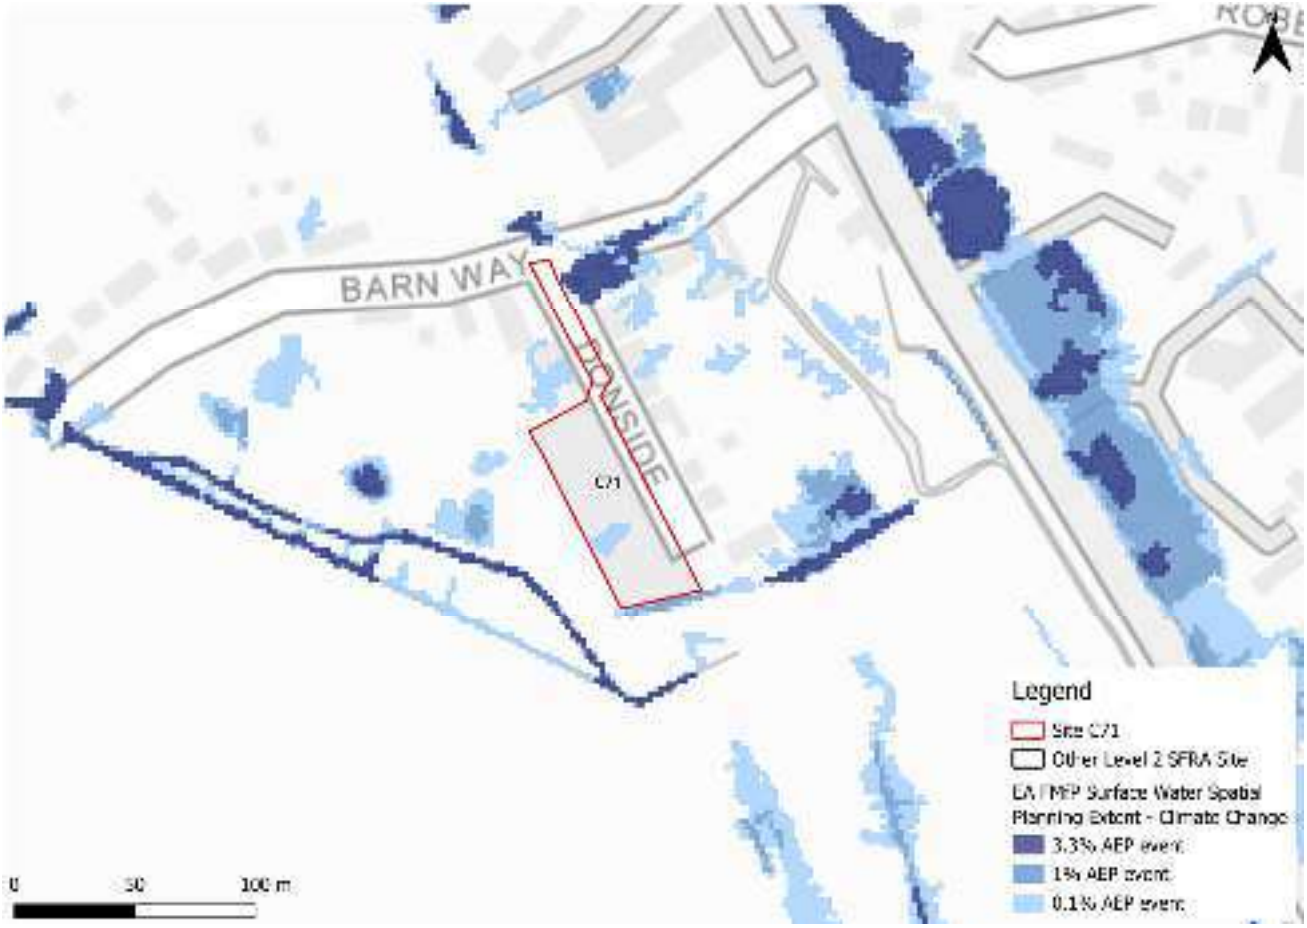

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

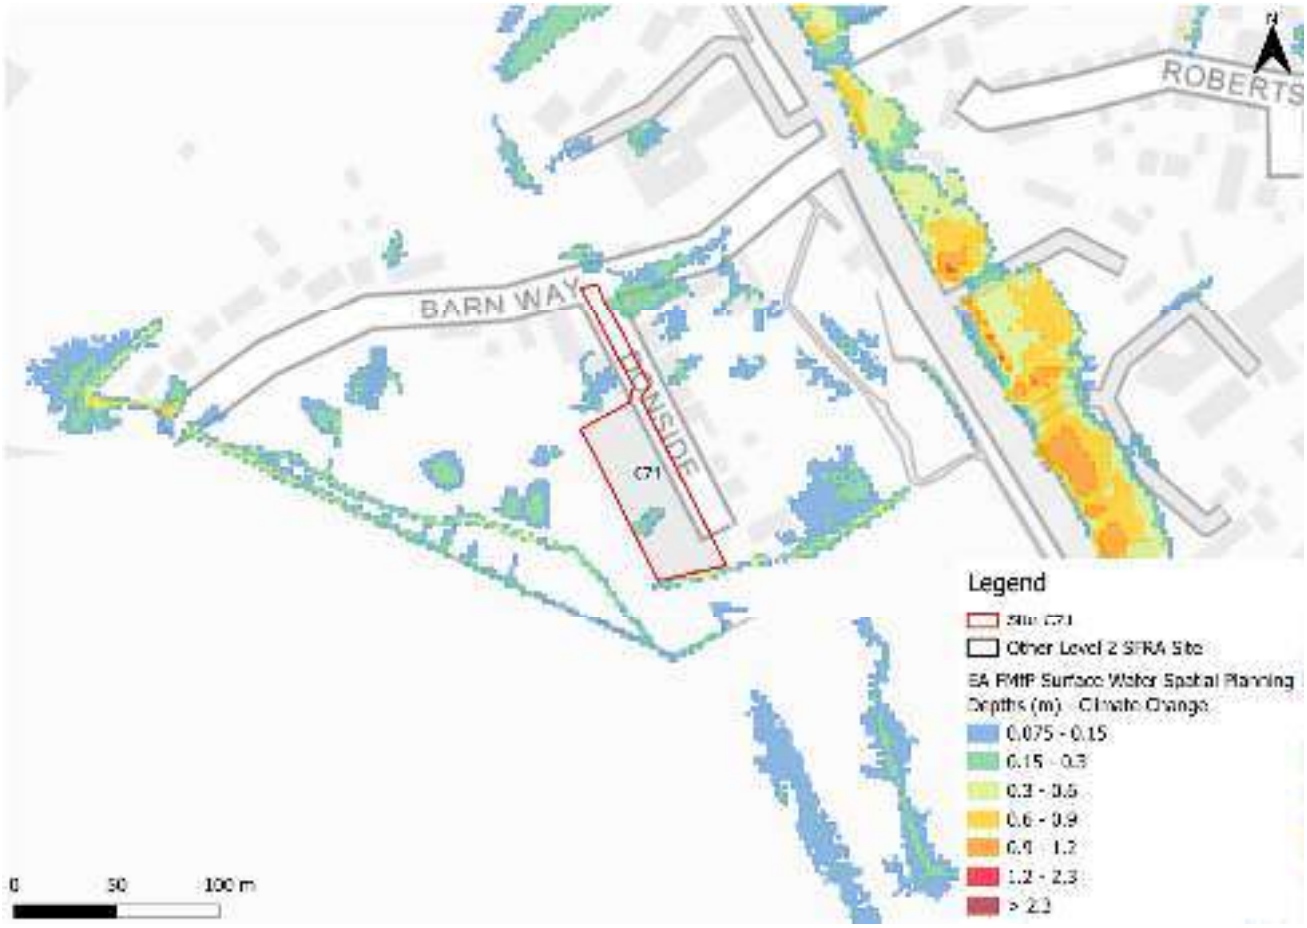

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 0.1% AEP event flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is categorised as low (Figure 3-3).

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There are no recorded sewer flooding incidents nearby the site nor within the Stratton Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 99% of the site being outside of the 0.1% AEP surface water flood extent.
- Risk to the site is shown to slightly increase in extent within the site when considering the impact of climate change with a shallow area of ponding developing in the 0.1% AEP event.
- Topographic low spots should be considered and included in site design and ideally left in place to flood naturally when required.
- The drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.
- Safe access and escape routes would likely be achievable via Barn Way when considering surface water risk in isolation.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within one catchment, namely, the Daglingworth Stream (Source to Churn) catchment. This catchment is ranked as a low sensitivity catchment. Planning considerations for all sites can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications. The site is classified as no risk and therefore any infiltration SuDS should be suitable within these areas.

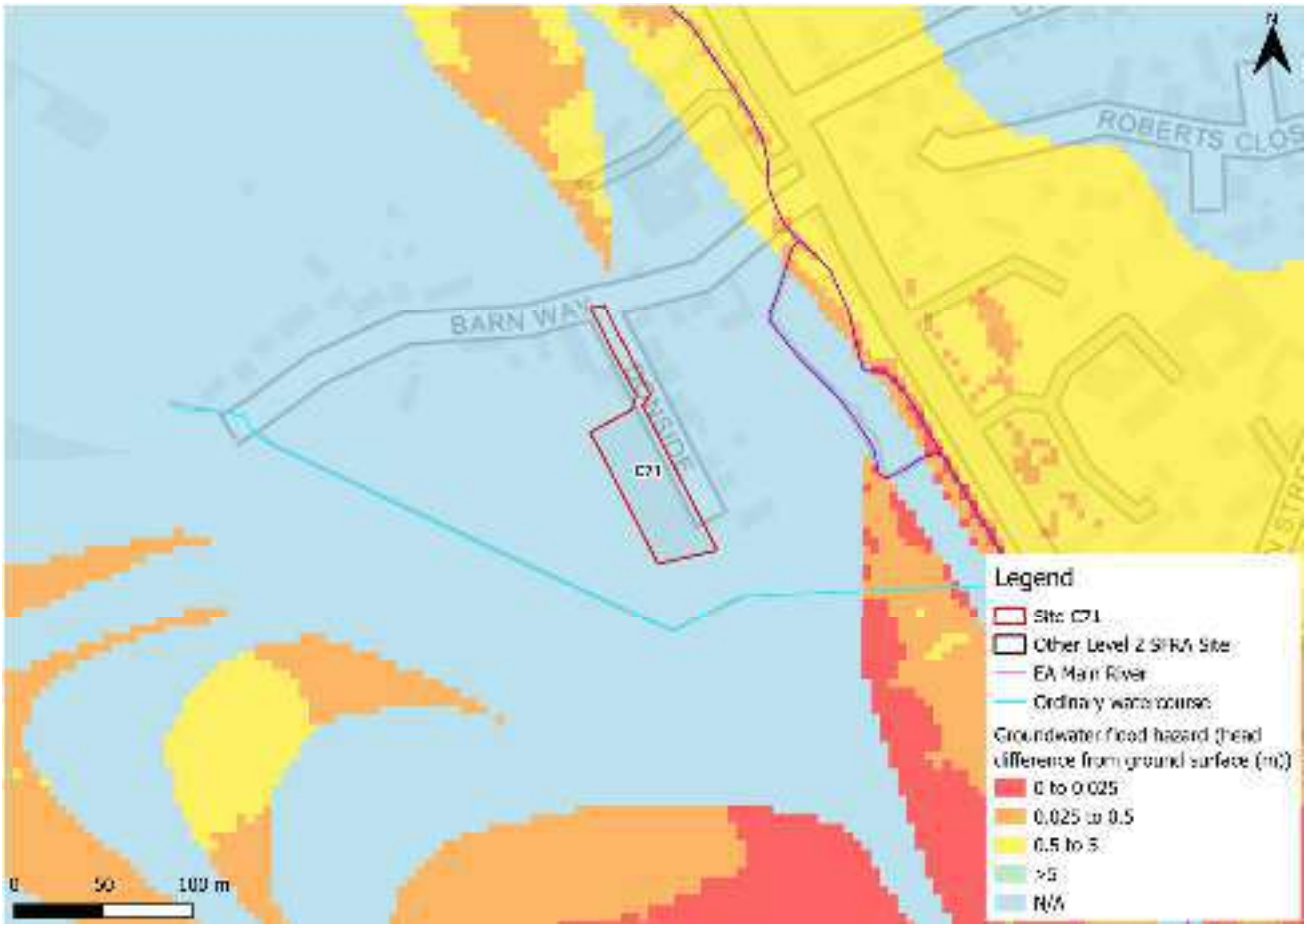

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is sandstone, limestone and argillaceous rocks (Figure 5-2) which generally have high permeability and porosity, allowing water to infiltrate into the rock. Infiltration SuDS at this site should be an option though the drainage strategy for the site should fully investigate water table levels and ground conditions. There is no record of superficial deposits in the area.

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There are no defences in place along the Daglingworth Stream. However, the watercourse is culverted under Barn Way, as indicated by the green circle on Figure 6-1. There is a potential residual risk of a blockage of this culvert. This risk should be investigated at the site-specific FRA stage.

Figure 6-1: Culvert location (green circle)

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is required to pass part b) of the exception test as it is proposed for more vulnerable residential development and is partially located within Flood Zone 3a. The risk is confined to the access road into the site, according to the Flood Map for Planning. As stated in para 005 of the PPG, for a site to be considered safe for its lifetime, it must be proven that residents and users can safely access and exit a building during a design flood and to evacuate before an extreme flood (0.1% annual probability of flooding with allowance for climate change). Updated modelling of Daglingworth Stream is required to inform the Exception Test.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be possible to allocate this site based on current information. However, the Daglingworth Stream model must be updated to robustly define the risk to the site and the access road for both present day and with climate change.
- Based on the Flood Map for Planning and the functional floodplain, the access and escape route via Donside and Barn Way should be redirected to Flood Zone 1.
- Risk from the unmodelled ordinary watercourse must be quantified through appropriate investigations and potential modelling.
- A drainage strategy should ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WGAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Joanne Corbett of Cotswold District Council. Laura Thompson of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken in August 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site DA16A. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site DA16A

- Location: Down Ampney Road
- Existing site use: Open greenspace
- Existing site use vulnerability: Water compatible
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 2.76
- Watercourse: Ampney Brook, ordinary watercourses
- Environment Agency (EA) flood model: Ampney Brook Thames (MRL to St Johns) 2014 model
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of fluvial flood depths, velocities and hazards
    - Assessment of surface water flood extent, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

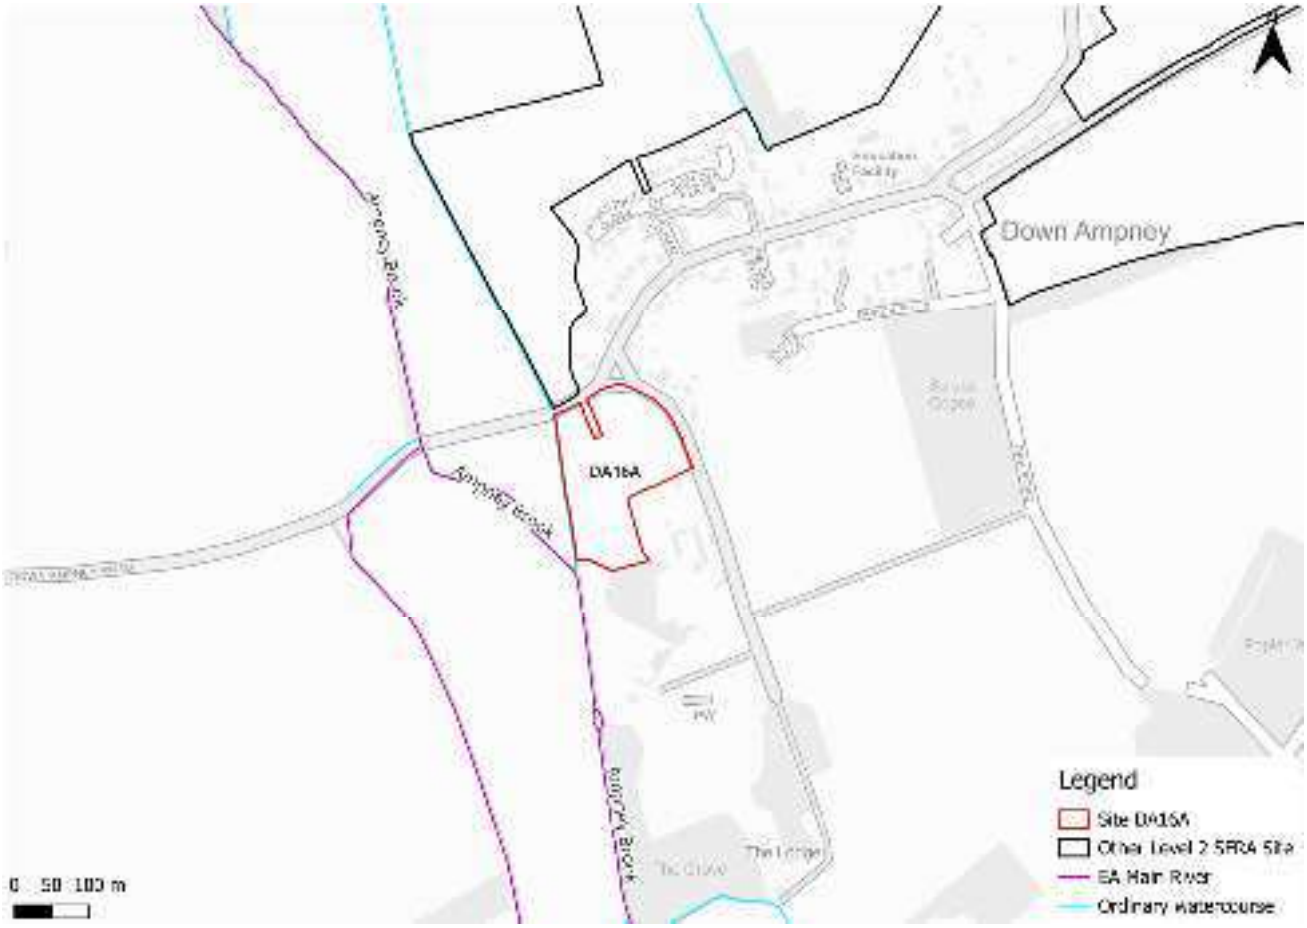

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

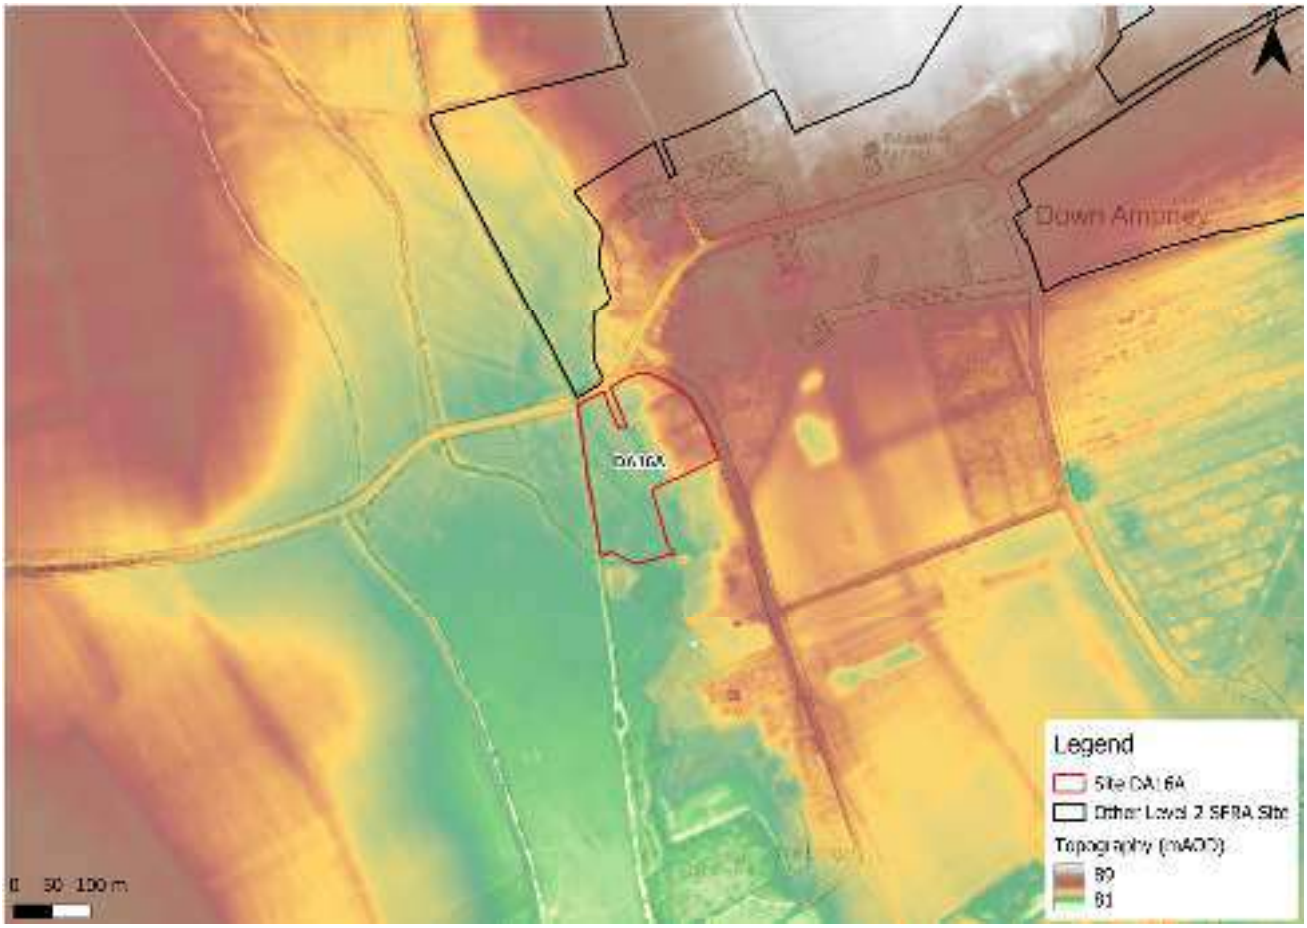

Figure 1-3: Topography

The topography of the site slopes from east to west towards the floodplain of Ampney Brook.

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the percentage areas of the site within each flood zone are stated in Table 2-1 and can be viewed on Figure 2-1. The Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

Over half of the site is within the functional floodplain due to risk from Ampney Brook. The functional floodplain in this location is based on a combination of the modelled 2% AEP defended flood event from the Ampney Brook Thames (MRL to St Johns) 2014 model, and the EA's New National Model (NNM) dataset 'Rivers and Sea 3.3% defended flood risk extents - present day'. There should be no development within the functional floodplain.

Table 2-1: Present day flood risk based on percentage area of site at risk

Flood Zone 1 (% area)	Flood Zone 2 (% area)	Flood Zone 3a (% area)	Flood Zone 3b (% area)
41	2	3	54

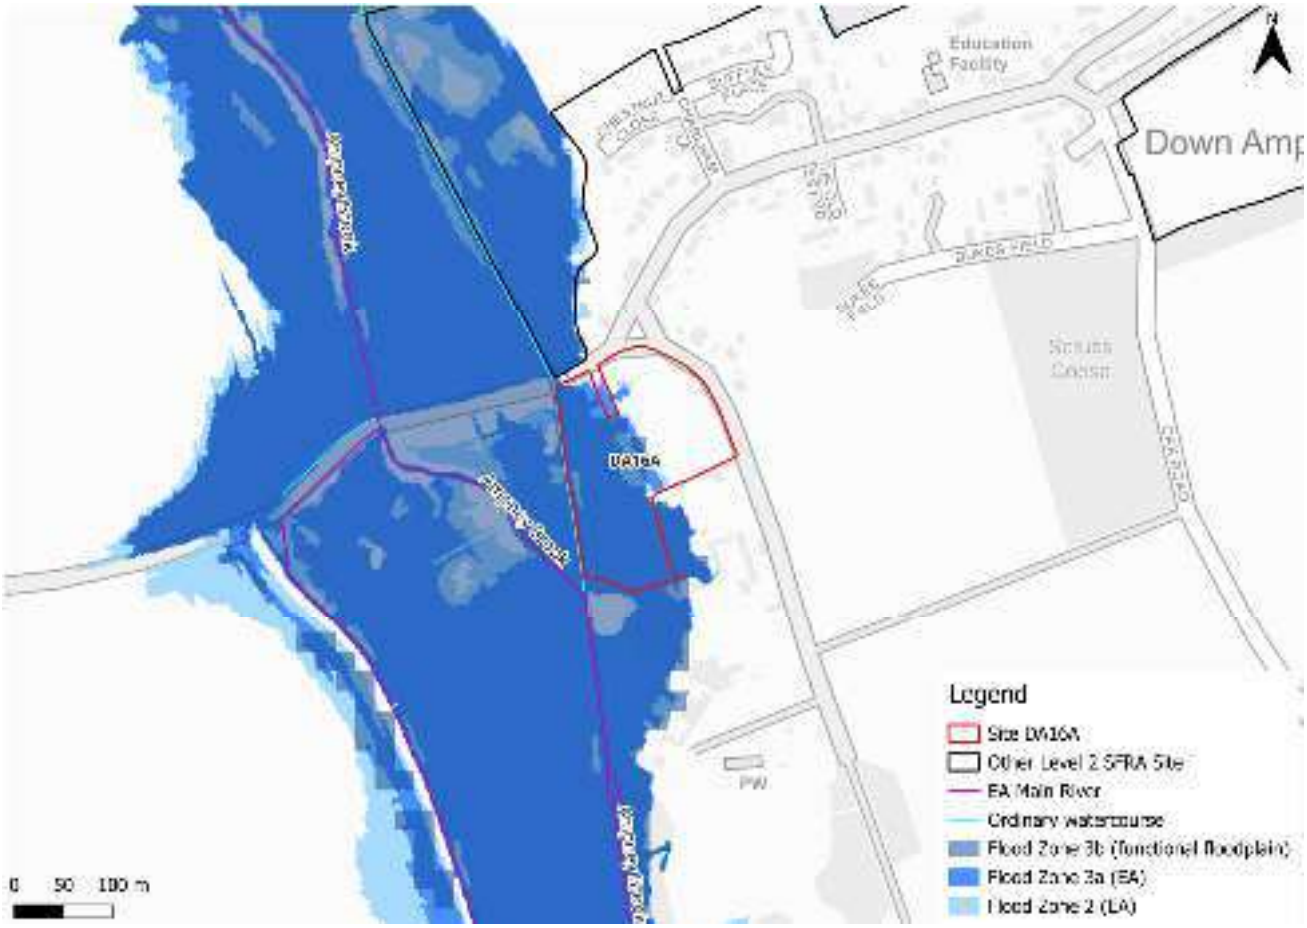

Figure 2-1: Present day risk

2.1.2 Ampney Brook Thames (MRL to St Johns) 2014 model outputs

Present day risk to the site comes from Ampney Brook to the west of the site. However, the Flood Map for Planning is not based on the outputs from this model but on the NNM. The NNM does not contain depth or hazard data. The Ampney Brook Thames (MRL to St Johns) 2014 model will therefore require updating to robustly inform on risk to the site.

However, Figure 2-2, Figure 2-3, Figure 2-4 present the modelled flood depths, velocities, and hazards respectively for the 1% AEP undefended event, this being the event Flood Zone 3 of the Flood Map for Planning would normally represent. Depths are mainly shallow, velocities low, and hazards mainly very low or danger for some.

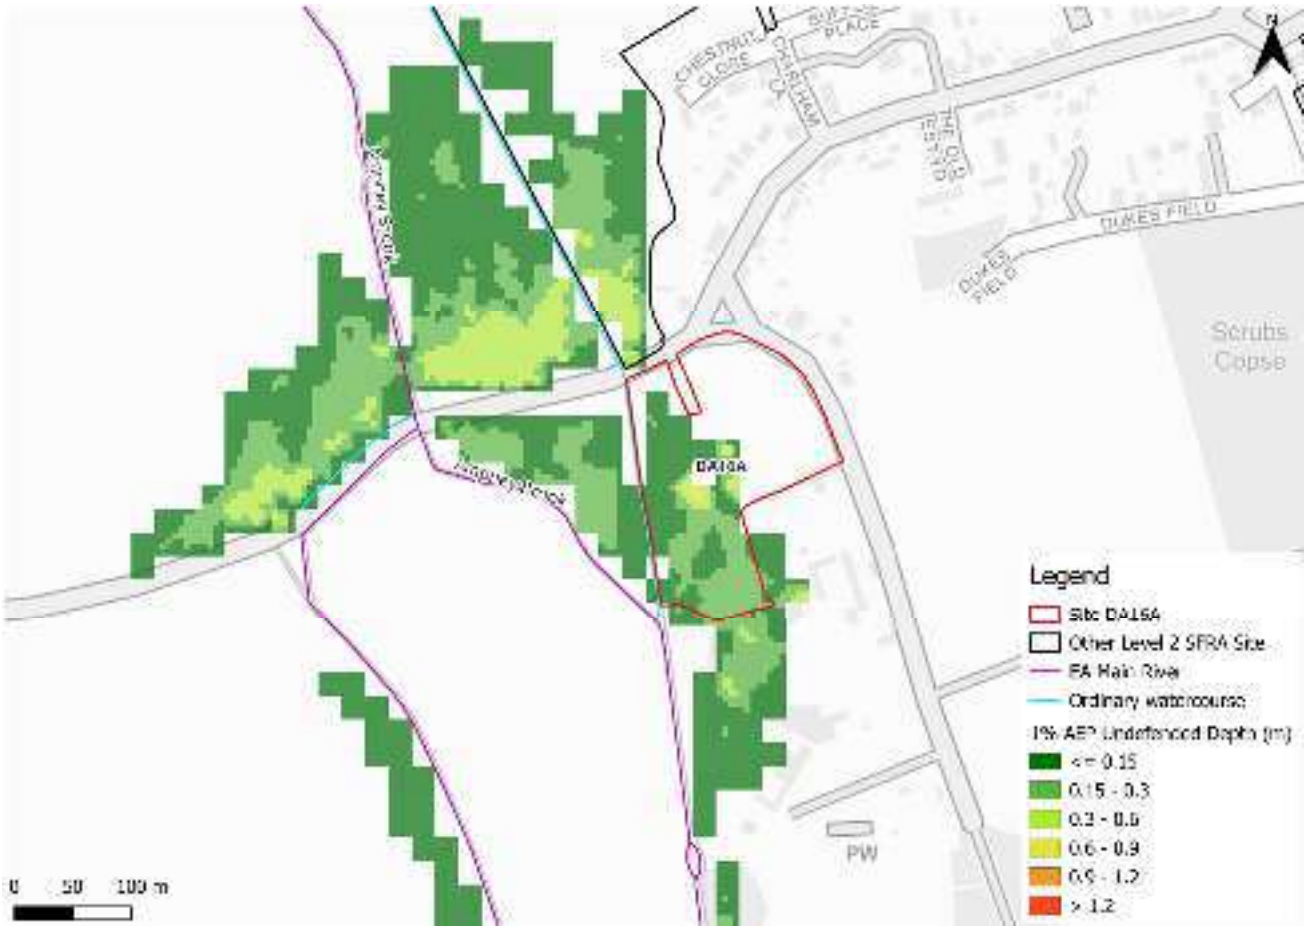

Figure 2-2: Flood depths for the 1% AEP undefended flood event

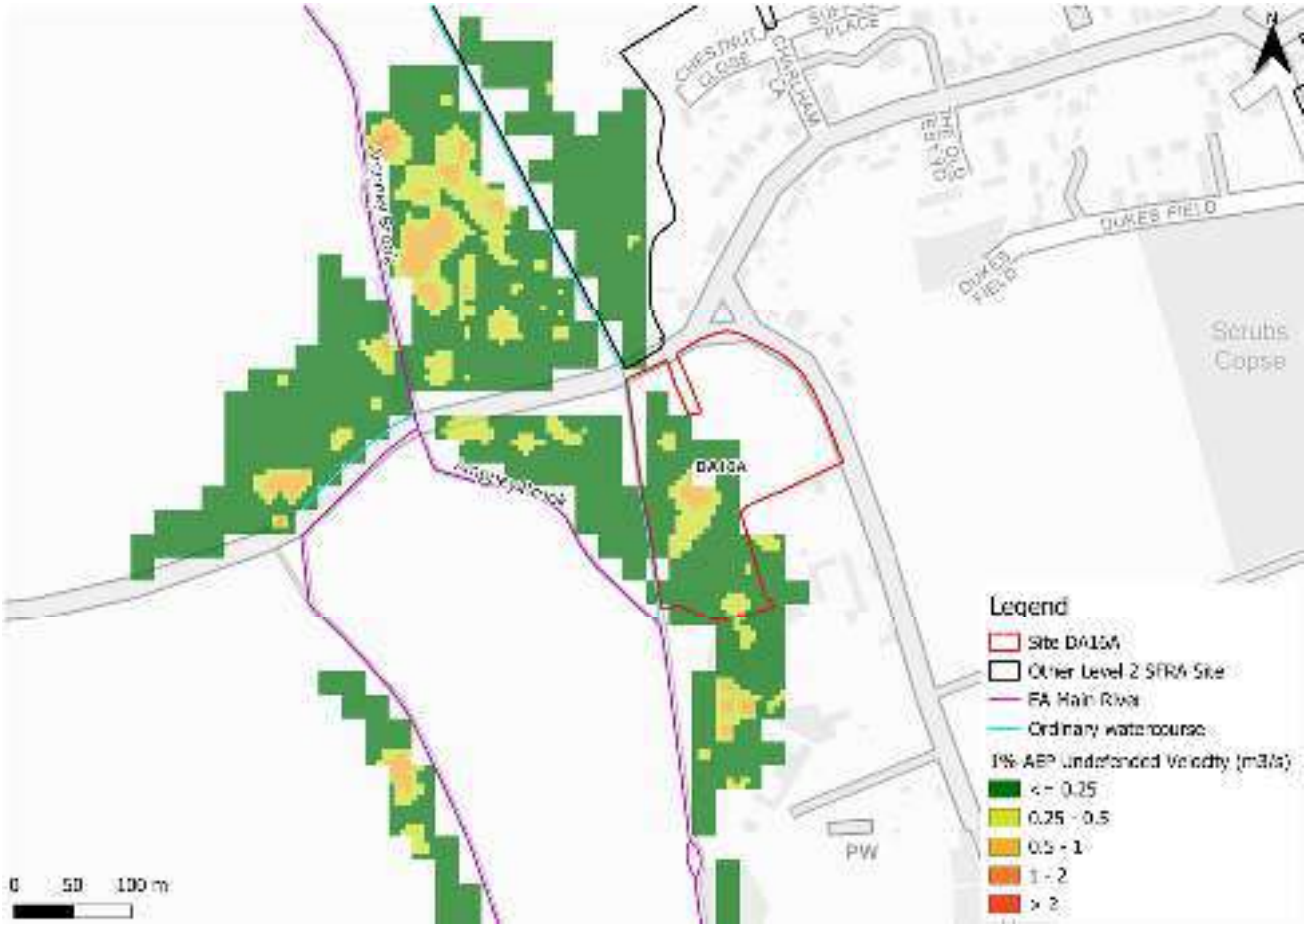

Figure 2-3: Flood velocities for the 1% AEP undefended flood event

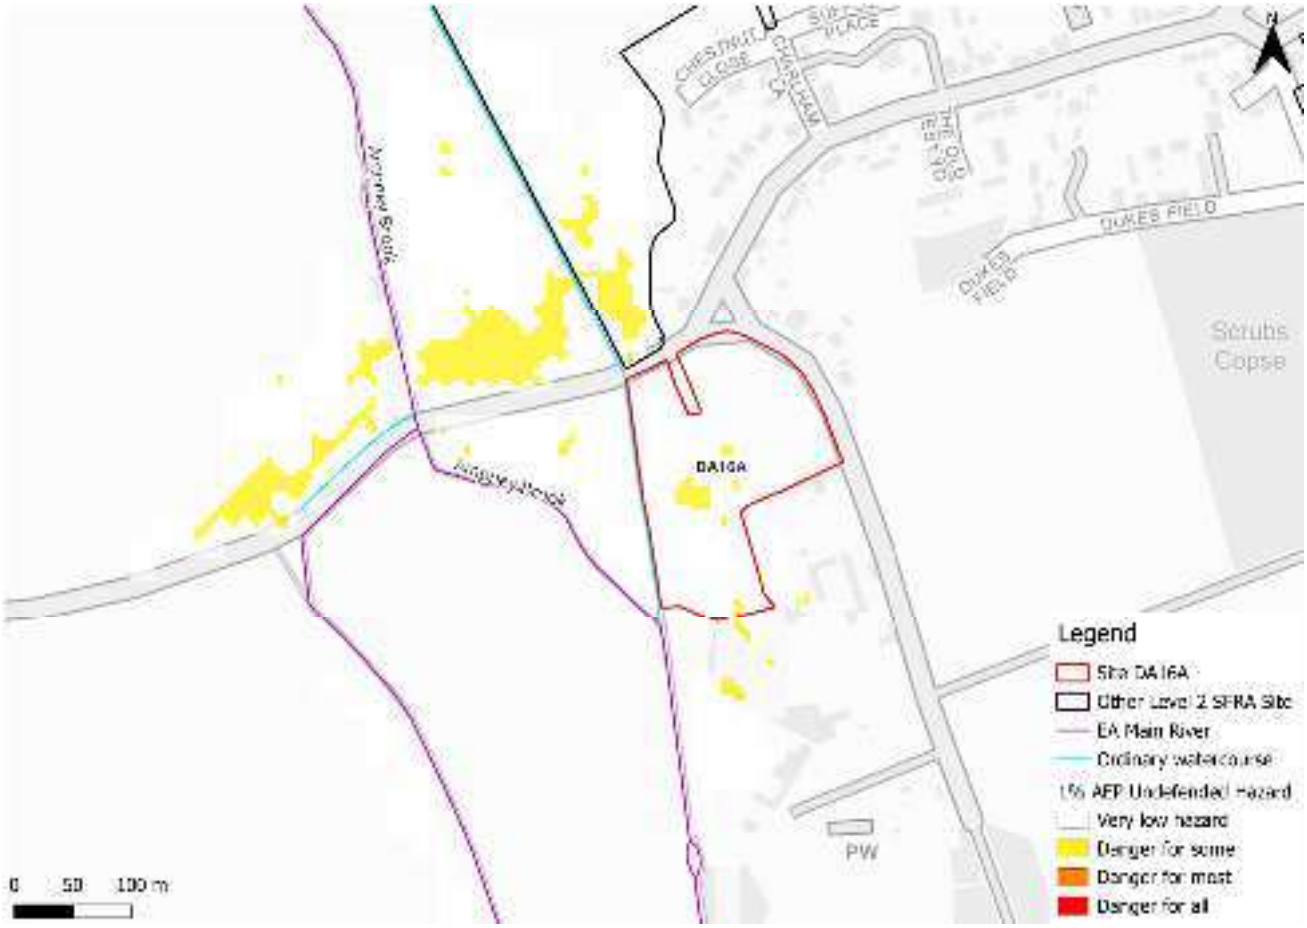

Figure 2-4: Flood hazards for the 1% AEP undefended flood event

2.2 Impacts from climate change

2.2.1 Ampney Brook Thames (MRL to St Johns) 2014 model outputs

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Gloucestershire and the Vale Management Catchment. The central allowance within this catchment is 26% on peak flows (Table 2-2). The impacts of climate change on flood risk are included in the model for the 1% AEP undefended event using 30% on peak flows rather than the current central allowance of 26%.

Table 2-2: Modelled climate change allowances for peak river flows within the Gloucestershire and the Vale Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	11	17	33
2050s	11	19	43
2080s	26	41	84

Figure 2-5, Figure 2-6, and Figure 2-7 show the modelled flood depths, velocities, and hazards respectively for the 1% AEP undefended event plus the central allowance for peak river flows. The risk area does not significantly increase in size though depths and velocities do increase across the risk area. Hazards remain the same.

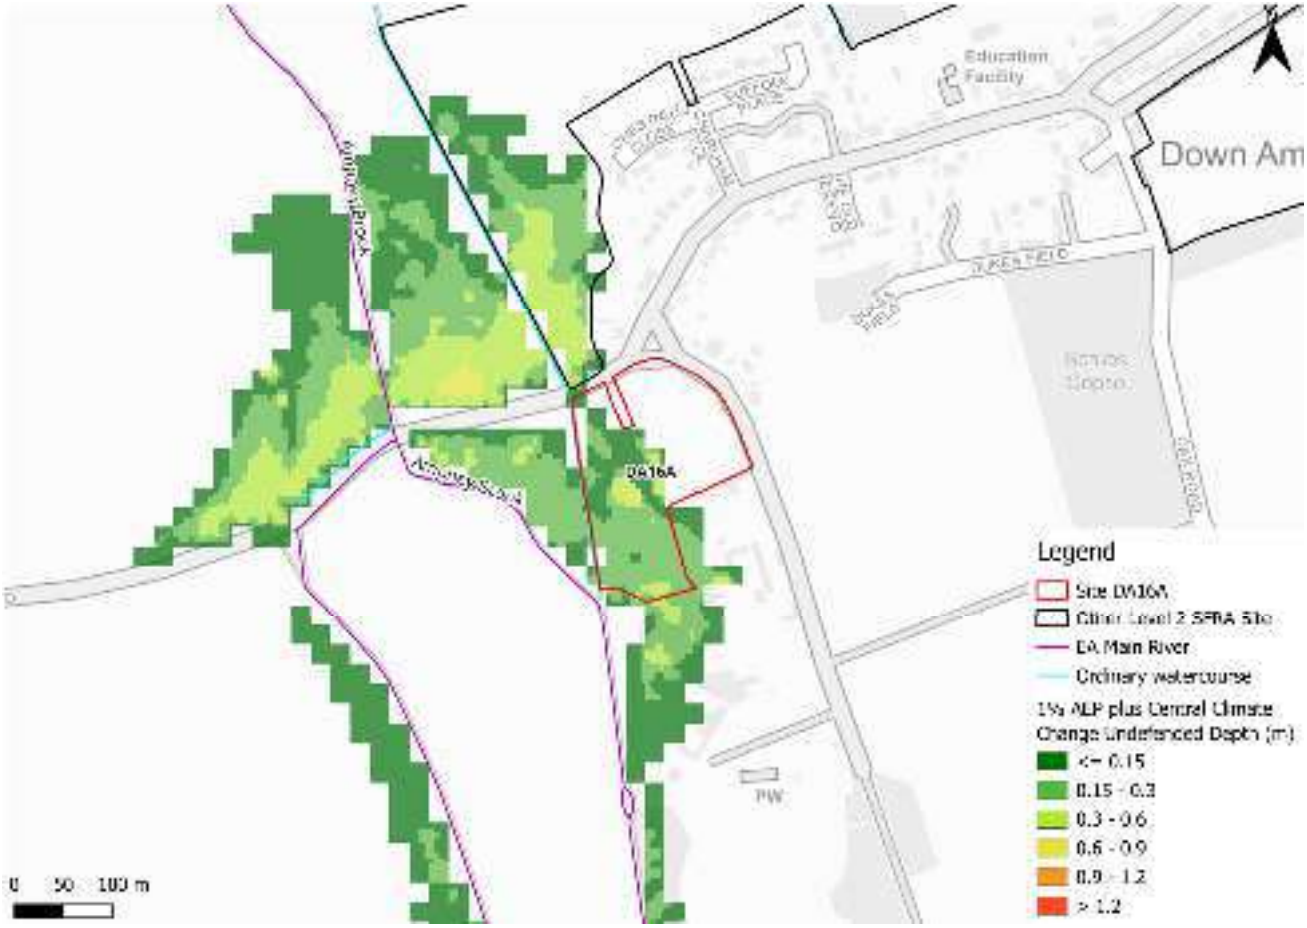

Figure 2-5: Flood depths for the 1% AEP undefended flood event plus central climate change allowance for the 2080s epoch

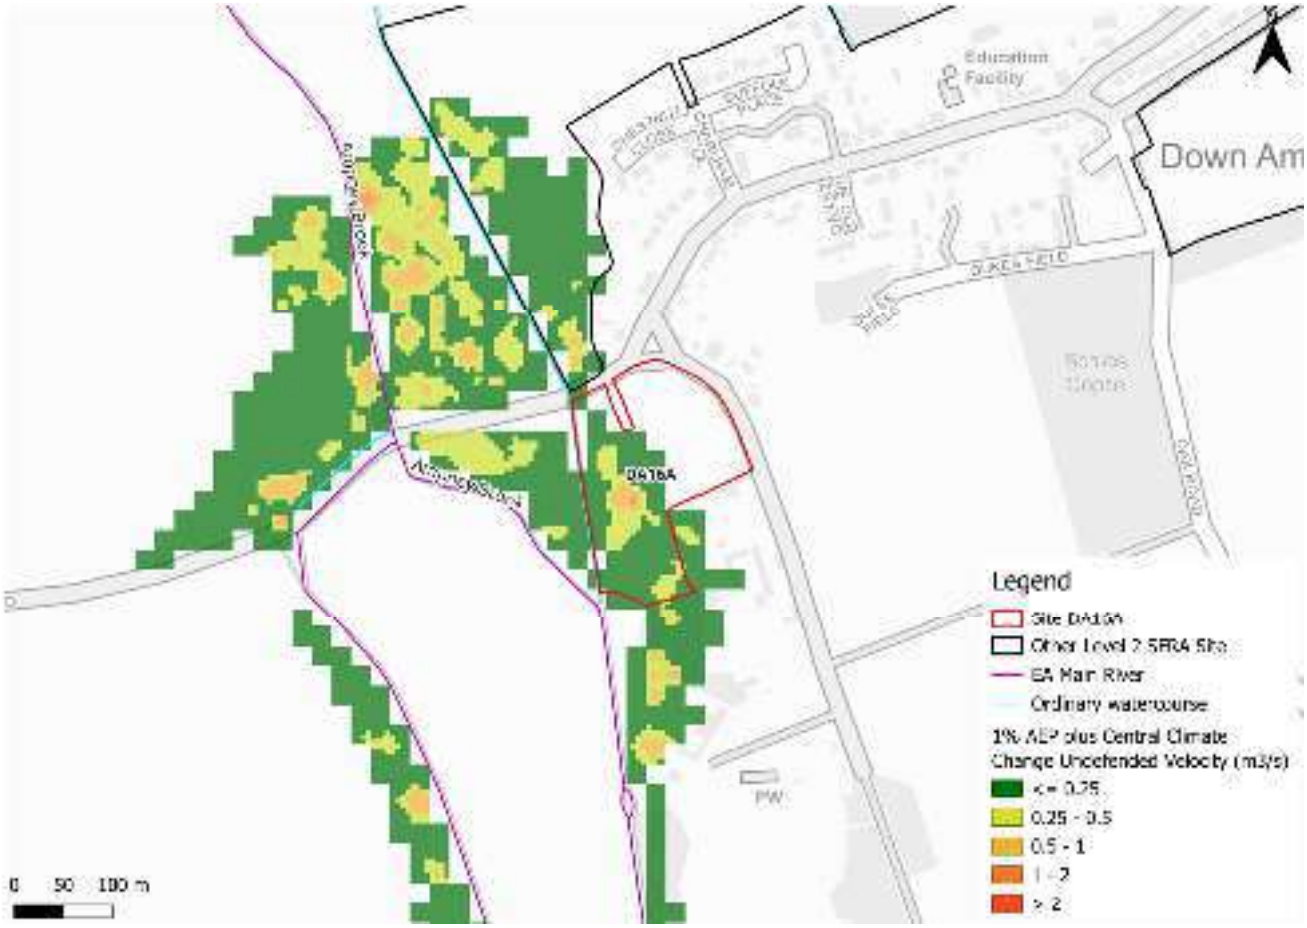

Figure 2-6: Flood velocities for the 1% AEP undefended flood event plus central climate change allowance for the 2080s epoch

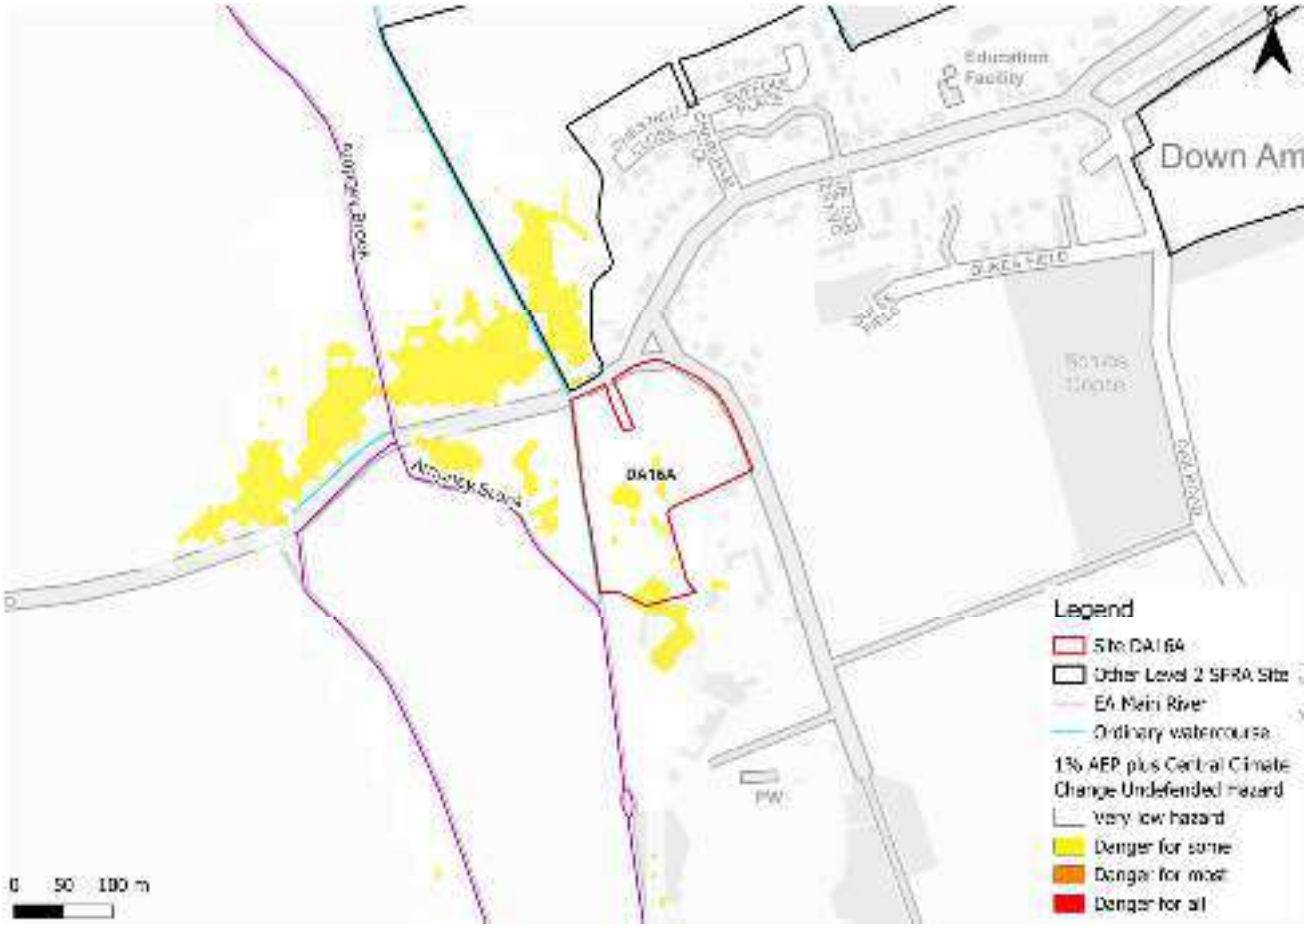

Figure 2-7: Flood hazards for the 1% AEP undefended flood event plus central climate change allowance for the 2080s epoch

2.2.2 Flood Map for Planning - Flood Zones plus Climate Change

Figure 2-8 shows the Flood Map for Planning - Flood Zones plus Climate Change dataset which includes the central allowance for the 2080s epoch. This represents the impact of climate change on Flood Zone 3a and Flood Zone 2 combined. This shows a greater extent of flooding than the modelled event. This is due to the Flood Map for Planning outputs being based on the NNM and not the outputs from the Ampney Brook Thames (MRL to St Johns) 2014 model, and also the fact that the Flood Zones plus Climate Change dataset also includes the larger 0.1% AEP event.

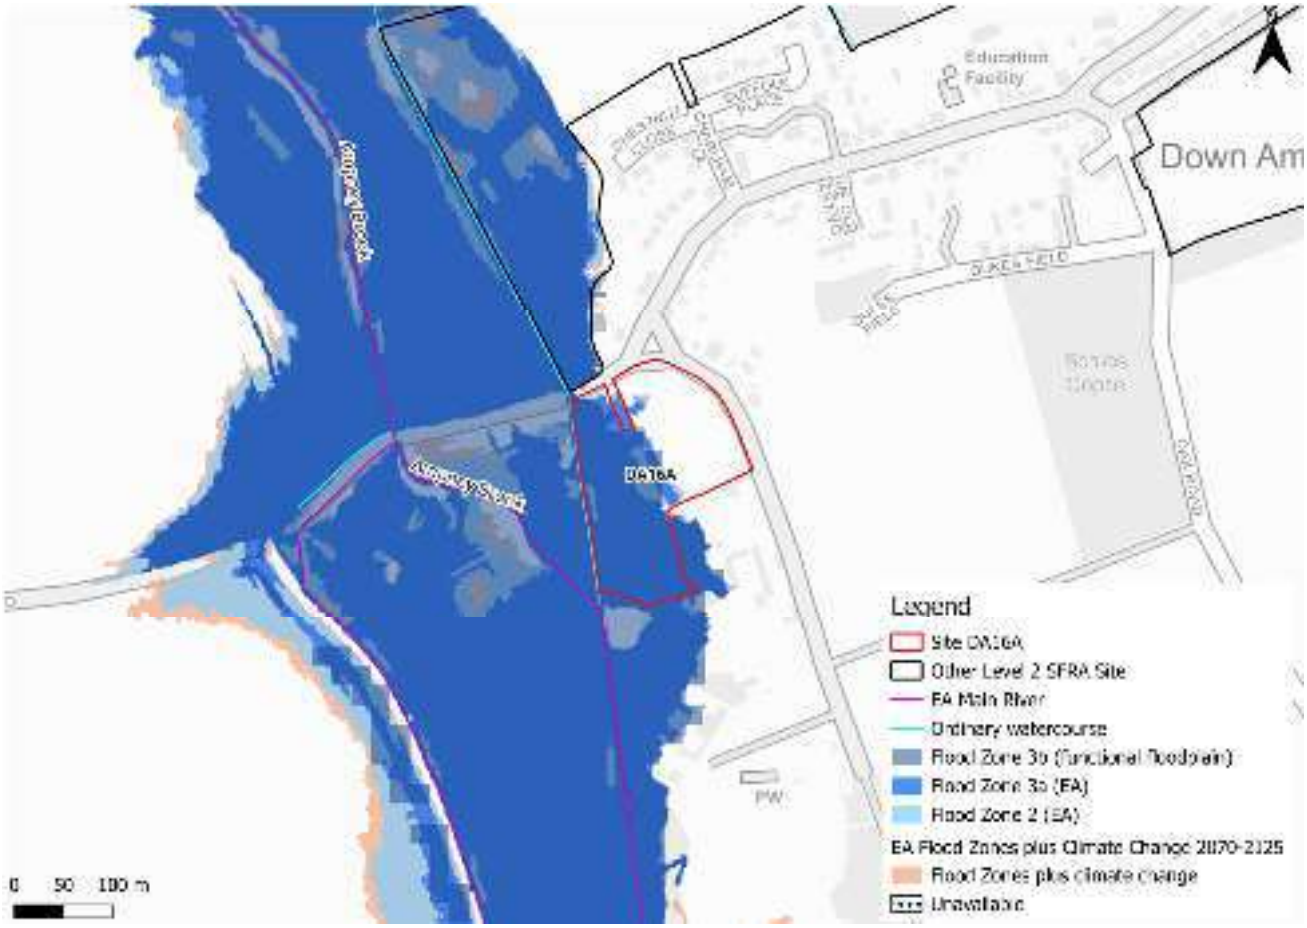

Figure 2-8: EA Flood Zones plus Climate Change

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been 11 recorded flooding incidents within the Ampneys & Hampton Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-9 shows that the site and wider area could benefit from riparian, floodplain, and wider catchment tree planting. Tree planting can help to slow the

flow to benefit areas downstream. There is also potential for floodplain reconnection to restore the natural floodplain which can help with floodwater attenuation. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

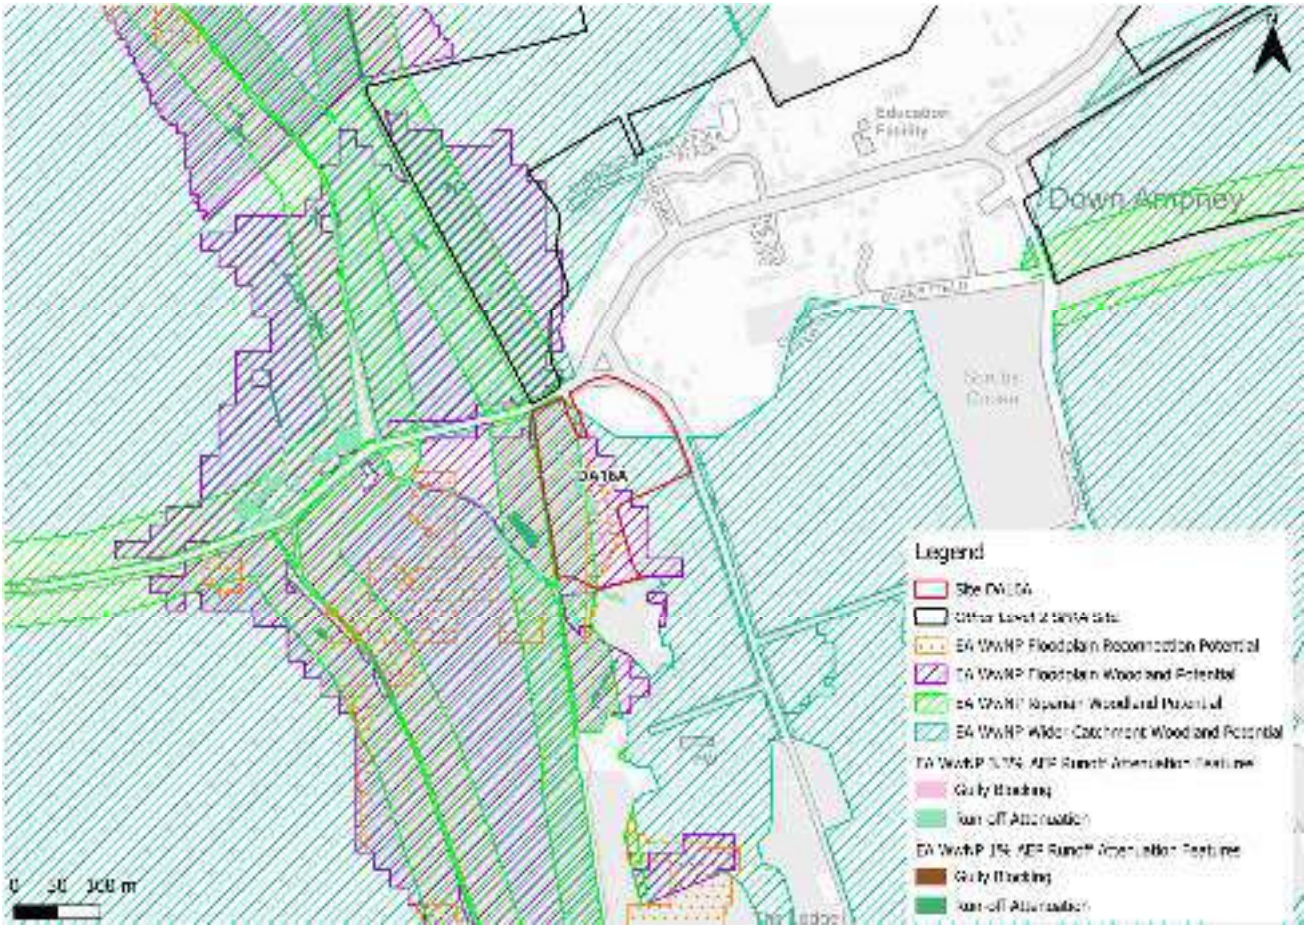

Figure 2-9: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warning and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The majority of the risk area is included within a FWA, namely the 'Ampney Brook from Ampney Crucis to Sheeppen Bridge' FWA, as shown in Figure 2-10.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The site and the adjacent floodplains are partially located within a FAA, namely the 'Ampney Brook from Barnsley Wood to Sheeppen Bridge' FAA, as shown in Figure 2-10.

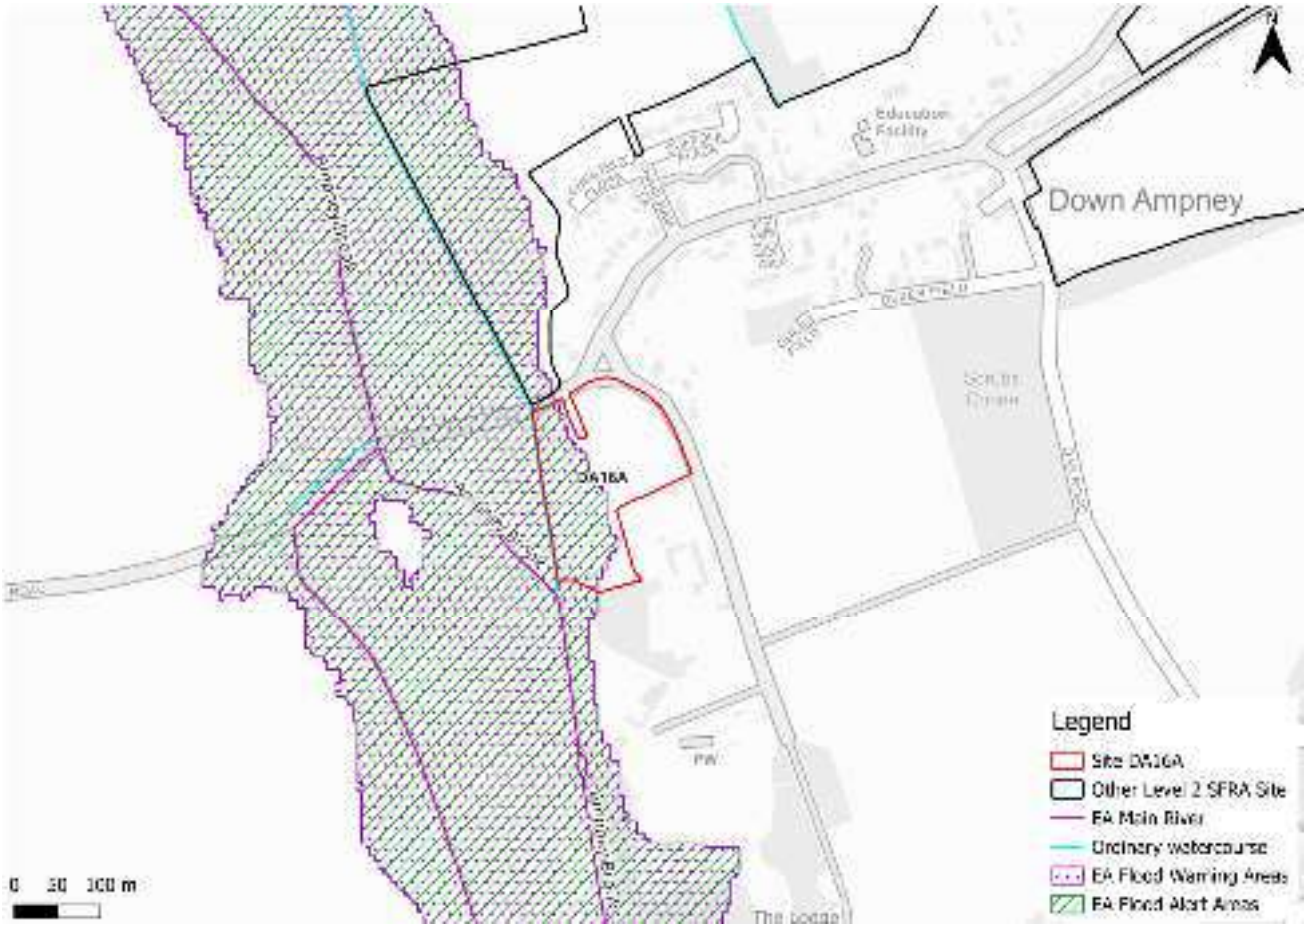

Figure 2-10: Flood warnings and alerts

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes could likely be achieved during a flood event via the north of the site to Charlham Way. However, updated modelling of Ampney Brook will be required to fully inform on safe access and escape routes (Figure 2-11).

Figure 2-11: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The area of the site within the functional floodplain should not be developed and should remain as open greenspace. Ideally, all built development would be directed to Flood Zone 1 whilst also accounting for the impacts of climate change. More vulnerable development should not be permitted within the undefended 0.5% AEP plus upper end climate change event risk area. All risk areas would ideally be utilised as open green space, providing a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits.
  - The Ampney Brook Thames (MRL to St Johns) 2014 model is out of date and the EA's NNM is considered to be the most up to date information on fluvial risk to the site and surrounding area. The NNM does not contain depth or hazard information, therefore risk cannot be robustly defined at this stage.
  - The Flood Map for Planning shows the site could be at additional risk from climate change.

- Mitigation:
  - It is not appropriate at this stage to advise on potential mitigations, given the absence of sufficiently robust and up to date flood risk information. An updated model for Ampney Brook must be developed to robustly define risk to the site and the surrounding areas.
  - EA flood warnings and alerts should continue to be in place to ensure early evacuation of site users before an extreme flood event occurs.
- Access and escape:
  - Based on current information, safe access and escape routes appear achievable via the north of the site. Updated modelling must be carried out to inform on access and escape routes.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents Present Day maps (May 2026), the site is predominantly at low risk of surface water flooding as shown in Table 3-1 and Figure 3-1 and also the depth map in Figure 3-2. There are two flow paths in the centre of the site of shallow flood depths <0.3m.

Safe access and escape routes are achievable in several locations, when considering surface water risk only.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning Extents Present Day dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
91	4	3	2

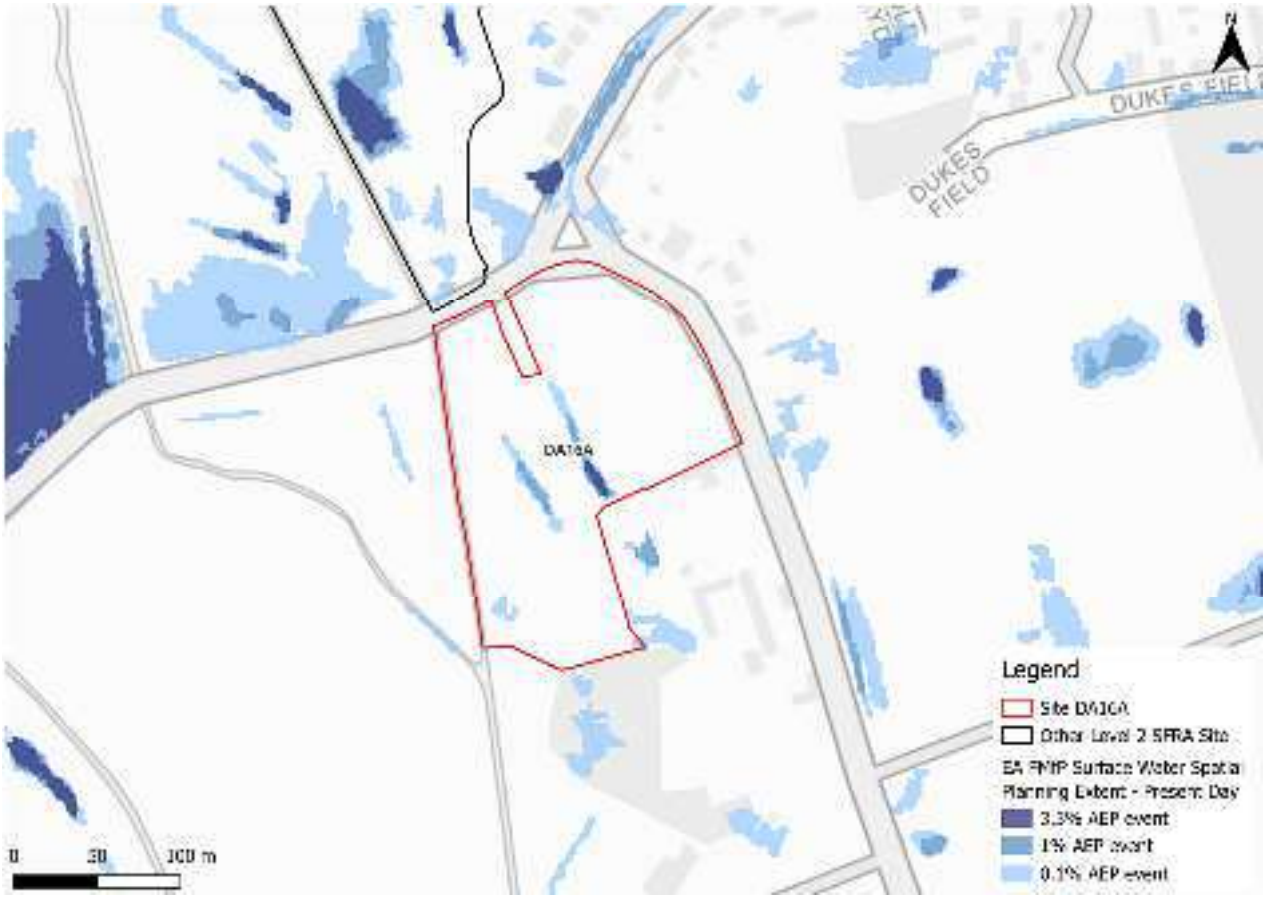

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

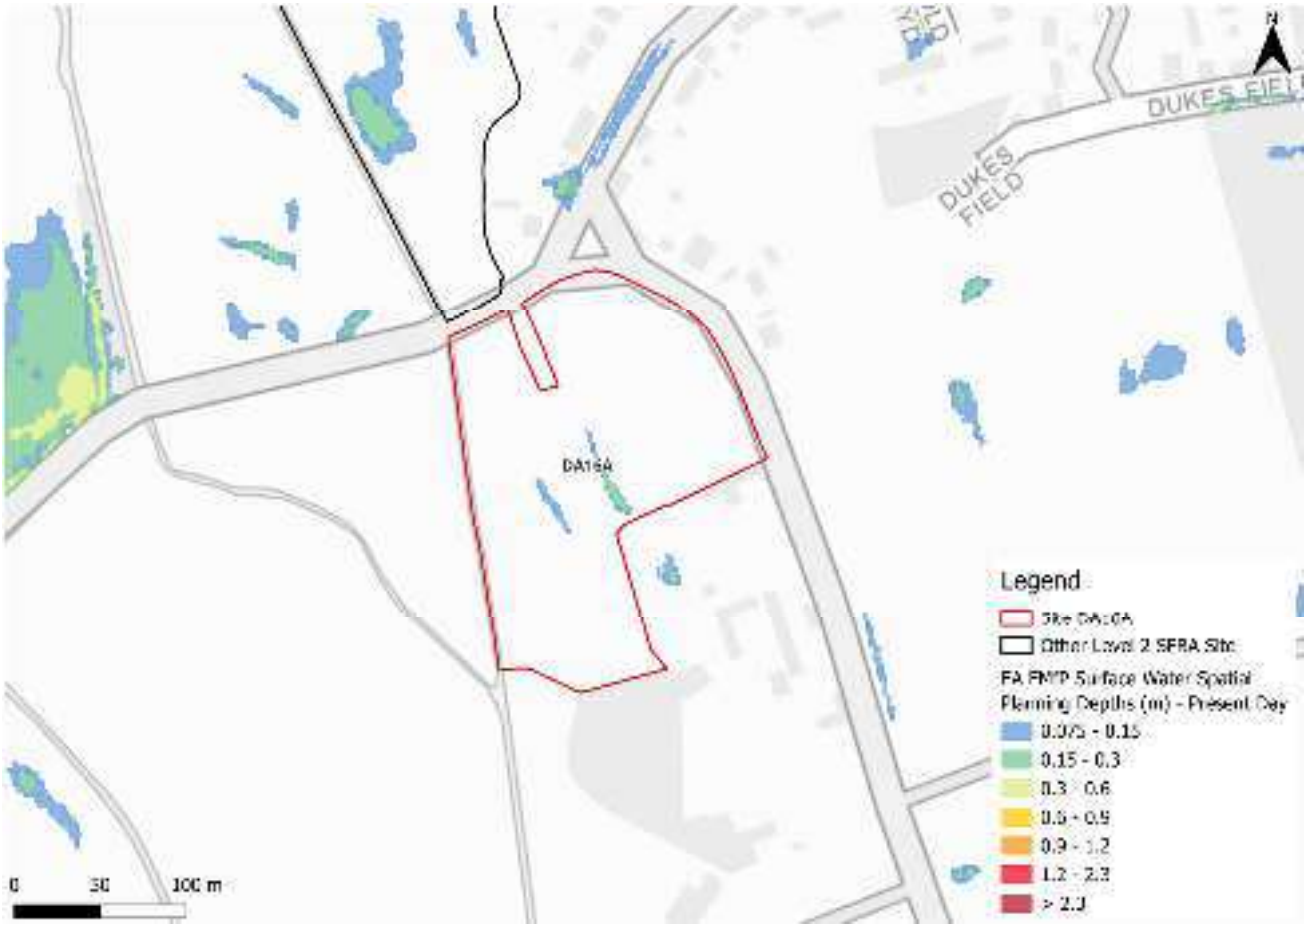

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows there to be areas of moderate to significant flood hazard in the centre of the site and along the western site boundary (Figure 3-3). There are clearly differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping whereby the RoFSW shows a much larger area to be at risk. Given the significant differences between the two datasets, the hazard information should be discounted and assessed further at the FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

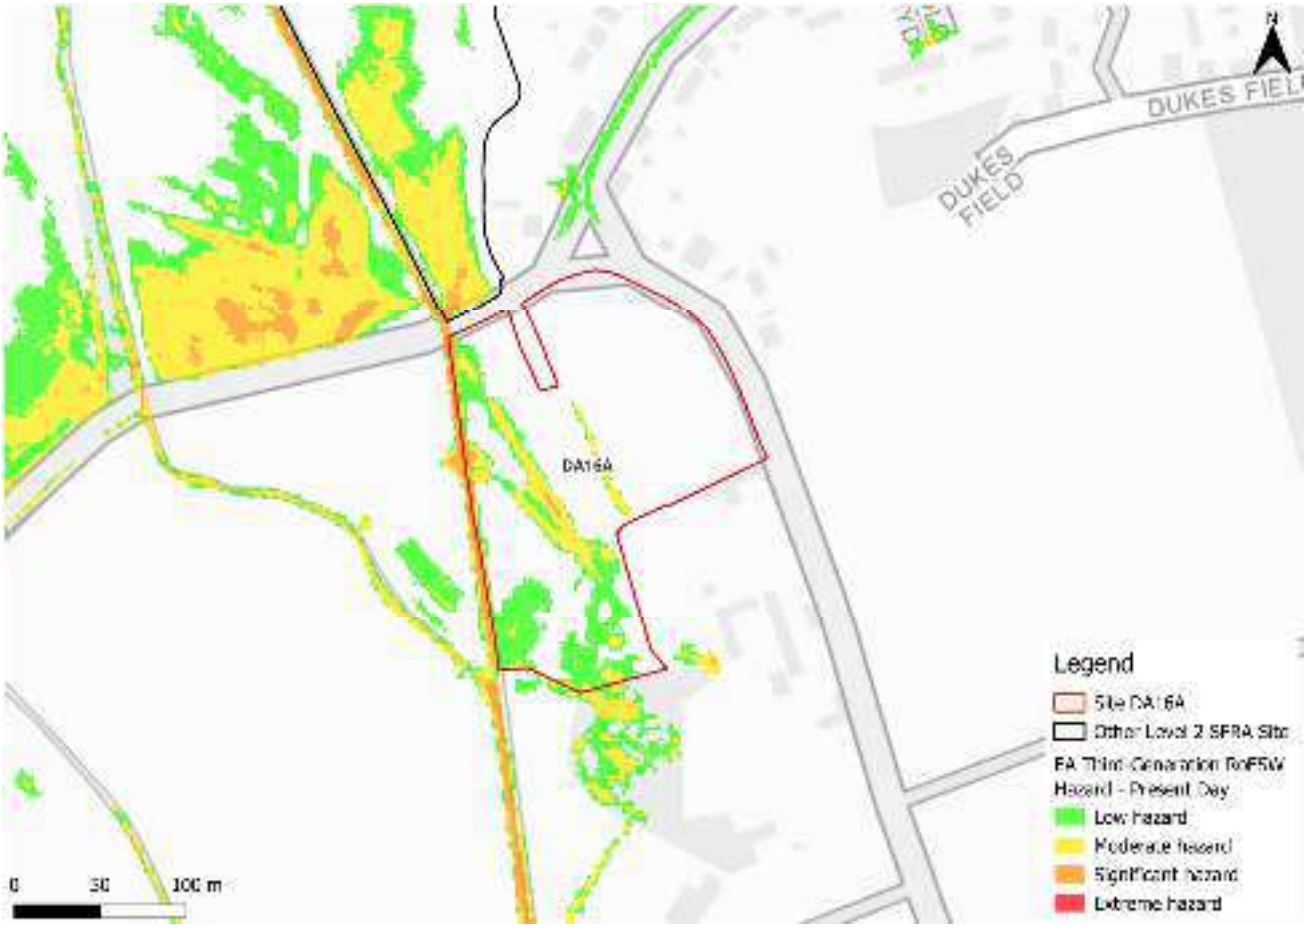

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day medium risk surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Gloucestershire and the Vale management catchment are shown Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

Table 3-2: Peak rainfall intensity allowances for the Gloucestershire and the Vale Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. The site is not shown to be at significant additional risk from surface water climate change. However, there are additional areas of ponding in the 0.1% AEP event and the flow paths increase in size and risk.

Flood depths are mainly shallow, with only a small area between 0.3m - 0.6m deep (Figure 3-5).

Safe access and escape routes would likely remain achievable via several locations.

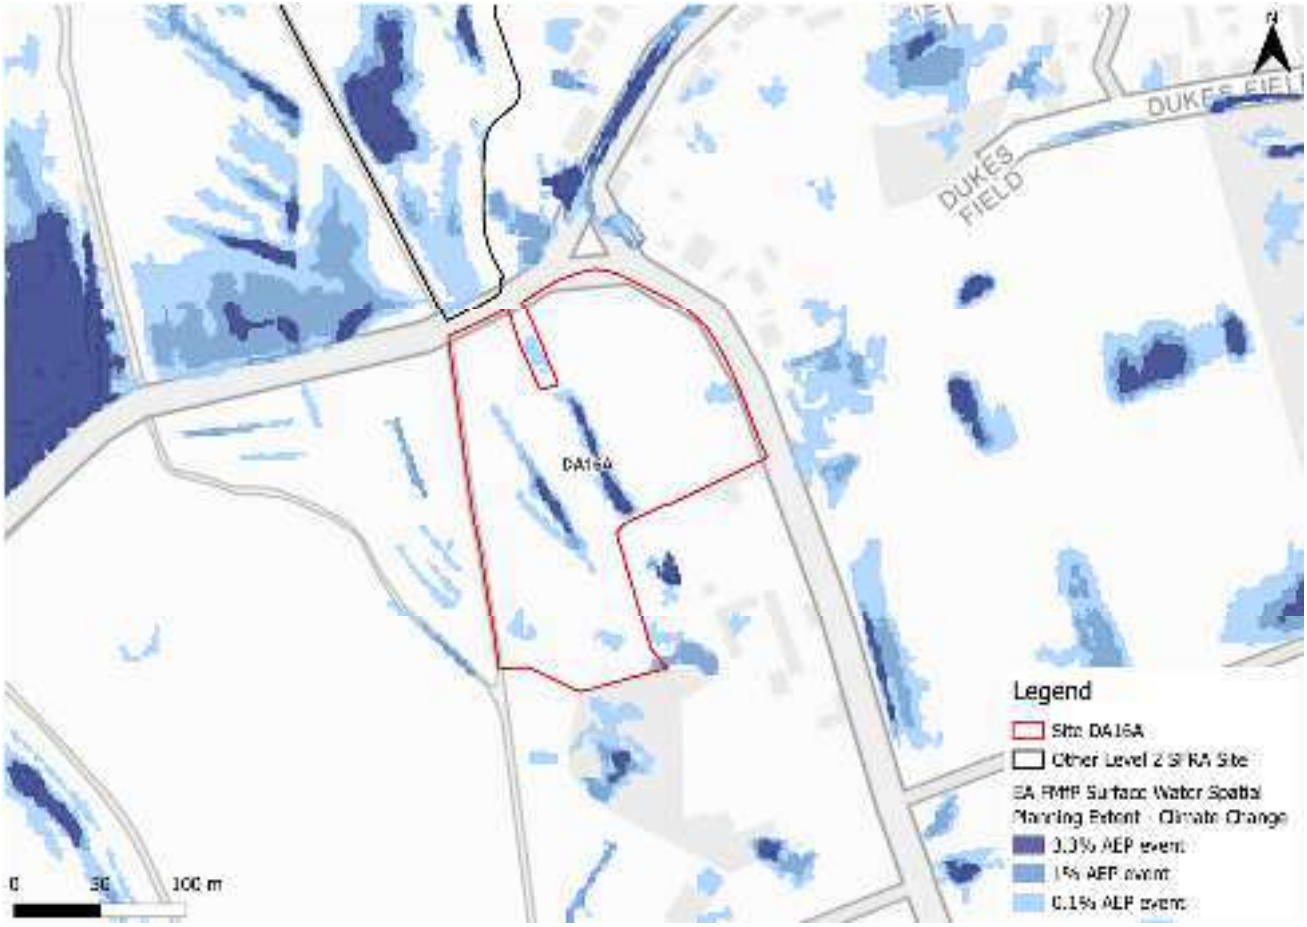

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

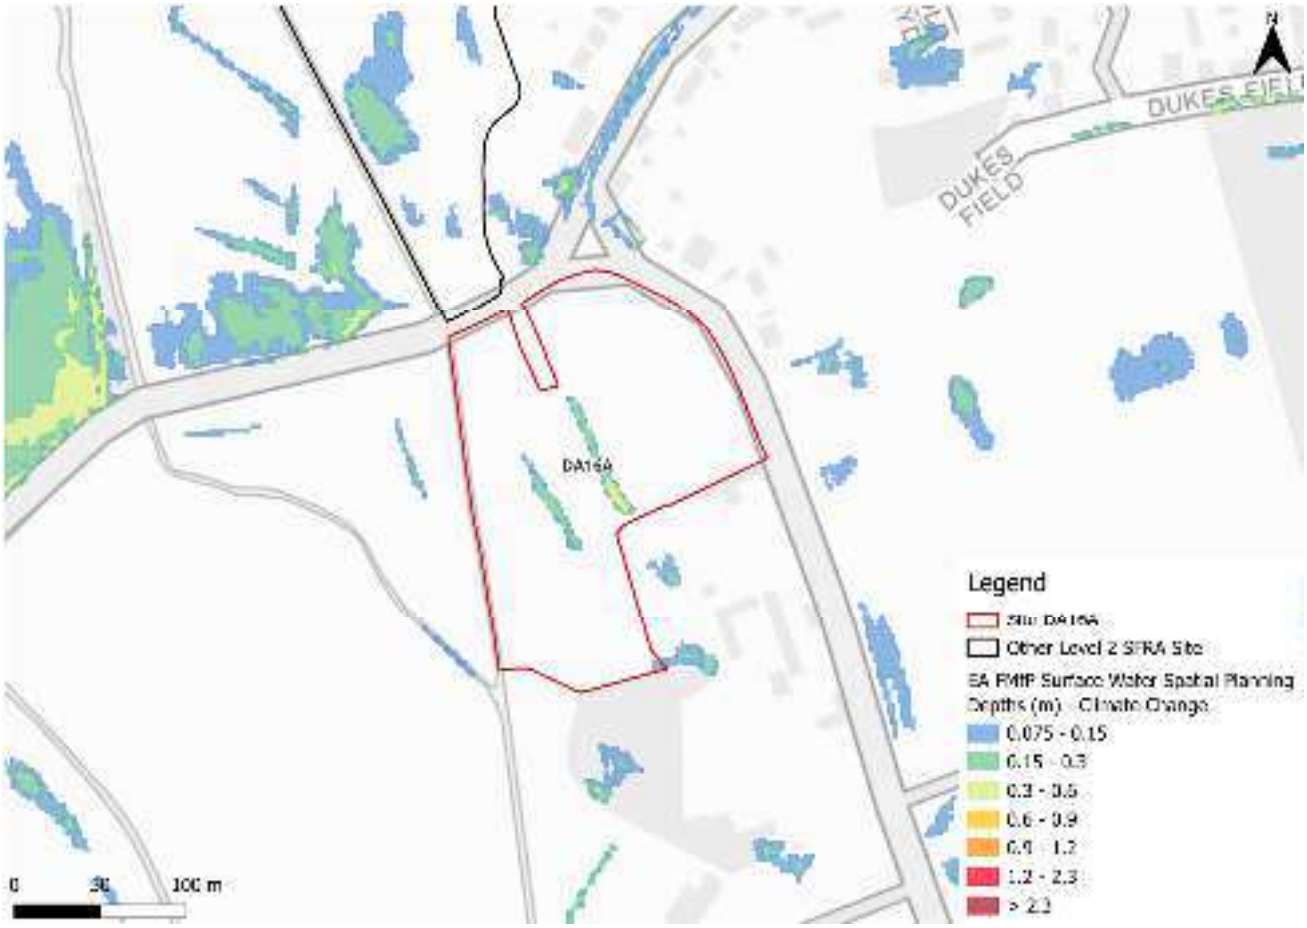

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event surface water flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning climate change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the RoFSW low risk surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards (Figure 3-6). However, given the differences between the two datasets, the hazard information should be discounted and assessed further at the FRA stage.

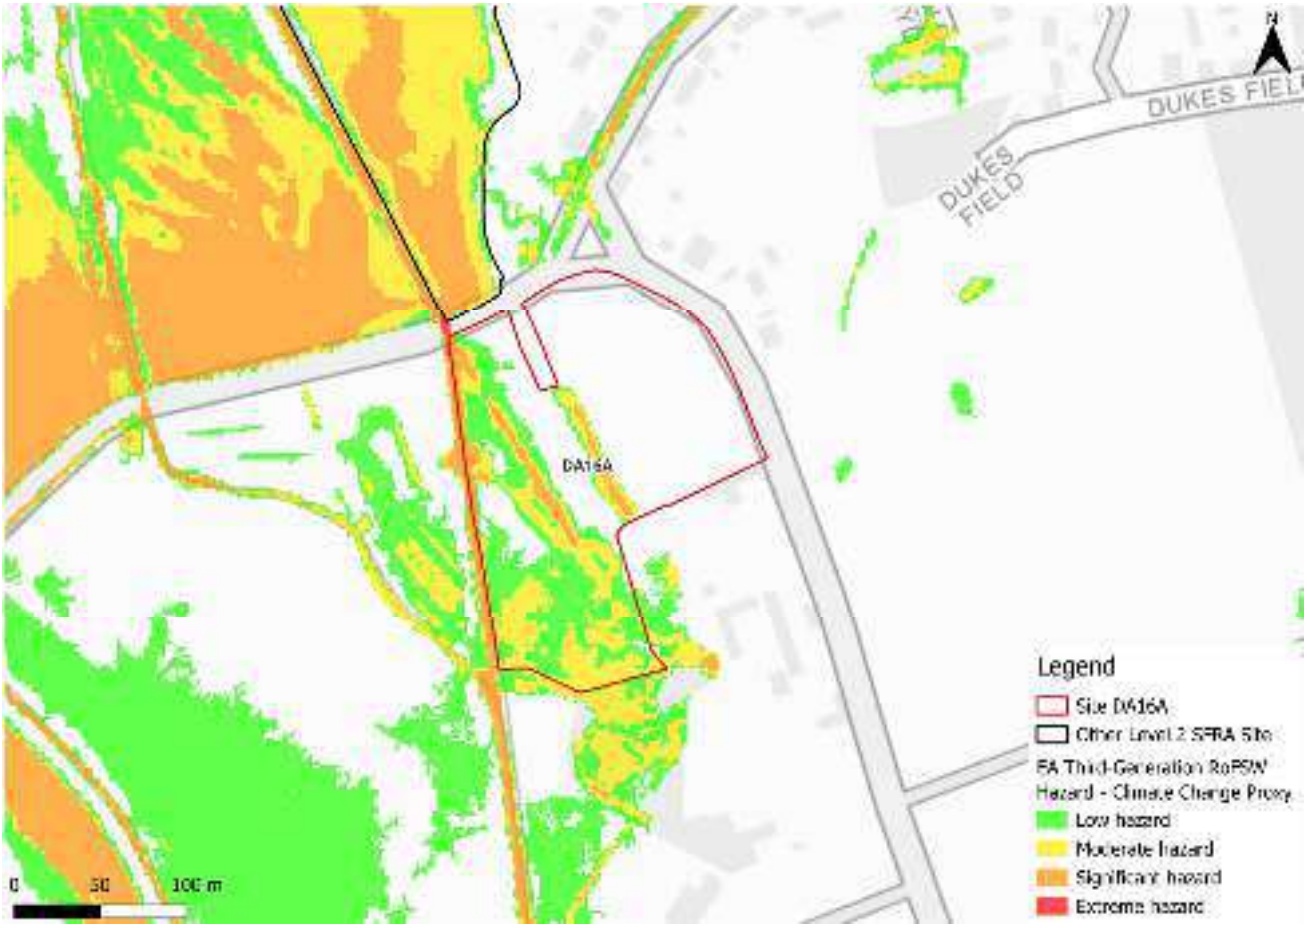

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day low risk surface water flood hazard as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There are no recorded sewer flooding incidents nearby the site nor within the The Ampneys & Hampton Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 91% of the site being outside of the 0.1% AEP surface water flood extent.
- Risk to the site is shown to slightly increase in extent within the site when considering the impact of climate change.
- Topographic low spots and flow paths should be considered and included in site design and ideally left in place to flood naturally when required.
- The drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.

- Safe access and escape routes would likely be achievable via multiple locations when considering surface water risk in isolation.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within one catchment, namely, the Ampney and Poulton Brooks (Source to Thames) catchment. This catchment is ranked as a low sensitivity catchment. Planning considerations for all sites can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications. The map shows there is a risk of groundwater flooding to both surface and subsurface assets, and groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.

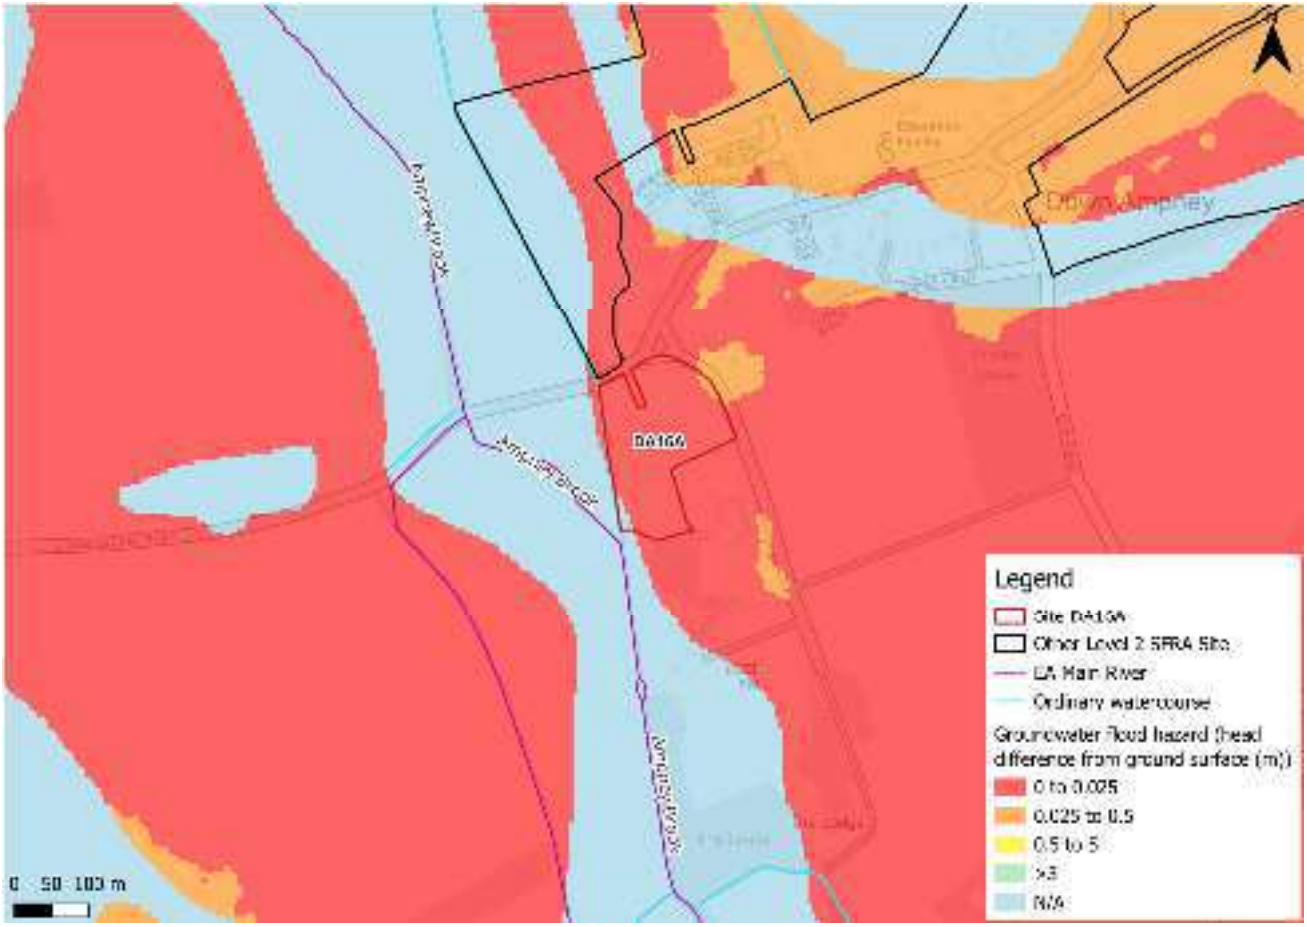

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is mudstone, siltstone, and sandstone (Figure 5-2). Mudstone and siltstone generally have a low permeability and low level of porosity, reducing infiltration rates. Superficial deposits include clay and silt which also have low permeability. Infiltration SuDS at this site may not be an option though the drainage strategy for the site should fully investigate water table levels through standpipe monitoring during the period of highest groundwater levels e.g. November to April.

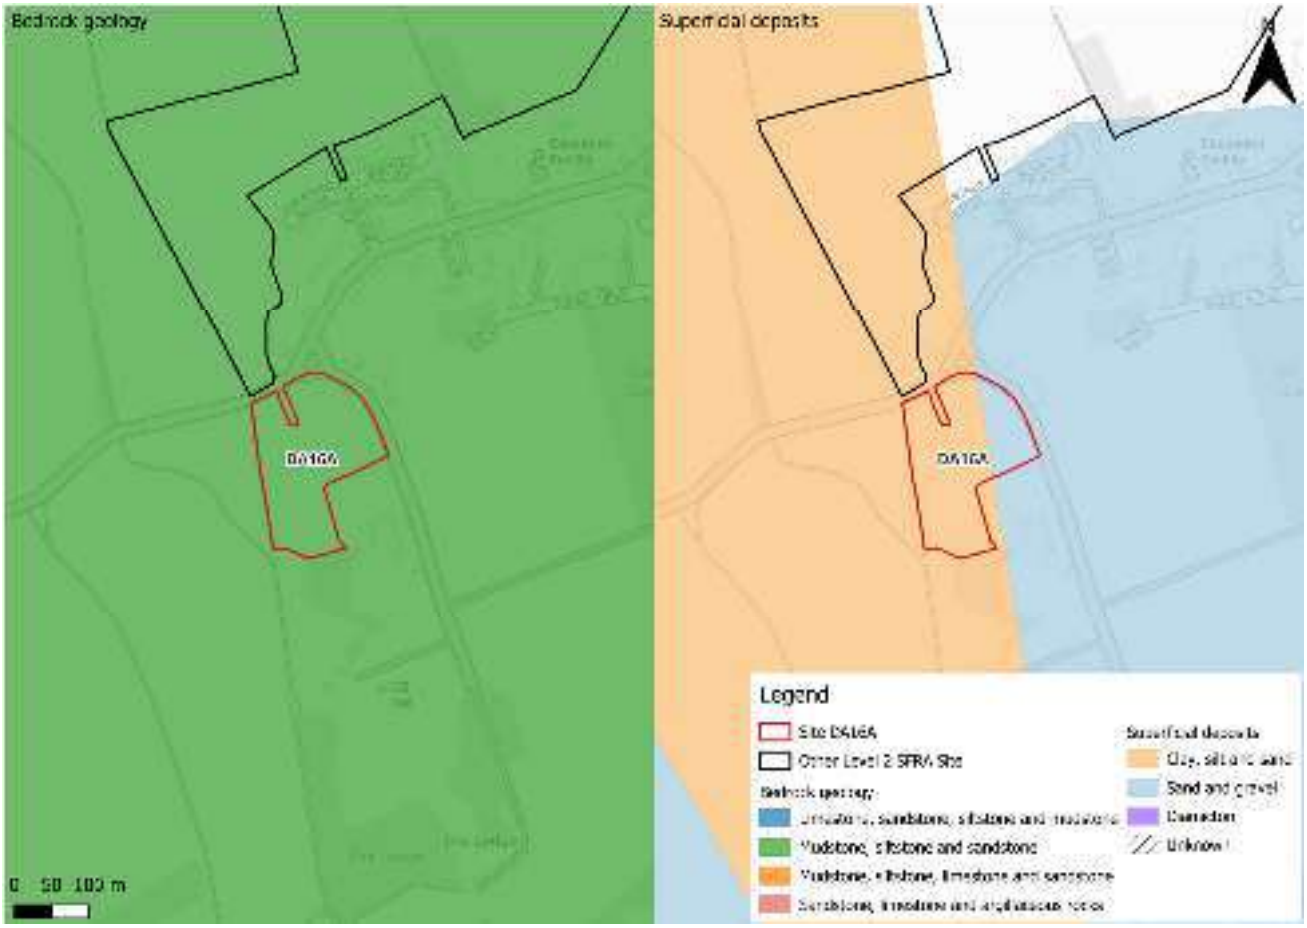

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There are no defences in place along Ampney Brook. However, the watercourse is culverted in two places under Down Ampney Road, as indicated by the green circle on Figure 6-1. There is a potential residual risk of a blockage of these culverts. This risk should be investigated at the site-specific FRA stage.

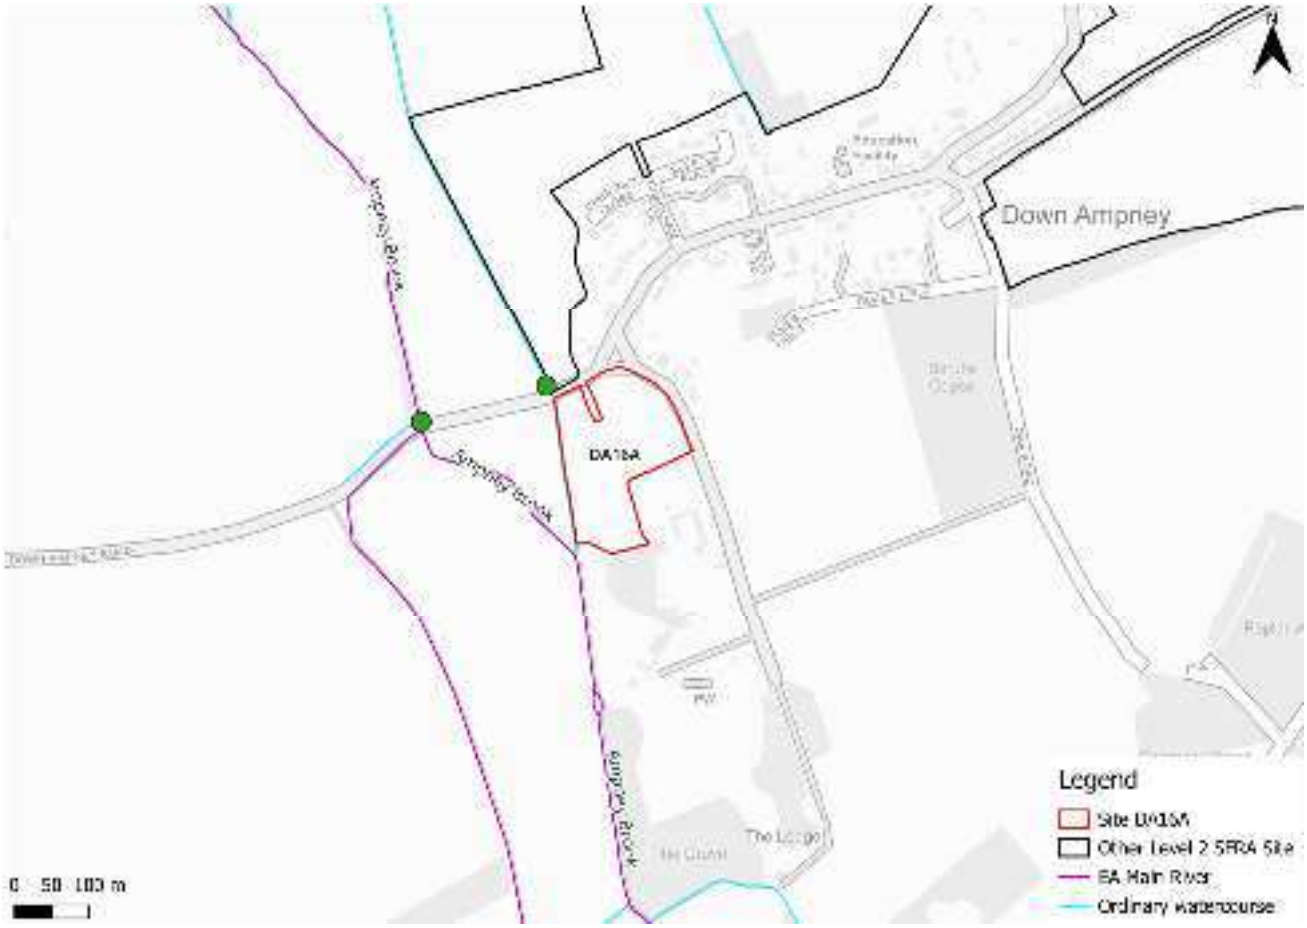

Figure 6-1: Culvert location (green circle)

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is required to pass part b) of the exception test as it is proposed for more vulnerable residential development and is partially located within Flood Zone 3a. half of the site is within the functional floodplain and cannot be developed. As stated in para 005 of the PPG, for a site to be considered safe for its lifetime, it must be proven that residents and users can safely access and exit a building during a design flood and to evacuate before an extreme flood (0.1% annual probability of flooding with allowance for climate change). Updated modelling of Ampney Brook is required to inform the Exception Test.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- Based on current information, it is recommended that this site is not allocated for residential development. However, the area currently in Flood Zone 1 and not at risk from climate change may be developed, though updated modelling of Ampney Brook must be carried out to robustly define the risk to the site for both present day and with climate change.
- A drainage strategy should ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- Groundwater conditions must be investigated further through the site-specific FRA. This should be assessed through standpipe monitoring during the period of highest groundwater levels e.g. November to April.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WCAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

JBA Project Manager	Mike Williamson
Address	Phoenix House, Lakeside Drive, Centre Park, Warrington, WA1 1RX
JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Jo Corbett of Cotswold District Council. Kira Khangura and Laura Thompson of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken in July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site SD15. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site SD15

- Location: Plummers Farm, east of Ashton Road
- Existing site use: Agriculture
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 3.17
- Watercourse: River Churn
- Environment Agency (EA) flood model: River Churn (Churn (Baunton to Siddington) 2011 model
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of fluvial flood depths, velocities and hazards
    - Assessment of surface water flood extent, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

The topography of the site slopes from west to east towards the floodplain of the River Churn (Figure 1-3).

Figure 1-3: Topography

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the percentage areas of the site within each flood zone are stated in Table 2-1 and can be viewed on Figure 2-1. The Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

The majority of the site is in Flood Zone 1 and therefore at low risk of from flooding from rivers. There is a small area of Flood Zone 2 (1%) at the southern boundary of the site.

Table 2-1: Present day flood risk based on percentage area of site at risk

Flood Zone 1 (% area)	Flood Zone 2 (% area)	Flood Zone 3a (% area)	Flood Zone 3b (% area)
99	1	0	0

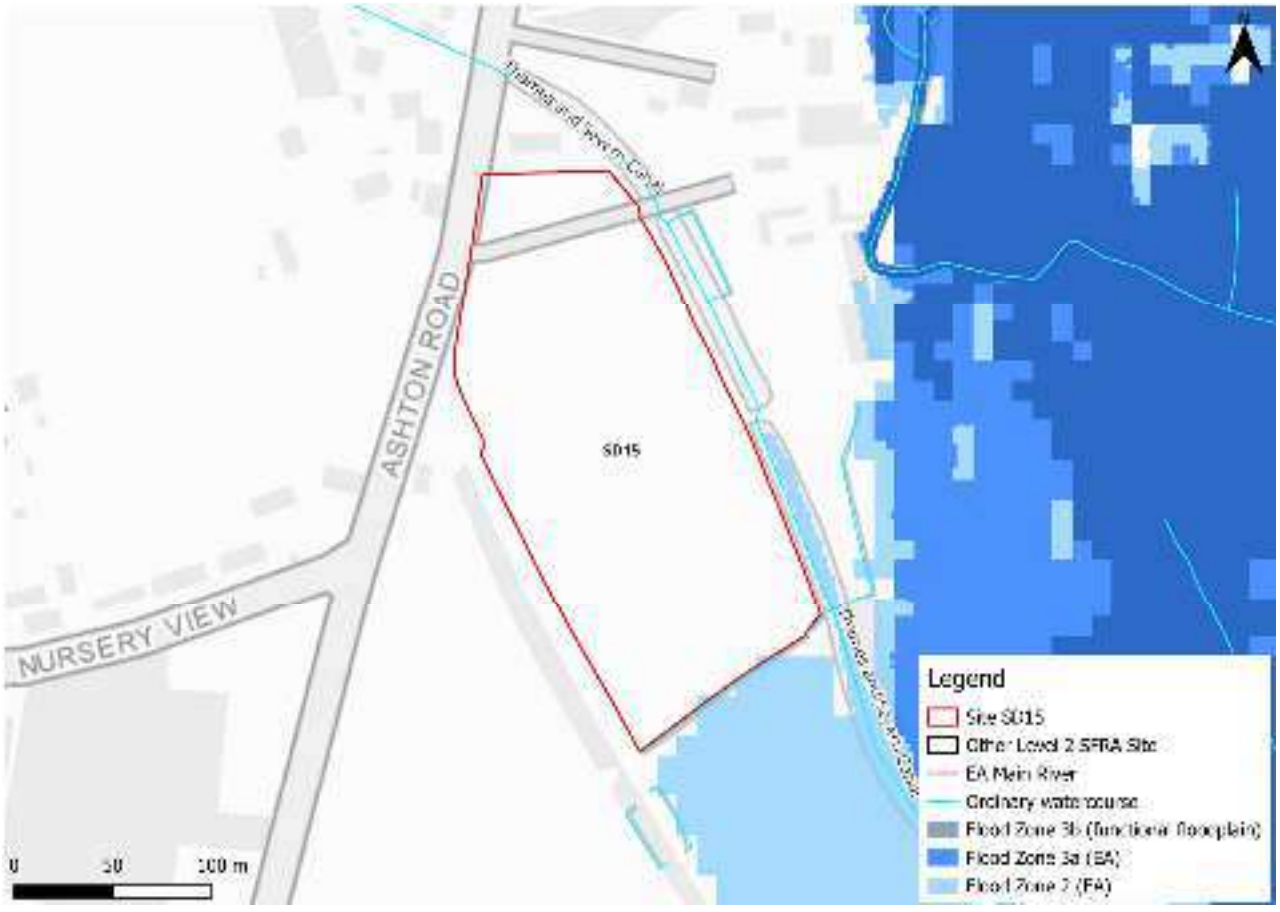

Figure 2-1: Present day risk

2.1.2 River Churn (Baunton to Siddington) 2011 model outputs.

Present day risk to the site comes from the River Churn to the east of the site. The 0.1% AEP undefended event from the River Churn (Baunton to Siddington) 2011 model shows the same extent of flooding to the site as Flood Zone 2 of the Flood Map for Planning (Figure 2-2). Risk is modelled to be confined to a very small area along the southern site boundary, with depths of less than 0.15 m.

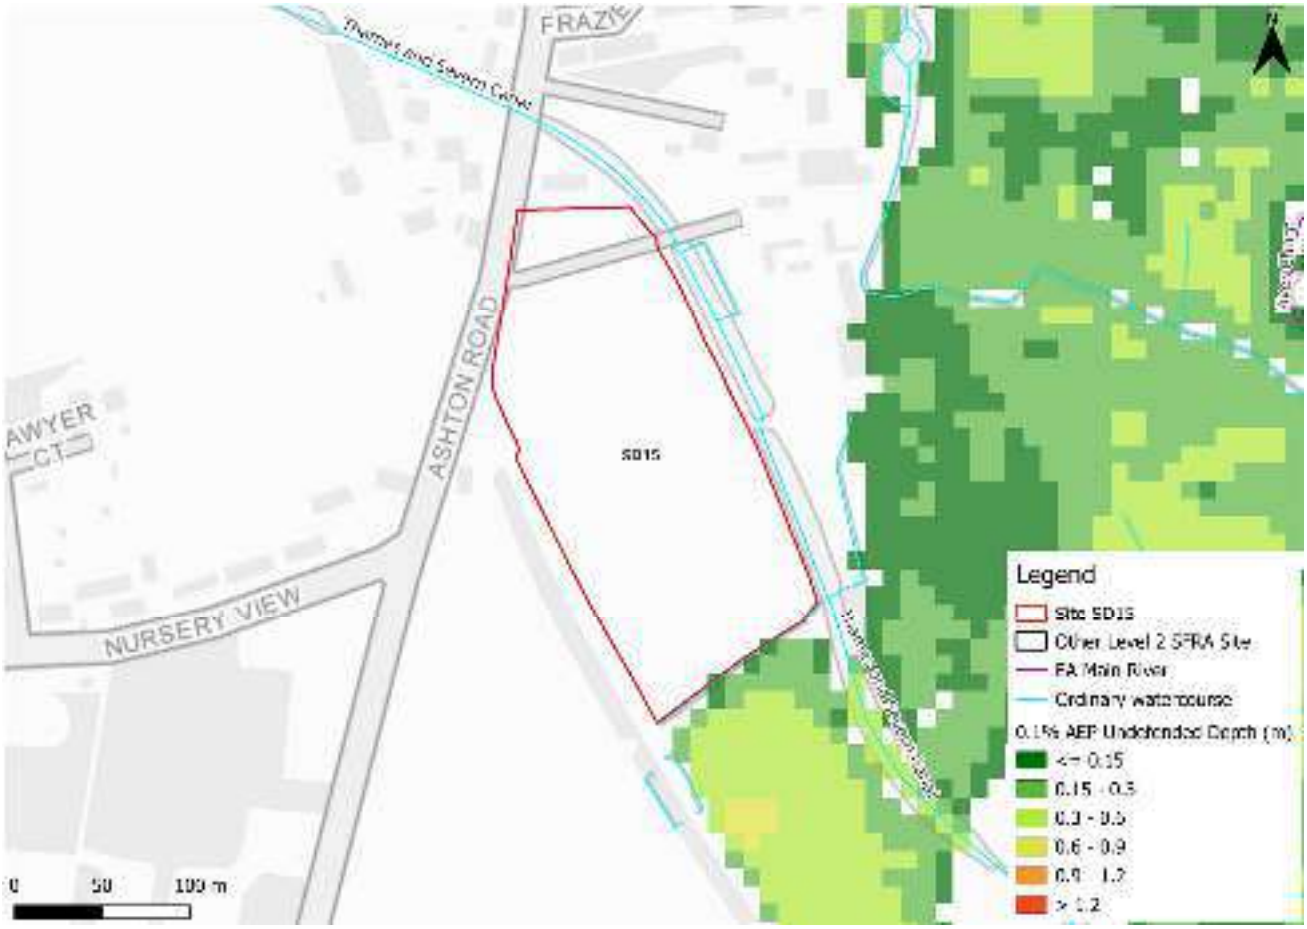

Figure 2-2: Flood depths for the 0.1% AEP undefended flood event

2.2 Impacts from climate change

2.2.1 River Churn (Baunton to Siddington) 2011 model outputs

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Gloucestershire and the Vale Management Catchment. The central allowance within this catchment is 26% on peak flows (Table 2-2). The impacts of climate change on flood risk are included in the model for the 1% AEP undefended event using 30% on peak flows rather than the current central allowance of 26%.

Table 2-2: Modelled climate change allowances for peak river flows within the Gloucestershire and the Vale Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	11	17	33
2050s	11	19	43
2080s	26	41	84

Figure 2-3 shows the modelled flood depths for the 0.1% AEP undefended event plus the central allowance for peak river flows. The risk area does not significantly increase in size, and the site remains at low modelled risk. There is no modelled risk to the site in the 1% AEP undefended plus central climate change event.

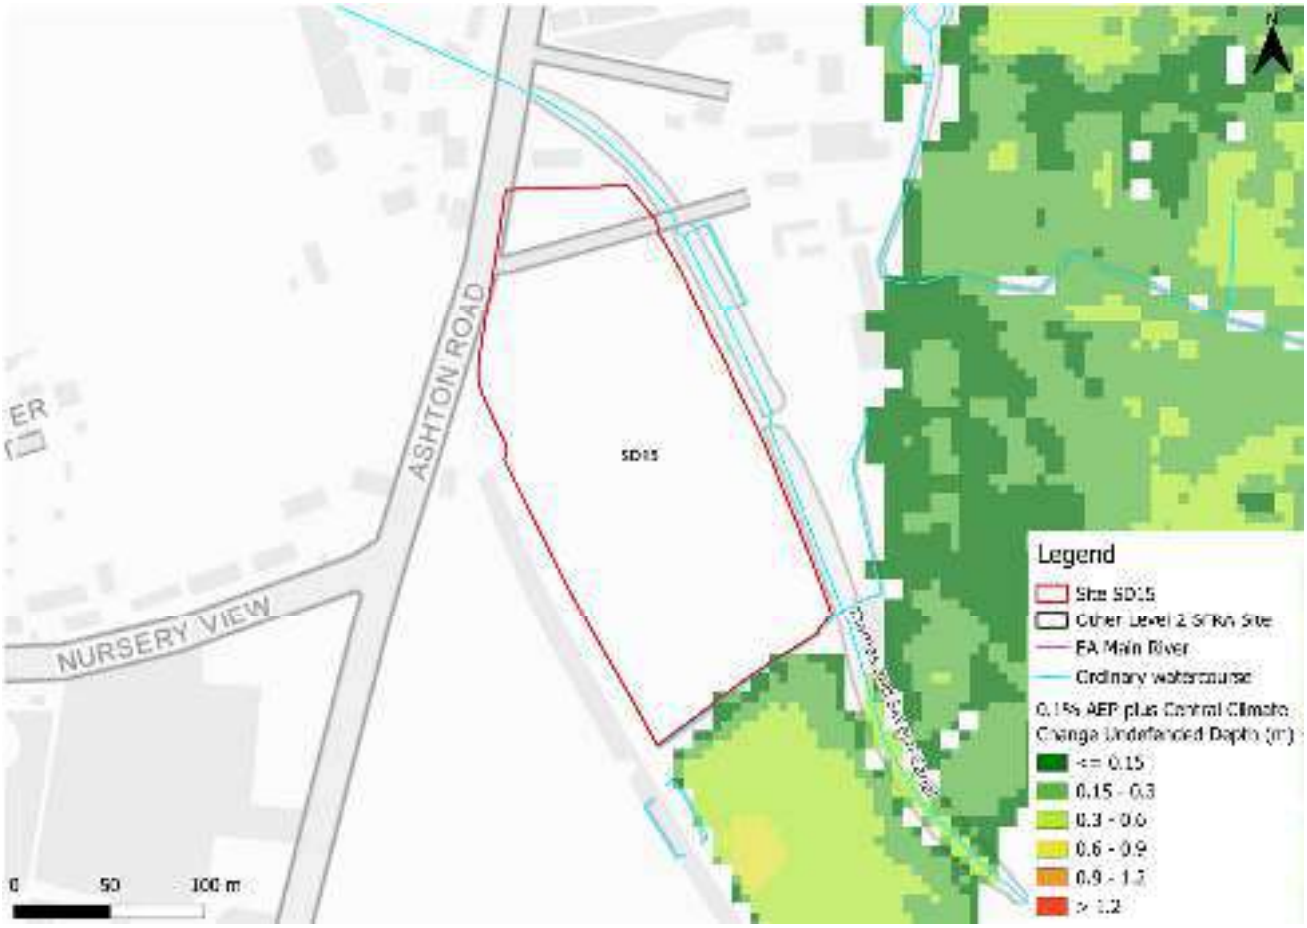

Figure 2-3: Flood depths for the 0.1% AEP undefended flood event plus central climate change allowance for the 2080s epoch

2.2.2 Flood Map for Planning - Flood Zones plus Climate Change

Figure 2-4 shows the Flood Map for Planning - Flood Zones plus Climate Change dataset which includes the central allowance for the 2080s epoch. This represents the impact of climate change on Flood Zone 3a and Flood Zone 2 combined. This shows a greater extent of flooding than the modelled event. This is due to the fact that the Flood Zones plus

Climate Change dataset also includes the larger 0.1% AEP event. However, risk to the site does not increase.

Figure 2-4: EA Flood Zones plus Climate Change

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been six recorded flooding incidents within the Siddington and Cerney Rural Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and

surrounding areas. Figure 2-5 shows that the east of the site could benefit from riparian woodland tree planting, with areas outside of the site potentially benefitting from floodplain woodland tree planting. Tree planting can help to slow the flow of water to benefit areas downstream. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

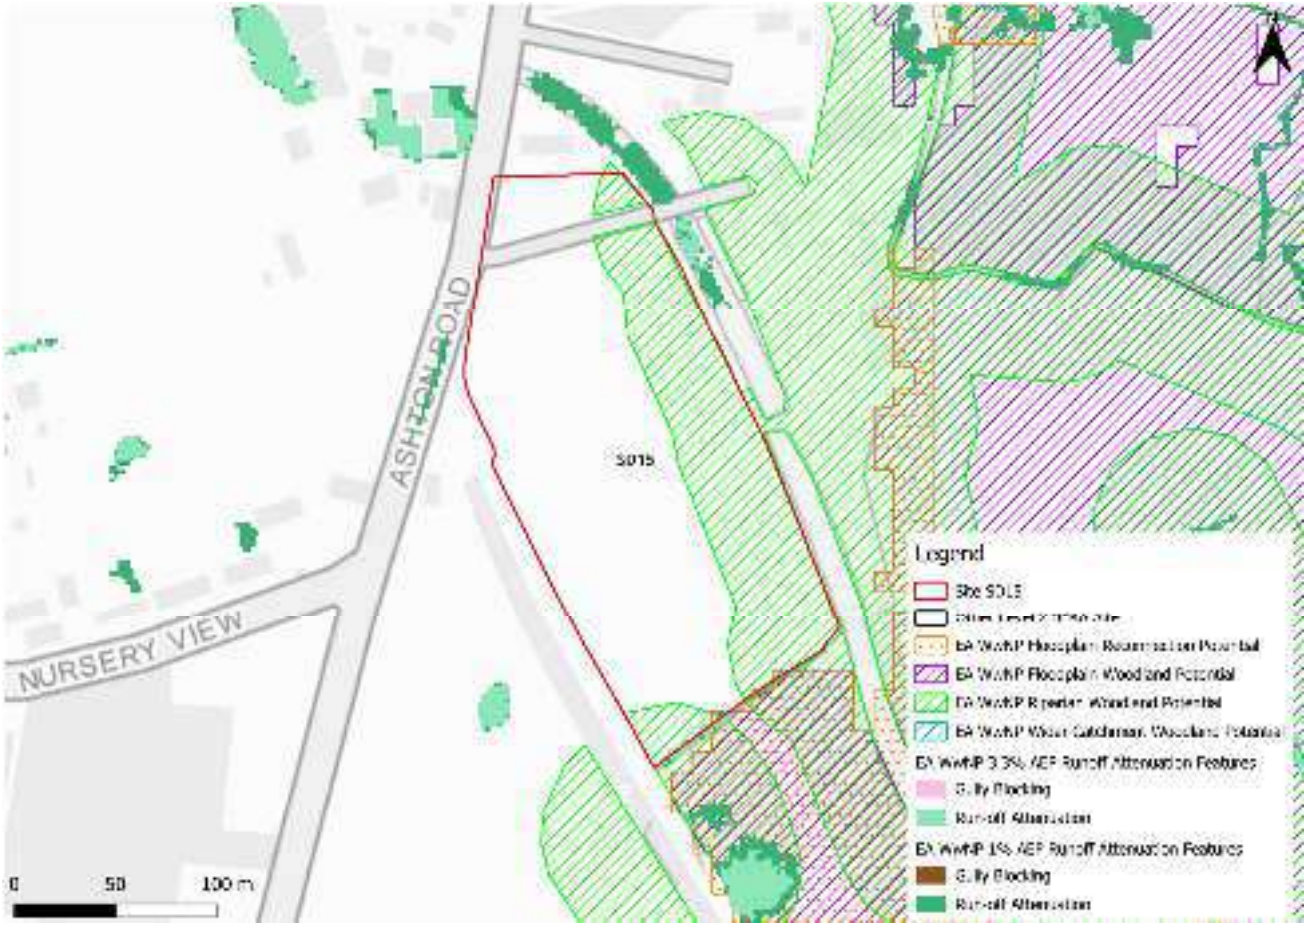

Figure 2-5: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warning and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. A small area along the southern boundary of the site is included within a FWA, namely 061FWF02Cirncstr - River Churn from Baunton to Siddington including Cirencester, as shown in Figure 2-6.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. A small area along the southern boundary of the site is located within a FAA, namely 061WAF02Churn - River Churn and its tributaries.

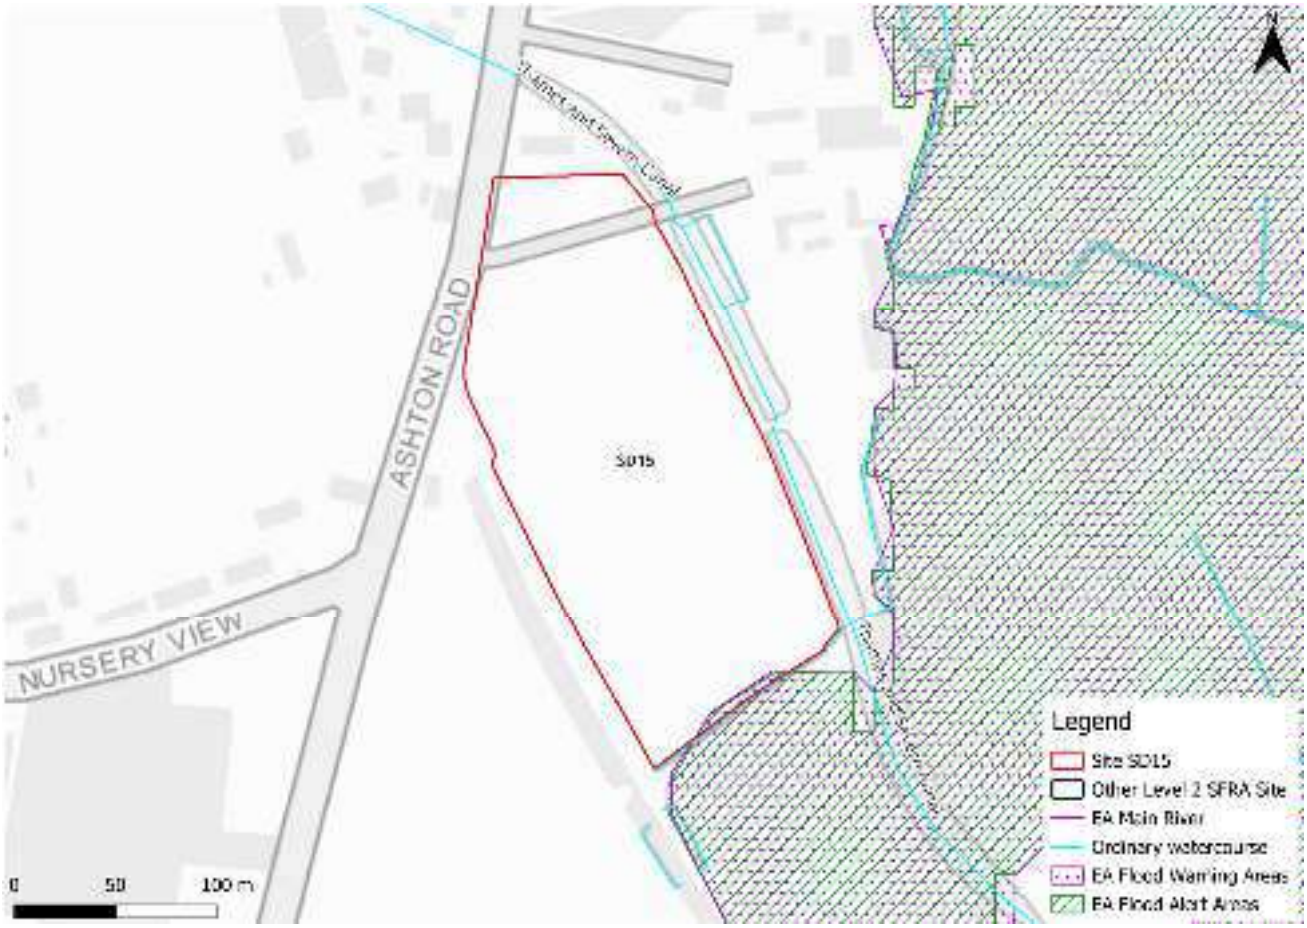

Figure 2-6: Flood warnings and alerts

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes could likely be achieved during a flood event via the northwest of the site via Ashton Road (Figure 2-7).

Figure 2-7: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The majority of the site is located within Flood Zone 1 and therefore at low risk from rivers.
  - There is no significant additional risk to the site when considering climate change.
- Mitigation:
  - EA flood warnings and alerts should continue to be in place to ensure early evacuation of site users before an extreme flood event occurs.
- Access and escape:
  - Based on current information, safe access and escape routes appear achievable via the northwest of the site via Ashton Road.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents Present Day maps (May 2026), the site is predominantly at low risk of surface water flooding as shown in Table 3-1 and Figure 3-1, and also the depth map in Figure 3-2.

There is a small flow path along the southern boundary of the site with depths of between 0.3 and 0.6m. In the 0.1% AEP event, there is a small area of ponding in the northeast of the site. Safe access and escape routes would likely be achievable via Ashton Road to the northwest of the site in all events.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning Extents Present Day datasets

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
95	3	1	1

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

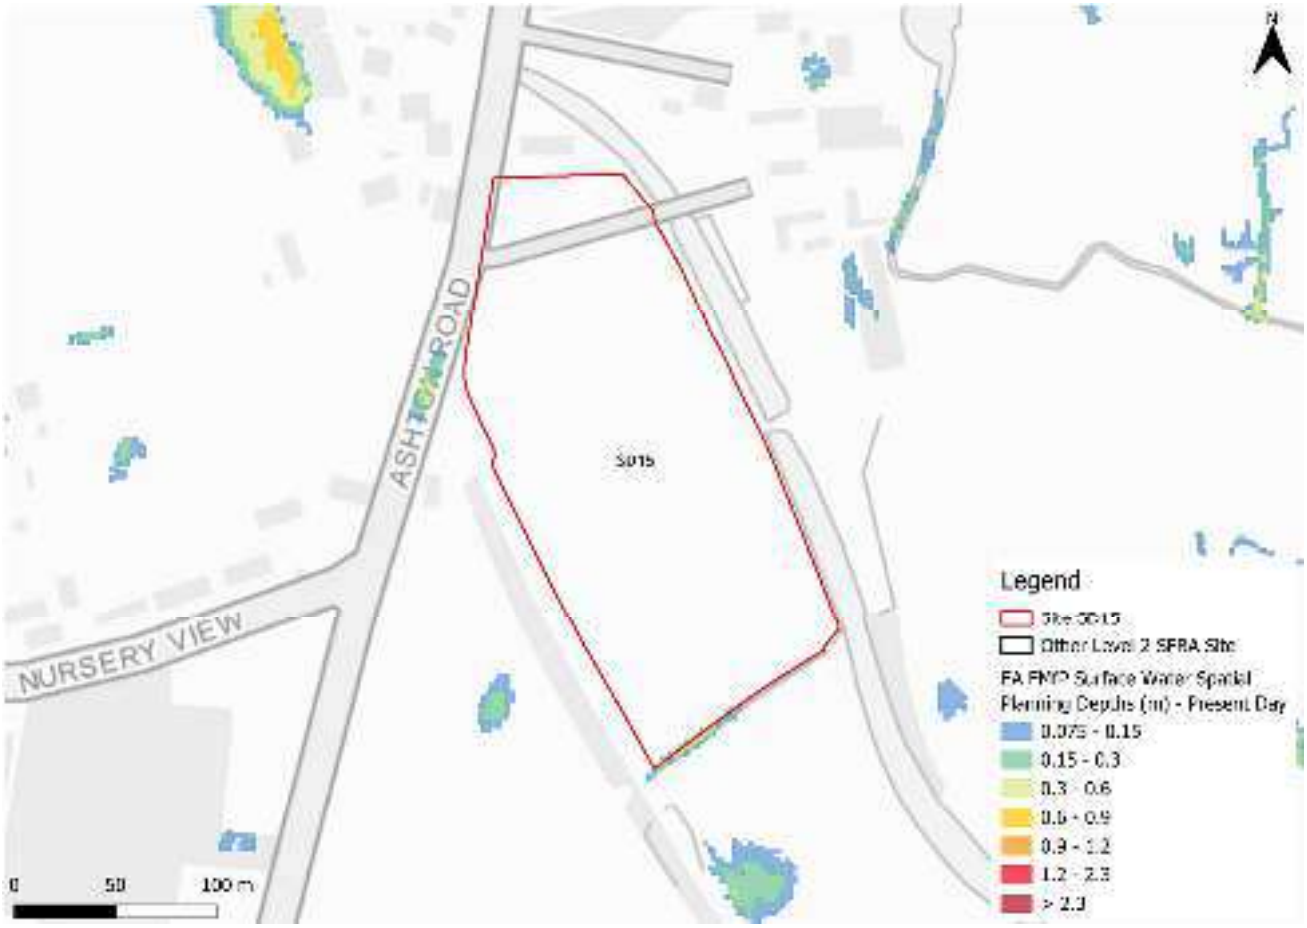

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day, as the best available information.

The RoFSW map indicates the flow path at the south of the site to be at moderate to significant hazard. Risk mapped to the site does not differ between the Flood Map for Planning - Surface Water Spatial Planning maps and the third generation RoFSW hazard mapping.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

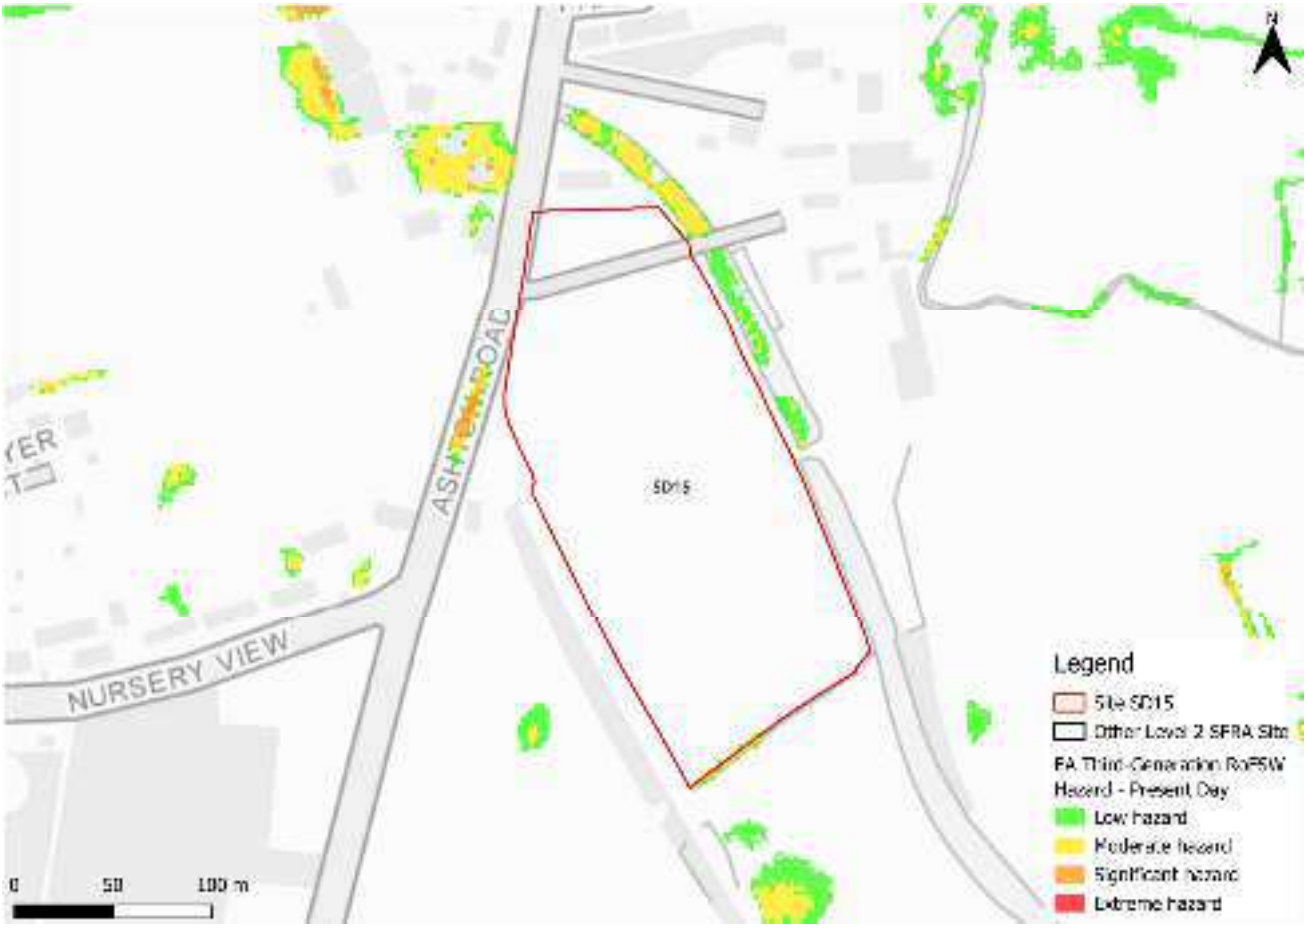

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day medium risk surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Climate Change

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Gloucestershire and the Vale management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Gloucestershire and the Vale Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3% (high risk)	25	35
1% (medium risk)	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. The site is not shown to be at significant additional risk from surface water climate change. Flood depths along the southern flow path remain between 0.3 and 0.6m (Figure 3-5). In the 0.1% AEP plus climate change event, the area of ponding in the northeast of the site increases in extent, and additional areas of ponding appear in the south of the site.

Safe access and escape routes would likely remain achievable via Ashton Road.

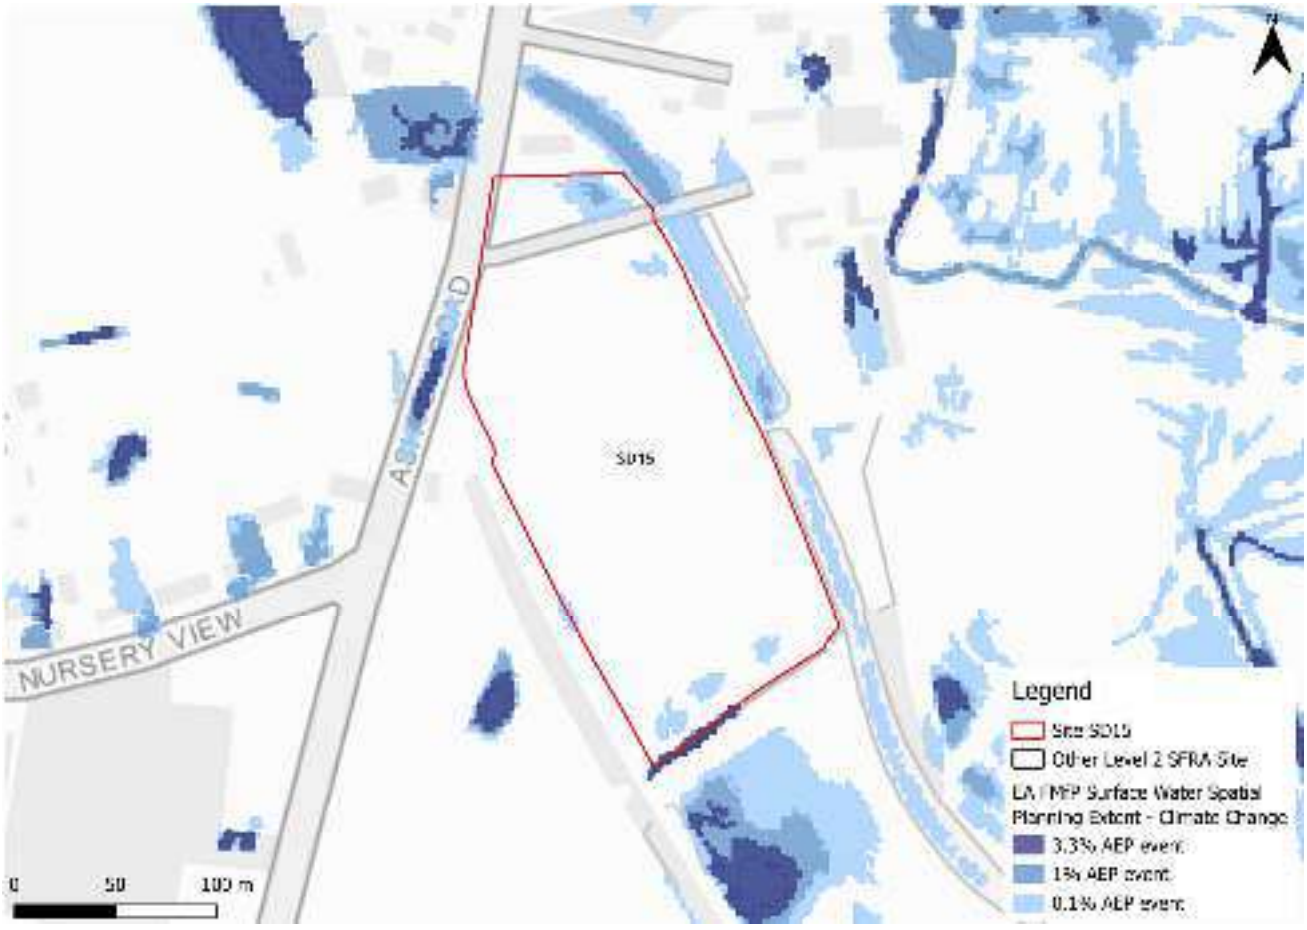

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning climate change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the RoFSW low risk surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards (Figure 3-6). The RoFSW map indicates hazard to be 'significant' along the flow path at the south of the site. It also shows a flow path of low hazard in the northwest of the site.

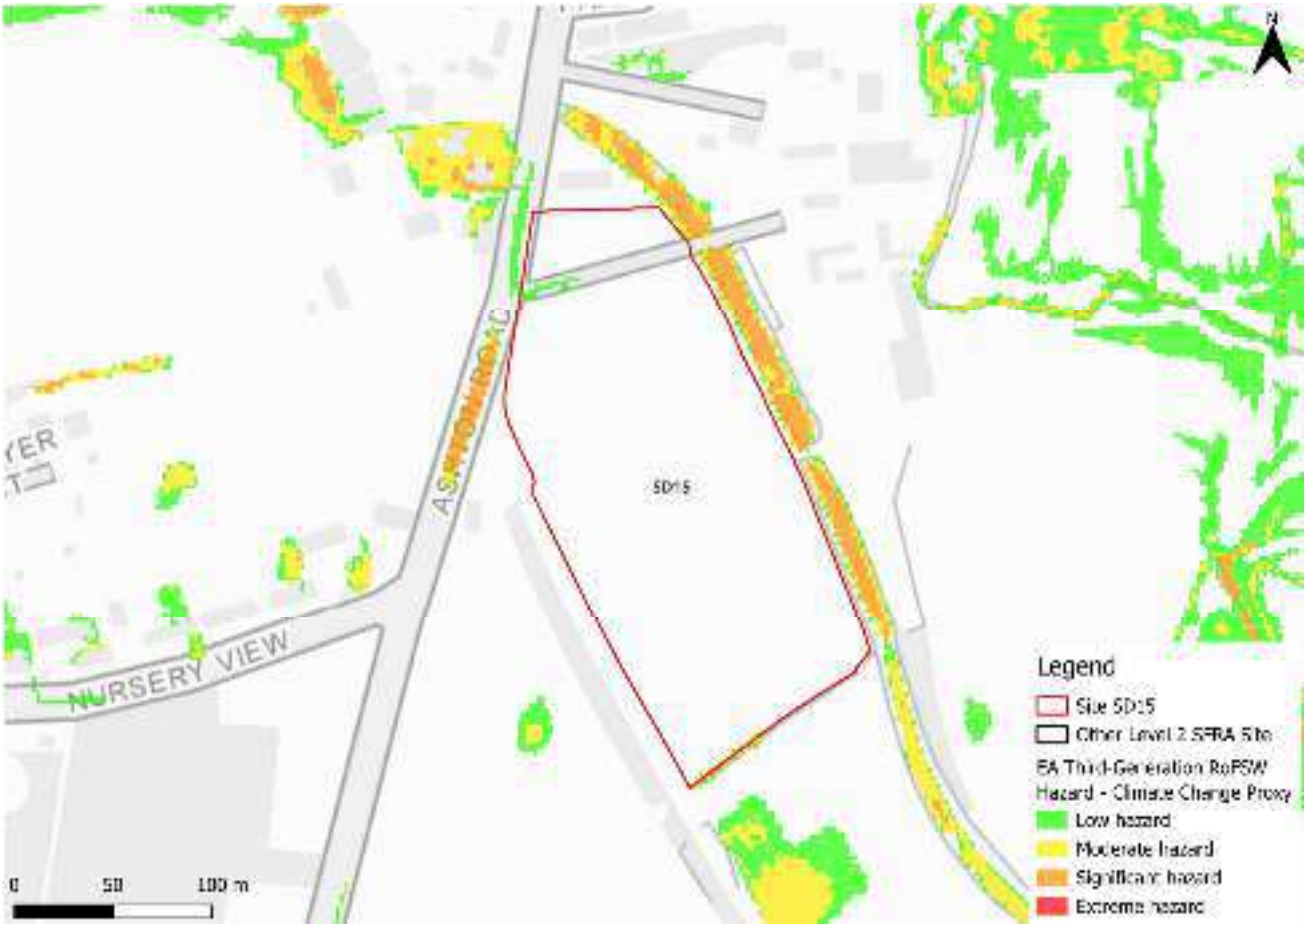

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day low risk surface water flood hazard as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There are no recorded sewer flooding incidents nearby the site, nor within the Siddington & Cerney Rural Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 95% of the site being outside of the 0.1% AEP flood extent.
- Risk to the site is shown to slightly increase in extent within the site when considering the impact of climate change.
- Topographic low spots and flow paths should be considered and included in site design and ideally left in place to flood naturally when required.
- The drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.

- Safe access and escape routes would likely be achievable via Ashton Road in all events.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within one catchment, namely, the Churn (Baunton to Cricklade) catchment. This catchment is ranked as a high sensitivity catchment. Planning considerations for all sites can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications.

Almost the entire site is within an area where there is a risk of groundwater flooding to both surface and subsurface assets. In this area, groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is sandstone, limestone and argillaceous rocks (Figure 5-2). Limestone is generally permeable. The permeability of sandstone varies. Infiltration SuDS at this site may not be an option, though the drainage strategy for the site should fully investigate water table levels through standpipe monitoring during the period of highest groundwater levels e.g. November to April.

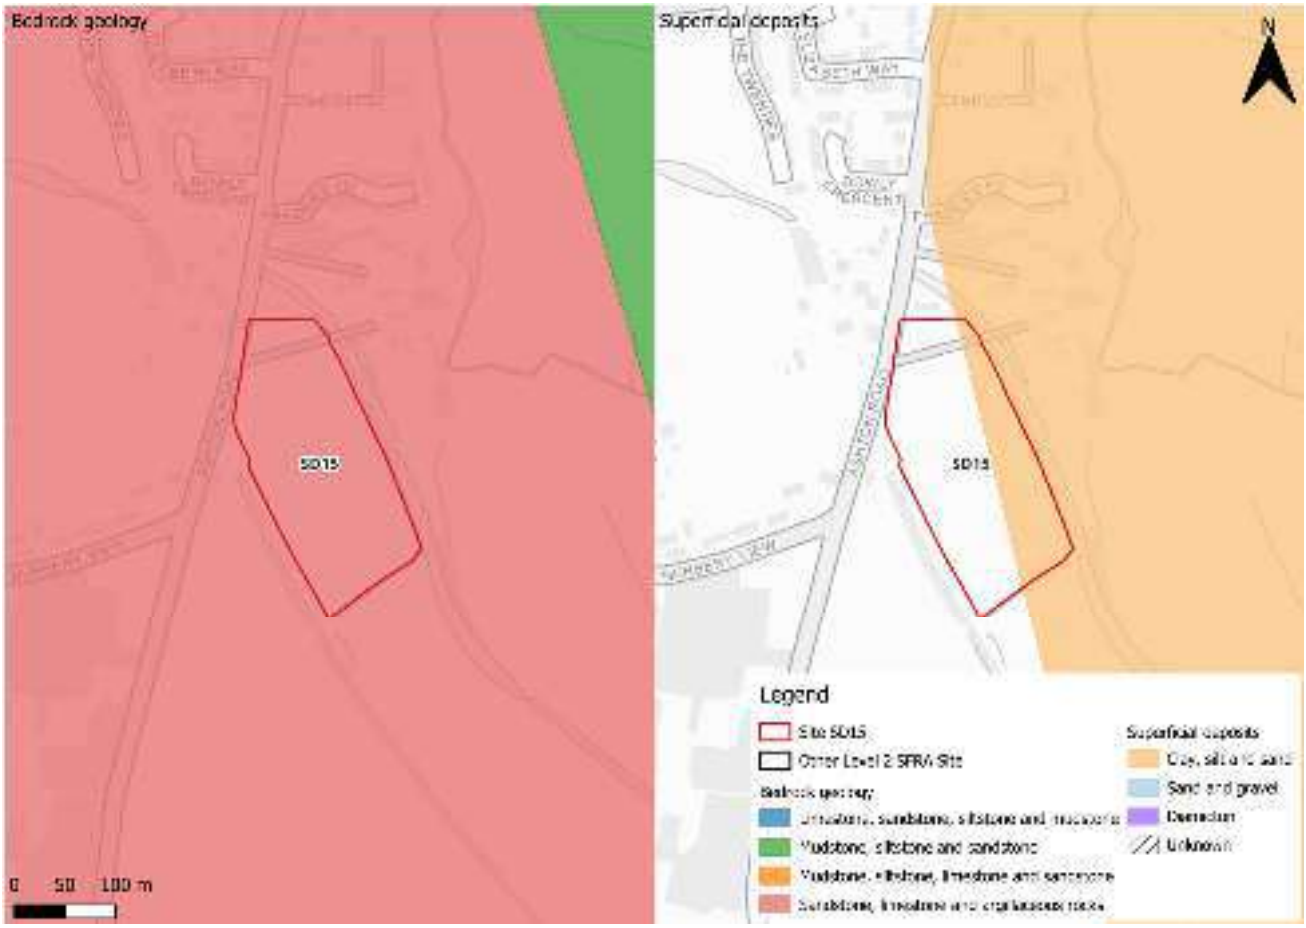

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There does not appear to be any residual risk to the site from asset blockage or defence breach.

6.1 Flood risk from canals

The Thames and Severn Canal runs adjacent to the eastern boundary of the site. Canals are a potential source of residual risk, however the site is situated approximately 1.5m above the level of the canal. Therefore, it is unlikely that a canal breach would impact the site. However, the Cotswold Canals Trust should be consulted at the application stage.

6.2 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. Figure 6-1 shows the RFM in a 'dry day' and 'wet day' scenario.

The site is potentially at risk from one reservoir in the 'wet day' scenario, namely Cirencester Park - The Mansion Lake reservoir, owned and maintained by Bathurst Estate Farming Limited, located within the Gloucestershire LLFA.

The EA's SFRA guidance states that where a proposed development site is shown to be at potential risk from reservoir failure, then an assessment into whether the reservoir design or maintenance schedule needs improving should be carried out. Expert advice may be required from an all-reservoirs panel engineer. The Council should consult United Utilities to ascertain whether the proposed development could affect the reservoir’s risk designation, it’s design category or how it is operated. The Council, as category 1 responders, can access more detailed information about reservoir risk and reservoir owners using the Resilience Direct system.

Figure 6-1: EA Reservoir Flood Map

..

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is not required to pass part b) of the exception test as it is not located within Flood Zone 3a, however it must still be proven that the development can be safe for its lifetime, which is generally considered to be 100 years for residential development.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be possible to allocate this site based on its location largely within Flood Zone 1 and very low surface water flood risk.
- A drainage strategy should ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- Groundwater conditions must be investigated further through the site-specific FRA. This should be assessed through standpipe monitoring during the period of highest groundwater levels e.g. November to April.
- Consultation with the relevant reservoir undertaker may be required to assess if the design or maintenance of the reservoir would need improving as a result of new development.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WGAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Joanne Corbett of Cotswold District Council. Rosie Holmes of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken in July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site SD17. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site SD17

- Location: Land east of Siddington Road and west of Bluebell Drive
- Existing site use: farmland, open greenspace
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 0.64
- Watercourse: River Churn, unnamed ordinary watercourse
- Environment Agency (EA) flood model: River Churn (Churn (Baunton to Siddington) 2011 model
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of fluvial flood depths, velocities and hazards
    - Assessment of surface water flood extent, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

Figure 1-3: Topography

The topography of the site slopes from west to east towards the floodplain of the River Churn.

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the percentage areas of the site within each flood zone are stated in Table 2-1 and can be viewed on Figure 2-1. The Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

Nearly half of the site is situated in Flood Zone 1 and therefore is at low risk from flooding from rivers and sea. An area of Flood Zone 2 (53%) extends from the middle to the southern boundary of the site, with a small area to the northern boundary. Part of the functional floodplain crosses the site boundary in the south-eastern corner of the site. There should be no development within the functional floodplain. The functional floodplain in this location is based on the 3.3% AEP defended event of the River Churn (Baunton to Siddington) 2011 model.

Table 2-1: Present day flood risk based on percentage area of site at risk

Flood Zone 1 (% area)	Flood Zone 2 (% area)	Flood Zone 3a (% area)	Flood Zone 3b (% area)
46	53	0	1

Figure 2-1: Present day risk

2.1.2 River Churn (Baunton to Siddington) 2011 model outputs, 1% AEP

Present day risk to the site comes from the River Churn to the east of the site. The 1% AEP undefended event from the River Churn (Baunton to Siddington) 2011 model shows the same extent of flooding to the site as Flood Zone 3a of the Flood Map for Planning (Figure 2-2). The detailed modelling shows that the south-eastern boundary of the site is at risk from the 1% AEP undefended event. Depths are mainly shallow, velocities low (Figure 2-3), and hazards are mainly very low (Figure 2-4).

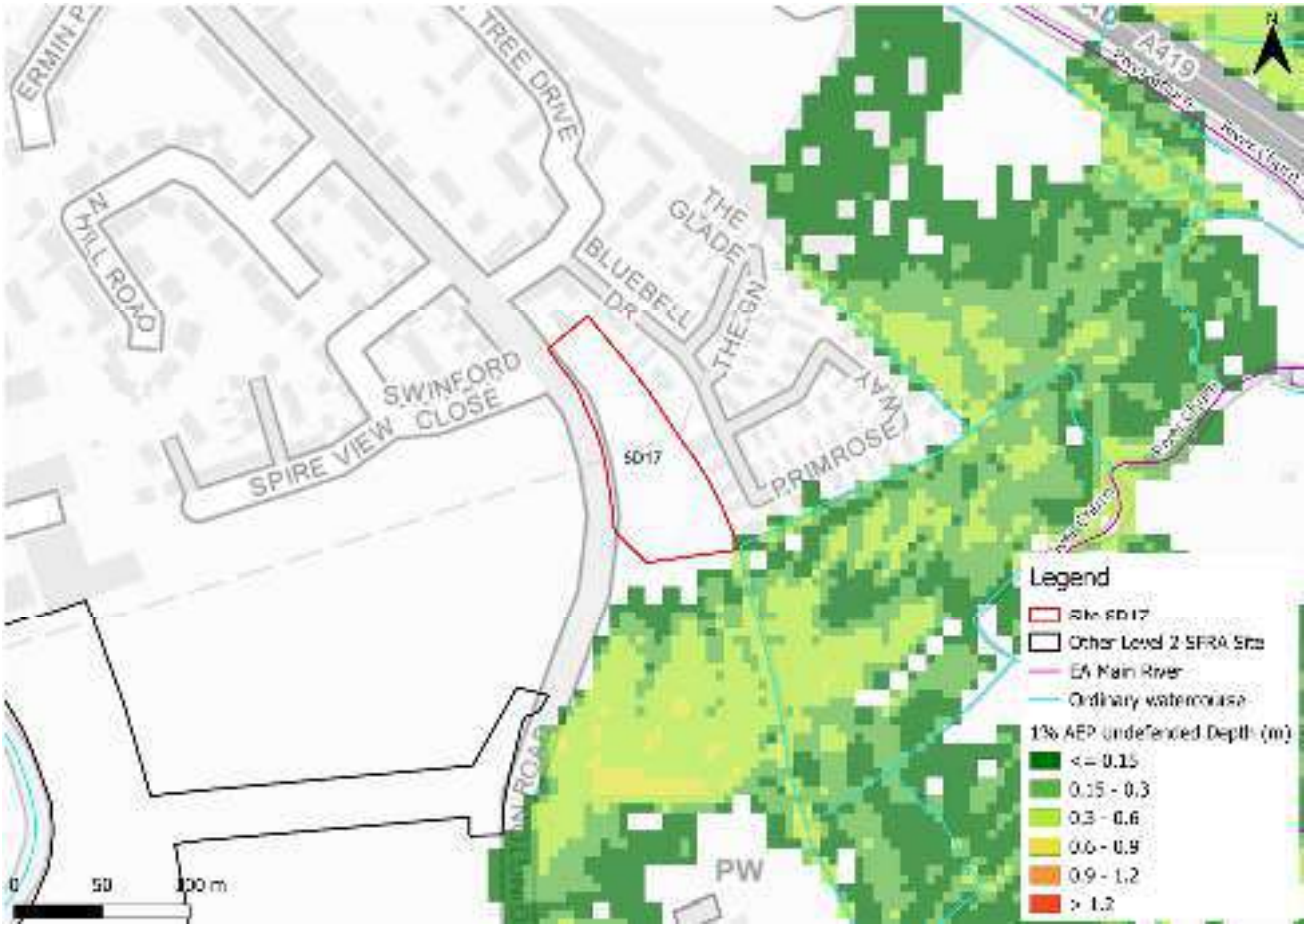

Figure 2-2: Flood depths for the 1% AEP undefended flood event

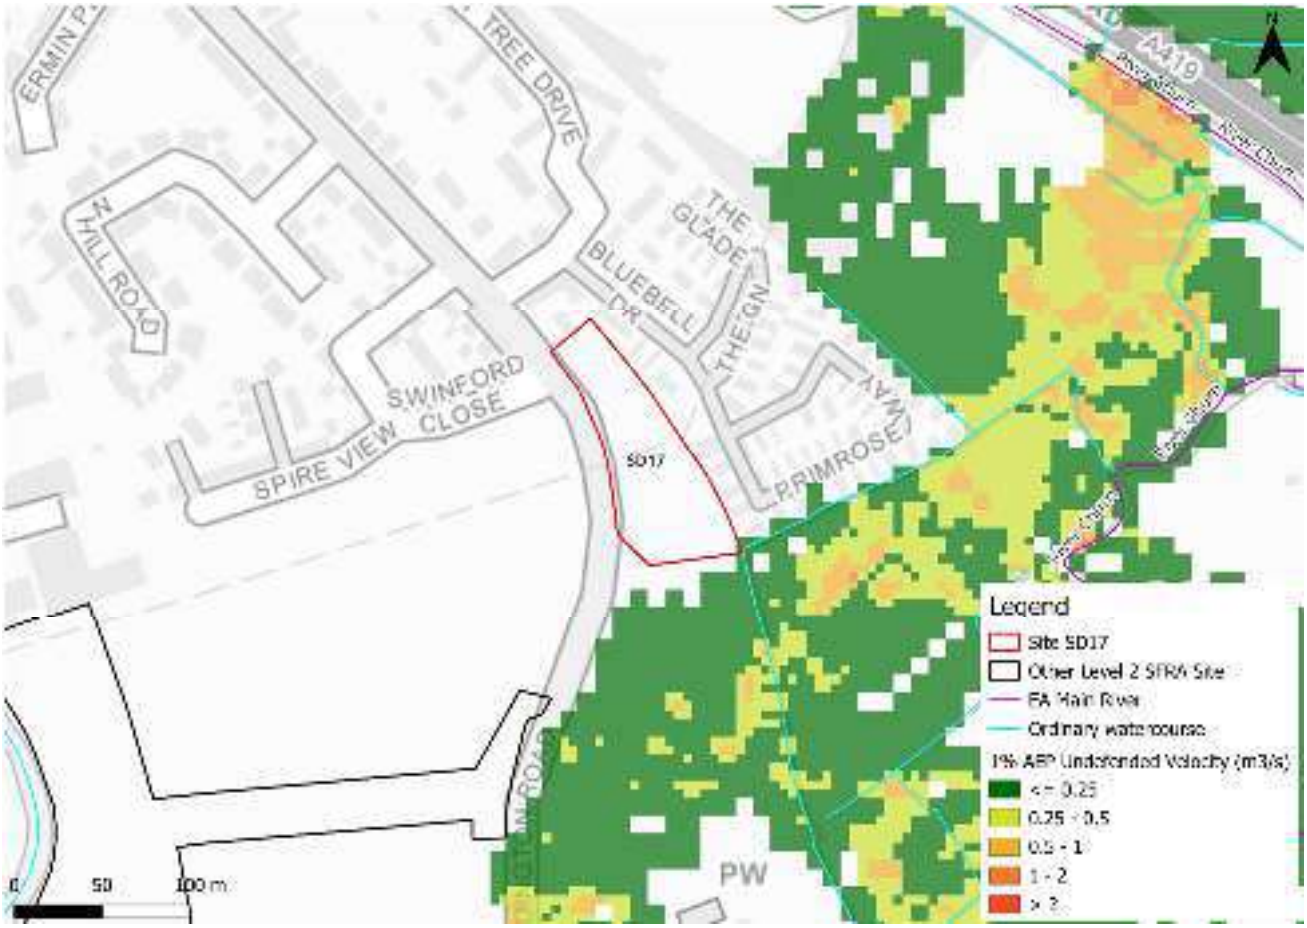

Figure 2-3: Flood velocities for the 1% AEP undefended flood event

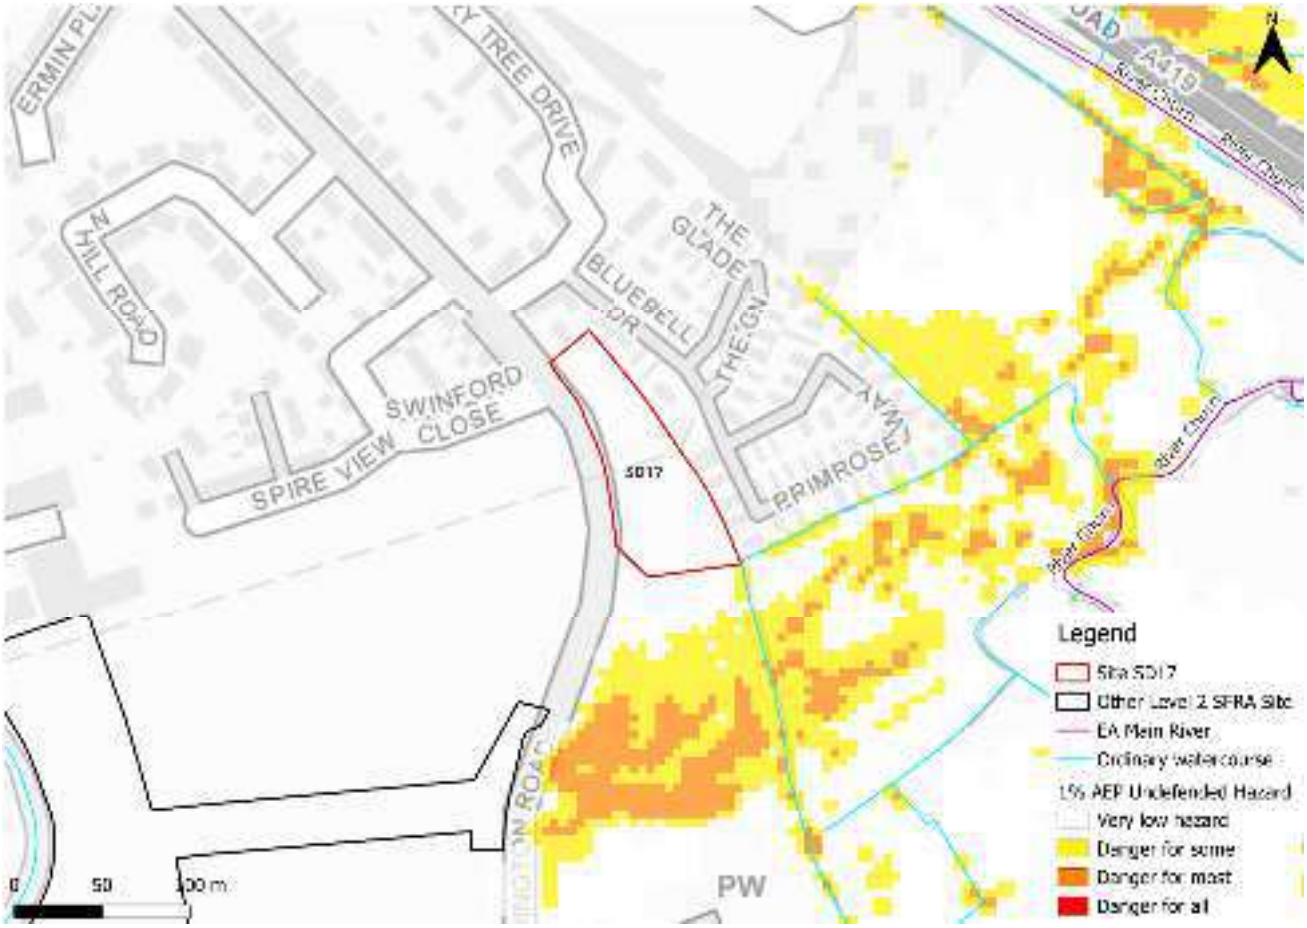

Figure 2-4: Flood hazards for the 1% AEP undefended flood event

2.1.3 River Churn (Baunton to Siddington) 2011 model outputs, 0.1% AEP

The 0.1% AEP undefended event from the River Churn (Baunton to Siddington) 2011 model exhibits a similar flood extent to Flood Zone 2 of the Flood Map for Planning (Figure 2-5). The detailed modelling shows that the southern half of the site is at risk from the 0.1% AEP undefended event. Depths remain mainly shallow, velocities low (Figure 2-6), and hazards are shown to be 'danger for some' (Figure 2-7).

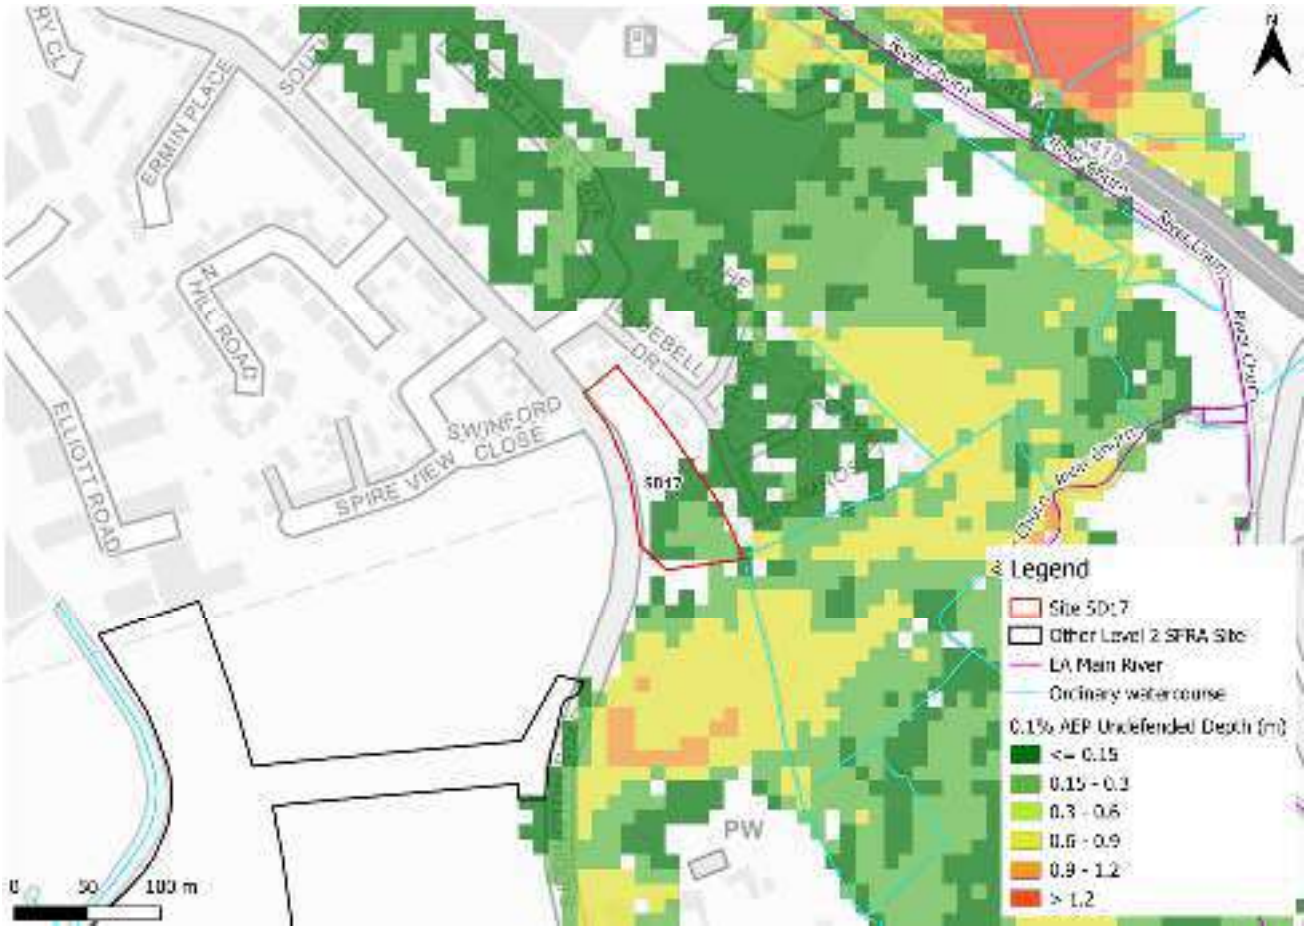

Figure 2-5: Flood depths for the 0.1% AEP undefended flood event

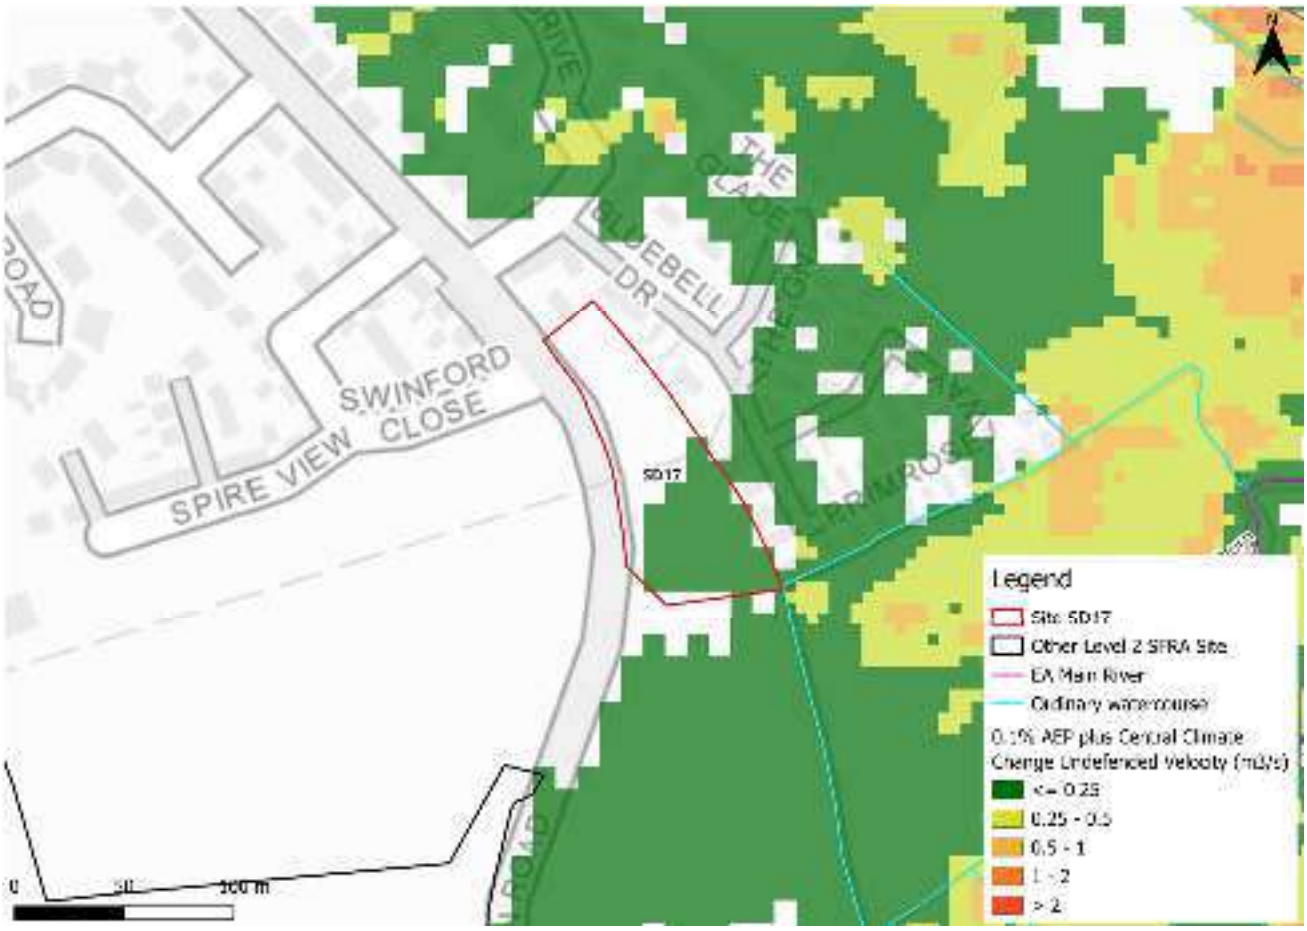

Figure 2-6: Flood velocities for the 0.1% AEP undefended flood event

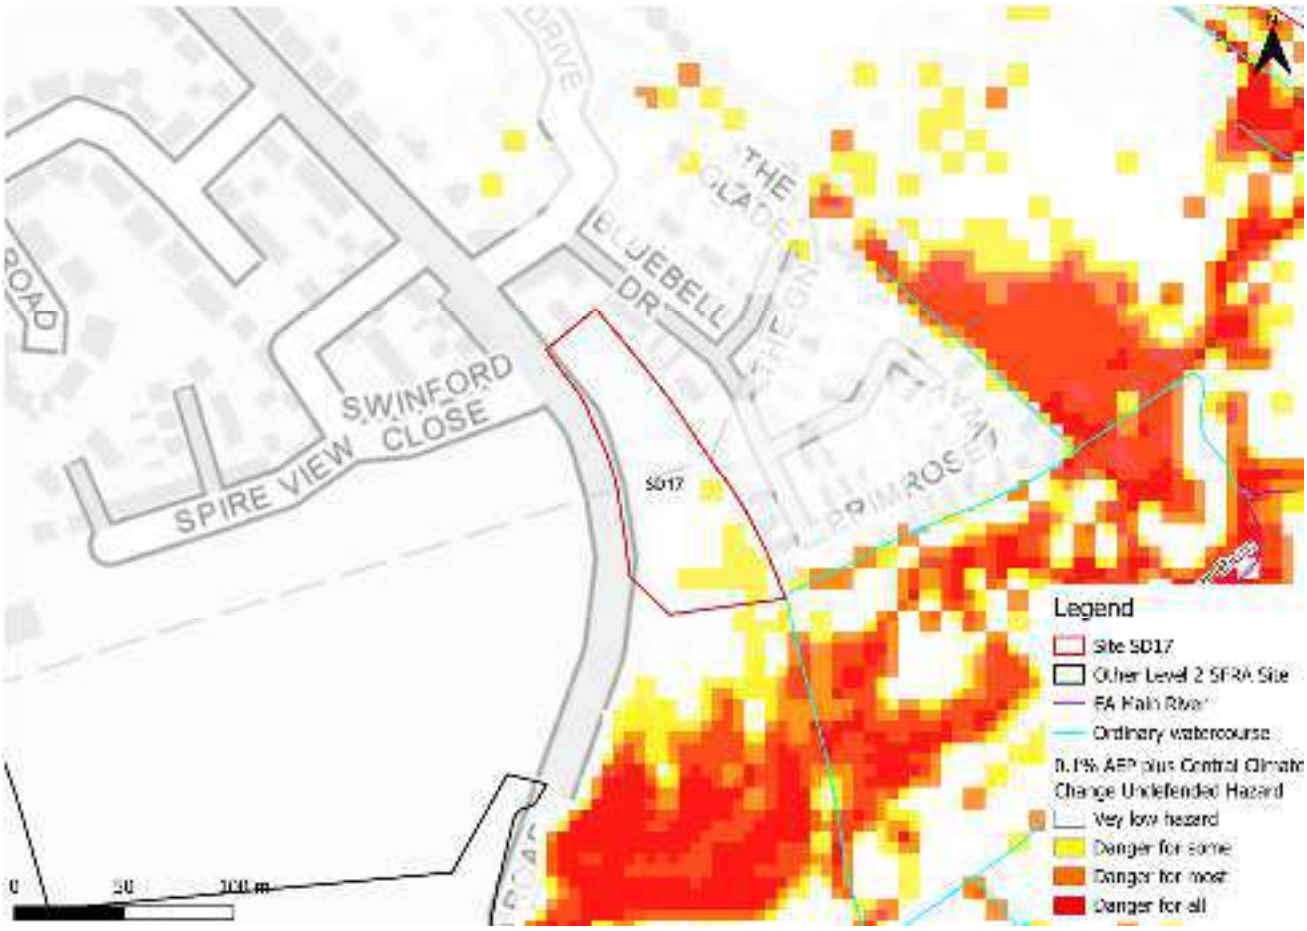

Figure 2-7: Flood hazards for the 0.1% AEP undefended flood event

2.2 Impacts from climate change

2.2.1 River Churn (Baunton to Siddington) 2011 model outputs

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Gloucestershire and the Vale Management Catchment. The central allowance within this catchment is 26% on peak flows (Table 2-2). The impacts of climate change on flood risk are included in the model for the 1% AEP undefended event using 30% on peak flows rather than the current central allowance of 26%.

Table 2-2: Modelled climate change allowances for peak river flows within the Gloucestershire and the Vale Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	11	17	33
2050s	11	19	43
2080s	26	41	84

Figure 2-8, Figure 2-9, and Figure 2-10 show the modelled flood depths, velocities, and hazards respectively for the 1% AEP undefended event plus the central allowance for peak river flows. The risk area increases in size, with flood depths increasing to between 0.3 and 0.6 m, with velocities remaining low. Flood hazards are shown to be 'danger for some'.

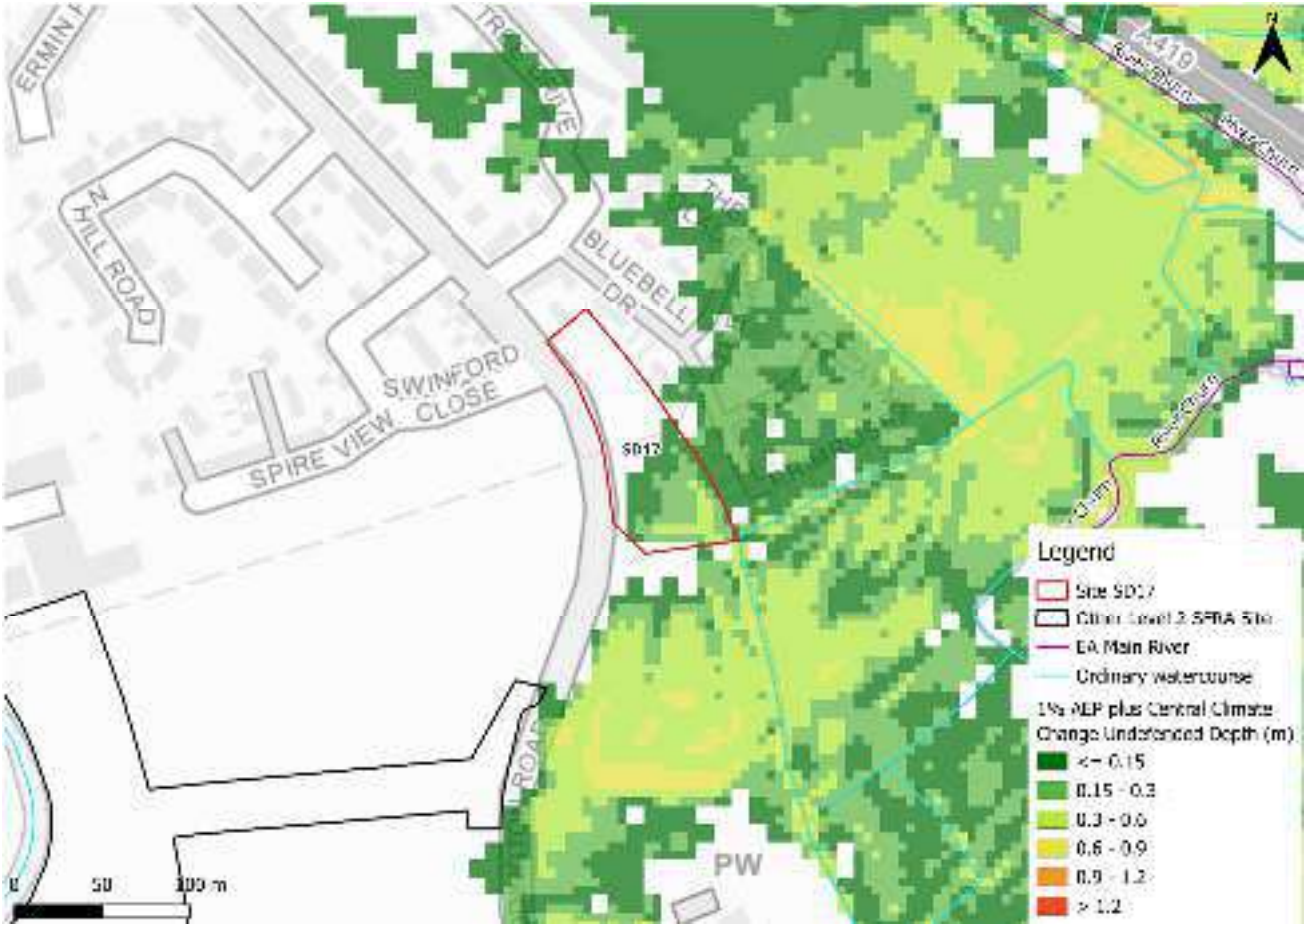

Figure 2-8: Flood depths for the 1% AEP undefended flood event plus central climate change allowance for the 2080s epoch

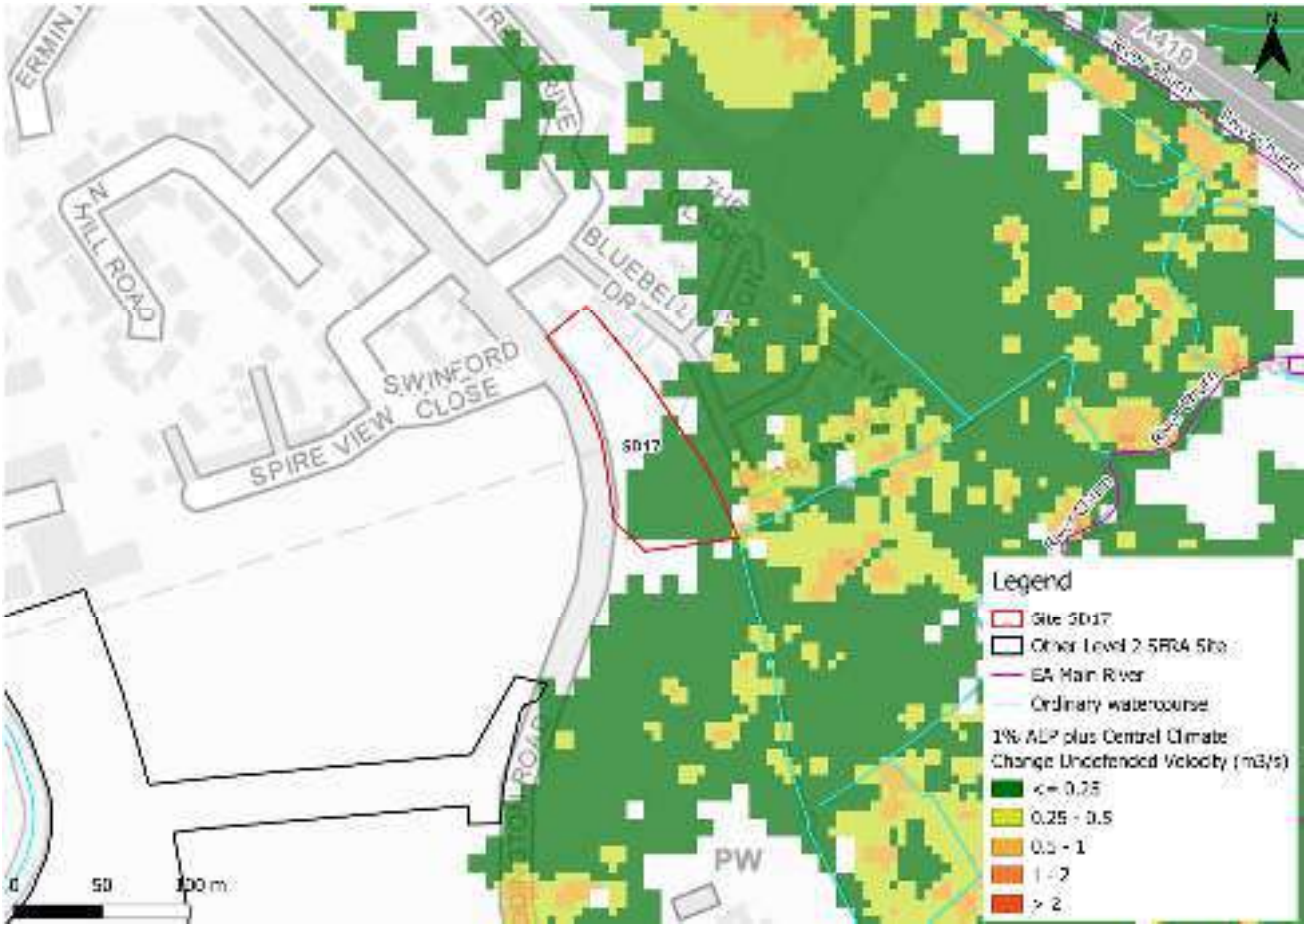

Figure 2-9: Flood velocities for the 1% AEP undefended flood event plus central climate change allowance for the 2080s epoch

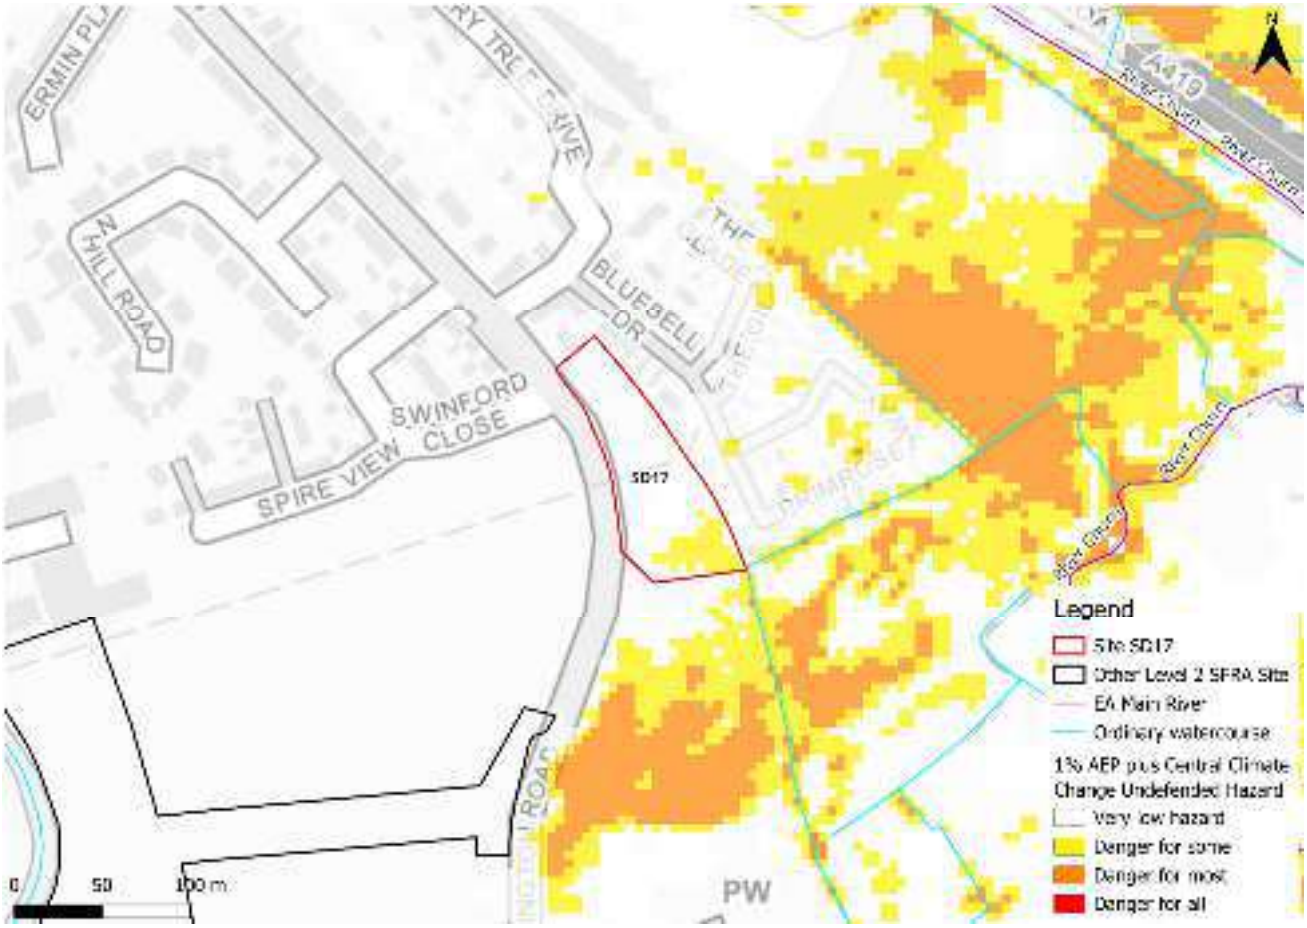

Figure 2-10: Flood hazards for the 1% AEP undefended flood event plus central climate change allowance for the 2080s epoch

2.2.2 Flood Map for Planning - Flood Zones plus Climate Change

Figure 2-11 shows the Flood Map for Planning - Flood Zones plus Climate Change dataset which includes the central allowance for the 2080s epoch. This represents the impact of climate change on Flood Zone 3a and Flood Zone 2 combined. This shows a greater extent of flooding than the modelled event. This is due to the Flood Zones plus Climate Change dataset also including the larger 0.1% AEP event. Therefore, the risk to the site does increase.

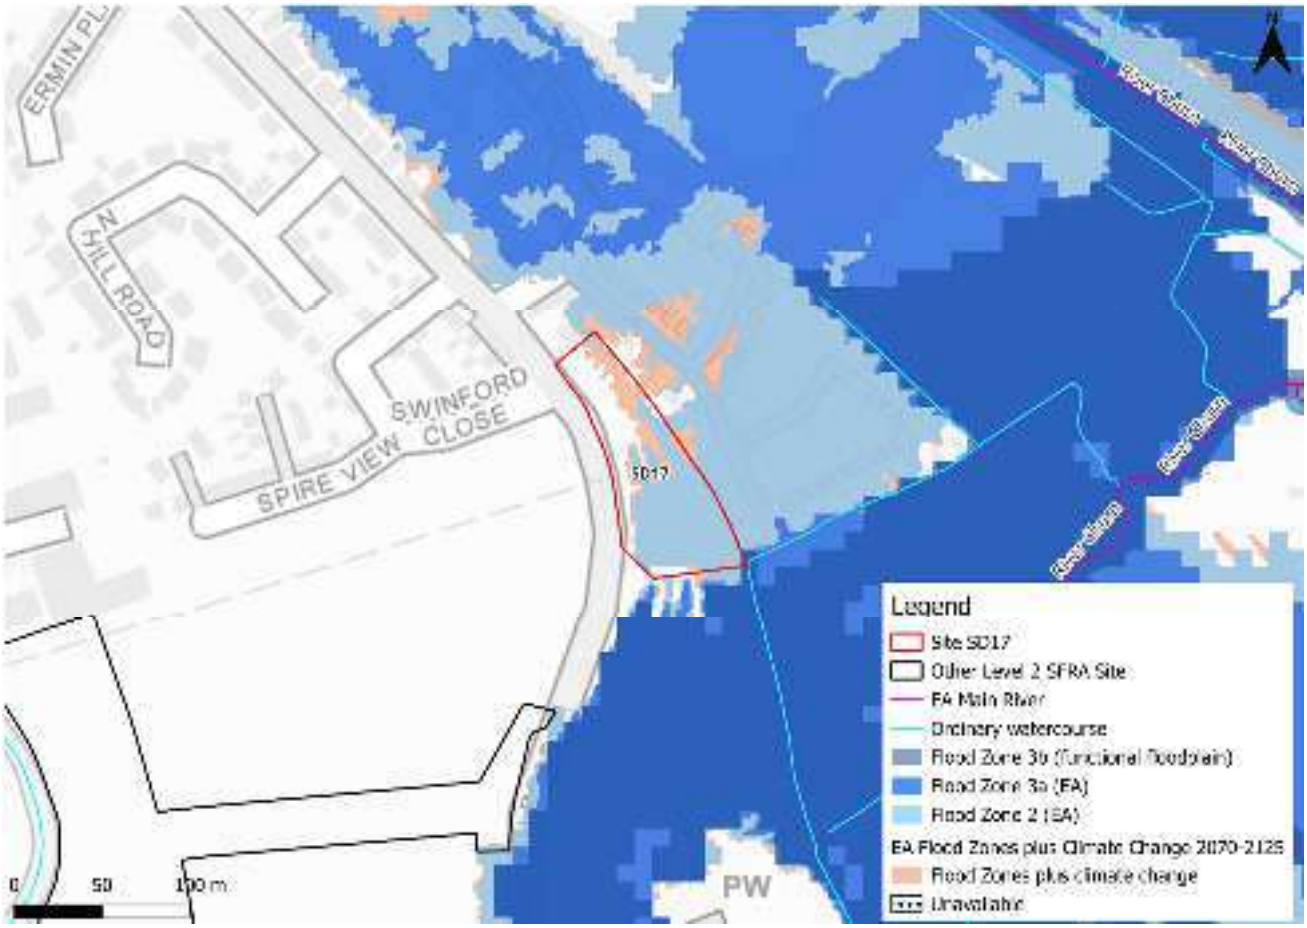

Figure 2-11: EA Flood Zones plus Climate Change

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been six recorded flooding incidents within the Siddington and Cerney Rural Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-12 shows that the site and wider area could benefit from riparian, floodplain, and wider catchment tree planting. Tree planting can help to slow the

flow to benefit areas downstream. There is also potential for runoff attenuation. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

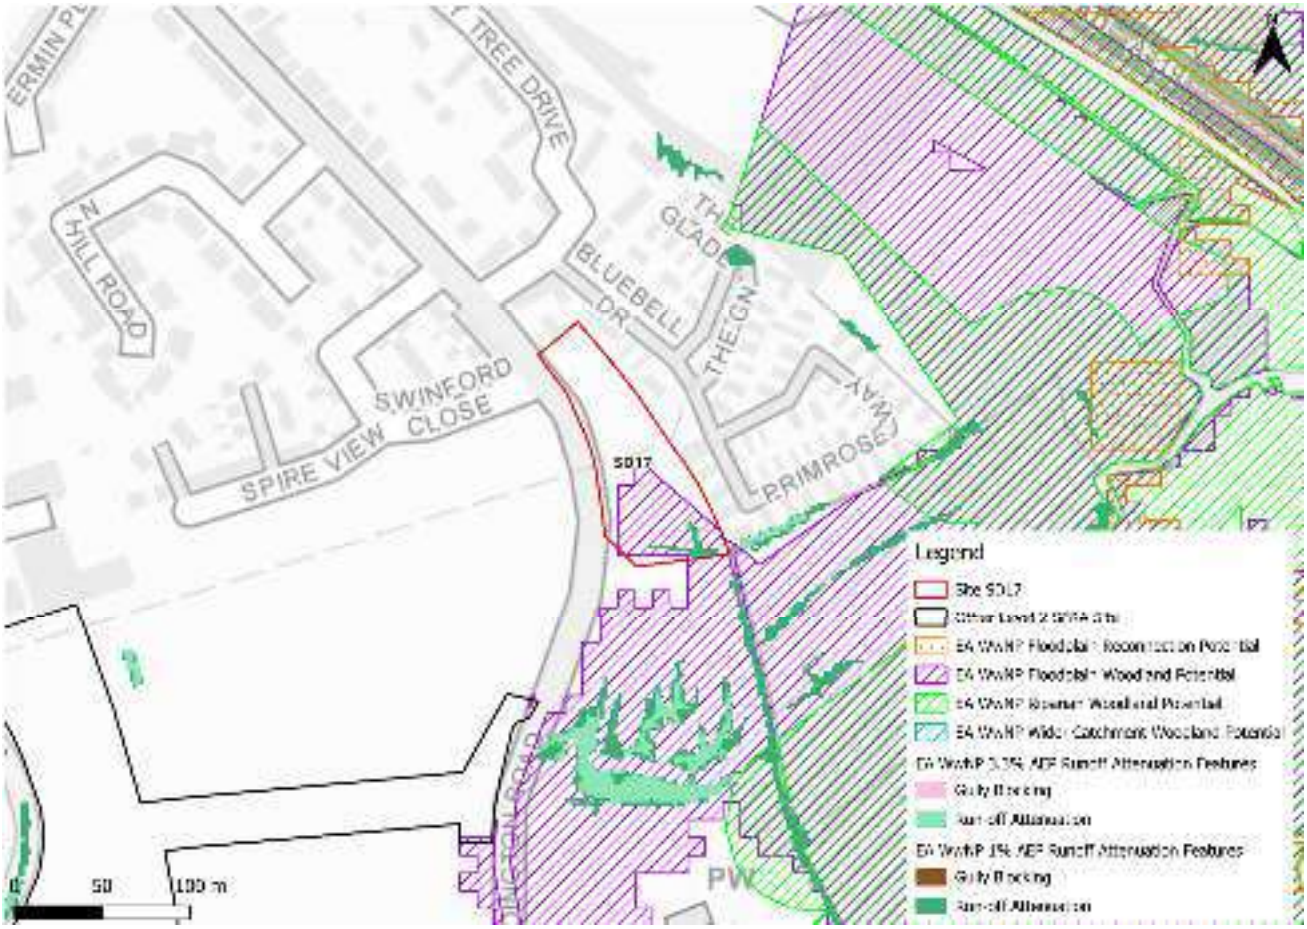

Figure 2-12: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warning and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The majority of the area at risk from fluvial climate change is included within a FWA, namely 061FWF02Cirncstr - River Churn from Baunton to Siddington including Cirencester, as shown in Figure 2-13.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The majority of the area at risk from fluvial climate change is included within a FAA, namely 061WAF02Churn - River Churn and its tributaries, as shown in Figure 2-13.

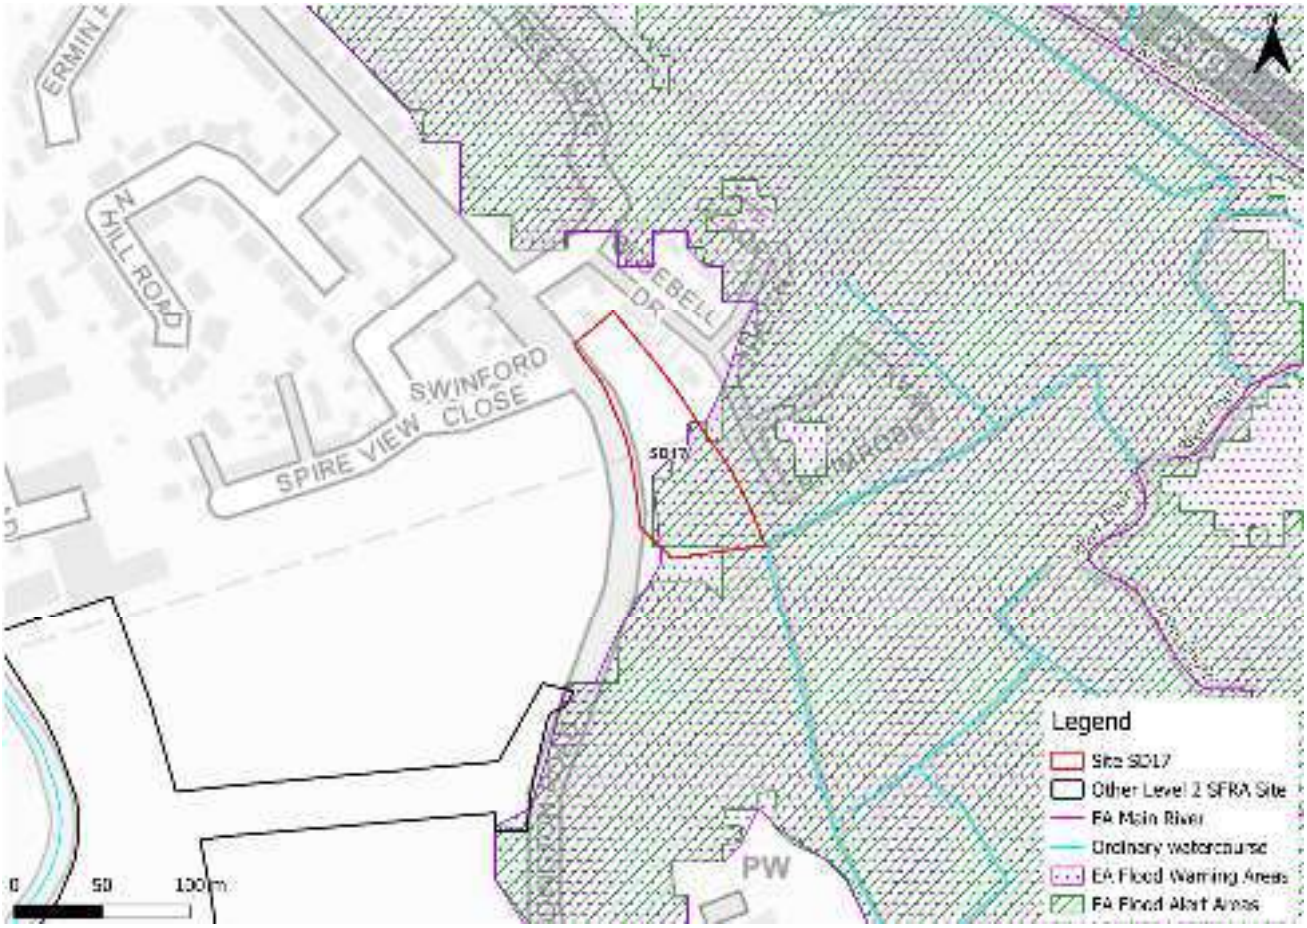

Figure 2-13: Flood warnings and alerts

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes could likely be achieved during a flood event via the west of the site via Siddington Road (Figure 2-14).

Figure 2-14: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - Just under half of the site is located within Flood Zone 1 and therefore at low risk from rivers. However, 53% of the site is within Flood Zone 2. Modelled depths are however shallow and hazards mainly very low with some danger for some.
  - Local modelling shows the site is at additional risk from climate change.
  - Risk from the ordinary watercourse is currently unknown though may be included in the risk from the River Churn.
- Mitigation:
  - The area of the site within the functional floodplain should not be developed and should remain as open greenspace. More vulnerable development should be directed to Flood Zone 1 whilst also accounting for the impacts of climate change. Ideally, the areas at modelled risk from climate change would remain as open green space, providing a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits.

- Were development in the risk area to be considered, land raising may be an option. However, compensatory storage would be required onsite or nearby, whilst ensuring there is no detriment to existing development or infrastructure.
- Risk from the ordinary watercourse must be assessed and quantified at the FRA stage.
- EA flood warnings and alerts should continue to be in place to ensure early evacuation of site users before an extreme flood event occurs.

- Access and escape:
  - Based on current information, safe access and escape routes appear achievable via Siddington Road to the west of the site.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents Present Day maps (May 2026), the site is predominantly at low risk of surface water flooding as shown in Table 3-1 and Figure 3-1 and the depth map in Figure 3-2. There is a flow path in the south of the site of shallow flood depths <0.3m.

Safe access and escape routes are achievable via Siddington Road to the west of the site in all events.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
92	6	2	0

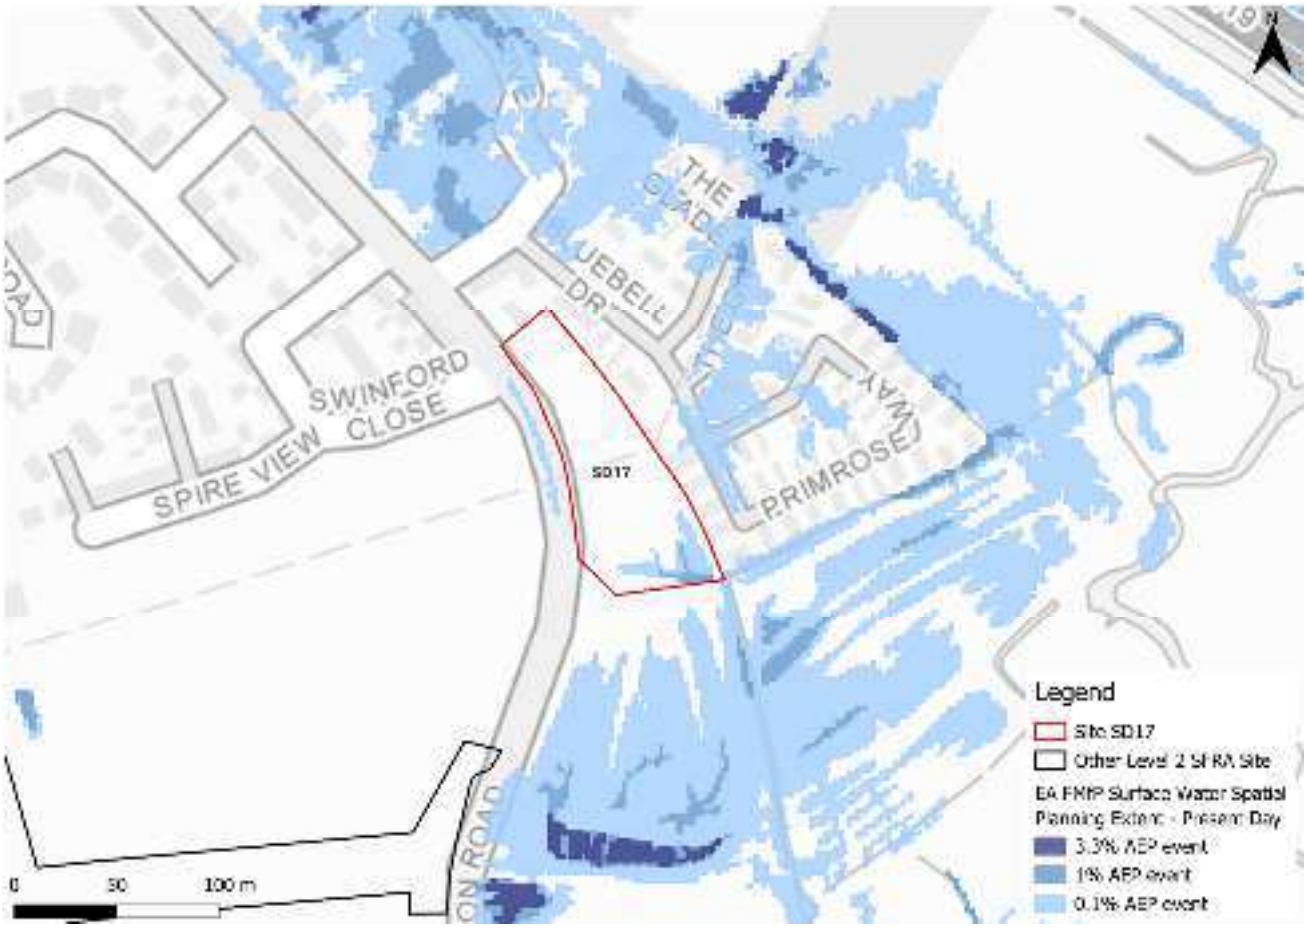

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

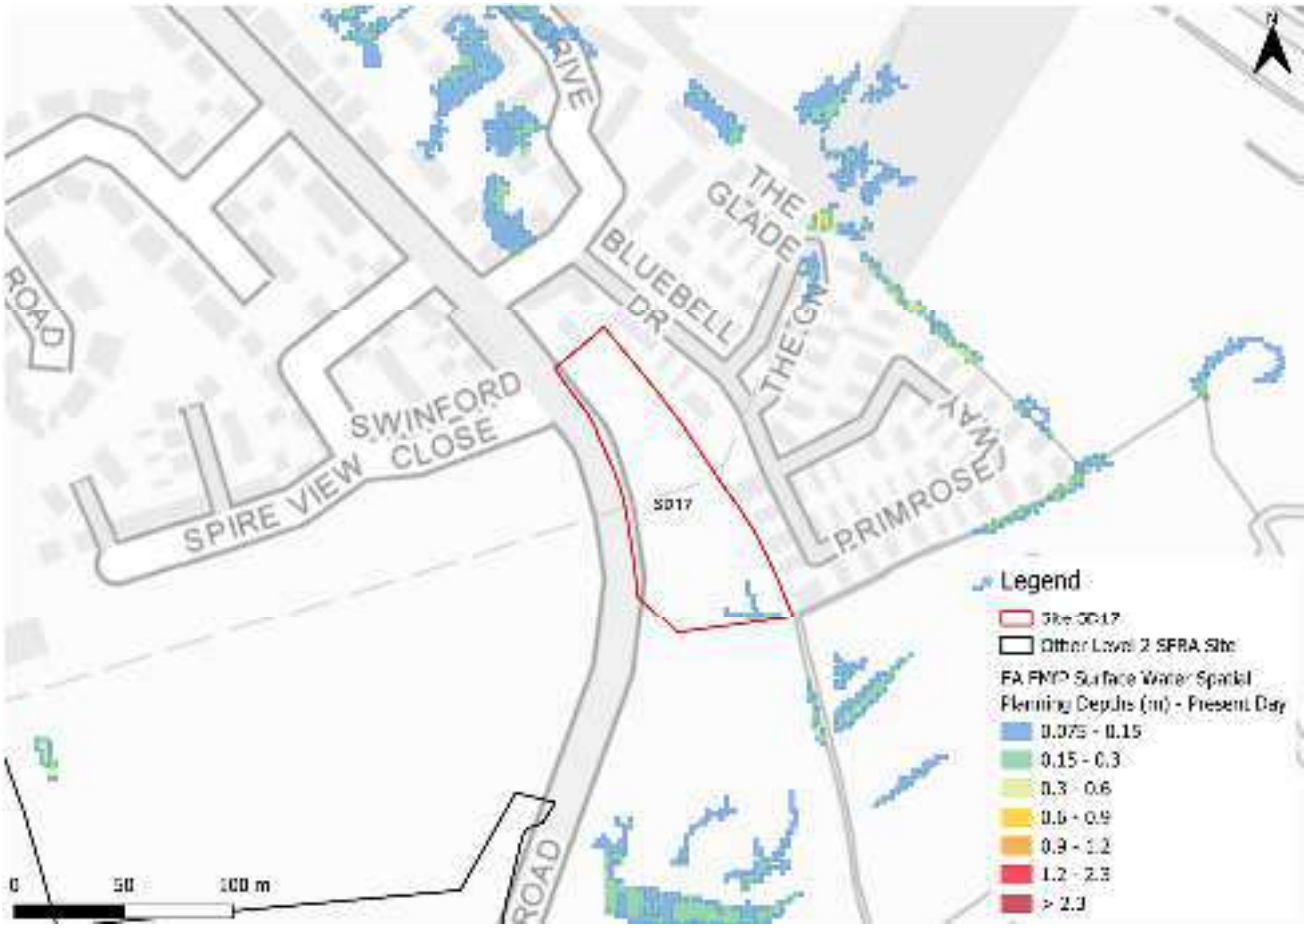

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows there to be areas of low to moderate flood hazard in the south of the site and along the southern site boundary (Figure 3-3).

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

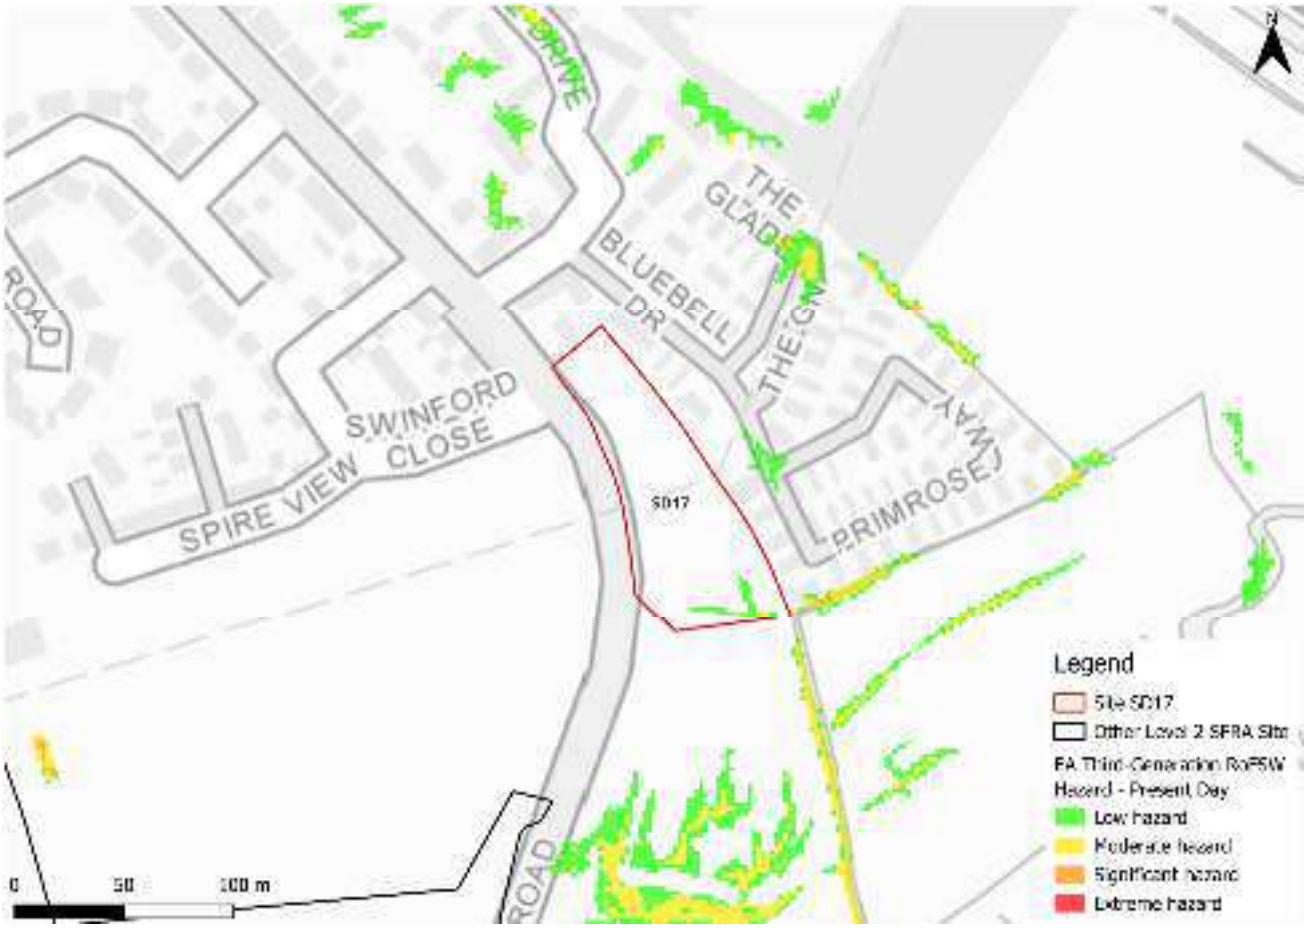

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day medium risk surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is now included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Gloucestershire and the Vale management catchment are shown in

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

Table 3-2: Peak rainfall intensity allowances for the Gloucestershire and the Vale Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. The site is shown to be at additional risk from surface water climate change, mainly in the low risk event. There are additional areas of ponding in the low-risk event, and the flow path in the south of the site increases in size and risk.

Flood depths are mainly shallow, with only a small area between 0.15m - 0.3m deep (Figure 3-5). Safe access and escape routes would likely remain achievable via Siddington Road to the west of the site.

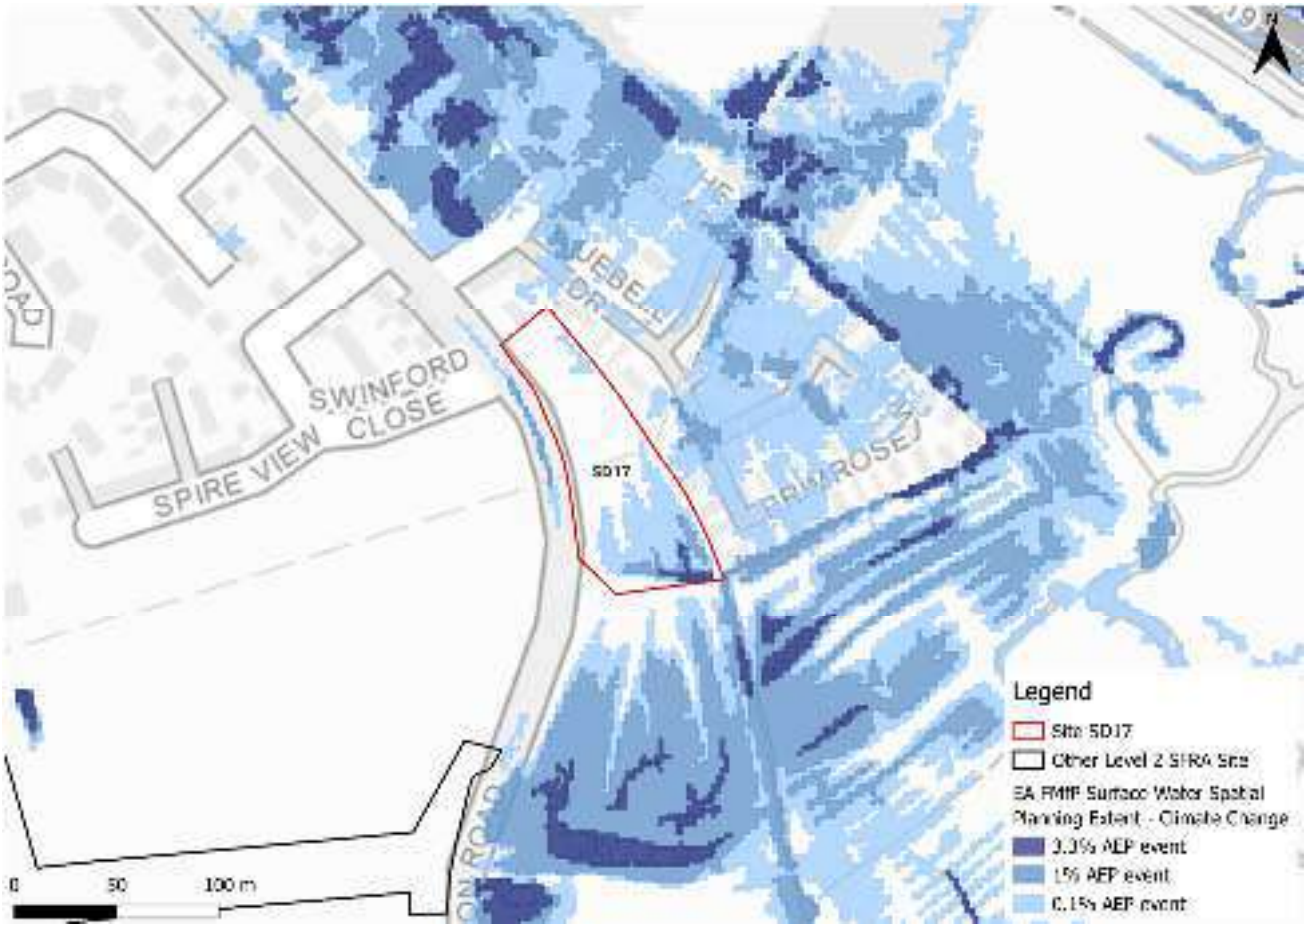

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

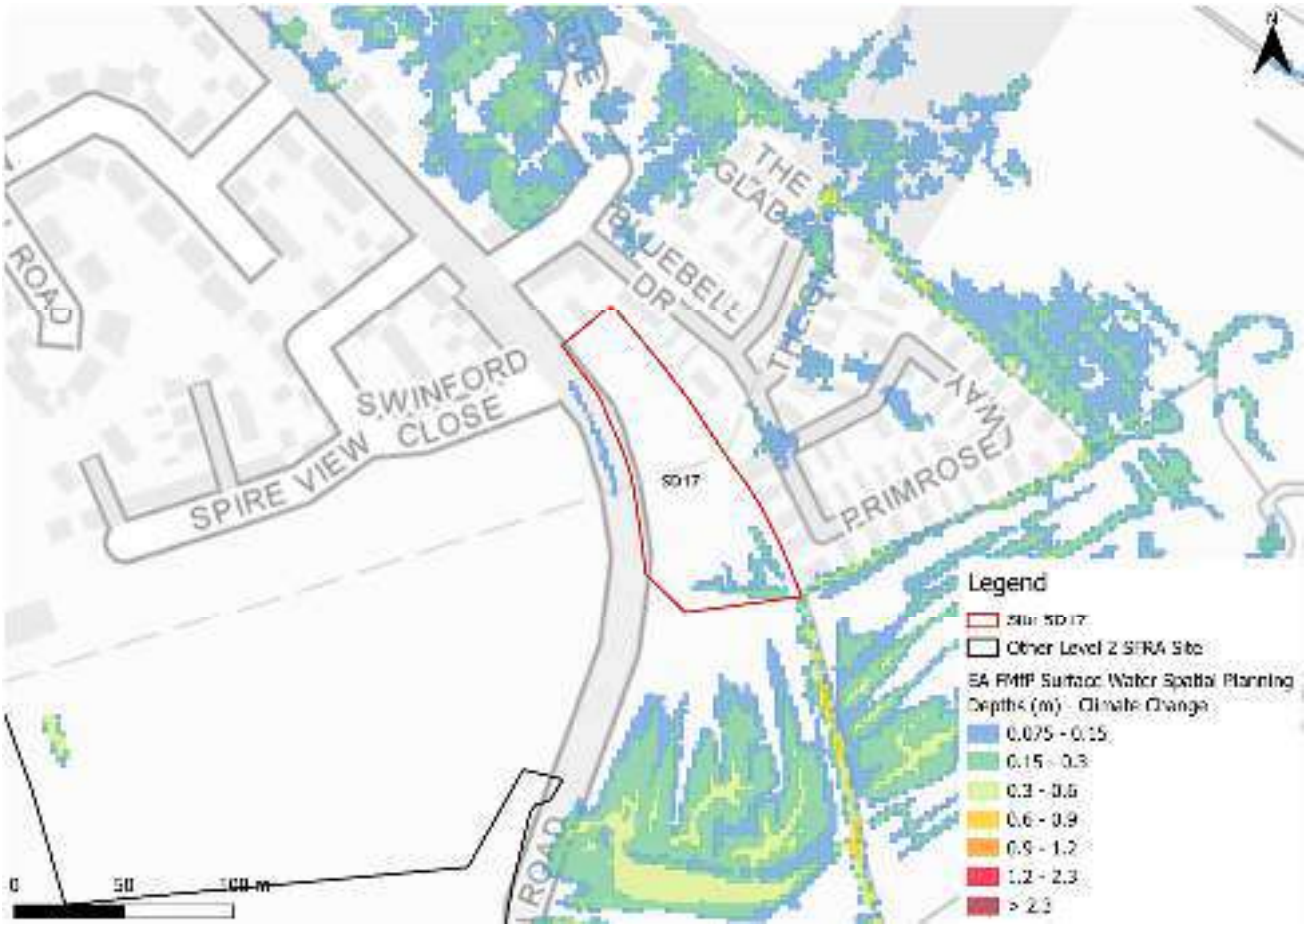

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning climate change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the RoFSW low-risk surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards (Figure 3-6).

The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

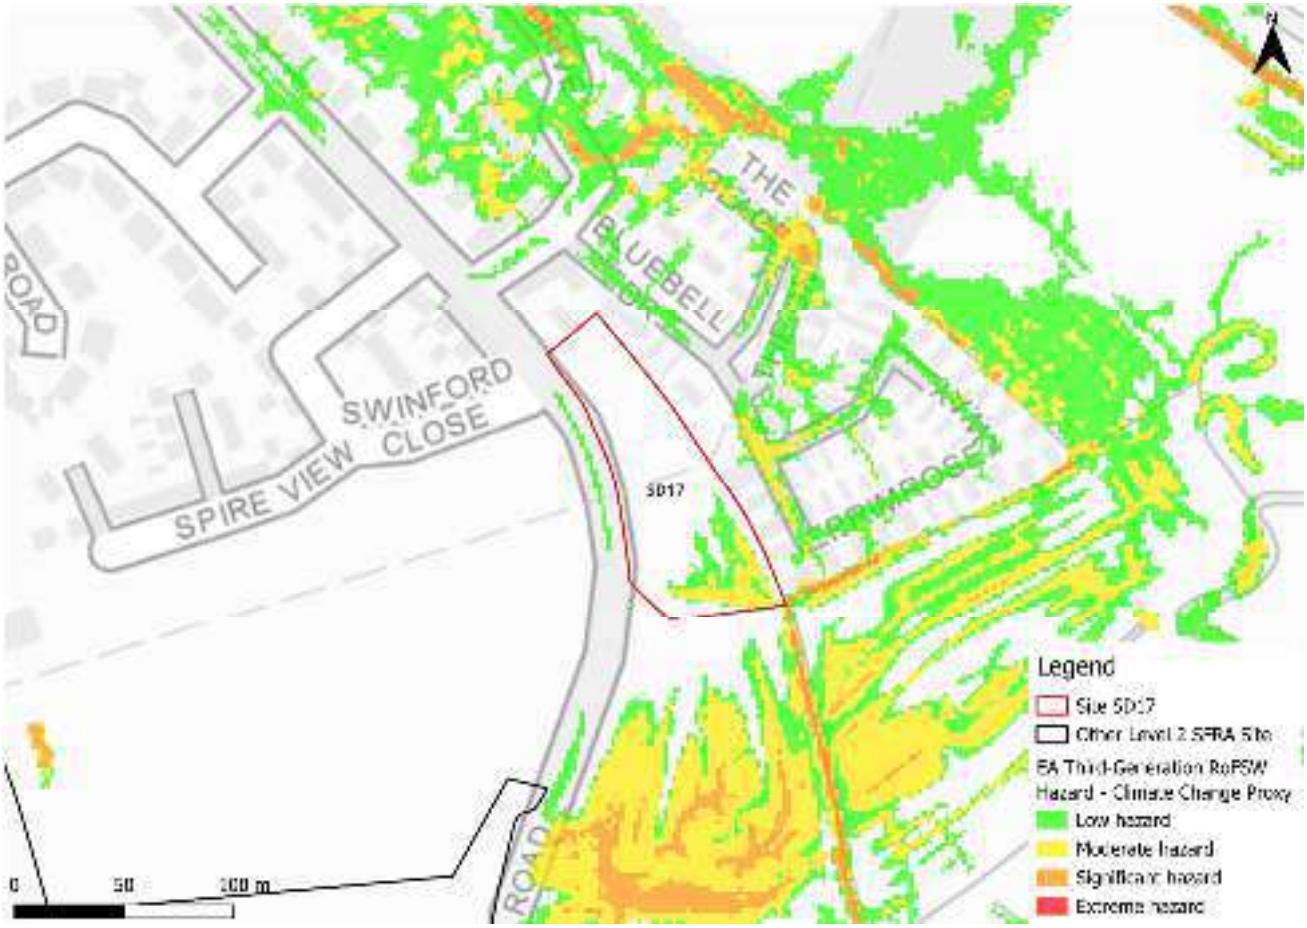

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day low risk surface water flood hazard as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There are no recorded sewer flooding incidents nearby the site nor within the Siddington & Cerney Rural Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly very low, with 92% of the site being at very low surface water flood risk.
- Risk to the site is shown to slightly increase in extent within the site when considering the impact of climate change. The surface water risk area is generally within the fluvial risk area and should be managed through any mitigation measures used to manage the fluvial risk.
- Topographic low spots and flow paths should be considered and included in site design and ideally left in place to flood naturally when required.
- The drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or

betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.

- Safe access and escape routes would likely be achievable via Siddington Road to the west of the site.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within one catchment, namely, the Churn (Baunton to Cricklade) catchment. This catchment is ranked as a high sensitivity catchment. Planning considerations for all sites can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications. The map shows there is a risk of groundwater emergence to both surface and subsurface assets in the southwestern half of the site. Groundwater may emerge at significant rates in this area and has the capacity to flow overland and/or pond within any topographic low spots. The northeastern half of the site is not at risk.

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is sandstone, limestone and argillaceous rocks (Figure 5-2). Sandstone and limestone generally have a high permeability and high level of porosity, increasing infiltration rates. Superficial deposits include clay and silt which have low permeability. Infiltration SuDS at this site may not be an option, though the drainage strategy for the site should fully investigate water table levels through standpipe monitoring during the period of highest groundwater levels e.g. November to April.

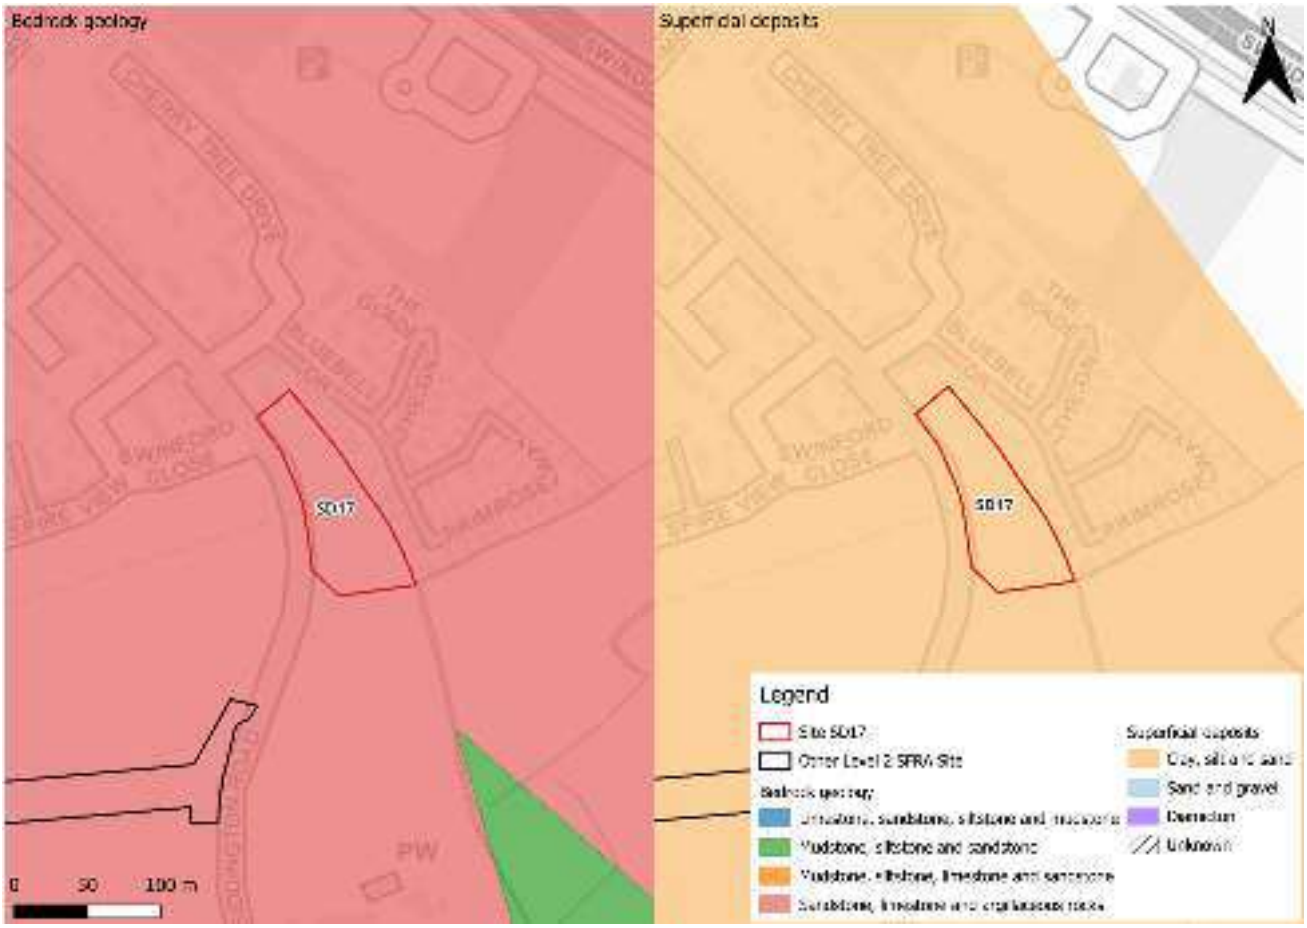

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There does not appear to be any residual risk to the site from asset blockage or defence breach.

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is not required to pass part b) of the exception test as it is not located within Flood Zone 3a, however it must still be proven that the development can be safe for its lifetime, which is generally considered to be 100 years for residential development.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- Based on current information, it is recommended that all development is directed to the area within the north of the site located in Flood Zone 1. Development should also avoid the area shown to be at additional risk from climate change in the 1% AEP undefended event plus central climate change allowance.
- The risk area would ideally be utilised as open green space, providing a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits. However, this will limit plot numbers onsite.
- Risk from the ordinary watercourse must be assessed and quantified at the FRA stage.
- A drainage strategy should ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- Groundwater conditions must be investigated further through the site-specific FRA. This should be assessed through standpipe monitoring during the period of highest groundwater levels e.g. November to April.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WCAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Jo Corbett of Cotswold District Council. Laura Thompson-Jones of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken in July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for the strategic extension site to the north, east and south of Down Ampney. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Strategic extension to the north, east and south of Down Ampney

- Location: Down Ampney
- Existing site use: Open greenspace
- Existing site use vulnerability: Water compatible
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 135.4
- Watercourse: Ampney Brook, ordinary watercourses
- Environment Agency (EA) flood model: Ampney Brook Thames (MRL to St Johns) 2014 model
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of fluvial flood depths, velocities and hazards
    - Assessment of surface water flood extents, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

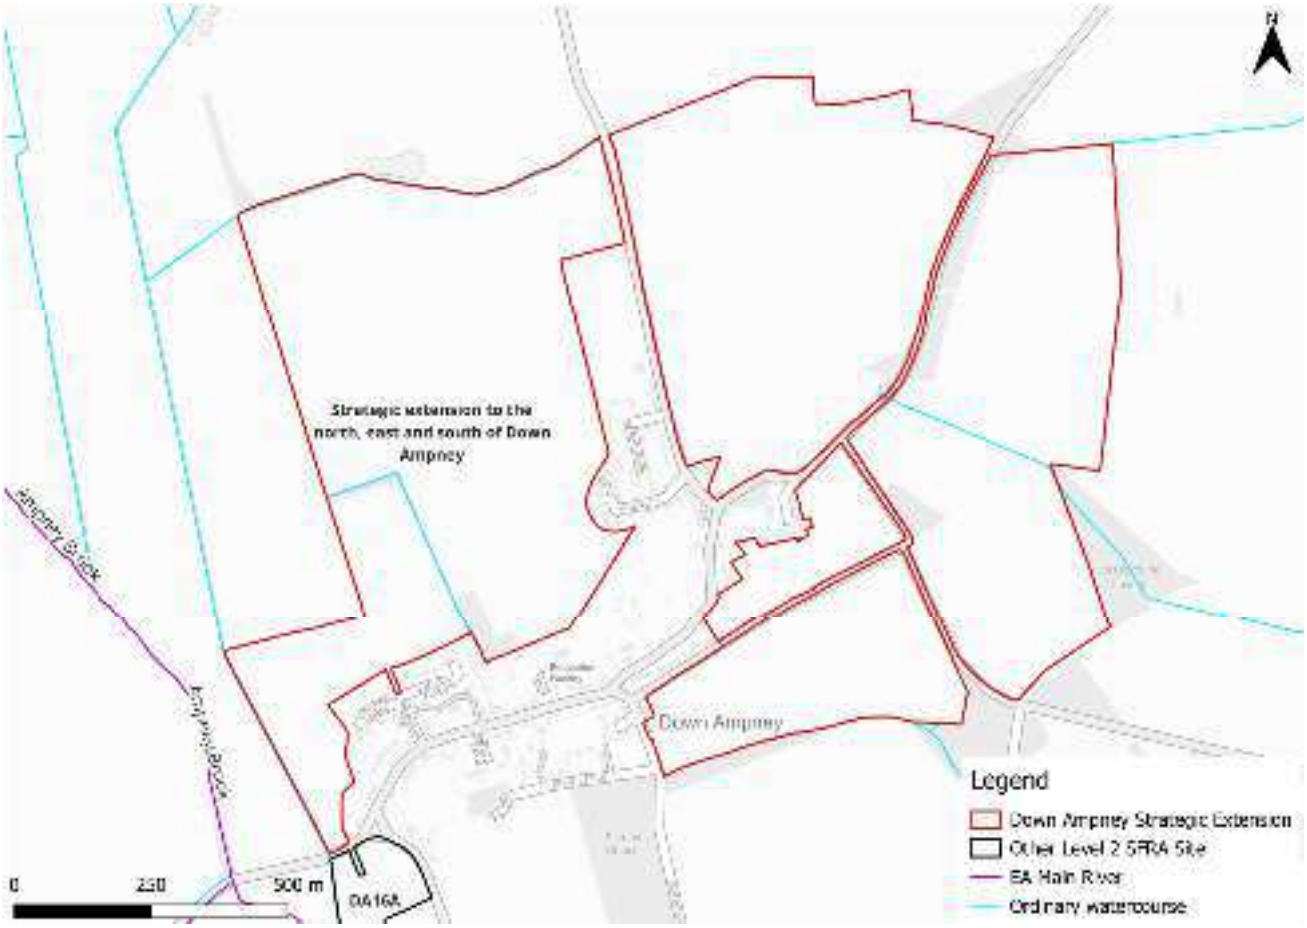

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

There are areas of higher elevation within the central and northern areas of the site, which slope towards the southeast and southwest (Figure 1-3).

Figure 1-3: Topography

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the percentage areas of the site within each flood zone are stated in Table 2-1 and can be viewed on Figure 2-1. The Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

An area within the southwest of the western site parcel is situated within the functional floodplain, adjacent to Ampney Brook. The functional floodplain in this location is based on a combination of the modelled 2% AEP defended flood event from the Ampney Brook Thames (MRL to St Johns) 2014 model, and the EA's New National Model (NNM) dataset 'Rivers and Sea 3.3% defended flood risk extents - present day', where the Thames model domain ends. There should be no development within the functional floodplain.

The other site parcels are located wholly within Flood Zone 1 and therefore at low risk of flooding from rivers. However, there are a number of unnamed, unmodelled ordinary watercourses which run through several of the site parcels.

CDC are aware of an unmapped ordinary watercourse within the southernmost site parcel (DA17A). Future development proposals should preserve and maintain this route and provide appropriate maintenance access and stand-offs. Opportunities for restoration / de-culverting should be explored where possible. The presence of this watercourse may influence the developable area and site layout.

Table 2-1: Present day flood risk based on percentage area of site at risk

Flood Zone 1 (% area)	Flood Zone 2 (% area)	Flood Zone 3a (% area)	Flood Zone 3b (% area)
95	1	1	3

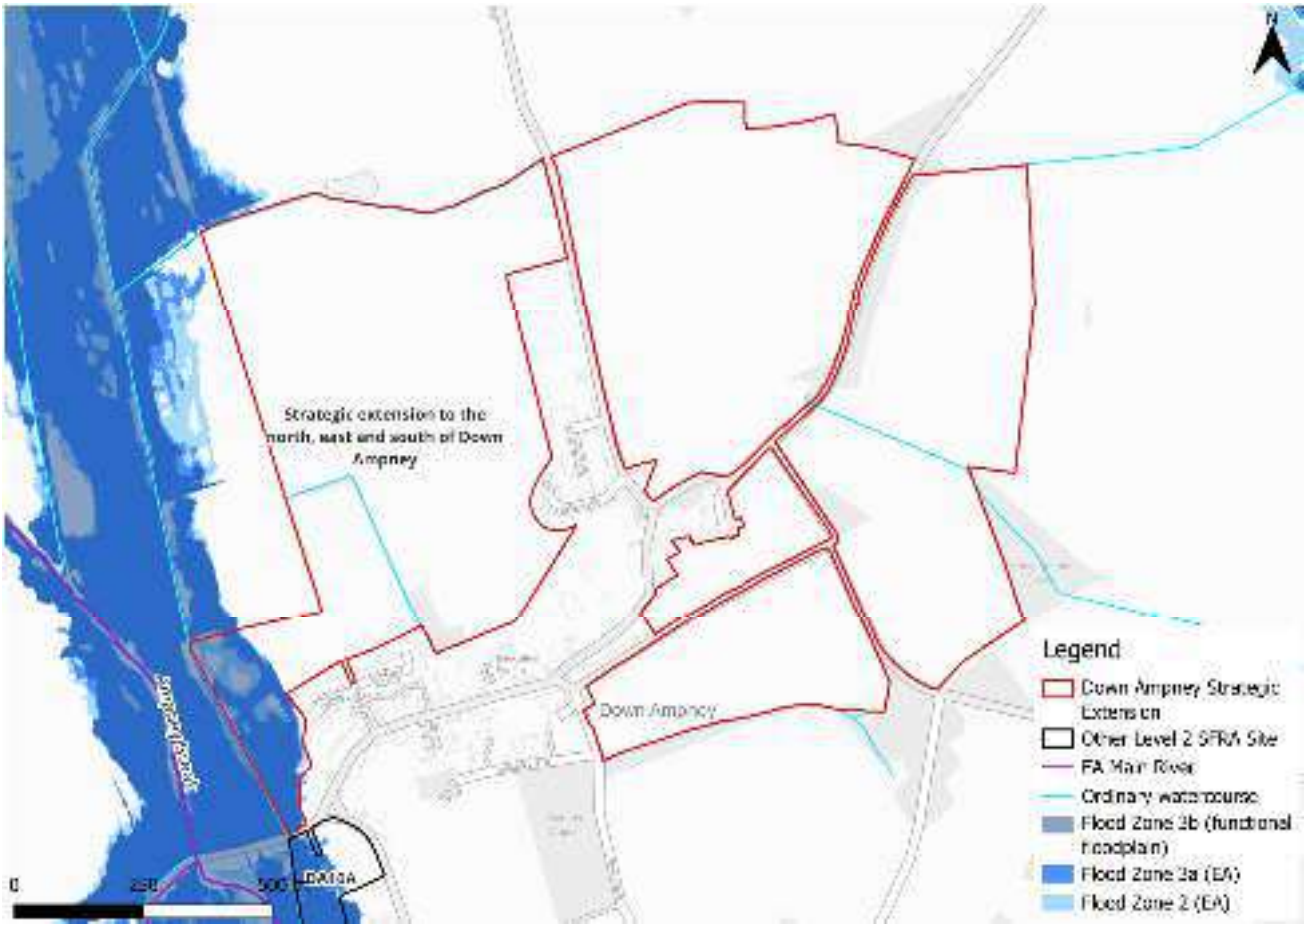

Figure 2-1: Present day risk

2.1.2 Ampney Brook Thames (MRL to St Johns) 2014 model outputs

Present day risk to the site comes from Ampney Brook to the west of the site. However, the Flood Map for Planning is not based on the outputs from this model but on the NNM. The NNM does not contain depth or hazard data. The Ampney Brook Thames (MRL to St Johns) 2014 model will therefore require updating to robustly inform on risk to the site.

However, Figure 2-2, Figure 2-3, Figure 2-4 present the modelled flood depths, velocities, and hazards respectively for the 1% AEP undefended event, this being the event Flood Zone 3 of the Flood Map for Planning would normally represent. Maximum flood depths within the western site parcel are between 0.3 and 0.6 m, with low velocities and areas of hazard categorised as 'danger for some'.

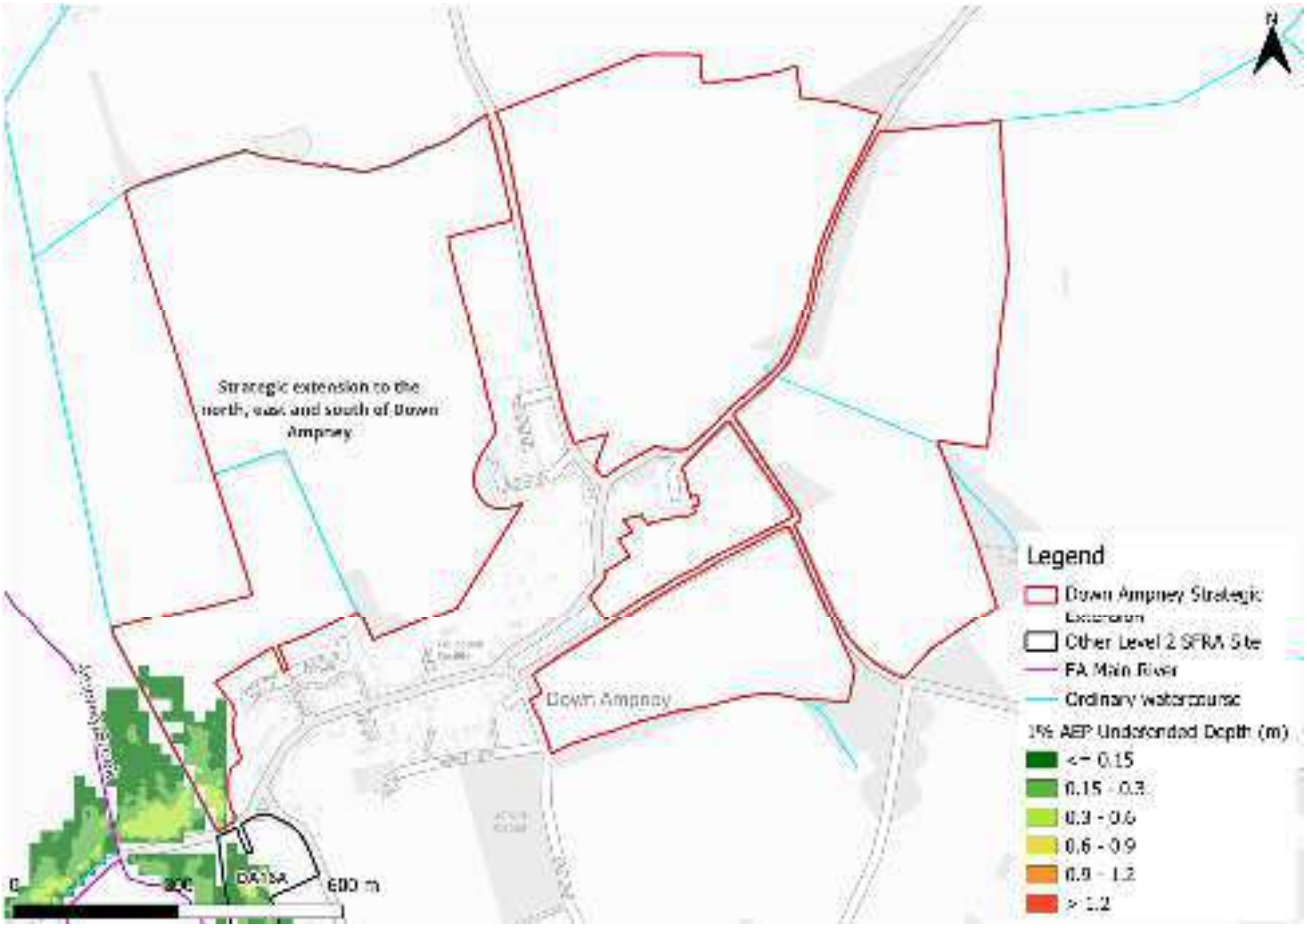

Figure 2-2: Flood depths for the 1% AEP undefended flood event

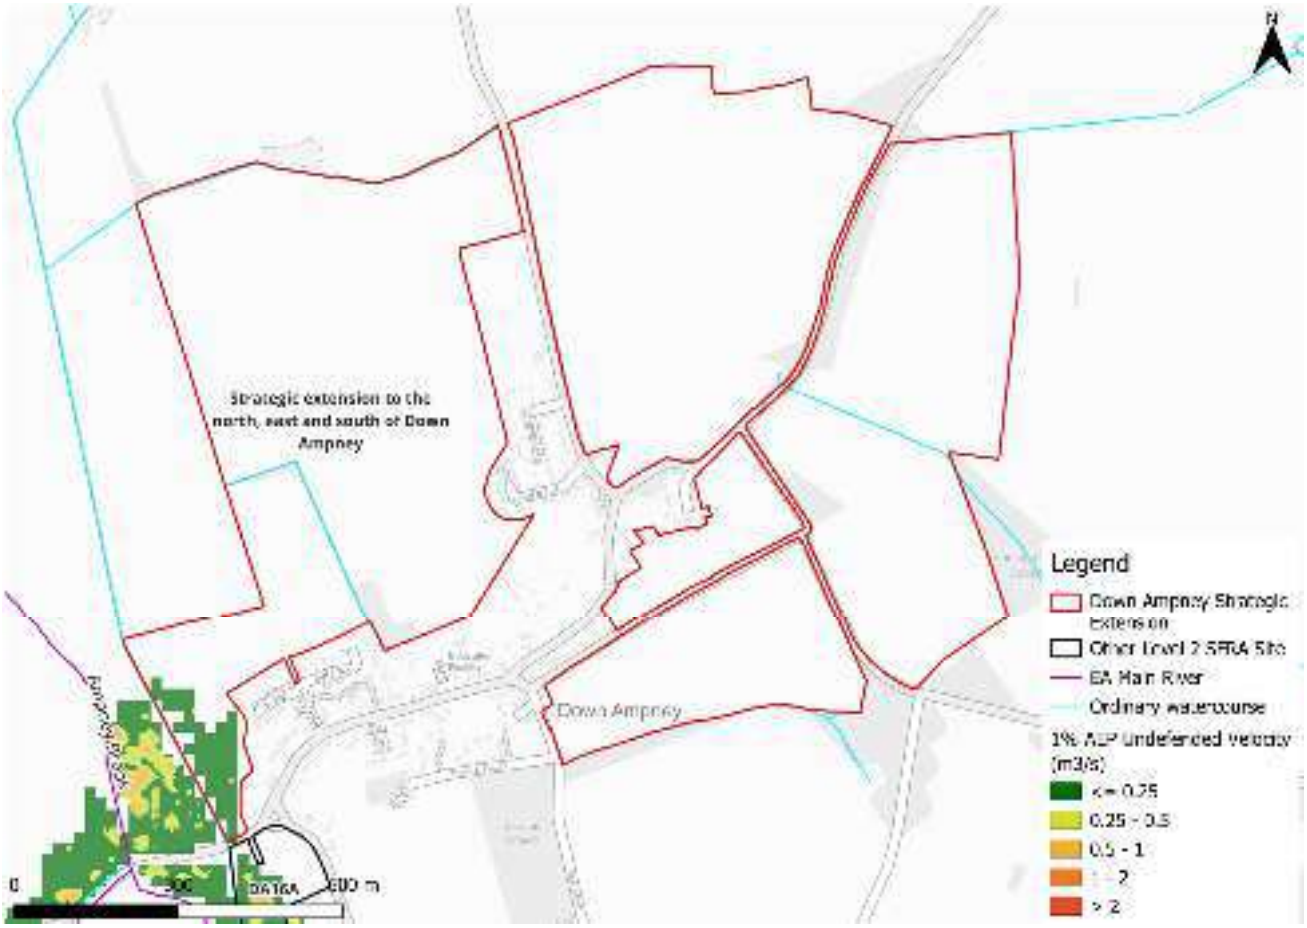

Figure 2-3: Flood velocities for the 1% AEP undefended flood event

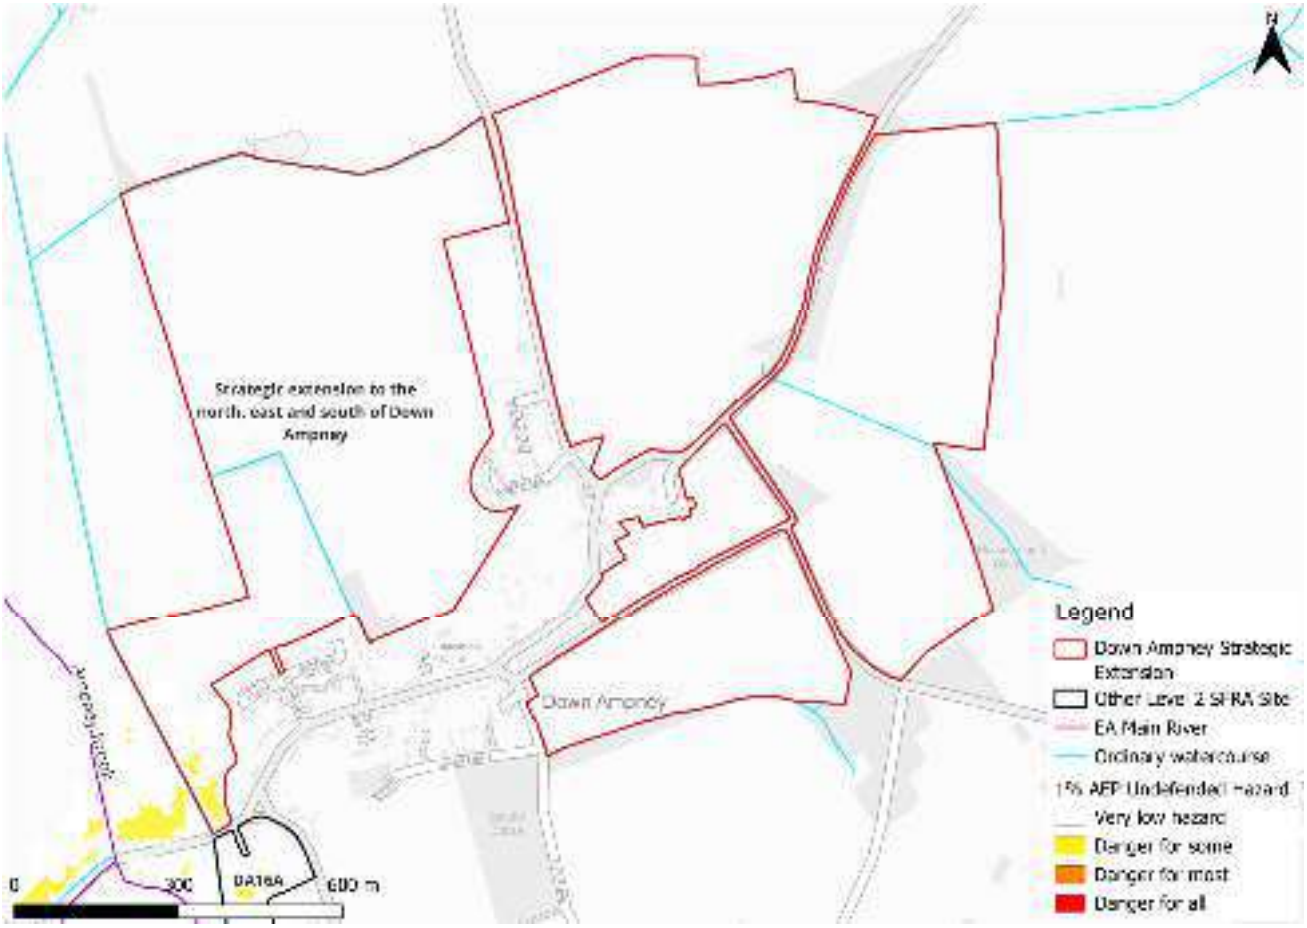

Figure 2-4: Flood hazards for the 1% AEP undefended flood event

2.2 Impacts from climate change

2.2.1 Ampney Brook Thames (MRL to St Johns) 2014 model outputs

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Gloucestershire and the Vale Management Catchment. The central allowance within this catchment is 26% on peak flows (Table 2-2). The impacts of climate change on flood risk are included in the model for the 1% AEP undefended event using 30% on peak flows rather than the current central allowance of 26%.

Table 2-2: Modelled climate change allowances for peak river flows within the Gloucestershire and the Vale Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	11	17	33
2050s	11	19	43
2080s	26	41	84

Figure 2-5, Figure 2-6, and Figure 2-7 show the modelled flood depths, velocities, and hazards respectively for the 1% AEP undefended event plus the central allowance for peak river flows. The risk area does not significantly increase in size though depths and velocities do increase across the risk area. Hazards remain the same.

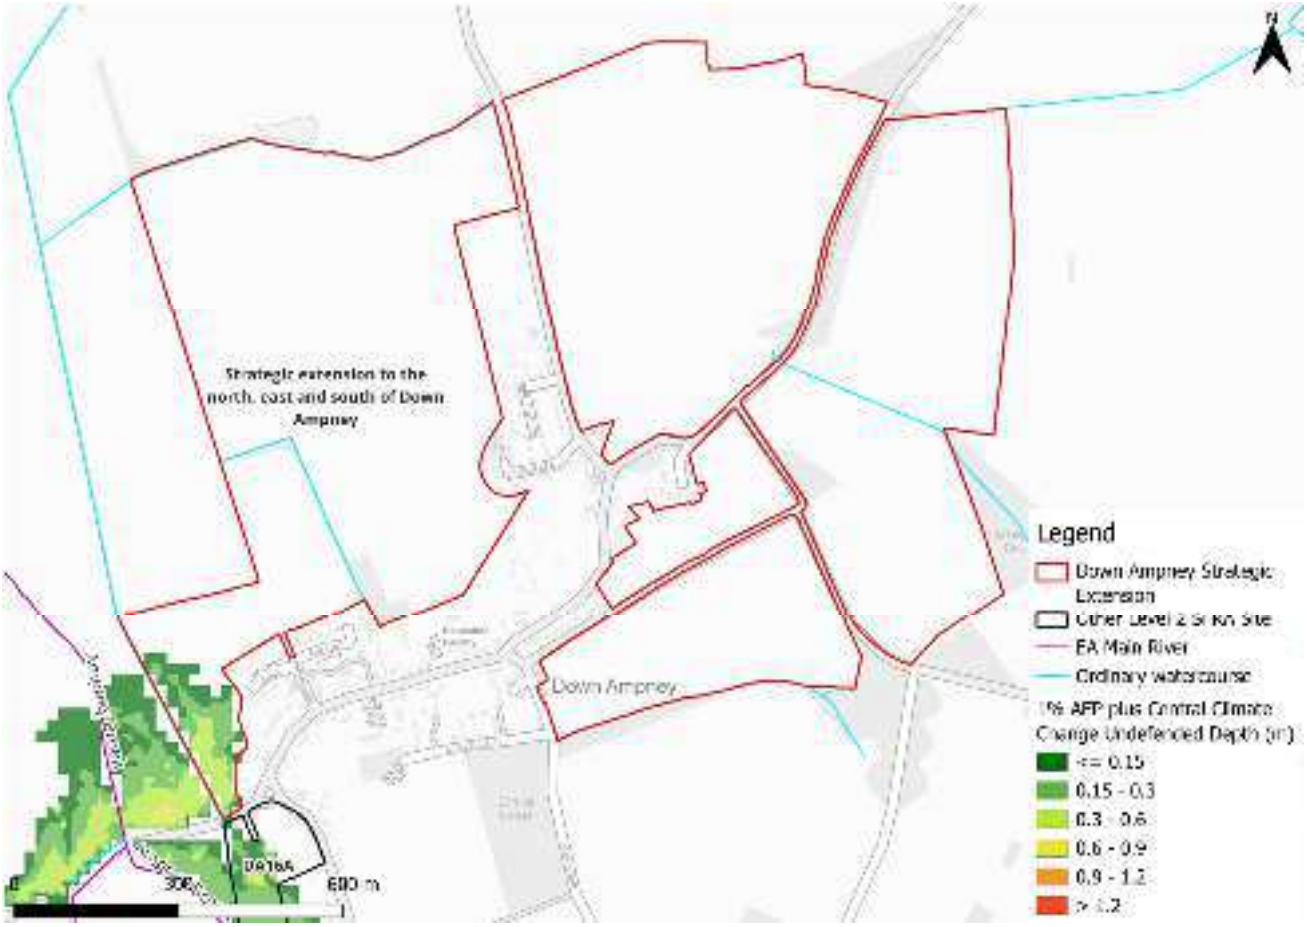

Figure 2-5: Flood depths for the 1% AEP undefended flood event plus central climate change allowance for the 2080s epoch

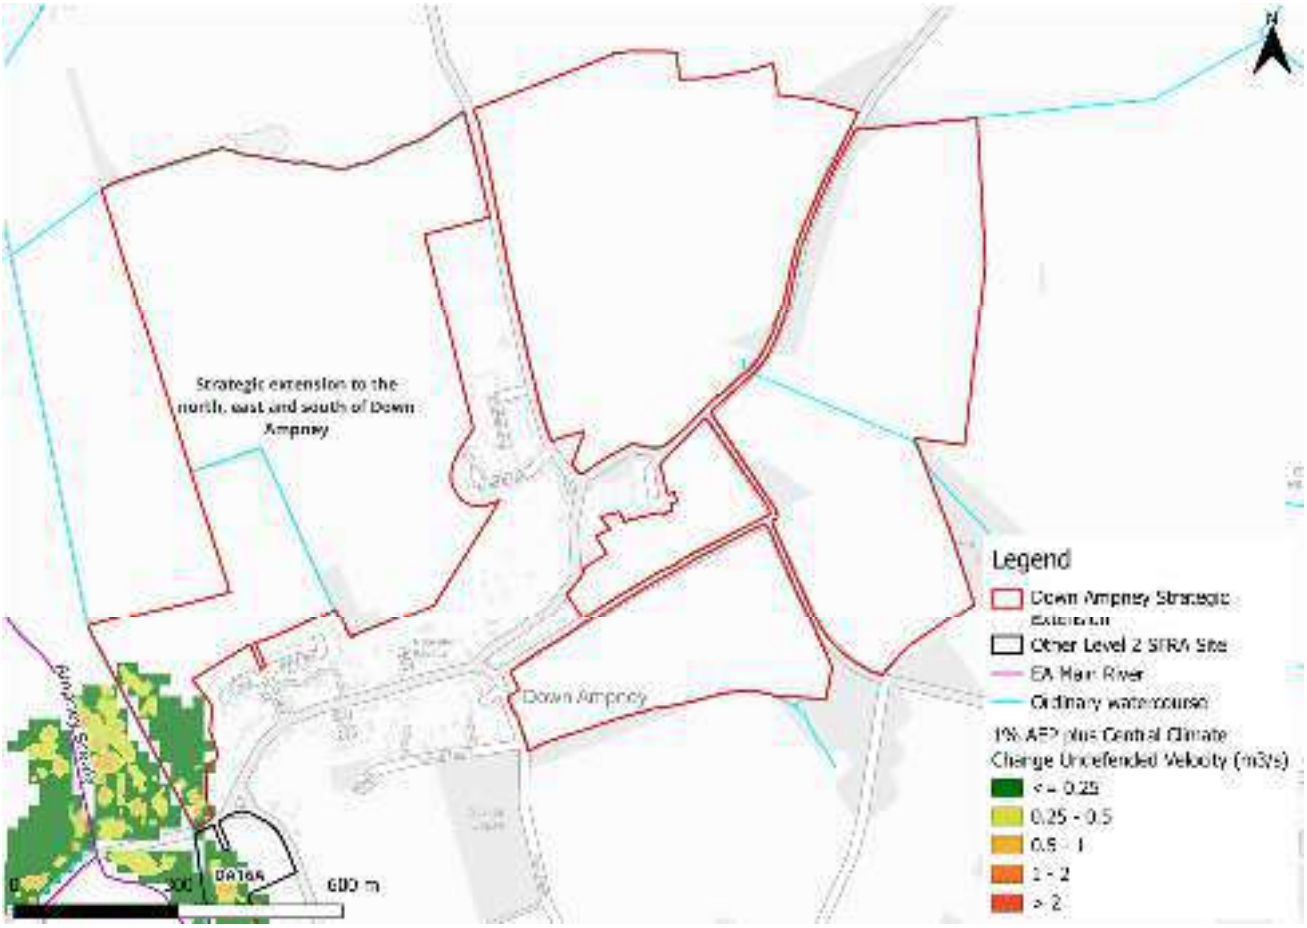

Figure 2-6: Flood velocities for the 1% AEP undefended flood event plus central climate change allowance for the 2080s epoch

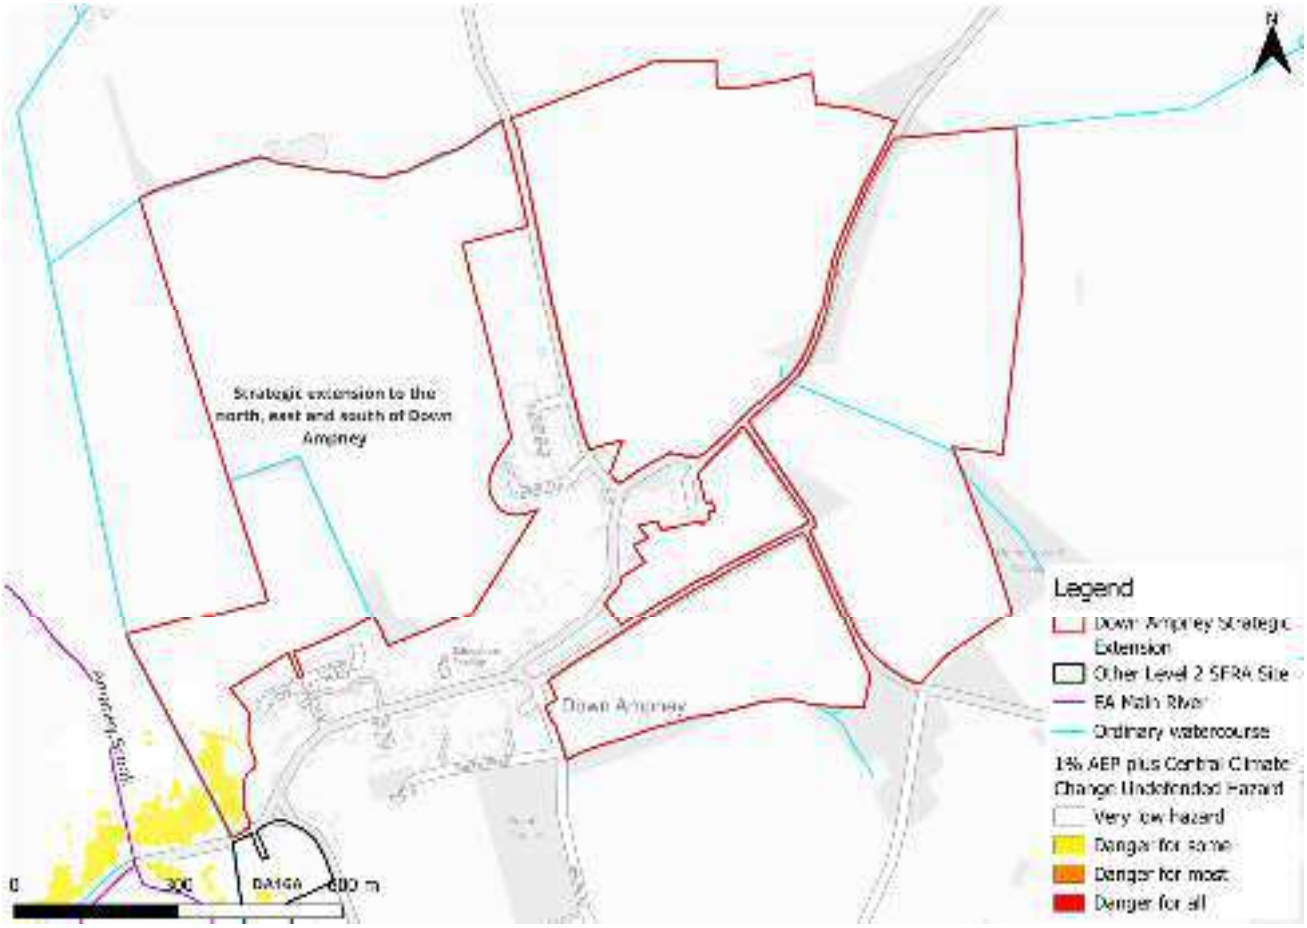

Figure 2-7: Flood hazards for the 1% AEP undefended flood event plus central climate change allowance for the 2080s epoch

2.2.2 Flood Map for Planning - Flood Zones plus Climate Change

Figure 2-8 shows the Flood Map for Planning - Flood Zones plus Climate Change dataset which includes the central allowance for the 2080s epoch. This represents the impact of climate change on Flood Zone 3a and Flood Zone 2 combined. This shows a slightly greater extent of flooding than the modelled event, impacting an additional area within the northwest of the site. This is due to the Flood Map for Planning outputs being based on the NNM and not the outputs from the Ampney Brook Thames (MRL to St Johns) 2014 model, and also the fact that the Flood Zones plus Climate Change dataset also includes the larger 0.1% AEP event.

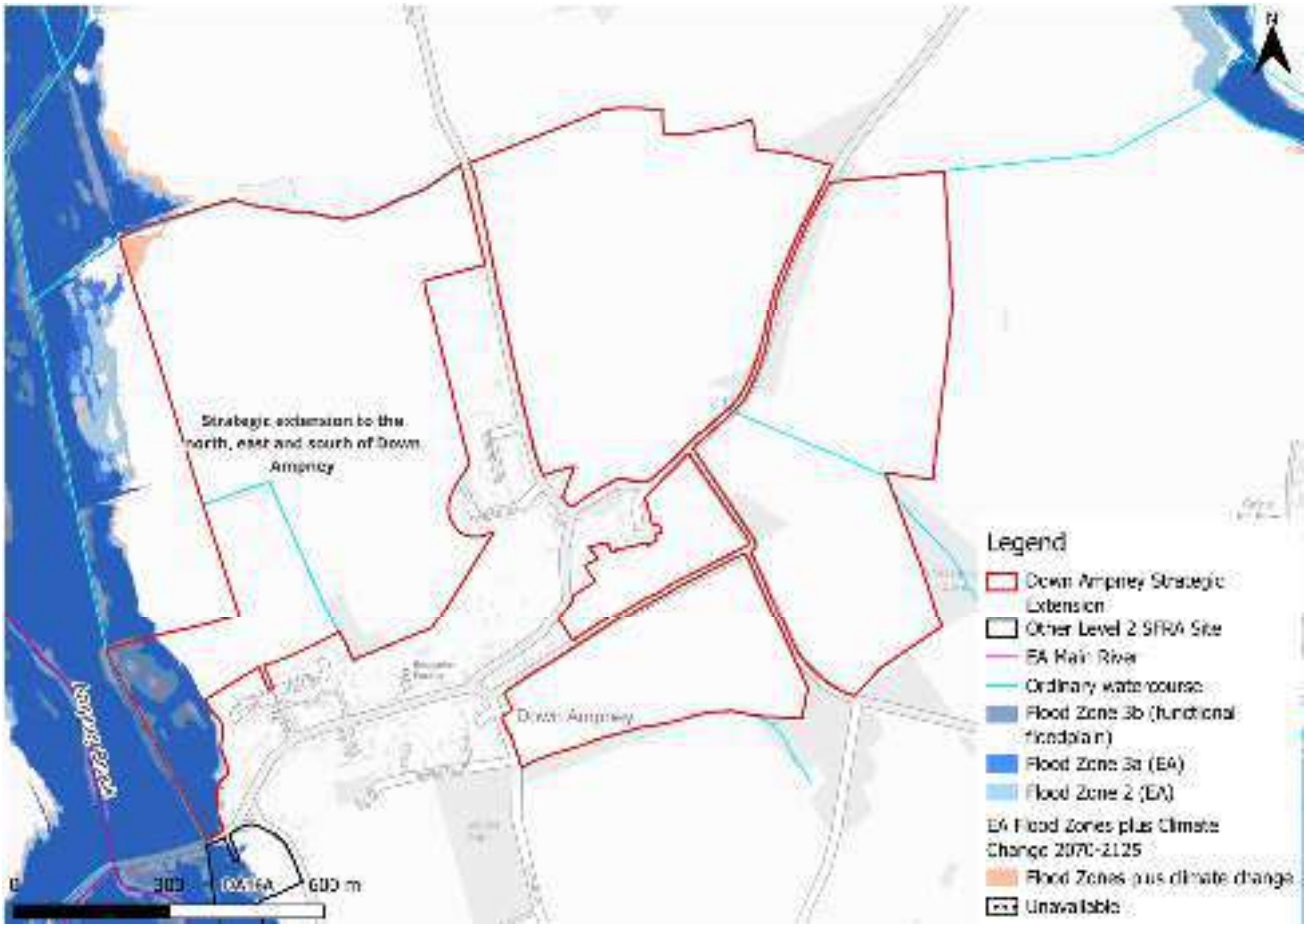

Figure 2-8: EA Flood Zones plus Climate Change

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been 11 recorded flooding incidents within the Ampneys & Hampton Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-9 shows that the site and wider area could benefit from riparian, floodplain, and wider catchment tree planting. Tree planting can help to slow the

flow to benefit areas downstream. There is also potential for runoff attenuation features where it may be possible to temporarily store water and attenuate flooding during high flows. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

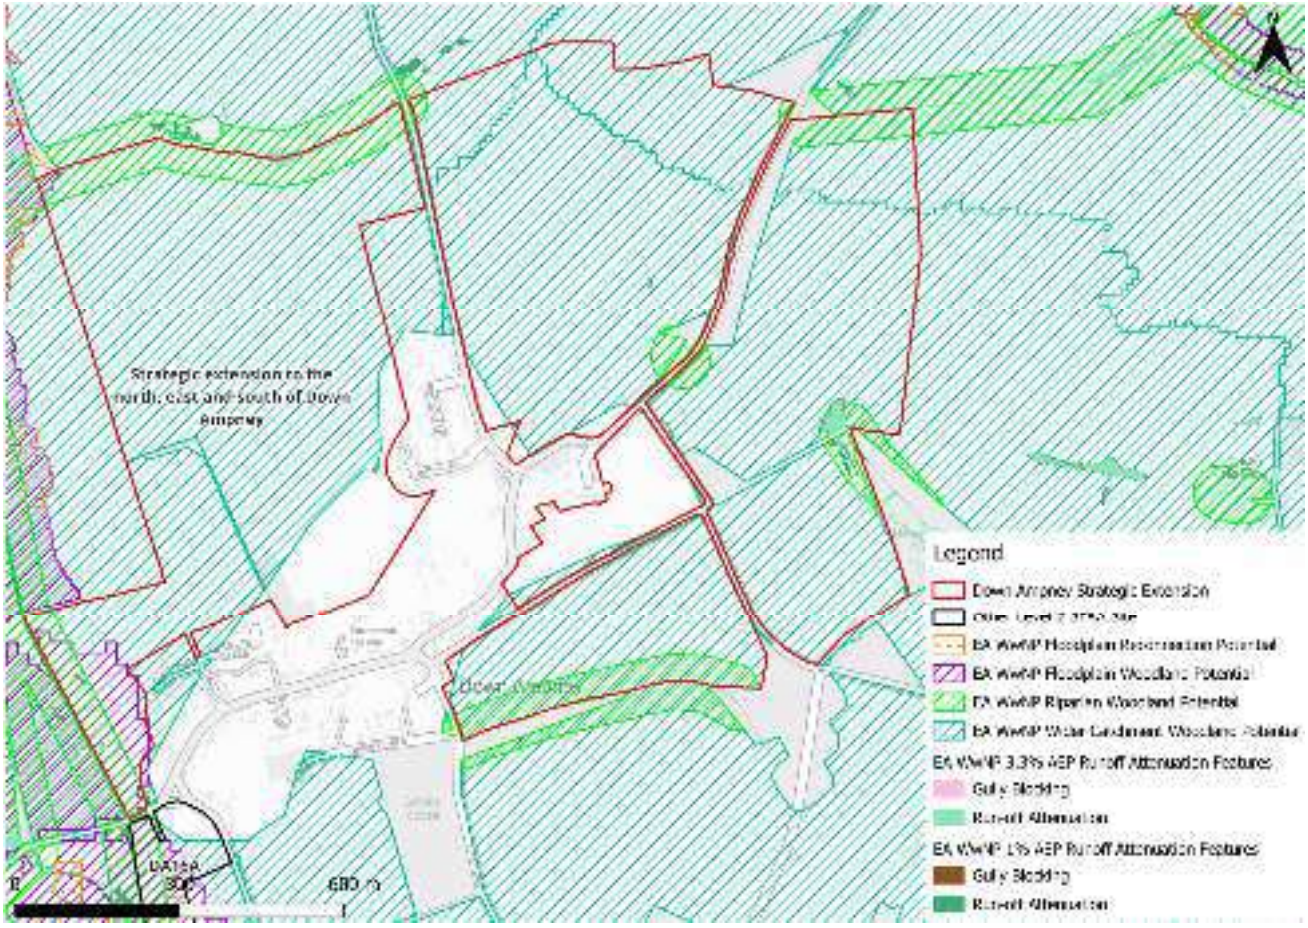

Figure 2-9: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warning and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The majority of the risk area is included within a FWA, namely the 'Ampney Brook from Ampney Crucis to Sheeppen Bridge' FWA, as shown in Figure 2-10.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The majority of the risk area is located within a FAA, namely the 'Ampney Brook from Barnsley Wood to Sheeppen Bridge' FAA, as shown in Figure 2-10.

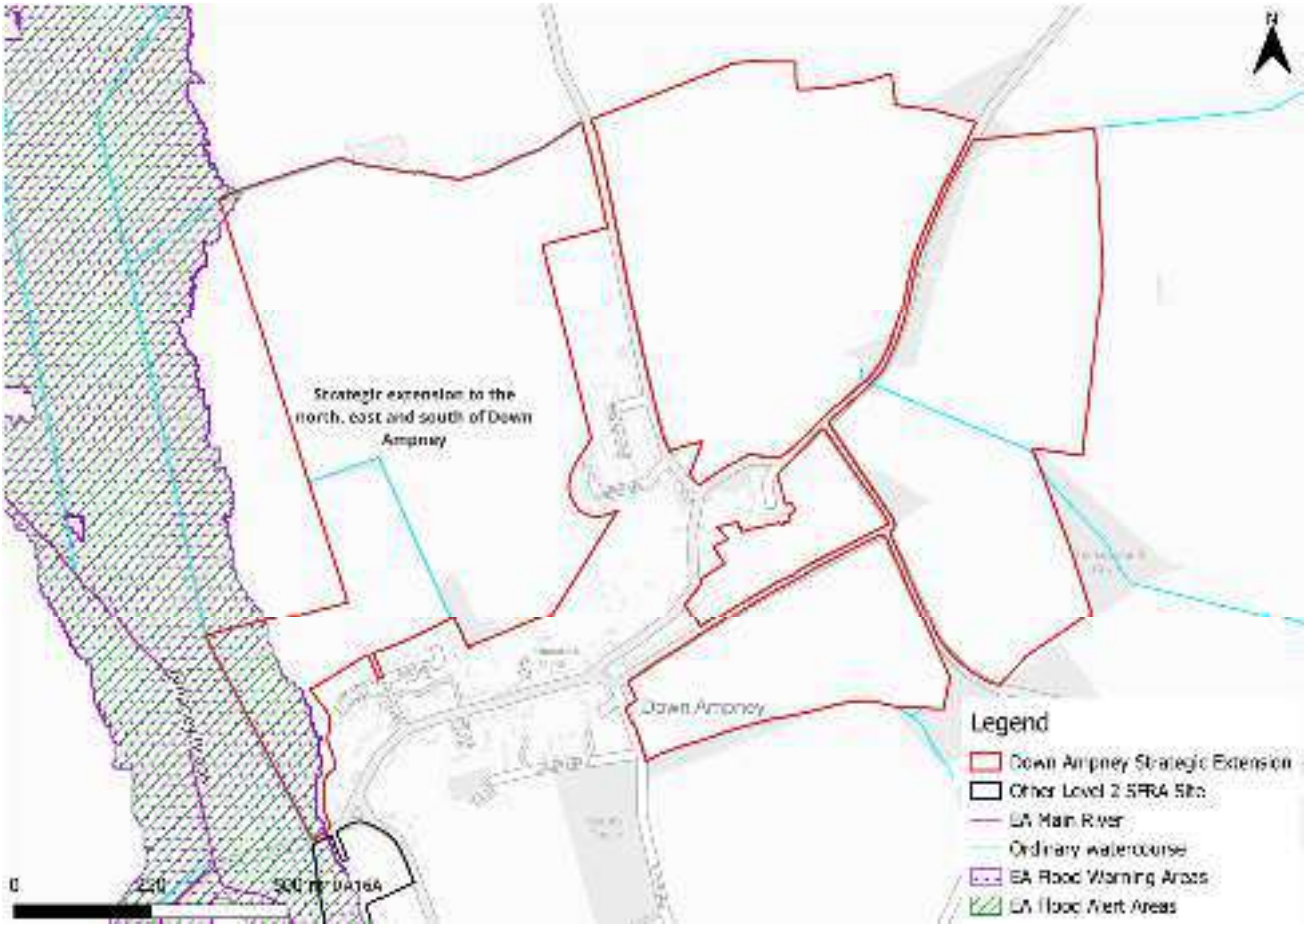

Figure 2-10: Flood warnings and alerts

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes could likely be achieved during a flood event via multiple locations surrounding the site (Figure 2-11).

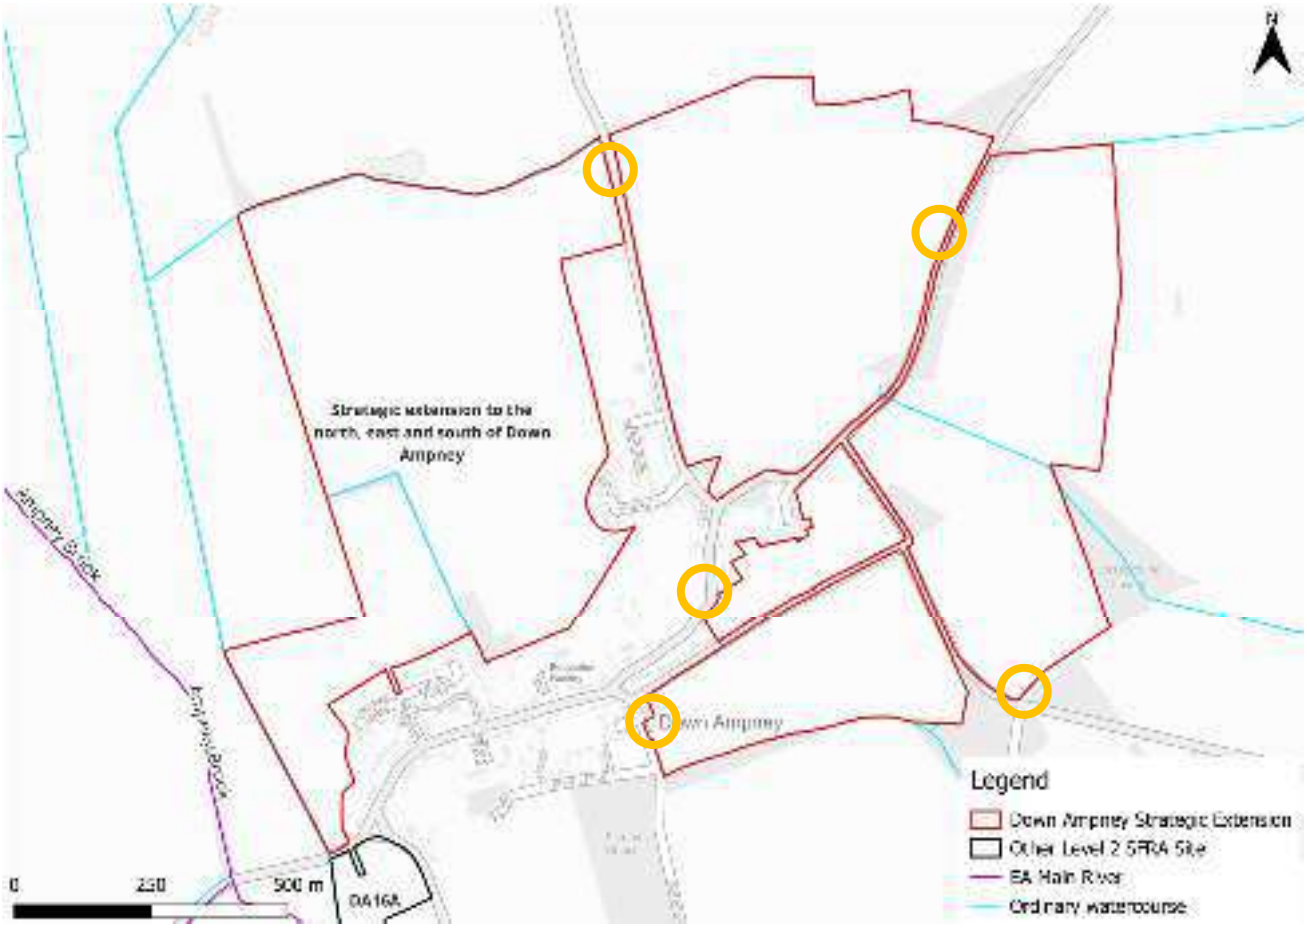

Figure 2-11: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The area of the site within the functional floodplain should not be developed and should remain as open greenspace. Ideally, all built development would be directed to Flood Zone 1 whilst also accounting for the impacts of climate change.
  - More vulnerable development should not be permitted within the climate change risk area. All risk areas would ideally be utilised as open green space, providing a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits.
  - The Ampney Brook Thames (MRL to St Johns) 2014 model is out of date and the EA's NNM is considered to be the most up to date information on fluvial risk to the site and surrounding area. The NNM does not contain depth or hazard information, therefore risk cannot be robustly defined at this stage.
  - There are several unmodelled ordinary watercourses. Risk from these watercourses must be quantified at the FRA stage.

- Mitigation:
  - It is not appropriate at this stage to advise on potential mitigations, given the absence of sufficiently robust and up to date flood risk information. An updated model for Ampney Brook must be developed to robustly define risk to the site and the surrounding areas.
  - EA flood warnings and alerts should continue to be in place to ensure early evacuation of site users before an extreme flood event occurs.
- Access and escape:
  - Based on current information, safe access and escape routes appear achievable via multiple locations surrounding the site.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents map (May 2026), the site is predominantly at low risk of surface water flooding as shown in Table 3-1 and Figure 3-1. There is a flow path present through the eastern site parcels, along the ordinary watercourse. There is another flow path adjacent to the northern boundary of the western site parcel. Surface water risk is also present as areas of scattered ponding across the site. Greatest surface water flood depths in the 1% AEP event are between 0.3 and 0.6 m outside of the ordinary watercourse present onsite (Figure 3-2).

Safe access and escape routes are achievable via multiple locations surrounding the site.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
91	4	2	3

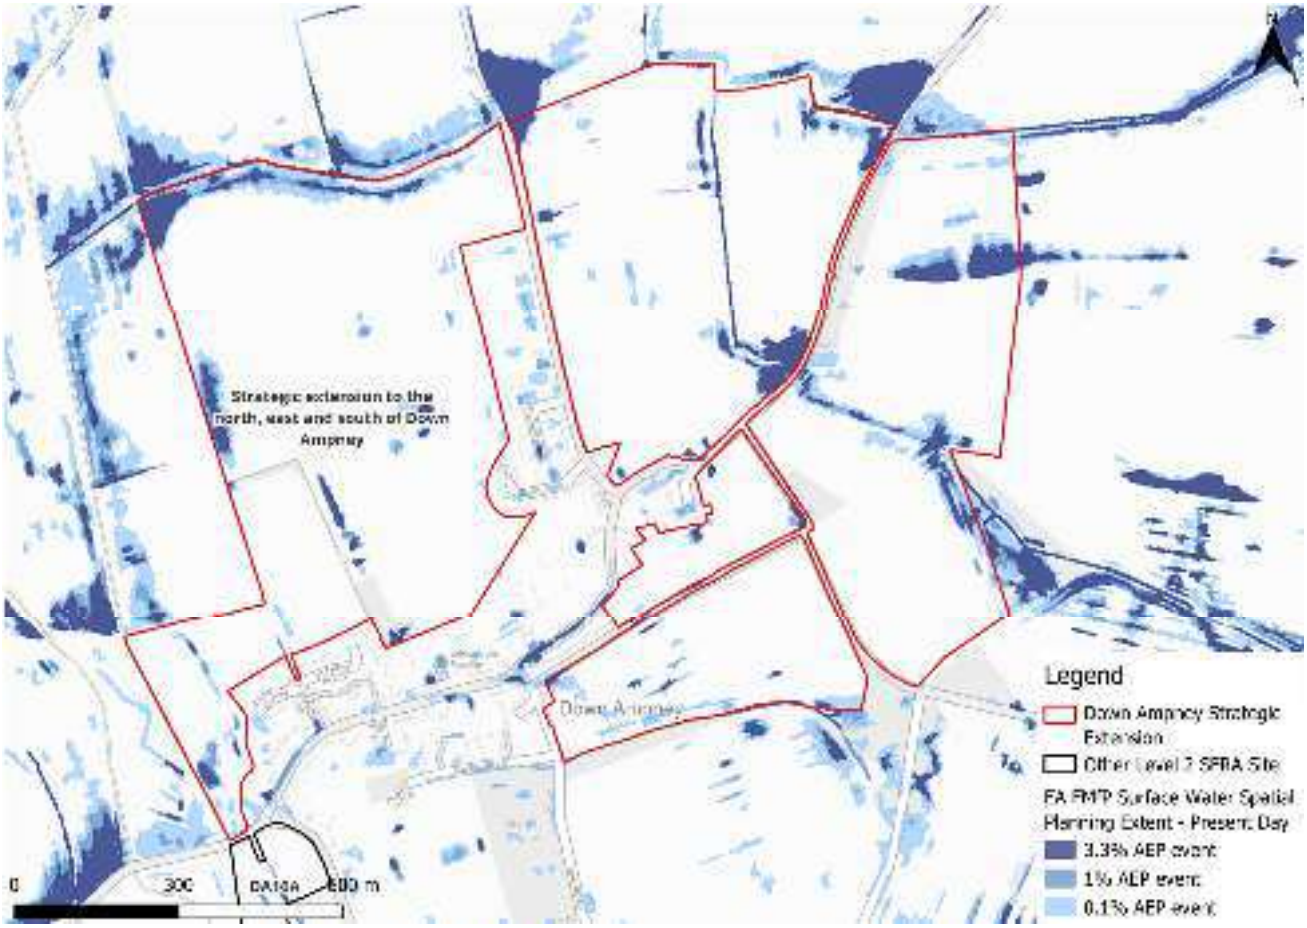

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

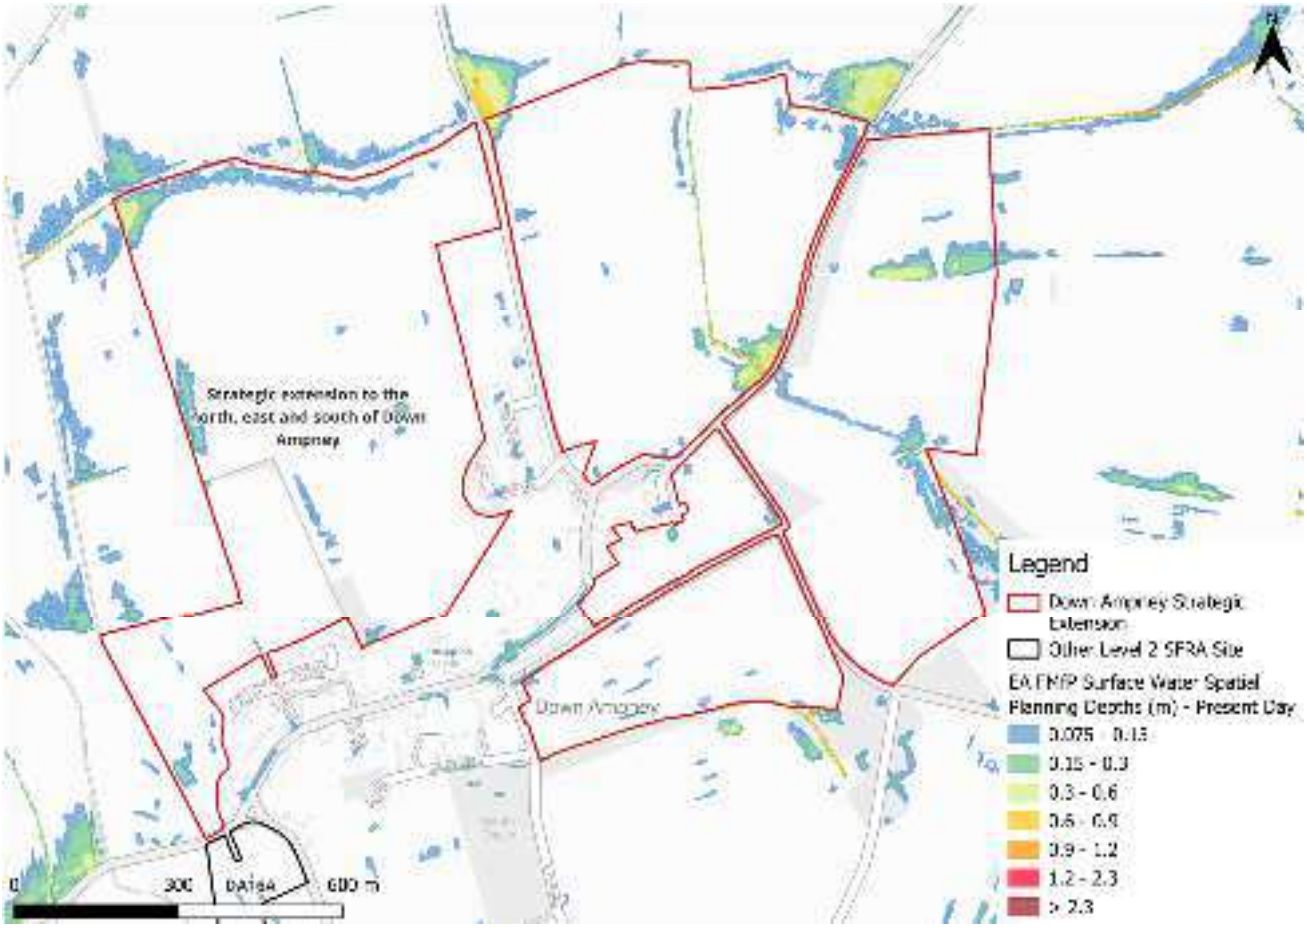

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows there to be areas of 'moderate' flood hazard (Figure 3-3). There are clearly differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping whereby the RoFSW shows a much larger area to be at risk. Given the differences between the two datasets, the hazard information should be discounted and assessed further at the FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

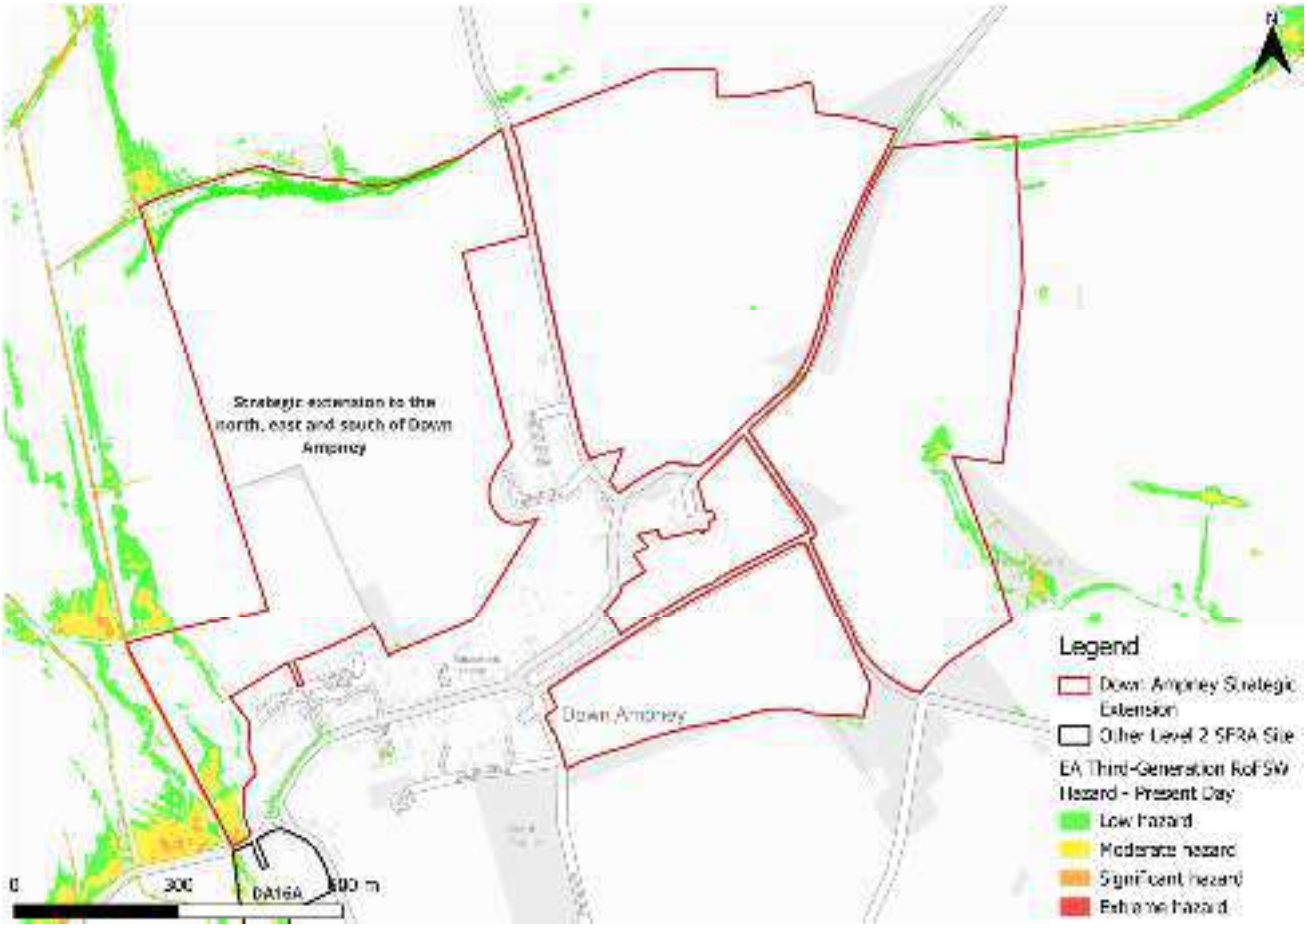

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day 1% AEP event surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Gloucestershire and the Vale management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Gloucestershire and the Vale Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. The site is not shown to be at significant additional risk from surface water climate change. There is a greater extent of flooding along the flow paths through the site in the 0.1% AEP plus climate change event. Flood depths are shown to increase to between 0.6 and 0.9 m within a small area in the east of the site (Figure 3-5).

Safe access and escape routes would likely remain achievable via several locations surrounding the site.

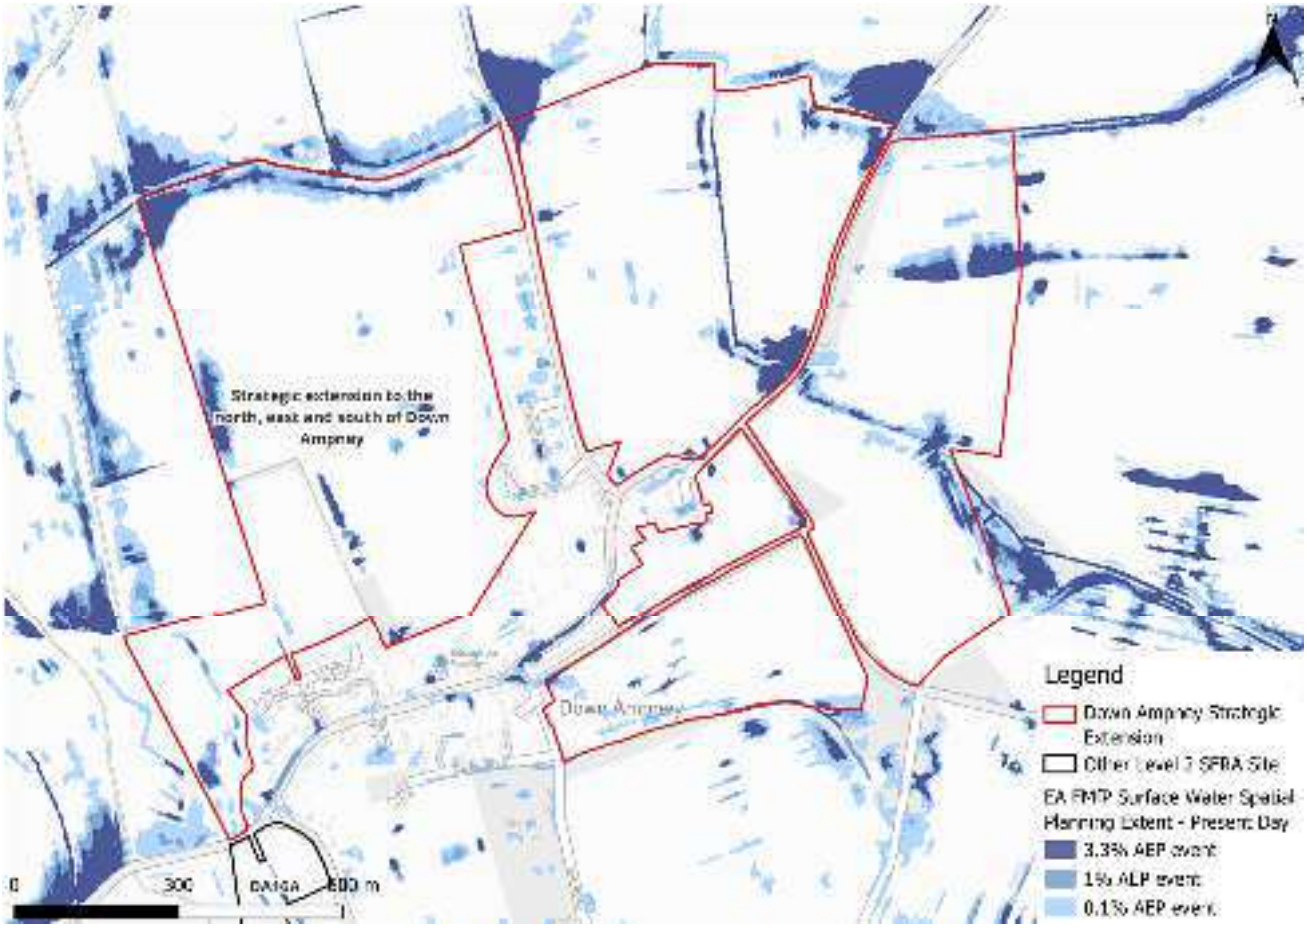

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

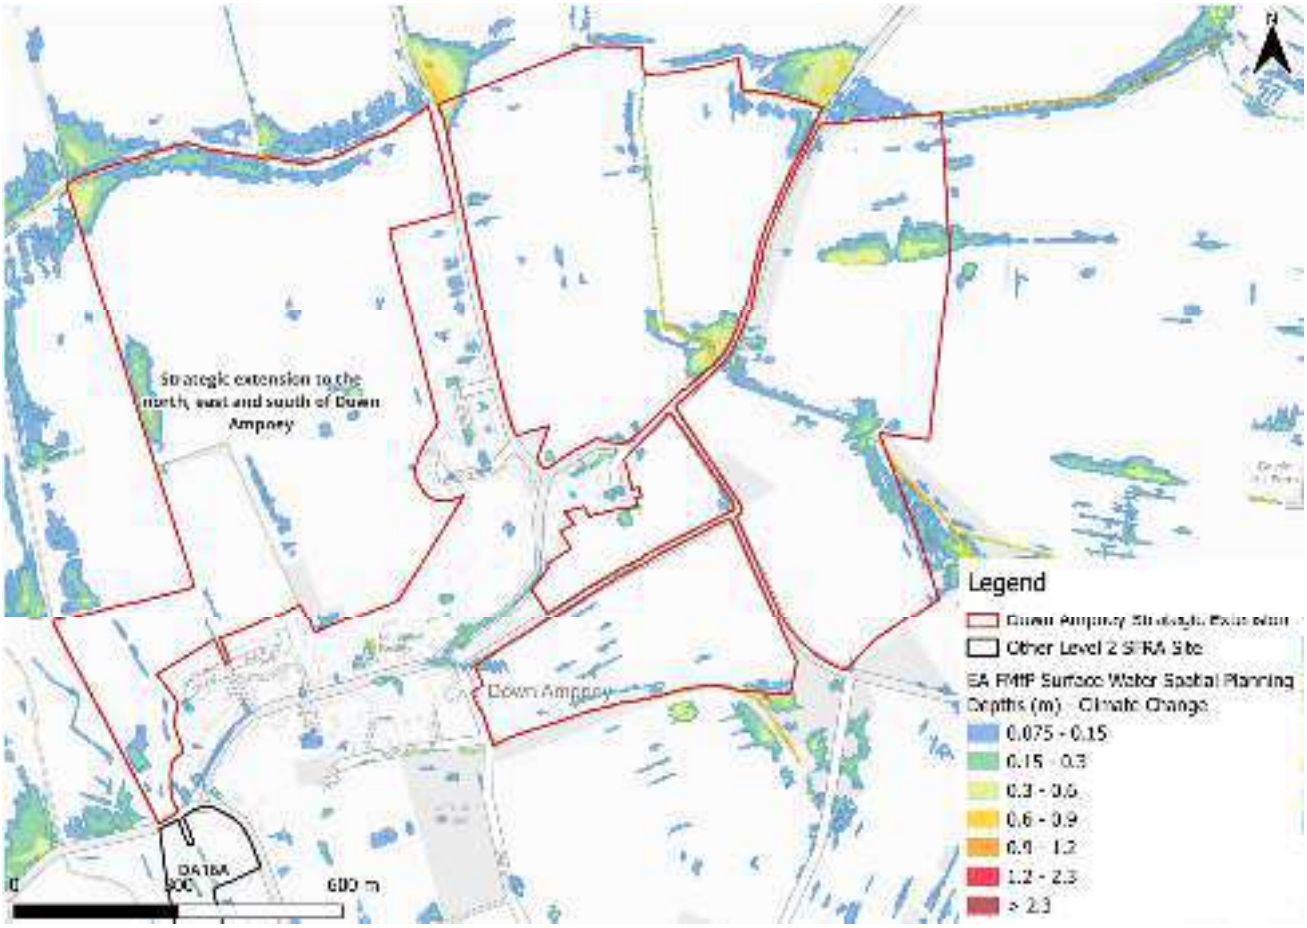

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event surface water flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning climate change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the RoFSW 0.1% AEP surface water event as a conservative proxy for the RoFSW 1% AEP event plus climate change, as the best available information to assess surface water flood hazards (Figure 3-6). However, given the differences between the two datasets, the hazard information should be discounted and assessed further at the FRA stage.

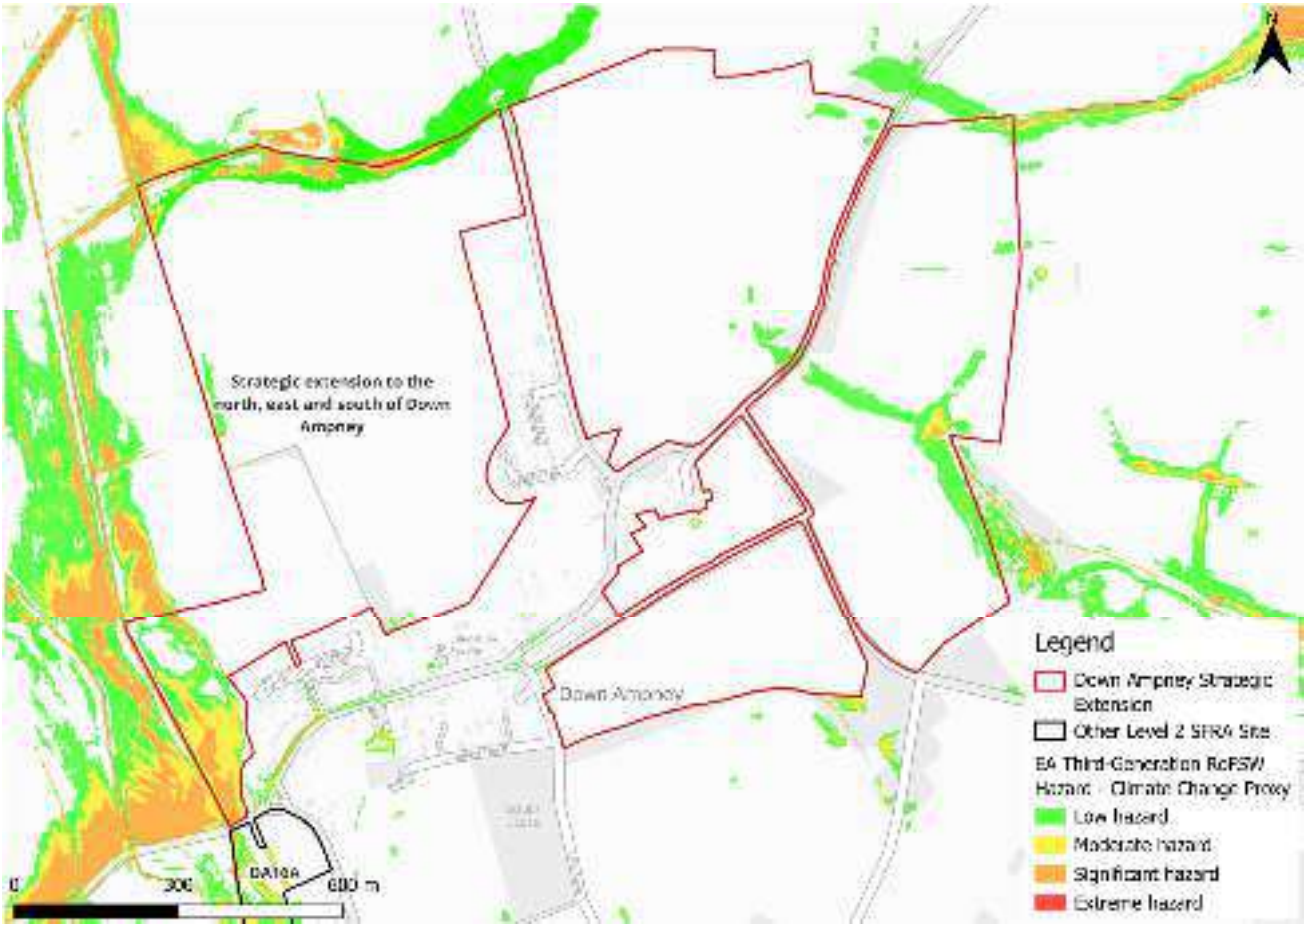

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day 0.1% AEP event surface water flood hazard as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There are no recorded sewer flooding incidents nearby the site nor within the The Ampneys & Hampton Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 91% of the site being outside of the 0.1% AEP surface water flood extent.
- Risk to the site is shown to slightly increase in extent within the site when considering the impact of climate change.
- Topographic low spots and flow paths should be considered and included in site design and ideally left in place to flood naturally when required.
- The drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.

- Safe access and escape routes would likely be achievable via multiple locations when considering surface water risk.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within three catchments, namely, the Ampney and Poulton Brooks (Source to Thames), Marston Meysey Brook and Thames (Churn to Coln) and catchments. The first two catchments are ranked as low sensitivity catchments, and the latter as high sensitivity. Planning considerations for sites at high sensitivity to the cumulative impacts of development can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications.

The risk of groundwater emergence varies across the site parcels. Across the majority, there is a risk of groundwater emergence to both surface and subsurface assets. In some areas, groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots. There are also large areas of no risk.

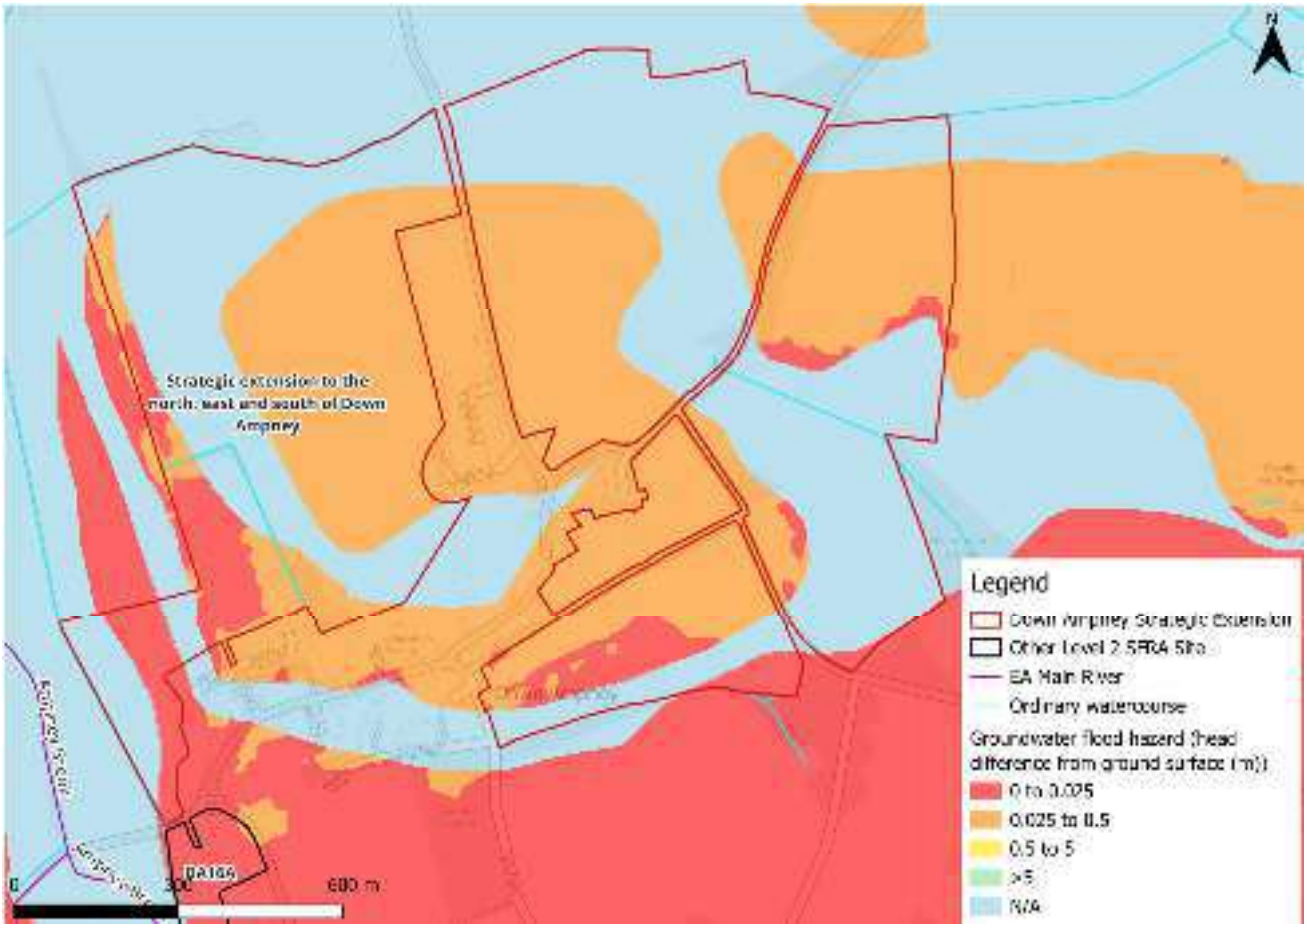

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is mudstone, siltstone, and sandstone (Figure 5-2). Mudstone and siltstone generally have a low permeability and low level of porosity, reducing infiltration rates. Superficial deposits include clay and silt which also have low permeability. Infiltration SuDS at this site may not be an option, though the drainage strategy for the site should fully investigate water table levels through standpipe monitoring during the period of highest groundwater levels e.g. November to April.

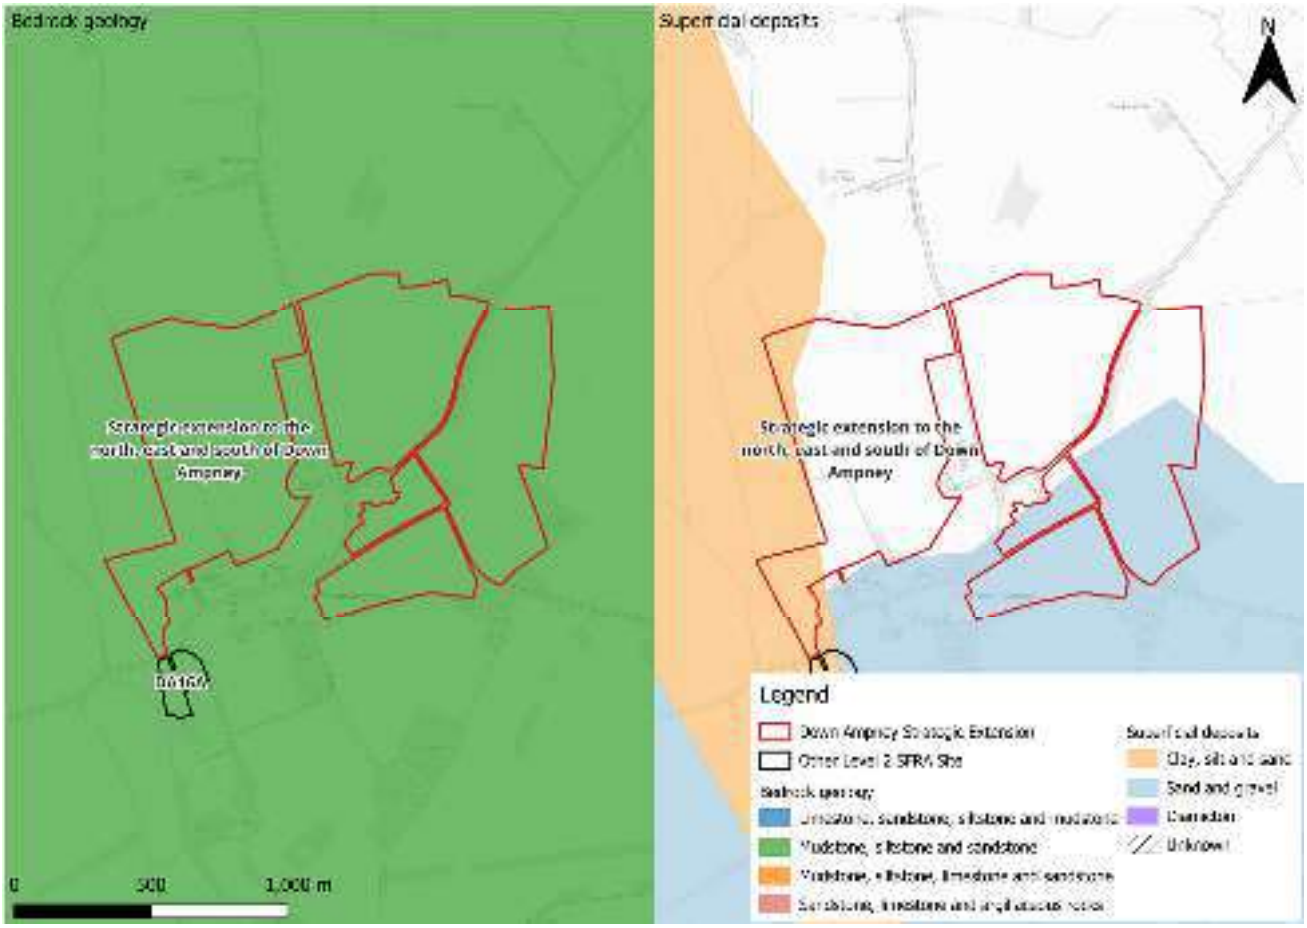

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There are no defences in place along Ampney Brook. However, the watercourse is culverted under Down Ampney Road to the southwest of the site, as indicated by the green circle on Figure 6-1. The ordinary watercourse adjacent to Ampney Brook is also culverted beneath Down Ampney Road. There is a potential residual risk of a blockage of these culverts. This risk should be investigated at the site-specific FRA stage.

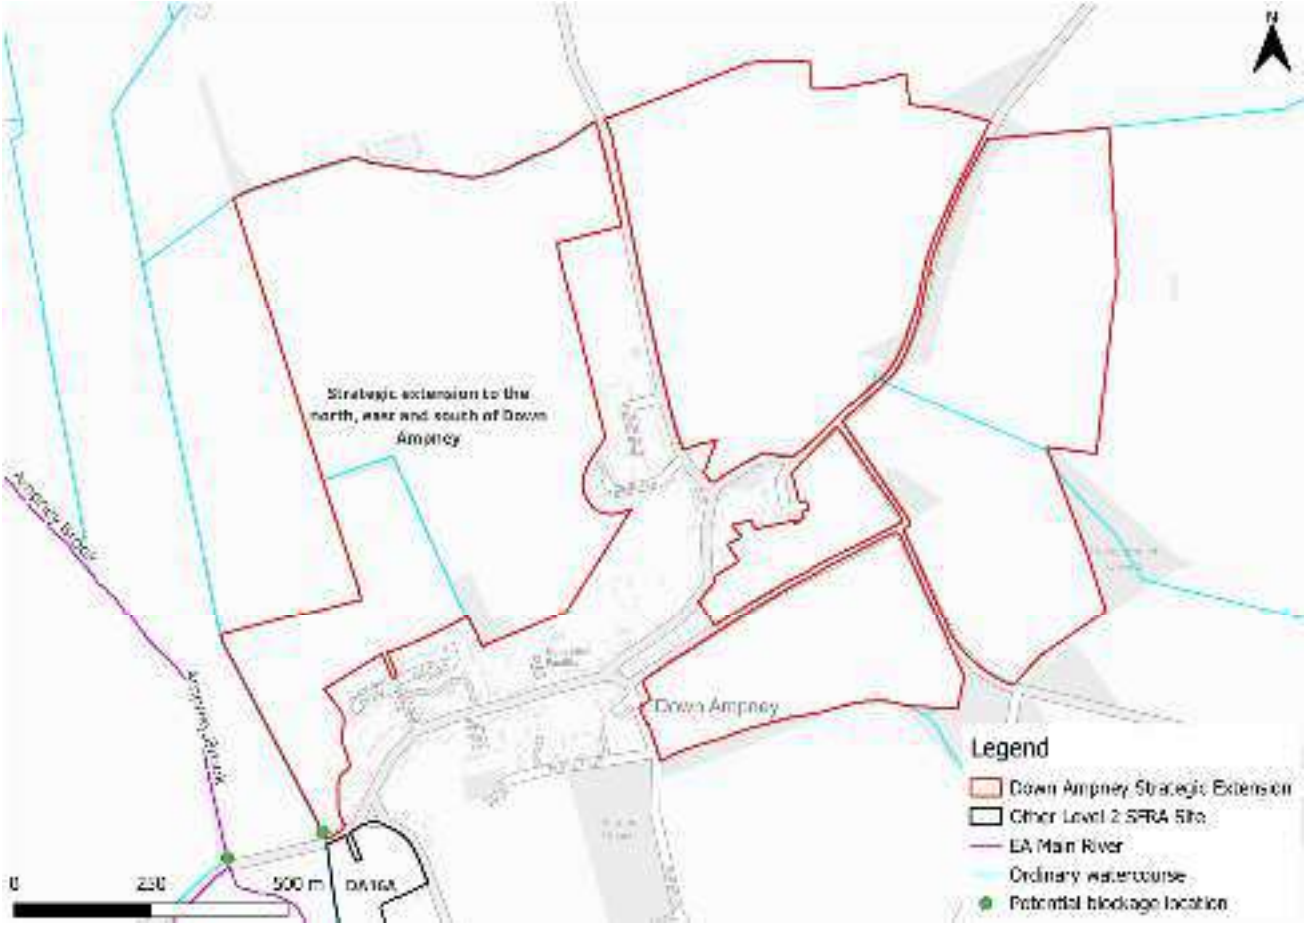

Figure 6-1: Potential blockage location

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is required to pass part b) of the exception test as it is proposed for more vulnerable residential development and is partially located within Flood Zone 3a. The site would likely pass the Exception Test given fluvial risk is confined to the boundary of the larger site parcel to the west. However, updated modelling of Ampney Brook is required to inform the Exception Test.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be possible to develop this site for residential uses given its location largely within Flood Zone 1 and very low surface water flood risk.
- There should be no development within the area of functional floodplain present onsite. Ideally, this area would be converted to open space offering multifunctional benefits alongside flood risk mitigation including BNG contributions, and social and amenity benefits.
- Updated modelling of Ampney Brook must be carried out to robustly define the risk to the site for both present day and with climate change.
- A drainage strategy should ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- Groundwater conditions must be investigated further through the site-specific FRA. This should be assessed through standpipe monitoring during the period of highest groundwater levels e.g. November to April.
- The site-specific FRA should undertake a condition assessment of the culverts beneath Down Ampney Road.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WGAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

Contract

JBA Project Manager	Mike Williamson
Address	Phoenix House, Lakeside Drive, Centre Park, Warrington, WA1 1RX
JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Joanne Corbett of Cotswold District Council. Rosie Holmes of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken in July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site SD23. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site SD23

- Location: Land between disused canal and disused railway line, north of Park Way
- Existing site use: Farmland, open greenspace
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 5.69
- Watercourse: River Churn, unnamed ordinary watercourse
- Environment Agency (EA) flood model: River Churn (Churn (Baunton to Siddington) 2011 model
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of fluvial flood depths, velocities and hazards
    - Assessment of surface water flood extent, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

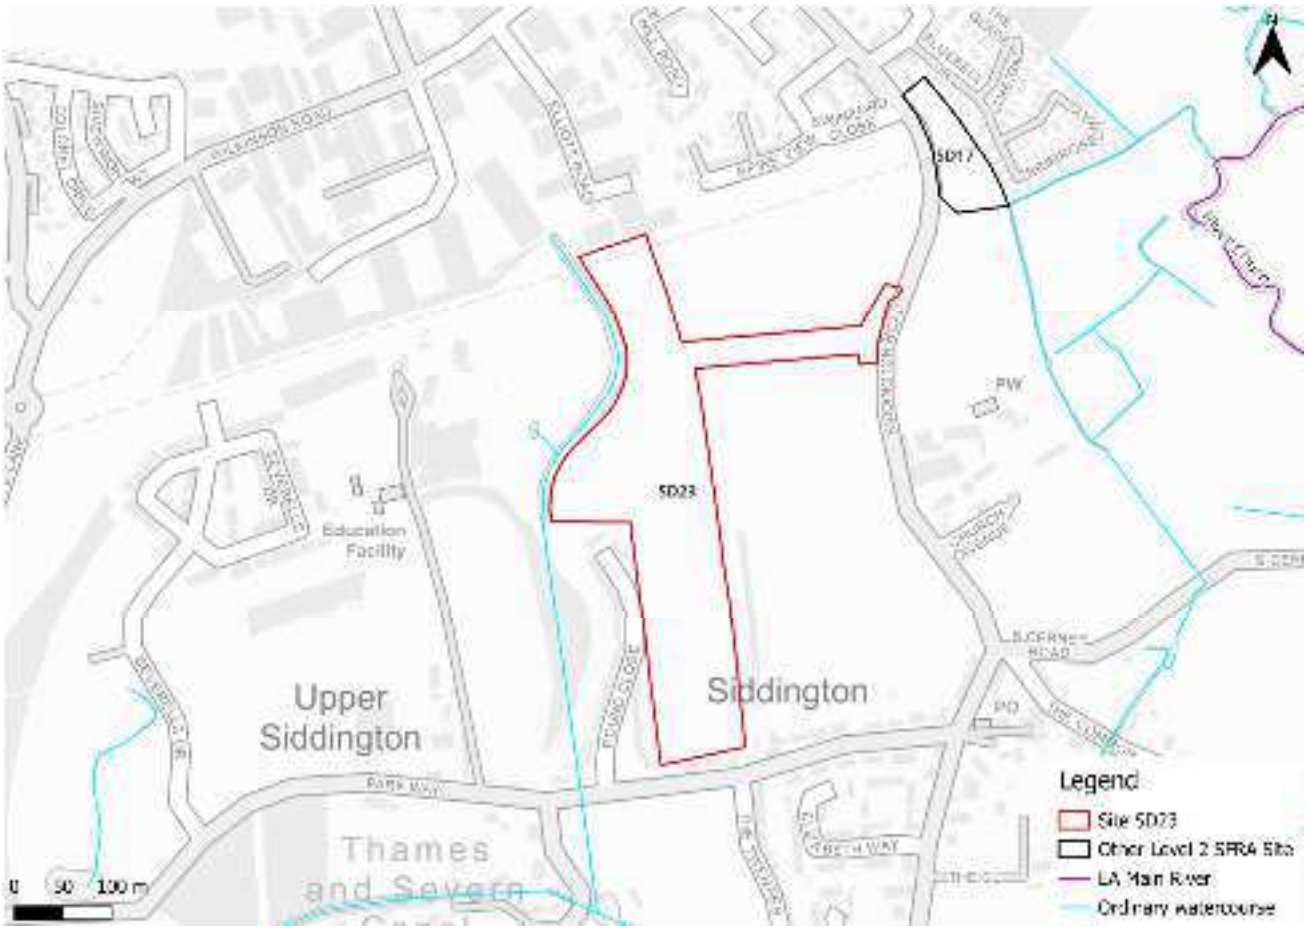

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

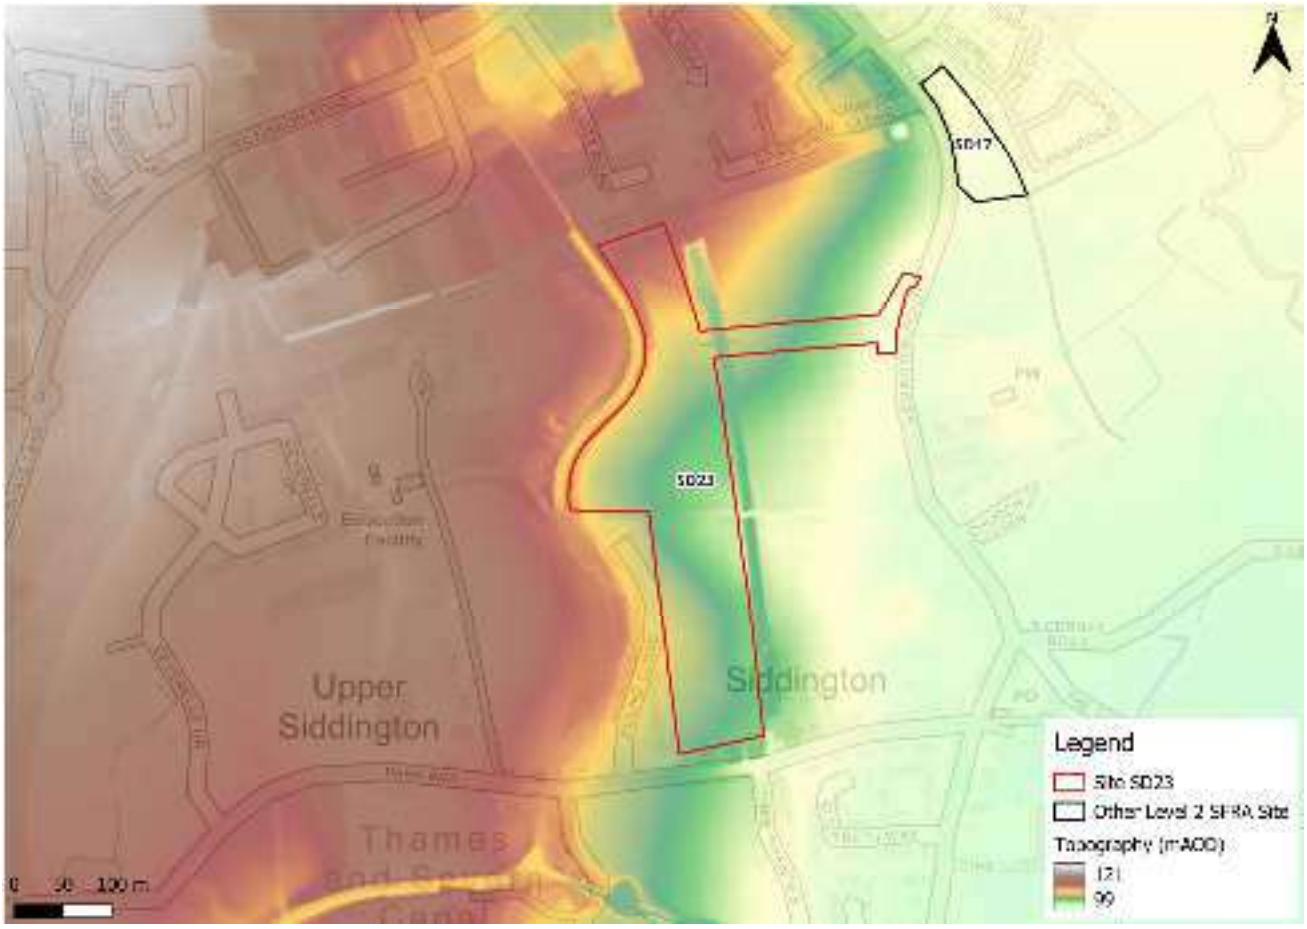

Figure 1-3: Topography

The topography of the site slopes from west to east towards the floodplain of the River Churn.

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the percentage areas of the site within each flood zone are stated in Table 2-1 and can be viewed on Figure 2-1. The Flood Map for Planning does not consider flood defence infrastructure (Section 0).

The majority of the site is situated in Flood Zone 1 and therefore is at low risk from flooding from rivers and sea. There is a small area of Flood Zone 2 (1%) at the proposed access road of the site, associated with risk from the River Churn.

Table 2-1: Present day flood risk based on percentage area of site at risk

Flood Zone 1 (% area)	Flood Zone 2 (% area)	Flood Zone 3a (% area)	Flood Zone 3b (% area)
99	1	0	0

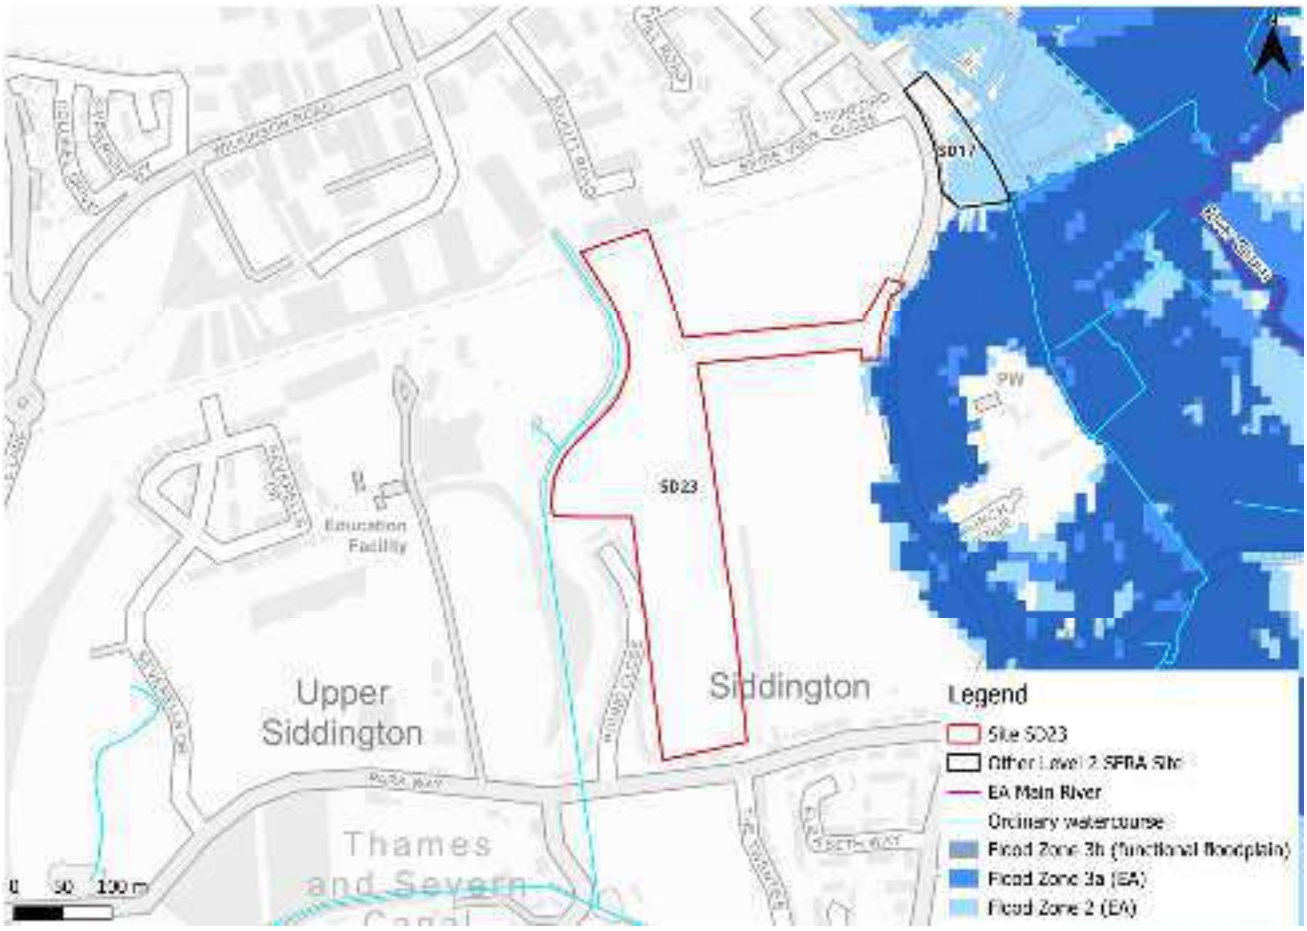

Figure 2-1: Present day risk

2.1.2 River Churn (Baunton to Siddington) 2011 model outputs

Present day risk to the site comes from the River Churn to the east of the site. The 1% AEP undefended event from the River Churn (Baunton to Siddington) 2011 model shows the same extent of flooding to the site as Flood Zone 2 of the Flood Map for Planning (Figure 2-2). Risk is modelled to be confined to the proposed access point on the eastern site boundary, with depths of less than 0.15 m and velocity less than 0.25 m3/s.

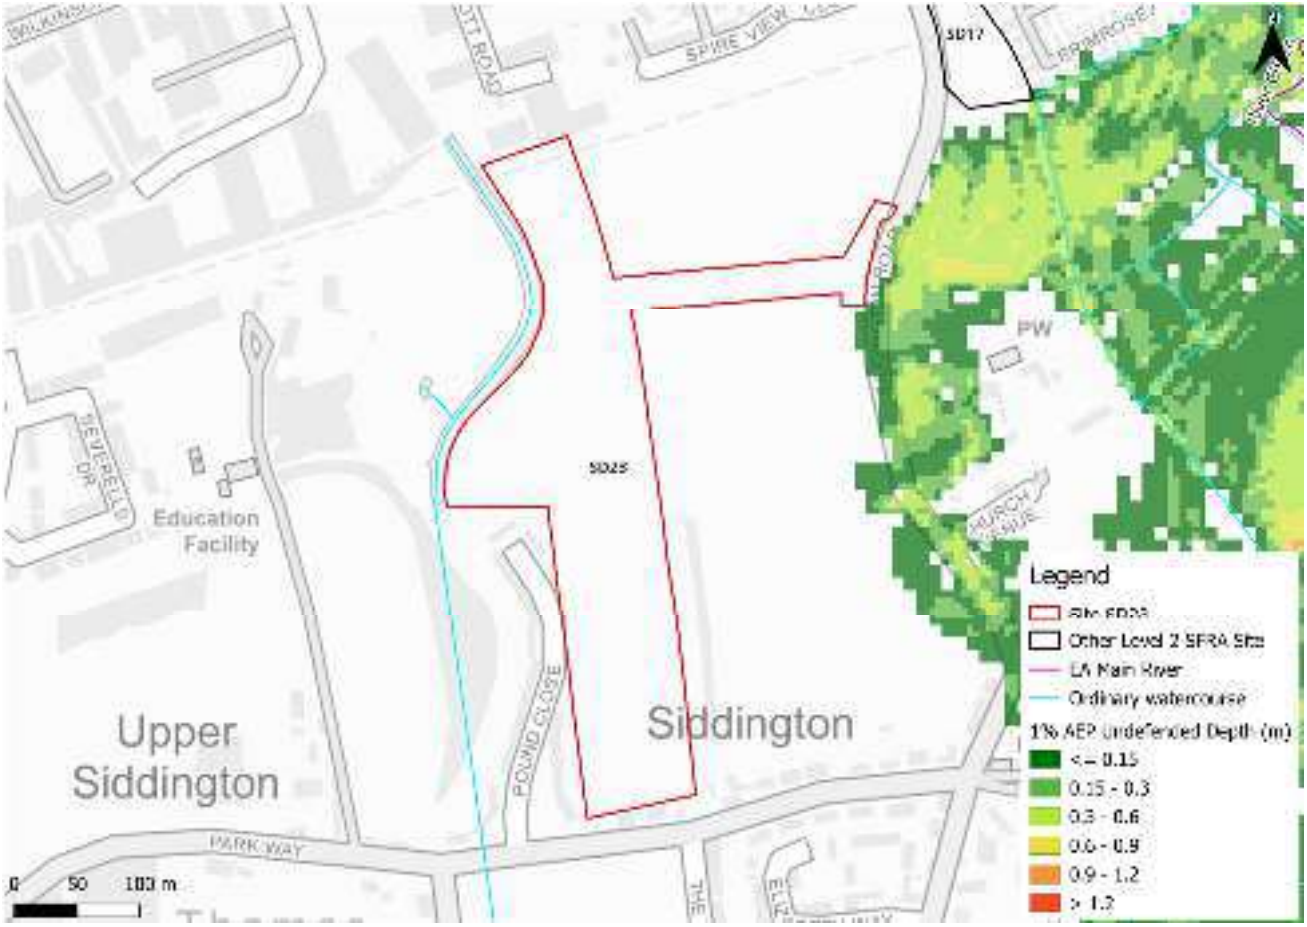

Figure 2-2: Flood depths for the 1% AEP undefended flood event

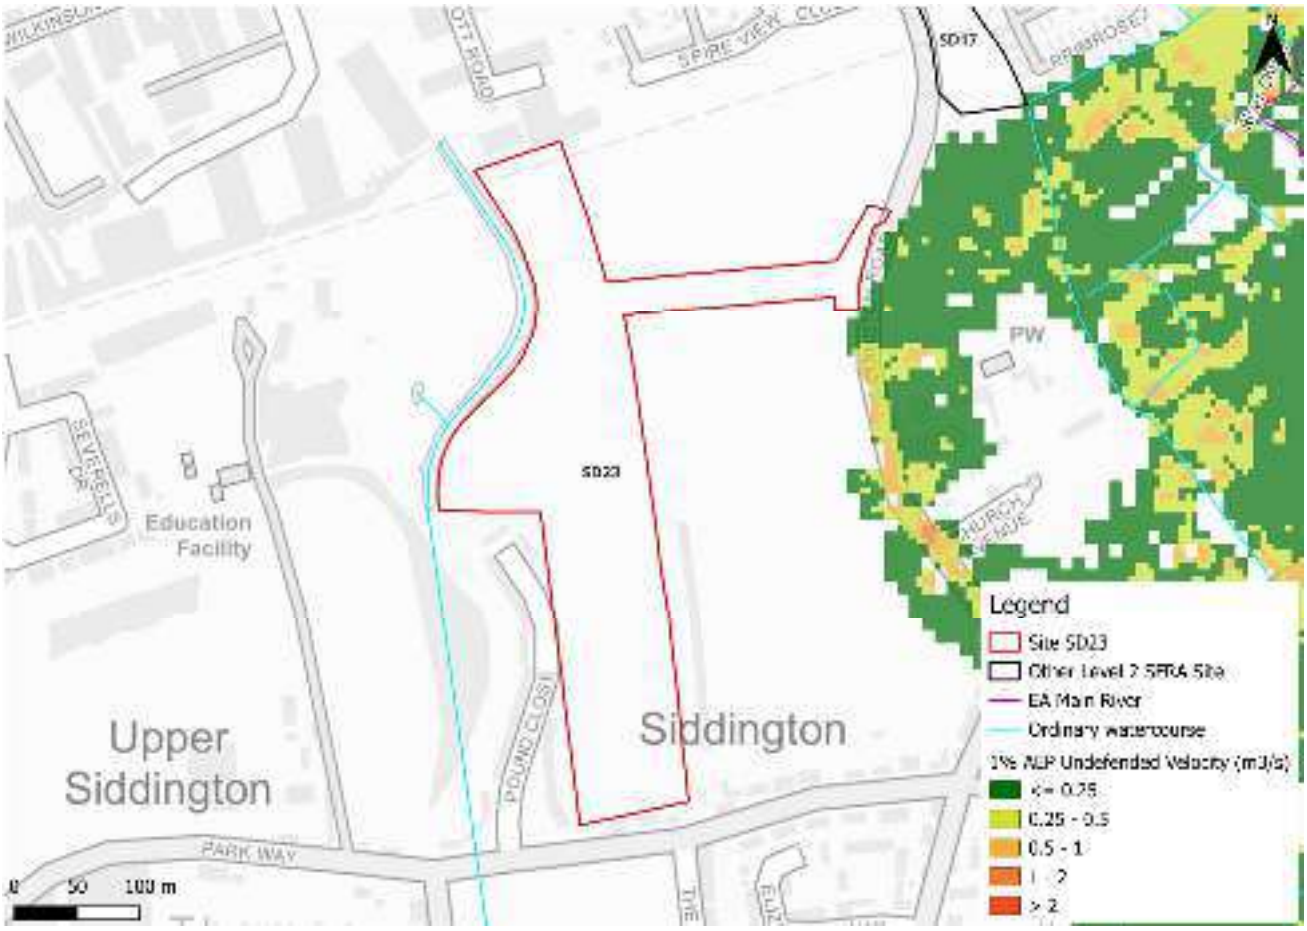

Figure 2-3: Flood velocities for the 1% AEP undefended flood event

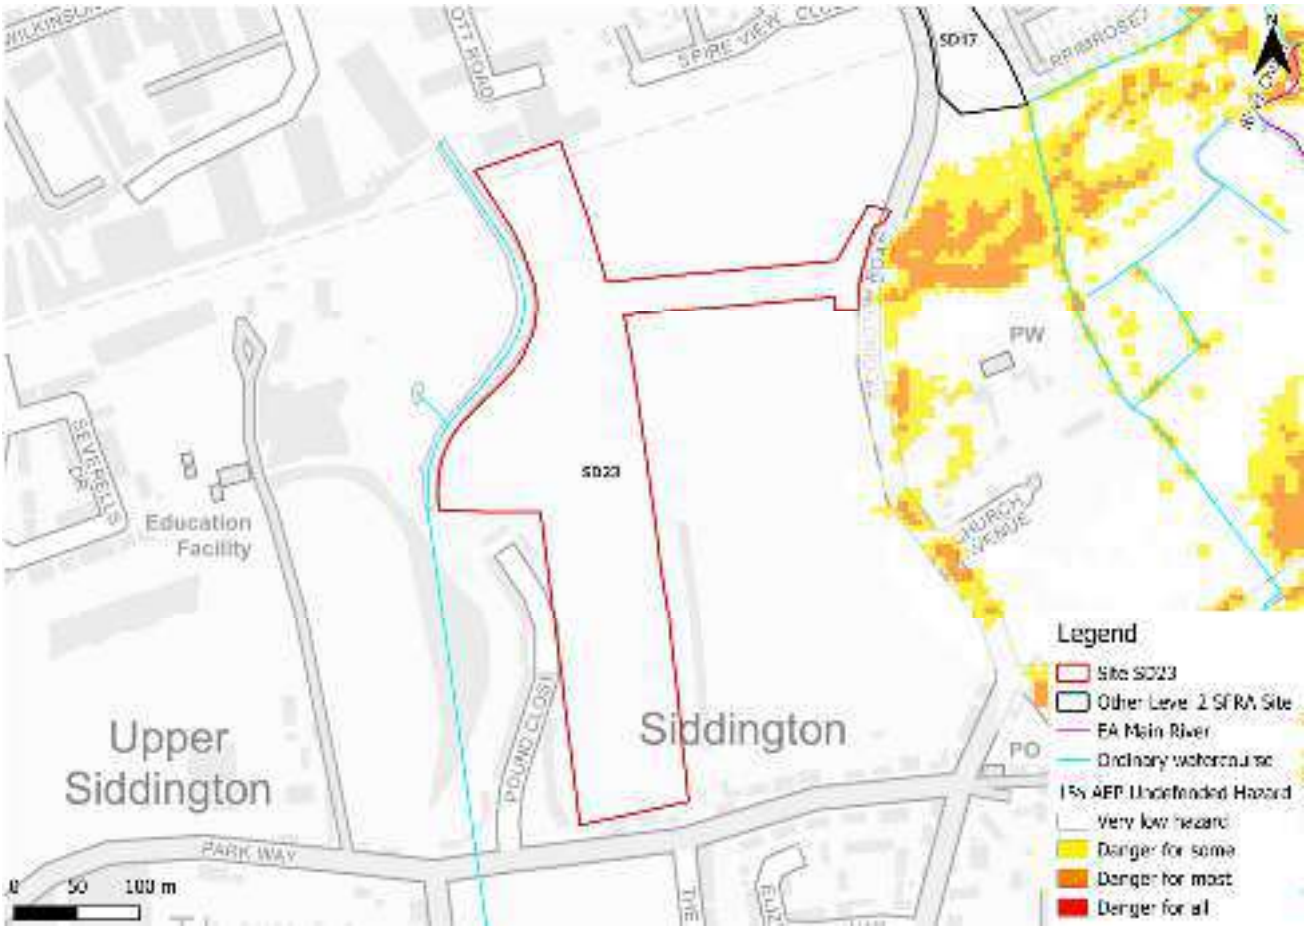

Figure 2-4: Flood hazards for the 1% AEP undefended flood event

2.2 Impacts from climate change

2.2.1 River Churn (Baunton to Siddington) 2011 model outputs

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Gloucestershire and the Vale Management Catchment. The central allowance within this catchment is 26% on peak flows (Table 2-2). The impacts of climate change on flood risk are included in the model for the 1% AEP undefended event using 30% on peak flows rather than the current central allowance of 26%.

Table 2-2: Modelled climate change allowances for peak river flows within the Gloucestershire and the Vale Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	11	17	33
2050s	11	19	43
2080s	26	41	84

Figure 2-5, Figure 2-6, and Figure 2-7 show the modelled flood depths, velocities, and hazards respectively for the 1% AEP undefended event plus the central allowance for peak river flows. The risk area increases in size, but flood depths velocities remain low. Flood hazards are shown to be 'very low hazard'.

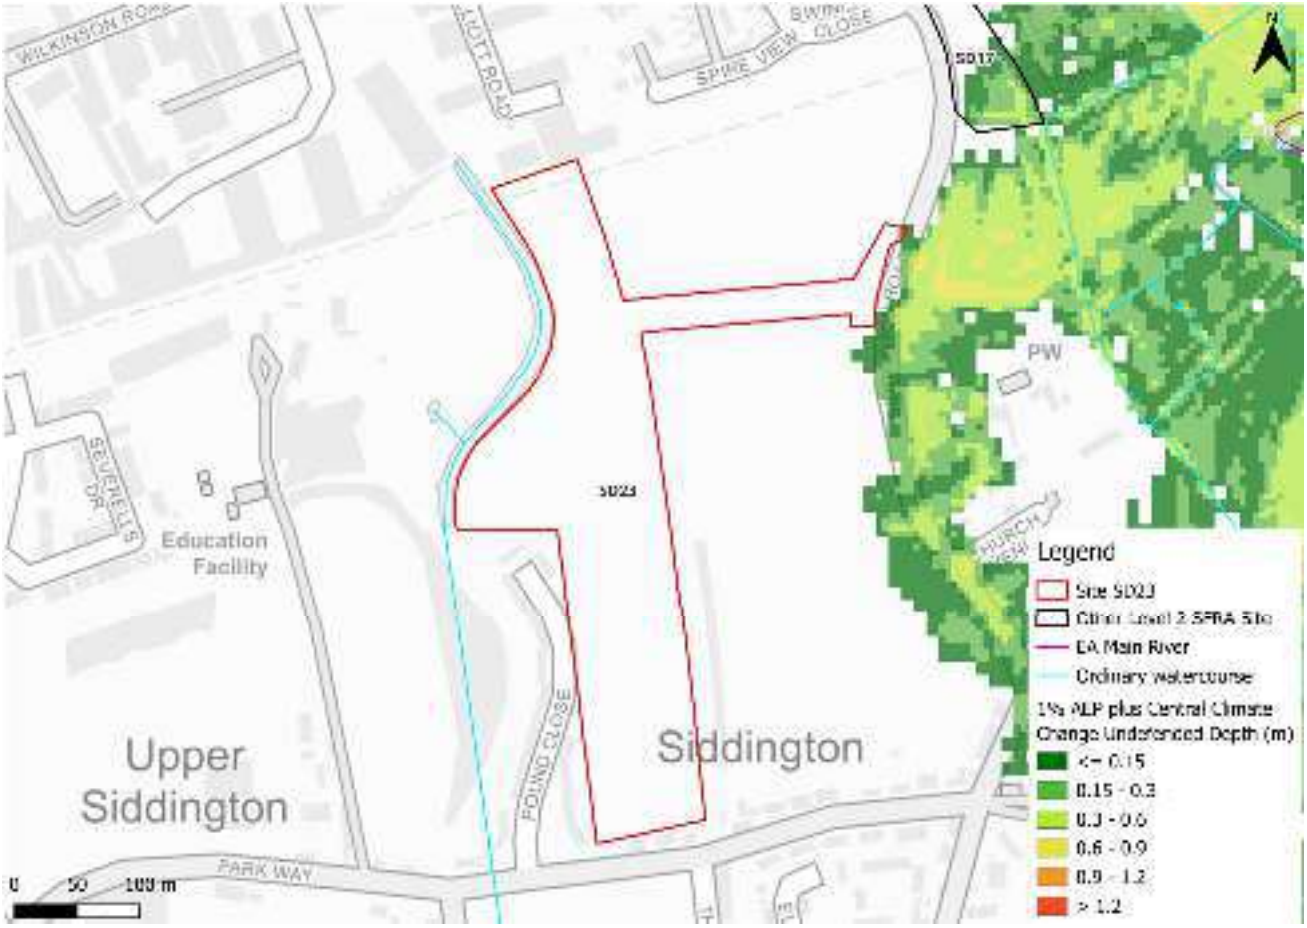

Figure 2-5: Flood depths for the 1% AEP undefended flood event plus central climate change allowance for the 2080s epoch

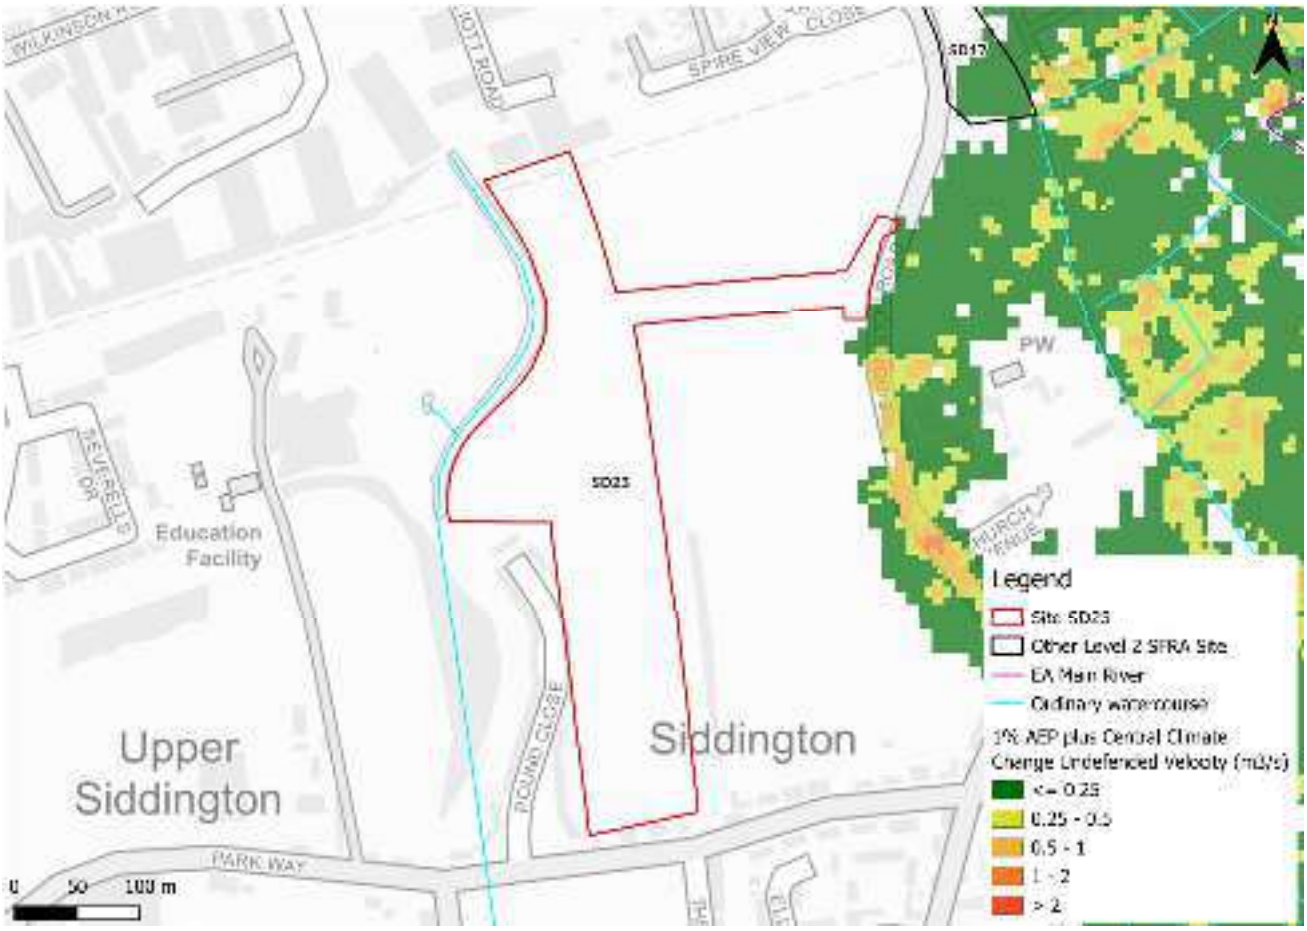

Figure 2-6: Flood velocities for the 1% AEP undefended flood event plus central climate change allowance for the 2080s epoch

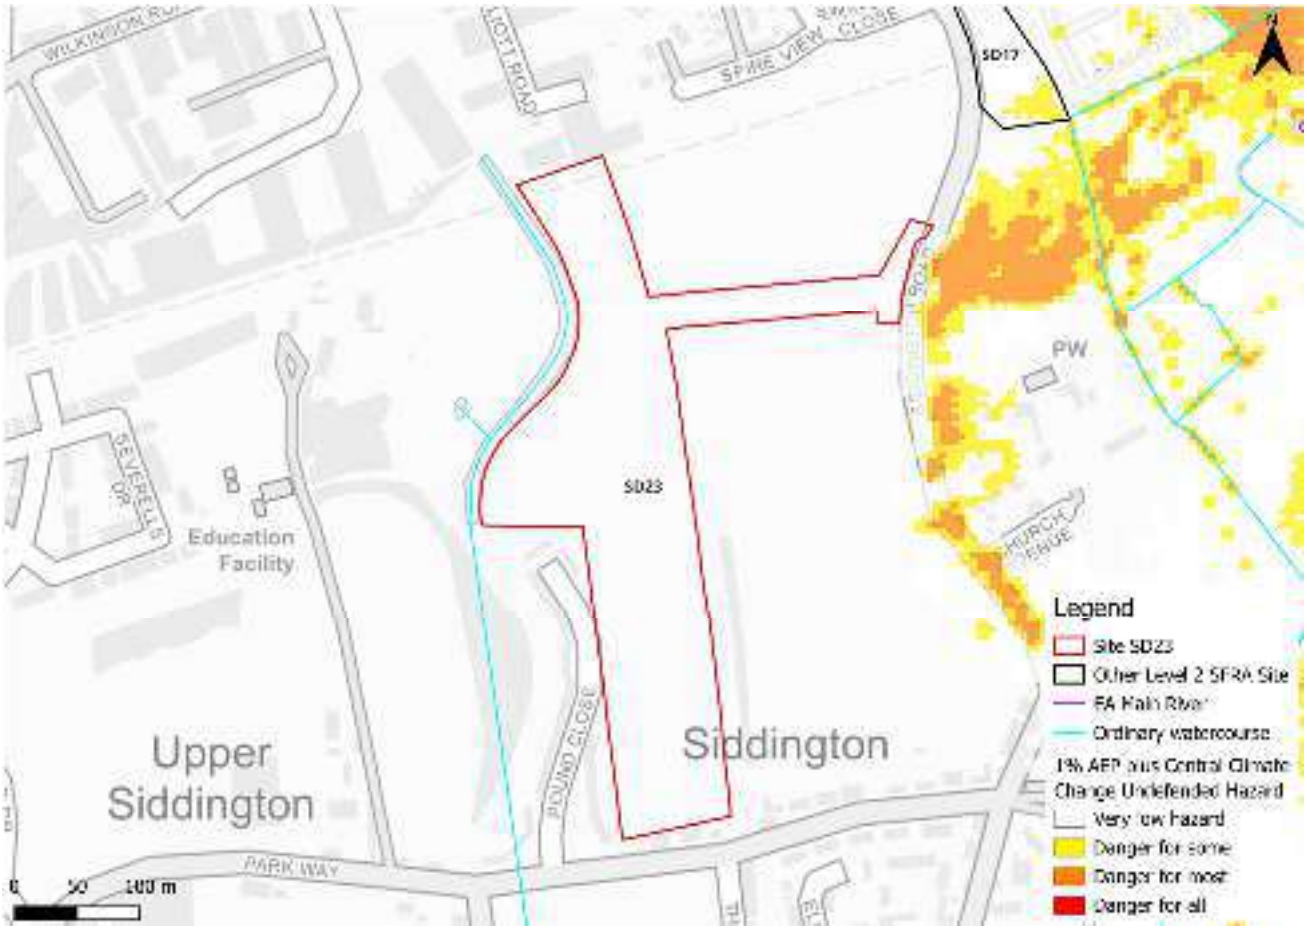

Figure 2-7: Flood hazards for the 1% AEP undefended flood event plus central climate change allowance for the 2080s epoch

2.2.2 Flood Map for Planning - Flood Zones plus Climate Change

Figure 2-8 shows the Flood Map for Planning - Flood Zones plus Climate Change dataset which includes the central allowance for the 2080s epoch. This represents the impact of climate change on Flood Zone 3a and Flood Zone 2 combined. This shows a greater extent of flooding than the modelled event. This is due to the Flood Zones plus Climate Change dataset also including the larger 0.1% AEP event. However, the risk to the site only increases slightly.

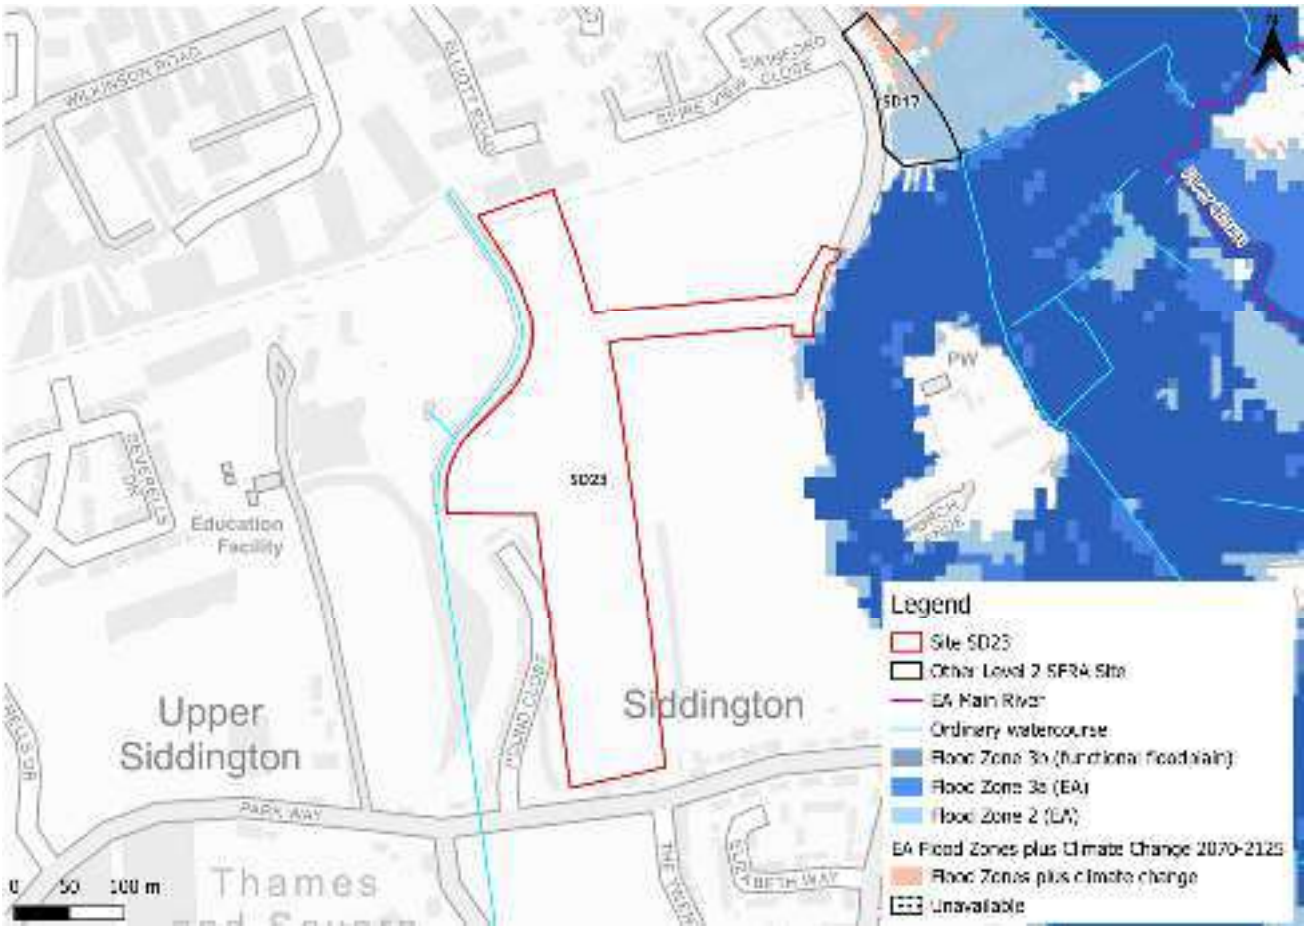

Figure 2-8: EA Flood Zones plus Climate Change

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been six recorded flooding incidents within the Siddington and Cerney Rural Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-9 shows that the site and wider area could benefit from

riparian, floodplain, and wider catchment tree planting. Tree planting can help to slow the flow to benefit areas downstream. There is also potential for runoff attenuation. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

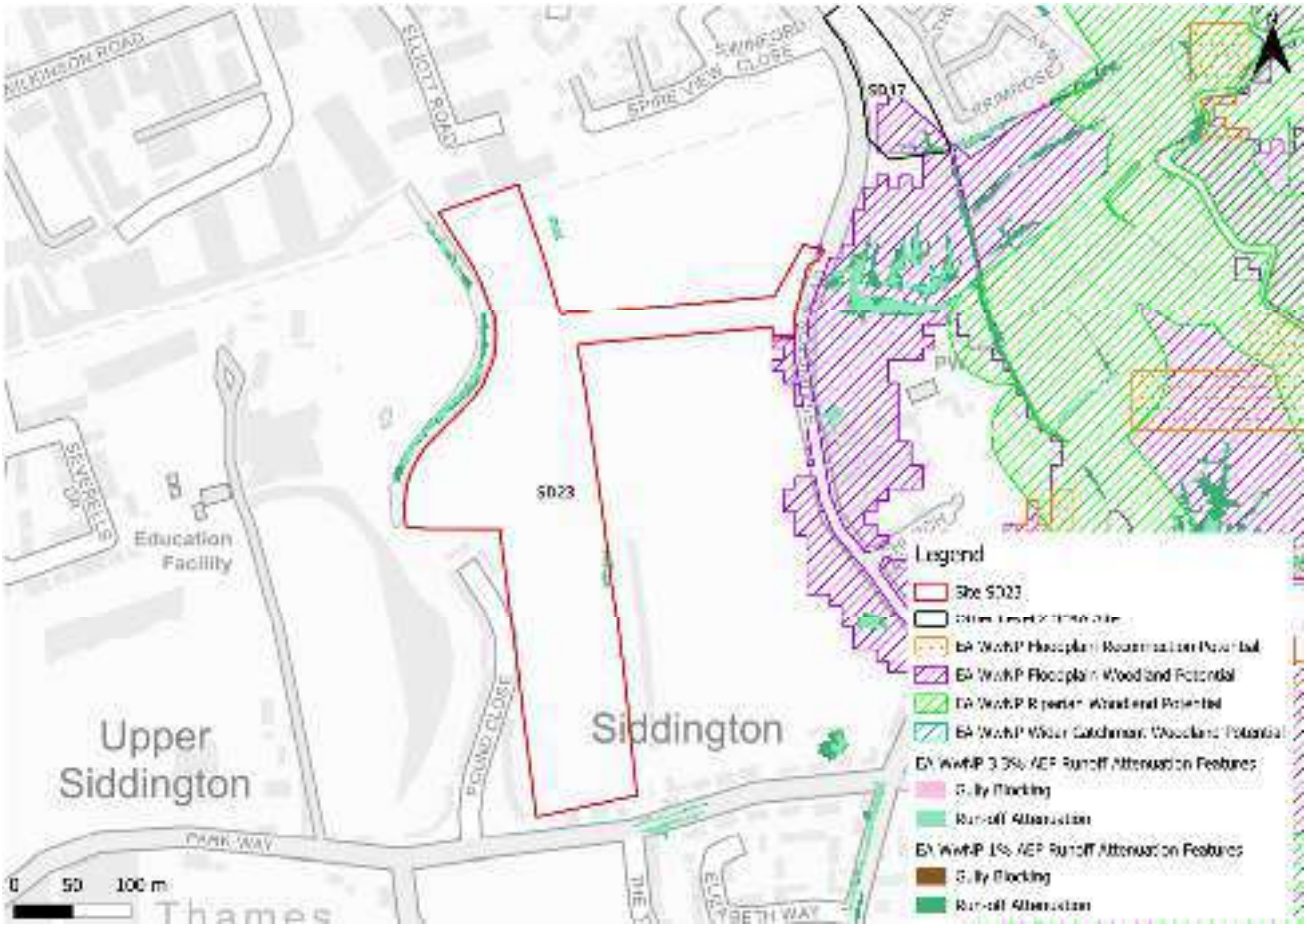

Figure 2-9: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warning and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The area at risk is included within a FWA, namely 061FWF02Cirncstr - River Churn from Baunton to Siddington including Cirencester, as shown in Figure 2-10.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The area at risk is included within a FAA, namely 061WAF02Churn - River Churn and its tributaries, as shown in Figure 2-10.

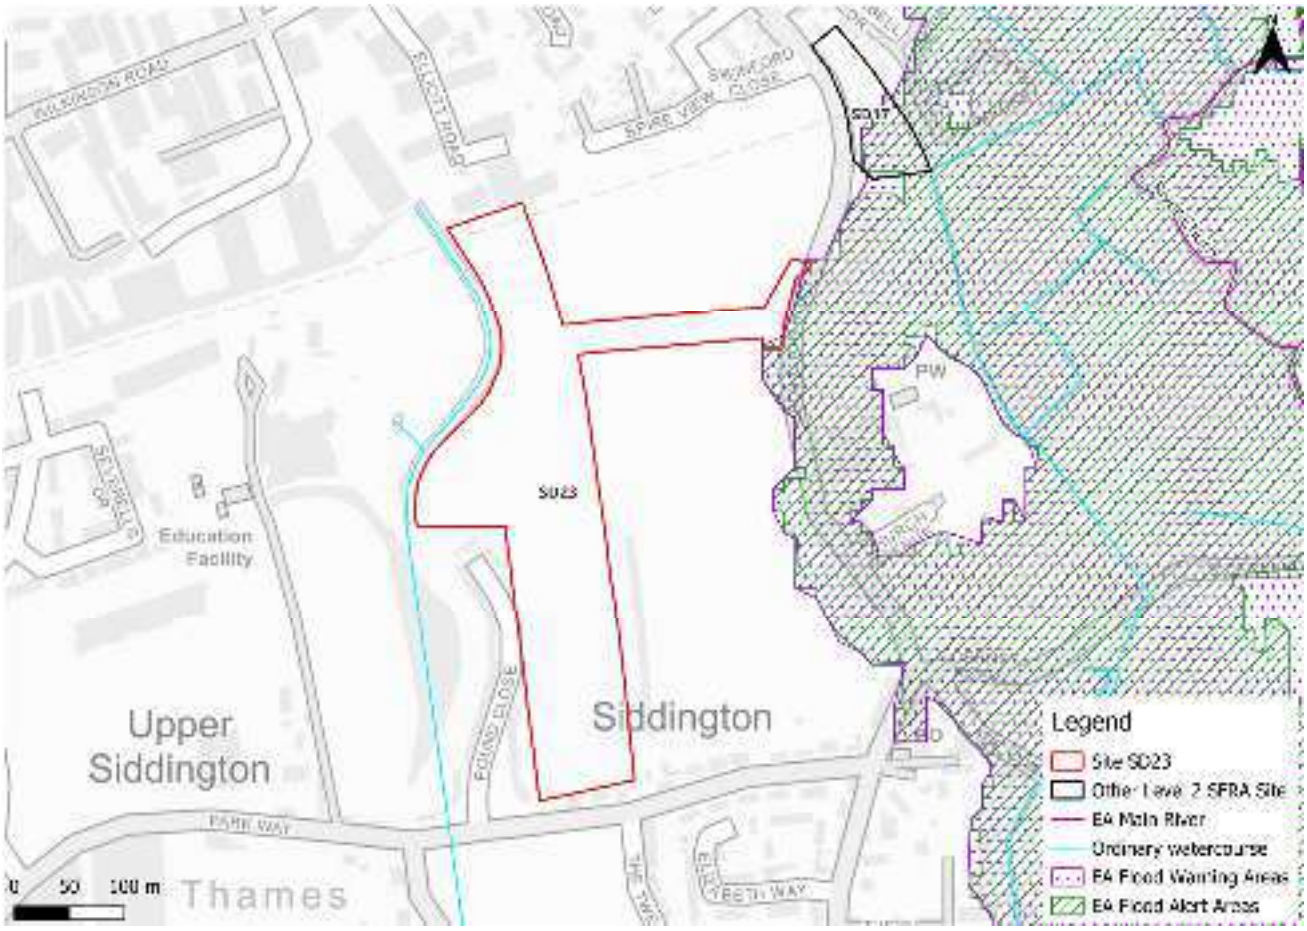

Figure 2-10: Flood warnings and alerts

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes could likely be achieved during a flood event via the west of the site via Siddington Road (Figure 2-11).

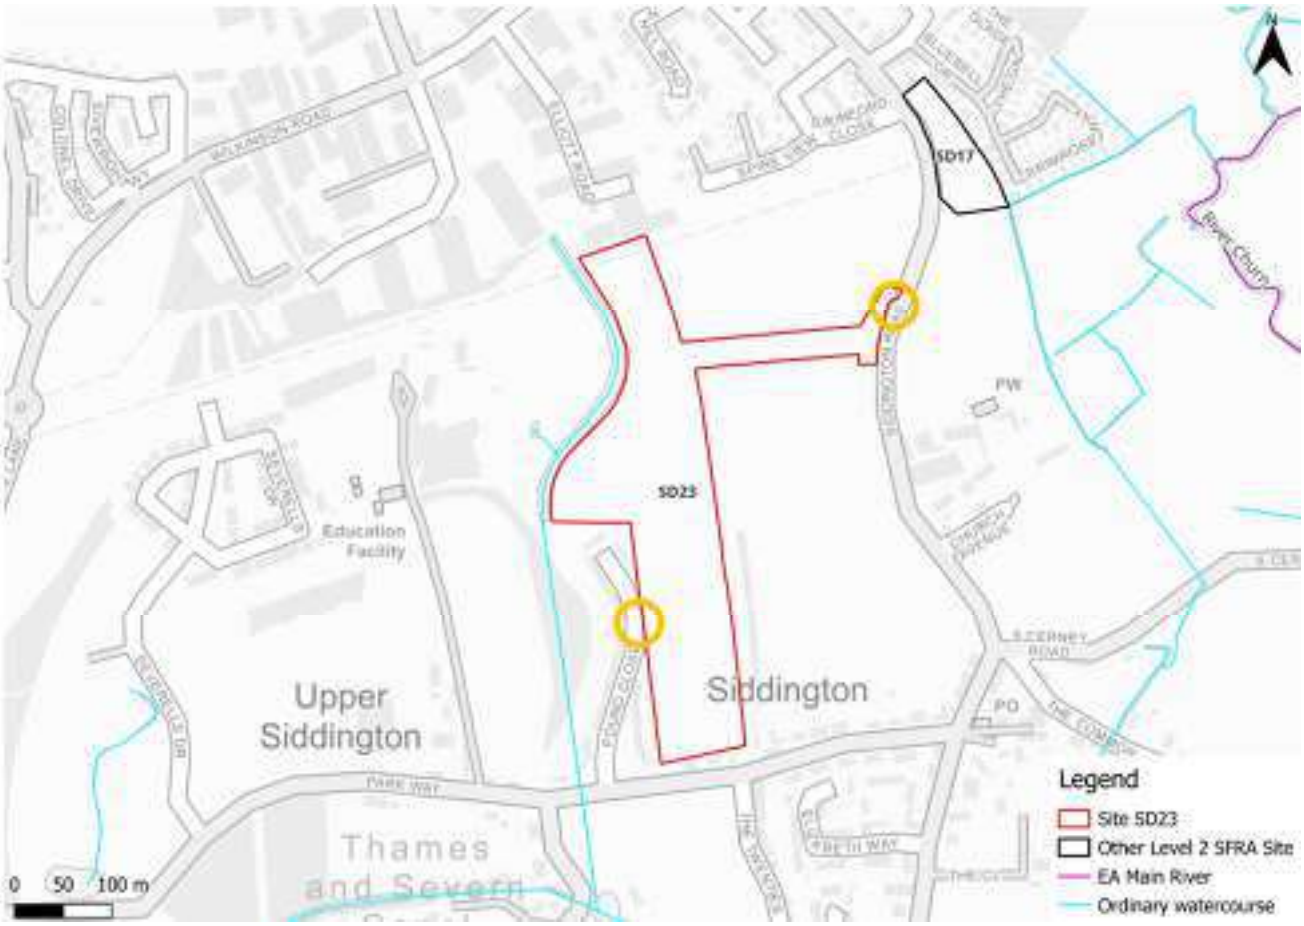

Figure 2-11: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The majority of the site is located within Flood Zone 1 and therefore at low risk from rivers.
  - Detailed modelling and the Flood Map for Planning show that the site is at no additional risk from climate change.
  - There is risk to the main access road, Siddington Road, heading south.
- Mitigation:
  - EA flood warnings and alerts should continue to be in place to ensure early evacuation of site users before an extreme flood event occurs.
- Access and escape:
  - Safe access and escape routes must be available at all times. This includes the ability of residents and site users to safely access and exit a building during a design flood and to evacuate before an extreme flood (0.1% AEP event plus climate change). Routes should be directed to the north of Siddington Road or via Pound Close to the west.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents Present Day map (May 2026), the site is predominantly at low risk of surface water flooding as shown in Table 3-1 and Figure 3-1 and the depth map in Figure 3-2. There is some risk to the primary access road, Siddington Road. However, safe access and escape routes appear to be achievable via the north of Siddington Road and potentially via Pound Close to the west in all events.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning Extents Present Day datasets

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
97	1	1	1

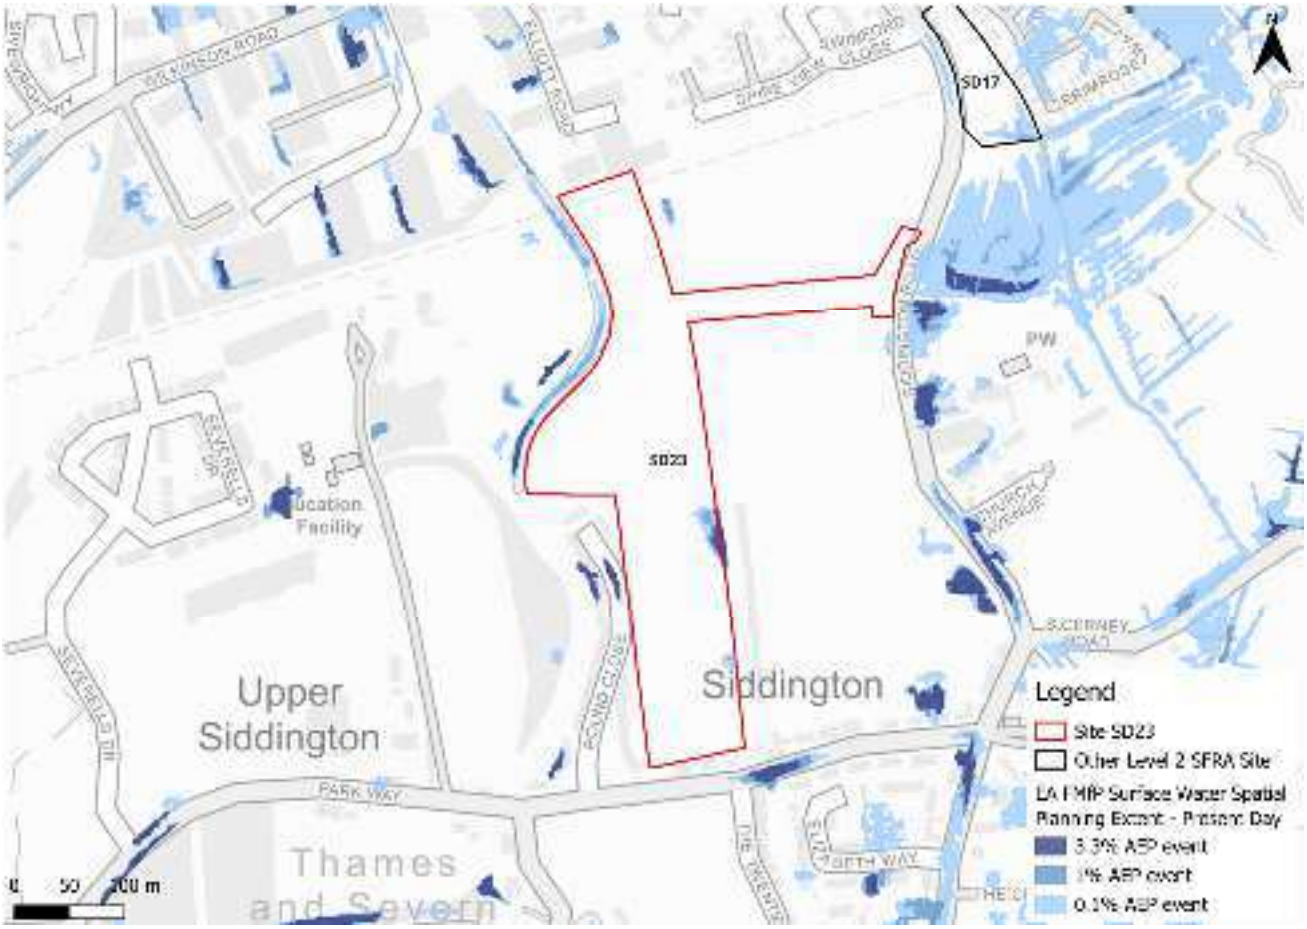

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

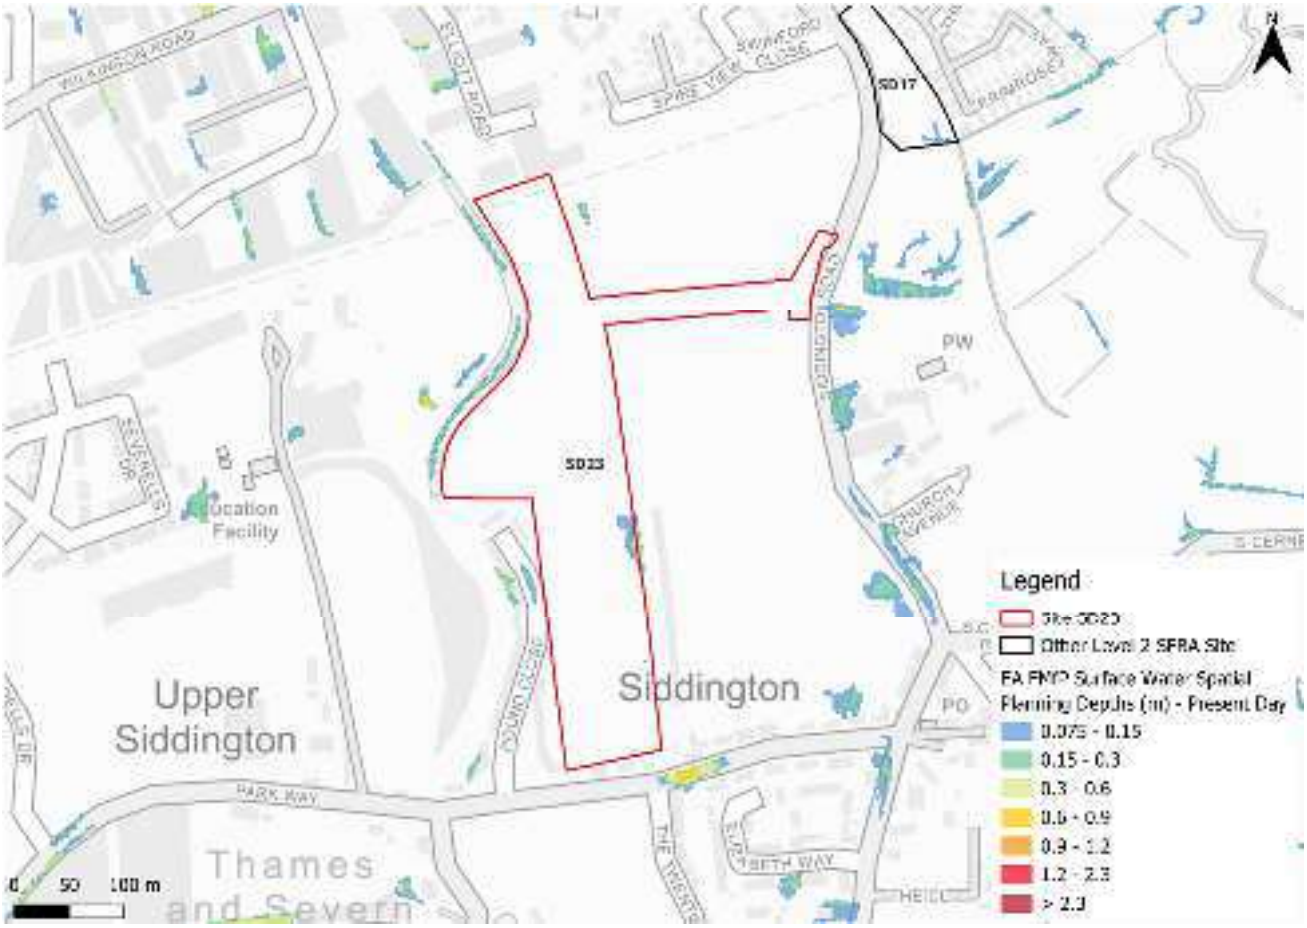

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows there to be areas of low to moderate flood hazard along the centre-east boundary of the site (Figure 3-3).

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day medium risk surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Climate Change

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Gloucestershire and the Vale management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Gloucestershire and the Vale Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. The site is shown to be at additional risk from surface water climate change. There is a small additional area of ponding to the south and an expansion in the present day area of ponding.

Flood depths are mainly shallow, with only a small area between 0.3m - 0.6m deep (Figure 3-5). Safe access and escape routes would likely remain achievable via the north of Siddington Road and via Pound Close.

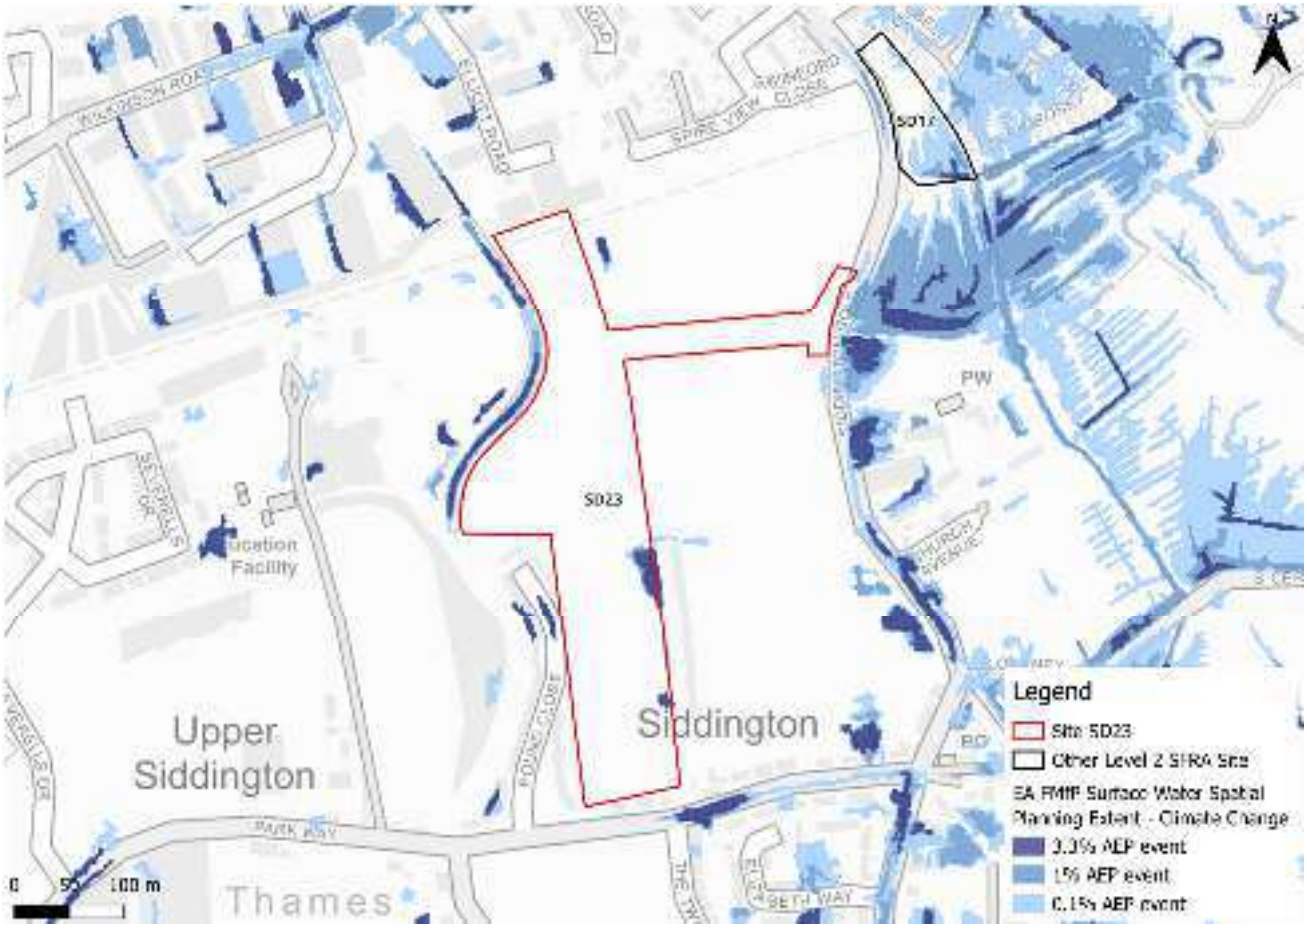

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

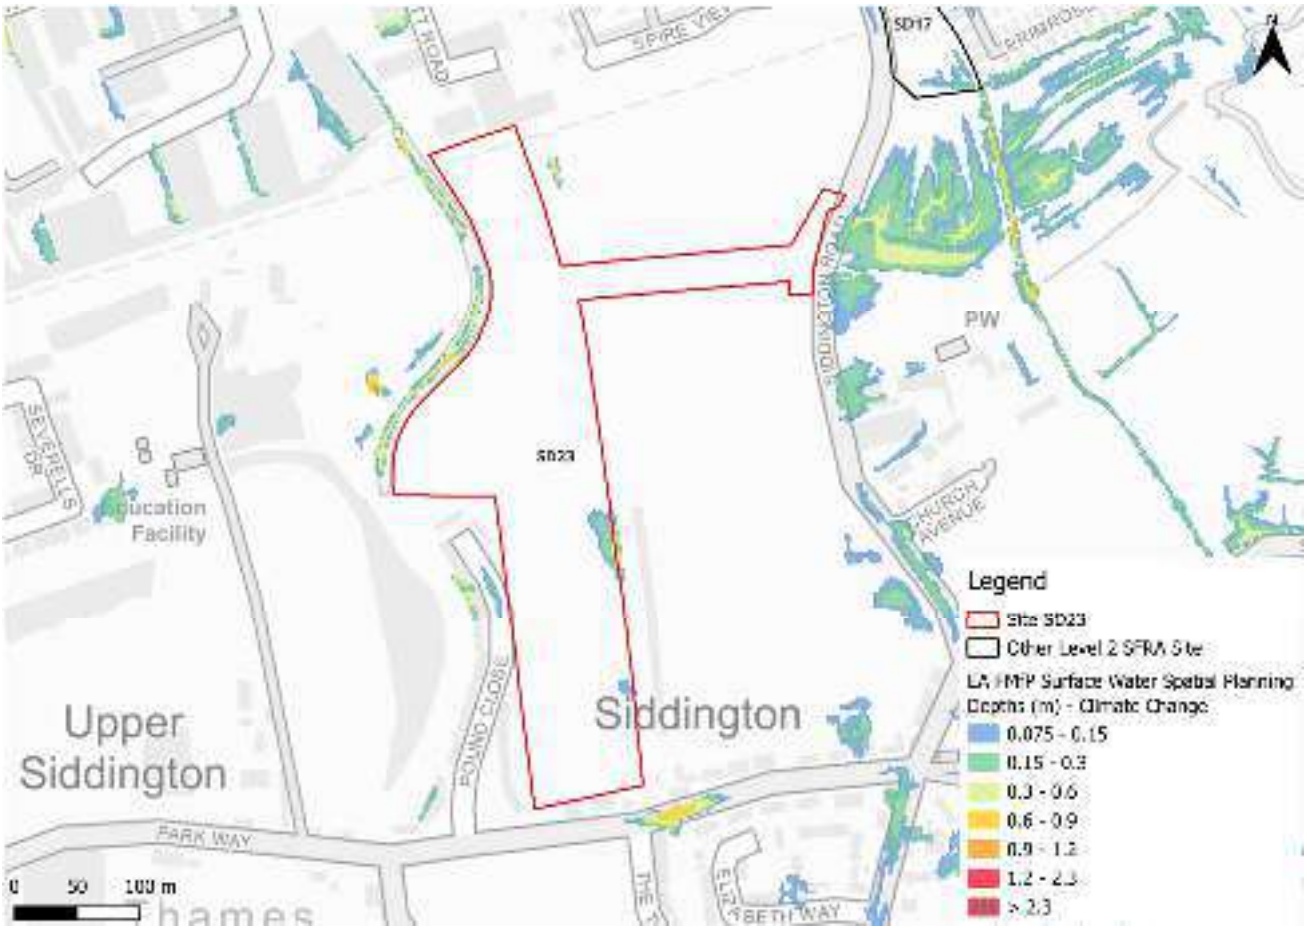

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning climate change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the RoFSW low-risk surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards (Figure 3-6).

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day low risk surface water flood hazard as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There are no recorded sewer flooding incidents nearby the site nor within the Siddington & Cerney Rural Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 97% of the site being outside of the 0.1% AEP surface water flood event.
- Risk to the site is shown to slightly increase in extent within the site when considering the impact of climate change.
- Topographic low spots should be considered and included in site design and ideally left in place to flood naturally when required.
- The drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.

- Safe access and escape routes would likely be achievable via the north of Siddington Road to the east of the site, as well as Pound Close to the west of the site.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within one catchment, namely, the Churn (Baunton to Cricklade) catchment. This catchment is ranked as a high sensitivity catchment. Planning considerations for all sites can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications. The map shows there is a risk of groundwater emergence to both surface and subsurface assets in the western and eastern side of the site, including the access route. Here, groundwater may emerge at significant rates in this area has the capacity to flow overland and/or pond within any topographic low spots. The centre of the site is not at risk.

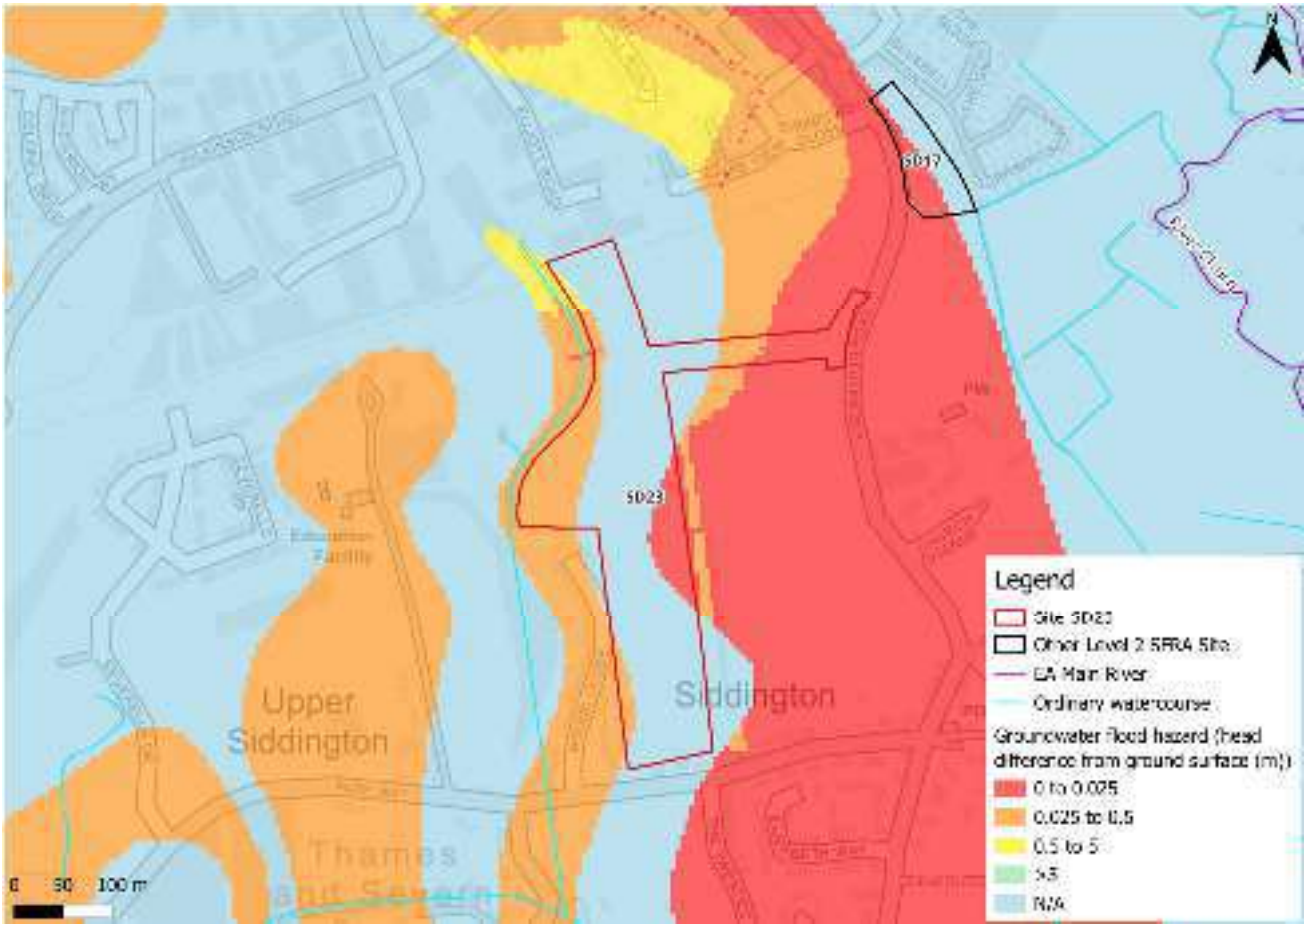

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is sandstone, limestone and argillaceous rocks (Figure 5-2). Sandstone and limestone generally have a high permeability and high level of porosity, increasing infiltration rates. Superficial deposits include clay and silt which have low permeability. Infiltration SuDS may not be an option in parts of the site, though the drainage strategy for the site should fully investigate water table levels through standpipe monitoring during the period of highest groundwater levels e.g. November to April.

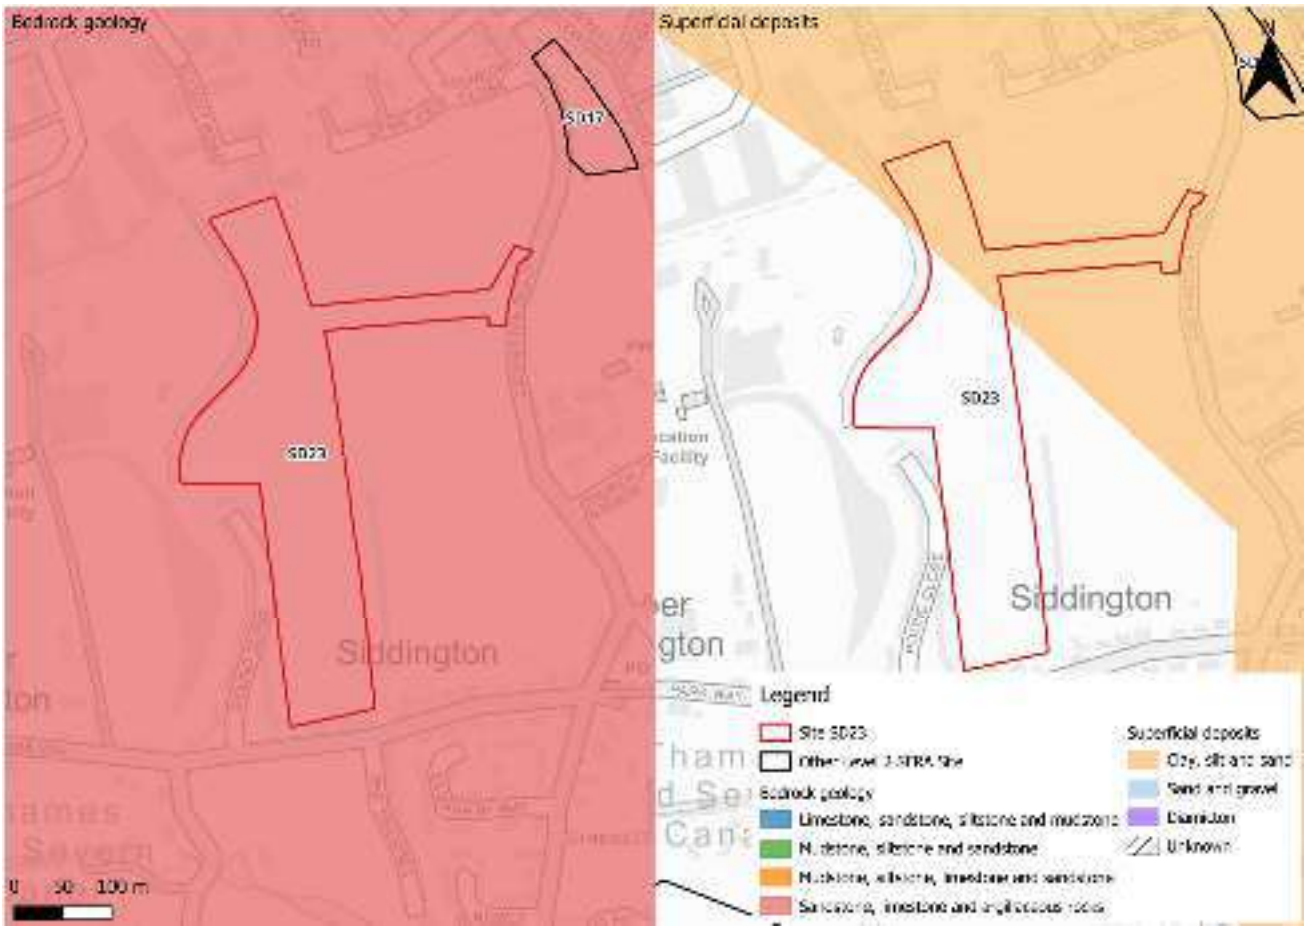

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There does not appear to be any residual risk to the site from asset blockage or defence breach.

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is not required to pass part b) of the exception test as it is not located within Flood Zone 3a, however it must still be proven that the development can be safe for its lifetime, which is generally considered to be 100 years for residential development.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- Based on current information, this site can be allocated.
- Safe access arrangements must be available and confirmed at the FRA stage.
- A drainage strategy should ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- Groundwater conditions must be investigated further through the site-specific FRA. This should be assessed through standpipe monitoring during the period of highest groundwater levels e.g. November to April.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WCAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

Contract

JBA Project Manager	Mike Williamson
Address	Phoenix House, Lakeside Drive, Centre Park, Warrington, WA1 1RX
JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Joanne Corbett of Cotswold District Council. Laura Thompson-Jones of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken between June and July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site BK14A. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site BK14A

- Location: The Limes, Station Road
- Existing site use: Greenspace. Also includes a current residential property and curtilage of which it is assumed is to remain in situ
- Existing site use vulnerability: More vulnerable
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 1.52
- Watercourse: Blockley Brook ordinary watercourse
- Environment Agency (EA) flood model: N/A
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of fluvial flood depths, velocities and hazards
    - Assessment of surface water flood extent, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

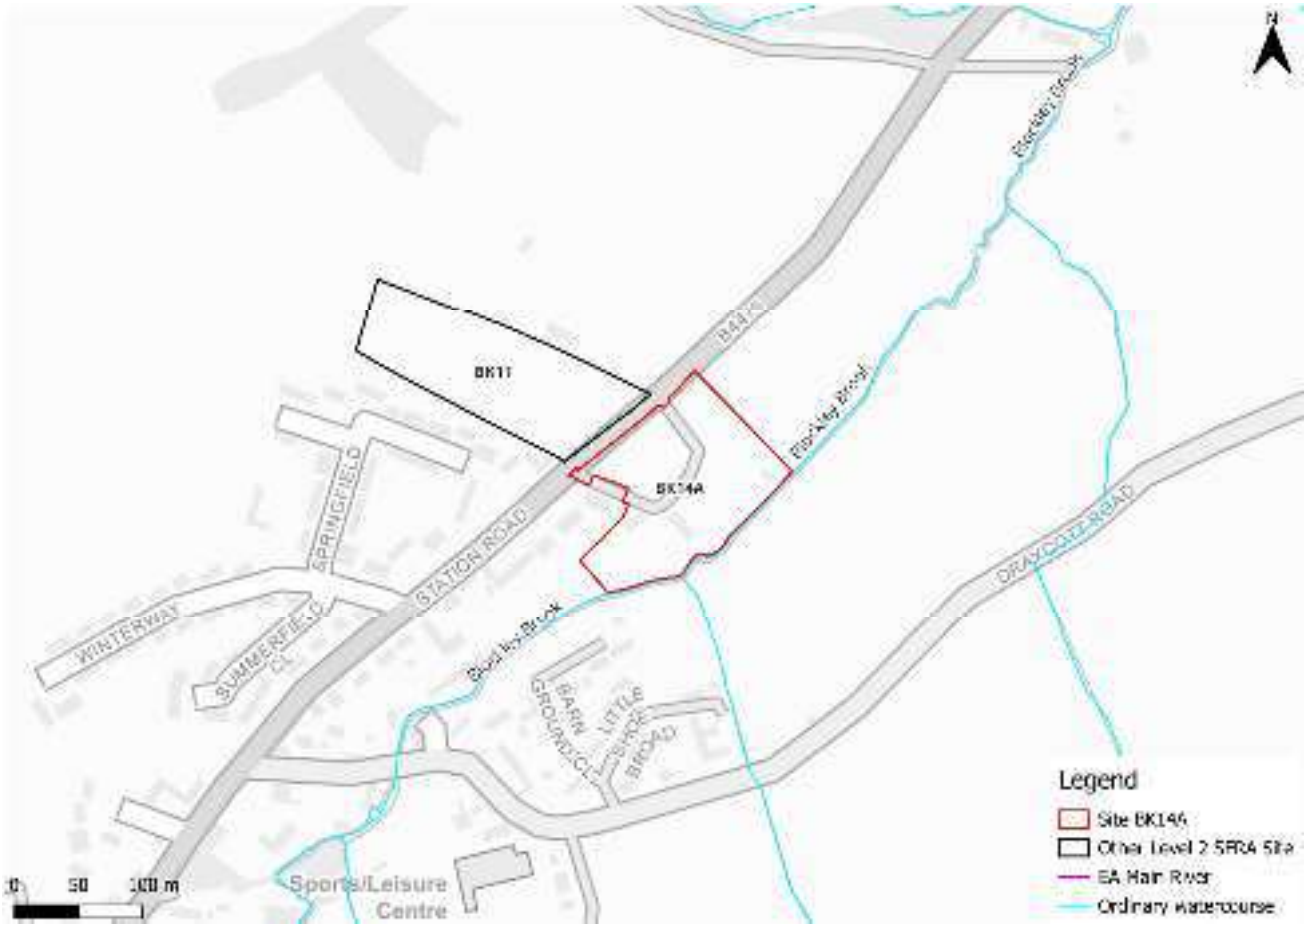

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

Figure 1-3: Topography

The topography of the site slopes from west to east towards the floodplain of Blockley Brook.

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the percentage areas of the site within each flood zone are stated in Table 2-1 and can be viewed on Figure 2-1. The Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

The site is partially within the functional floodplain due to risk from Blockley Brook, which borders the southeastern boundary of the site. The majority of the site is within Flood Zone 1 and therefore at low risk from rivers and the sea. The functional floodplain in this location is based on the EA's New National Model (NNM) dataset 'Rivers and Sea 3.3% defended flood risk extents - present day'.

Table 2-1: Present day flood risk based on percentage area of site at risk

Flood Zone 1 (% area)	Flood Zone 2 (% area)	Flood Zone 3a (% area)	Flood Zone 3b (% area)
95	2	1	2

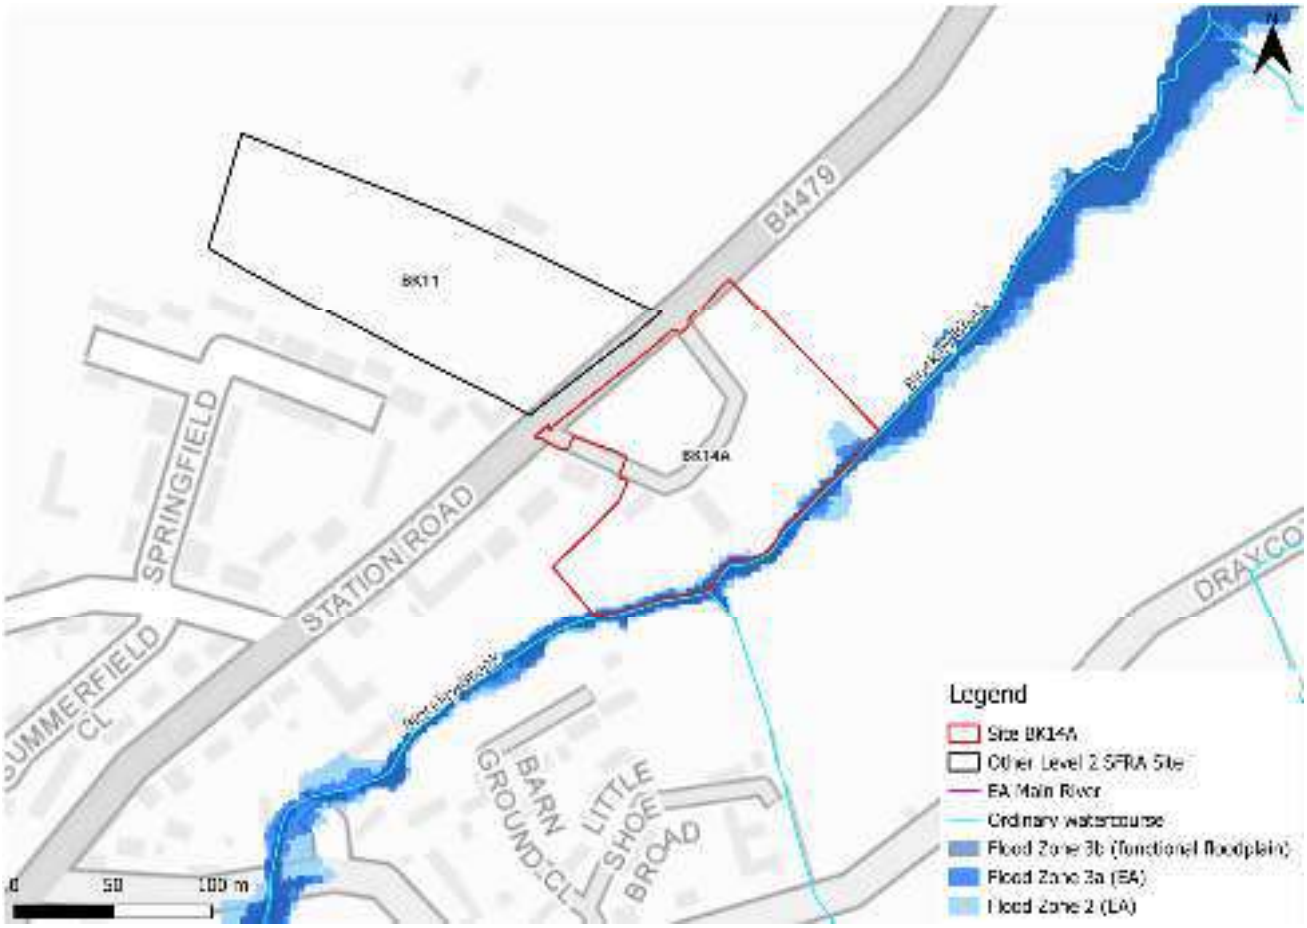

Figure 2-1: Present day risk

2.2 Impacts from climate change

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Avon Warwickshire Management Catchment. The central allowance within this catchment is 21% on peak flows (Table 2-2). There is no local detailed model for Blockley Brook therefore the required event cannot be assessed.

Table 2-2: Modelled climate change allowances for peak river flows within the Avon Warwickshire Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	7	12	22
2050s	8	14	31
2080s	21	32	59

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Figure 2-2 shows the Flood Map for Planning - Flood Zones plus Climate Change dataset which includes the central allowance for the 2080s epoch. This represents the impact of climate change on Flood Zone 3a and Flood Zone 2 combined.

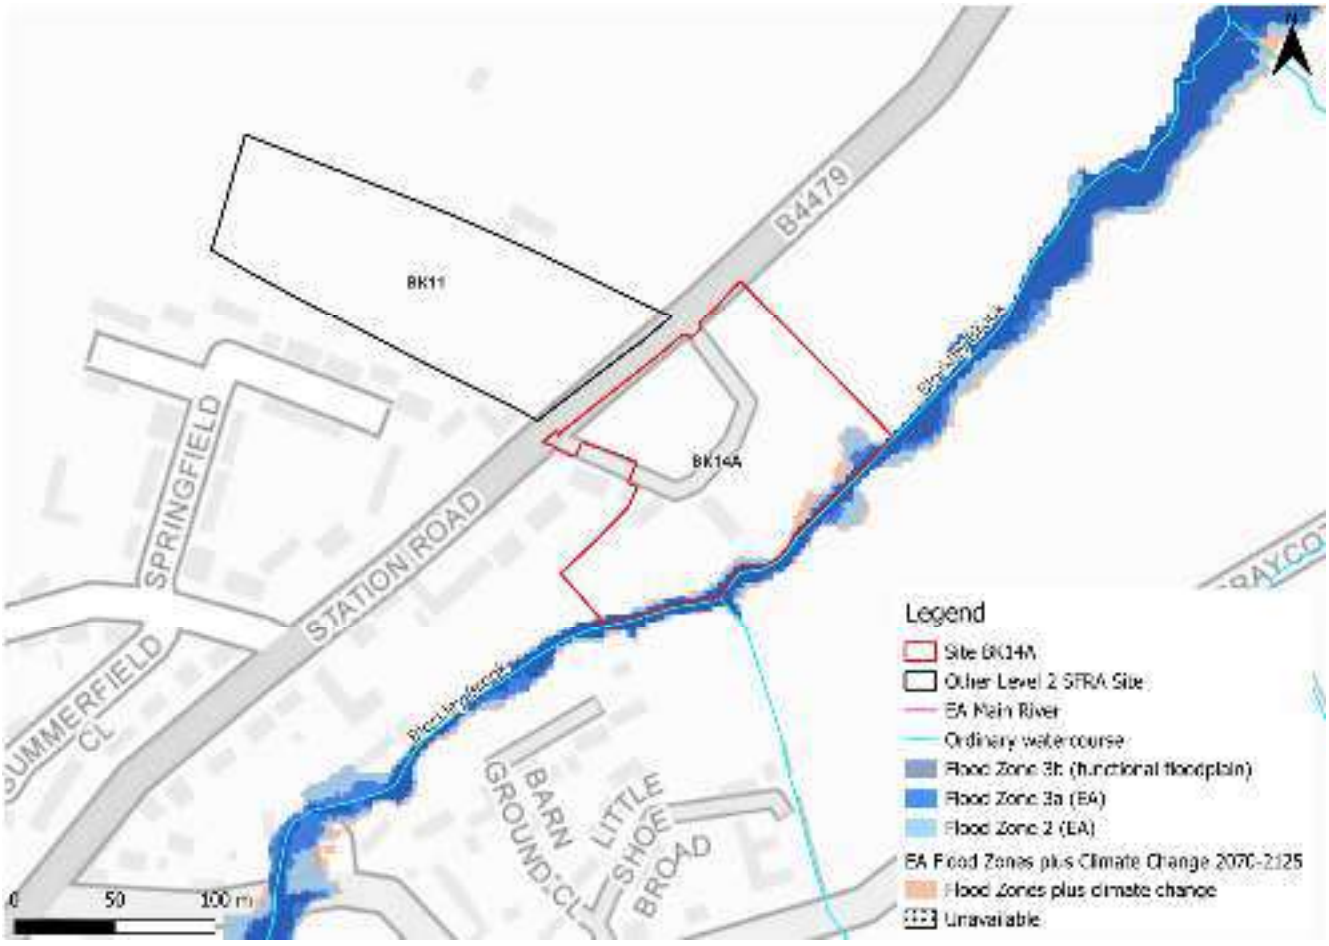

Figure 2-2: EA Flood Zones plus Climate Change

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There are no recorded flooding incidents within the Blockley Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-3 shows that the site and wider area could benefit from riparian and floodplain tree planting. Tree planting can help to slow the flow to benefit areas downstream. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

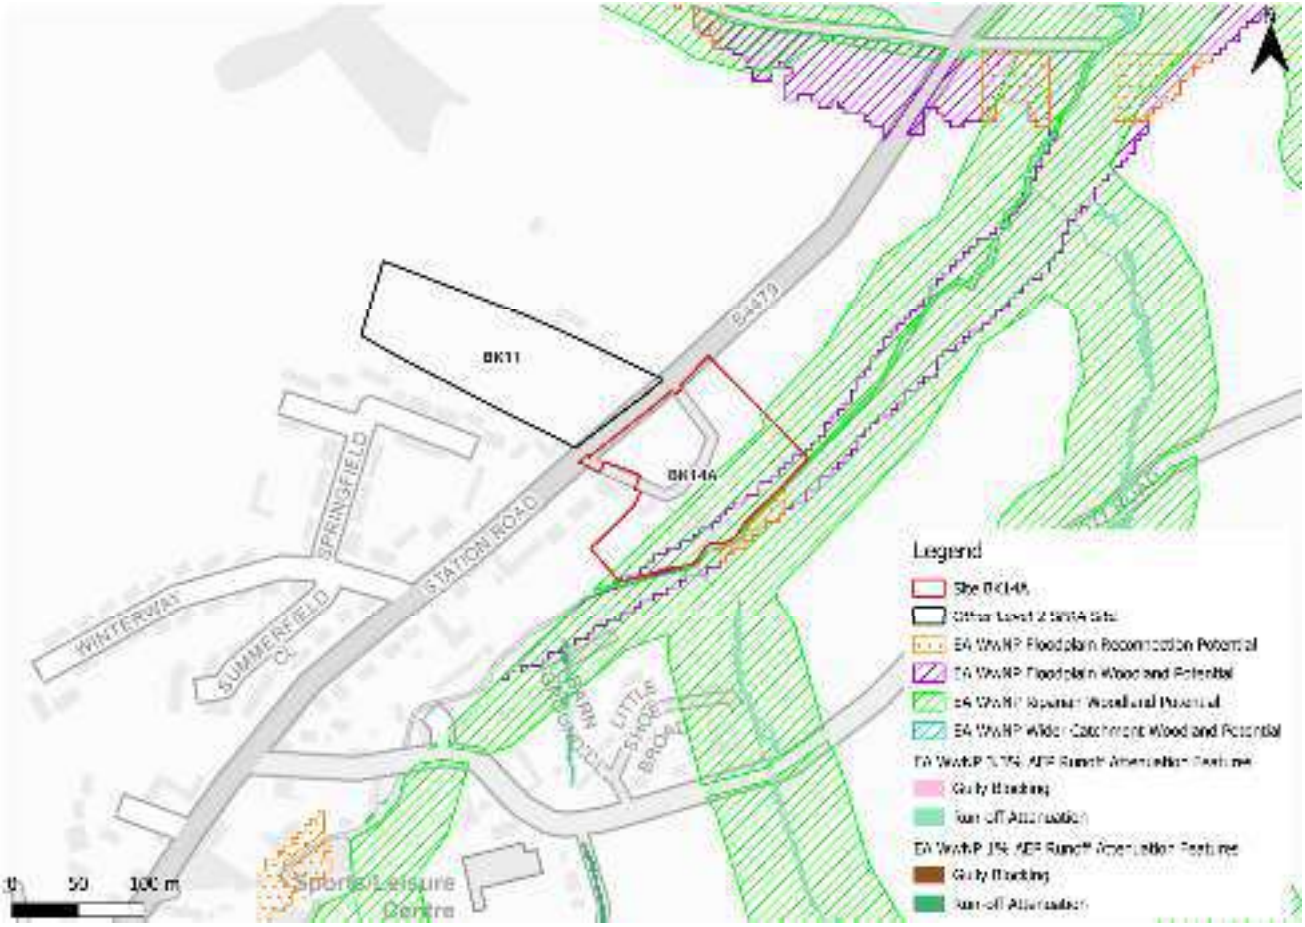

Figure 2-3: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warnings and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The floodplain of Blockley Brook is located within a FAA, namely the 'River Stour in South Warwickshire' FAA.

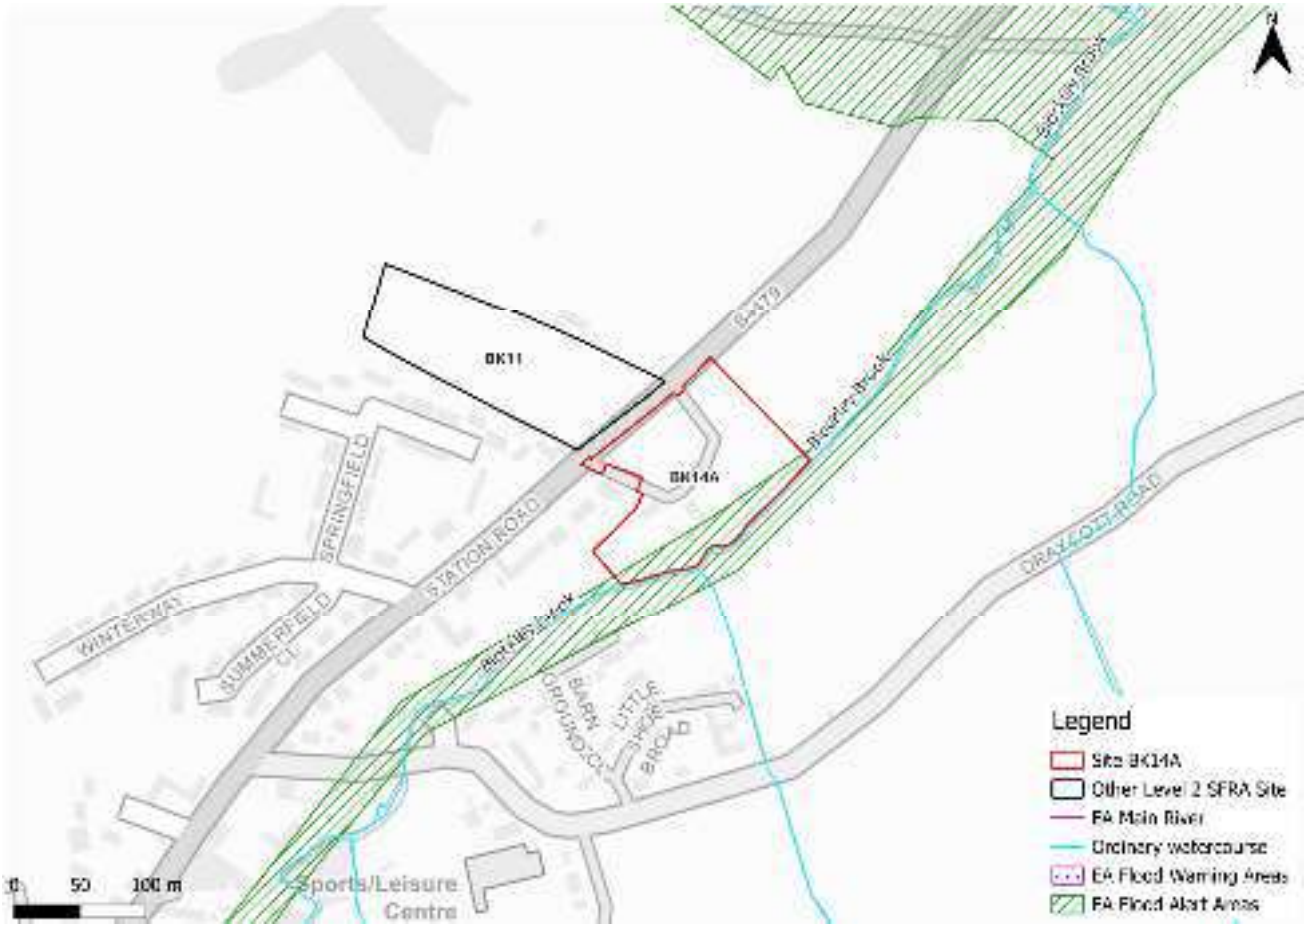

Figure 2-4: Flood warnings and alerts

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes are available during a flood event via existing routes to Station Road (Figure 2-5).

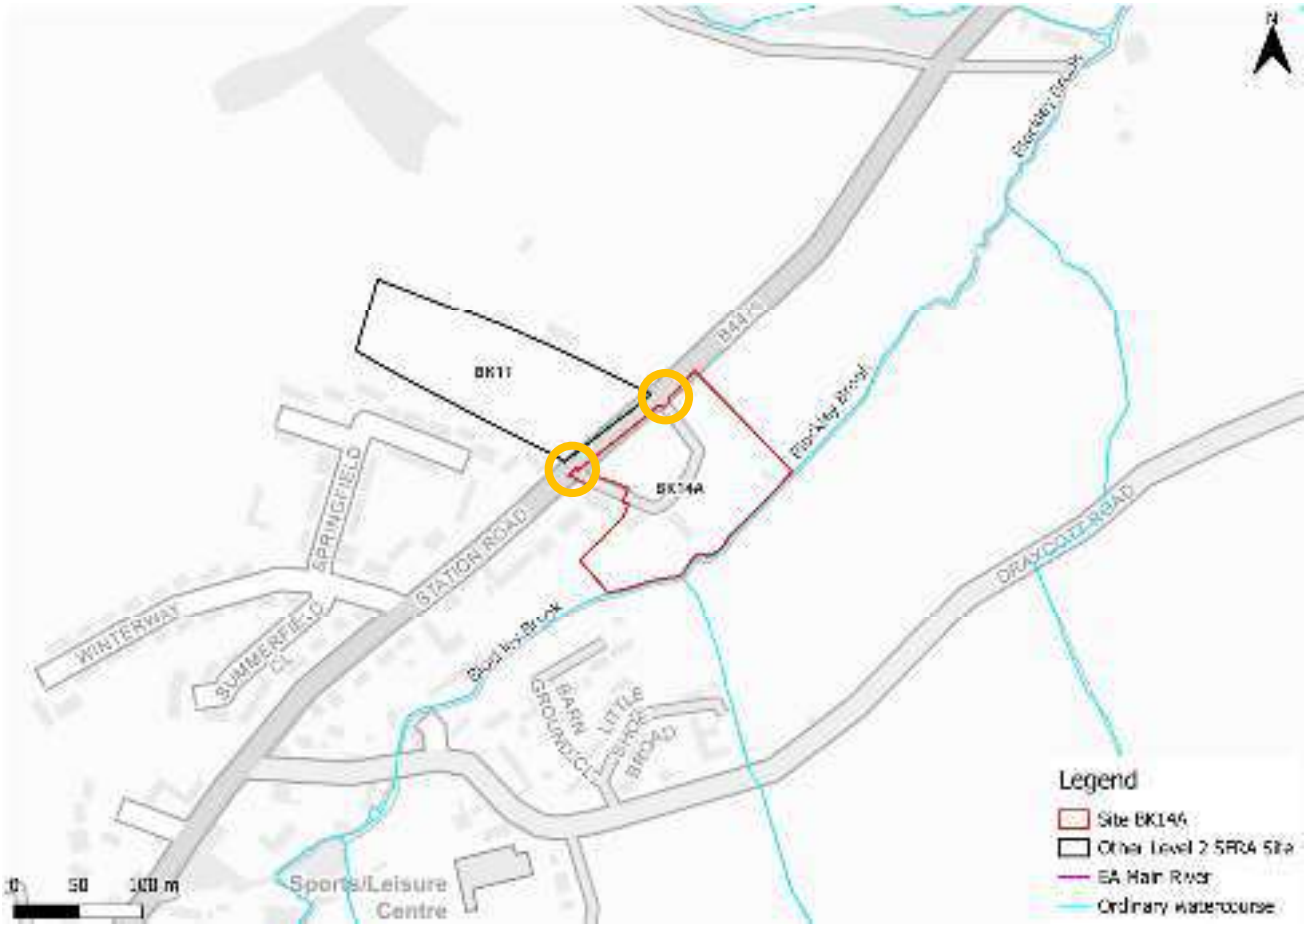

Figure 2-5: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site borders Blockley Brook ordinary watercourse. However, most of the site is located within Flood Zone 1 and outside of the Flood Map for Planning climate change extent and therefore mainly at low risk from rivers.
  - The risk from Blockley Brook is based on the EA's NNM and not detailed modelling which is considered to be the most up to date information on fluvial risk to the site and surrounding area. However, the NNM does not contain depth or hazard information, therefore risk cannot be robustly defined at this stage.
- Mitigation:
  - A no development buffer should be in place along the floodplain of Blockley Brook in the form of a blue green corridor, which can provide a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits. All development should be directed to Flood Zone 1 outside of the climate change risk area.

- The EA may expect detailed modelling of Blockley Brook to be carried out at the site-specific FRA stage to robustly inform on present day and future risk to the site.
- EA flood warnings and alerts should continue to be in place to ensure early evacuation of site users before an extreme flood event occurs.

- Access and escape:
  - Based on current information, safe access and escape routes are available.

This page is intentionally left blank

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (May 2026), the site is at nominal risk of surface water flooding as shown in Table 3-1 and Figure 3-1 and also the depth map in Figure 3-2.

Safe access and escape routes are achievable via Station Road.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
98	2	0	0

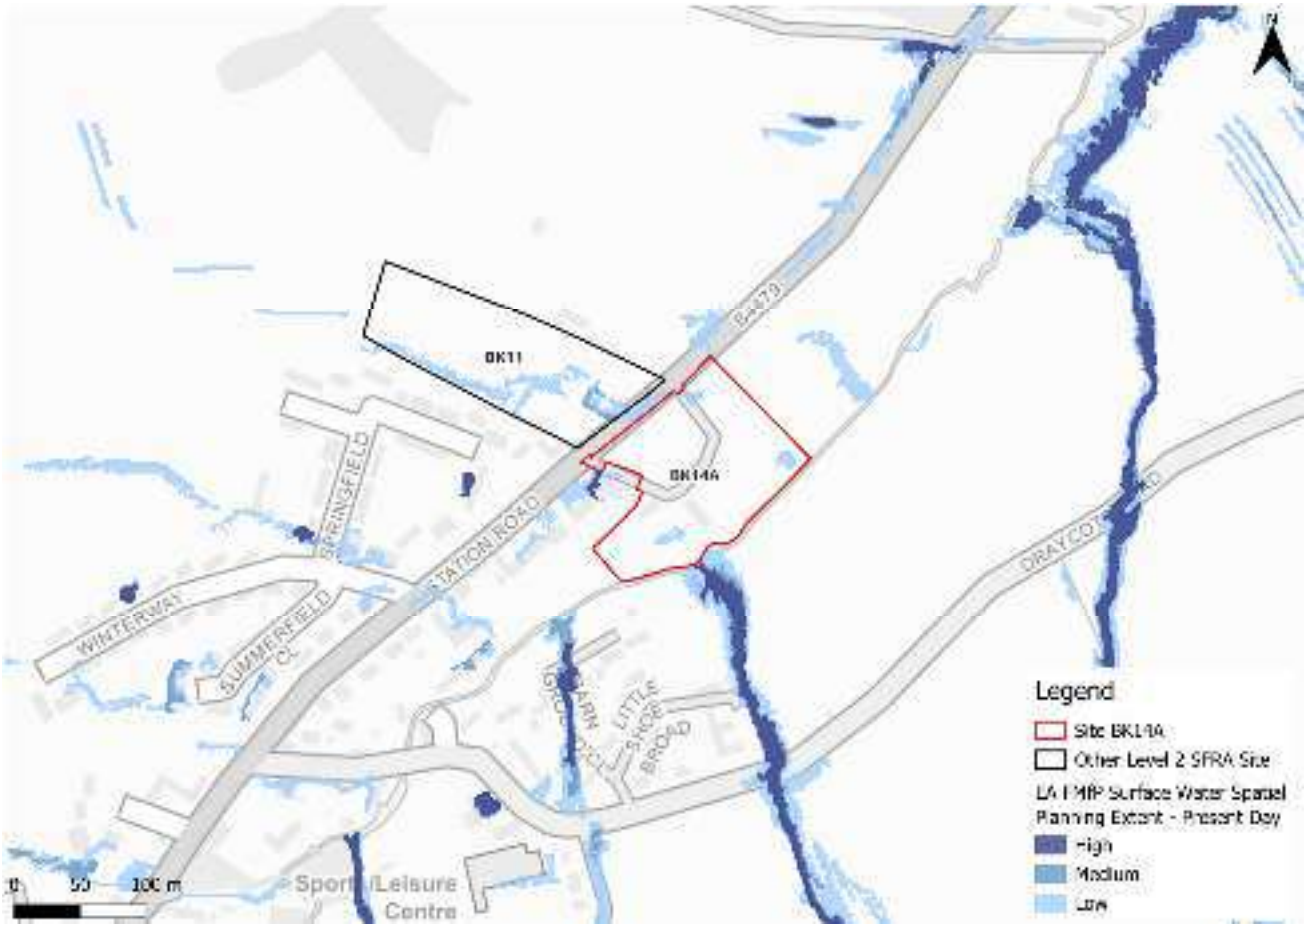

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

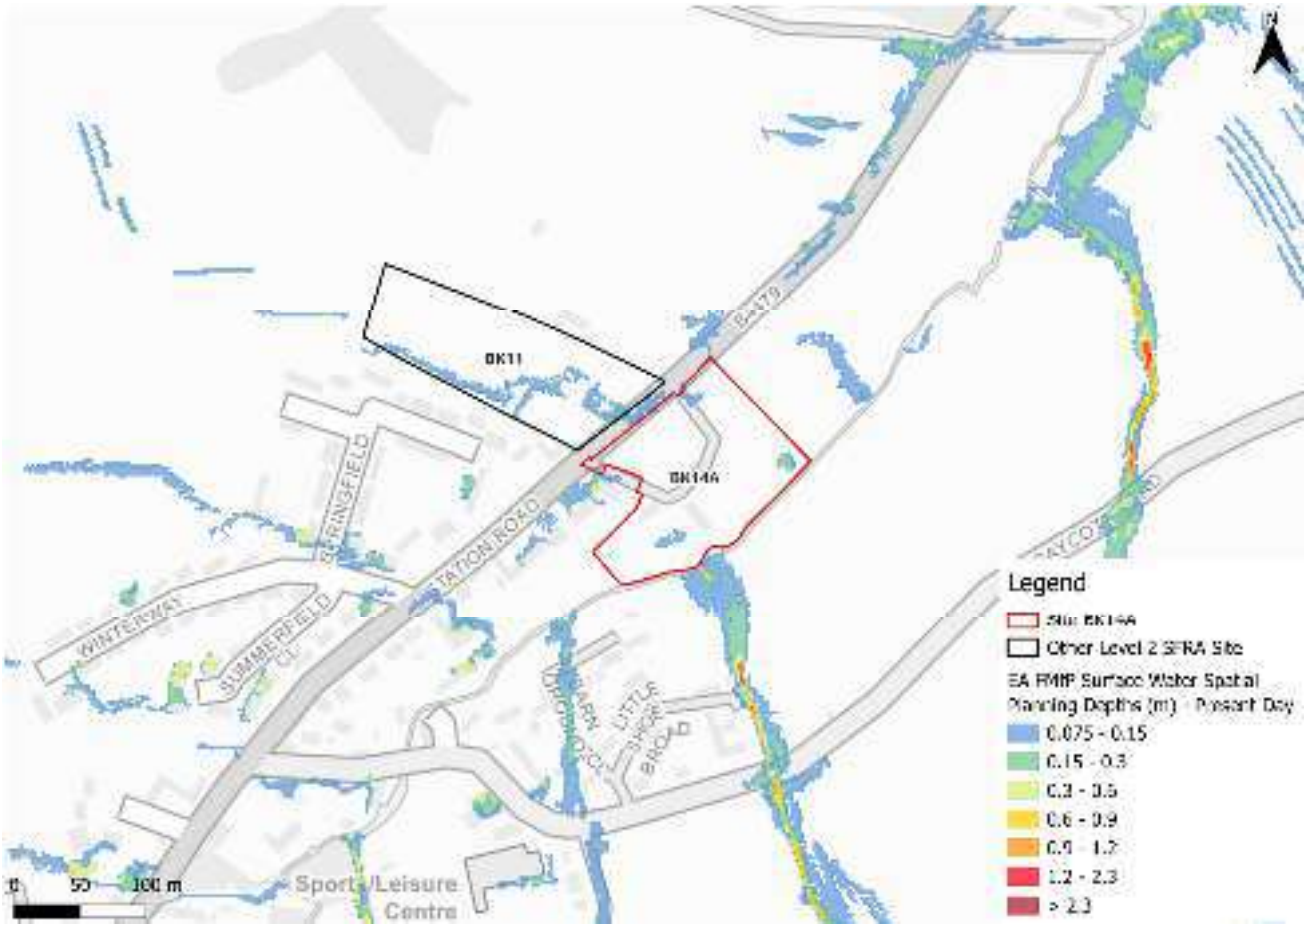

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 0.1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows there to be a extreme flood hazard along the channel of Blockley Brook which should be contained within the recommended blue green corridor. Access via Station Road is low hazard and therefore should remain a viable route (Figure 3-3). There are differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping. However, updated surface water hazard information should be confirmed at the site-specific FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

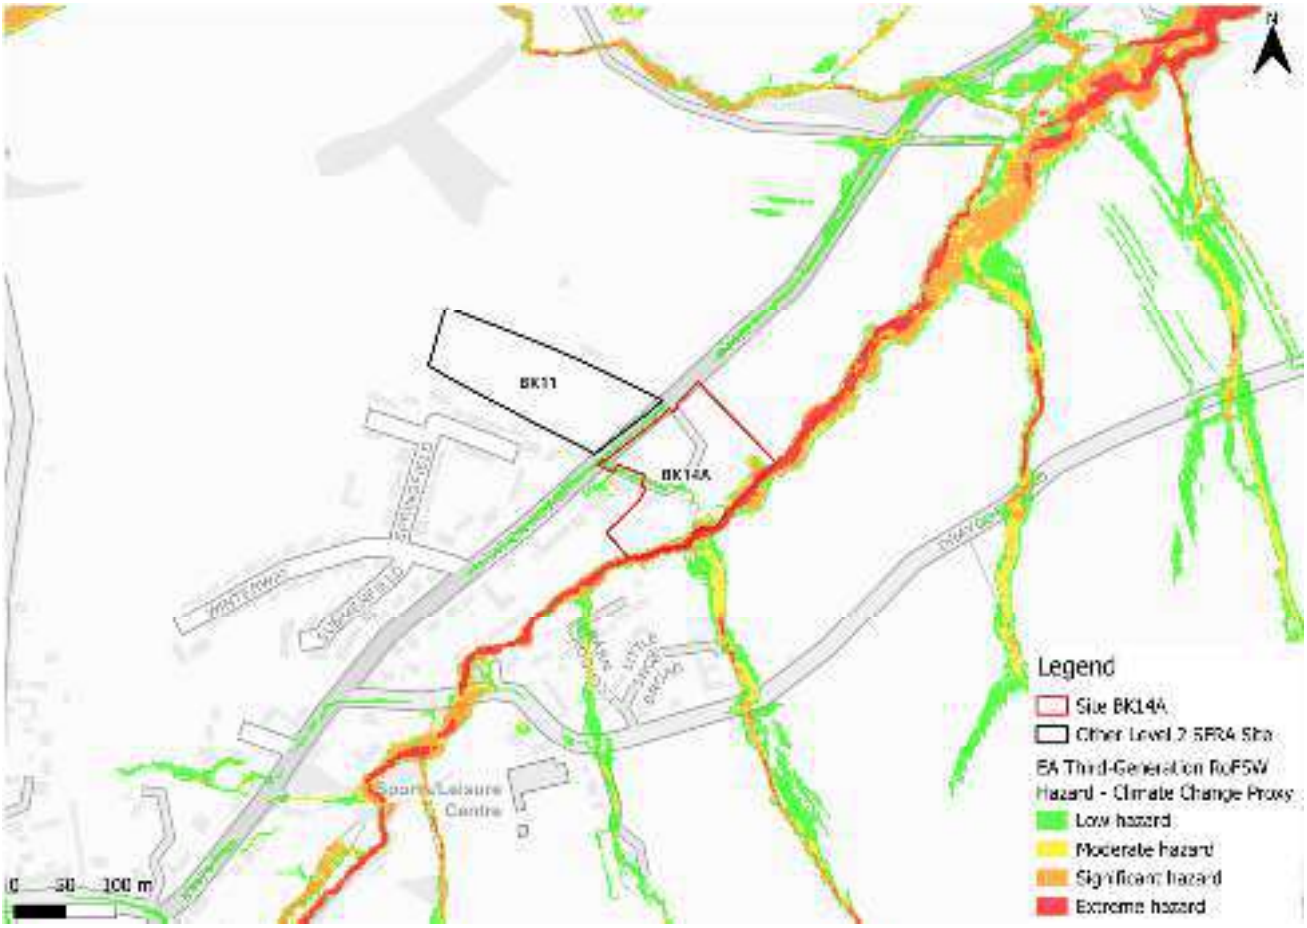

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day low risk surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRAs should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is now included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Avon Warwickshire management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Avon Warwickshire Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. The site is not shown to be at significant additional risk from surface water climate change.

Flood depths are shallow, not exceeding 0.3m (Figure 3-5).

Safe access and escape routes would likely remain achievable via Station Road.

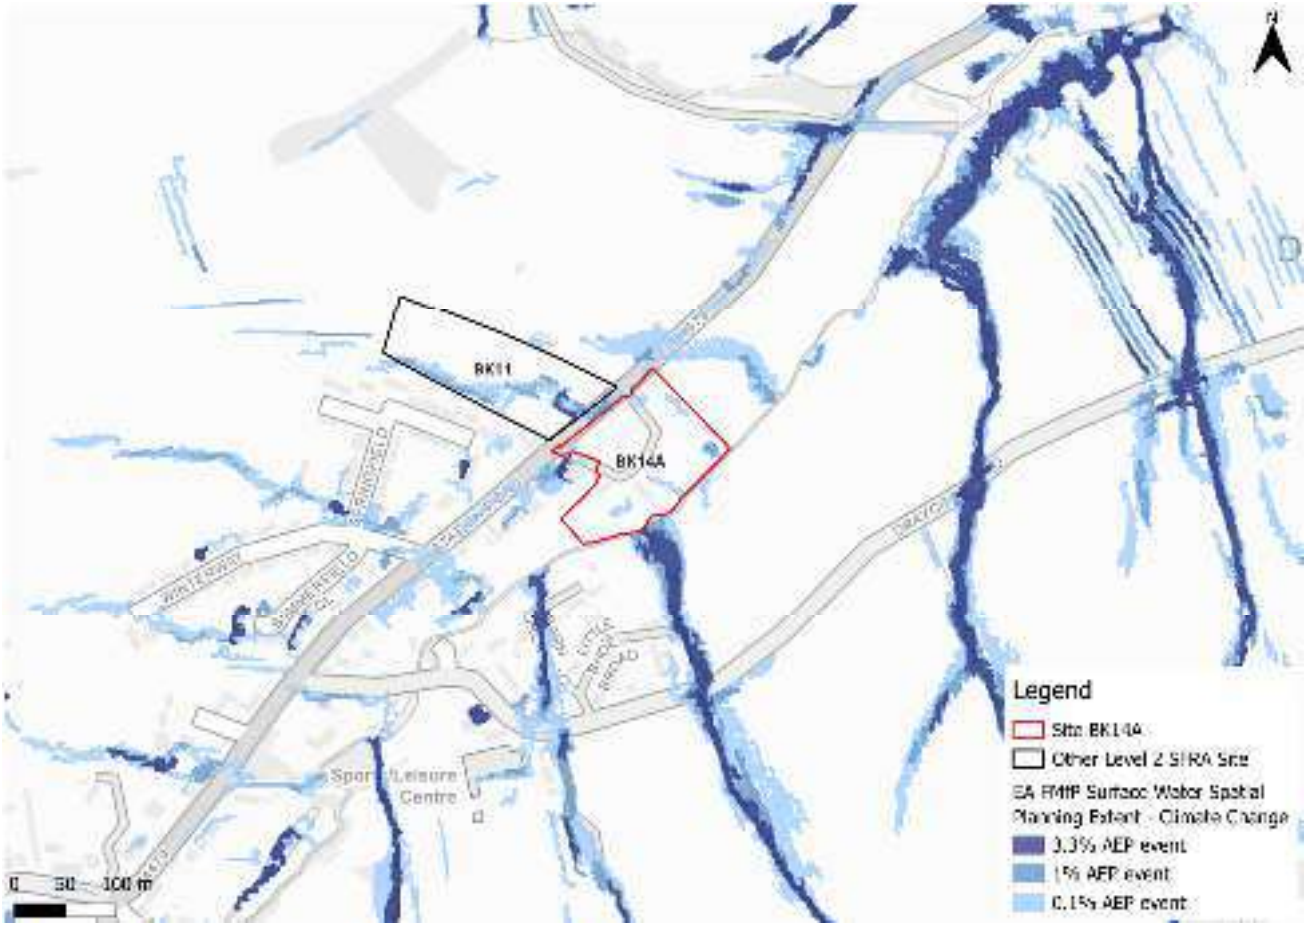

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

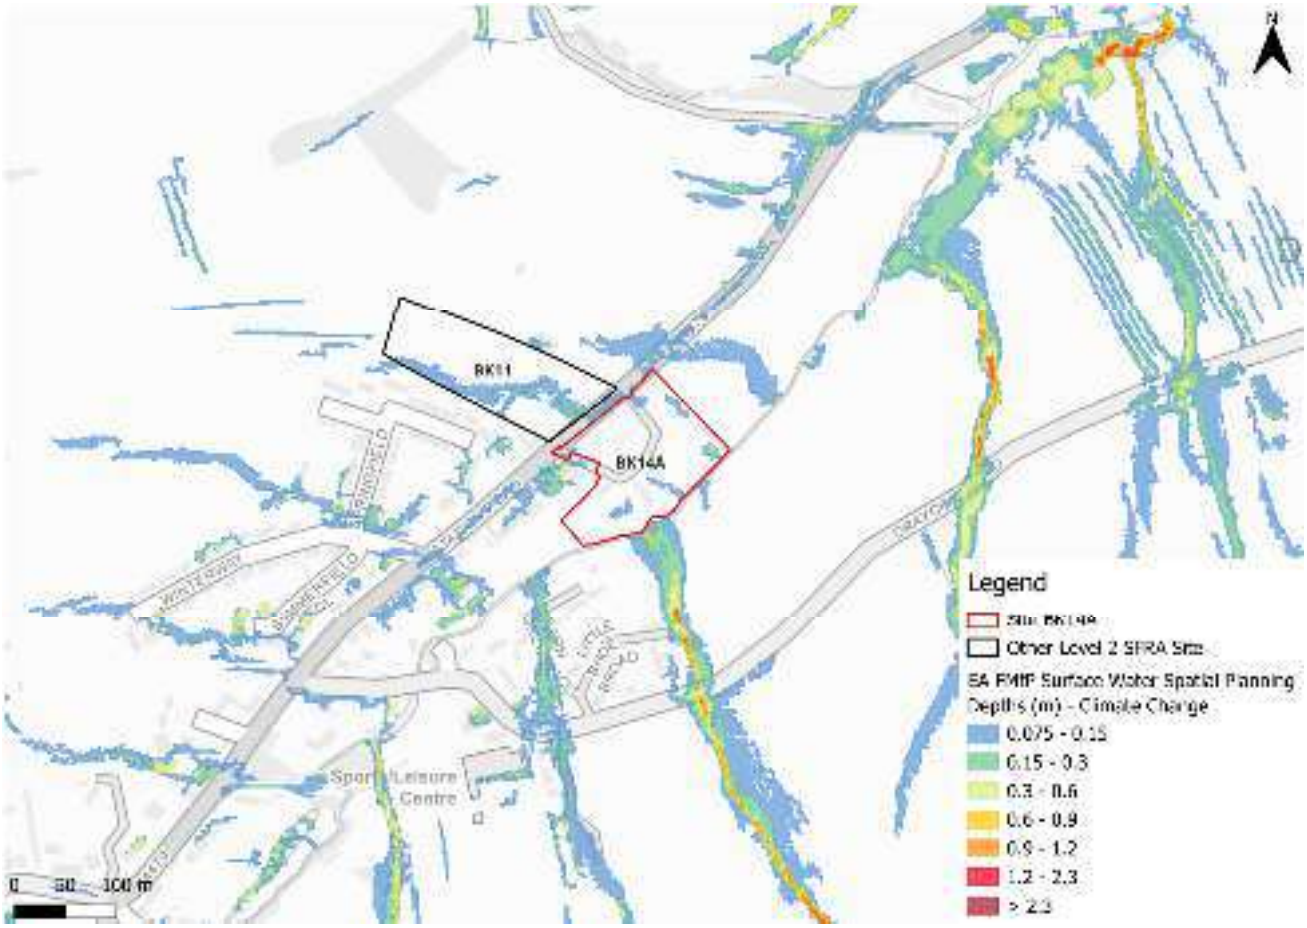

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 0.1% AEP event flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is mainly categorised as low, assuming the fluvial and surface water risk areas along Blockley Brook are included within the recommended blue green corridor (Figure 3-3).

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There is one recorded sewer flooding incidents within the Blockley Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 98% of the site being outside of the 0.1% AEP surface water flood extent.
- Risk to the site is shown to slightly increase in extent within the site when considering the impact of climate change.
- Topographic low spots and flow paths should be considered and included in site design and ideally left in place to flood naturally when required.
- The drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.
- Safe access and escape routes would likely be achievable via Station Road.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within one catchment, namely, the Blockley Bk - source to conf Knee Bk catchment. This catchment is ranked as a low sensitivity catchment. Planning considerations for all sites can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications. The site is at predominantly at high risk of groundwater emergence. There is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.

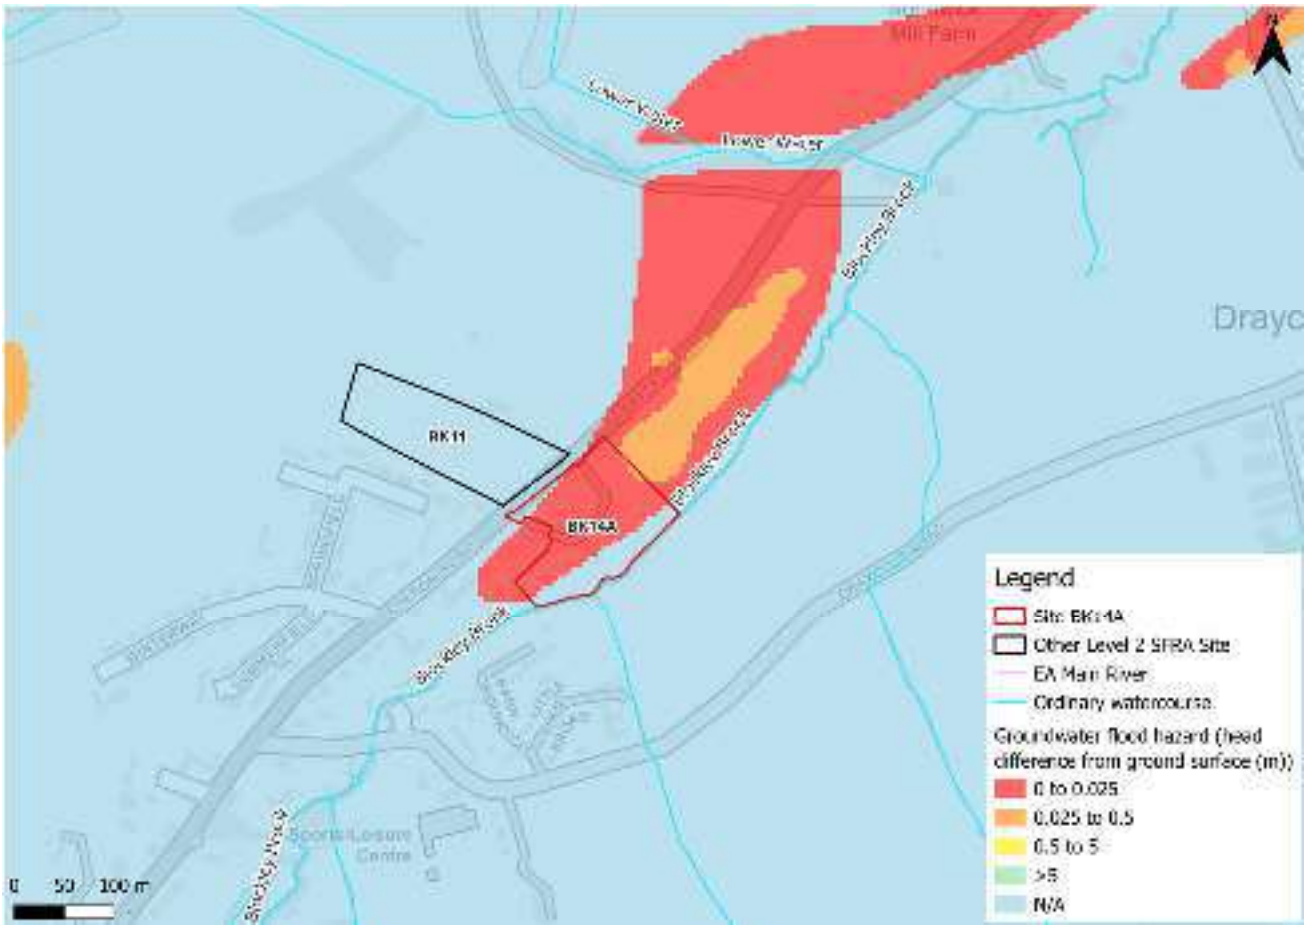

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is mudstone, siltstone, limestone and sandstone (Figure 5-2) which will have variable permeability and porosity. Based on the groundwater emergence map, infiltration SuDS at this site may not be an option, though the drainage strategy for the site should fully investigate water table levels through standpipe monitoring during the period of highest groundwater levels e.g. November to April.

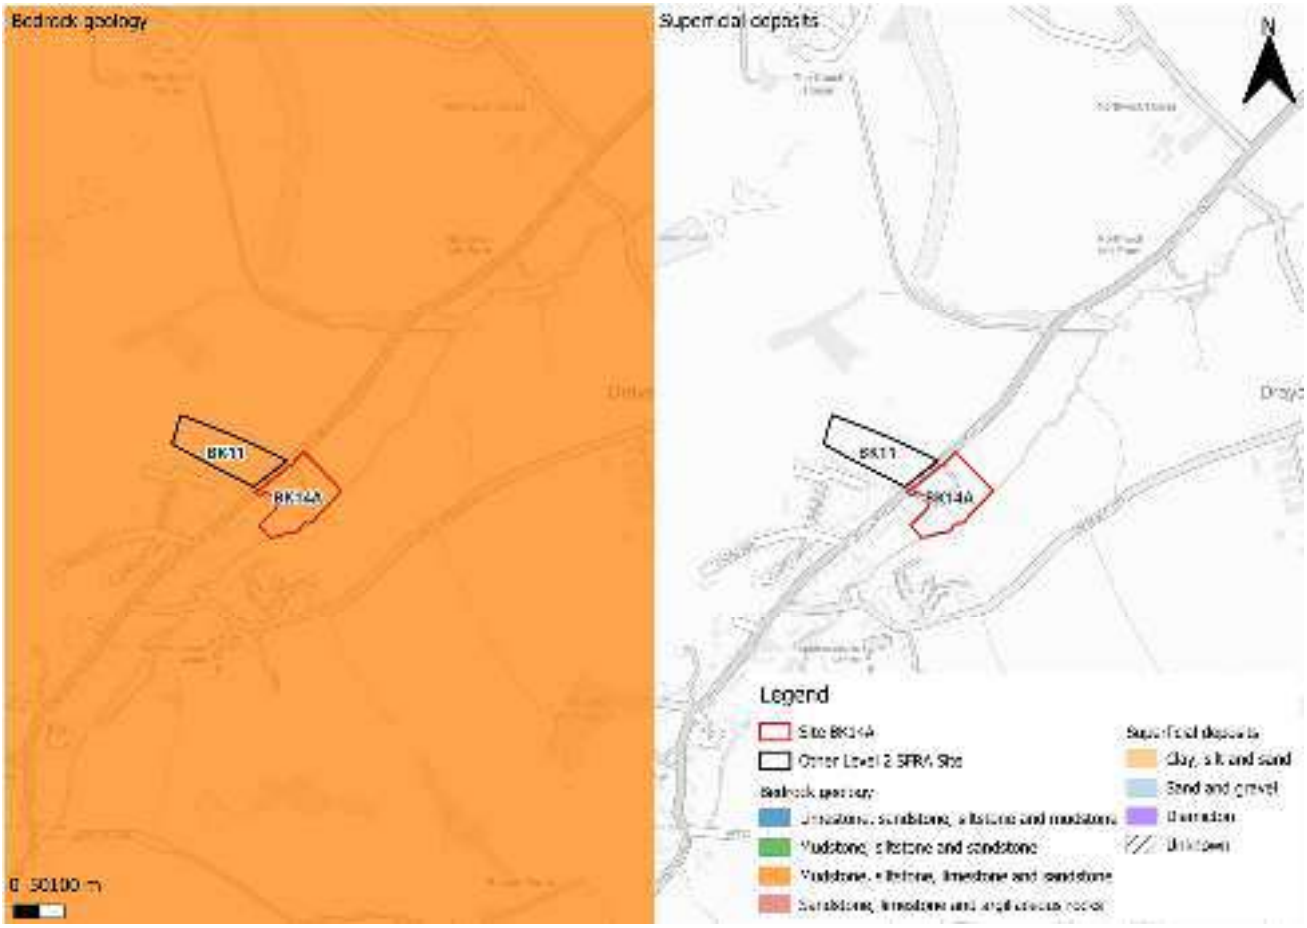

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There is no potential residual risk to the site.

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is required to pass part b) of the exception test as it is proposed for more vulnerable residential development and is partially located within Flood Zone 3a. The risk is confined to the floodplain of Blockley Brook along the southeastern boundary of the site, according to the Flood Map for Planning. It should be possible for this site to pass the Exception Test, based on current information, assuming the risk area of Blockley Brook can be incorporated into site design as a blue green corridor with no development.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- A no development buffer should be in place along the floodplain of Blockley Brook in the form of a blue green corridor, which can provide a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits.
- All development should be directed to Flood Zone 1 outside of the climate change risk area.
- However, the EA may expect detailed modelling of Blockley Brook to be carried out at the site-specific FRA stage to robustly inform on present day and future risk to the site.
- A drainage strategy should ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- Groundwater conditions must be investigated further through the site-specific FRA. This should be assessed through standpipe monitoring during the period of highest groundwater levels e.g. November to April.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for the strategic extension to the South and East of Moreton-in-Marsh site. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Strategic extension to the South and East of Moreton-in-Marsh

- Location: Moreton-in-Marsh
- Existing site use: Agricultural land and buildings
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential led mixed use
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 193.6
- Watercourse: River Evenlode, ordinary watercourses
- Environment Agency (EA) flood model: No detailed model available
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of fluvial flood depths, velocities and hazards (detailed modelling not available)
    - Assessment of surface water flood extents, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

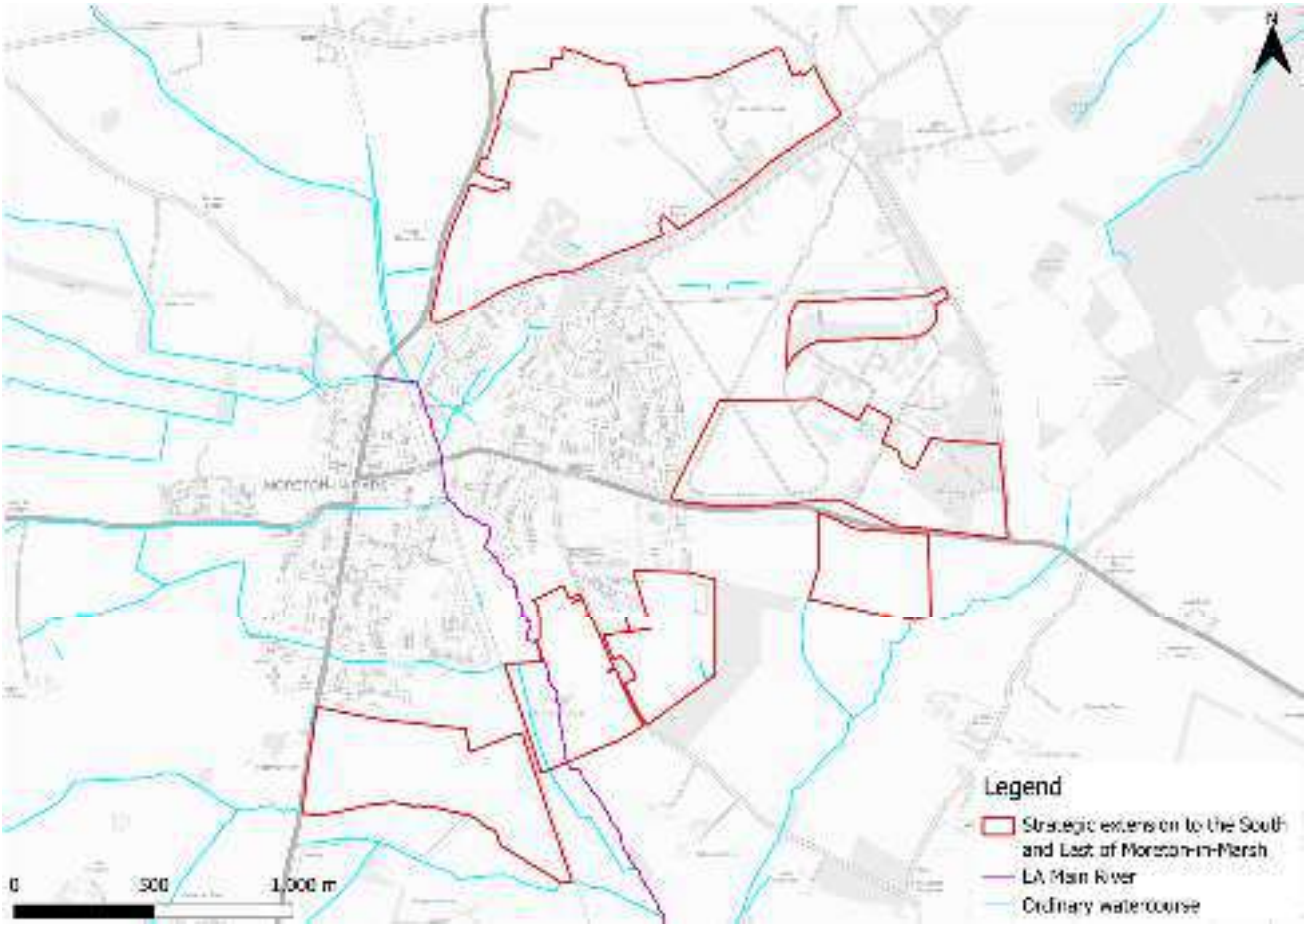

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

There are areas of higher elevation in the northern and eastern site parcels the land slopes down to Moreton-in-Marsh and the floodplains of the River Evenlode and its ordinary watercourse tributaries (Figure 1-3).

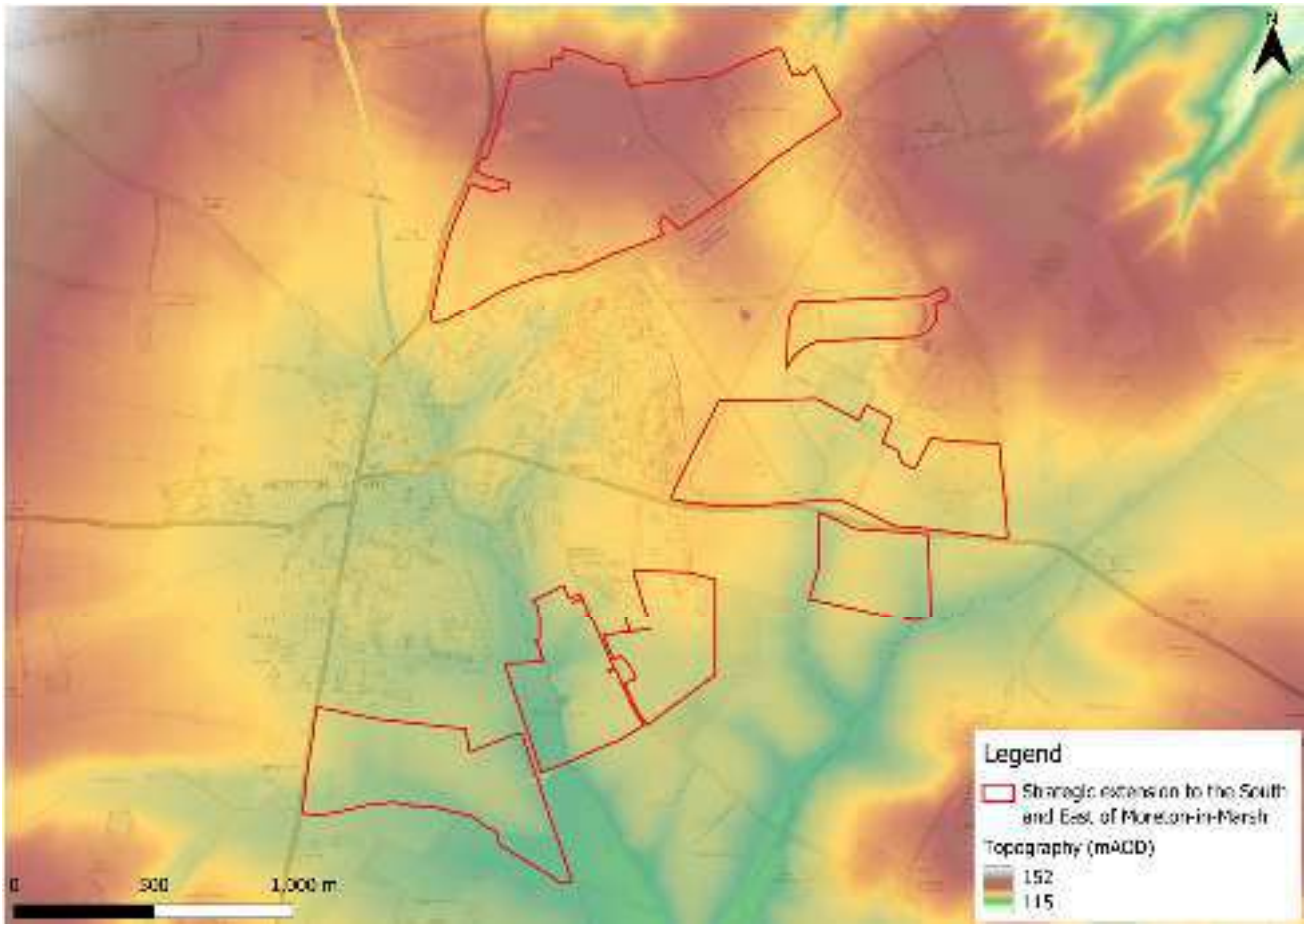

Figure 1-3: Topography

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, three of the seven parcels are shown to be at flood risk from rivers and can be viewed on Figure 2-1. As shown in Figure 2-1, one parcel has the River Evenlode flowing through it from north to south. The other two parcels at risk are at risk from unnamed tributaries to the Evenlode, one to the west and one to the east. Please note, the Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

All three at risk parcels have functional floodplain within them. The functional floodplain in this location for each watercourse is based on the EA's New National Model (NNM) dataset 'Rivers and Sea 3.3% defended flood risk extents - present day'. There should be no development within the functional floodplain.

The other site parcels are located wholly within Flood Zone 1 and therefore at low risk of flooding from rivers.

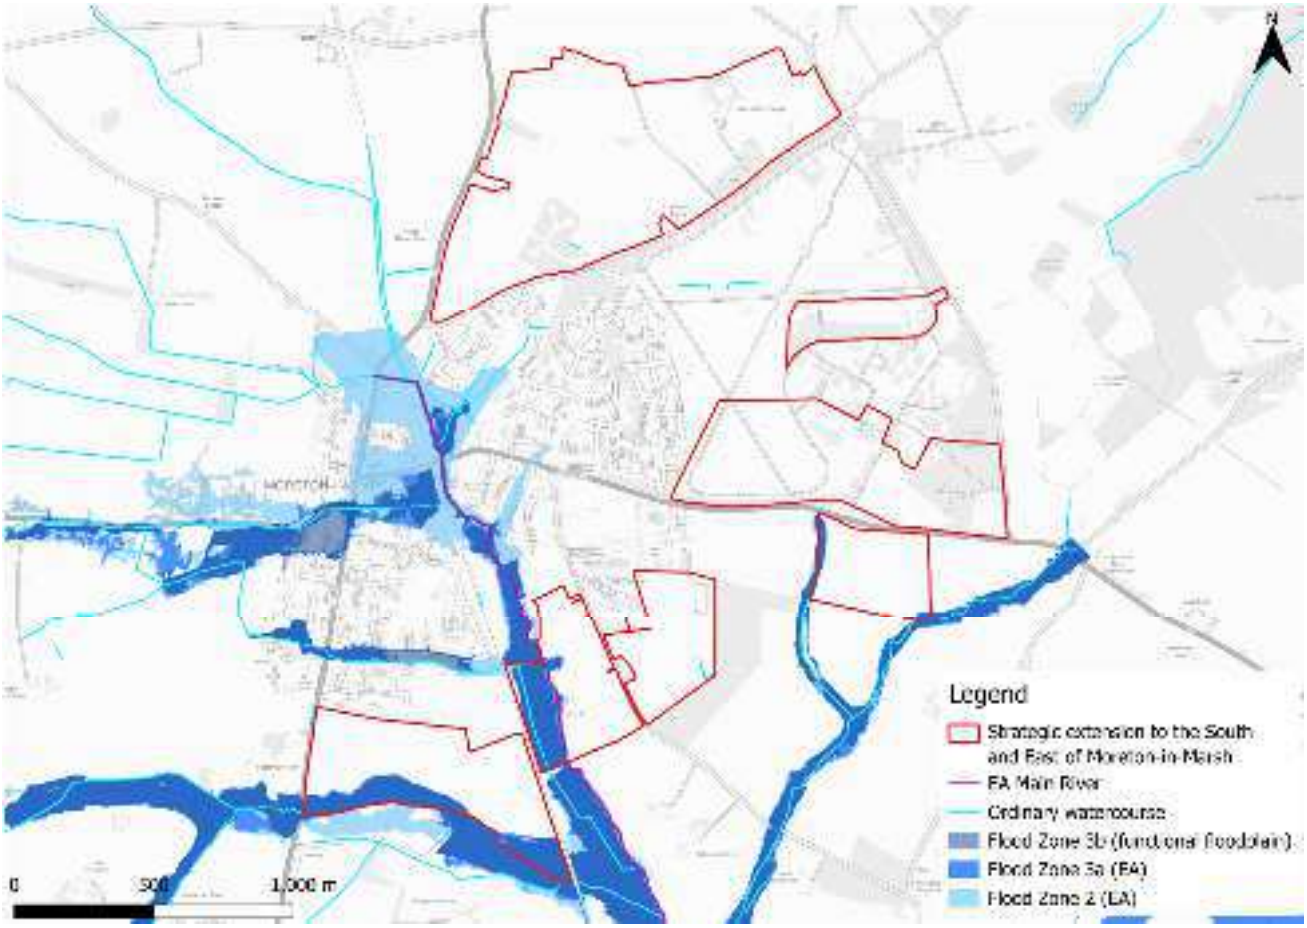

Figure 2-1: Present day risk

2.2 Impacts from climate change

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Cotswold Management Catchment. The central allowance within this catchment is 26% on peak flows (Table 2-1). There is no local detailed model for the River Evenlode or its tributaries, therefore the required event cannot be assessed.

Table 2-1: Modelled climate change allowances for peak river flows within the Cotswold Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	11	17	31
2050s	13	21	43
2080s	30	43	82

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Figure 2-2 shows the Flood Map for Planning - Flood Zones plus Climate Change dataset which includes the central allowance for the 2080s epoch. This represents the impact of climate change on Flood Zone 3a and Flood Zone 2 combined. This shows a slight increase in risk compared to present day though nothing significant.

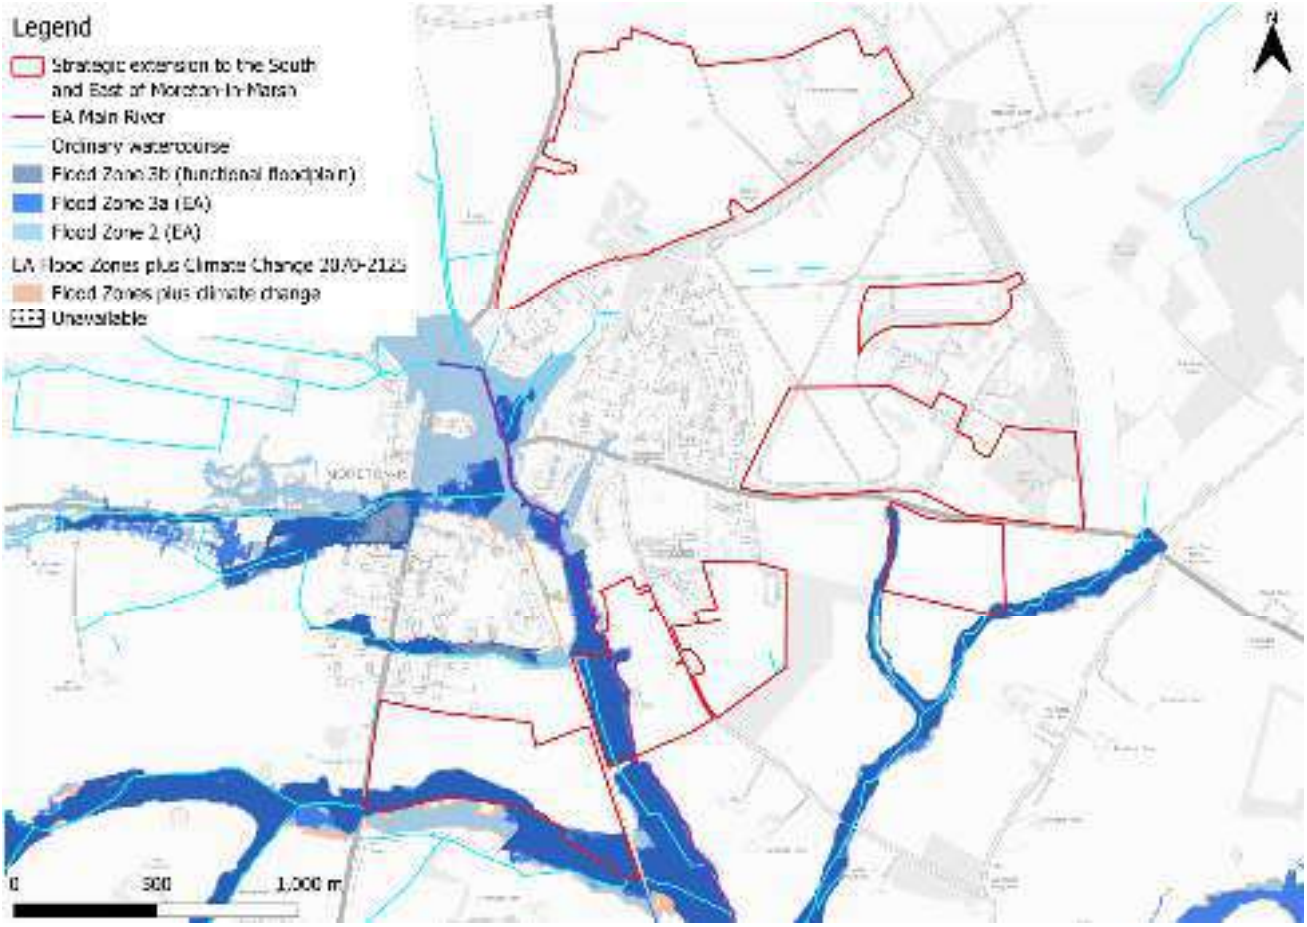

Figure 2-2: EA Flood Zones plus Climate Change

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. A large area of the centre of Morton-in-Marsh was flooded in 2007 due to channel exceedance of the River Evenlode and its tributaries (Figure 2-3).

The LLFA provided its historic floods register. There have been nine recorded flooding incidents within the Moreton West and East Wards within which the site parcels are located.

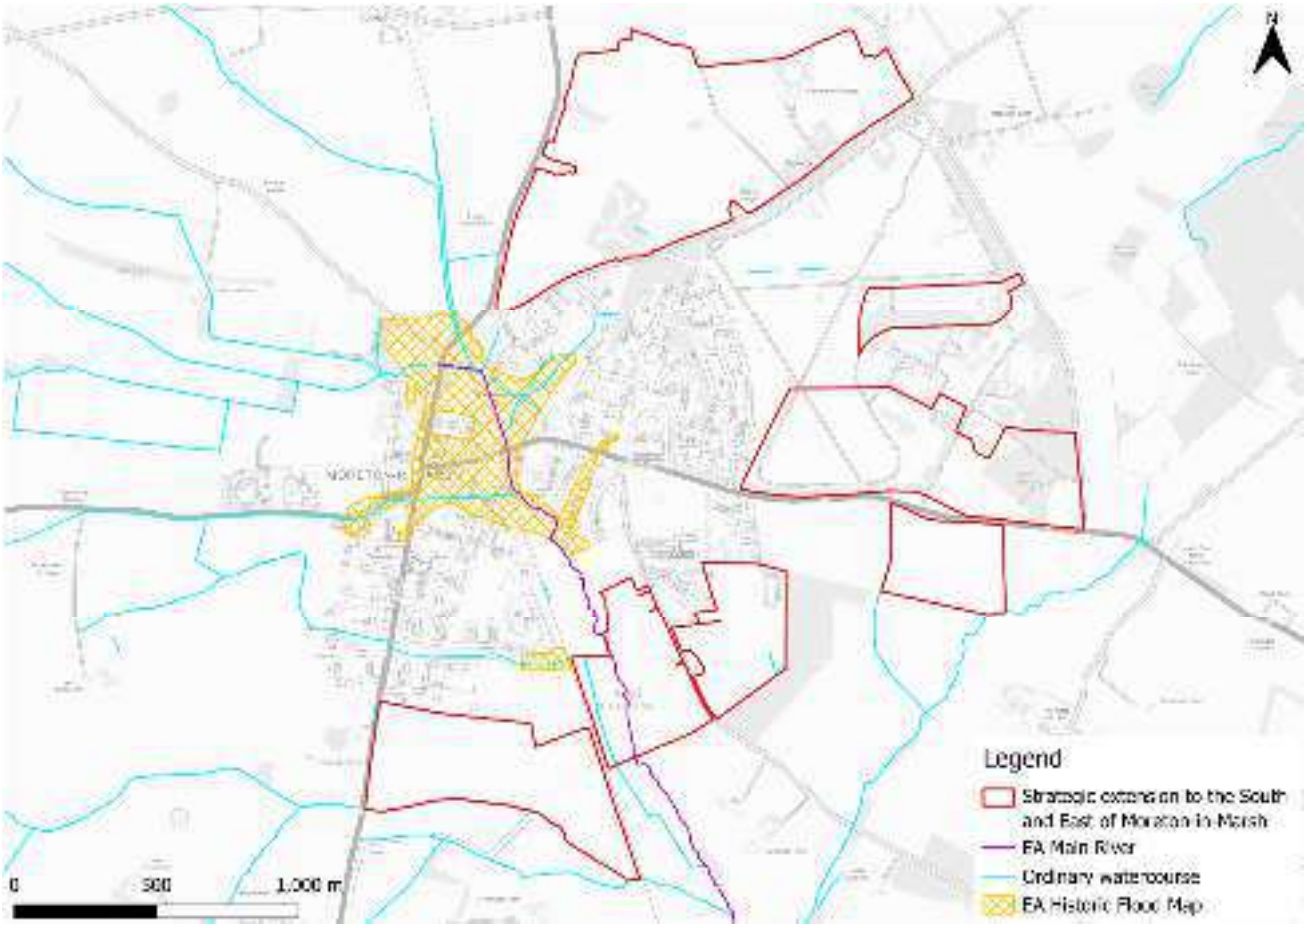

Figure 2-3: Historic flood events

2.4 Flood risk management

2.4.1 Flood defences

The site parcels do not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-4 shows that several site parcels and the surrounding watercourses in the wider area could benefit from riparian, floodplain, and wider catchment tree planting. Tree planting can help to slow the flow to benefit areas downstream. There is also potential for runoff attenuation features where it may be possible to temporarily store water and attenuate flooding during high flows, and floodplain reconnection. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

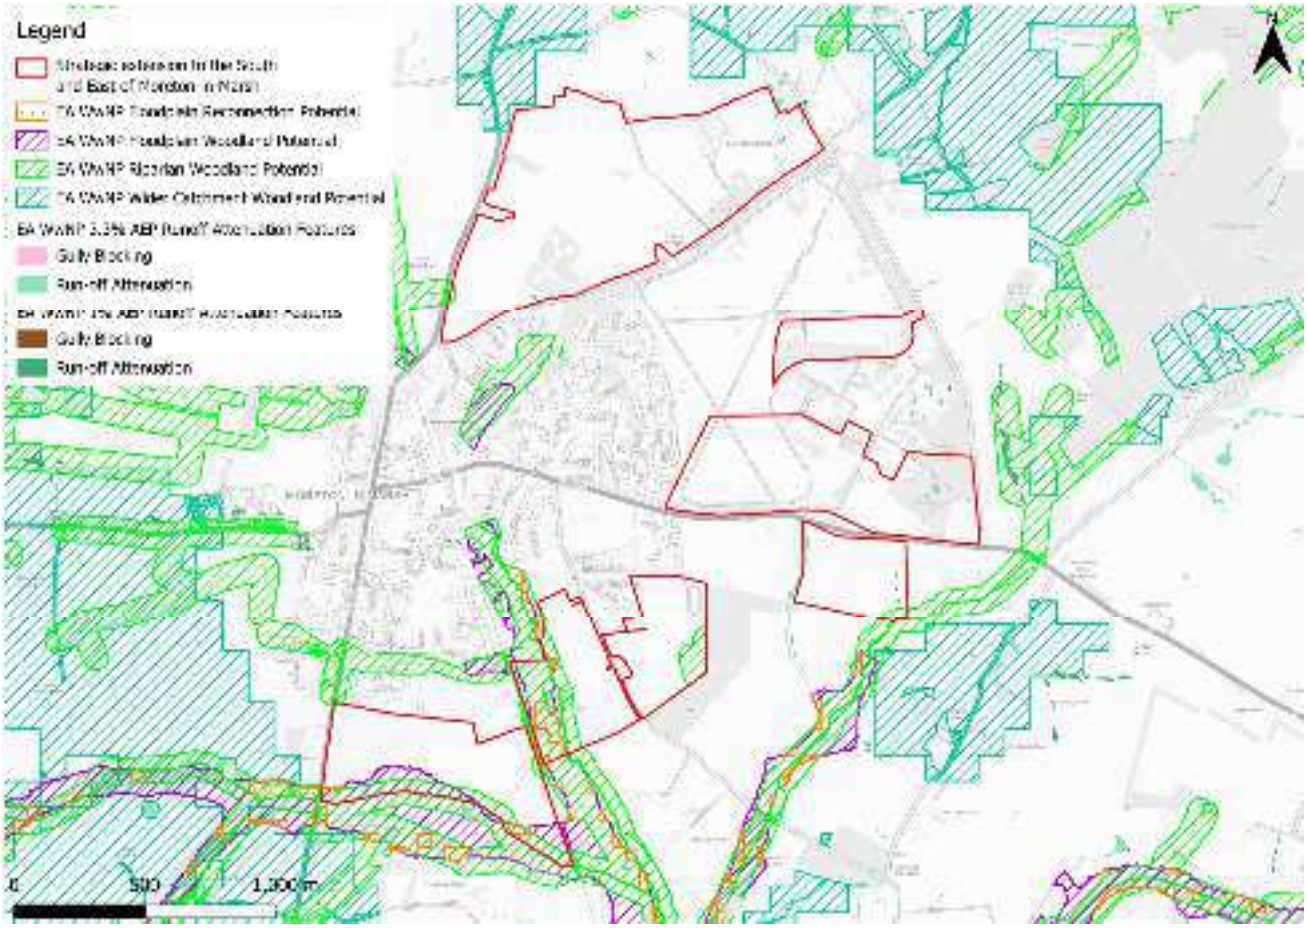

Figure 2-4: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warning and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The floodplain of the River Evenlode in Moreton-in-Marsh is within a FWA, namely the 'River Evenlode at Moreton in Marsh' FWA, as shown in Figure 2-5.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The floodplain of the River Evenlode in Moreton-in-Marsh and the watercourses to the south of the town are located within a FAA, namely the 'River Evenlode from Moreton in Marsh to Cassington and also the River Glyme at Wootton and Woodstock' FAA, as shown in Figure 2-5.

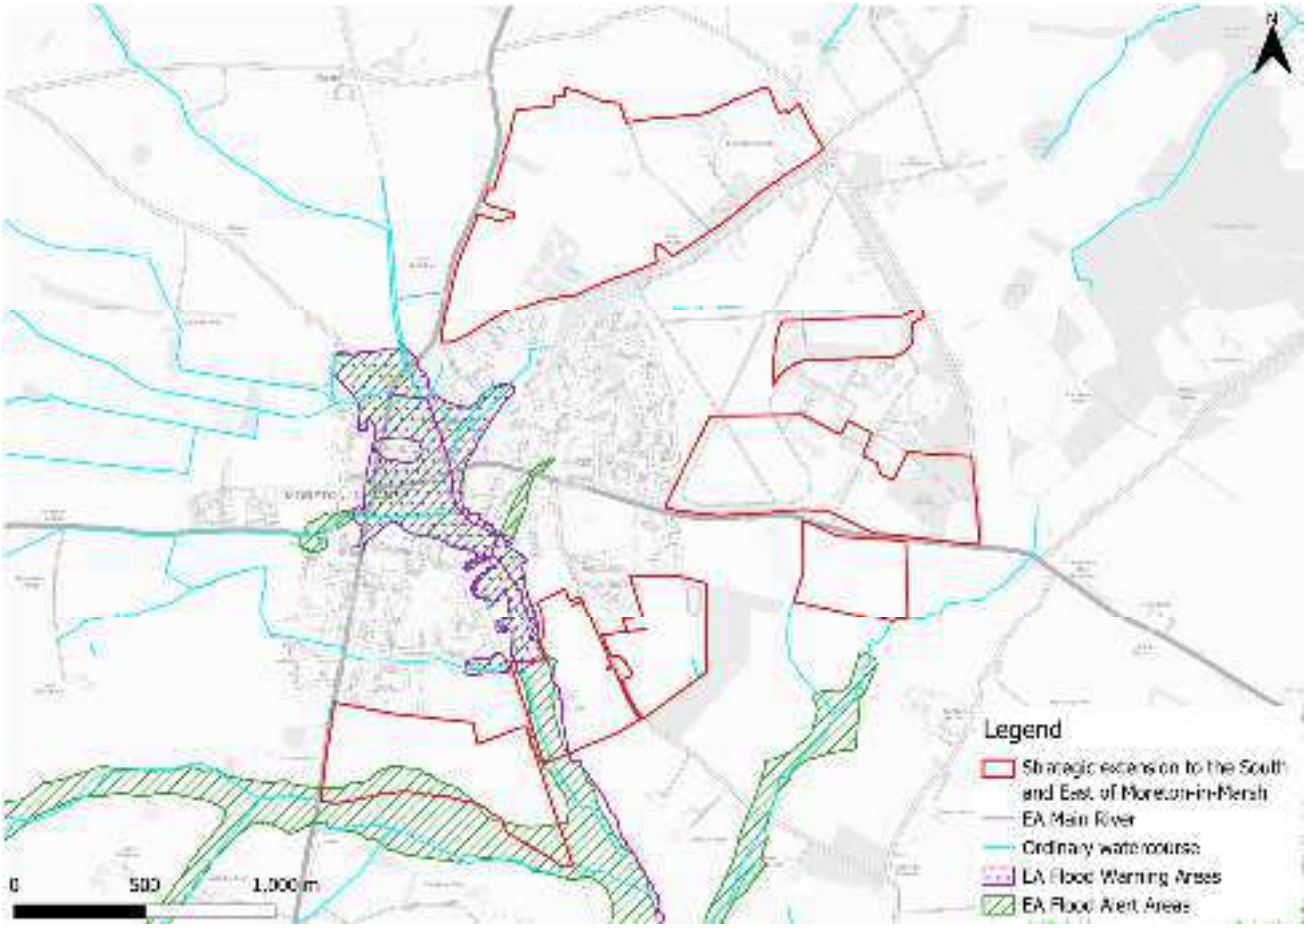

Figure 2-5: Flood warnings and alerts

2.5.2 Access and escape routes

Figure 2-6 shows the potential safe access and escape routes (orange circles) to and from the parcels at fluvial flood risk, based on the Flood Map for Planning.

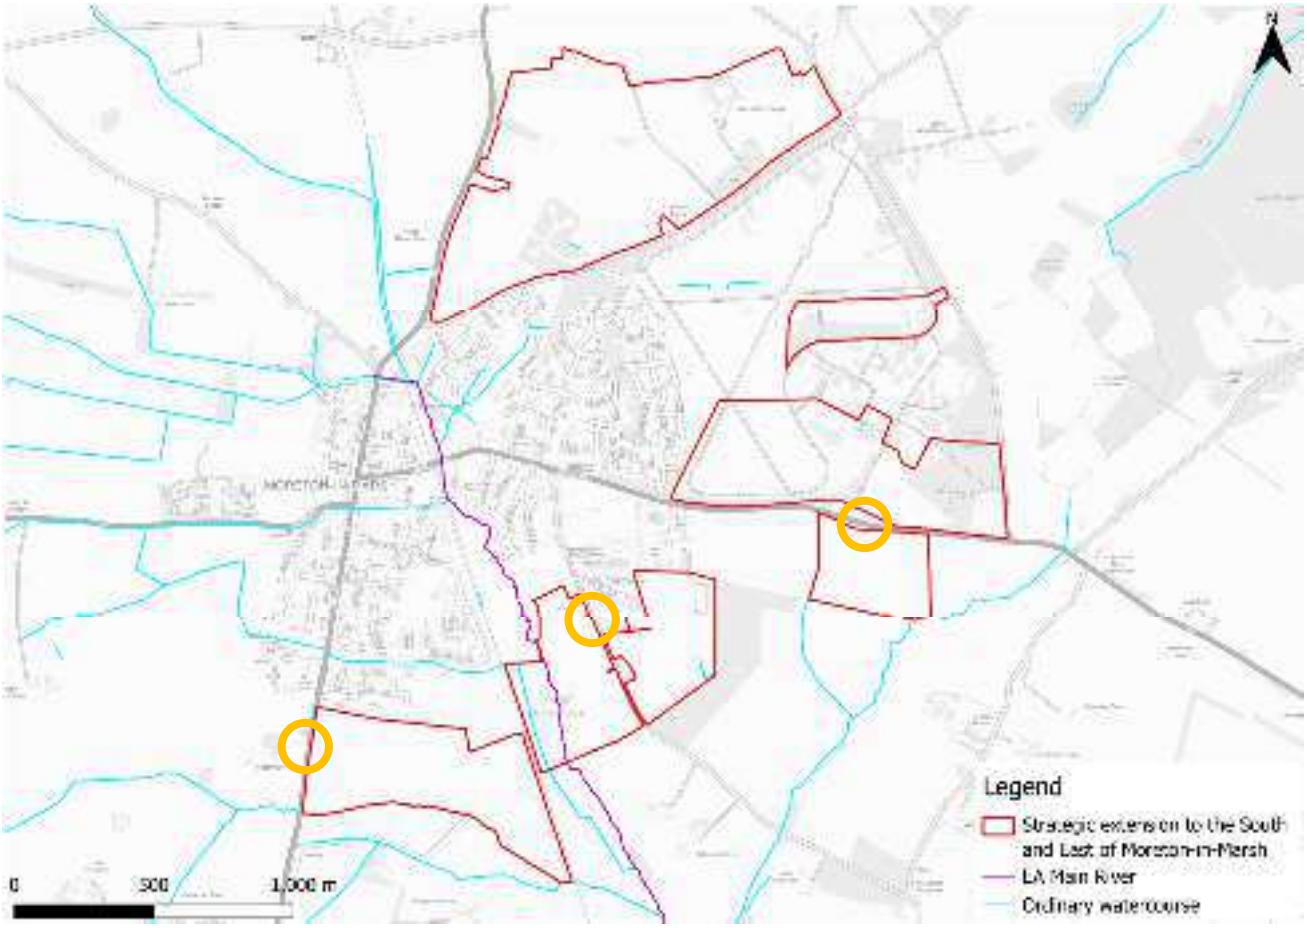

Figure 2-6: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - Four site parcels are wholly in Flood Zone 1 and not shown to be at additional risk from climate change. The areas of the site parcels within the functional floodplain should not be developed and should remain as open greenspace. Ideally, all built development would be directed to Flood Zone 1 whilst also accounting for the impacts of climate change. This means there should be no development to the west of the River Evenlode in the parcel through which the Evenlode flows.
  - There is no current detailed model available for this reach of the River Evenlode and its tributaries. The EA's NNM is therefore considered to be the most up to date information on fluvial risk to the site parcels and surrounding areas. The NNM does not contain depth or hazard information, therefore risk cannot be robustly defined at this stage.
- Mitigation:

- All risk areas should remain as open green space, providing a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits.
- The EA may request for the development of a detailed flood model of the River Evenlode and its tributaries at the FRA stage to robustly define risk to the site parcels and the surrounding areas.
- EA flood warnings and alerts should continue to be in place to ensure early evacuation of site users before an extreme flood event occurs.

- Access and escape:
  - Based on current information, safe access and escape routes appear achievable via several locations at each parcel.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents map (May 2026), the site parcels are predominantly at low risk of surface water flooding as shown in Figure 3-1. There are various flow paths and areas of ponding present throughout each site parcel. Greatest surface water flood depths in the 1% AEP event vary across each parcel (Figure 3-2).

Safe access and escape routes are achievable via multiple locations at each site parcel.

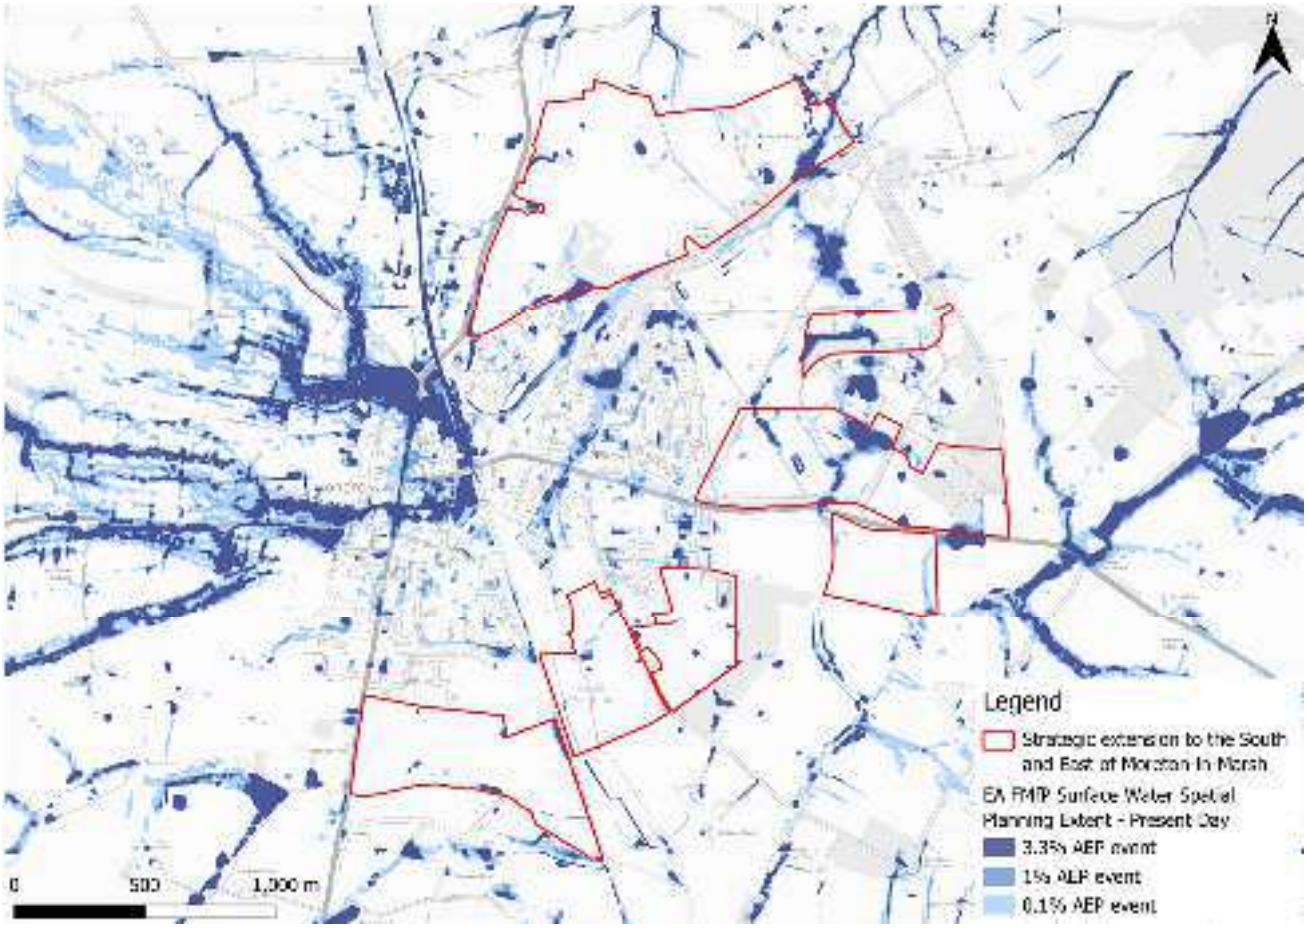

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

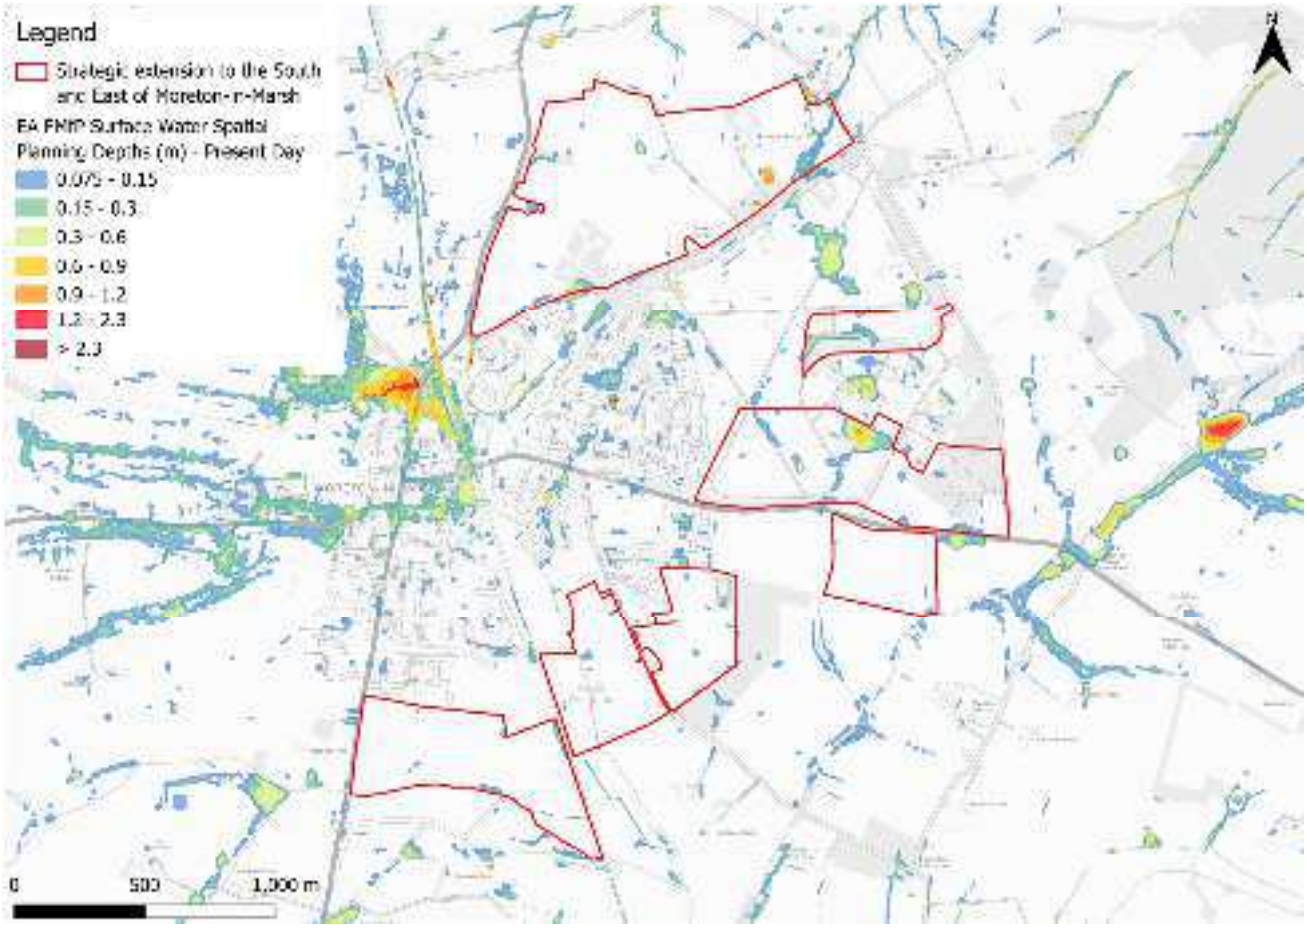

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW hazard map mainly shows 'low' to 'moderate' flood hazards across the at risk parcels (Figure 3-3). There are clearly differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping whereby the RoFSW shows a much larger area to be at risk. Given the differences between the two datasets, the hazard information should be discounted and assessed further at the FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

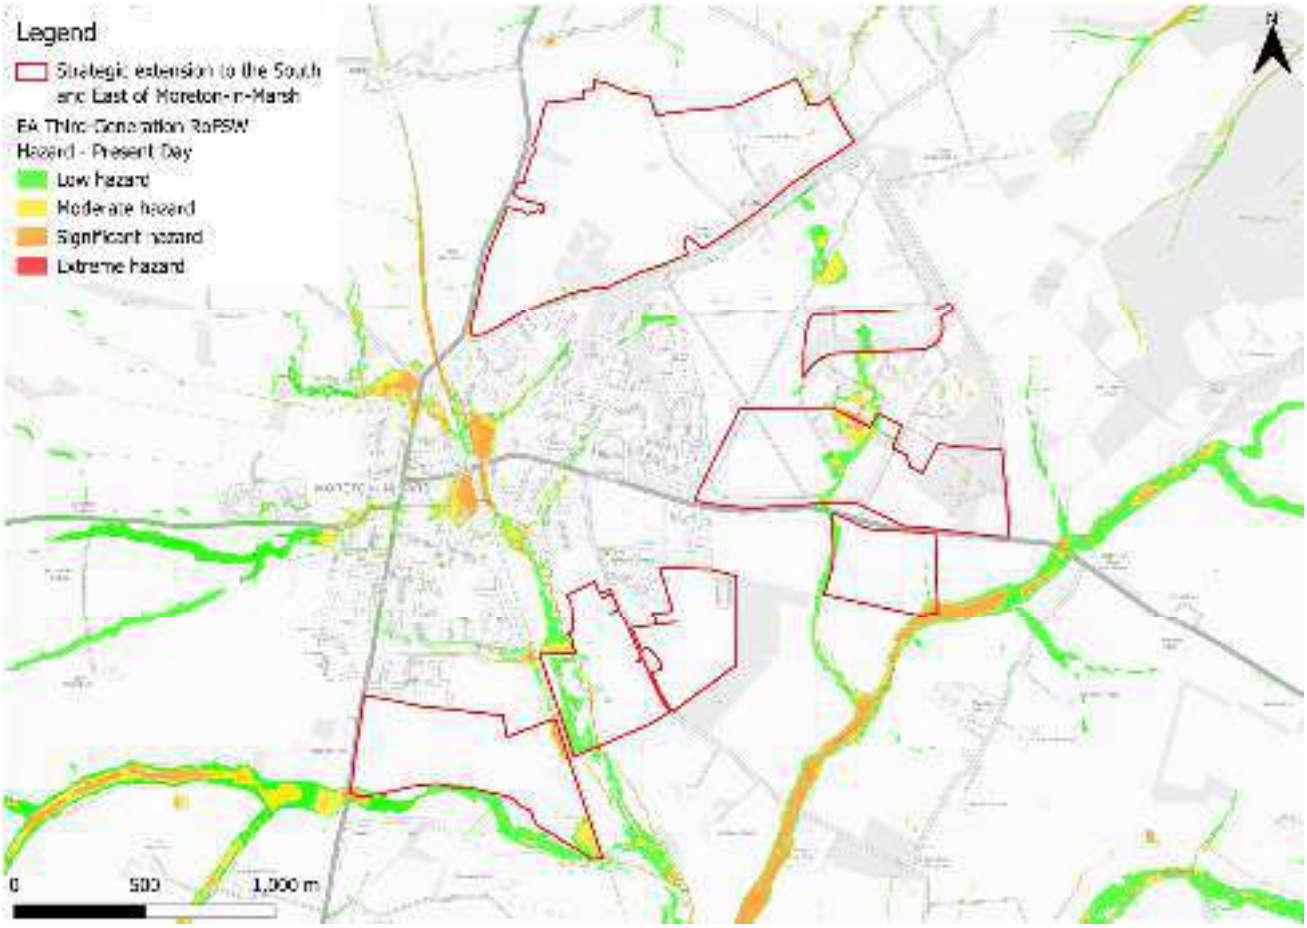

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day 1% AEP event surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Cotswolds management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-1: Peak rainfall intensity allowances for the Cotswolds Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. Risk is not shown to be significantly greater with climate change. However, the existing town does appear to be at greater risk in the future. Flood depths are shown to increase with climate change (Figure 3-5).

Safe access and escape routes would likely remain achievable via the same locations.

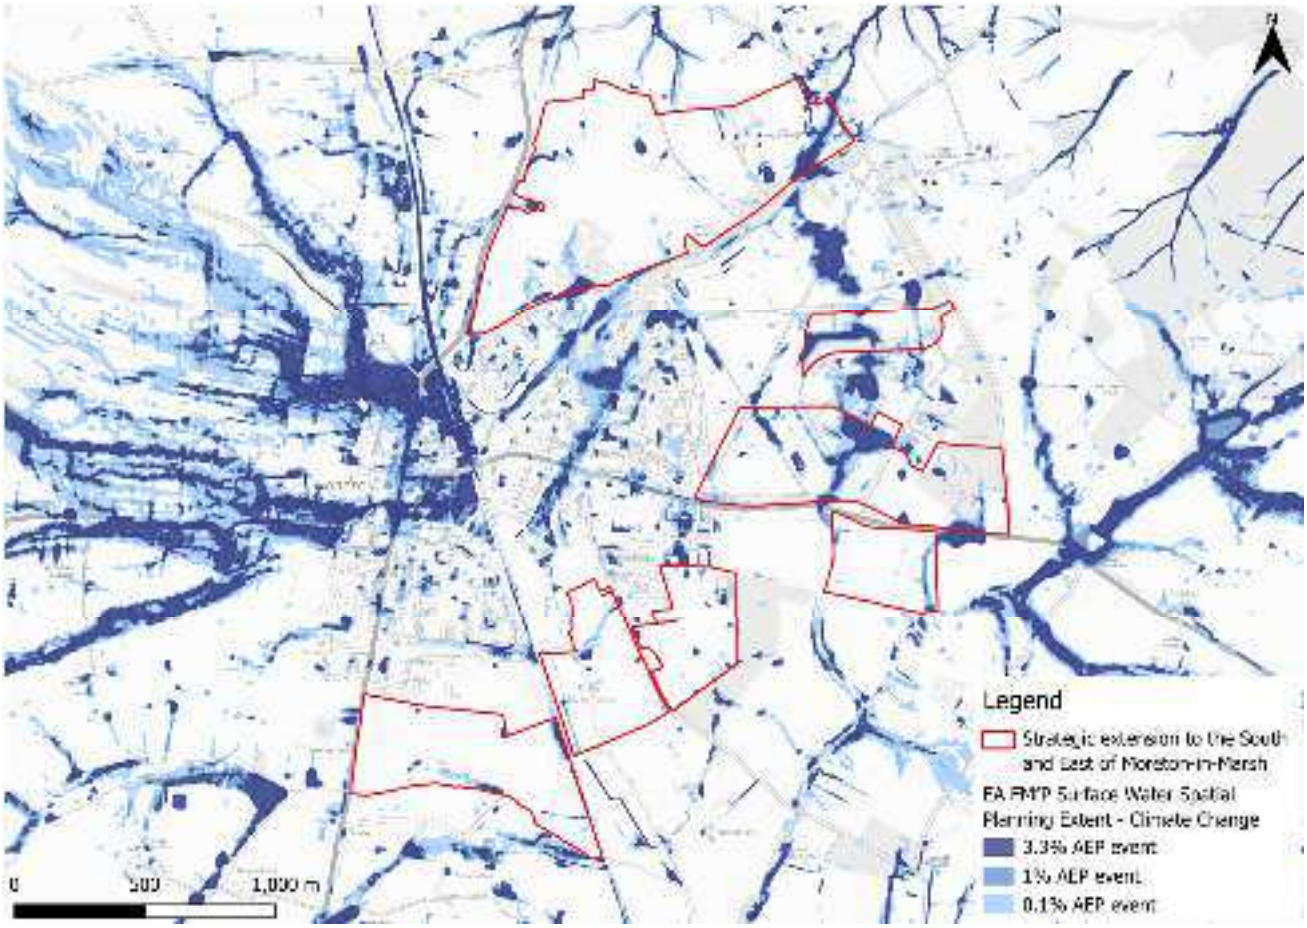

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

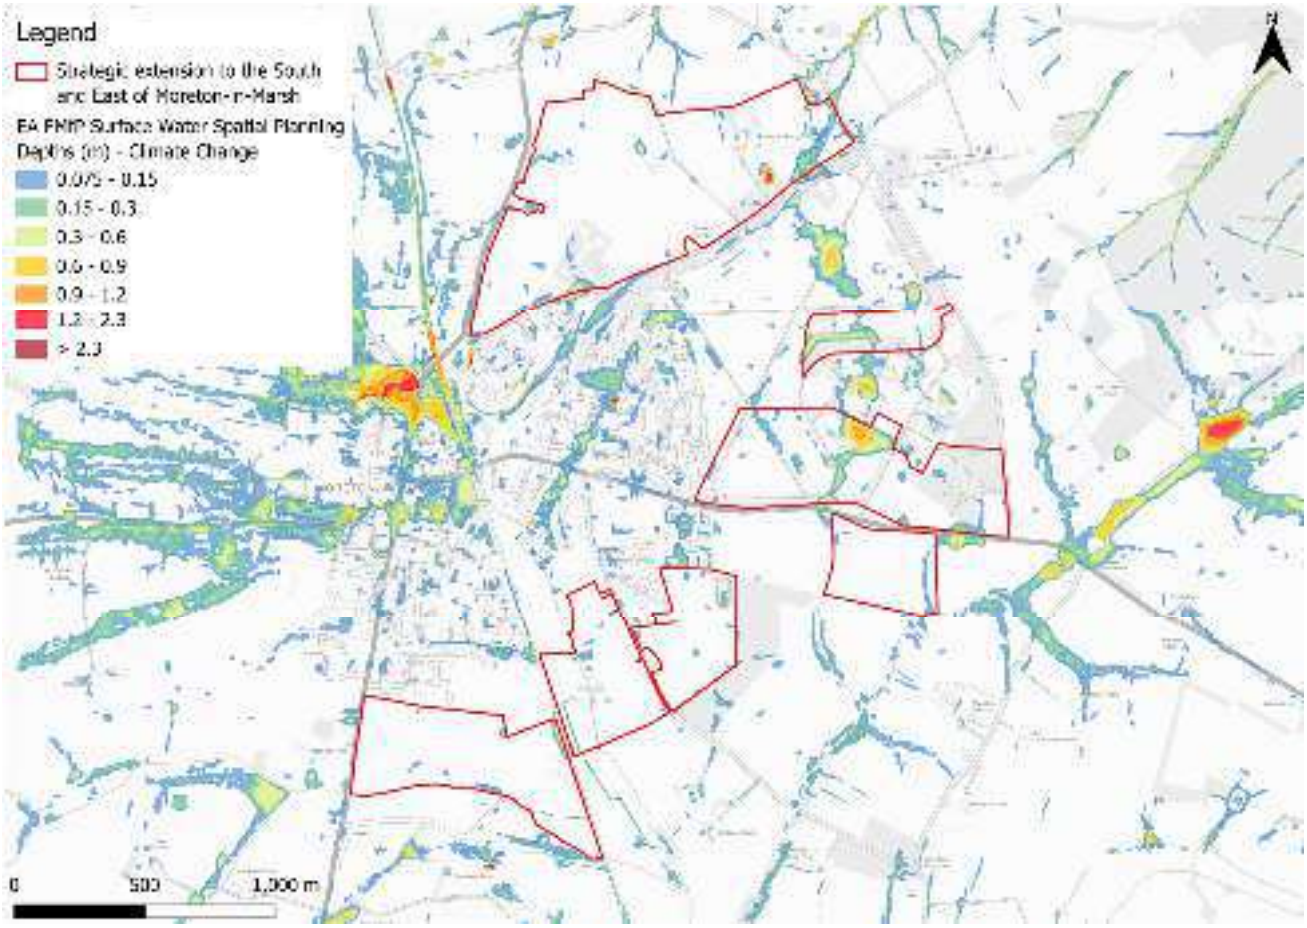

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event surface water flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning climate change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the RoFSW 0.1% AEP surface water event as a conservative proxy for the RoFSW 1% AEP event plus climate change, as the best available information to assess surface water flood hazards (Figure 3-6). However, given the differences between the two datasets, the hazard information should be discounted and assessed further at the FRA stage.

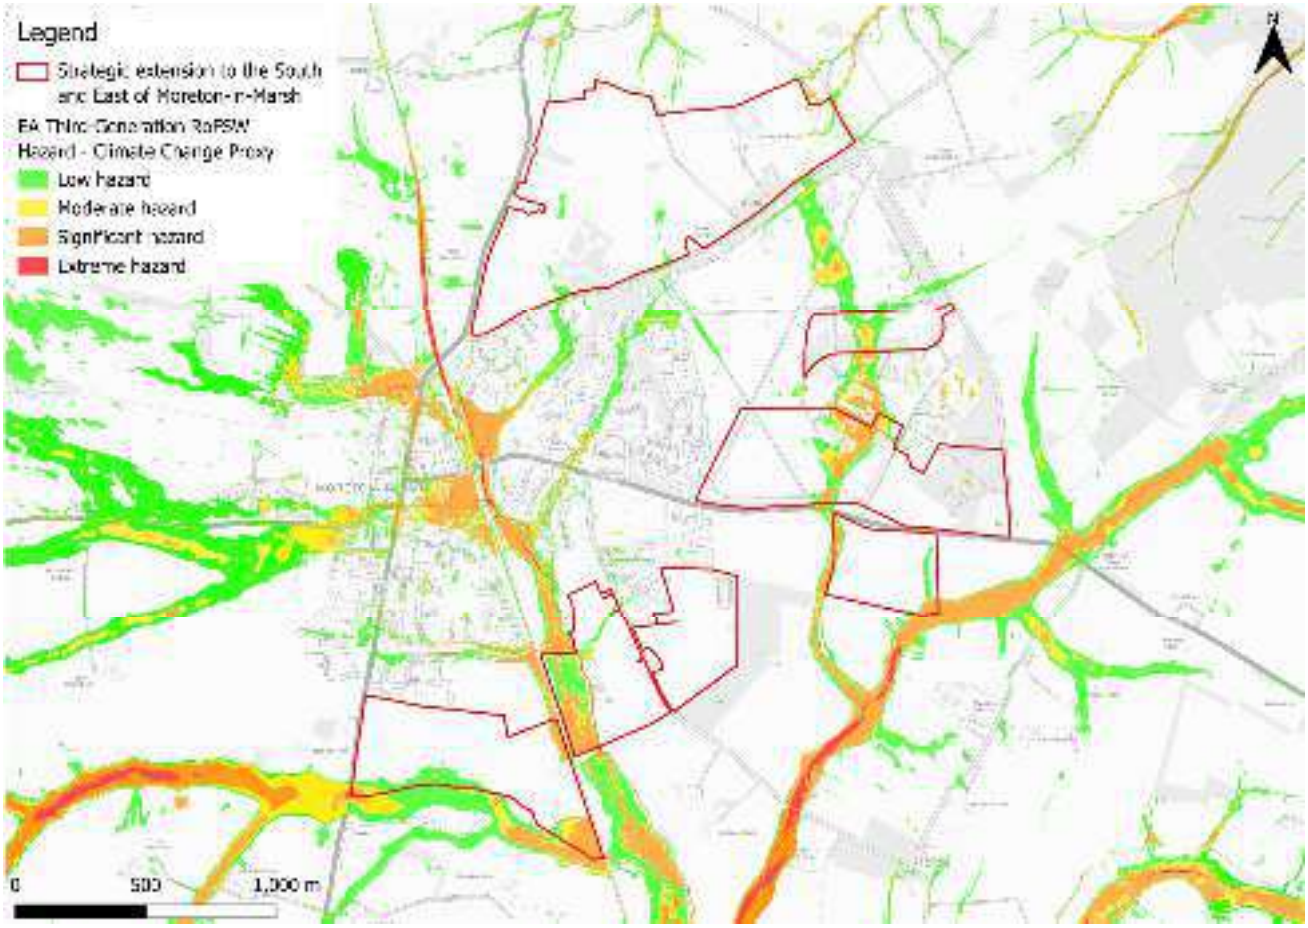

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day 0.1% AEP event surface water flood hazard as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There are 17 recorded sewer flooding incidents nearby the site nor within the Moreton West and East Wards.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site parcels is predominantly low, with small areas of ponding and flow paths within each parcel.
- Topographic low spots and flow paths should be considered and included in site design and ideally left in place to flood naturally when required.
- The drainage strategy for each site parcel must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.
- Safe access and escape routes would likely be achievable via multiple locations when considering surface water risk.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. The site parcels to the north and south of the town are mainly located within a high sensitivity catchment, namely, the Evenlode (Source to Four Shires S) and Longborough Stream catchment. The eastern site parcels are within a low sensitivity catchment, namely the Evenlode (Compton Bk to Bledington Bk) and 4 Shires catchment. Planning considerations for sites at high and low sensitivity to the cumulative impacts of development can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications.

The risk of groundwater emergence is significant across the site parcels and the wider area. Across the majority, there is a risk of groundwater emergence to both surface and subsurface assets. In some areas, groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.

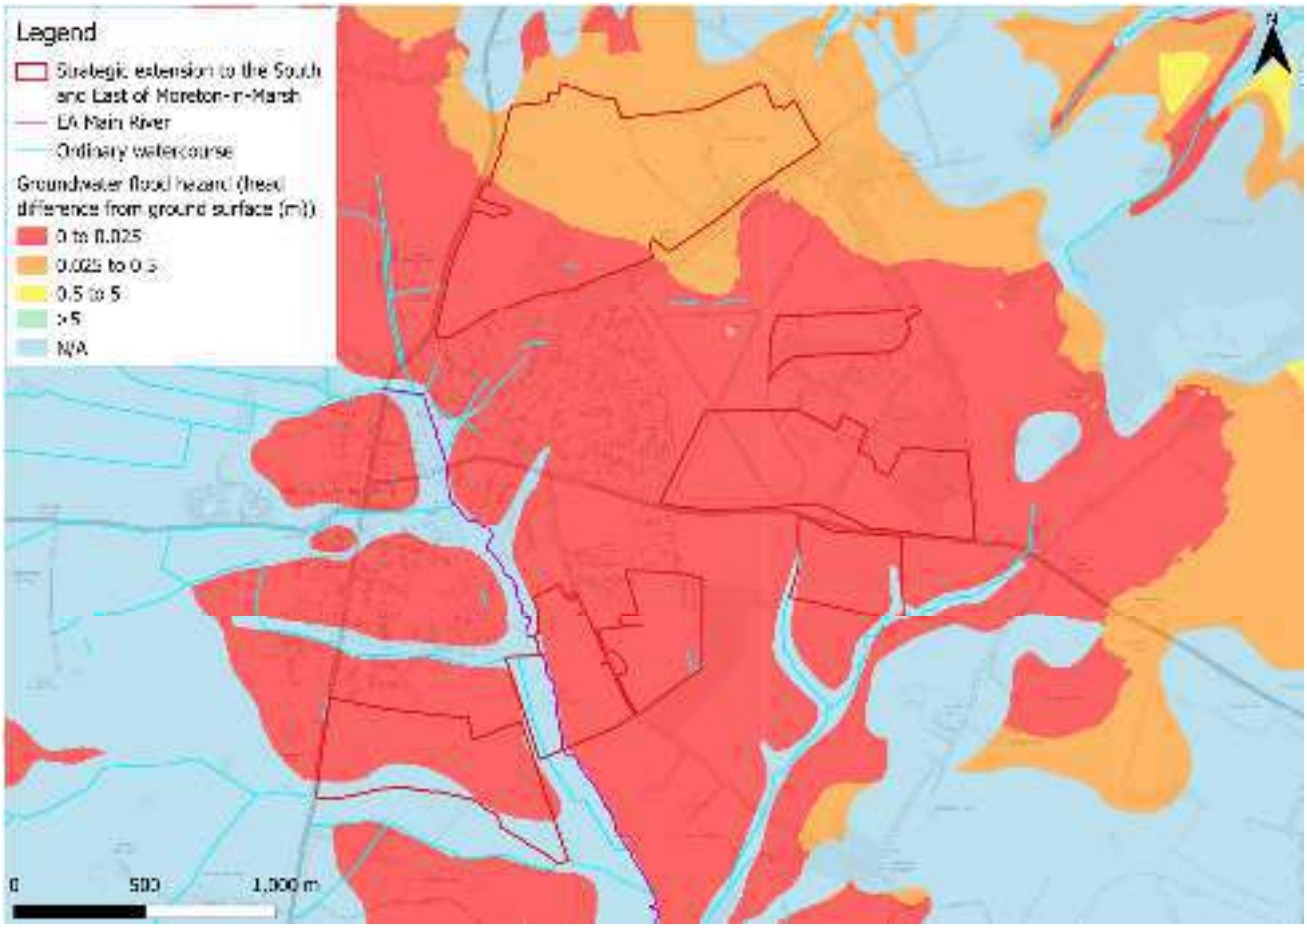

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is mudstone, siltstone, and sandstone (Figure 5-2). Mudstone and siltstone generally have a low permeability and low level of porosity, reducing infiltration rates. Superficial deposits include diamicton which also has low to very low permeability. Based on the groundwater emergence mapping and the underlying geology, infiltration SuDS at this site may not be an option, though the drainage strategy for the site should fully investigate water table levels through standpipe monitoring during the period of highest groundwater levels e.g. November to April.

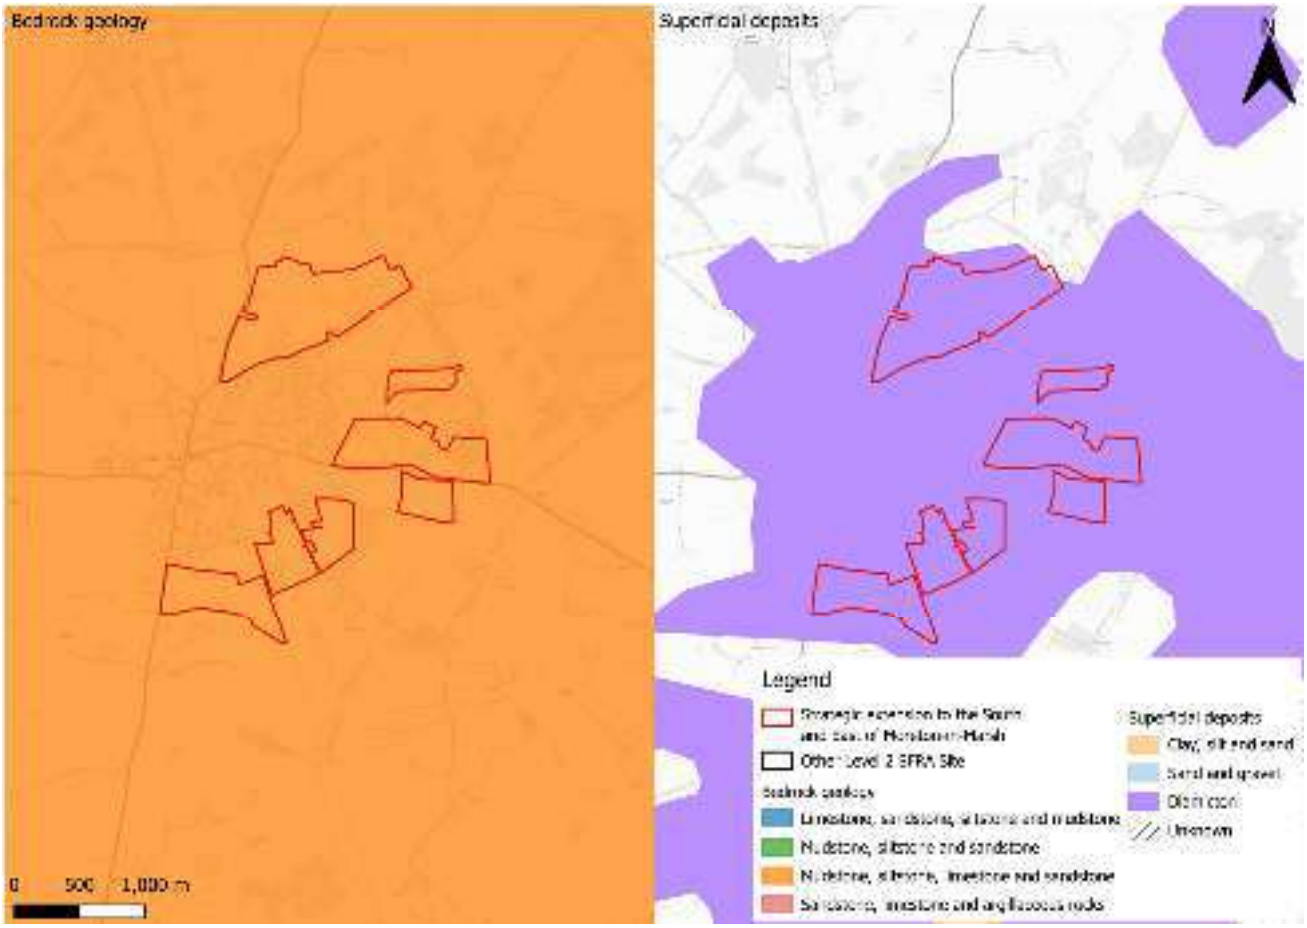

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There are no defences in place along the River Evenlode, nor its tributaries in this area. A ordinary watercourse is culverted under the railway line at the far southern boundary of the most southern site parcel. The culvert location is indicted by the green circle on Figure 6-1. There is a potential residual risk of a blockage of this culvert. This risk should be investigated at the site-specific FRA stage.

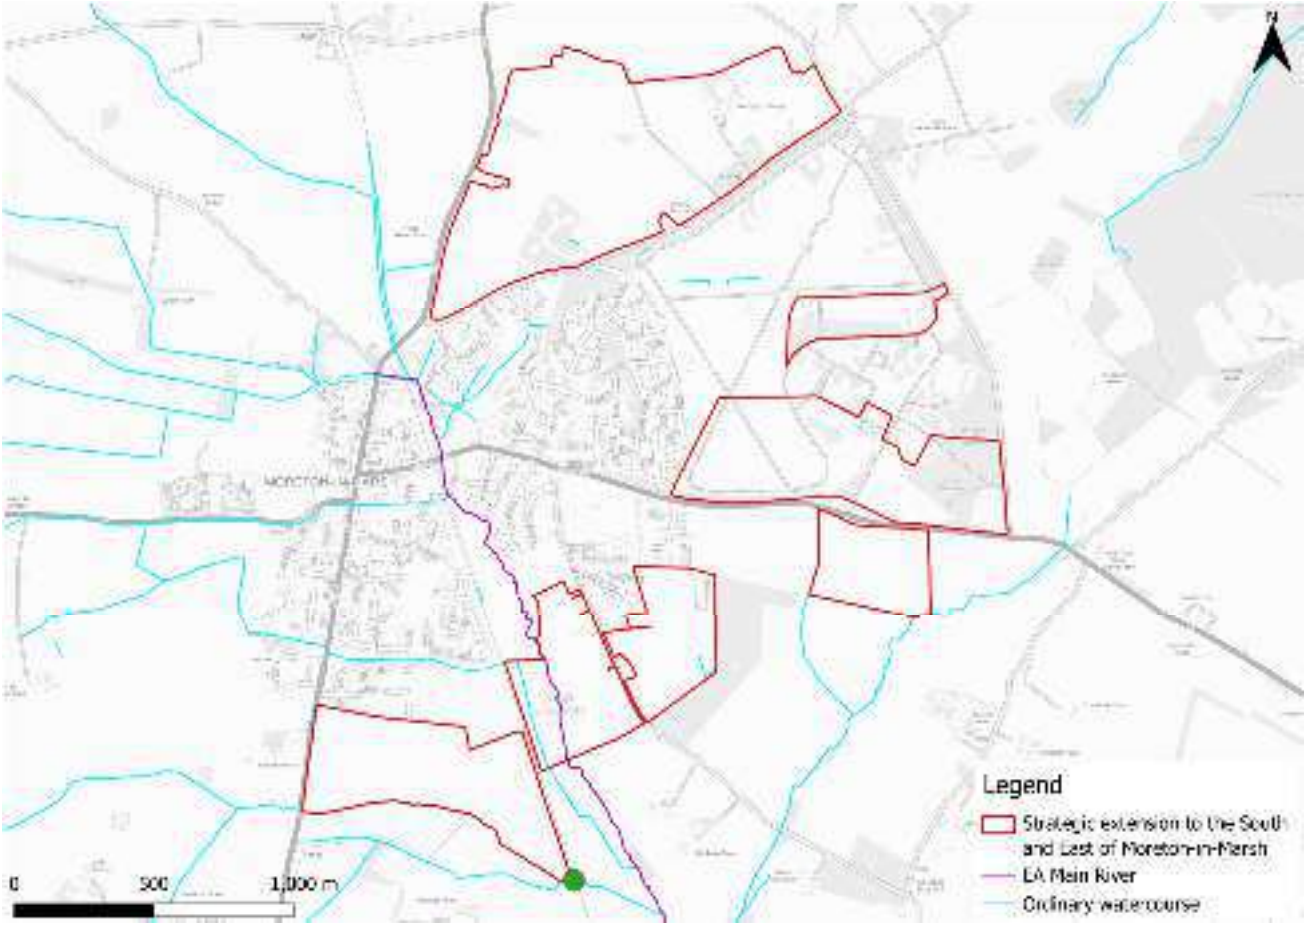

Figure 6-1: Potential blockage location

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

The site parcels at fluvial flood risk are required to pass part b) of the exception test, if more vulnerable development is proposed, as each site is partially located within Flood Zone 3a. Each parcel would likely pass the Exception Test given fluvial risk is confined to the floodplains of each watercourse, leaving larger areas of each parcel within Flood Zone 1. However, the EA may request for detailed modelling of the watercourses at the FRA stage which inform reapplication of the Exception Test.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be possible to develop these site parcels, given the large areas of Flood Zone 1 and nominal additional risk from climate change.
- There should be no development within the areas of functional floodplain. It should be possible to safeguard all areas at fluvial risk for flood storage whilst still enabling development in Flood Zone 1. The risk areas should remain as open space offering multifunctional benefits alongside flood risk mitigation including BNG contributions, and social and amenity benefits.
- Drainage strategies will be required for each site parcel. Each strategy should ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- Given the significant risk to the existing town, it may be beneficial to carry out a wider Surface Water Management Plan for the town and proposed development areas.
- Groundwater conditions must be investigated further through the site-specific FRA. This should be assessed through standpipe monitoring during the period of highest groundwater levels e.g. November to April.
- Safe access and escape routes appear achievable from each site parcel.
- Potential residual risk from the railway culvert to the southern site parcel should be assessed at the FRA stage.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WCAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

JBA Project Manager	Mike Williamson
Address	Phoenix House, Lakeside Drive, Centre Park, Warrington, WA1 1RX
JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Joanne Corbett of Cotswold District Council. Laura Thompson of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken between June and July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site M28B. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site M28B

- Location: Land west of Aldi
- Existing site use: Open greenspace, current access road
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 1.03
- Watercourse: Unnamed ordinary watercourse, tributary of River Evenlode
- Environment Agency (EA) flood model: N/A
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of fluvial flood extents (depths, velocities and hazards unavailable)
    - Assessment of surface water flood extent, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

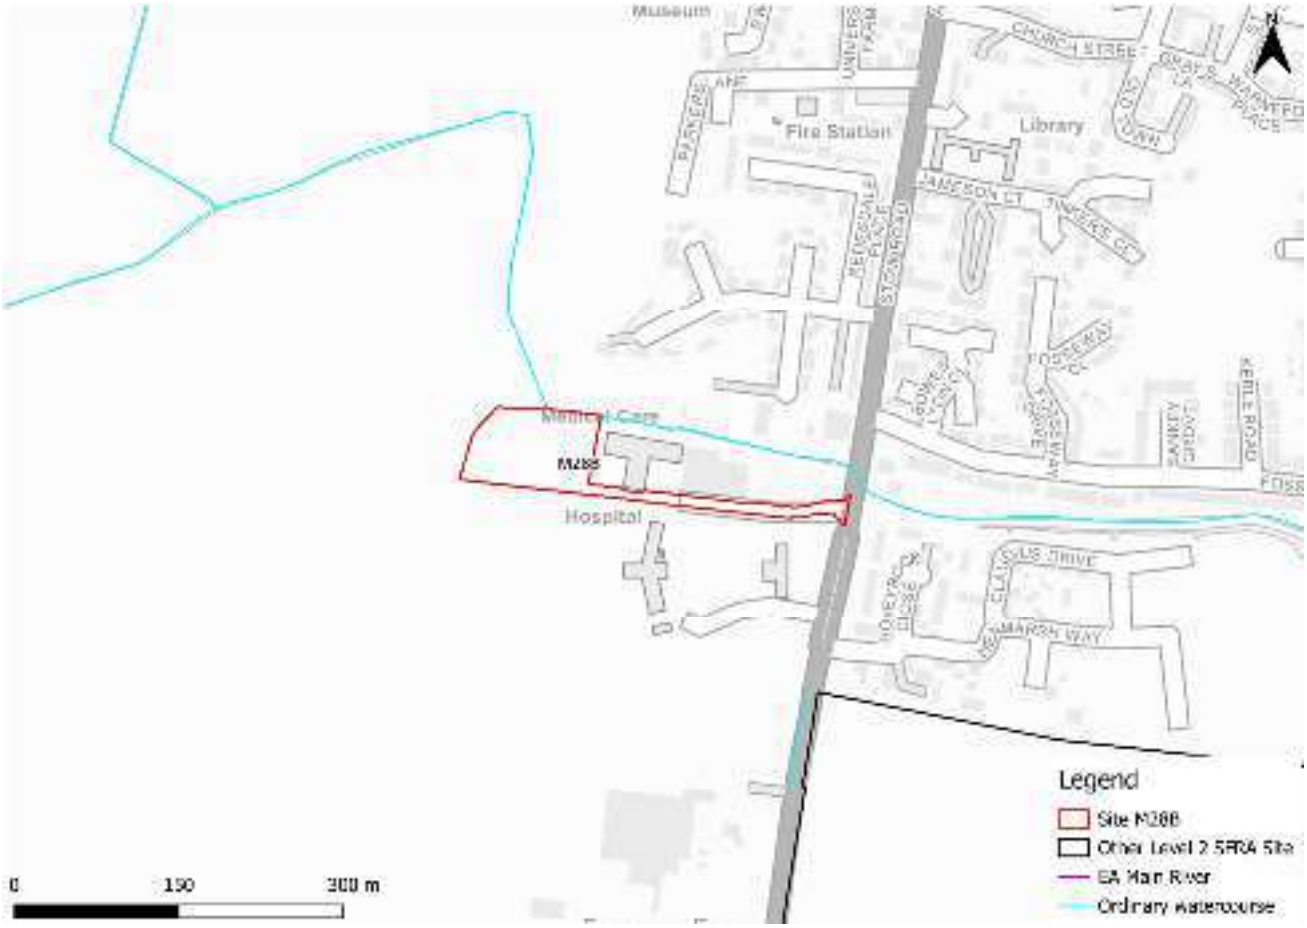

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

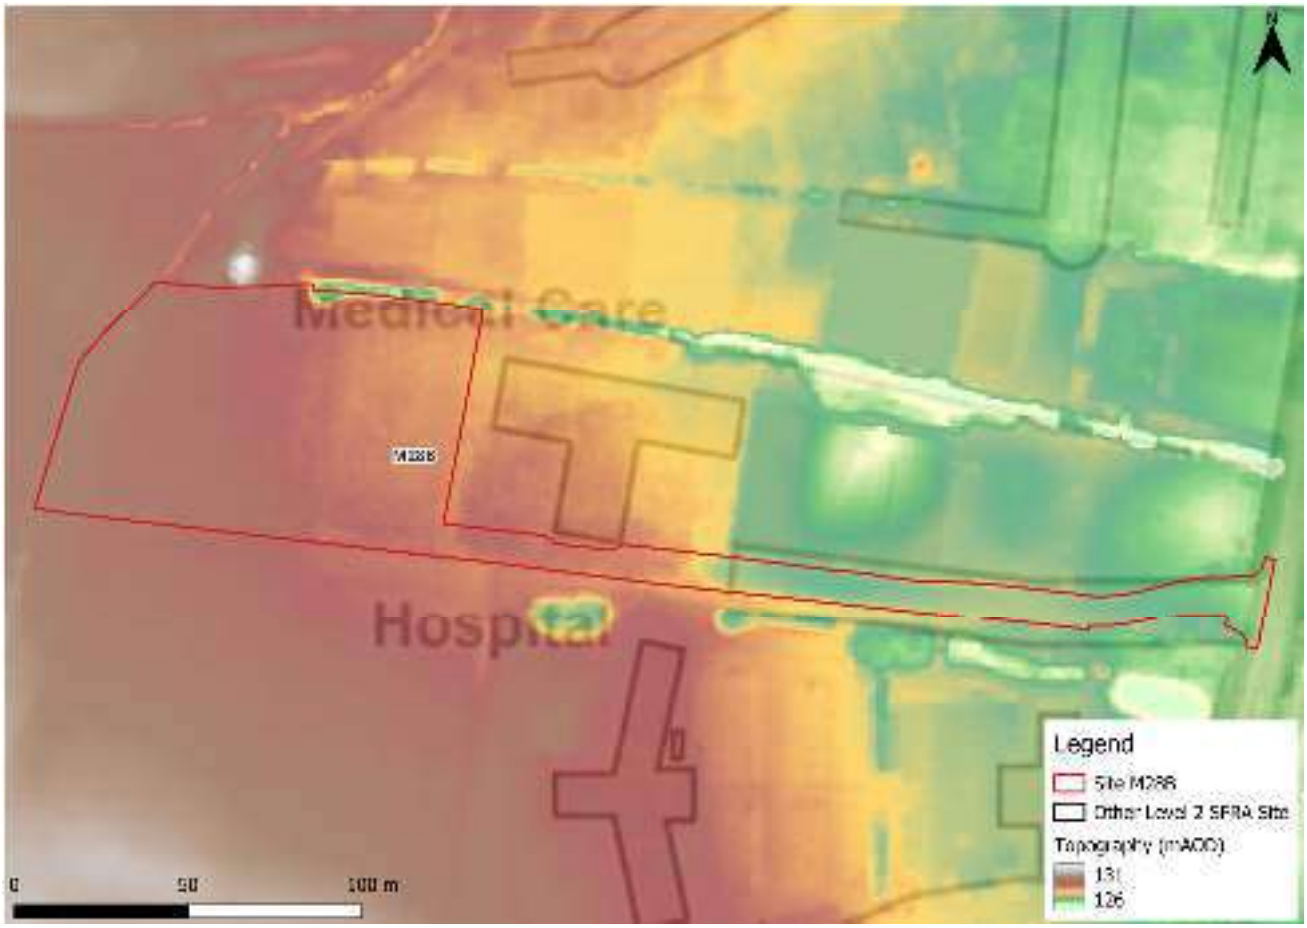

Figure 1-3: Topography

The topography of the site slopes from west to east towards the floodplain of the River Evenlode.

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the percentage areas of the site within each flood zone are stated in Table 2-1 and can be viewed on Figure 2-1. The Flood Map for Planning does not consider flood defence infrastructure (Section 0).

The site is partially within the functional floodplain due to risk from the unnamed ordinary watercourse, which borders the northern boundary of the site. The majority of the site is within Flood Zone 1 and therefore at low risk from rivers and the sea. The functional floodplain in this location is based on the EA's New National Model (NNM) dataset 'Rivers and Sea 3.3% defended flood risk extents - present day'. The Flood Map for Planning flood zones here are also based on the NNM dataset. Flood depths and hazards therefore are not available for interrogation.

Table 2-1: Present day flood risk based on percentage area of site at risk

Flood Zone 1 (% area)	Flood Zone 2 (% area)	Flood Zone 3a (% area)	Flood Zone 3b (% area)
95	1	1	3

Figure 2-1: Present day risk

2.2 Impacts from climate change

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Cotswolds Management Catchment. The central allowance within this catchment is 30% on peak flows (Table 2-2). There is no local detailed model for the unnamed watercourse therefore the required event cannot be assessed.

Table 2-2: Modelled climate change allowances for peak river flows within Cotswolds Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	11	17	31
2050s	13	21	43
2080s	30	43	82

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Figure 2-2 shows the Flood Map for Planning - Flood Zones plus Climate Change dataset which includes the central allowance for the 2080s epoch. This represents the impact of climate change on Flood Zone 3a and Flood Zone 2 combined. There is no significant additional fluvial risk to the site when considering climate change.

Figure 2-2: EA Flood Zones plus Climate Change

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been four recorded flooding incidents within the Moreton West Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-3 shows that the site and wider area could benefit from riparian tree planting. Tree planting can help to slow the flow to benefit areas downstream. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

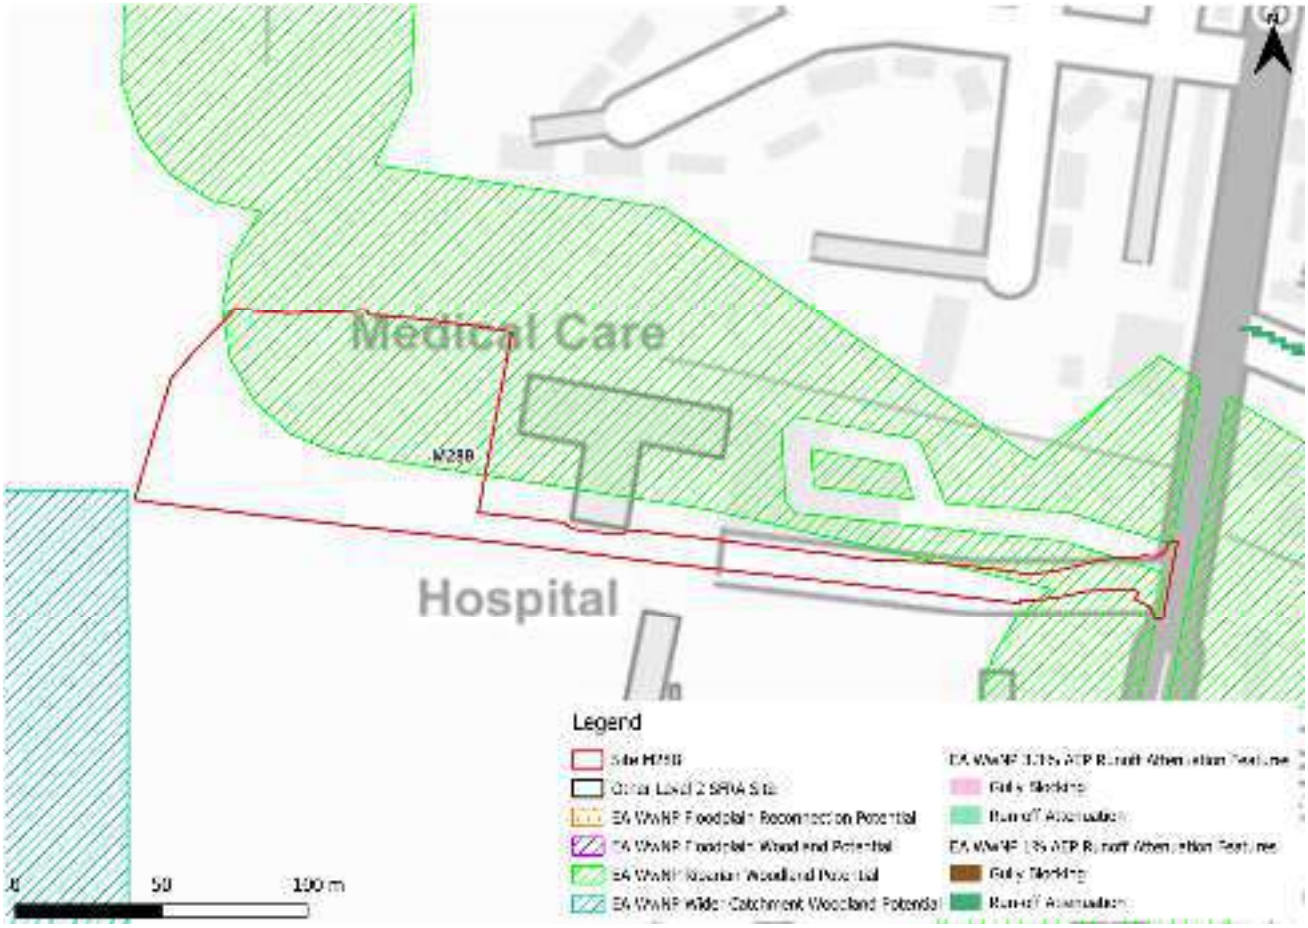

Figure 2-3: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warnings and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The site is not located within a FAA.

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes are available during a flood event via existing routes to Stow Road, travelling towards the south (Figure 2-4). However, detailed modelling may be required to confirm safe access and escape via the existing road.

Figure 2-4: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site borders the unnamed ordinary watercourse, which is a tributary of the River Evenlode. However, most of the site is located within Flood Zone 1 and outside of the Flood Map for Planning climate change extent and therefore mainly at low risk from rivers.
  - The risk from the unnamed watercourse is based on the EA's NNM and not detailed modelling which is considered to be the most up to date information on fluvial risk to the site and surrounding area. However, the NNM does not contain depth or hazard information, therefore risk cannot be robustly defined at this stage.
- Mitigation:
  - A no development buffer should be in place along the floodplain of the unnamed watercourse in the form of a blue green corridor, which can provide a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits. All development should be directed to Flood Zone 1 outside of the climate change risk area.
  - The EA may expect detailed modelling of the unnamed watercourse to be carried out at the site-specific FRA stage to robustly inform on present day and future risk to the site.
- Access and escape:
  - Based on current information, safe access and escape routes are available via Stow Road to the east of the site, travelling southwards. However, detailed modelling may be required to confirm safe access and escape via the existing road.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (May 2026), the majority of the site is at low risk of flooding from surface water (Table 3-1). There is a distinct flow path through the west of the site in the 0.1% AEP event, covering almost a quarter of the site area, with some areas of ponding shown in the 1% AEP event (Figure 3-1). The implementation of appropriate sustainable drainage systems (SuDS) will be essential in reducing the risk of surface water pooling on this site.

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Depth map, onsite surface water flood depths in the 1% AEP event are shallow (Figure 3-2). This is also the case in the 0.1% AEP event, with depths being less than 0.15 m across the entire risk area.

Safe access and escape routes are achievable via Stow Road to the east of the site.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
73	24	3	0

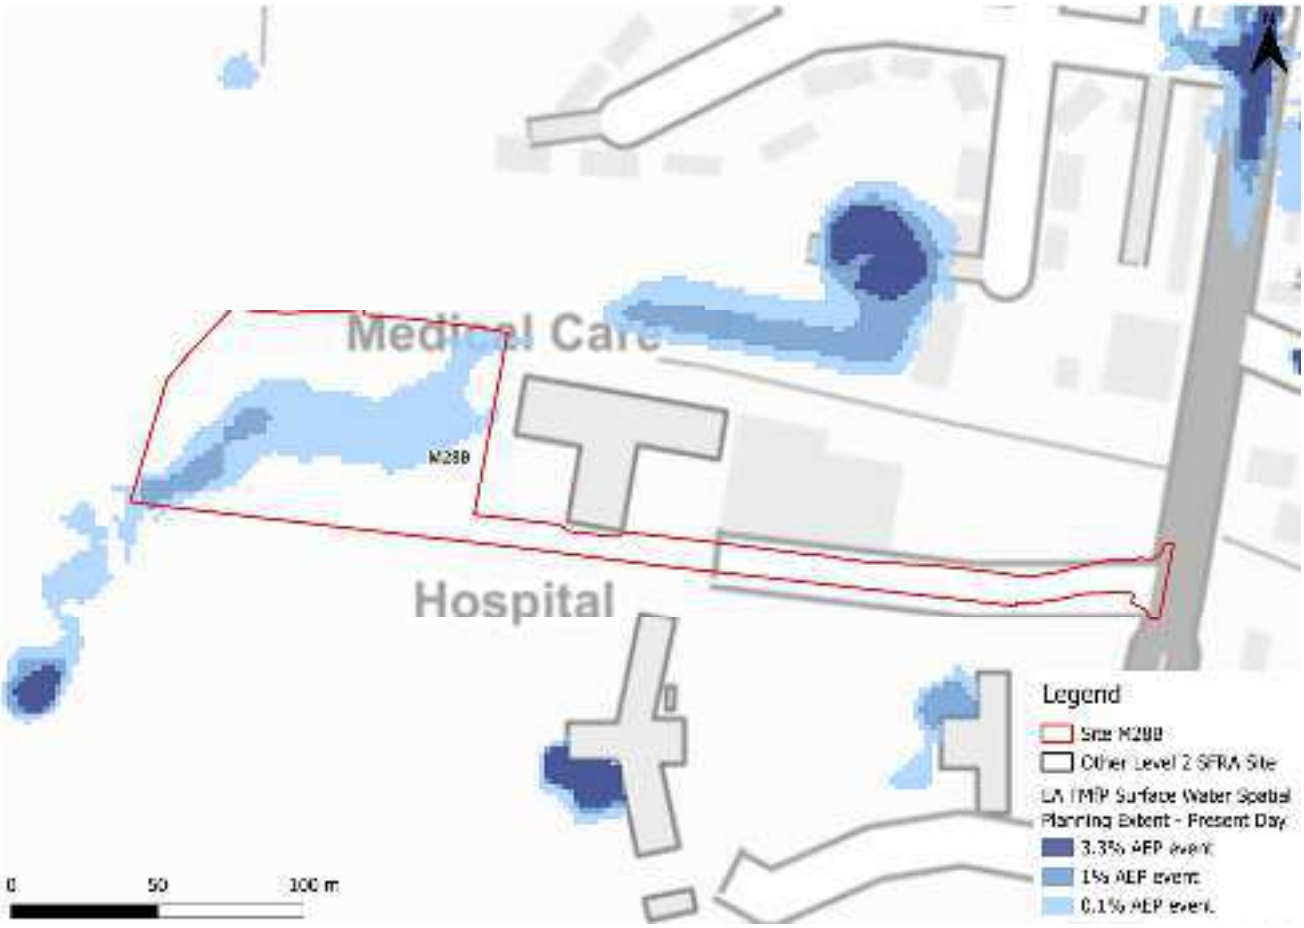

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

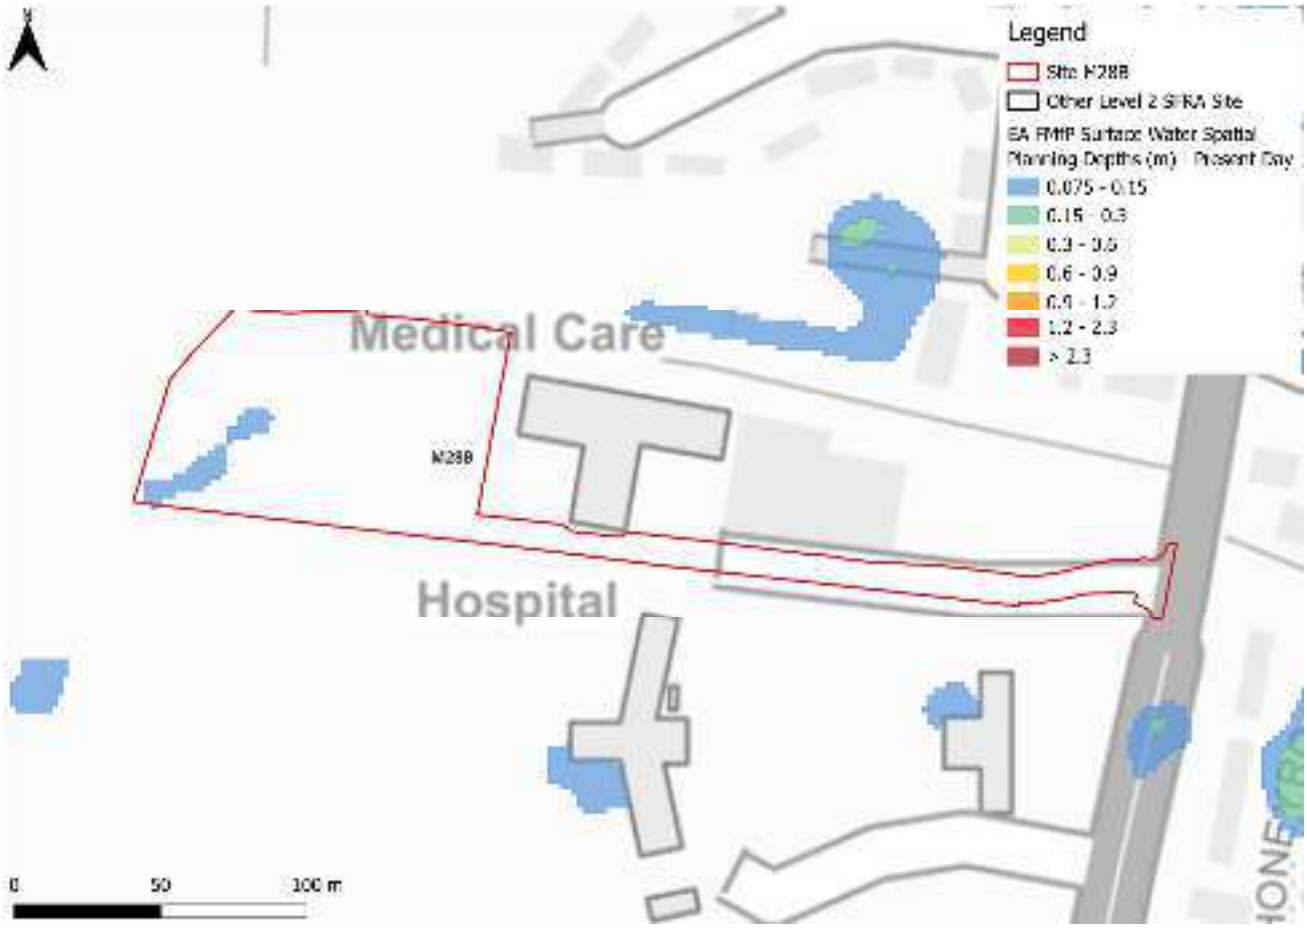

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

Based on the EA's national scale third generation RoFSW map, surface water flood hazard within the site in the medium event is categorised as 'low' (Figure 3-3). There are clear differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping. However, updated surface water hazard information should be confirmed at the site-specific FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

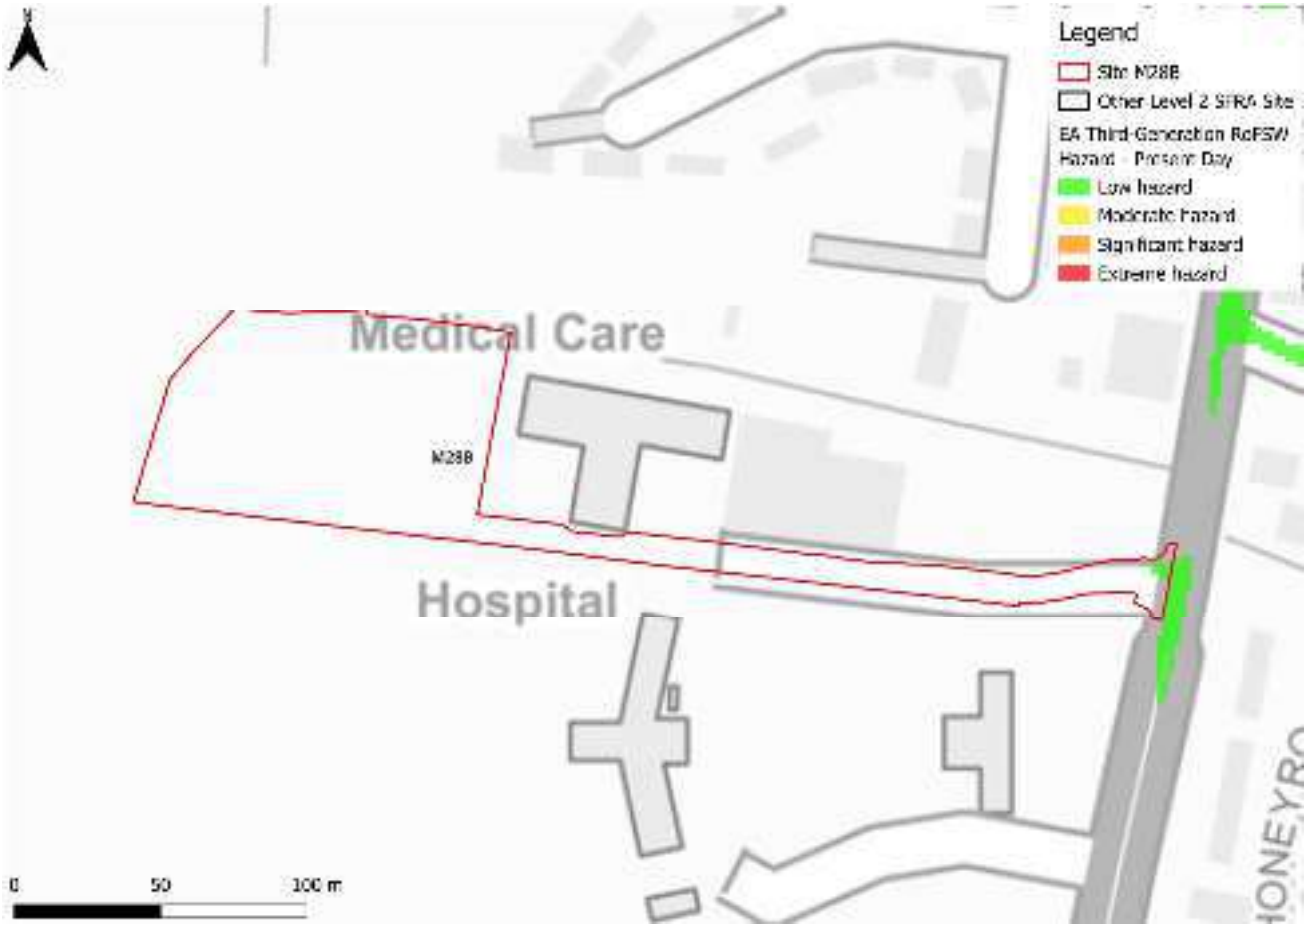

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day medium risk surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRAs should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is now included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Cotswolds management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Cotswolds Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. The flow path through the west of the site is shown to increase in extent when considering climate change. Flood depths within both the future 1% AEP and 0.1% AEP events are shallow (Figure 3-5).

Safe access and escape routes would likely remain achievable via Stow Road to the east of the site.

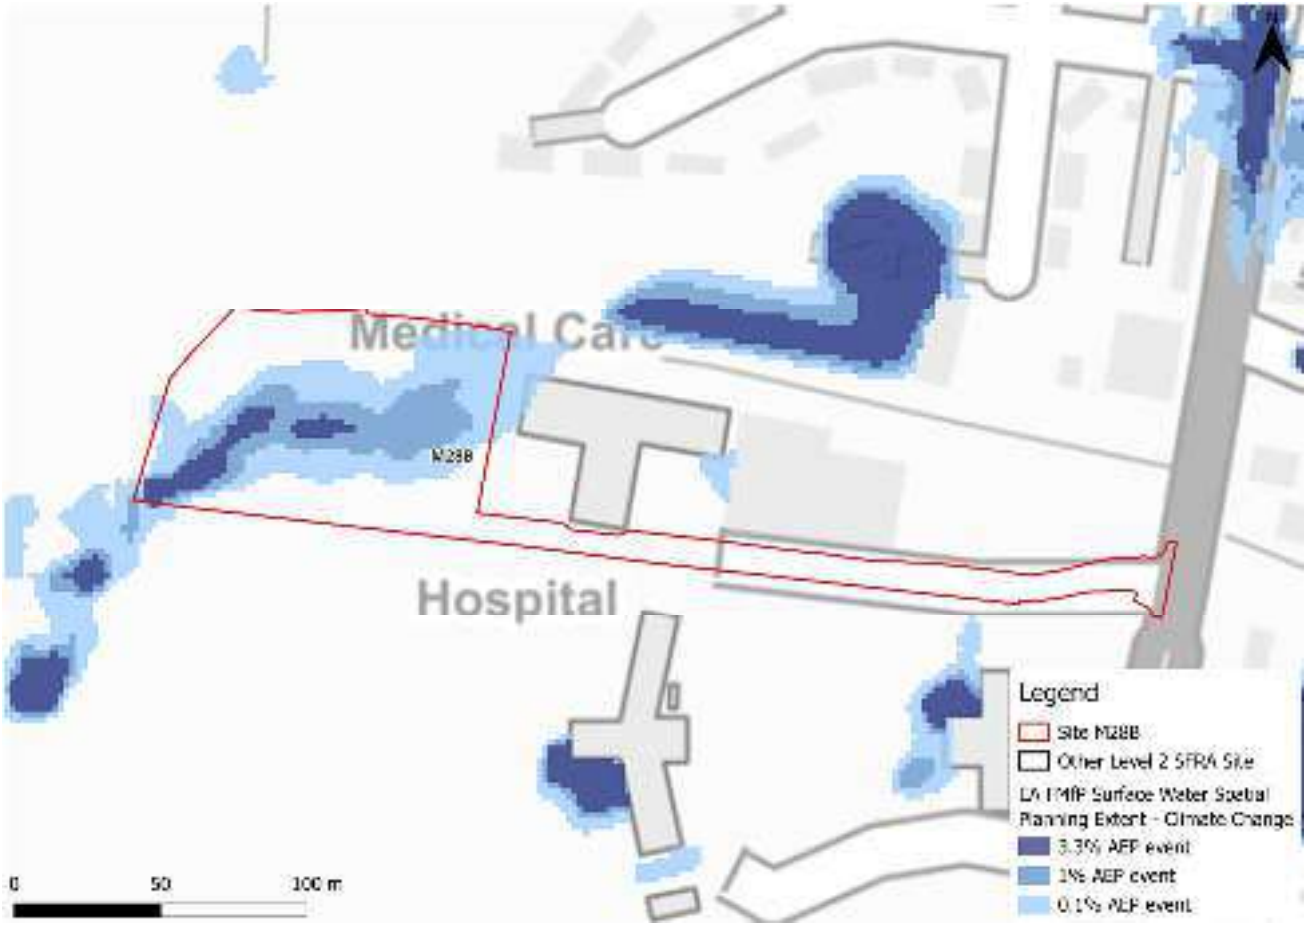

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

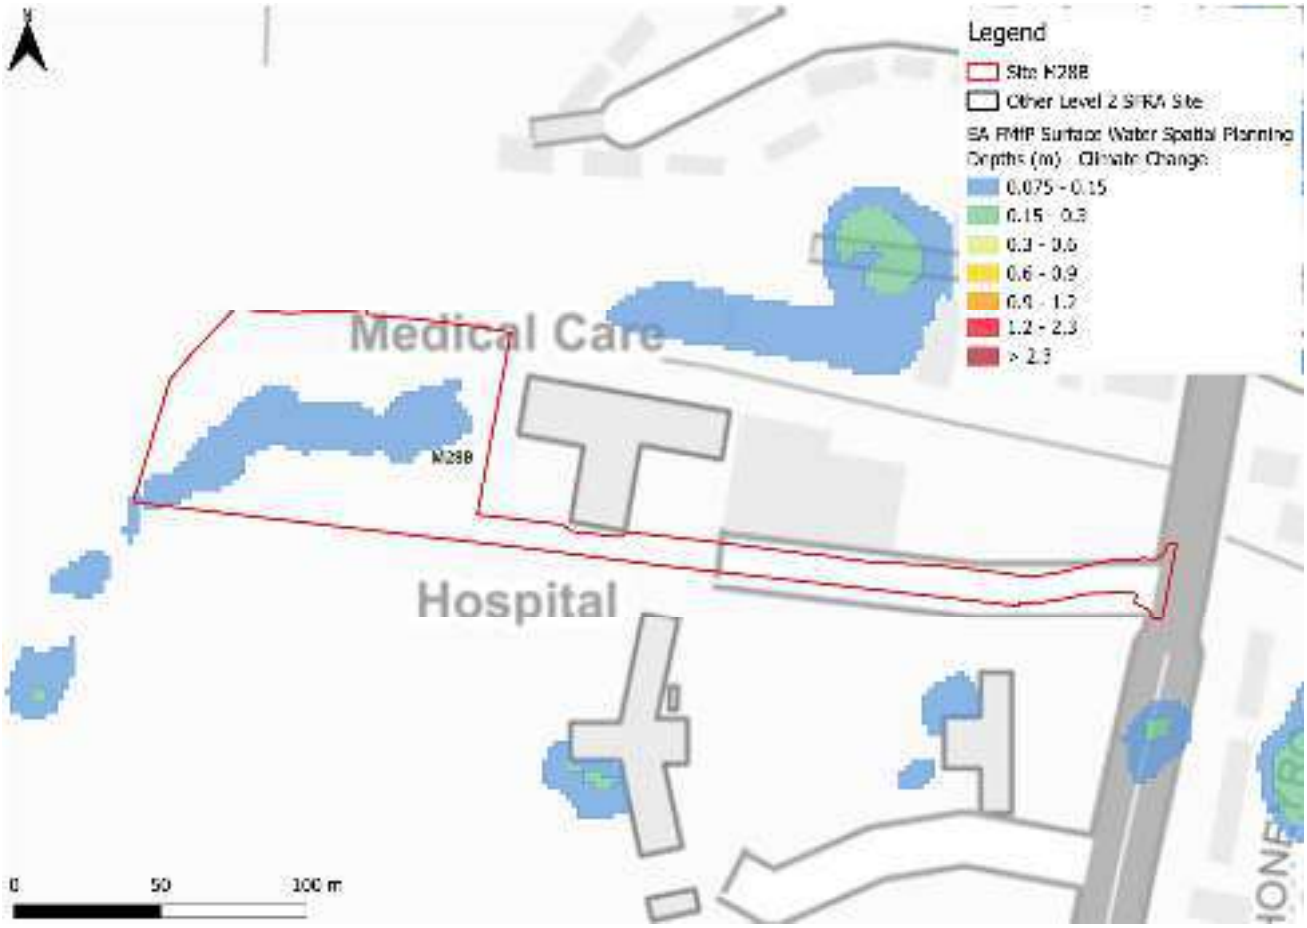

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is categorised as low (Figure 3-6).

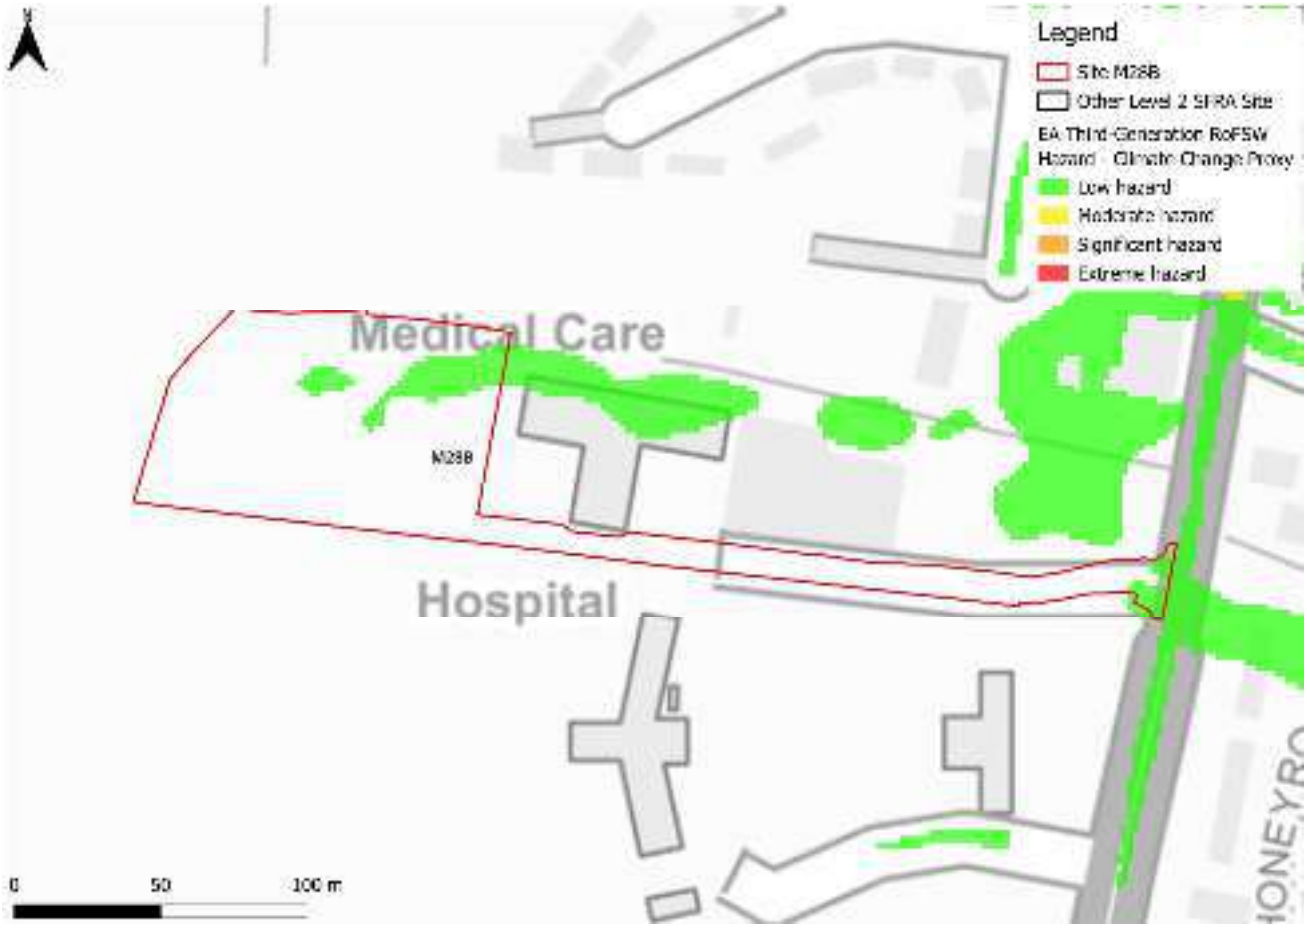

Figure 3-6: Low risk event surface water flood hazard[1], as a proxy for the medium risk event plus climate change (Third generation - Risk of Flooding from Surface Water map)

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There have been 16 recorded sewer flooding incidents within the Moreton West Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 73% of the site being outside of the 0.1% AEP surface water flood extent. There is a flow path through the west of the site in both the present day and future 0.1% AEP surface water flood events. However, depths are shallow and therefore it may be possible to mitigate surface water flood risk onsite. Ideally, this natural flow path would be left in place to flood naturally. However, this would likely limit the number of plots available on the site.
- Risk to the site is shown to slightly increase in extent within the site when considering the impact of climate change, however depths remain shallow.
- A drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment

should apply. The developer should consult the LLFA and follow local and National SuDS guidance.

- Safe access and escape routes would likely be achievable via Stow Road.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within one catchment, namely, the Evenlode (Source to Four Shires S) and Longborough Stream catchment. This catchment is ranked as a high sensitivity catchment. Planning considerations for sites at high sensitivity to the cumulative impacts of development can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications. The site is at predominantly at high risk of groundwater emergence. There is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is mudstone, siltstone, limestone and sandstone (Figure 5-2), which will have variable permeability and porosity. The bedrock is overlain with superficial deposits of diamicton which is generally of low permeability. Based on the groundwater emergence map and the underlying geology, infiltration SuDS are unlikely to be appropriate at this site. Groundwater conditions must be investigated further through the site-specific FRA. This should be assessed through standpipe monitoring during the period of highest groundwater levels e.g. November to April.

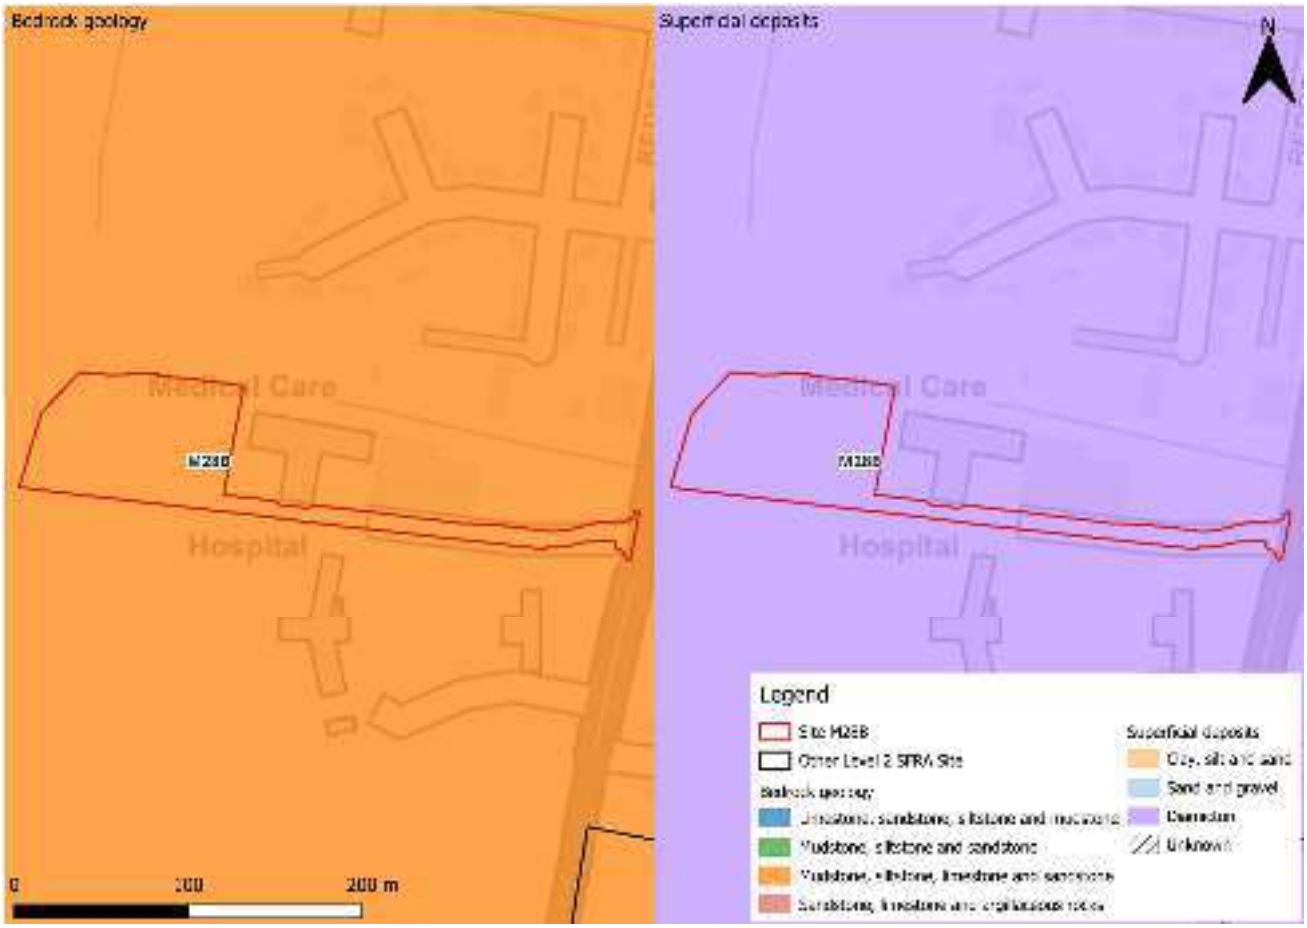

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets. Residual risk at this site comes from the potential blockage or structural failure of the culvert beneath Stow Road to the east of the site.

6.1 Potential blockage

A blockage or failure of the structure beneath Stow Road to the east of the site may cause water in the channel to back up and cause flooding to the site, depending on the severity of the blockage and magnitude of the flood event. This may impact the proposed access route to the site. Culvert capacity, and condition surveys may be required, including for consultation with the culvert owner.

Figure 6-1 indicates the location of the culvert beneath Stow Road. The potential residual risk to the site following a blockage of this asset should be assessed through the site-specific FRA.

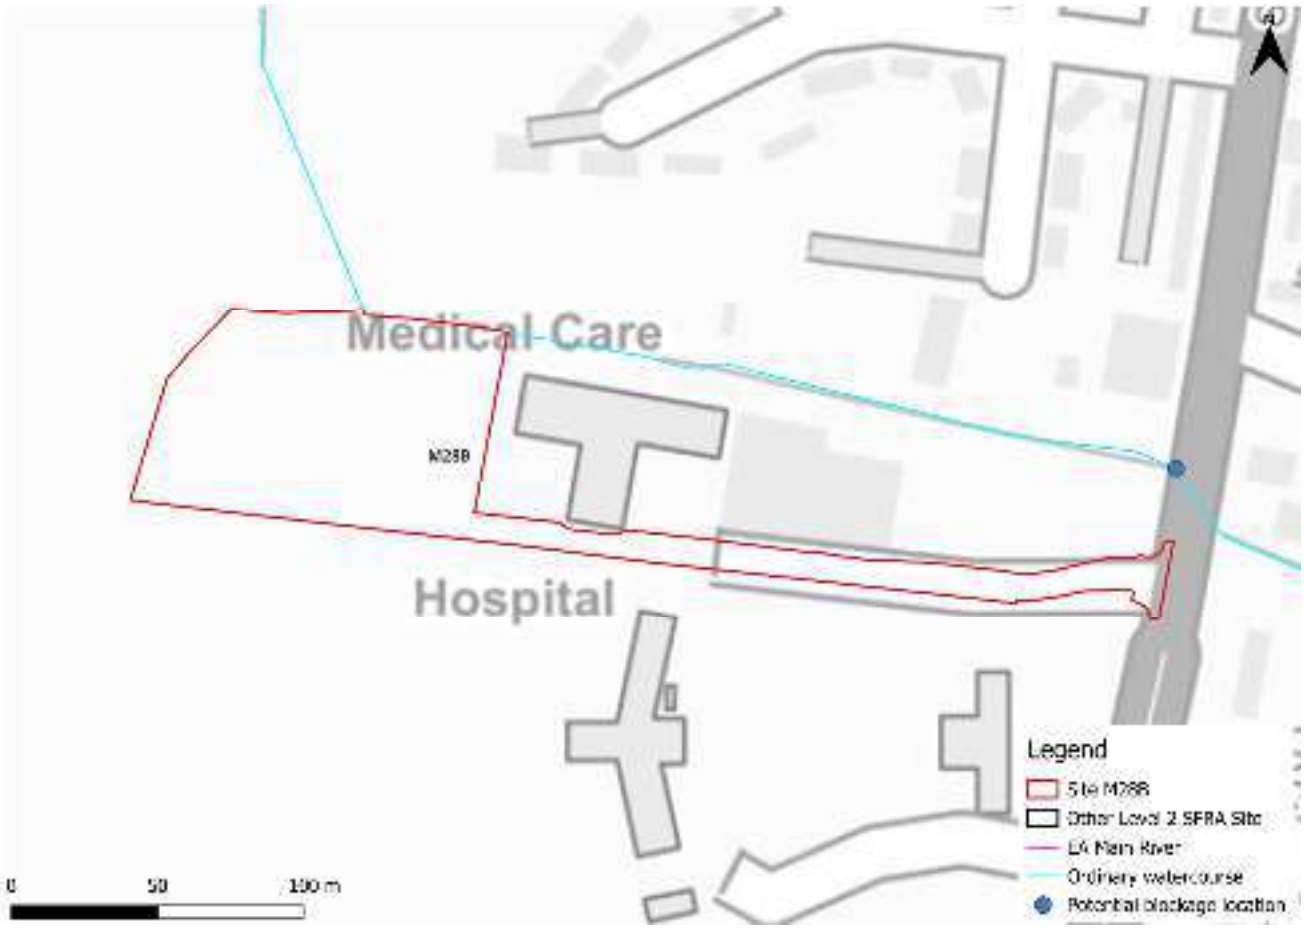

Figure 6-1: Potential blockage location

6.2 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

6.3 Observations, mitigation options and site suitability - residual risk

- The site is at potential residual risk from a blockage of the culvert beneath Stow Road to the east of the site. The site-specific FRA should consider modelling a blockage scenario to understand whether there would be any additional risk to the site.
- Areas adjacent to culverts and bridges are at particular risk from the rapid onset of fast flowing and deep flooding, with little or no warning if structures become blocked. Emergency plans must be in place for such areas and safe access and escape routes must be in place for the lifetime of development. Resistance and resilience measures may also need to be put in place to manage residual flood risk when avoidance measures have been exhausted.
- The LPA should use the information on residual risk in this Level 2 SFRA to state in the local plan strategic policies a preferred mitigation strategy for ensuring development will be safe throughout its lifetime in relation to urban form, risk management and where flood mitigation measures are likely to have wider sustainable design implications (para 042, FRCC-PPG).

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is required to pass part b) of the Exception Test as it is proposed for more vulnerable residential development and is partially located within Flood Zone 3a. The risk is confined to the floodplain of the unnamed watercourse along the northern boundary of the site, according to the Flood Map for Planning. It should be possible for this site to pass the Exception Test, based on current information, assuming the risk area along the unnamed watercourse can be incorporated into site design as a blue green corridor with no development. Were new information to made available, the Exception Test should be reapplied.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- A no development buffer should be in place along the floodplain of the unnamed watercourse in the form of a blue green corridor, which can provide a flood storage function as well as providing BNG, ecological, amenity, social, and wellbeing benefits.
- All development should be directed to Flood Zone 1 outside of the climate change risk area.
- However, the EA may expect detailed modelling of the unnamed watercourse to be carried out at the site-specific FRA stage to robustly inform on present day and future risk to the site, including depths and hazards.
- There is a shallow surface water flow path through the east of the site in the 0.1% AEP present day event. A drainage strategy should ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- Groundwater conditions must be investigated further through the site-specific FRA. This should be assessed through standpipe monitoring during the period of highest groundwater levels e.g. November to April.
- The FRA should undertake a capacity and condition assessment of the culvert beneath Stow Road to the east of the site.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WCAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

Contract

JBA Project Manager	Mike Williamson
Address	Phoenix House, Lakeside Drive, Centre Park, Warrington, WA1 1RX
JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Joanne Corbett of Cotswold District Council. Laura Thompson-Jones of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken between June and July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for the strategic extension to the North and West of Mickleton site. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Strategic extension to the North and West of Mickleton

- Location: Mickleton
- Existing site use: Agricultural land and buildings
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential led mixed use
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 69.5
- Watercourse: Norton Brook, unnamed ordinary watercourses
- Environment Agency (EA) flood model: No detailed model available
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of fluvial flood extents (depths, velocities and hazards not available)
    - Assessment of surface water flood extents, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

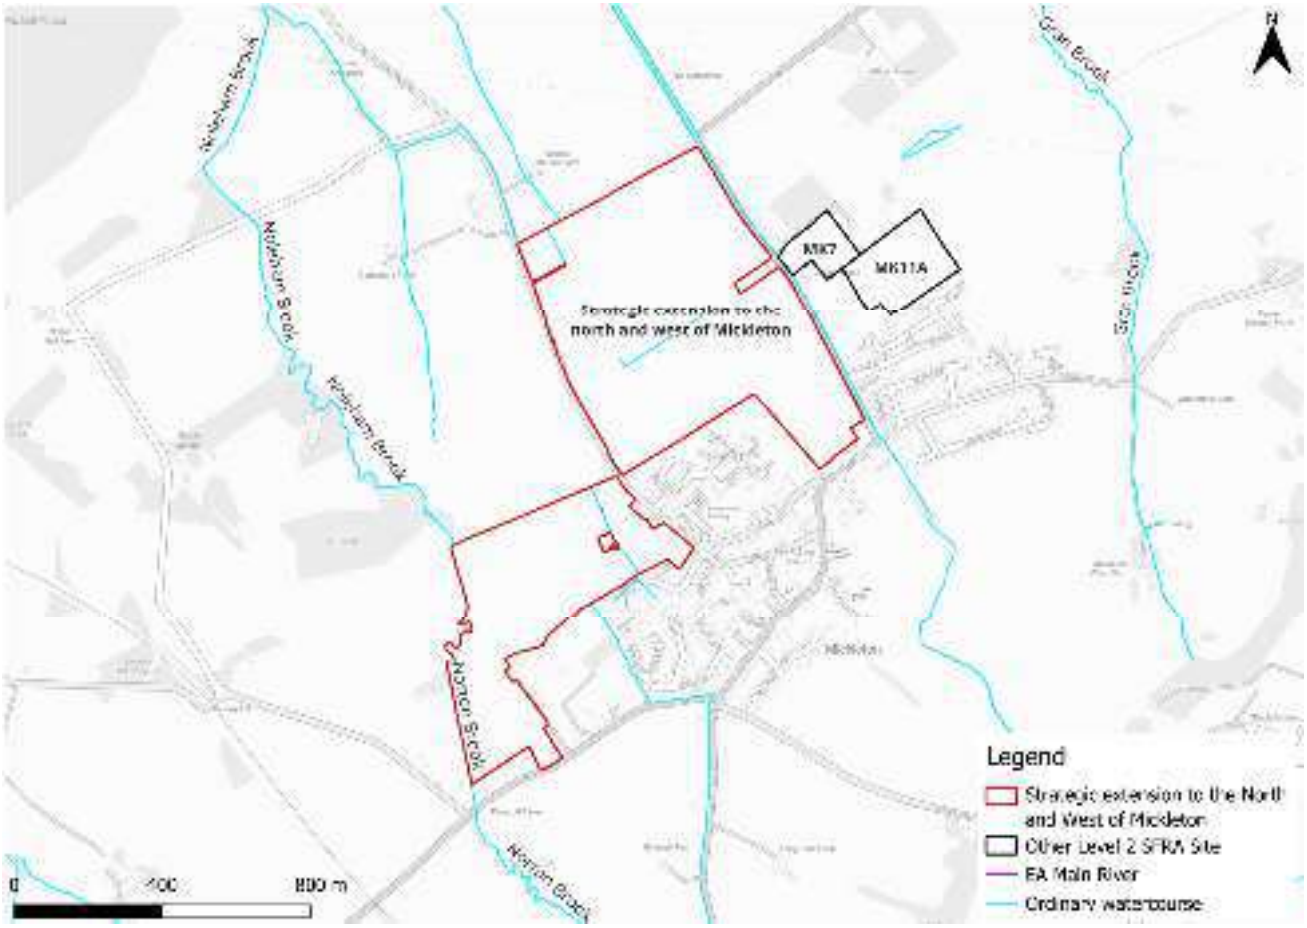

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

There are areas of higher elevation in the south of both site parcels, with the land sloping down towards the north (Figure 1-3).

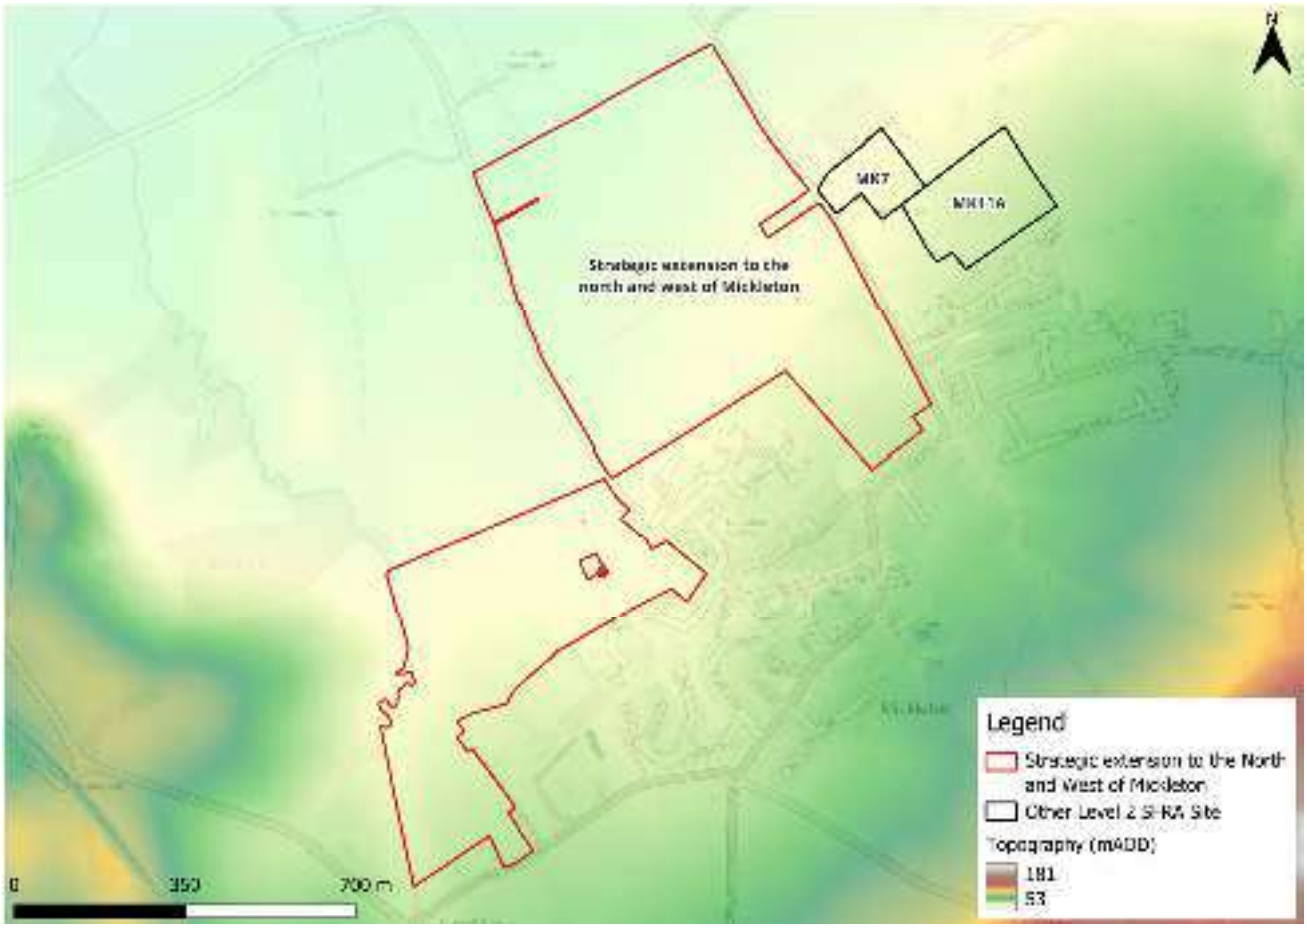

Figure 1-3: Topography

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the southwestern site parcel is shown to be at flood risk from rivers. As shown in Figure 2-1, Norton Brook is present adjacent to the western boundary of the southwestern site parcel which poses a risk of fluvial flooding to the site, based on the flood zones. Please note, the Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

Functional floodplain is present onsite along the western boundary of the southwestern site parcel. The functional floodplain in this location for each watercourse is based on the EA's New National Model (NNM) dataset 'Rivers and Sea 3.3% defended flood risk extents - present day'. There should be no development within the functional floodplain. The Flood Map for Planning flood zones here are also based on the NNM dataset. Flood depths and hazards therefore are not available for interrogation.

The majority of the remaining area of the southwestern site parcel and the entire northeastern site parcel is located within Flood Zone 1 and therefore at low risk of flooding from rivers.

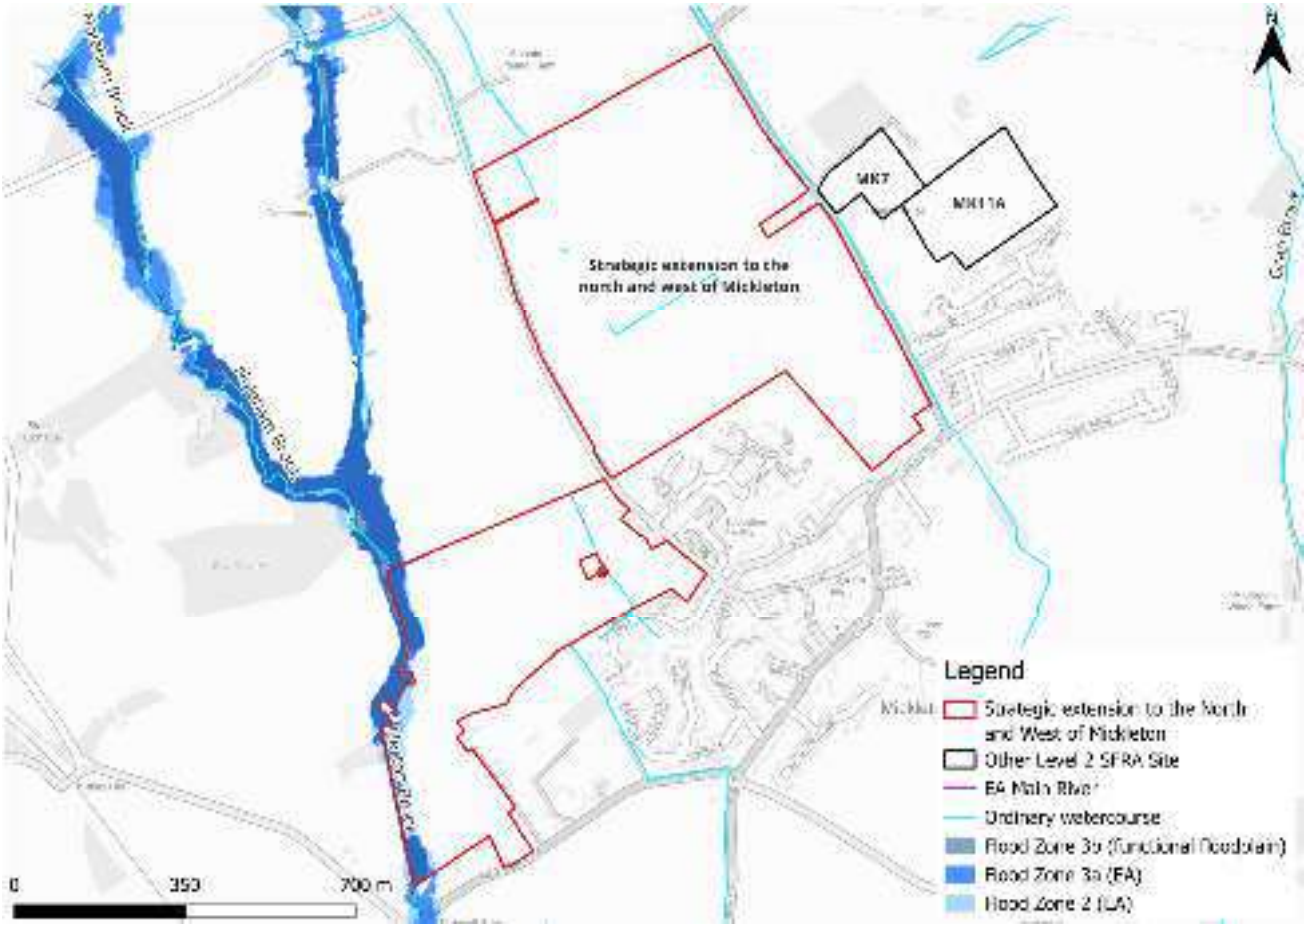

Figure 2-1: Present day risk

2.2 Impacts from climate change

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Avon Warwickshire Management Catchment. The central allowance within this catchment is 21% on peak flows (Table 2-1). There is no local detailed model for Norton Brook, therefore the required event cannot be assessed.

Table 2-1: Modelled climate change allowances for peak river flows within the Avon Warwickshire Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	7	12	22
2050s	8	14	31
2080s	21	32	59

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Figure 2-2 shows the Flood Map for Planning - Flood Zones plus Climate Change dataset which includes the central allowance for the 2080s epoch. This represents the impact of climate change on Flood Zone 3a and Flood Zone 2 combined. There is no significant increase in the extent of fluvial flooding when considering climate change.

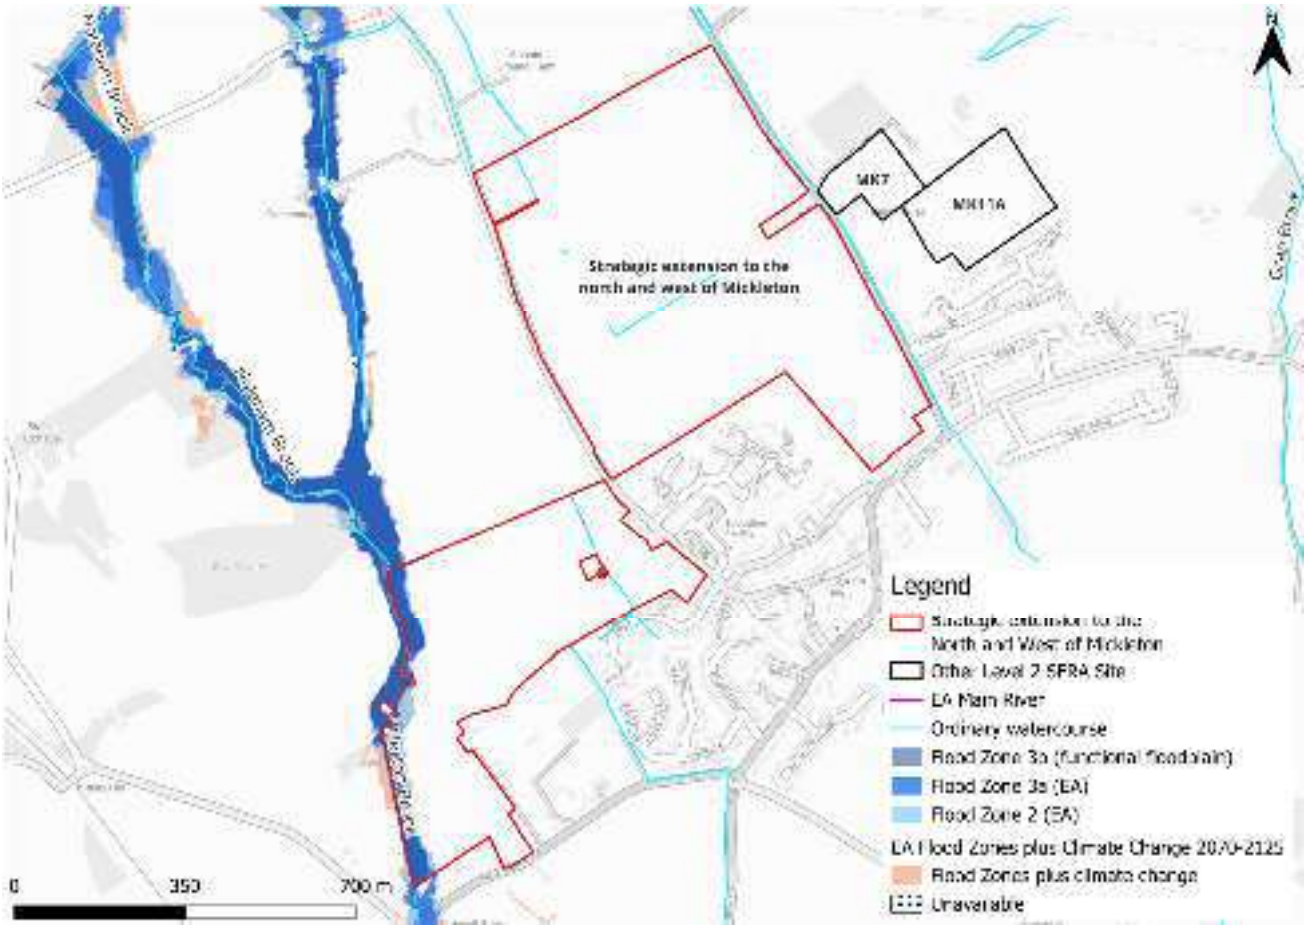

Figure 2-2: EA Flood Zones plus Climate Change

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been ten recorded flooding incidents within the Campden & Vale Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-3 shows that the site and wider area could benefit from riparian and floodplain tree planting. Tree planting can help to slow the flow to benefit areas downstream. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

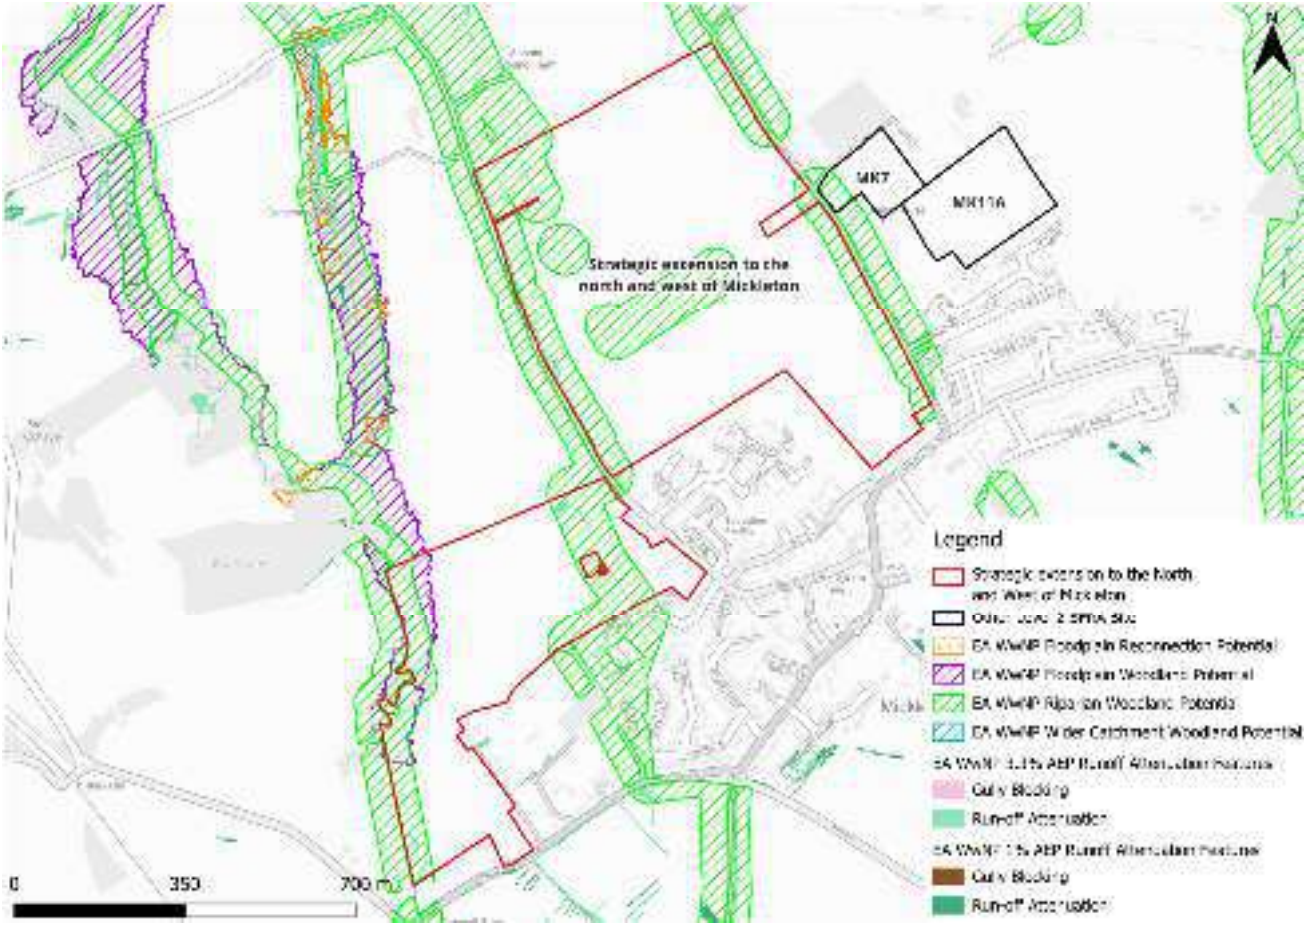

Figure 2-3: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warning and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The majority of the risk area within the southwestern site parcel is located within a FAA, namely the 'Middle Avon Rugby to Bidford' FAA, as shown in Figure 2-4.

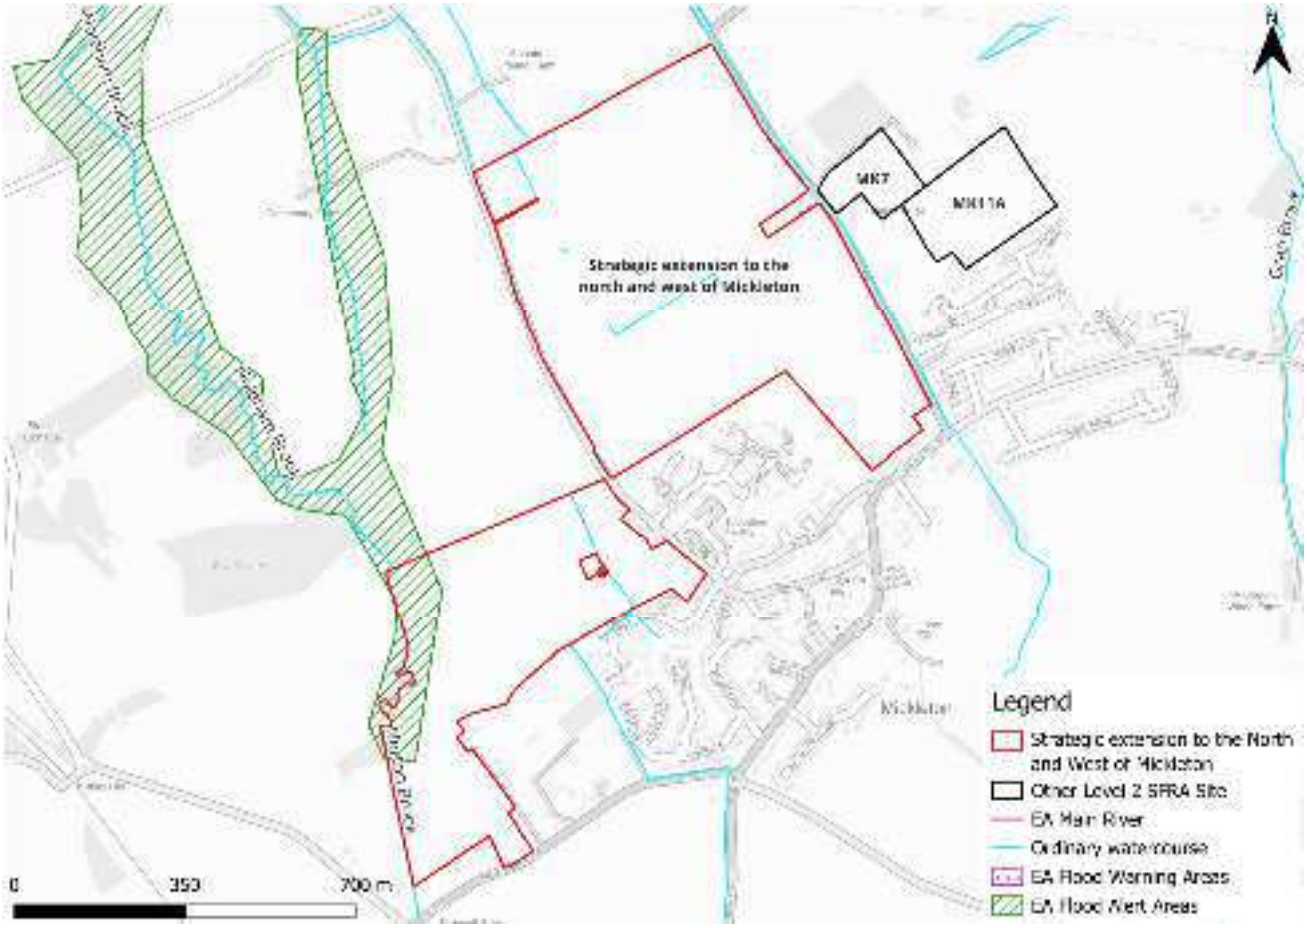

Figure 2-4: Flood warnings and alerts

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes could likely be achieved during a flood event via multiple locations surrounding the site (Figure 2-5).

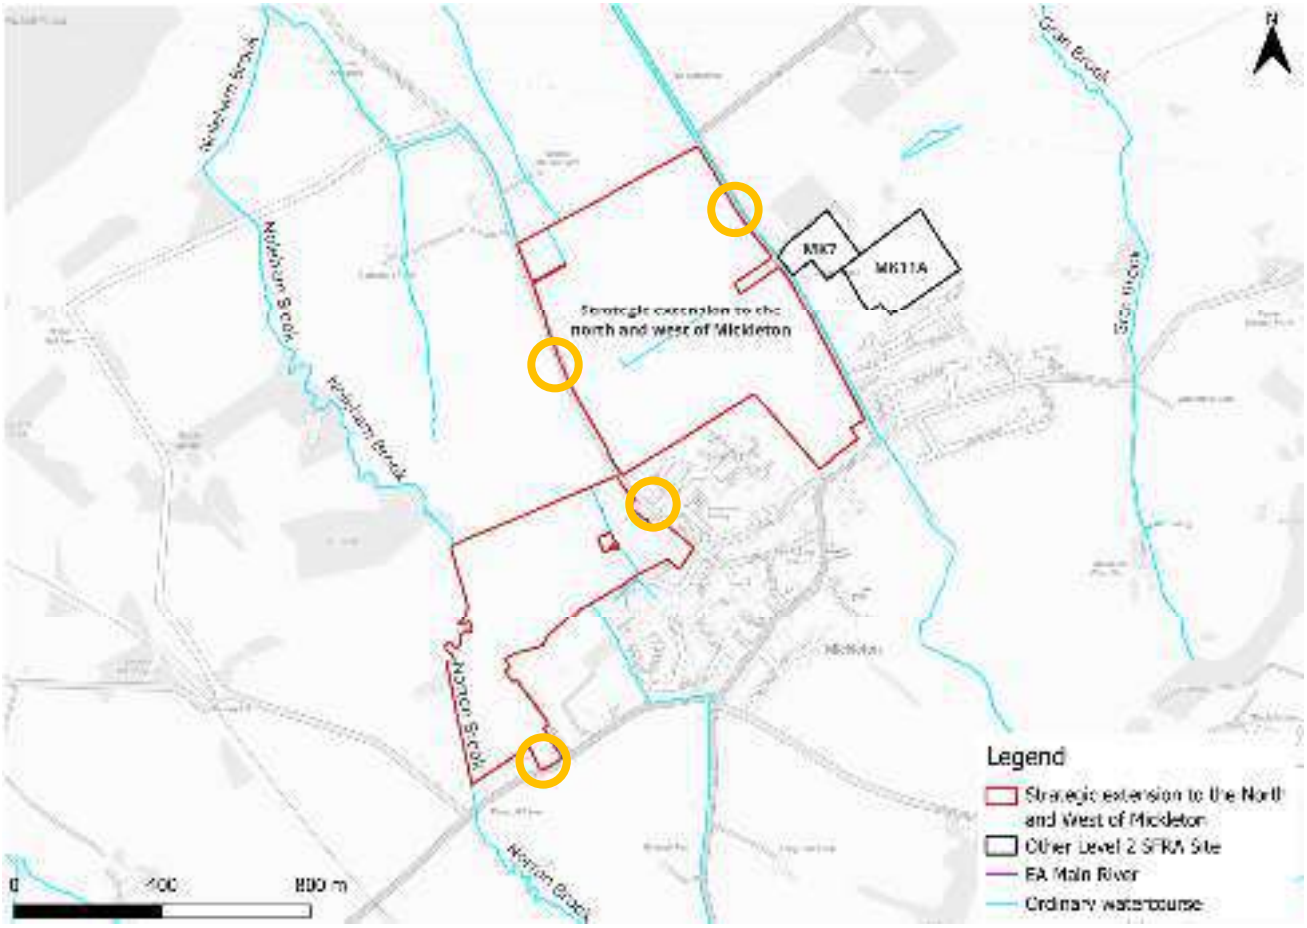

Figure 2-5: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site borders the Norton Brook ordinary watercourse. However, most of the site is located within Flood Zone 1 and outside of the Flood Map for Planning climate change extent and therefore mainly at low risk from rivers.
  - The risk from Norton Brook is based on the EA's NNM and not detailed modelling which is considered to be the most up to date information on fluvial risk to the site and surrounding area. However, the NNM does not contain depth or hazard information, therefore risk cannot be robustly defined at this stage.
- Mitigation:
  - A no development buffer should be in place along the floodplain of Norton Brook in the form of a blue green corridor, which can provide a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits. All development should be directed to Flood Zone 1 outside of the climate change risk area.

- The EA will may expect detailed modelling of Norton Brook to be carried out at the site-specific FRA stage to robustly inform on present day and future risk to the site, including flood depths and hazards.
- EA flood alerts should continue to be in place to ensure early evacuation of site users before an extreme flood event occurs.

- Access and escape:
  - Based on current information, safe access and escape routes appear achievable via multiple locations surrounding the site.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents map (May 2026), the site is predominantly at low risk of surface water flooding as shown in Table 3-1 and Figure 3-1. However, there is a significant surface water flow path present through the centre of the two site parcels, along the ordinary watercourse. There are also multiple flow paths through the northwestern site parcel. Surface water risk is present across the remaining areas of the site parcels as areas of scattered ponding in topographic low spots. Greatest surface water flood depths in the 1% AEP event are significant at between 0.9 and 1.2 m outside of the ordinary watercourse present onsite (Figure 3-2).

Safe access and escape routes are achievable via multiple locations surrounding the site.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
81	11	3	5

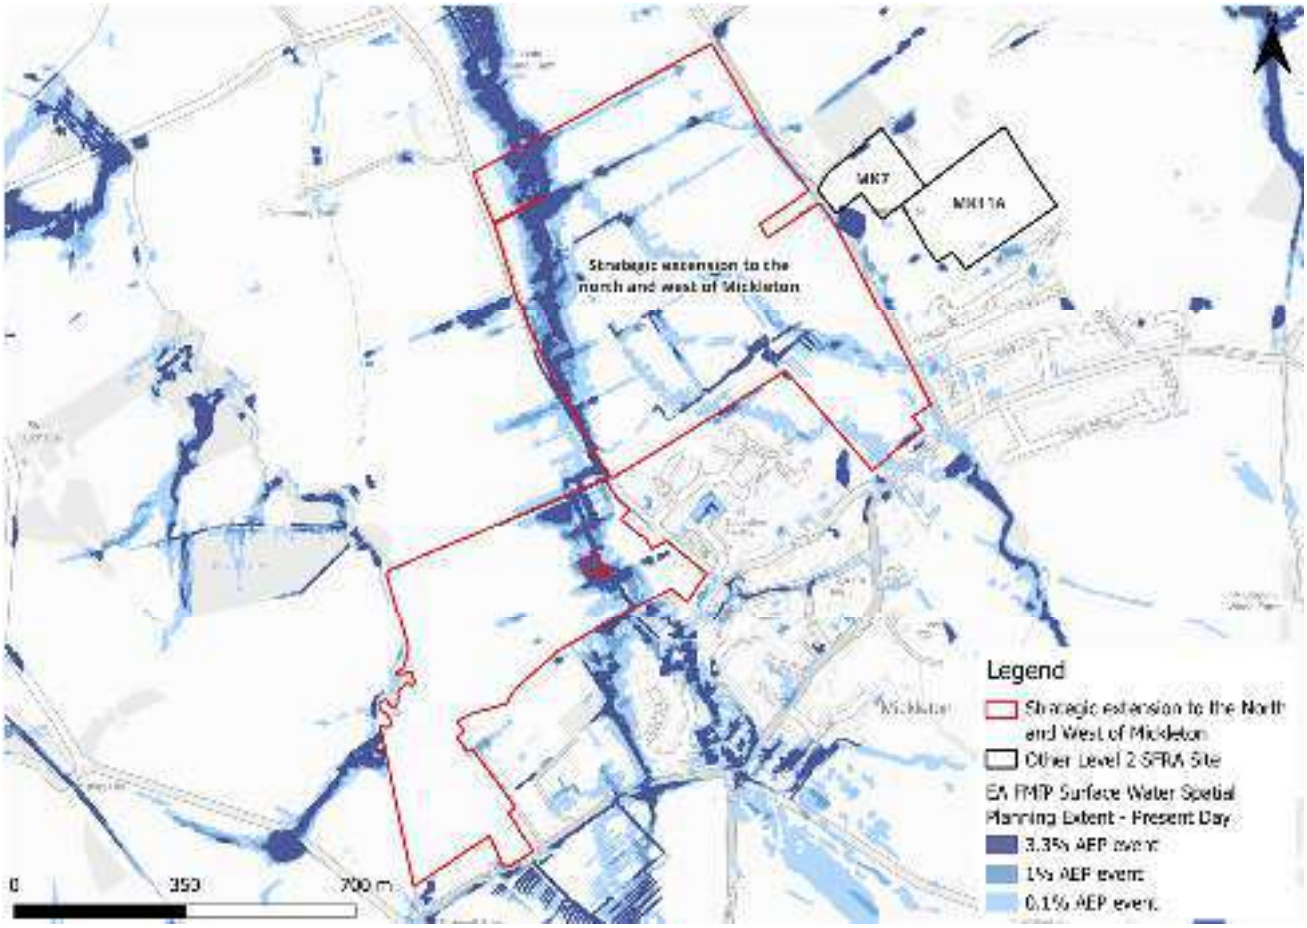

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

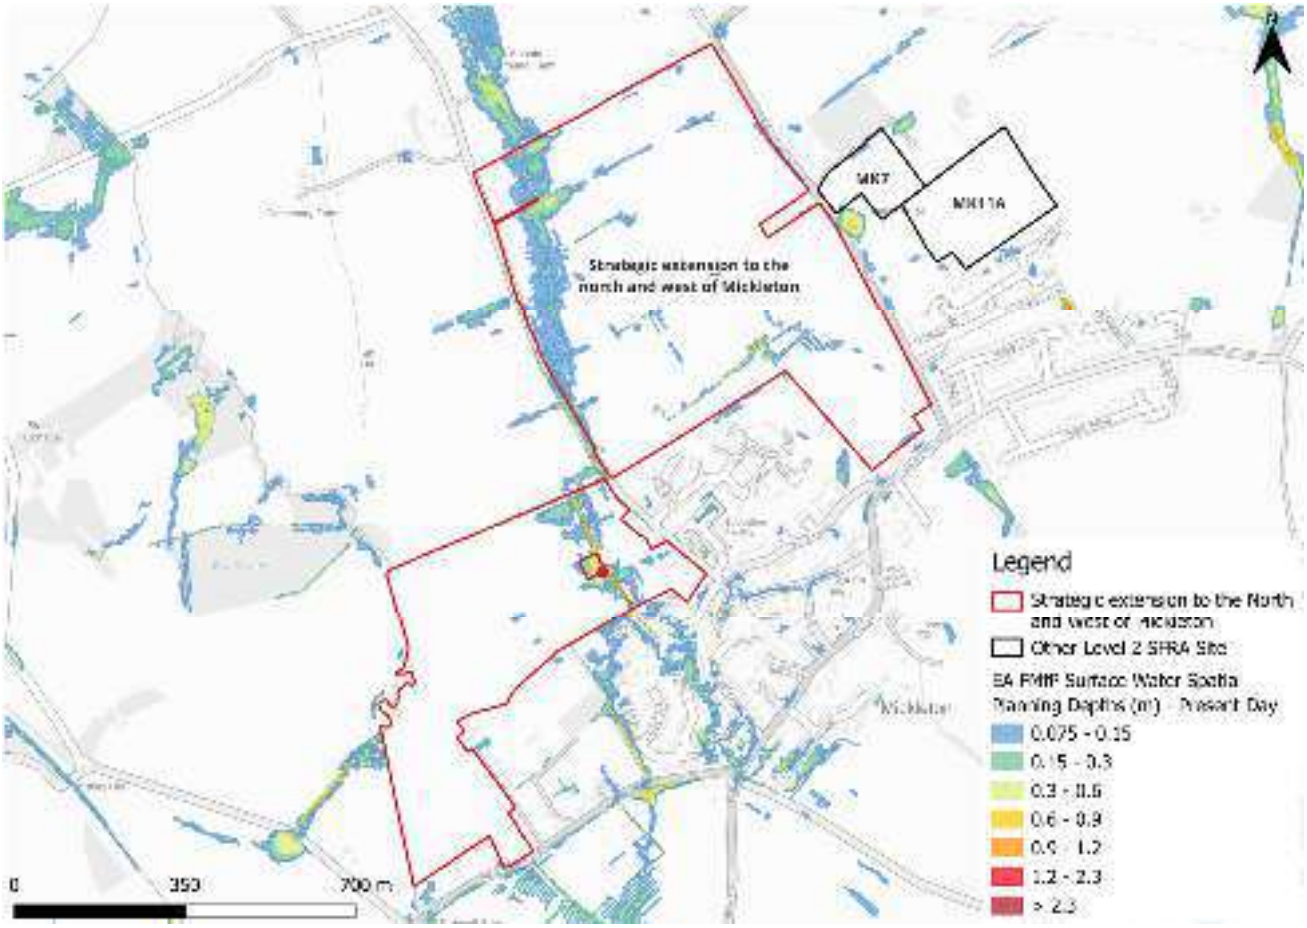

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows there to be some areas of 'significant' flood hazard (Figure 3-3). There are clear differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping whereby the RoFSW shows a much larger area to be at risk. Given the differences between the two datasets, the hazard information should be discounted and assessed further at the FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

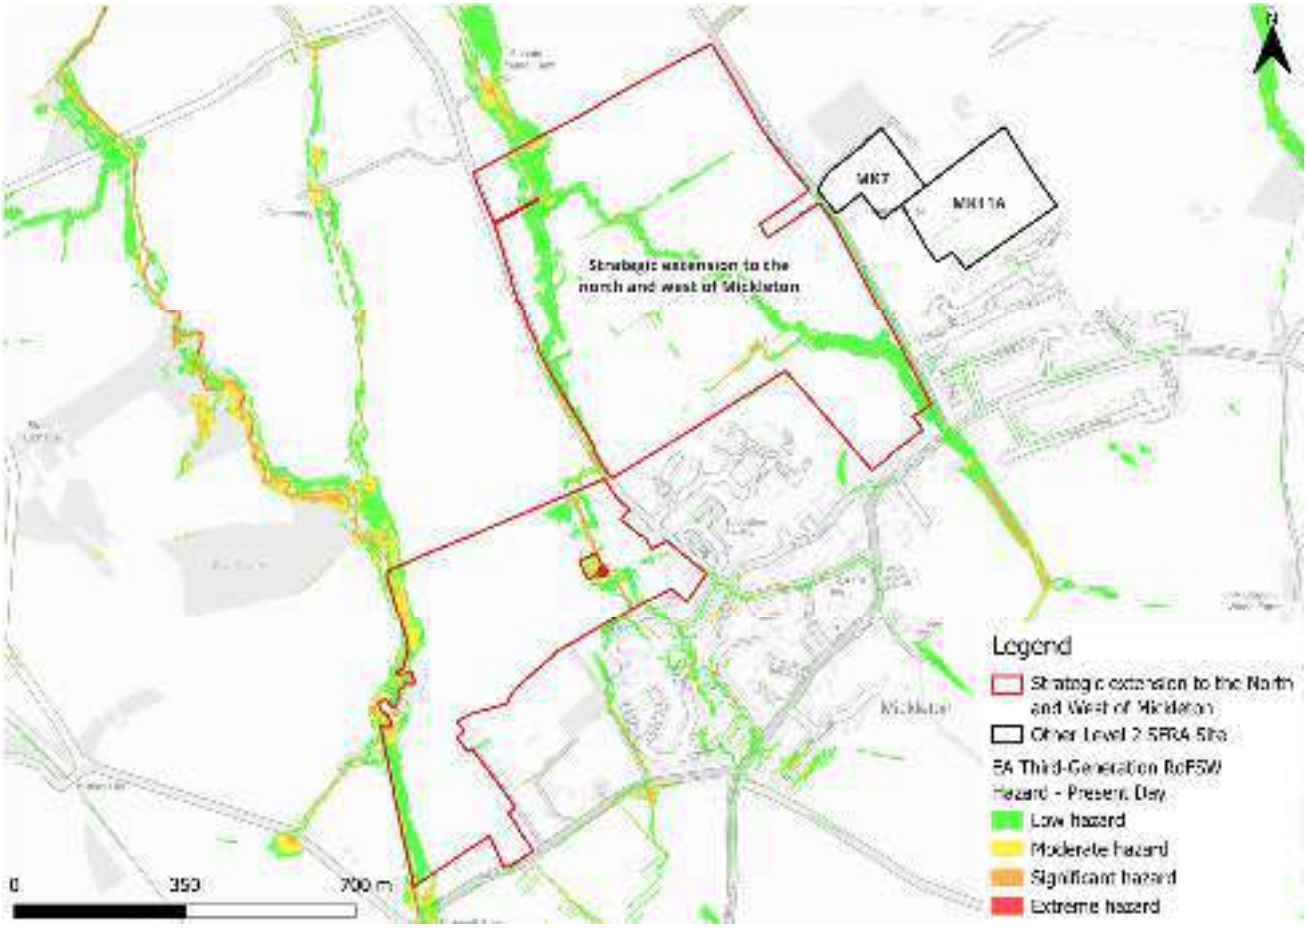

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day 1% AEP event surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Avon Warwickshire management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Avon Warwickshire Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. There is a greater extent of flooding along the flow paths through the site in all events, with a particularly large increase in the 0.1% AEP plus climate change event. Flood depths in the 1% AEP event are shown to increase to greater than 1.2 m within a small area in the south of the northeastern site parcel (Figure 3-5).

Safe access and escape routes would likely remain achievable via several locations surrounding the site.

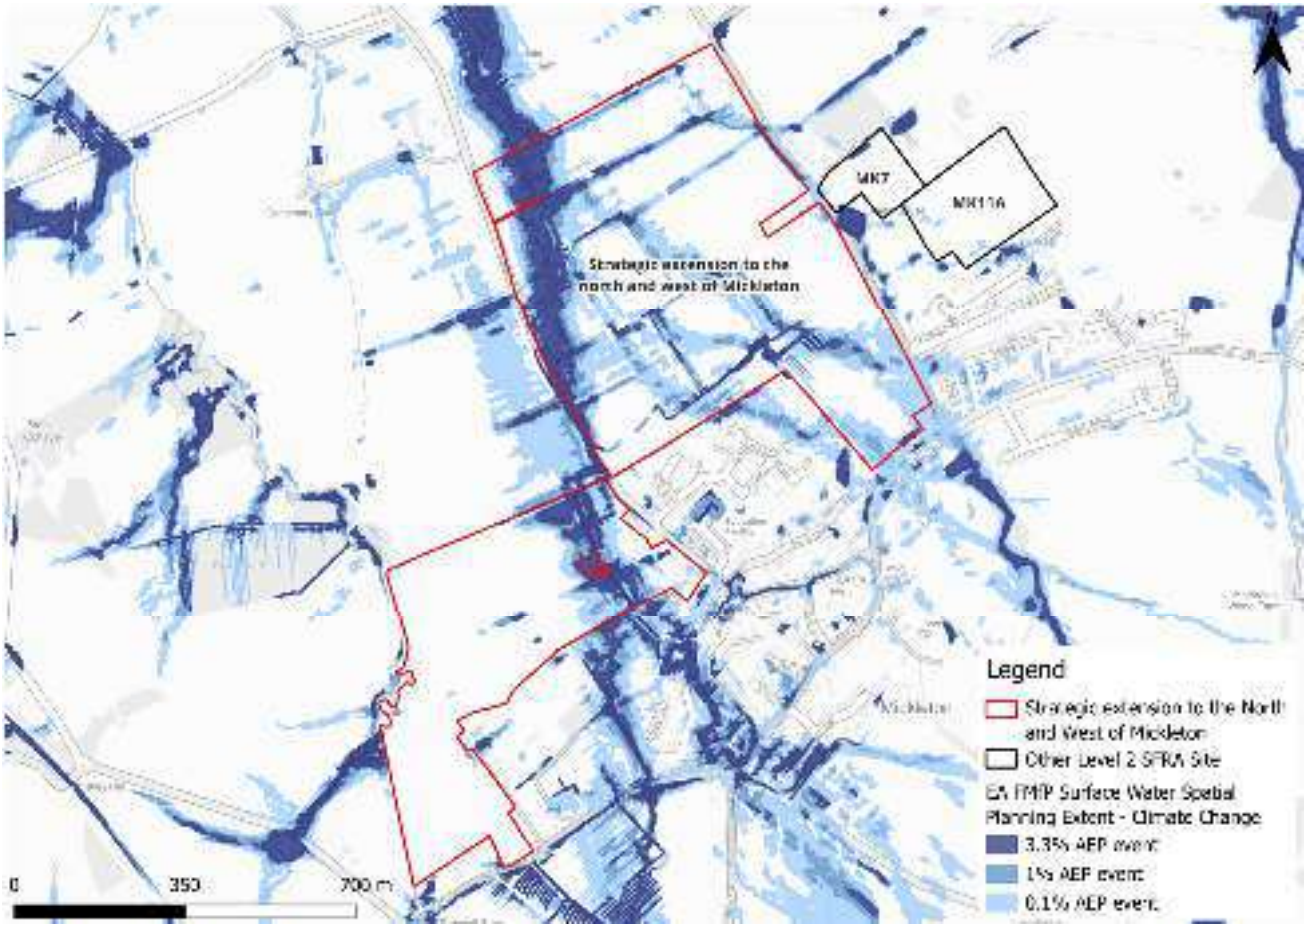

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

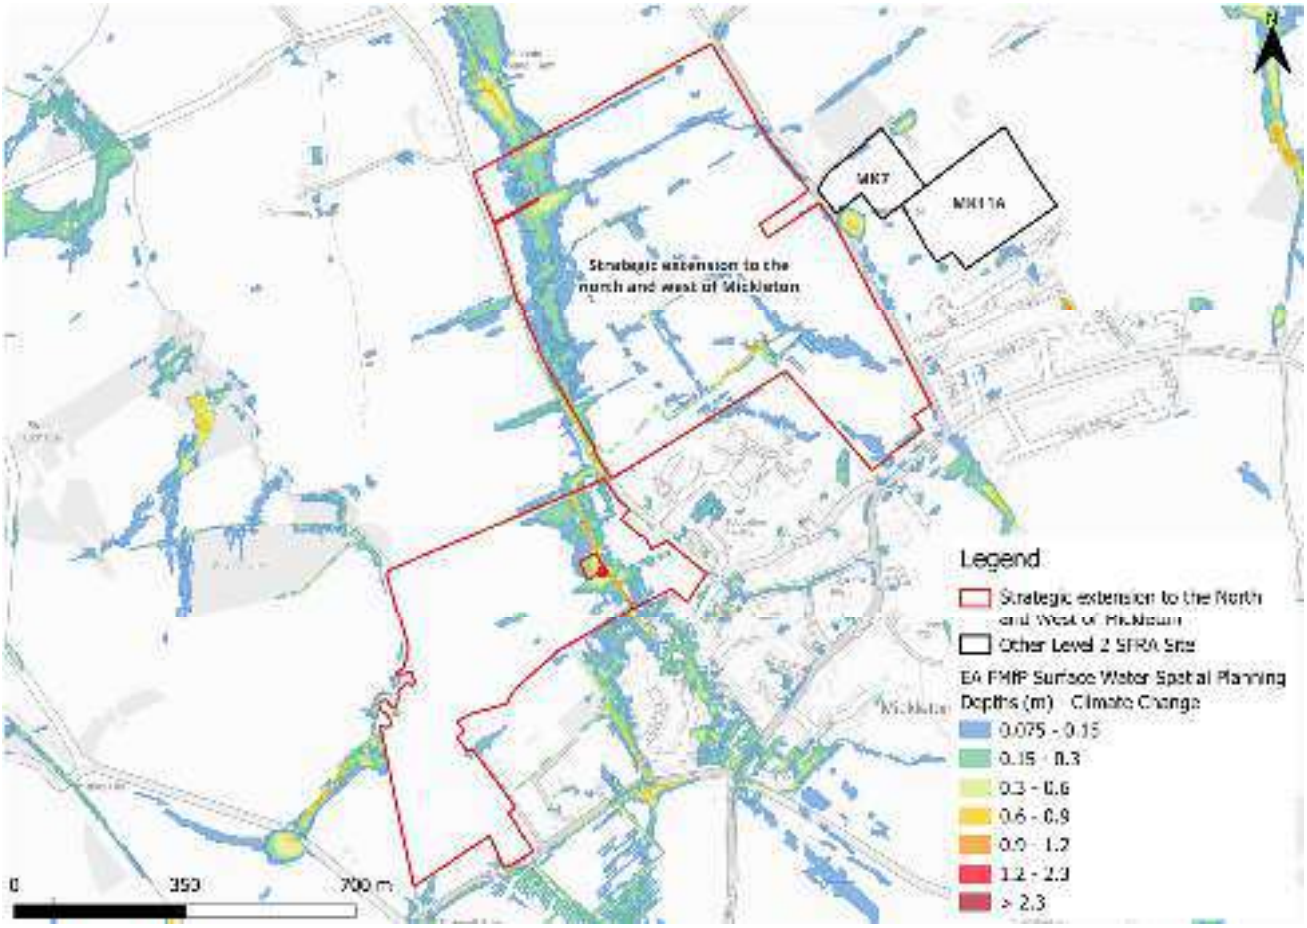

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event surface water flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is categorised as 'significant' (Figure 3-6).

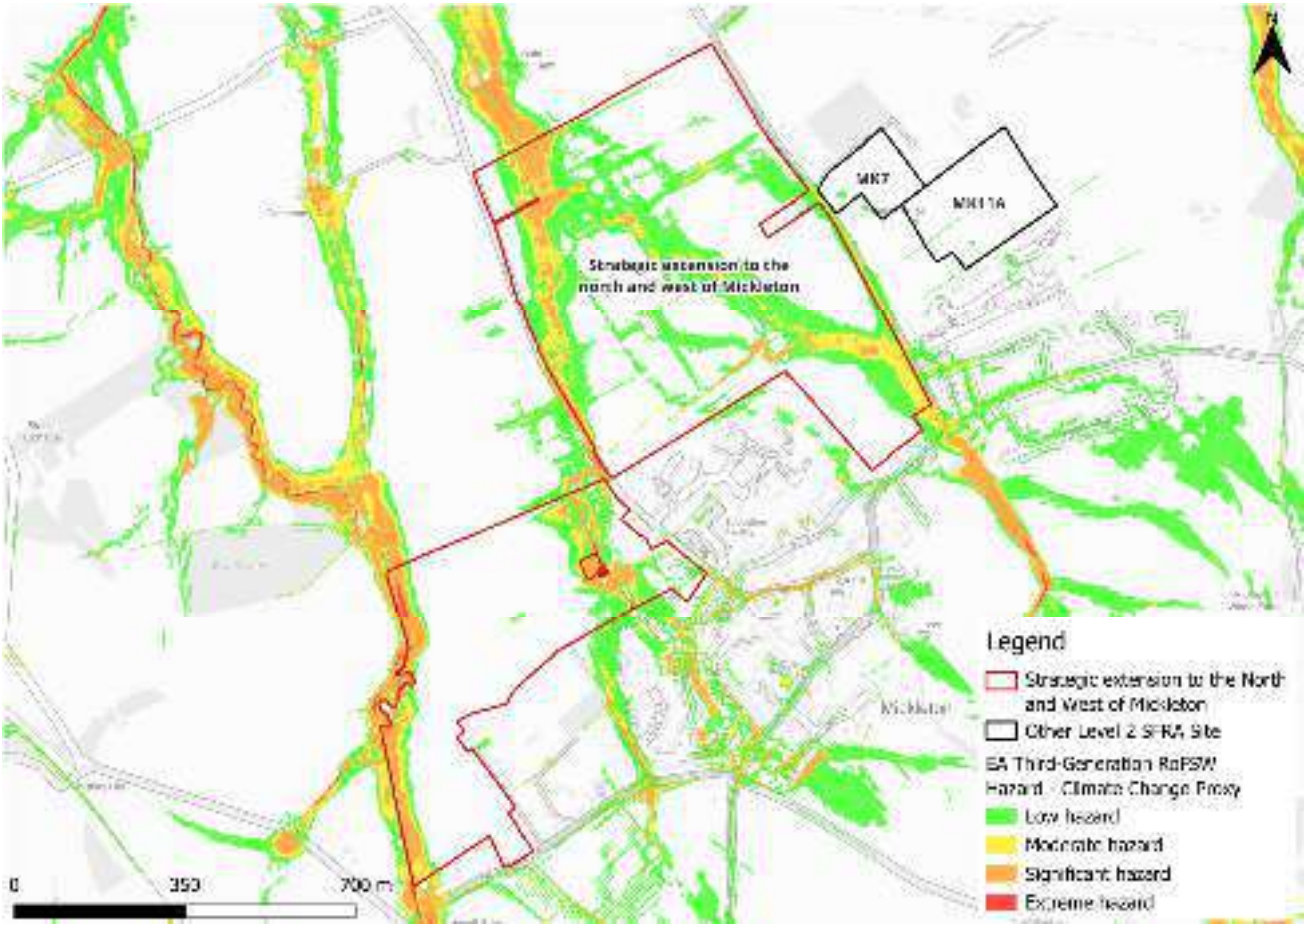

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day 0.1% AEP event surface water flood hazard as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There have been 22 recorded sewer flooding incidents within the Campden & Vale Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 81% of the site being outside of the 0.1% AEP surface water flood extent. However, there is a significant surface water flow path present through the centre of the two site parcels, along the ordinary watercourse, and a number of smaller flow paths feeding it.
- The significant surface water flow path and contributary ditches onsite should be considered and included in site design and ideally left in place to flood naturally when required.
- Based on the surface water flood extents in the northeastern site parcel, it may be challenging to develop this parcel and mitigate surface water flood risk onsite.
- Risk to the site is shown to increase in extent within the site when considering the impact of climate change.

- A detailed drainage strategy must be carried out at the FRA stage to ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.
- Safe access and escape routes would likely be achievable via multiple locations when considering surface water risk.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within a medium sensitivity catchment, namely, the Noleham Bk - source to conf R Avon catchment. Planning considerations for sites at medium sensitivity to the cumulative impacts of development can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications.

The entire site is located within an area where there is no risk of groundwater emergence. Infiltration SuDS may therefore be suitable at this site.

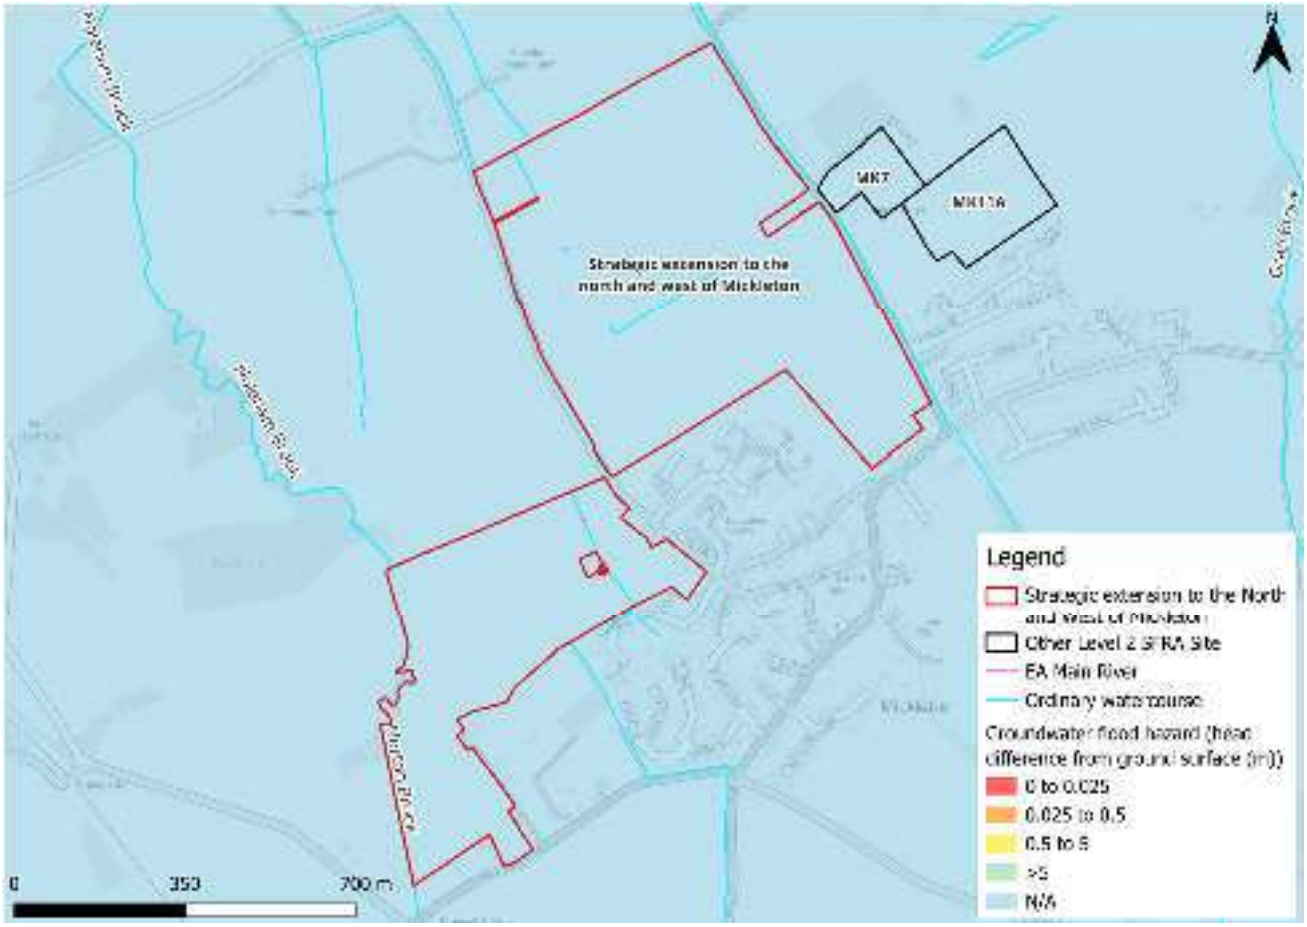

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is mudstone, siltstone, limestone and sandstone (Figure 5-2). Mudstone and siltstone generally have a low permeability and low level of porosity, reducing infiltration rates. There is no record of superficial deposits in the area.

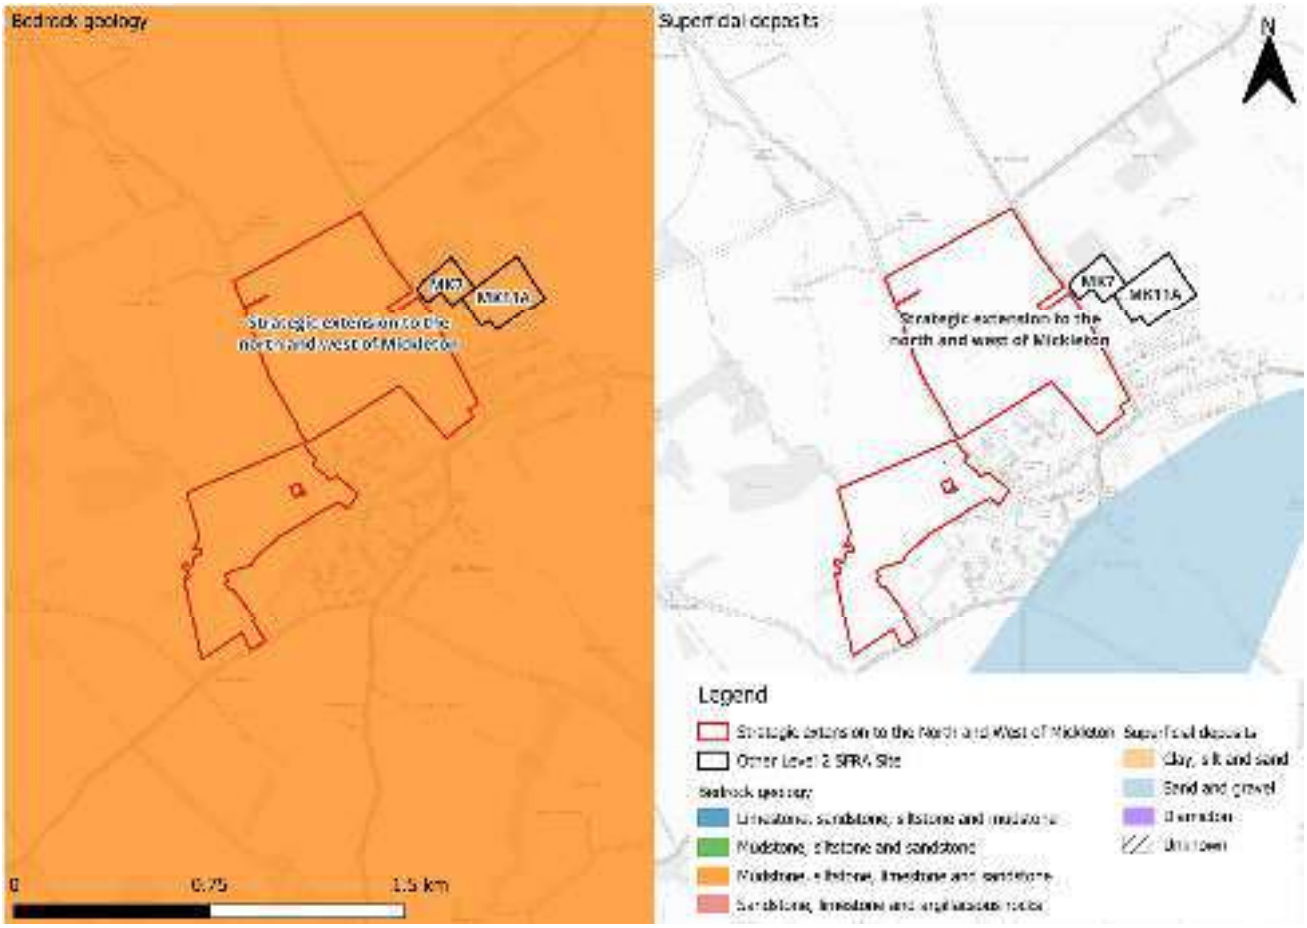

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There is no potential residual risk to the site.

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is required to pass part b) of the exception test as it is proposed for more vulnerable residential development and is partially located within Flood Zone 3a. The site would likely pass the Exception Test given fluvial risk is confined to the boundary of the southwestern site parcel. However, the EA may require detailed modelling of Norton Brook may to inform the reapplication of the Exception Test.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be possible to develop this site for residential uses given its location largely within Flood Zone 1 and surface water risk largely confined to distinct flow paths through the site.
- There should be no development within the area of functional floodplain present onsite. The risk area should be included within a blue green corridor offering multifunctional benefits alongside flood risk mitigation including BNG contributions, and social and amenity benefits.
- Updated modelling of Norton Brook may be carried out to robustly define the risk to the site for both present day and with climate change, including flood depths and hazards.
- Development should include the significant surface water flow paths through the site in site design. This would require a detailed drainage strategy.
- A drainage strategy should also ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WCAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

Contract

JBA Project Manager	Mike Williamson
Address	Phoenix House, Lakeside Drive, Centre Park, Warrington, WA1 1RX
JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Joanne Corbett of Cotswold District Council. Laura Thompson-Jones of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken between June and July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

Acknowledgements

We would like to thank the Environment Agency for their assistance with this work.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for the strategic extension to the south of Preston. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Strategic extension to the south of Preston

- Location: Preston
- Existing site use: Agricultural land
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential led mixed use
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 100.4
- Watercourse: Unnamed ordinary watercourses
- Environment Agency (EA) flood model: No detailed model available
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of surface water flood extents, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

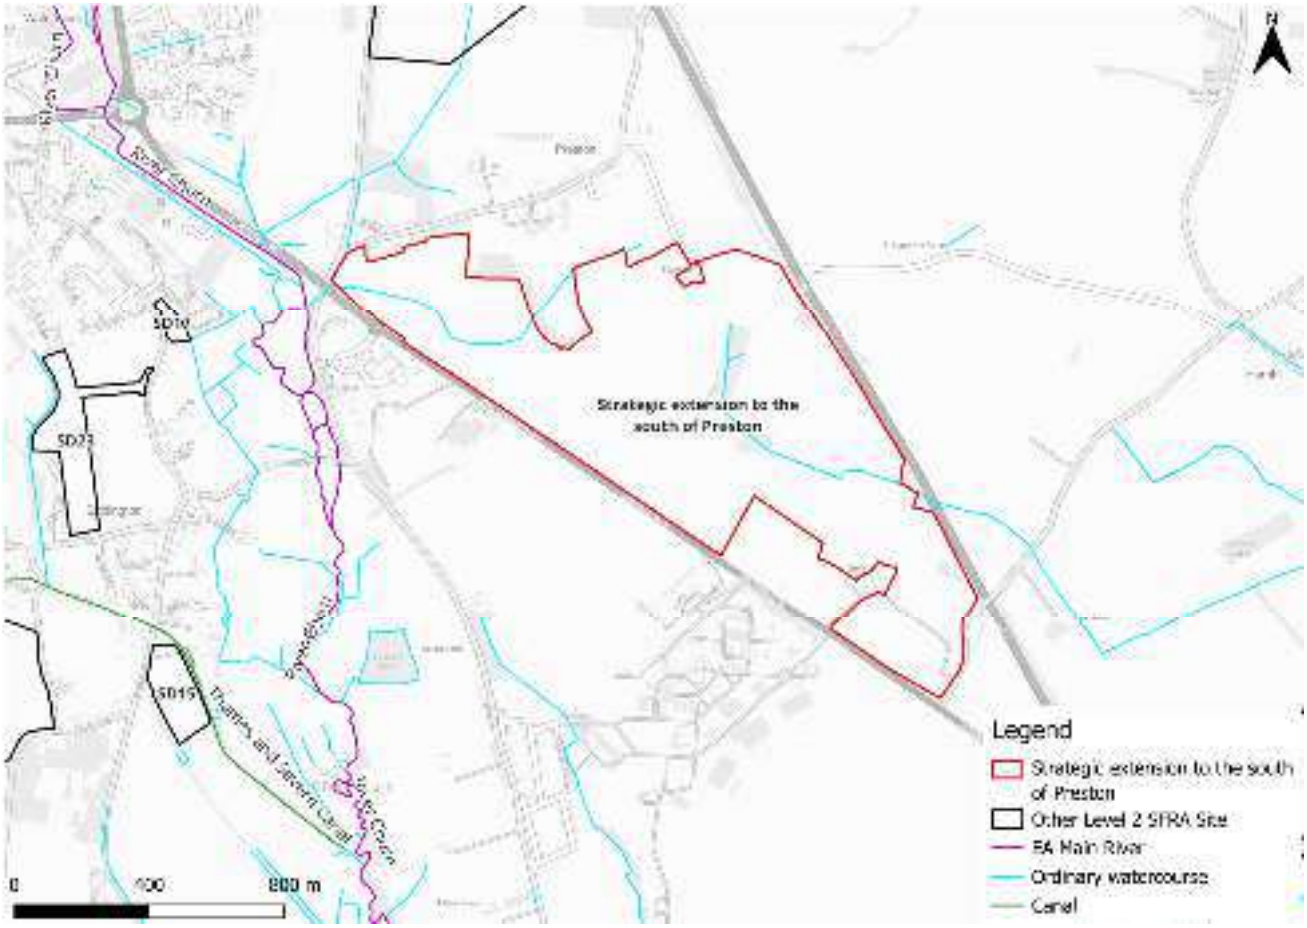

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

The site is located at a higher elevation than the surrounding areas, with the highest elevation through the centre of the site, sloping towards the River Churn floodplain to the west and the Ampney Brook floodplain to the east (Figure 1-3).

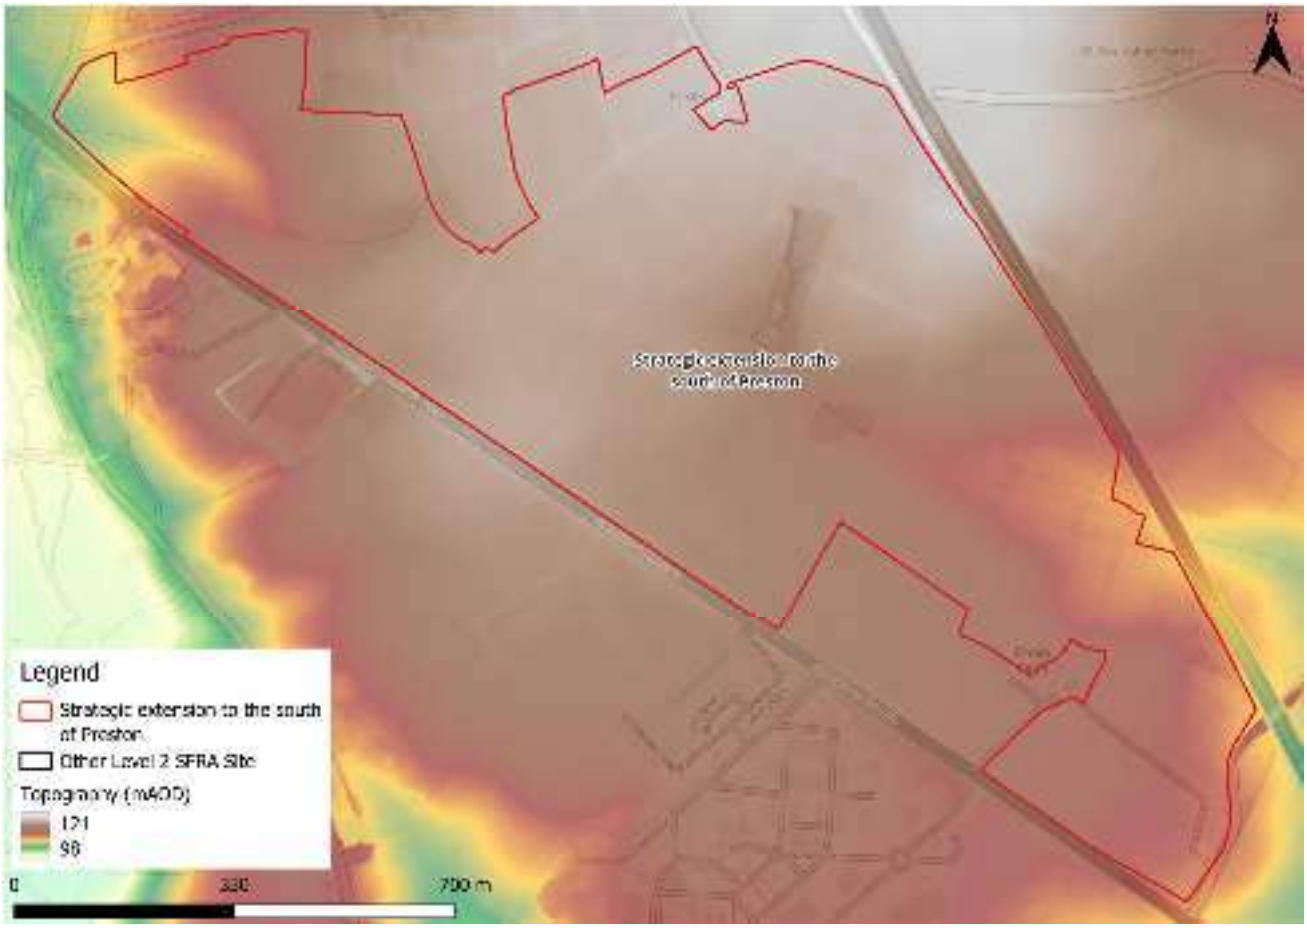

Figure 1-3: Topography

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the site is wholly located within Flood Zone 1 and therefore at low risk of flooding from rivers (Figure 2-1). Please note, the Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

There are two unnamed, unmodelled ordinary watercourses running through the site. The EA's New National Model (NNM) does not cover these watercourses, therefore the potential fluvial risk posed to the site cannot be assessed. This should be considered as part of a site-specific FRA.

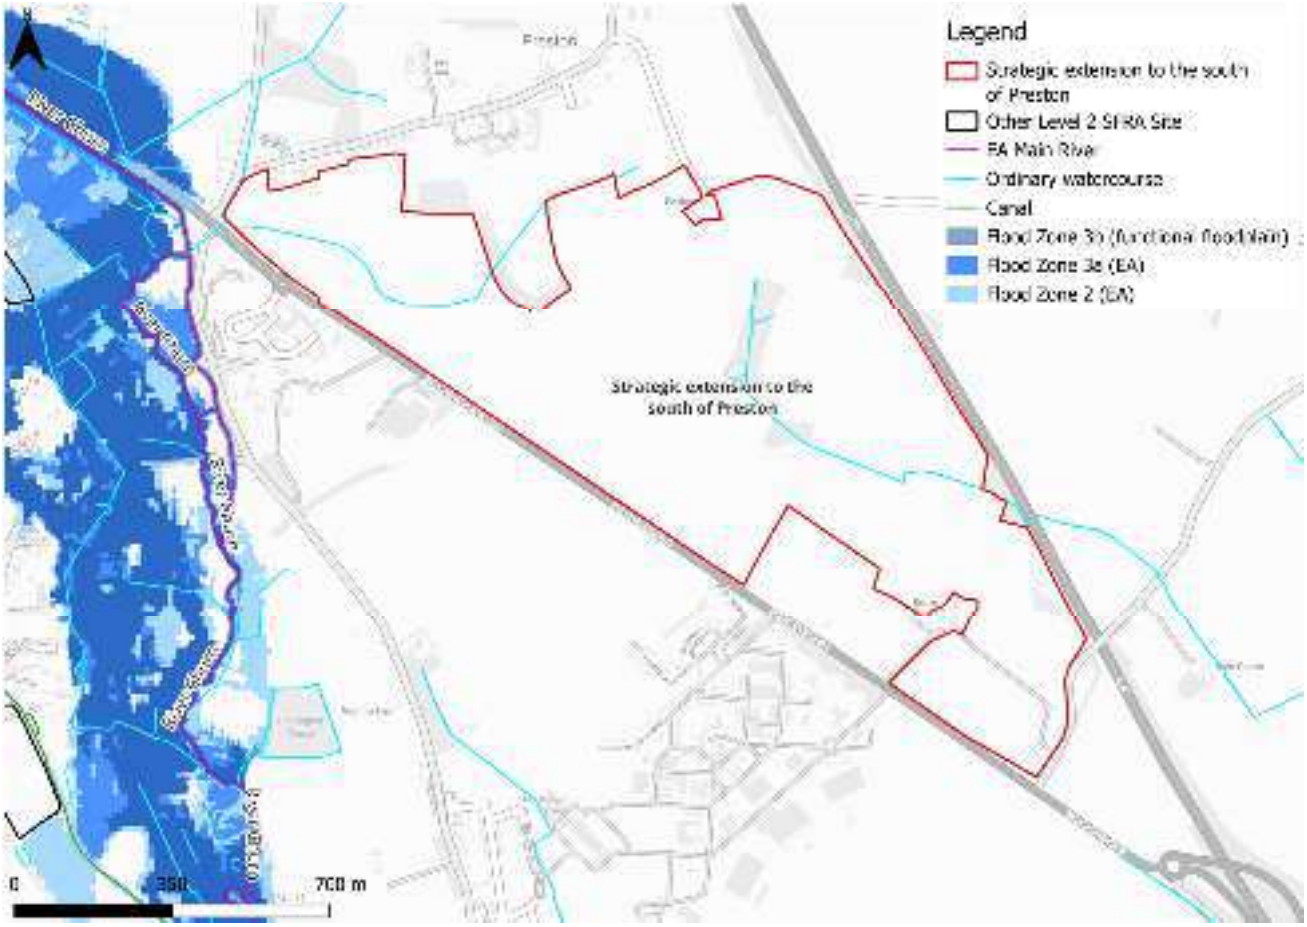

Figure 2-1: Present day risk

2.2 Impacts from climate change

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Gloucestershire and the

Vale Management Catchment. The central allowance within this catchment is 26% on peak flows (Table 2-1). There is no local detailed model for the unnamed watercourses through the site, therefore the required event cannot be assessed.

Table 2-1: Modelled climate change allowances for peak river flows within the Gloucestershire and the Vale Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	11	17	33
2050s	11	19	43
2080s	26	41	84

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Based on the EA's Flood Map for Planning - Flood Zones plus Climate Change dataset, the site is not shown to be at increased risk of fluvial flooding when considering climate change.

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been six recorded flooding incidents within the Siddington & Cerney Rural Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-2 shows that the site and wider area could benefit from riparian tree planting. Tree planting can help to slow the flow to benefit areas downstream. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

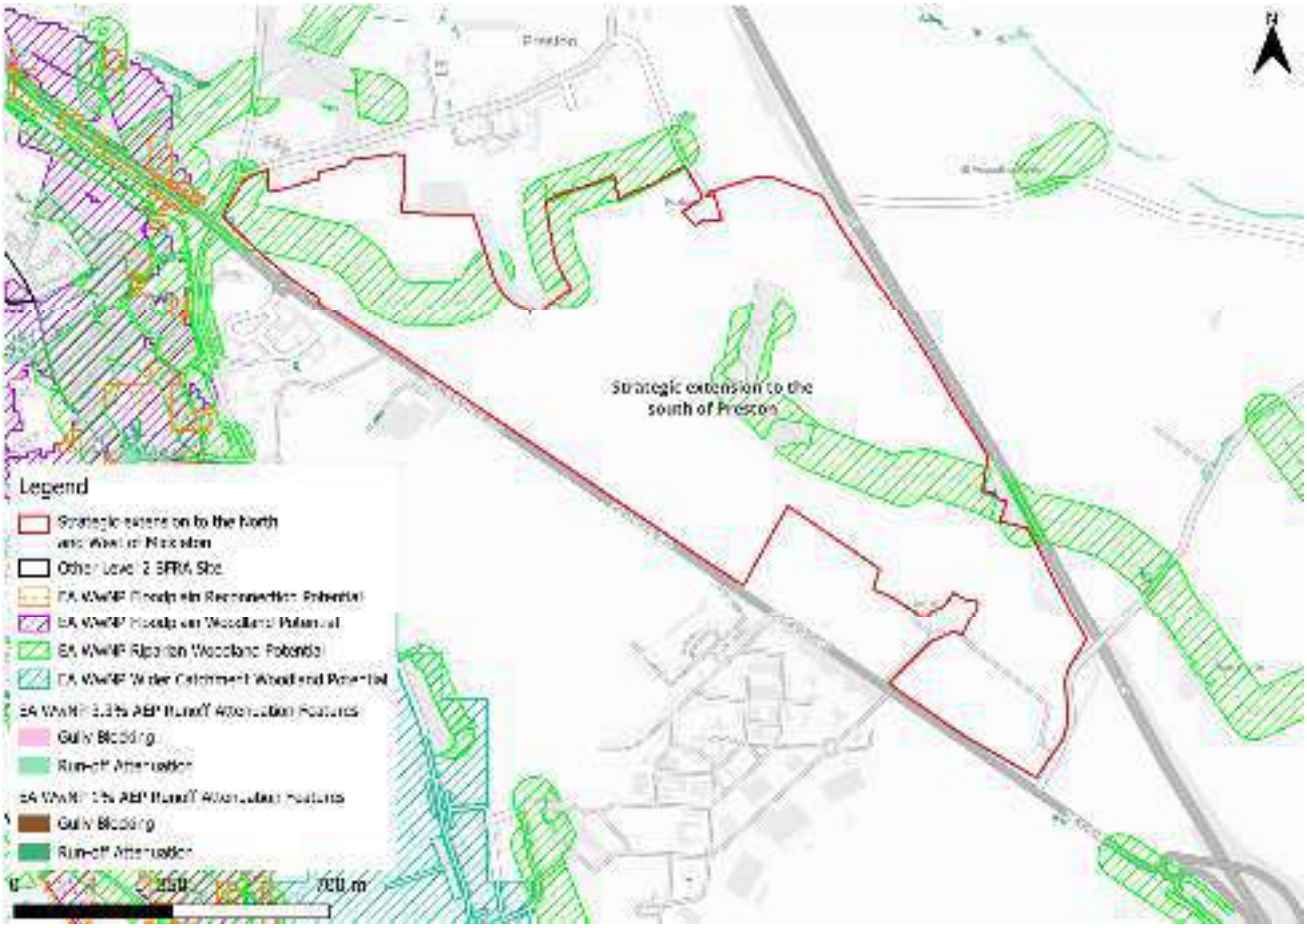

Figure 2-2: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warning and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The site is not located within a FAA.

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes could likely be achieved during a flood event via multiple locations surrounding the site (Figure 2-3).

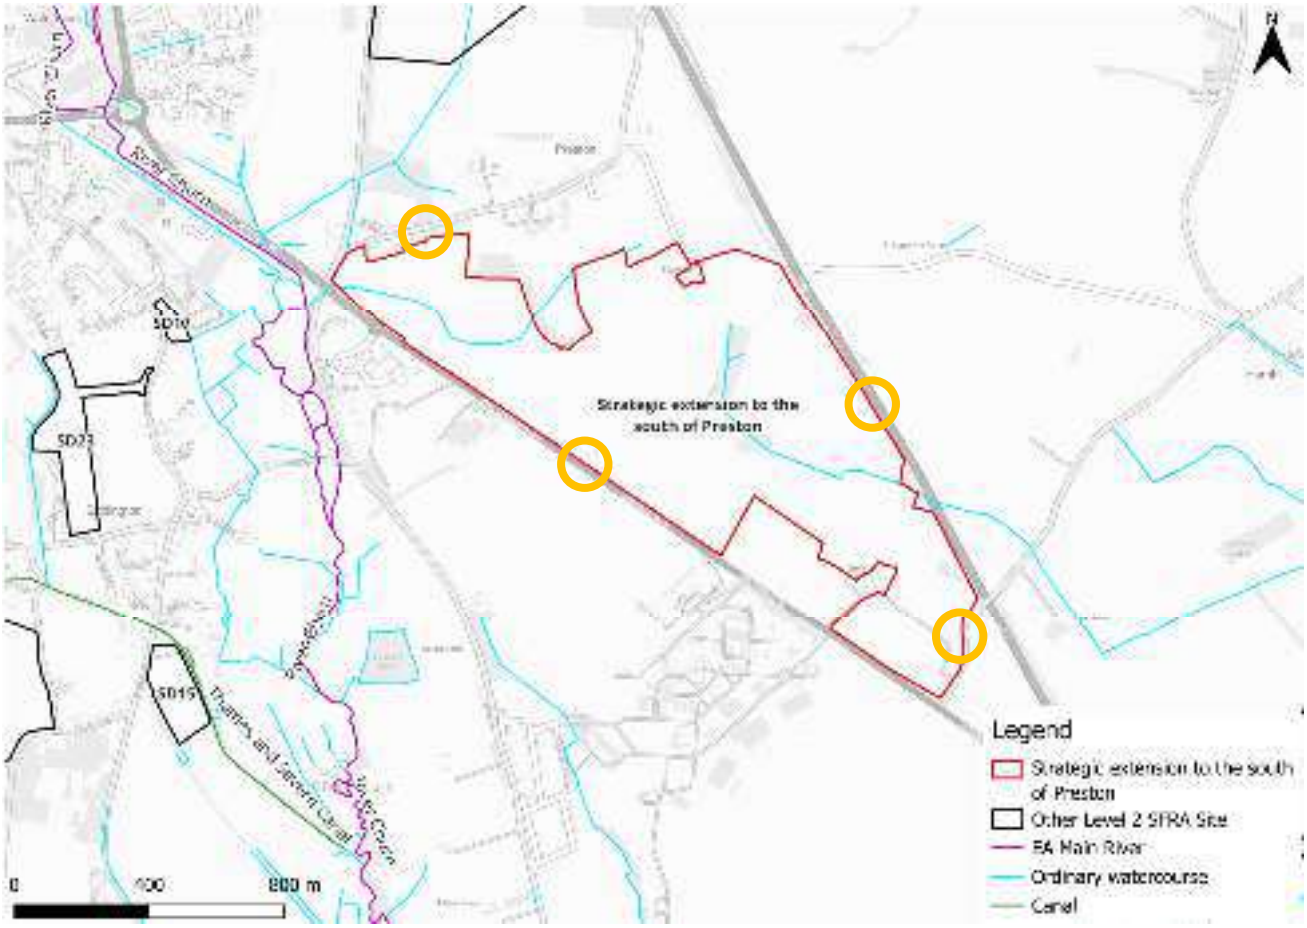

Figure 2-3: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site is located wholly within Flood Zone 1 and therefore at low risk of flooding from rivers.
  - The site is not shown to be at increased risk from fluvial flooding in the future, based on the EA's Flood Zones plus Climate Change dataset.
  - The potential fluvial risk posed by the unnamed ordinary watercourses cannot be assessed given no modelling is available. This should be considered as part of a site-specific FRA.
- Mitigation:
  - No development buffers should be in place along the ordinary watercourses in the form of blue green corridors, which can provide a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits.
- Access and escape:
  - Based on current information, safe access and escape routes appear achievable via multiple locations surrounding the site.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents map (May 2026), surface water risk across the site is nominal, as shown in Table 3-1 and Figure 3-1. Surface water risk is present across the site as areas of scattered ponding in topographic low spots. There is a surface water flow path within the east of the site, which is confined to the channel of the unnamed ordinary watercourse.

Greatest surface water flood depths in the 1% AEP event are between 0.3 and 0.6 m (Figure 3-2). Safe access and escape routes are achievable via multiple locations surrounding the site.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
97	1	1	1

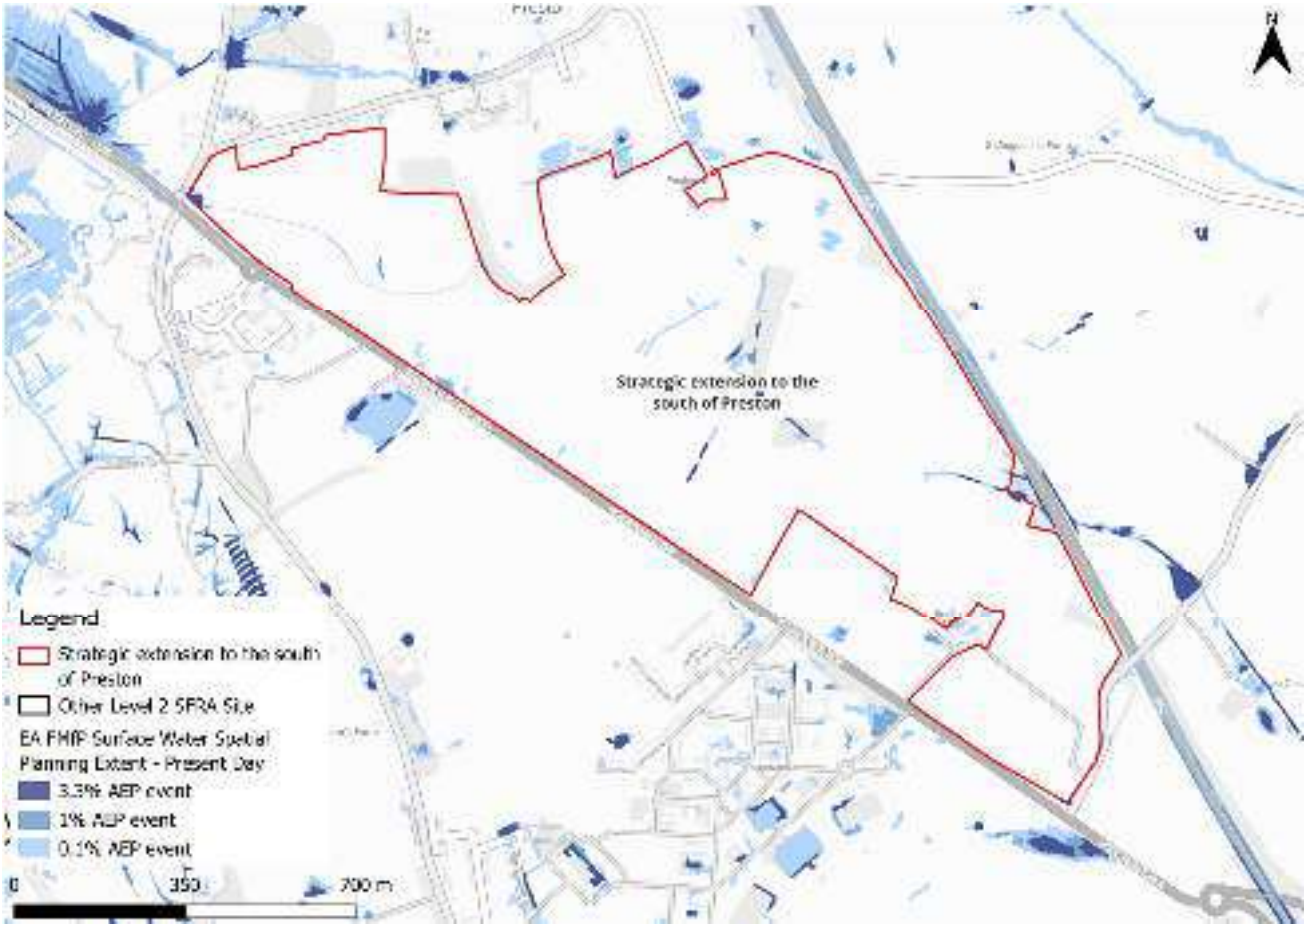

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

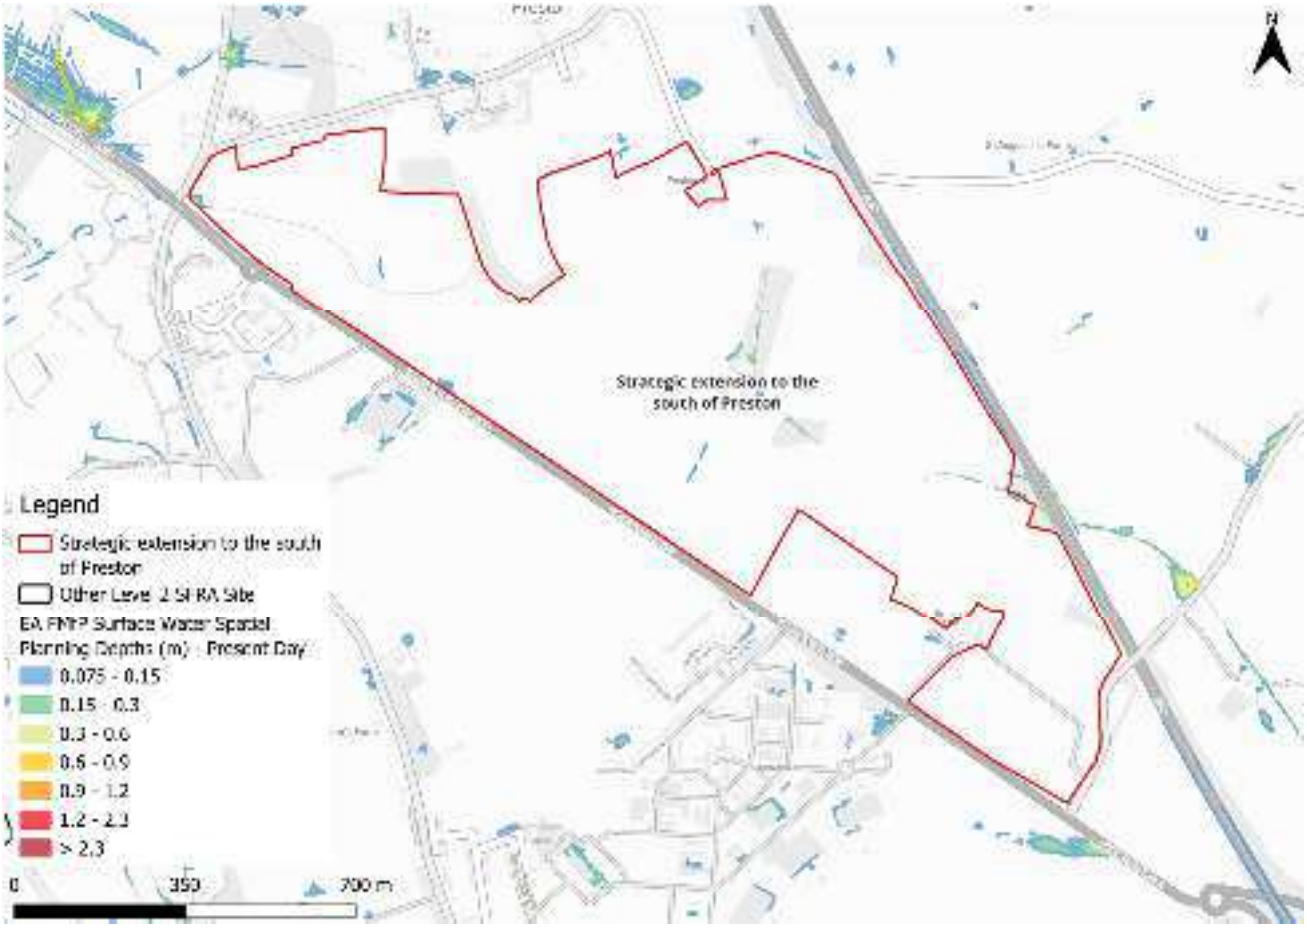

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows there to be an area of 'moderate' flood hazard (Figure 3-3). There are differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping whereby the RoFSW shows a much larger area to be at risk. Given the differences between the two datasets, the hazard information should be discounted and assessed further at the FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

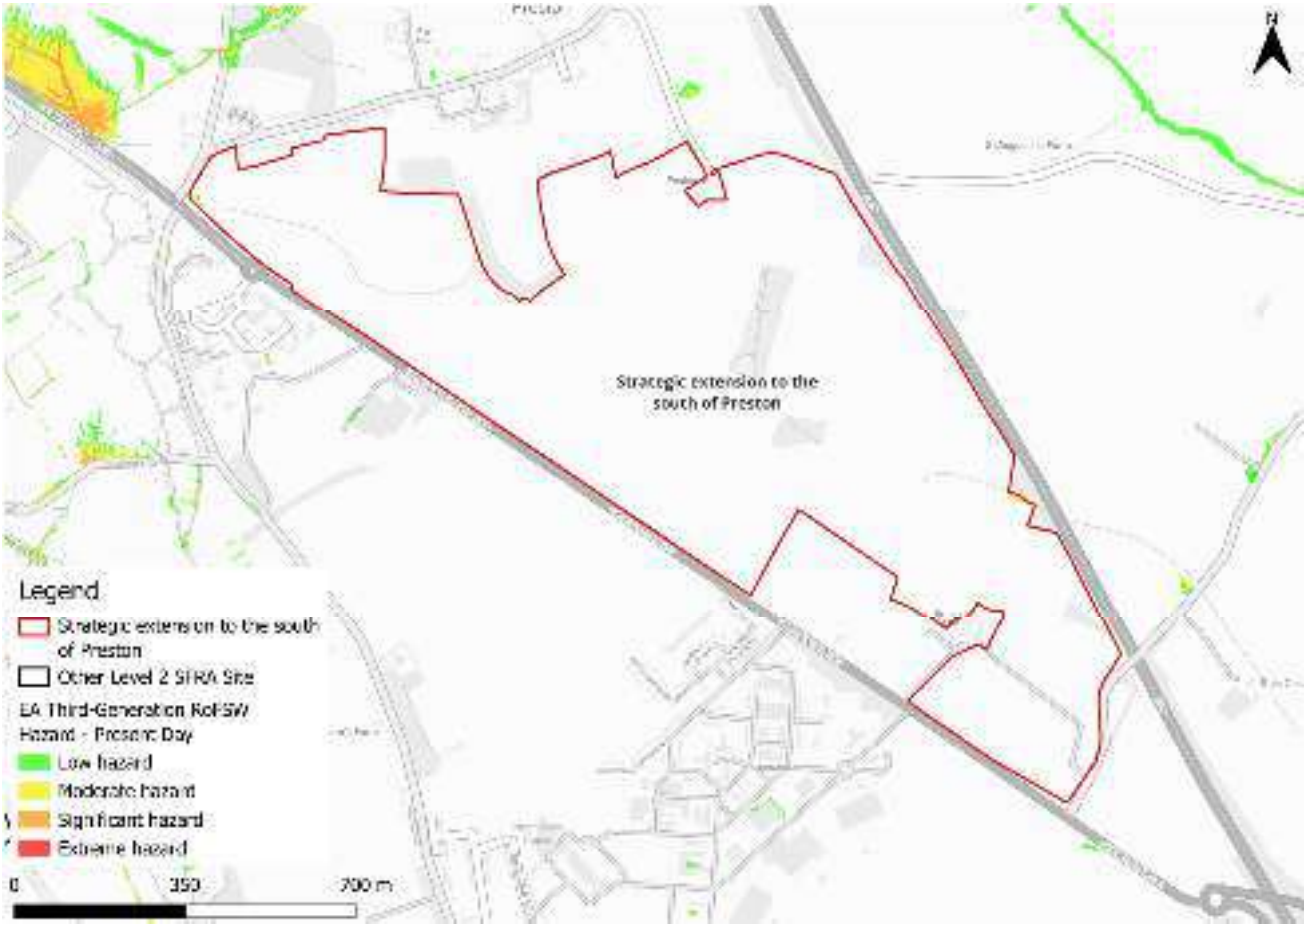

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day 1% AEP event surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Gloucestershire and the Vale management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Gloucestershire and the Vale Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. Surface water risk is not shown to increase significantly across the site when considering climate change. Flood depths are shown to remain at between 0.3 and 0.6 m (Figure 3-5). Safe access and escape routes would likely remain achievable via several locations surrounding the site.

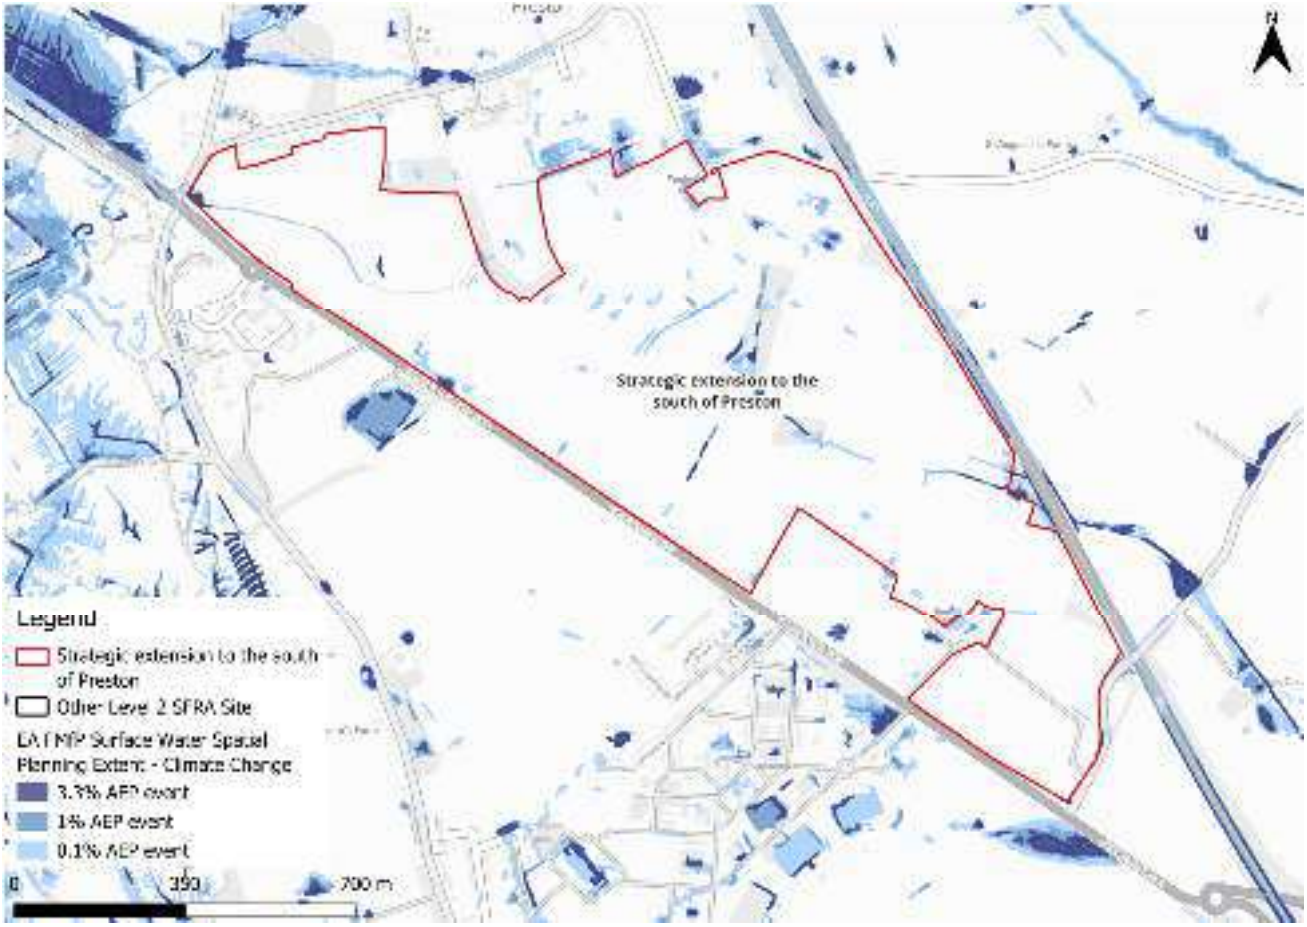

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

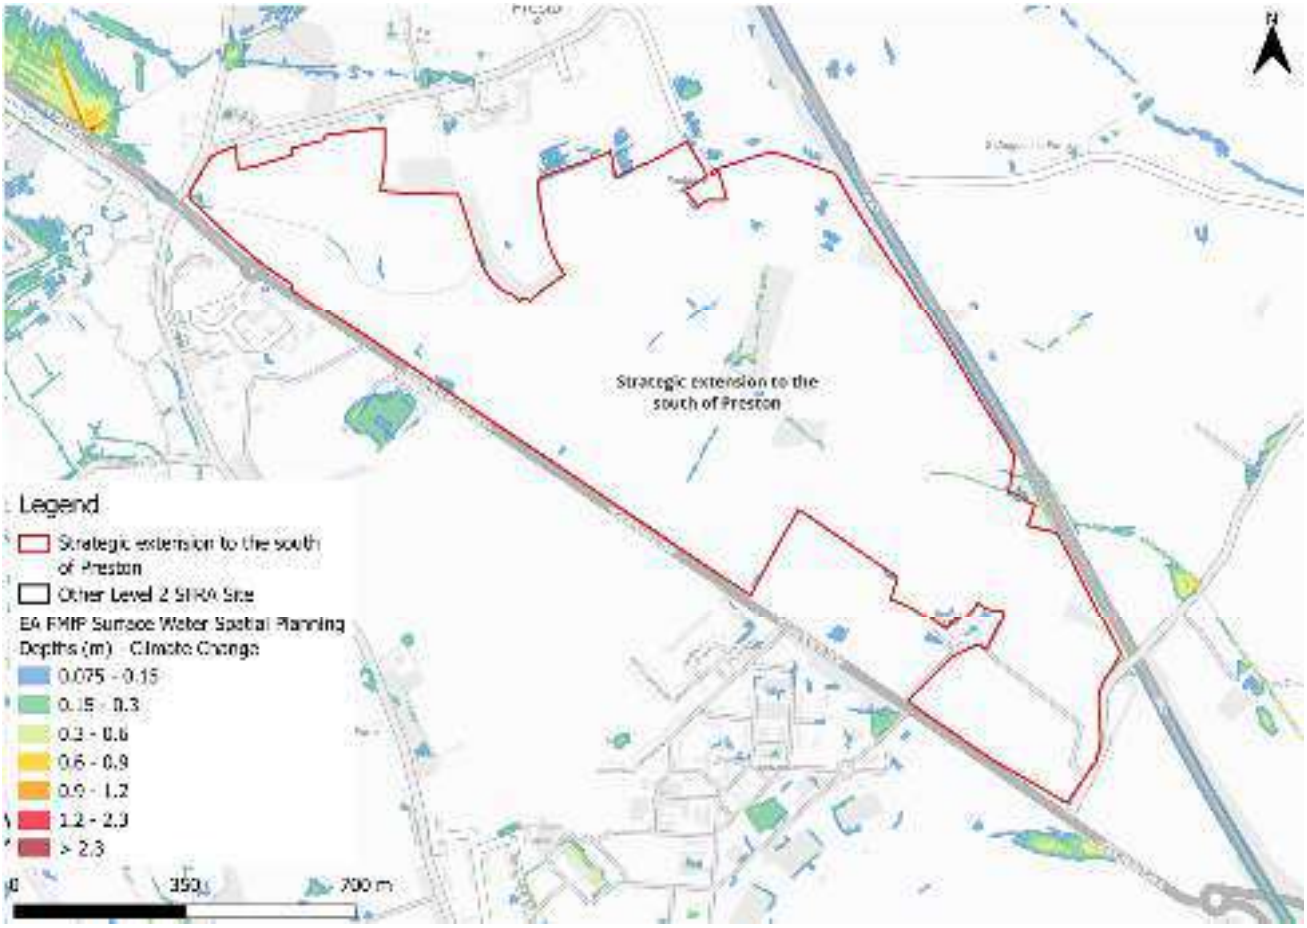

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event surface water flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is categorised as 'moderate' outside of the ordinary watercourse channel (Figure 3-6).

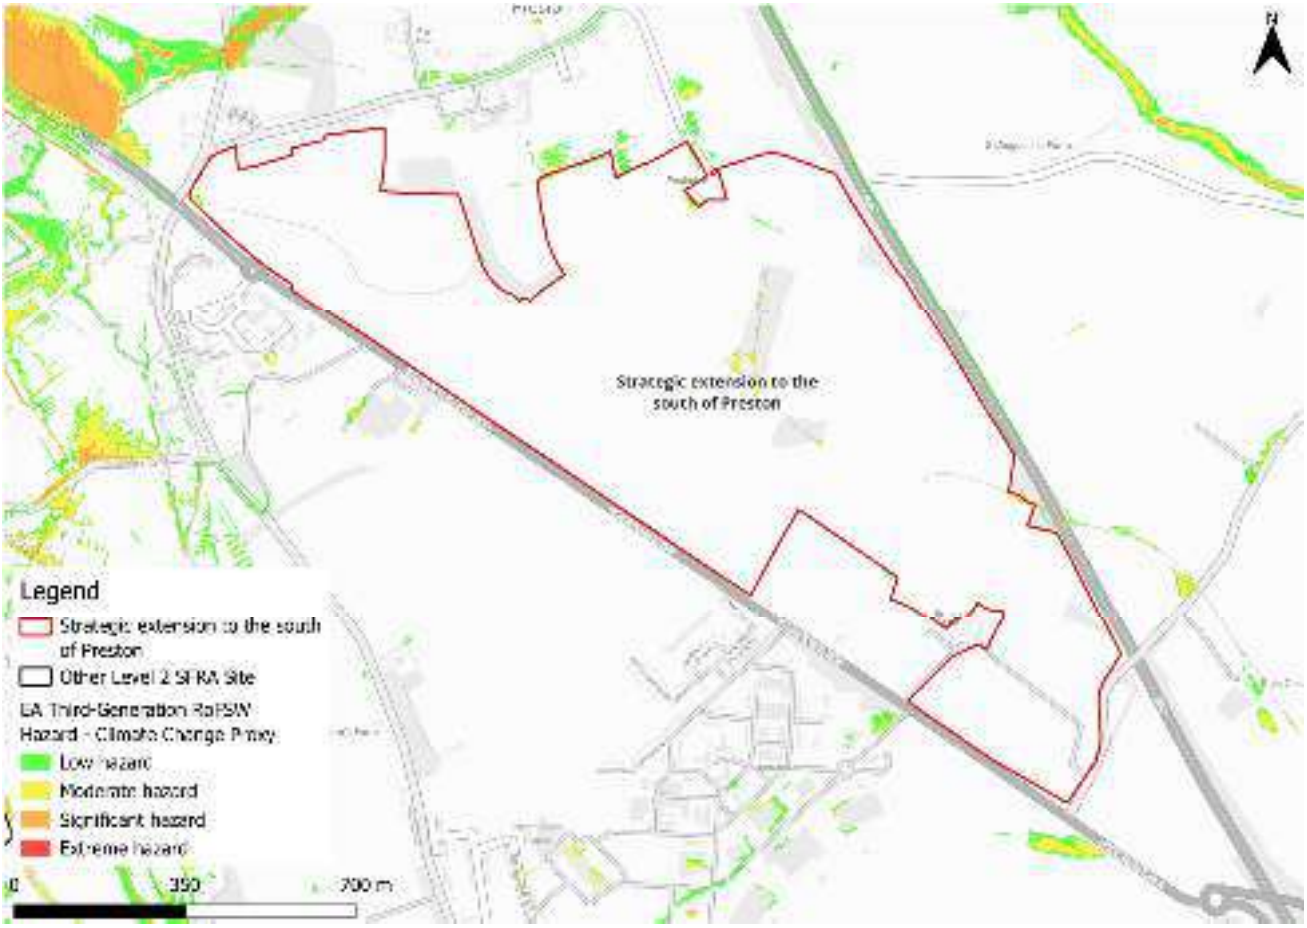

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day 0.1% AEP event surface water flood hazard as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There have been no recorded sewer flooding incidents within the Siddington & Cerney Rural Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 97% of the site being outside of the 0.1% AEP surface water flood extent. Surface water risk is largely present as areas of scattered ponding across the site.
- Topographic low spots, and the surface water flow paths along the course of the ordinary watercourses onsite, should be considered and included in site design and left in place to flood naturally when required.
- Risk to the site is not shown to increase significantly in extent within the site when considering the impact of climate change.
- The drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or

betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.

- Safe access and escape routes would likely be achievable via multiple locations when considering surface water risk.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within two catchments, namely Churn (Baunton to Cricklade) and Ampney and Poulton Brooks (Source to Thames). These have been identified as high and low sensitivity catchments respectively. Planning considerations for sites at high sensitivity to the cumulative impacts of development can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications.

The majority of the site is located within an area where there is a risk of groundwater emergence to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.

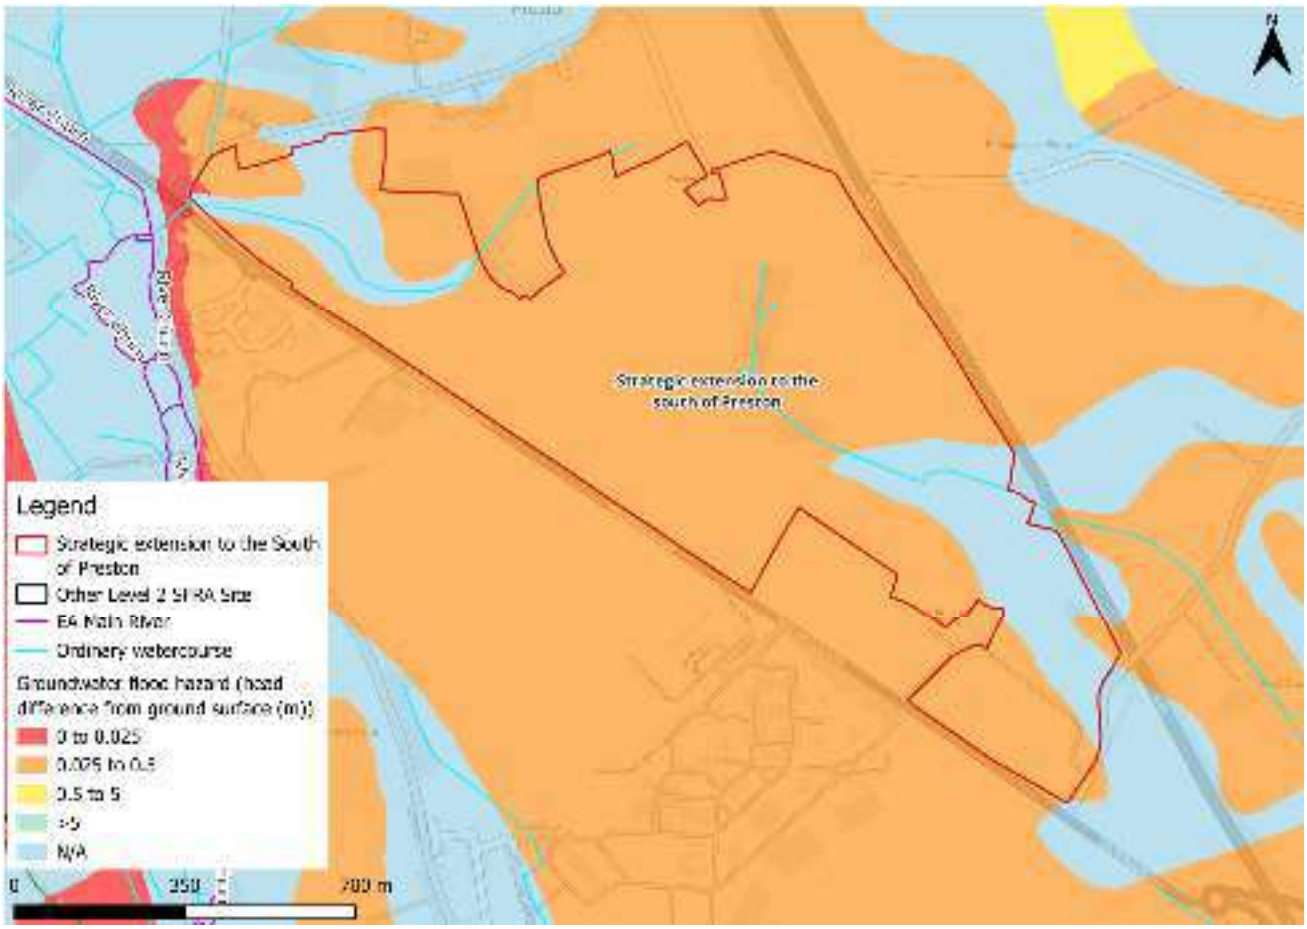

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is sandstone, limestone and argillaceous rocks (Figure 5-2). Limestone and argillaceous rocks vary widely in permeability and porosity. There is no record of superficial deposits in the area. Based on the groundwater emergence map, infiltration SuDS at this site may not be an option, though the drainage strategy for the site should fully investigate water table levels through standpipe monitoring during the period of highest groundwater levels e.g. November to April.

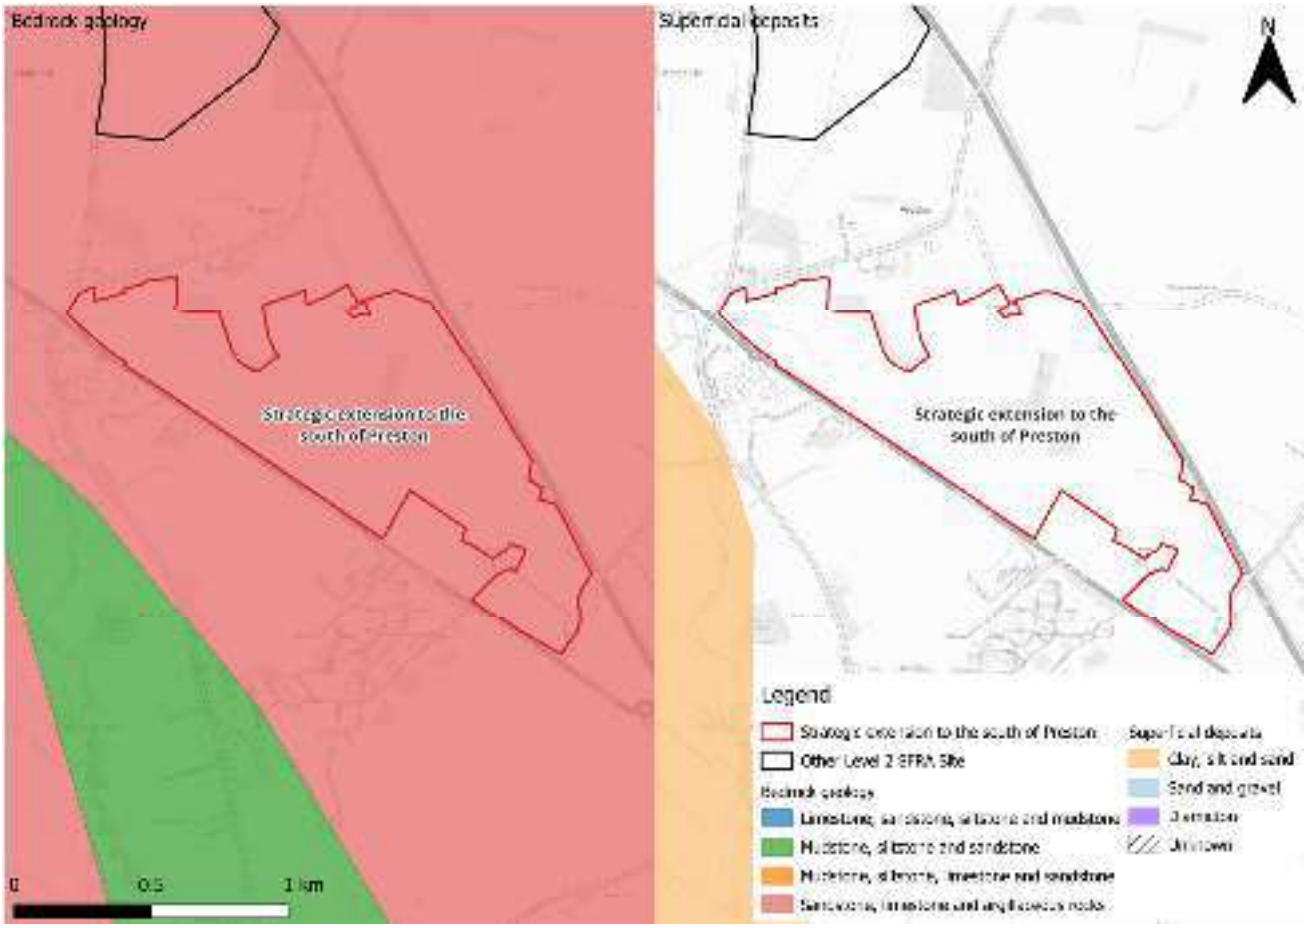

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets. Residual risk at this site comes from the potential blockage or structural failure of the culverts beneath the A419 to the east of the site and Swindon Road to the west.

6.1 Potential blockage

A blockage or structural failure of the structures beneath the A419 or Swindon Road may cause water in the channel to back up and cause flooding to the site, depending on the severity of the blockage and magnitude of the flood event. Culvert course and condition surveys may be required, including for consultation with the culvert owner.

Figure 6-1 indicates the location of the culverts beneath the A419 and Swindon Road. The potential residual risk to the site following a blockage of this asset should be assessed through the site-specific FRA.

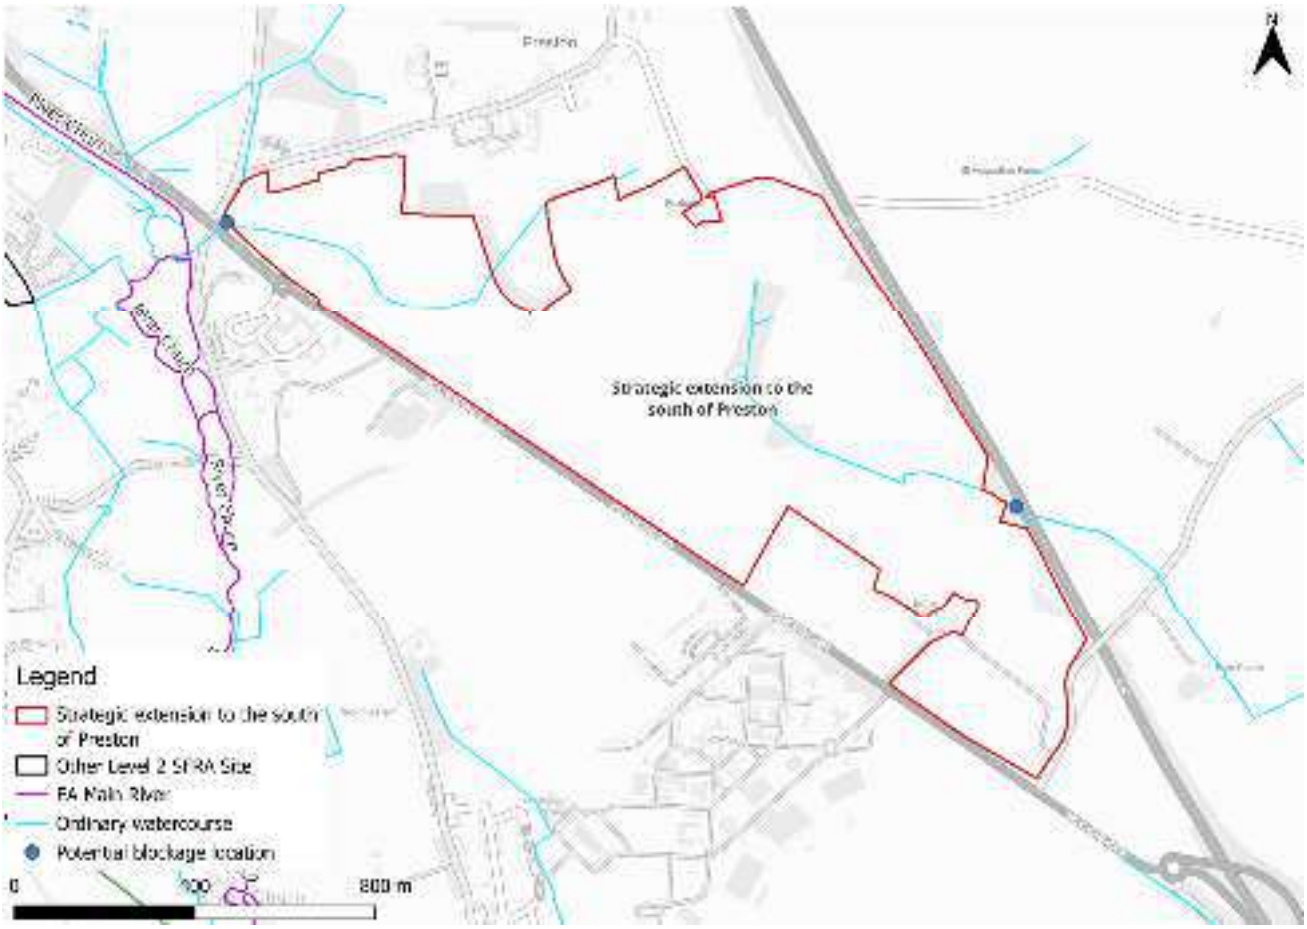

Figure 6-1: Potential blockage location

6.2 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is not required to pass part b) of the exception test, as it is not located within Flood Zone 3a, however it must still be proven that the development can be safe for its lifetime, which is generally considered to be 100 years for residential development.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be possible to develop this site for residential uses given its location within Flood Zone 1 and nominal surface water risk.
- Ideally, no development buffers should be in place along the unnamed ordinary watercourses in the form of blue green corridors, which can provide a flood storage function as well as providing BNG, ecological, amenity, social, and wellbeing benefits.
- Modelling of the unnamed ordinary watercourses onsite should be carried out to robustly define the risk to the site for both present day and with climate change.
- A drainage strategy should inform site layout and design. Greenfield runoff rates or betterment should apply.
- Groundwater conditions must be investigated further through the site-specific FRA. This should be assessed through standpipe monitoring during the period of highest groundwater levels e.g. November to April.
- The FRA should undertake a capacity and condition assessment of the culverts beneath the A419 to the east of the site and Swindon Road to the west.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WCAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

Contract

JBA Project Manager	Mike Williamson
Address	Phoenix House, Lakeside Drive, Centre Park, Warrington, WA1 1RX
JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Joanne Corbett of Cotswold District Council. Laura Thompson-Jones of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken between June and July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site W8C. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site W8C

- Location: Land west of Field Close & north of B4632
- Existing site use: Agricultural land
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential led mixed use
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 1.1
- Watercourse: Unnamed ordinary watercourse
- Environment Agency (EA) flood model: No detailed model available
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of surface water flood extents, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

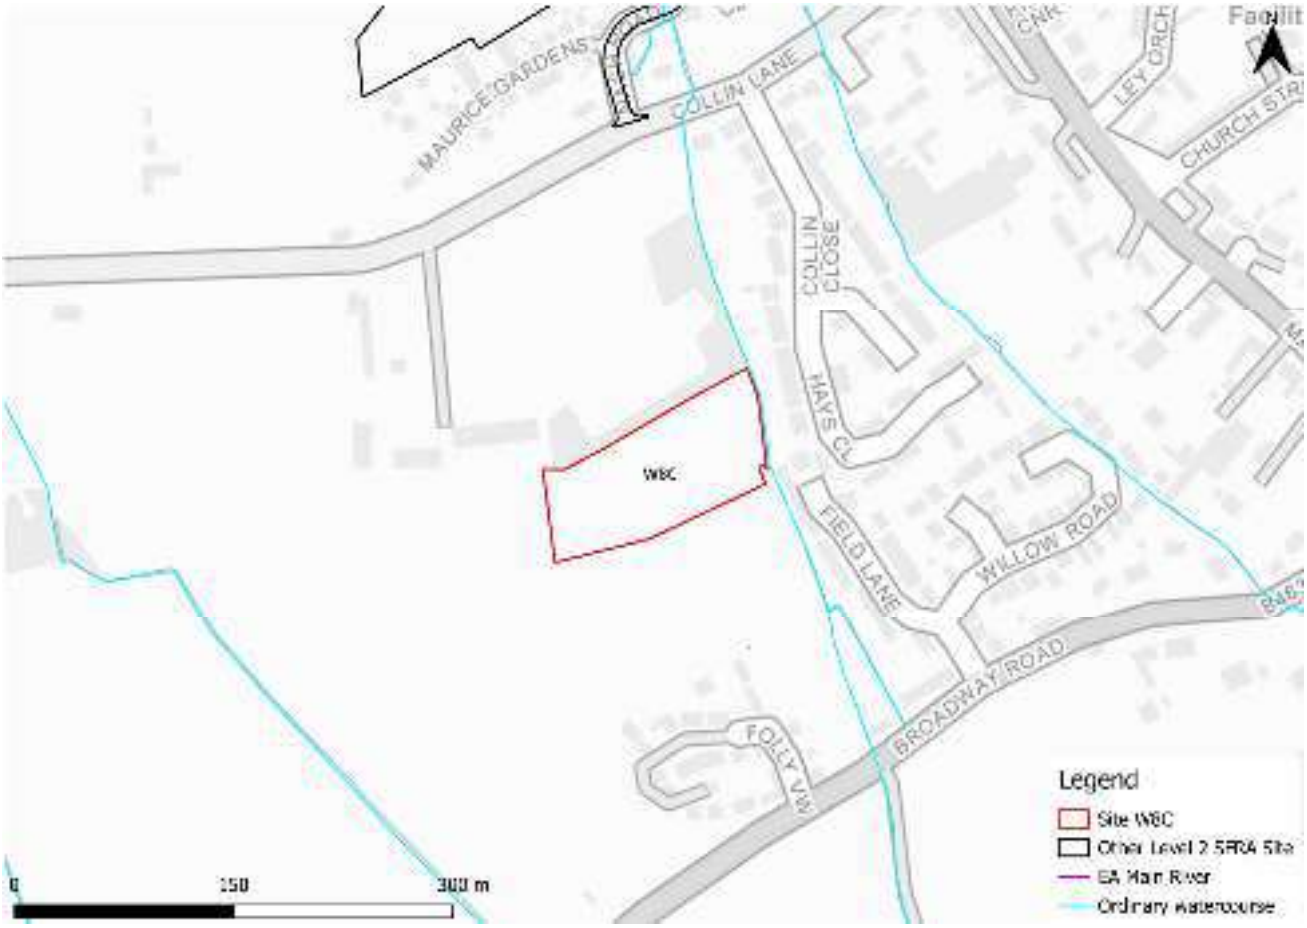

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

The site is located at a higher elevation than the surrounding areas, with the highest elevation through the centre of the site, sloping towards the River Churn floodplain to the west and the Ampney Brook floodplain to the east (Figure 1-3).

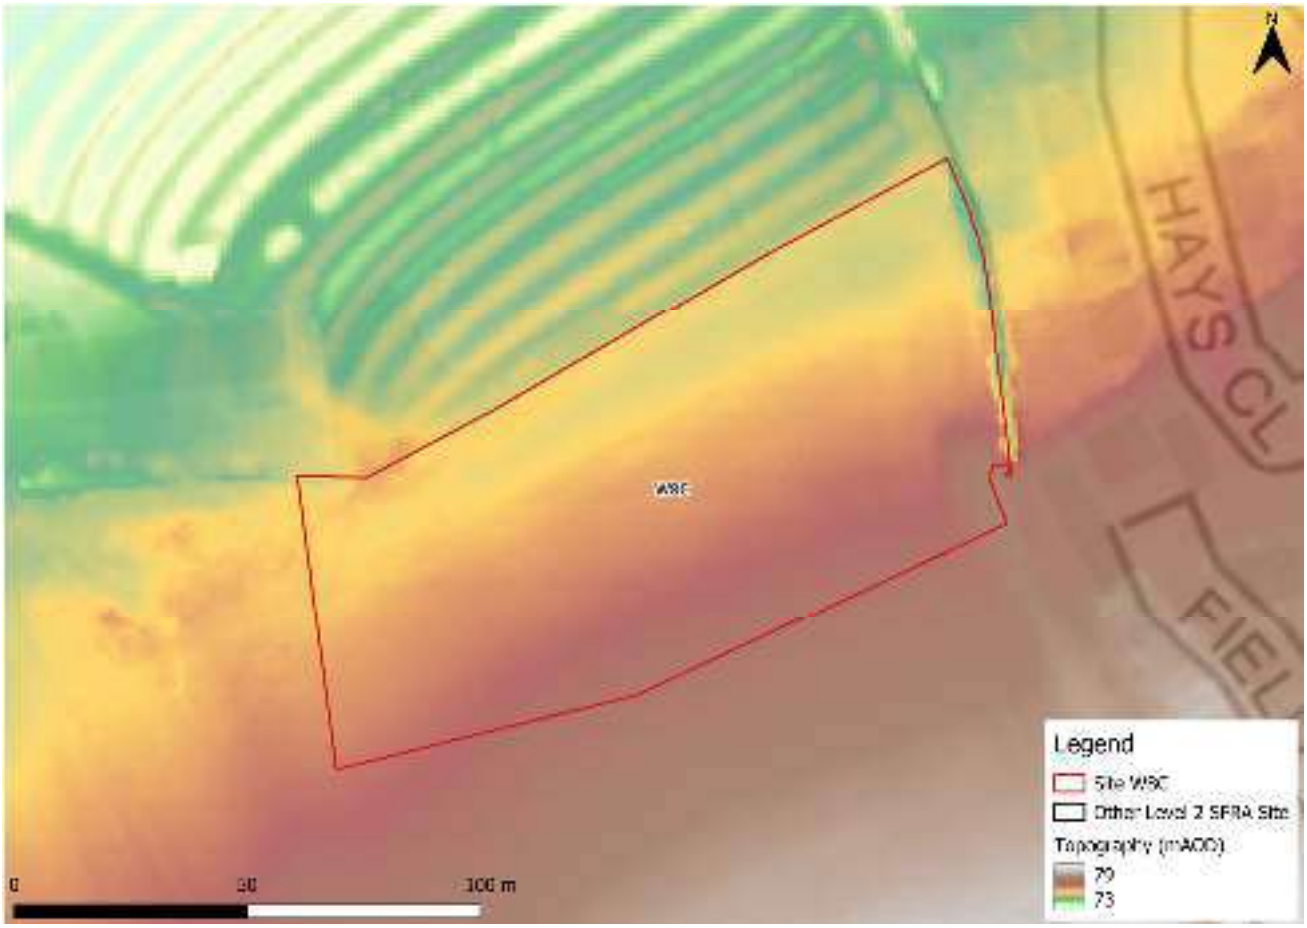

Figure 1-3: Topography

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the site is wholly located within Flood Zone 1 and therefore at low risk of flooding from rivers (Figure 2-1). Please note, the Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

There is an unnamed, unmodelled ordinary watercourses adjacent to the eastern boundary of the site. The EA's New National Model (NNM) does not cover this watercourse, therefore the potential fluvial risk posed to the site cannot be assessed. This should be considered as part of a site-specific FRA.

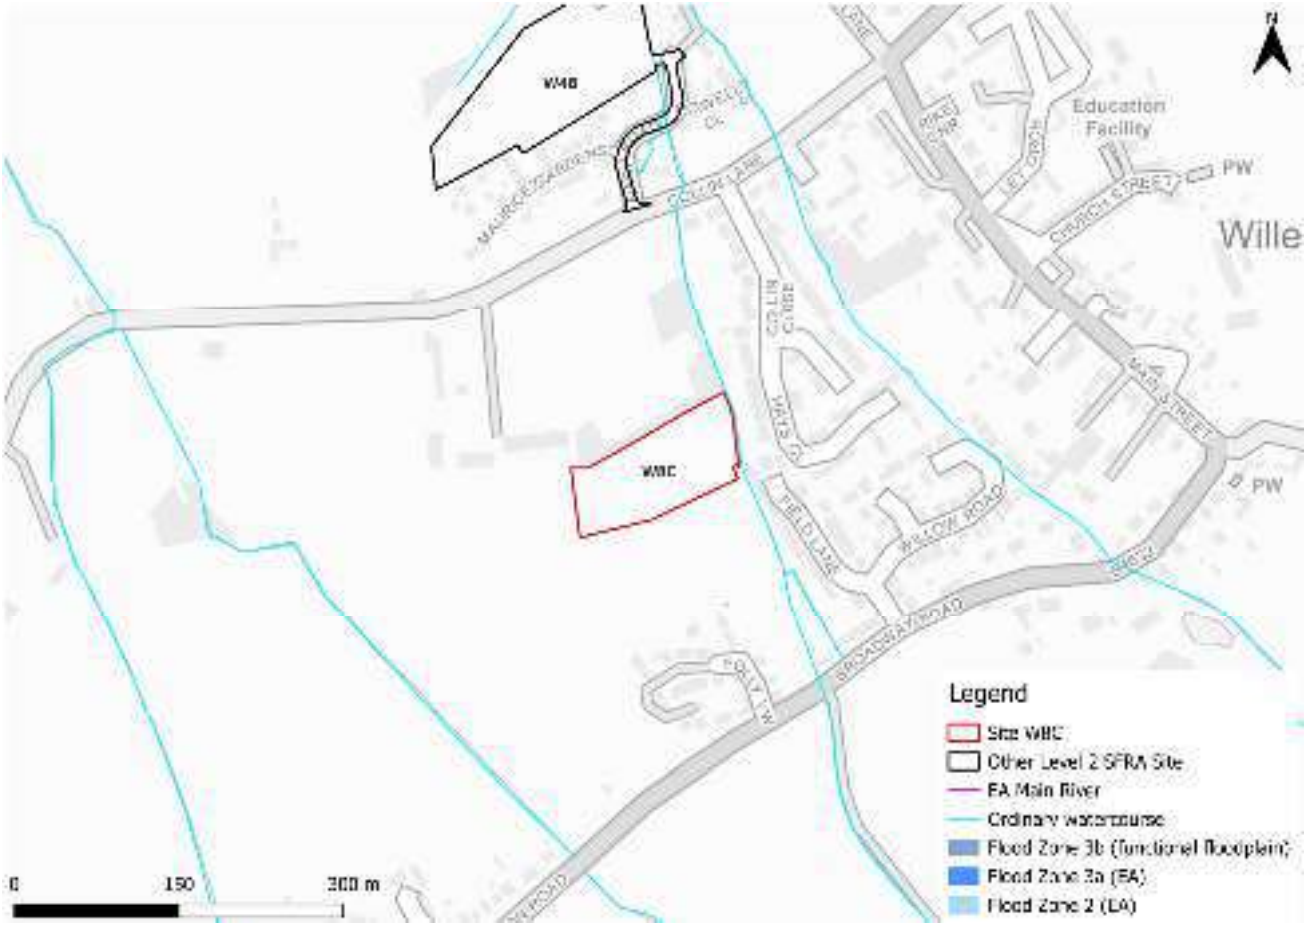

Figure 2-1: Present day risk

2.2 Impacts from climate change

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Avon Warwickshire

Management Catchment. The central allowance within this catchment is 21% on peak flows (Table 2-1). There is no local detailed model for the unnamed watercourses through the site, therefore the required event cannot be assessed.

Table 2-1: Modelled climate change allowances for peak river flows within the Avon Warwickshire Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	7	12	22
2050s	8	14	31
2080s	21	32	59

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Based on the EA's Flood Map for Planning - Flood Zones plus Climate Change dataset, the site is not shown to be at increased risk of fluvial flooding when considering climate change.

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been ten recorded flooding incidents within the Campden & Vale Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-2 shows that the site and wider area could benefit from riparian tree planting. Tree planting can help to slow the flow to benefit areas downstream. There are also opportunities for run-off attenuation features where it may be possible to temporarily store water and attenuate flooding during high flows. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

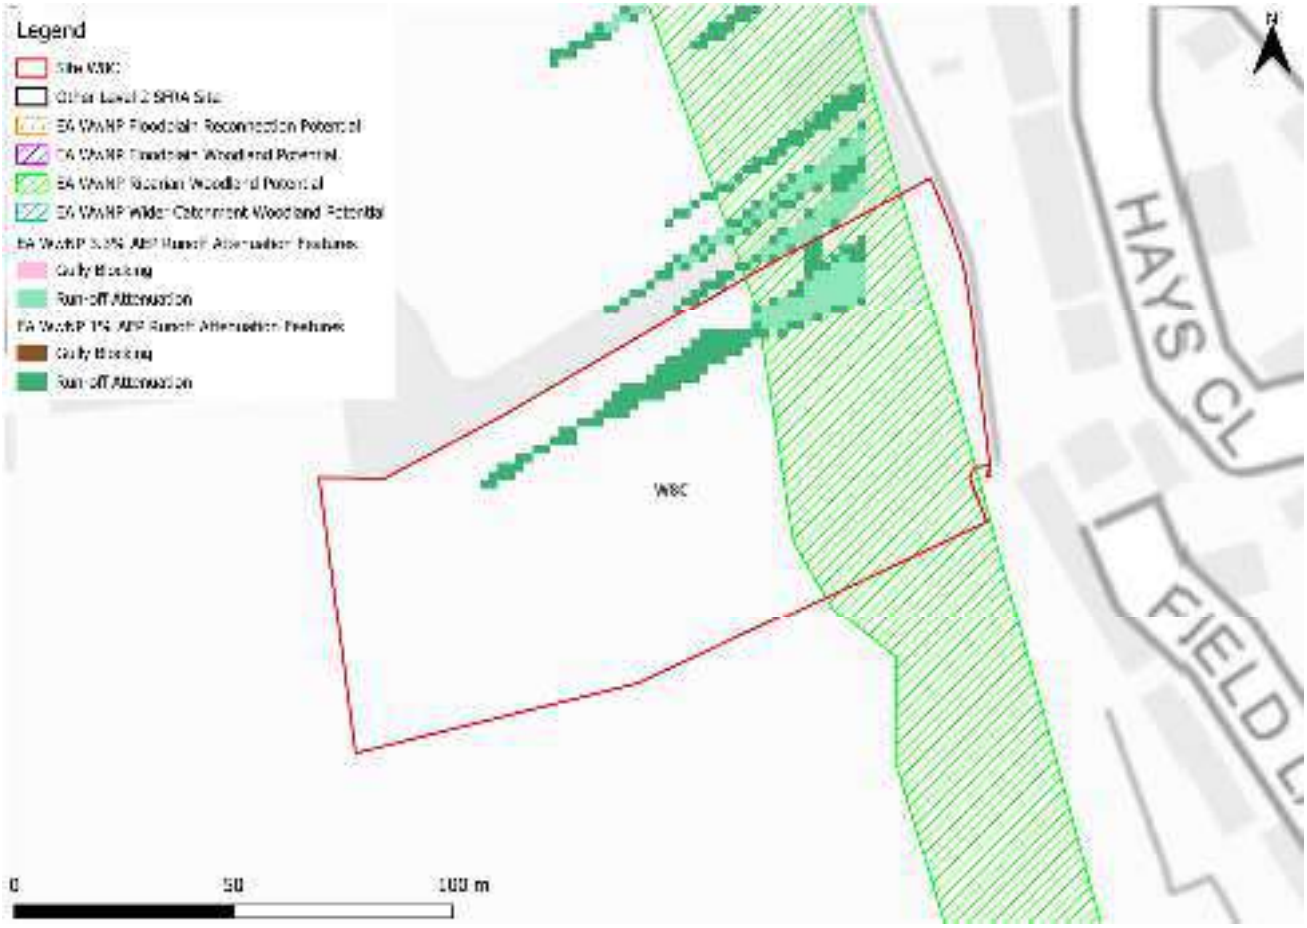

Figure 2-2: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warning and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The site is not located within a FAA.

2.5.2 Access and escape routes

There are no existing access routes to the site. However, based on the Flood Map for Planning, safe access and escape routes would likely be achievable via multiple locations surrounding the site (Figure 2-3).

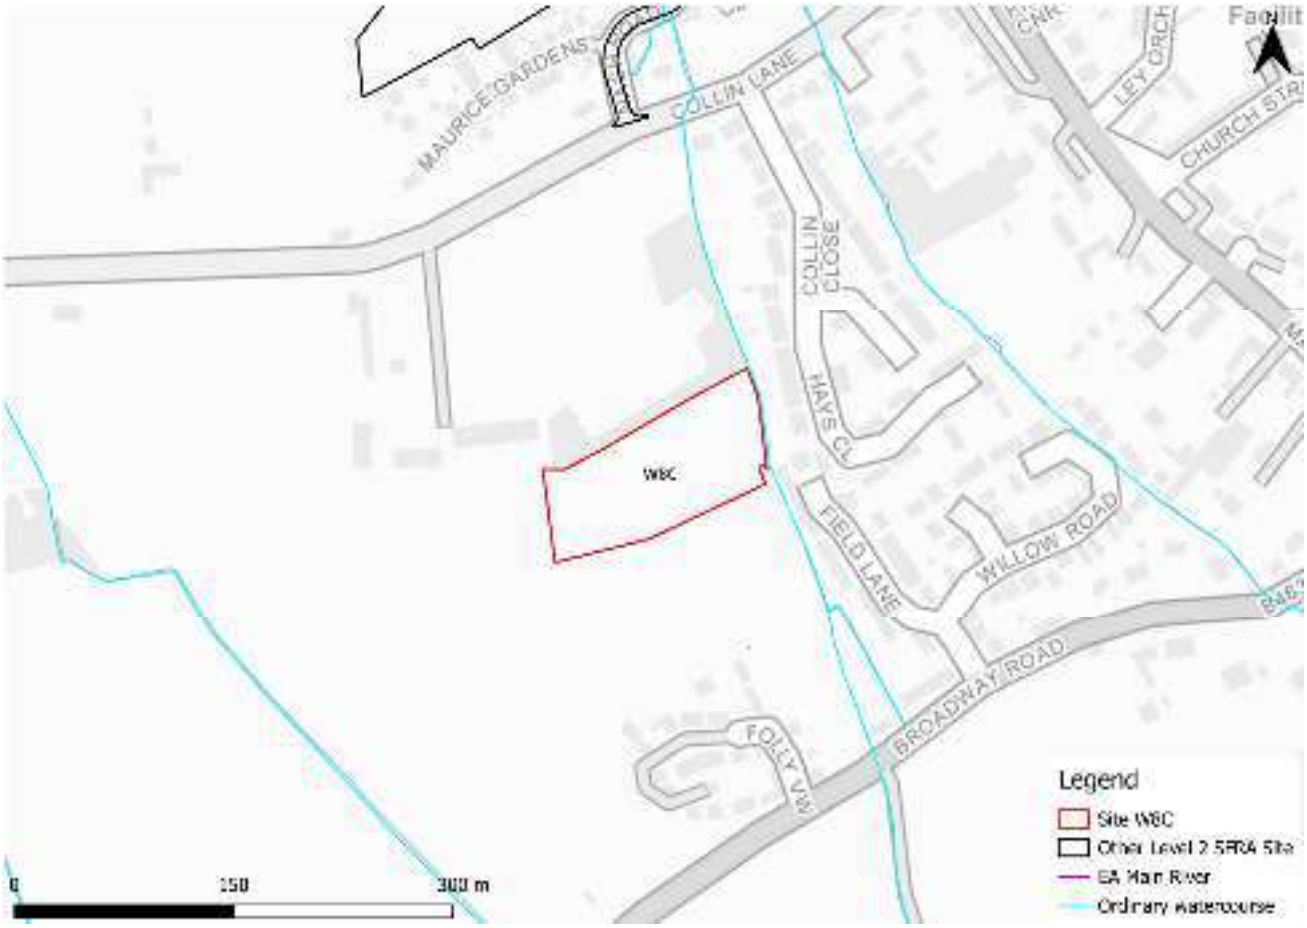

Figure 2-3: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site is located wholly within Flood Zone 1 and therefore at low risk of flooding from rivers.
  - The site is not shown to be at increased risk from fluvial flooding in the future, based on the EA's Flood Zones plus Climate Change dataset.
  - The potential fluvial risk posed by the unnamed ordinary watercourse to the site cannot be assessed given no modelling is available. This should be considered as part of a site-specific FRA.
- Mitigation:
  - A no development buffer should be in place along the unnamed ordinary watercourse in the form of a blue green corridor, which can provide a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits.
- Access and escape:
  - Based on current information, safe access and escape routes appear achievable via multiple locations surrounding the site.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents map (May 2026), surface water risk across the site is generally low, as shown in Table 3-1 and Figure 3-1.

Surface water risk is present across the site as two distinct shallow flow paths, within the north and east of the site. There is also a surface water flow path along the eastern boundary of the site, which is confined to the channel of the unnamed ordinary watercourse.

Greatest surface water flood depths in the 1% AEP event are shallow, at between 0.15 and 0.3 m (Figure 3-2). Safe access and escape routes would ideally need to be made available via the south or west of the site.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
66	17	7	10

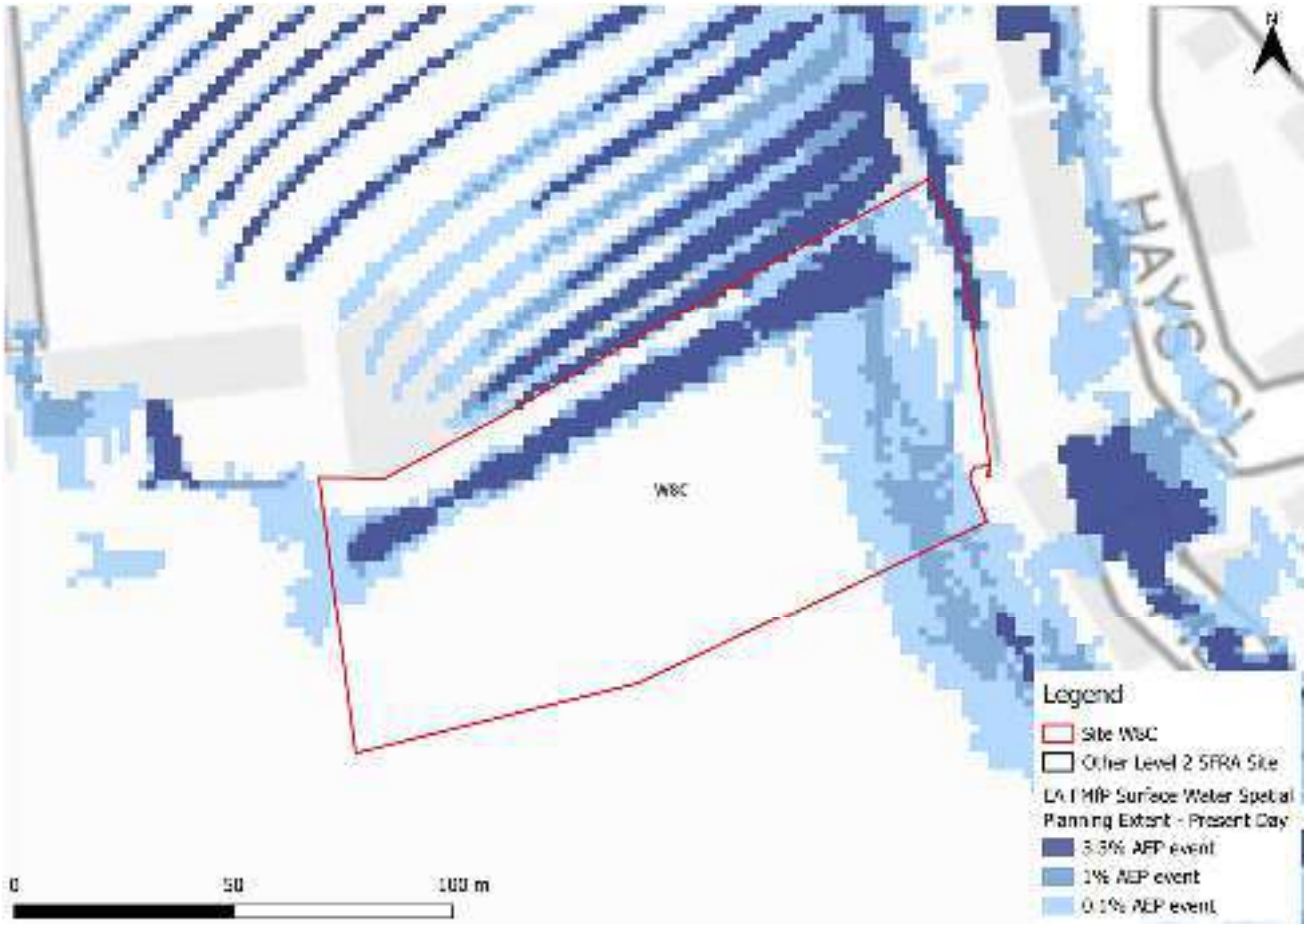

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

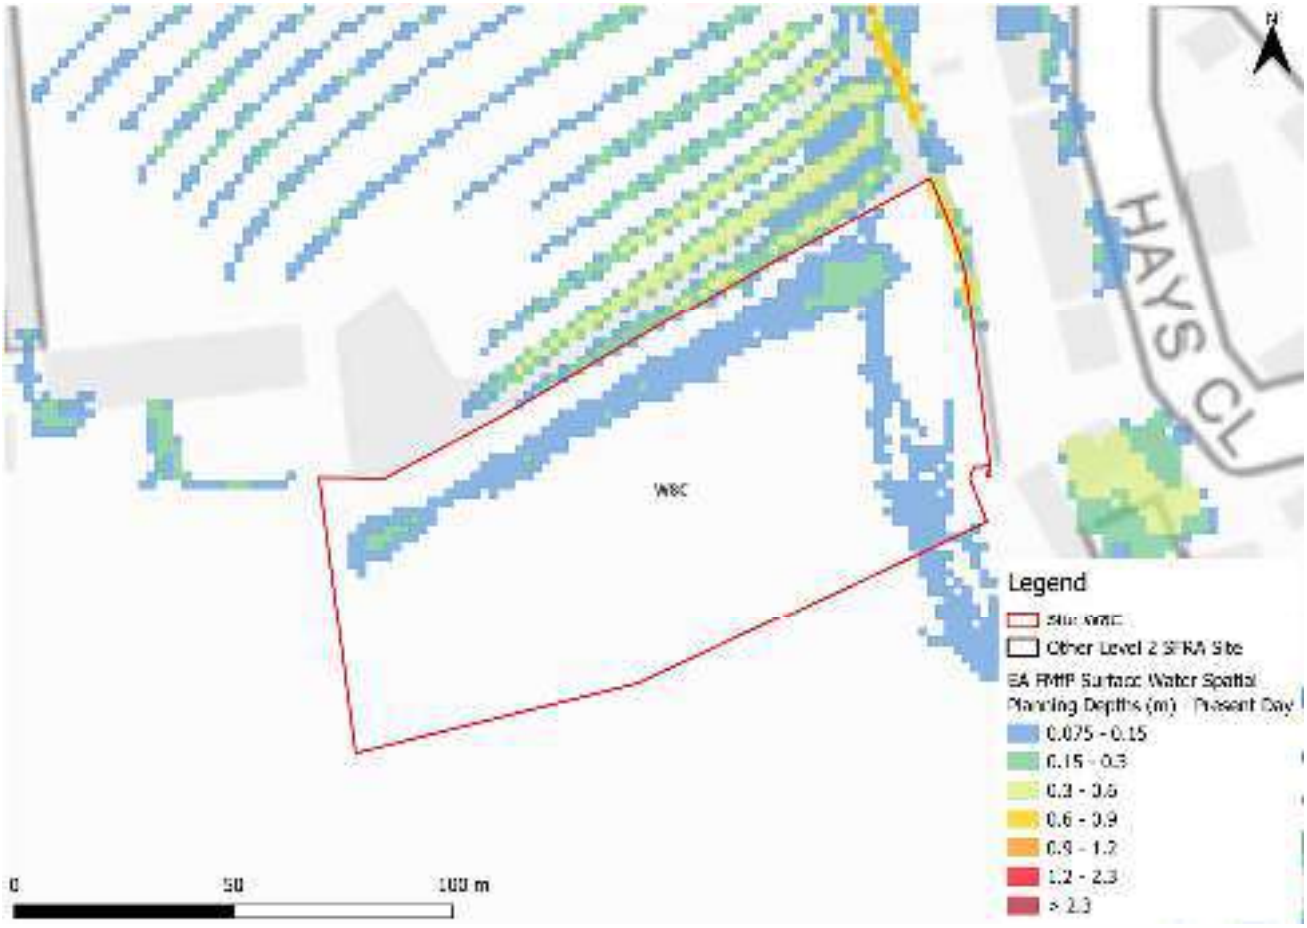

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows flood hazard to be low (Figure 3-3). There are differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping whereby the RoFSW shows a much larger area to be at risk. Given the differences between the two datasets, the hazard information should be discounted and assessed further at the FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day 1% AEP event surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Avon Warwickshire management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Avon Warwickshire Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. Surface water risk is shown to increase in extent across the site when considering climate change, particularly within the 0.1% AEP event. Flood depths, however, are shown to remain shallow at between 0.15 and 0.3 m (Figure 3-5). Safe access and escape routes would likely remain achievable if provided via the south or west of the site.

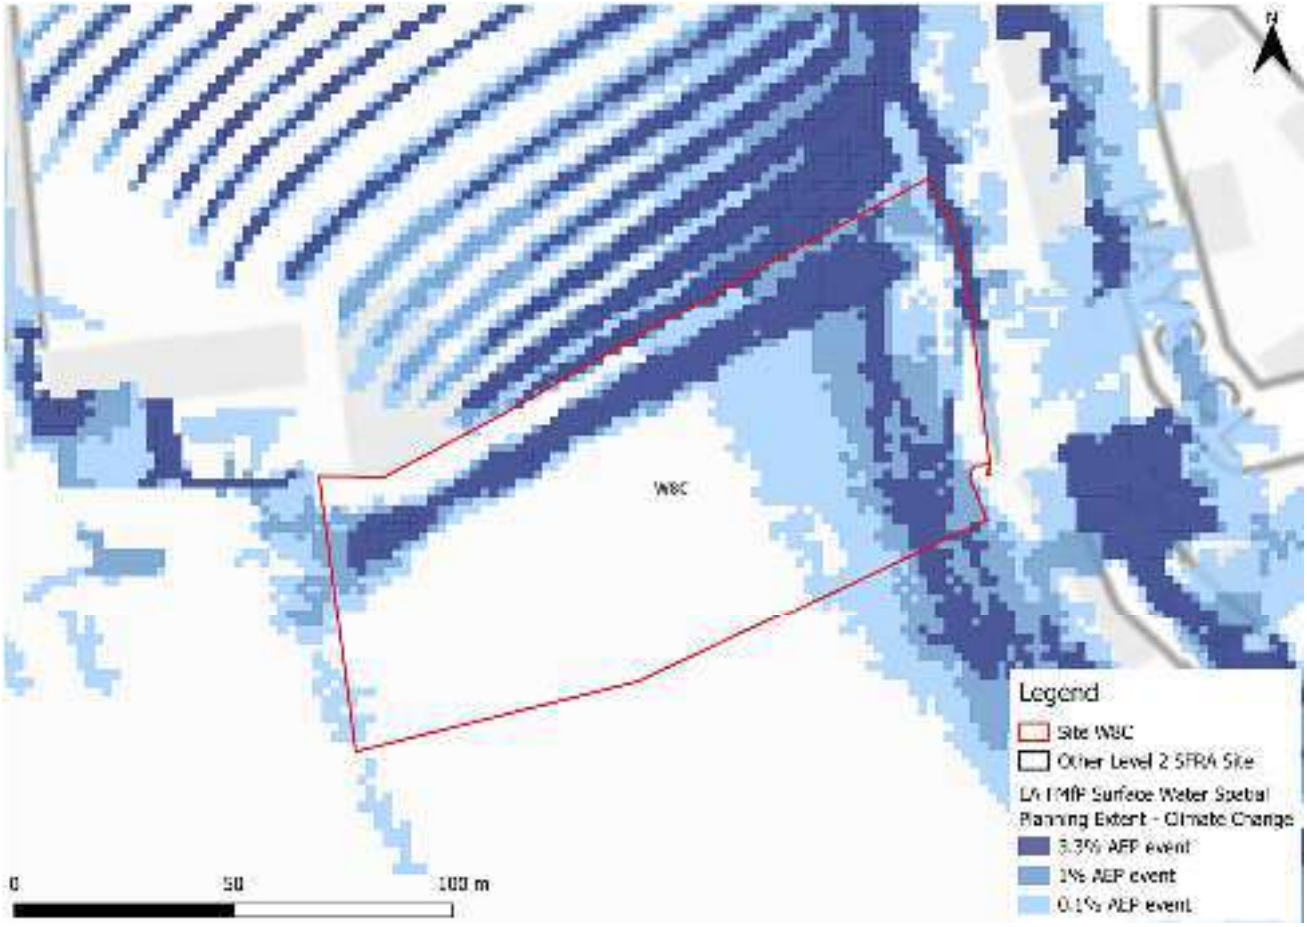

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

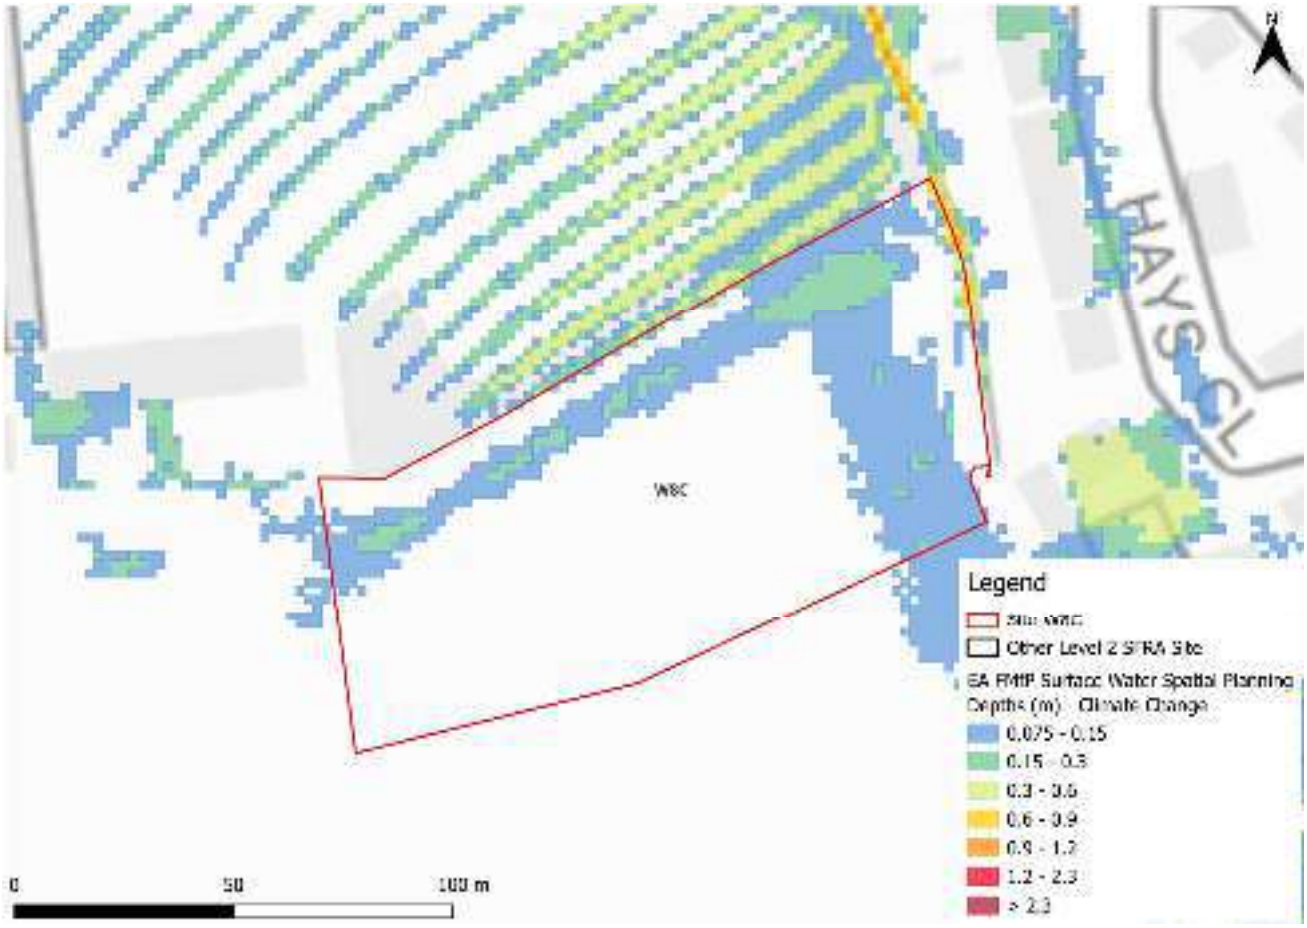

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event surface water flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is categorised as 'moderate' outside of the ordinary watercourse channel along the eastern site boundary (Figure 3-6).

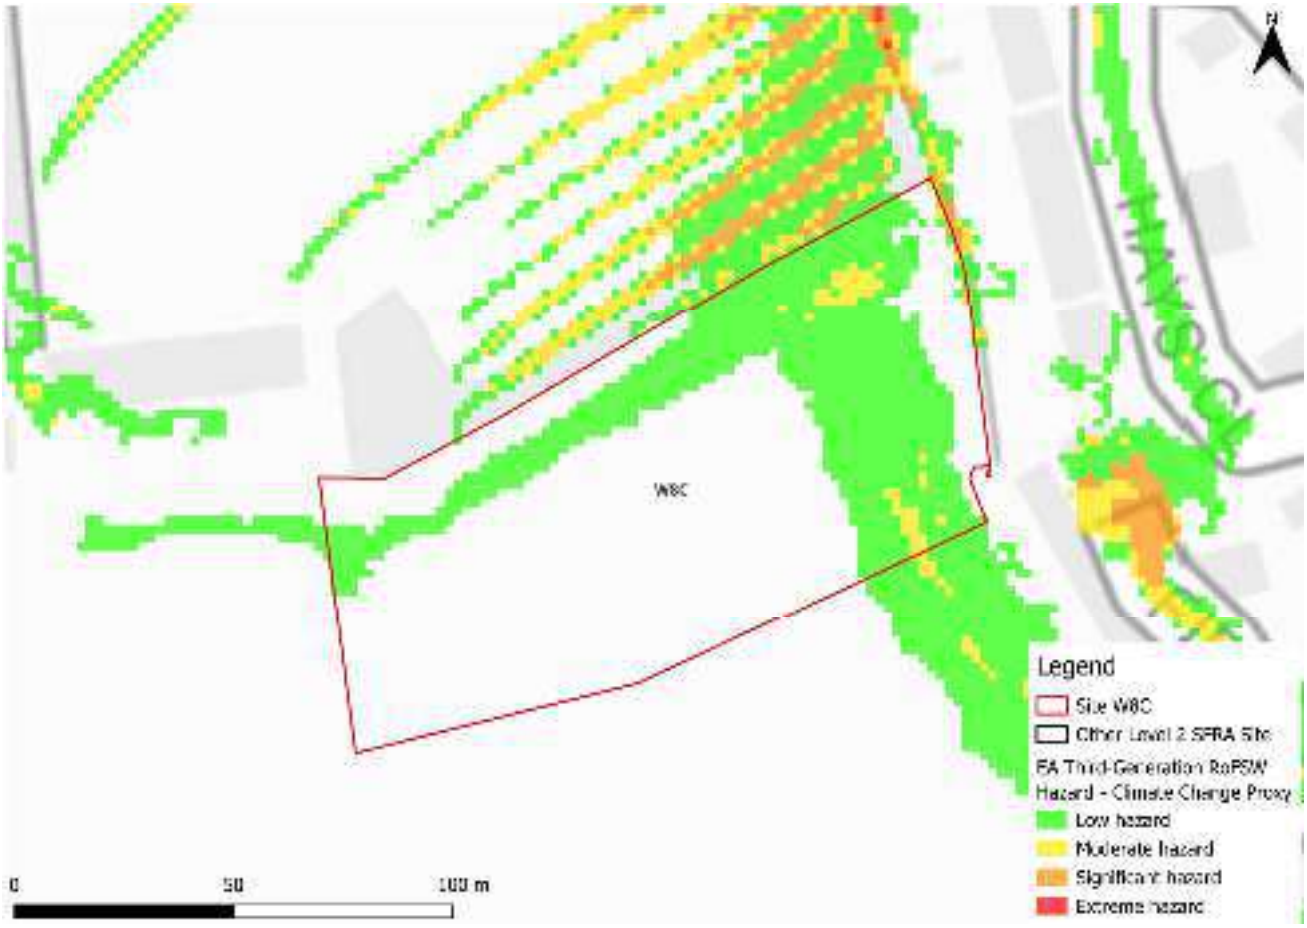

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day 0.1% AEP event surface water flood hazard as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There have been 22 recorded sewer flooding incidents within the Campden & Vale Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 66% of the site being outside of the 0.1% AEP surface water flood extent. Surface water risk is present across the site parcels as two distinct flow paths, within the north and east of the site.
- The surface water flow paths through the site and along the course of the ordinary watercourse should be considered and included in site design and left in place to flood naturally when required.
- Risk to the site is shown to increase in extent within the site when considering the impact of climate change.
- The drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or

betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.

- Safe access and escape routes would ideally need to be made available via the south or west of the site.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within a high sensitivity catchment, namely Bretforton Bk - source to conf Broadway-Badsey Bk. Planning considerations for sites at high sensitivity to the cumulative impacts of development can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications.

The entire site is located within an area where there is no risk of groundwater emergence.

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is mudstone, siltstone, limestone and sandstone (Figure 5-2). Mudstone and siltstone generally have a low permeability and low level of porosity, reducing infiltration rates. There is no record of superficial deposits in the area.

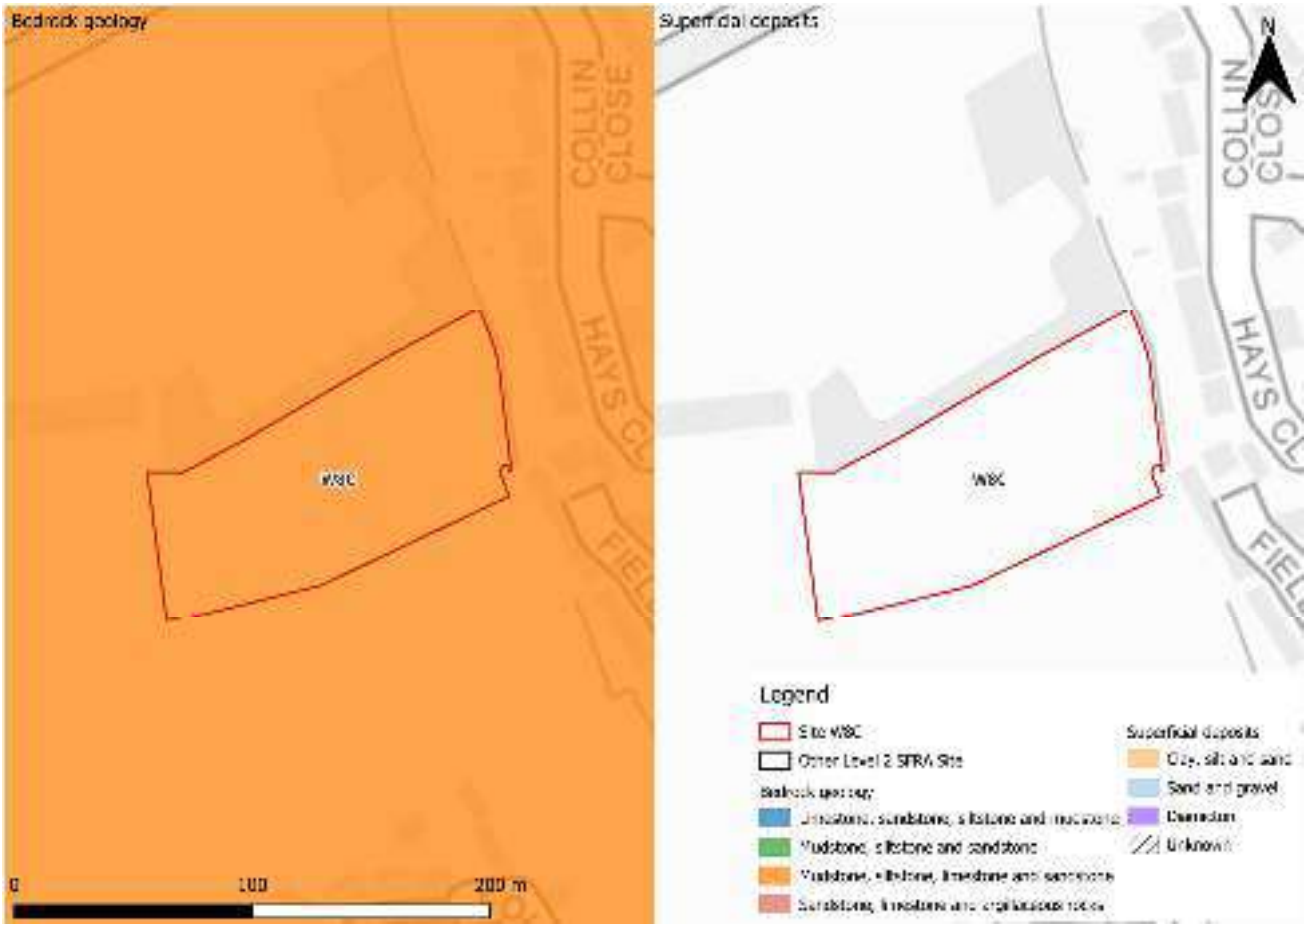

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There is no potential residual risk to the site.

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is not required to pass part b) of the Exception Test, as it is not located within Flood Zone 3a, however it must still be proven that the development can be safe for its lifetime, which is generally considered to be 100 years for residential development and 75 years for non-residential development.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be possible to develop this site for mixed use given its location within Flood Zone 1 and surface water risk confined to two distinct shallow flow paths through the site.
- Ideally, a no development buffer should be in place along the unnamed ordinary watercourse in the form of a blue green corridor, which can provide a flood storage function as well as providing BNG, ecological, amenity, social, and wellbeing benefits.
- Modelling of the unnamed ordinary watercourse adjacent to the site must be carried out to robustly define the risk to the site for both present day and with climate change.
- A drainage strategy must be in place to manage surface water flood risk and runoff rates.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for the new settlement to the south of Driffield. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 New settlement to the south of Driffield

- Location: Driffield
- Existing site use: Agricultural land
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Mixed use
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 198.8
- Watercourse: Unnamed ordinary watercourses
- Environment Agency (EA) flood model: No detailed model available
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of surface water flood extents, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

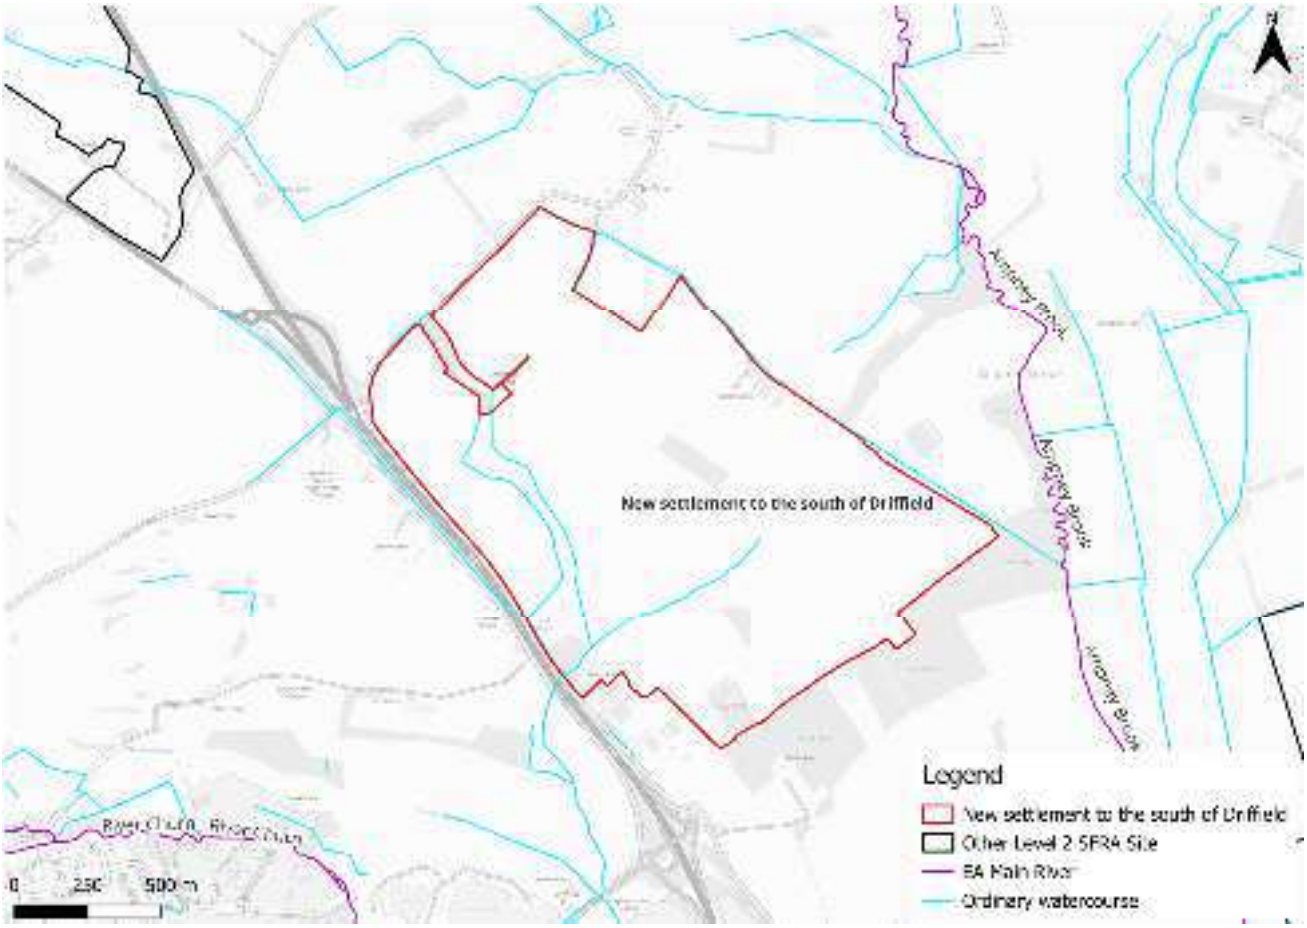

Figure 1-1: Site location boundary

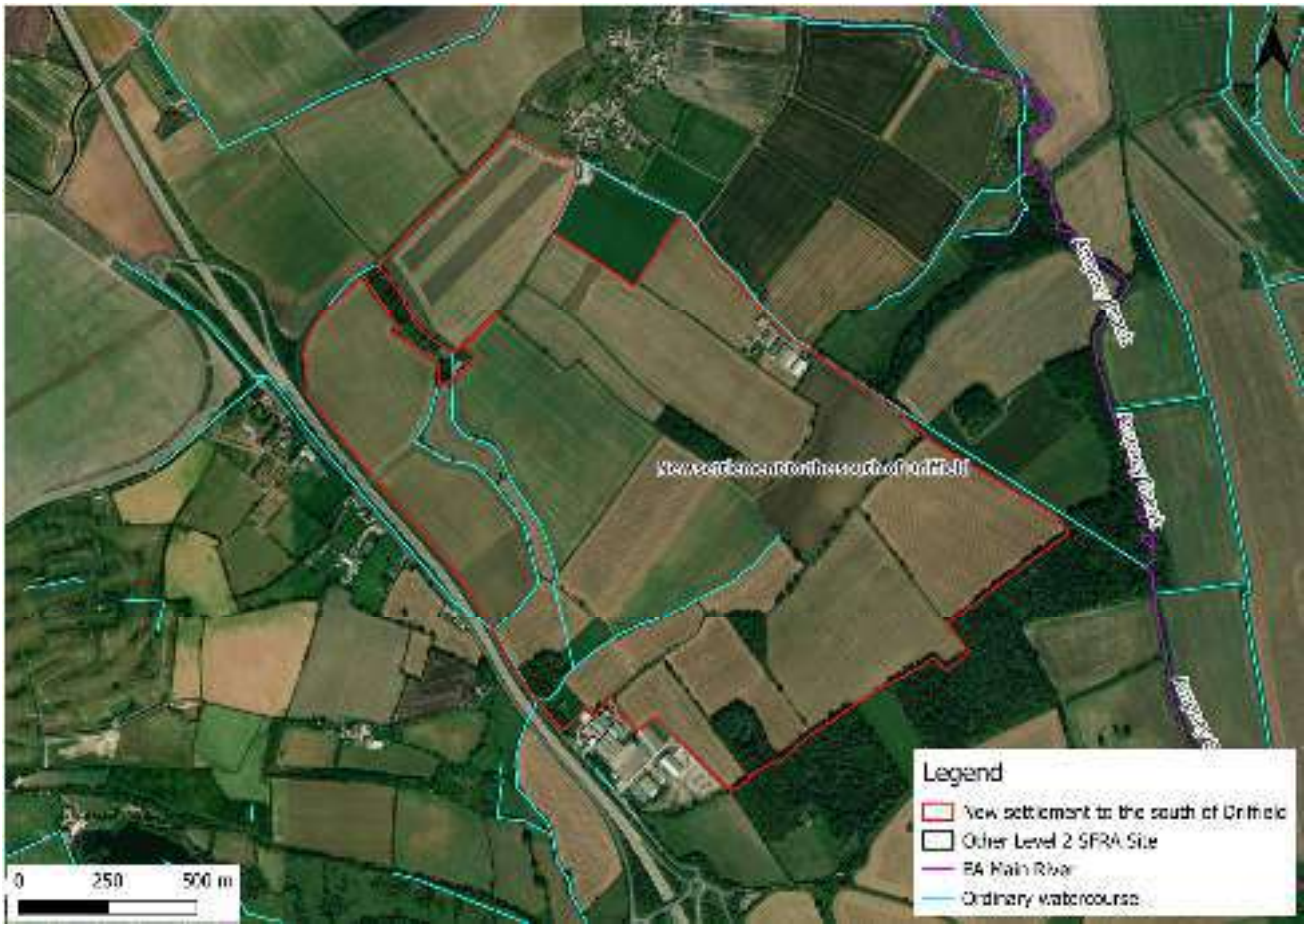

Figure 1-2: Aerial photography

The site is located at a lower elevation than the surrounding areas, with the highest elevation through the north and southeast boundaries of the site. The lowest elevation is at the centre and southwest of the site, sloping towards the River Churn floodplain to the southwest and the Ampney Brook floodplain to the east (Figure 1-3).

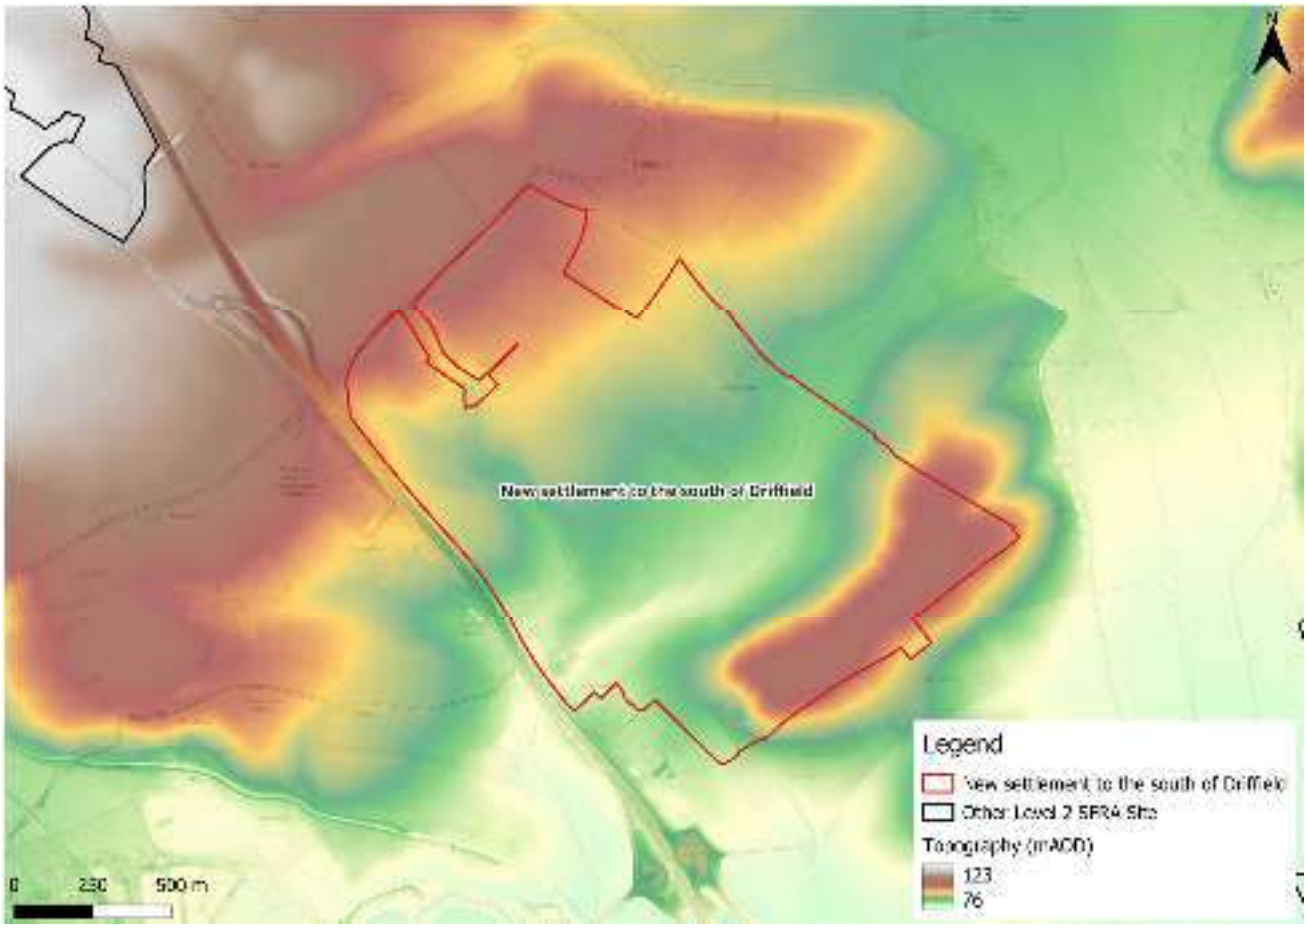

Figure 1-3: Topography

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the percentage areas of the site within each flood zone are stated in Table 2-1. The site is mainly located within Flood Zone 1 and therefore at low risk of flooding from rivers (Figure 2-1). The Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

The site is partially within the functional floodplain and Flood Zones 3a and 2 due to risk from an unnamed ordinary watercourse. There is no detailed model available for the ordinary watercourse meaning the flood zones here are based on the EA's New National Model (NNM) dataset. Flood depths and hazards therefore are not available for interrogation. The functional floodplain in this location is also based on the NNM dataset 'Rivers and Sea 3.3% defended flood risk extents - present day'. There should be no development within the functional floodplain. There are several other ordinary watercourses on the site that are not modelled, therefore, the potential fluvial risk posed to the site cannot be assessed. Risk should be assessed at the site-specific FRA stage.

Table 2-1: Present day flood risk based on percentage area of site at risk

Flood Zone 1 (% area)	Flood Zone 2 (% area)	Flood Zone 3a (% area)	Flood Zone 3b (% area)
97	1	1	1

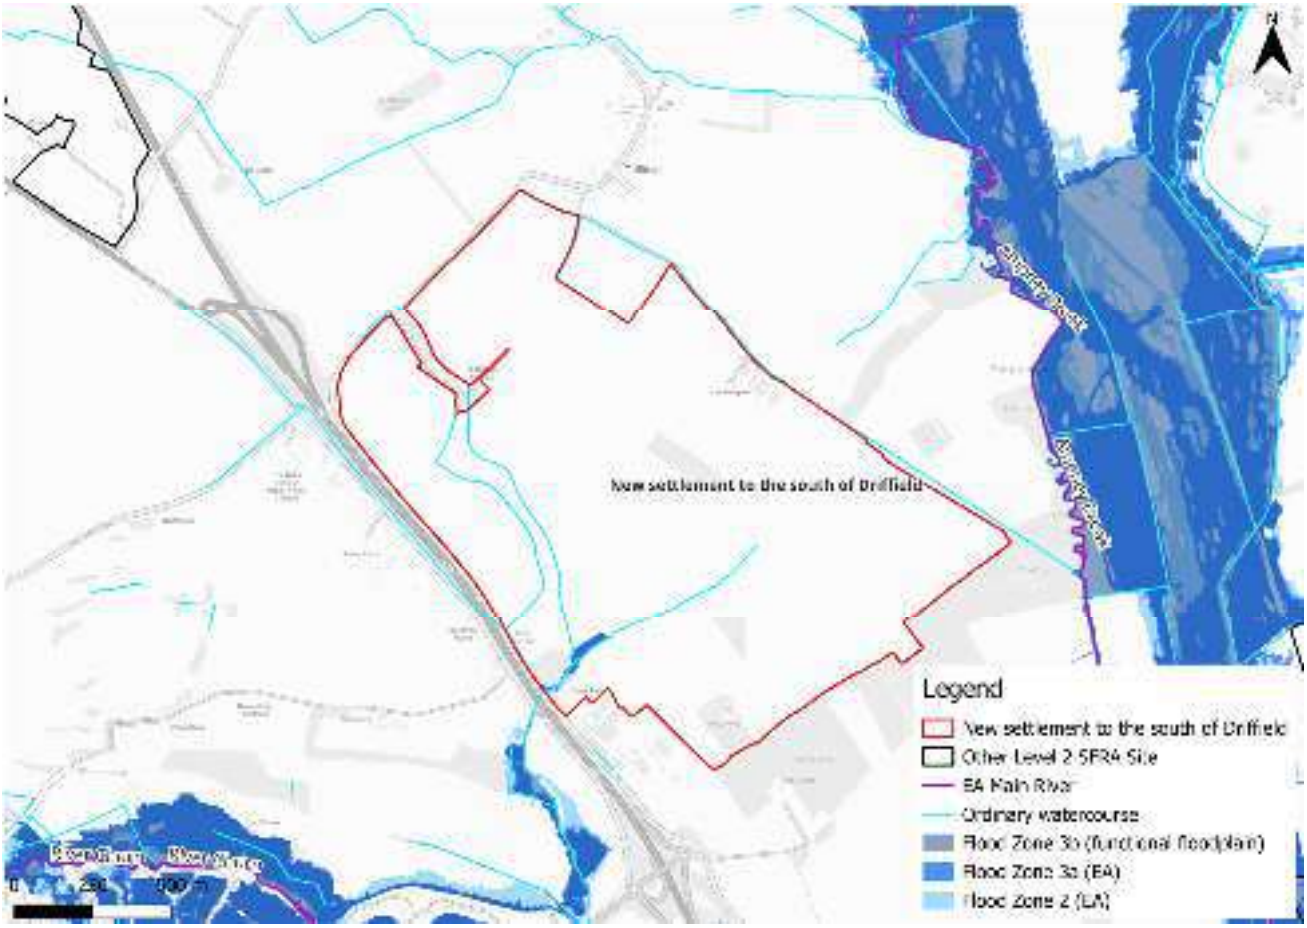

Figure 2-1: Present day risk

2.2 Impacts from climate change

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Gloucestershire and the Vale Management Catchment. The central allowance within this catchment is 26% on peak flows (Table 2-2). There is no local detailed model for the ordinary watercourses through the site, therefore the required event cannot be assessed.

Table 2-2: Modelled climate change allowances for peak river flows within the Gloucestershire and the Vale Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	11	17	33
2050s	11	19	43
2080s	26	41	84

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Figure 2-2 shows the Flood Map for Planning - Flood Zones plus Climate Change dataset which includes the central allowance for the 2080s epoch. This represents the impact of climate change on Flood Zone 3a and Flood Zone 2 combined. This shows a slight increase in risk compared to present day though nothing significant.

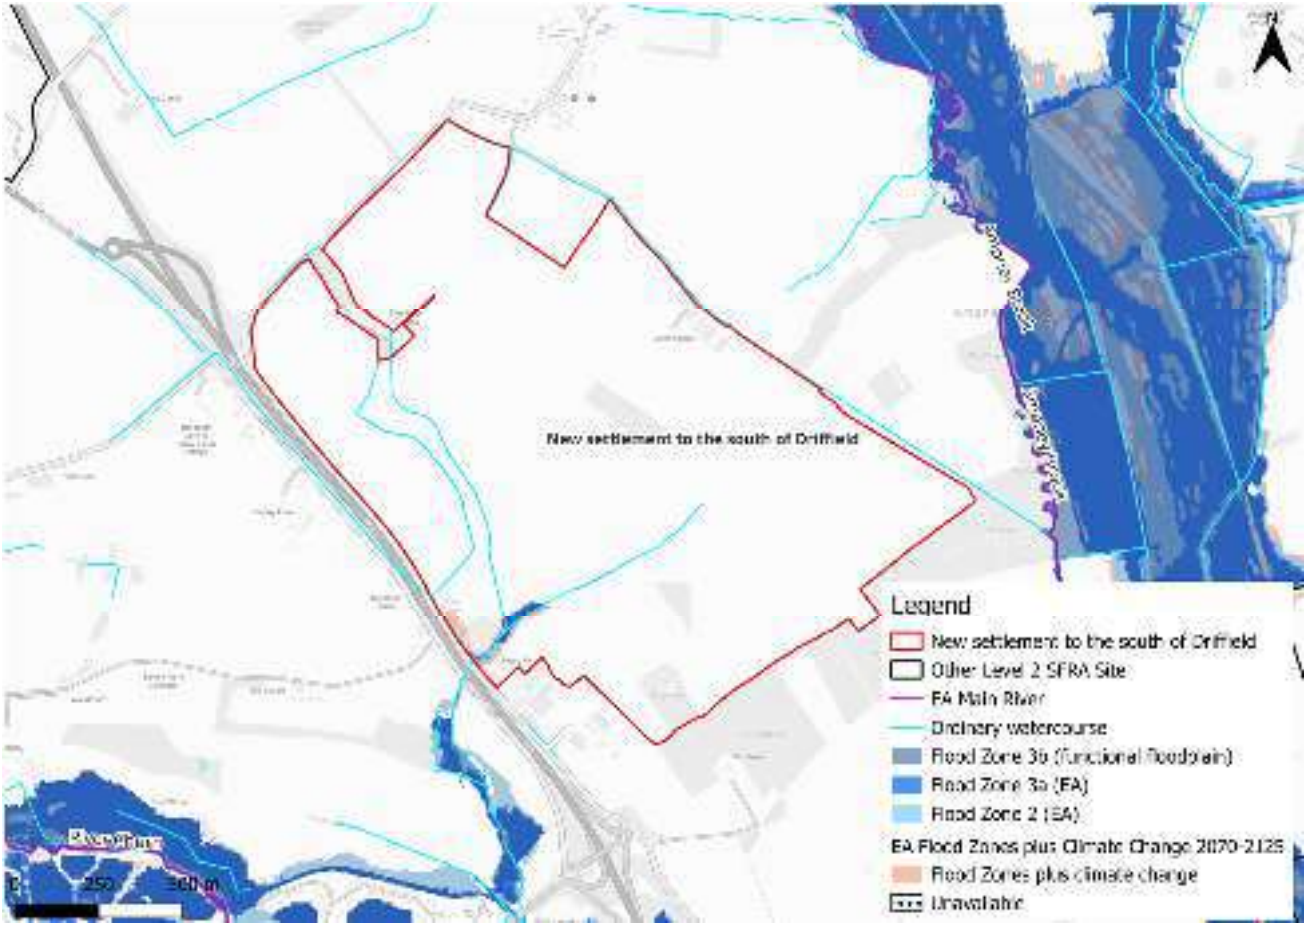

Figure 2-2: EA Flood Zones plus Climate Change

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been six recorded flooding incidents within the Siddington & Cerney Rural Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-3 shows that the ordinary watercourses onsite and wider area could benefit from riparian tree planting. Tree planting can help to slow the flow to benefit areas downstream. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

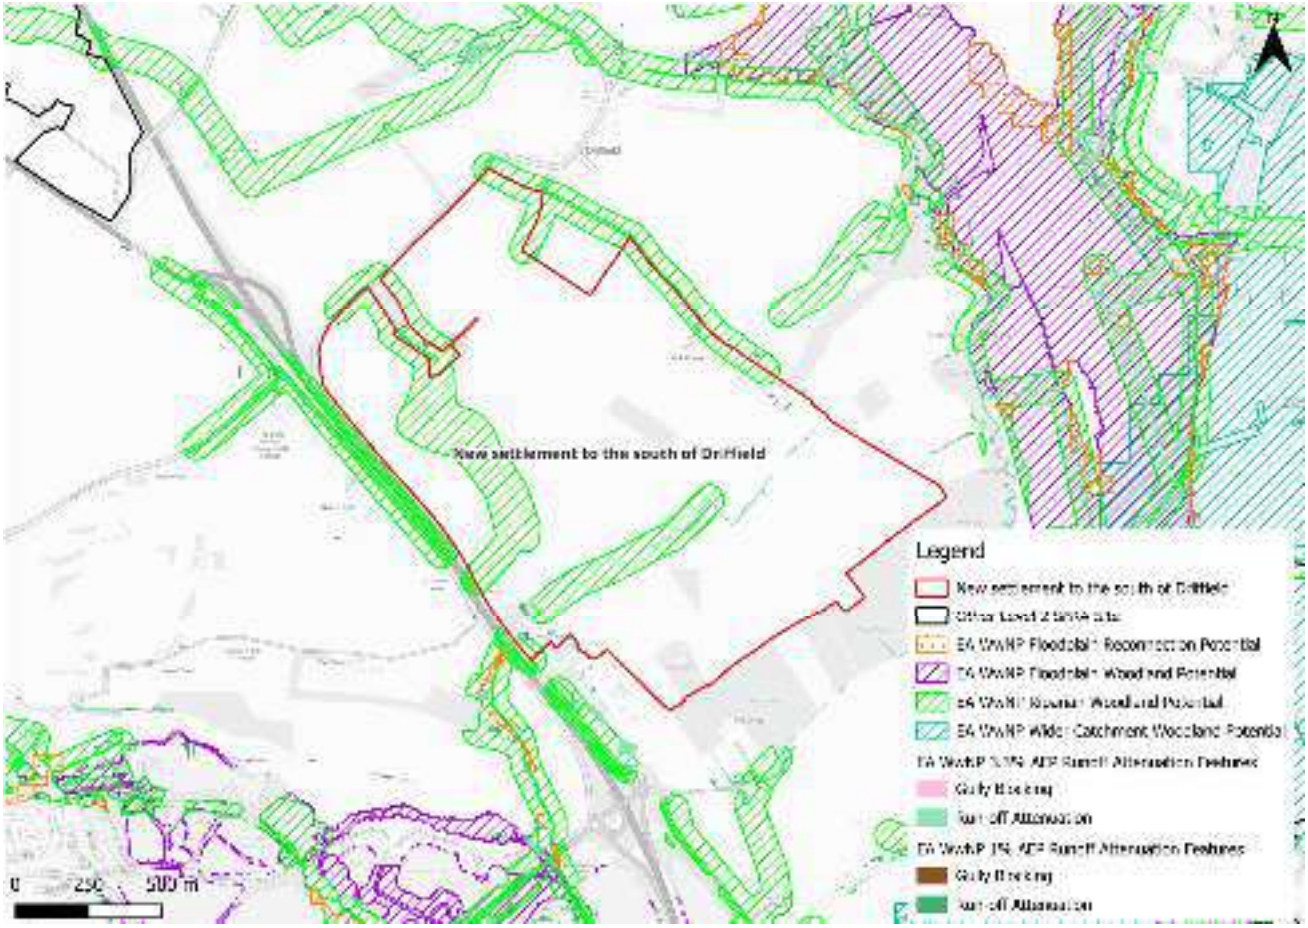

Figure 2-3: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warning and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The site is not located within a FAA.

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes could likely be achieved during a flood event via multiple locations surrounding the site (Figure 2-4).

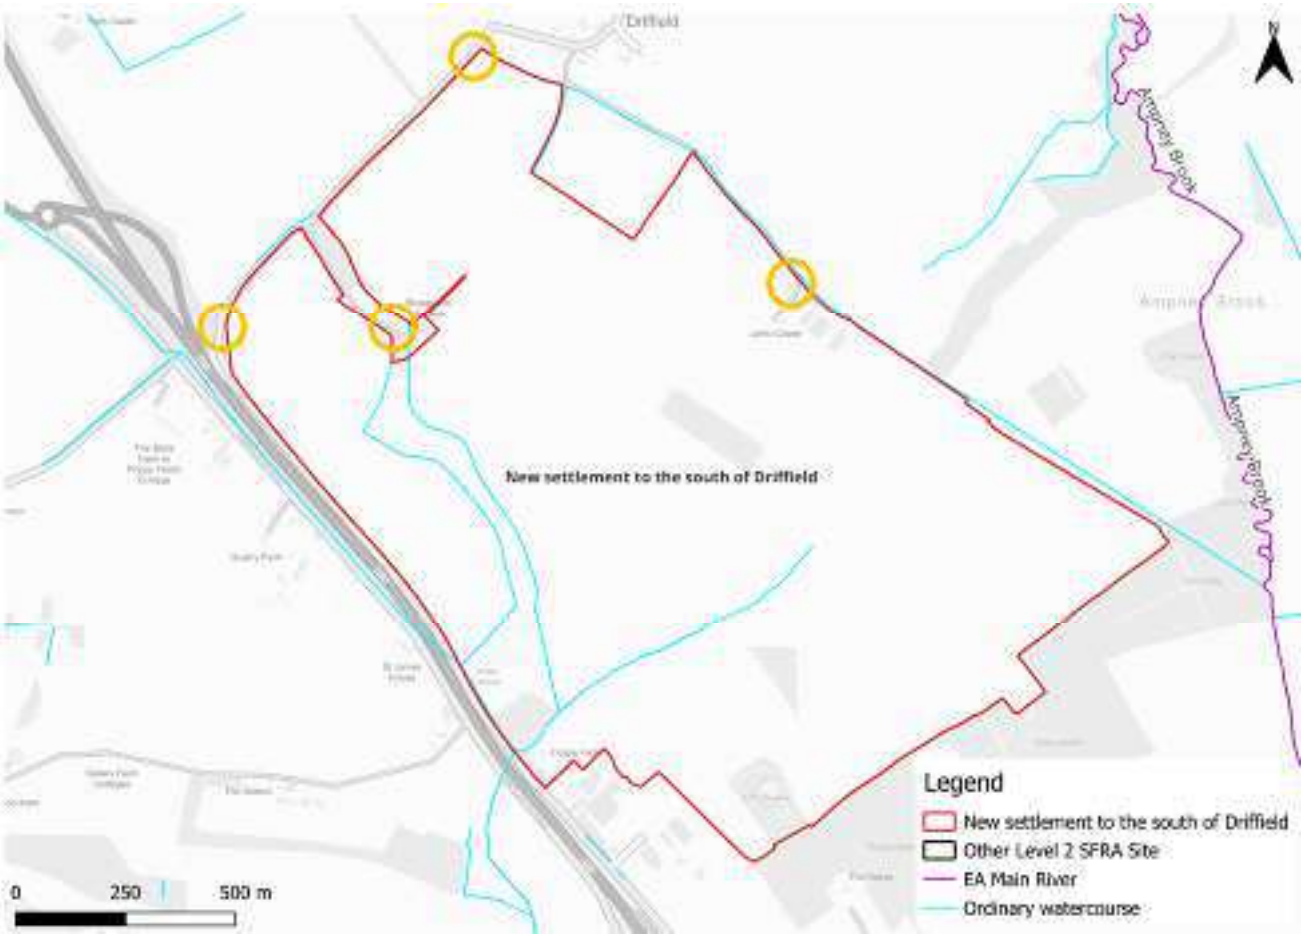

Figure 2-4: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site is located mostly within Flood Zone 1 and therefore at low risk of flooding from rivers.
  - The risk from ordinary watercourse in the south of the site is based on the EA's NNM and not detailed modelling which is considered to be the most up to date information on fluvial risk to the site and surrounding area. However, the NNM does not contain depth or hazard information, therefore risk cannot be robustly defined at this stage.
  - The potential fluvial risk posed by the unnamed ordinary watercourses to the site cannot be assessed given no modelling is available. This should be considered as part of a site-specific FRA.
- Mitigation:

- No development buffers should be in place along the ordinary watercourses in the form of blue green corridors, which can provide a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits. This is reflected in the WwNP mapping showing potential for riparian tree planting along each watercourse.

- Access and escape:
  - Based on current information, safe access and escape routes appear achievable via multiple locations surrounding the site.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents map (May 2026), surface water risk across the site is nominal, as shown in Table 3-1 and Figure 3-1. Surface water risk is present across the site as areas of scattered ponding in topographic low spots. There is a surface water flow path within the centre of the site, which is confined to the channel of the unnamed ordinary watercourse.

Greatest surface water flood depths in the 1% AEP event are between 0.9 and 1.2 m (Figure 3-2). Safe access and escape routes are achievable via multiple locations surrounding the site.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
95	2	1	2

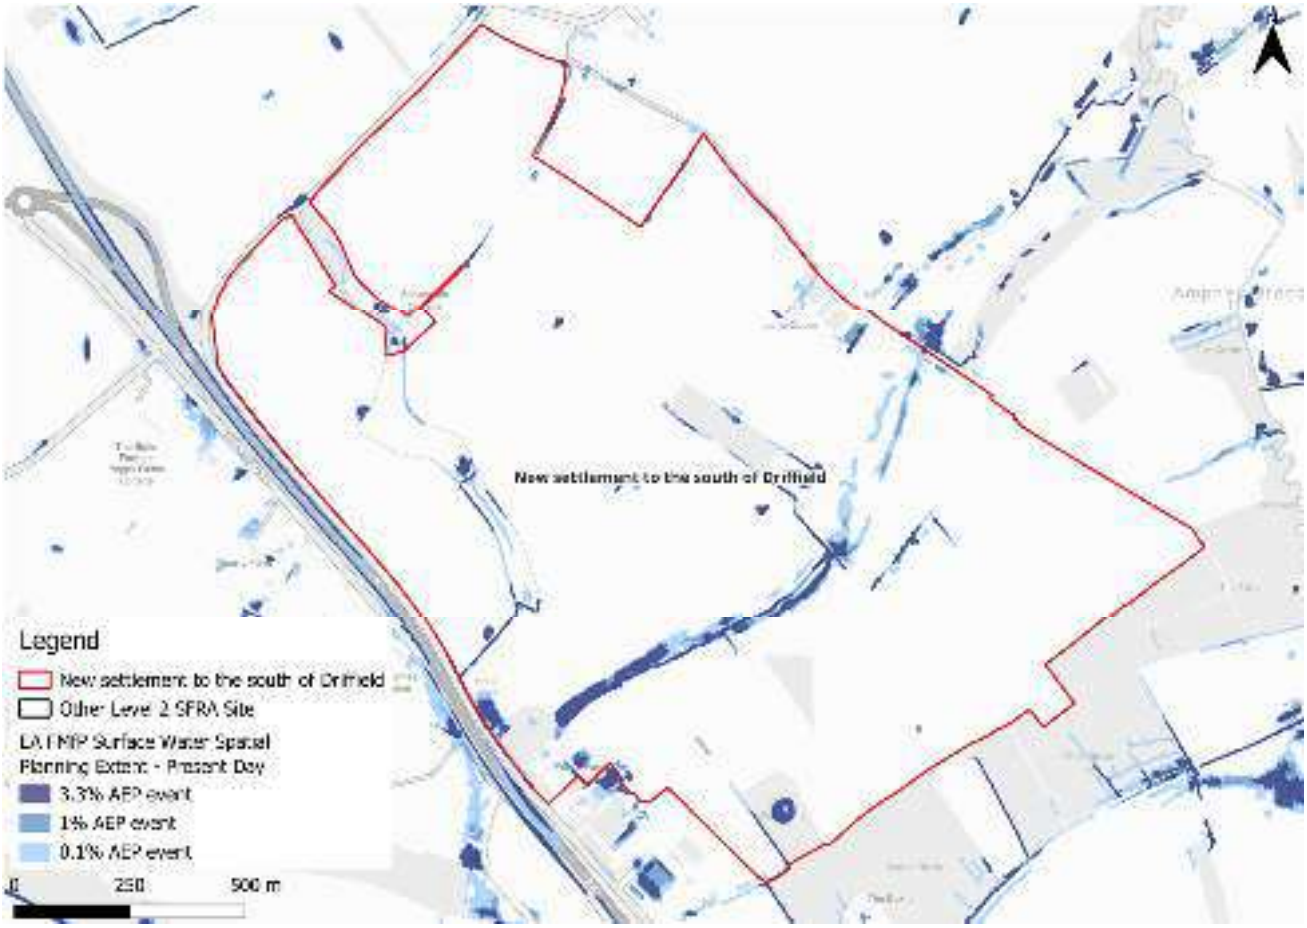

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

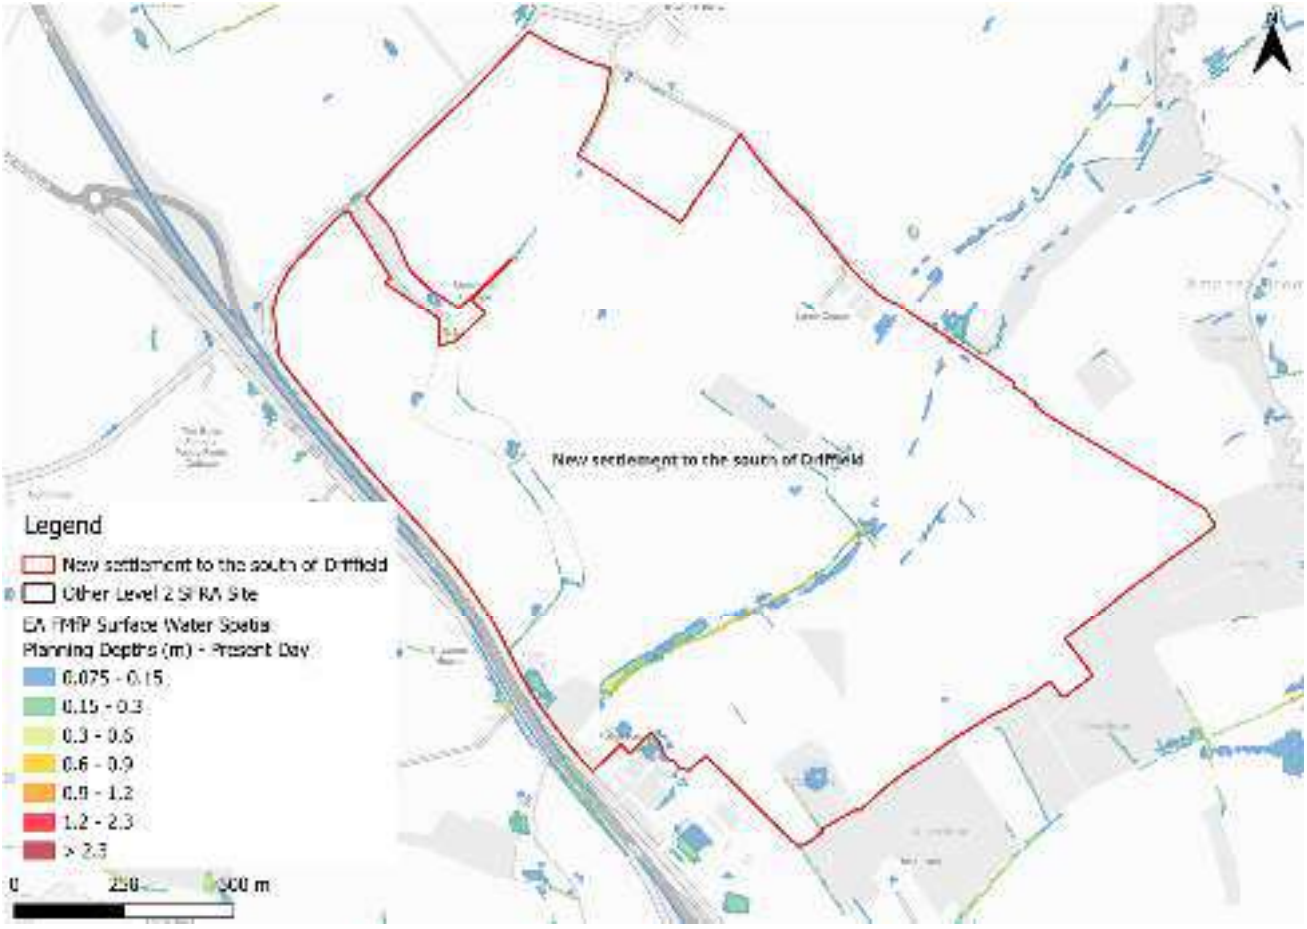

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows there to be an area of 'significant' flood hazard (Figure 3-3). There are differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping whereby the RoFSW shows a much larger area to be at risk. Given the differences between the two datasets, the hazard information should be discounted and assessed further at the FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day 1% AEP event surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Gloucestershire and the Vale management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Gloucestershire and the Vale Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. Surface water risk is not shown to increase significantly across the site when considering climate change. Flood depths are shown to remain at between 0.9 and 1.2 m (Figure 3-5). Safe access and escape routes would likely remain achievable via several locations surrounding the site.

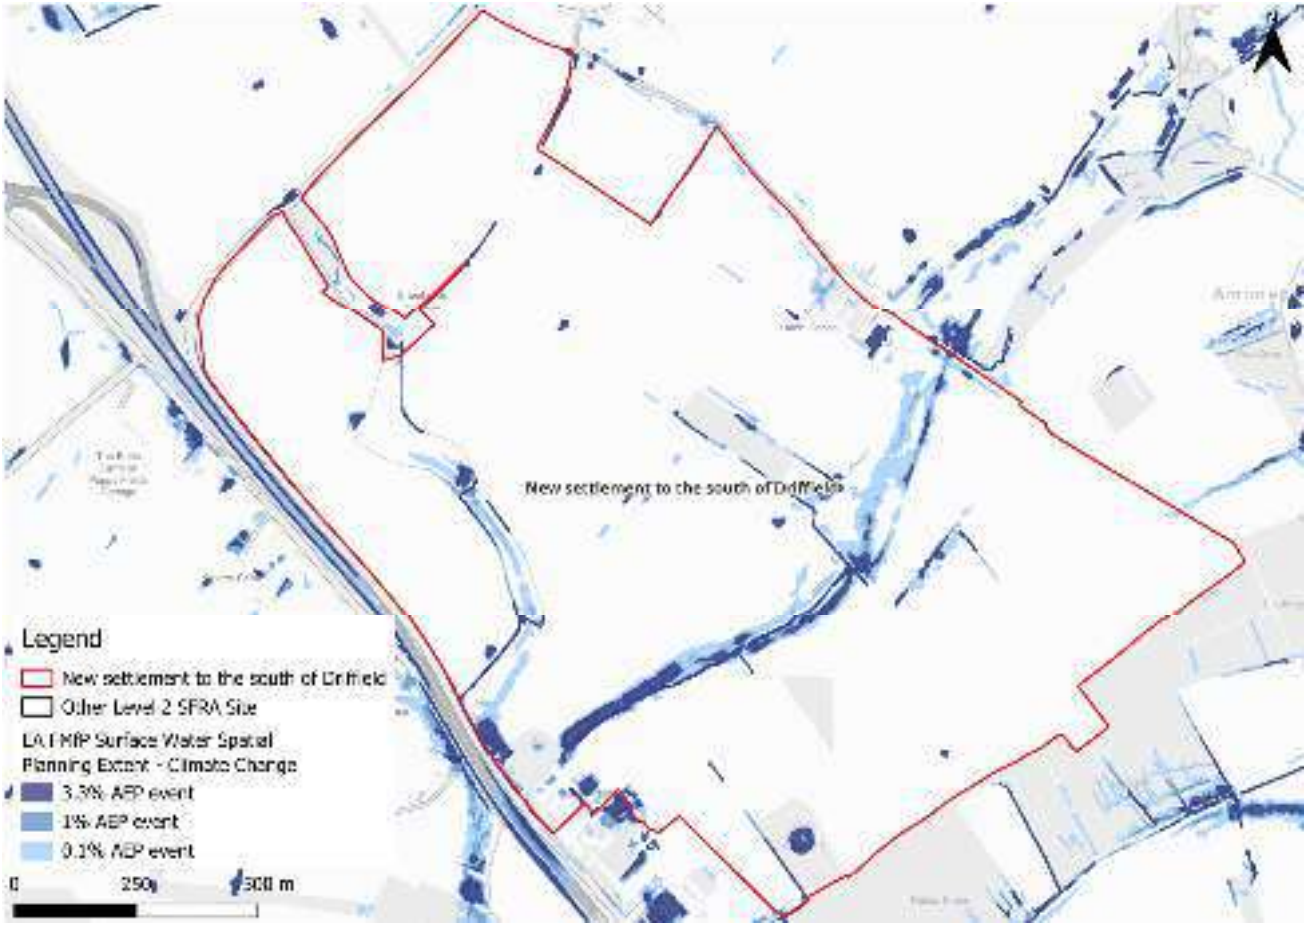

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

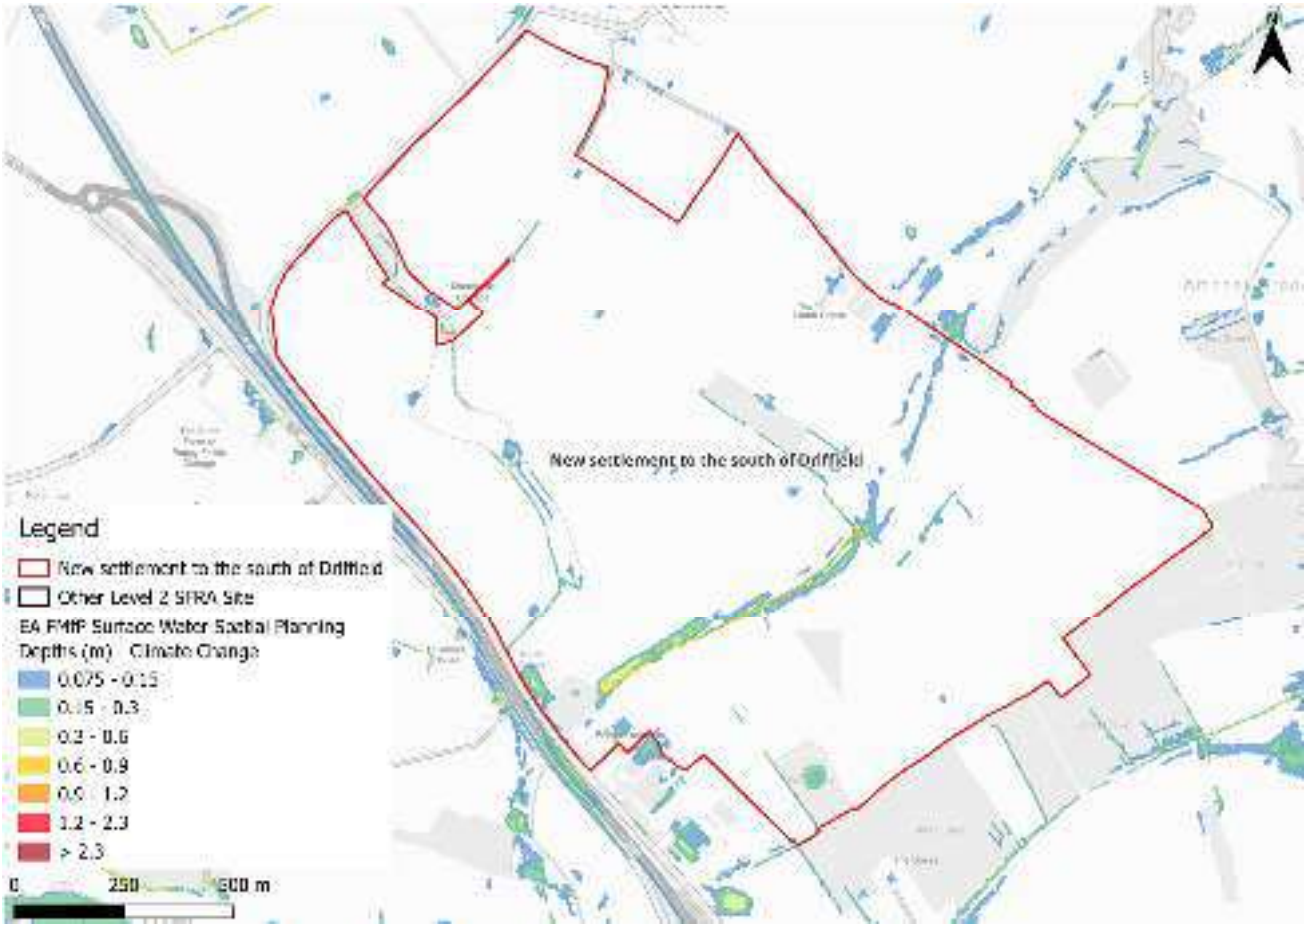

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event surface water flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is categorised as 'moderate' outside of the ordinary watercourse channel (Figure 3-6).

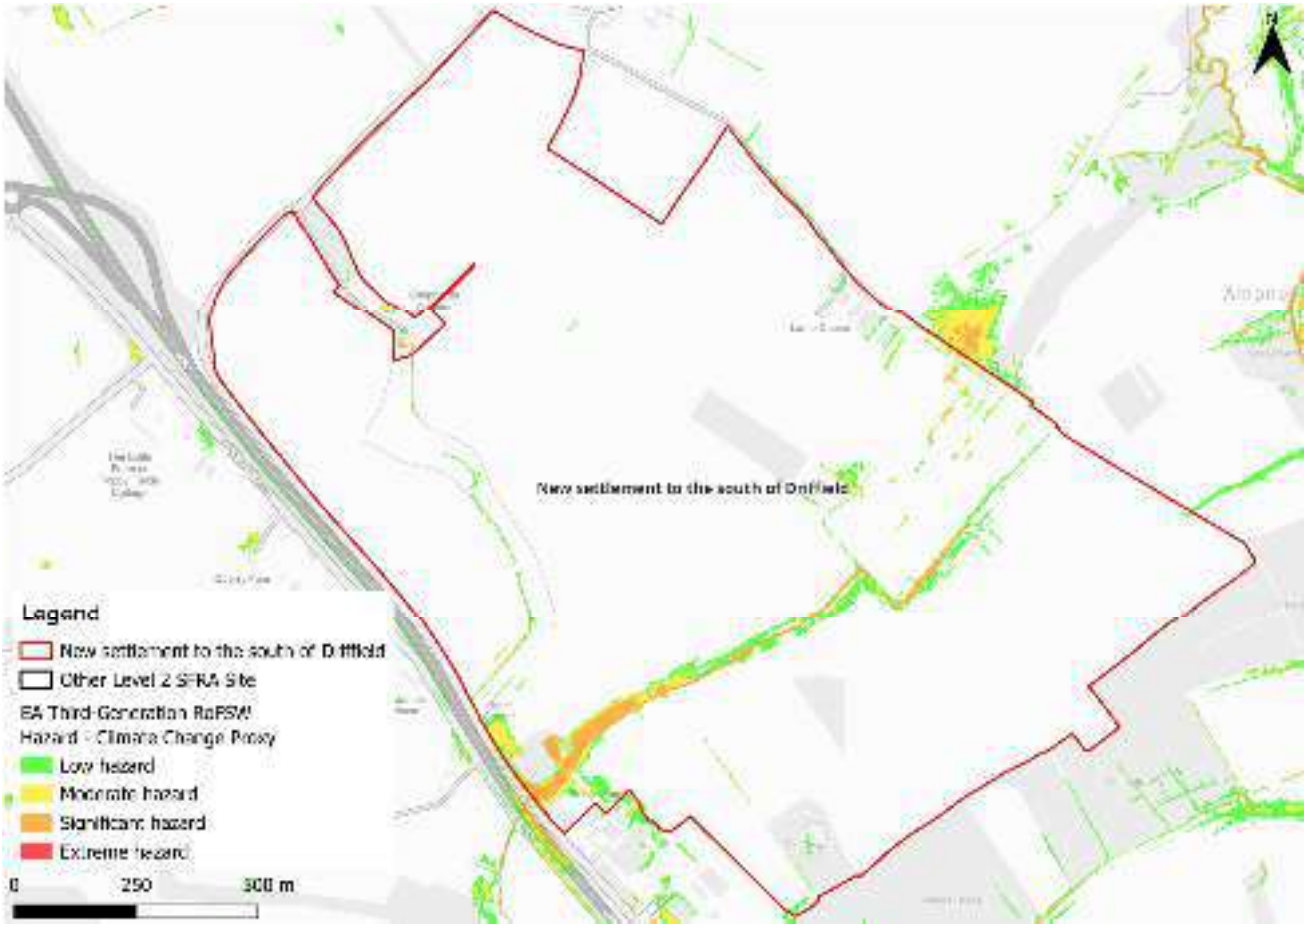

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day 0.1% AEP event surface water flood hazard as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There have been no recorded sewer flooding incidents within the Siddington & Cerney Rural Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 95% of the site being outside of the 0.1% AEP surface water flood extent. Surface water risk is largely present as areas along the ordinary watercourses and areas of scattered ponding across the site.
- Topographic low spots, and the surface water flow paths along the course of the ordinary watercourses onsite, should be considered and included in site design and left in place to flood naturally when required.
- Risk to the site is not shown to increase significantly in extent within the site when considering the impact of climate change.

- A drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.
- Safe access and escape routes would likely be achievable via multiple locations when considering surface water risk.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within two catchments, namely Churn (Baunton to Cricklade) and Ampney and Poulton Brooks (Source to Thames). These have been identified as high and low sensitivity catchments respectively. Planning considerations for sites at high and low sensitivity to the cumulative impacts of development can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications.

The majority of the site is located within an area where there is a risk of groundwater emergence to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The majority of the underlying bedrock within the site is sandstone, limestone and argillaceous rocks, with an area of the site being mudstone, siltstone and sandstone (Figure 5-2). Sandstone and limestone can have high permeability and porosity, increasing infiltration rates, though the permeability of limestone can vary widely. Superficial deposits include clay and silt which have low permeability. Based on the groundwater emergence map, infiltration SuDS at this site may not be an option, though the drainage strategy for the site should fully investigate water table levels through standpipe monitoring during the period of highest groundwater levels e.g. November to April.

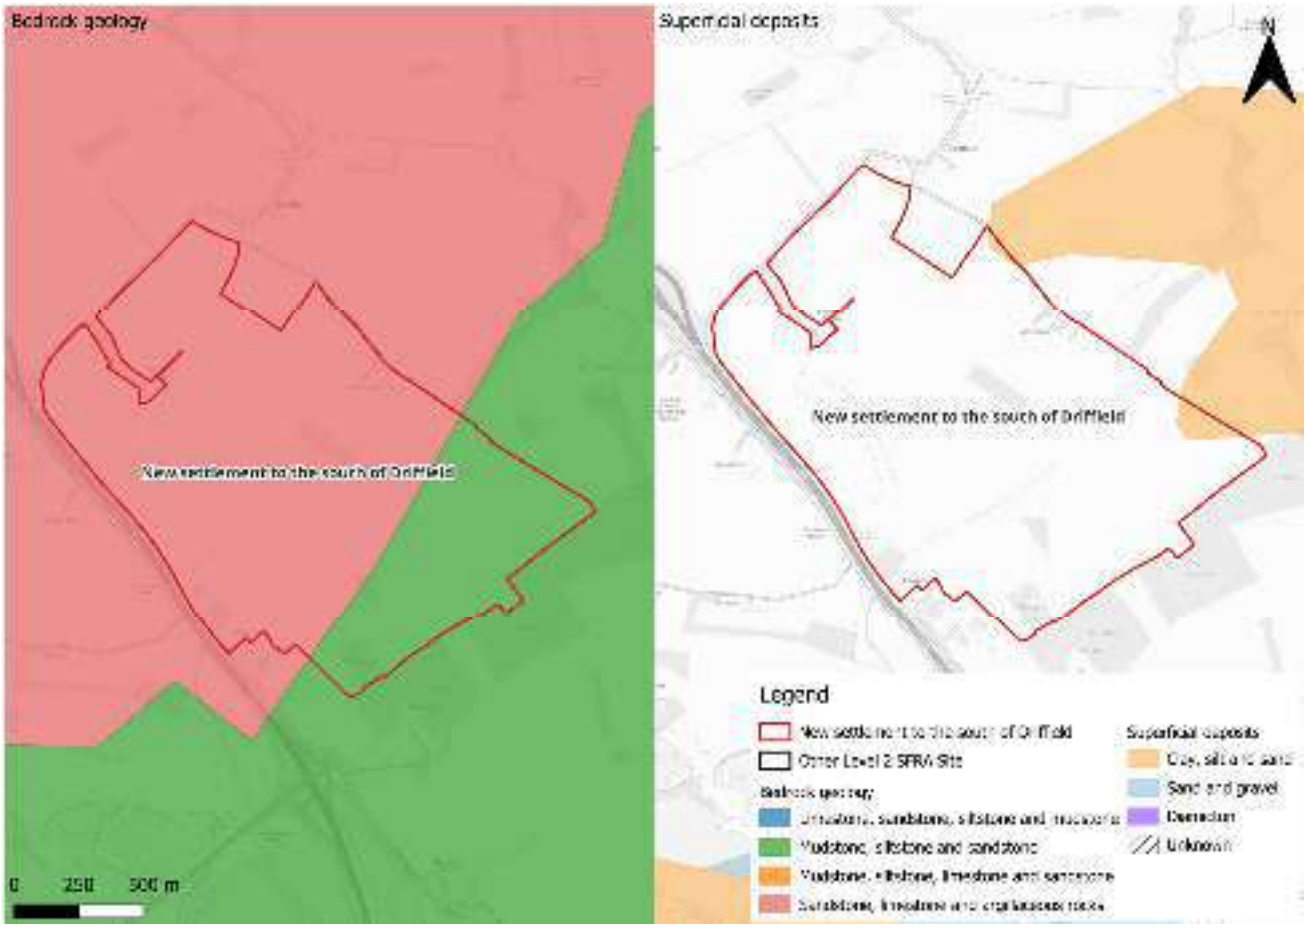

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There does not appear to be any residual risk to the site from asset blockage or defence breach.

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is required to pass part b) of the exception test as it is proposed for more vulnerable development and is partially located within Flood Zone 3a. Based on current information, the site would likely pass the Exception Test given fluvial risk is confined to the ordinary watercourse in the south. However, modelling of the unmodelled ordinary watercourses should be carried out at the FRA stage. Were new information to made available, the Exception Test should be reapplied.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be possible to develop this site for residential uses given its location largely within Flood Zone 1 and nominal surface water risk.
- Ideally, no development buffers should be in place along the unnamed ordinary watercourses in the form of blue green corridors, which can provide a flood storage function as well as providing BNG, ecological, amenity, social, and wellbeing benefits.
- Modelling of the unnamed ordinary watercourses onsite should be carried out to robustly define the risk to the site for both present day and with climate change.
- Groundwater conditions must be investigated further through the site-specific FRA. This should be assessed through standpipe monitoring during the period of highest groundwater levels e.g. November to April.
- Safe access and escape routes appear achievable from several locations, based on current information.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WGAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

Address	Phoenix House, Lakeside Drive, Centre Park, Warrington, WA1 1RX
JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Joanne Corbett of Cotswold District Council. Laura Thompson of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken between June and July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site CC10A. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site CC10A

- Location: Land East of Chandlers, Station Road
- Existing site use: Open greenspace
- Existing site use vulnerability: Water compatible
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 0.73
- Watercourse: The Cam (ordinary watercourse)
- Environment Agency (EA) flood model: N/A
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of fluvial flood depths, velocities and hazards (not possible as no detailed model available for The Cam)
    - Assessment of surface water flood extent, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

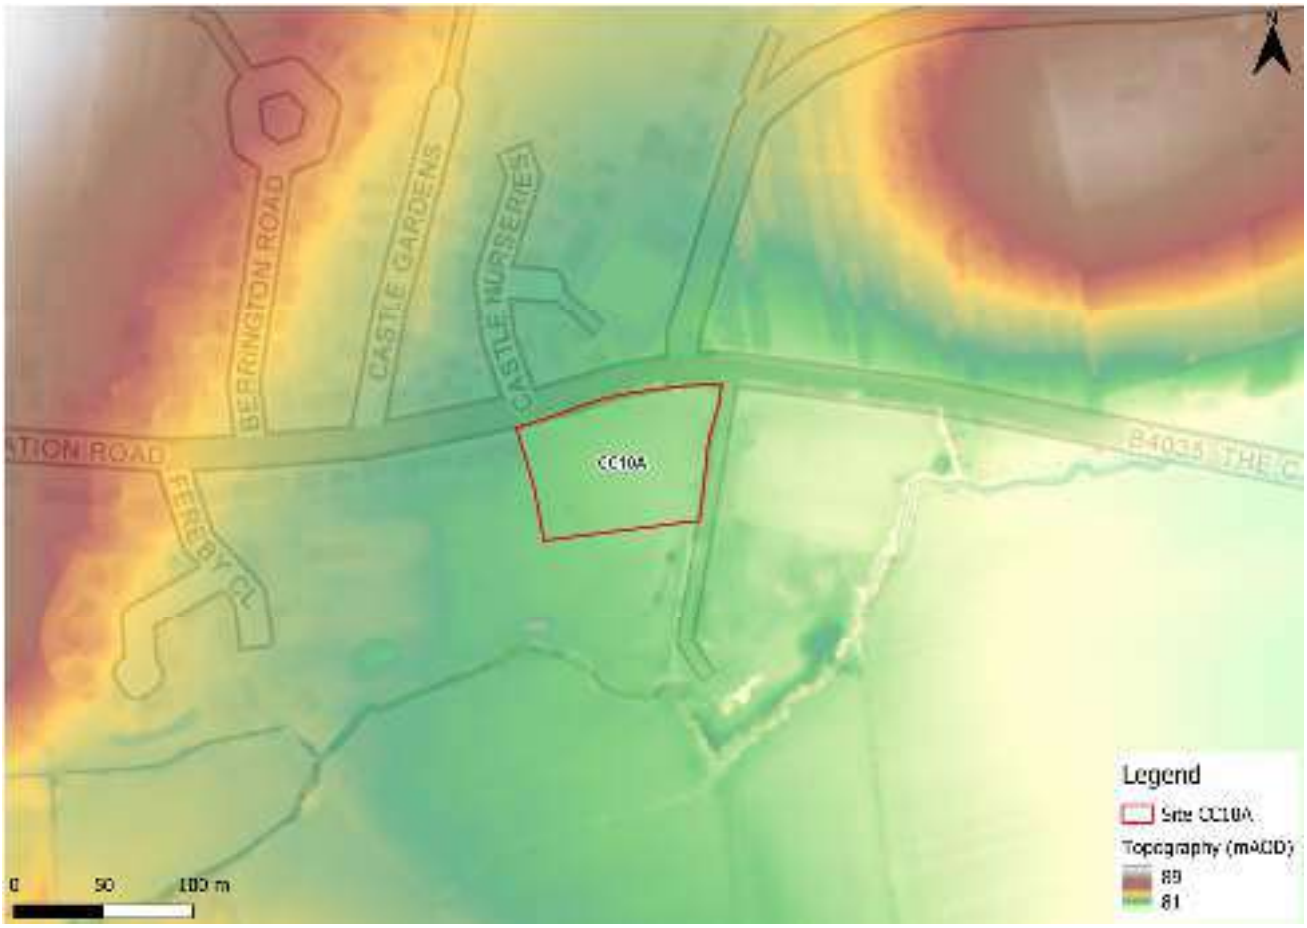

Figure 1-3: Topography

The topography of the site slopes from west to east towards the floodplain of The Cam.

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the percentage areas of the site within each flood zone are stated in Table 2-1 and can be viewed on Figure 2-1. The Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

The site is partially within Flood Zones 3a and 2 due to risk from The Cam, which is an ordinary watercourse. There is no detailed model available for The Cam meaning the flood zones here are based on the EA's New National Model (NNM) dataset. Flood depths and hazards therefore are not available for interrogation.

Table 2-1: Present day flood risk based on percentage area of site at risk

Flood Zone 1 (% area)	Flood Zone 2 (% area)	Flood Zone 3a (% area)	Flood Zone 3b (% area)
45	33	22	0

Figure 2-1: Present day risk

2.2 Impacts from climate change

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Avon Warwickshire Management Catchment. The central allowance within this catchment is 21% on peak flows (Table 2-2). There is no local detailed model for The Cam therefore the required event cannot be assessed.

Table 2-2: Modelled climate change allowances for peak river flows within the Avon Warwickshire Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	7	12	22
2050s	8	14	31
2080s	21	32	59

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Figure 2-2 shows the Flood Map for Planning - Flood Zones plus Climate Change dataset which includes the central allowance for the 2080s epoch. This represents the impact of

climate change on Flood Zone 3a and Flood Zone 2 combined. There is a slight increase in risk to the site as a result of climate change.

Figure 2-2: EA Flood Zones plus Climate Change

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There is one recorded event, according to these datasets, caused by channel capacity exceedance of The Cam in July 1968 (Figure 2-3). The LLFA provided its historic floods register. There are ten recorded flooding incidents within the Campden & Vale Ward within which the site is located.

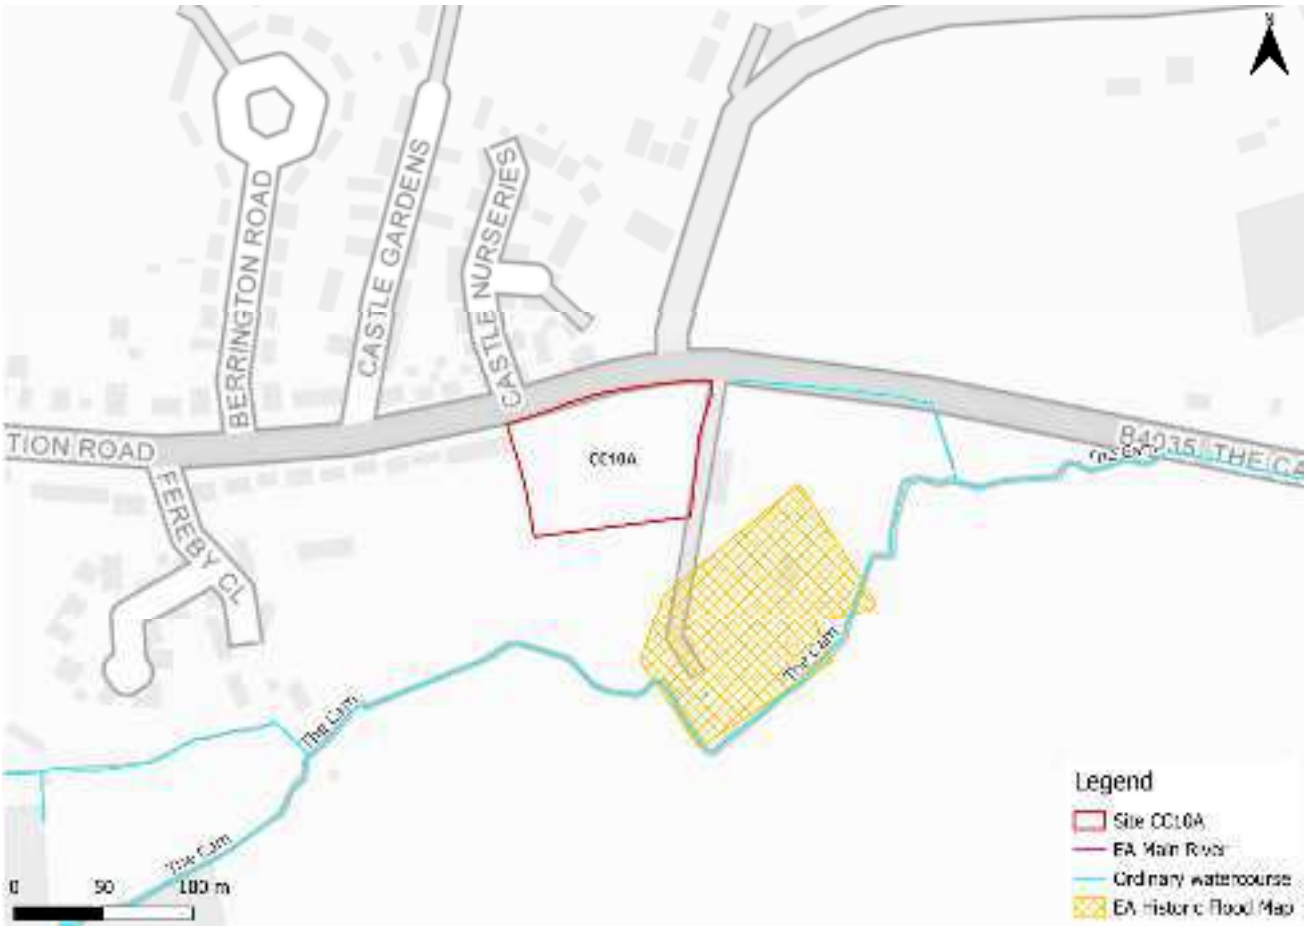

Figure 2-3: EA Historic Flood Map

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-4 shows that there are large areas around the site that could benefit from riparian and floodplain tree planting. Tree planting can help to slow the flow to benefit areas downstream. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

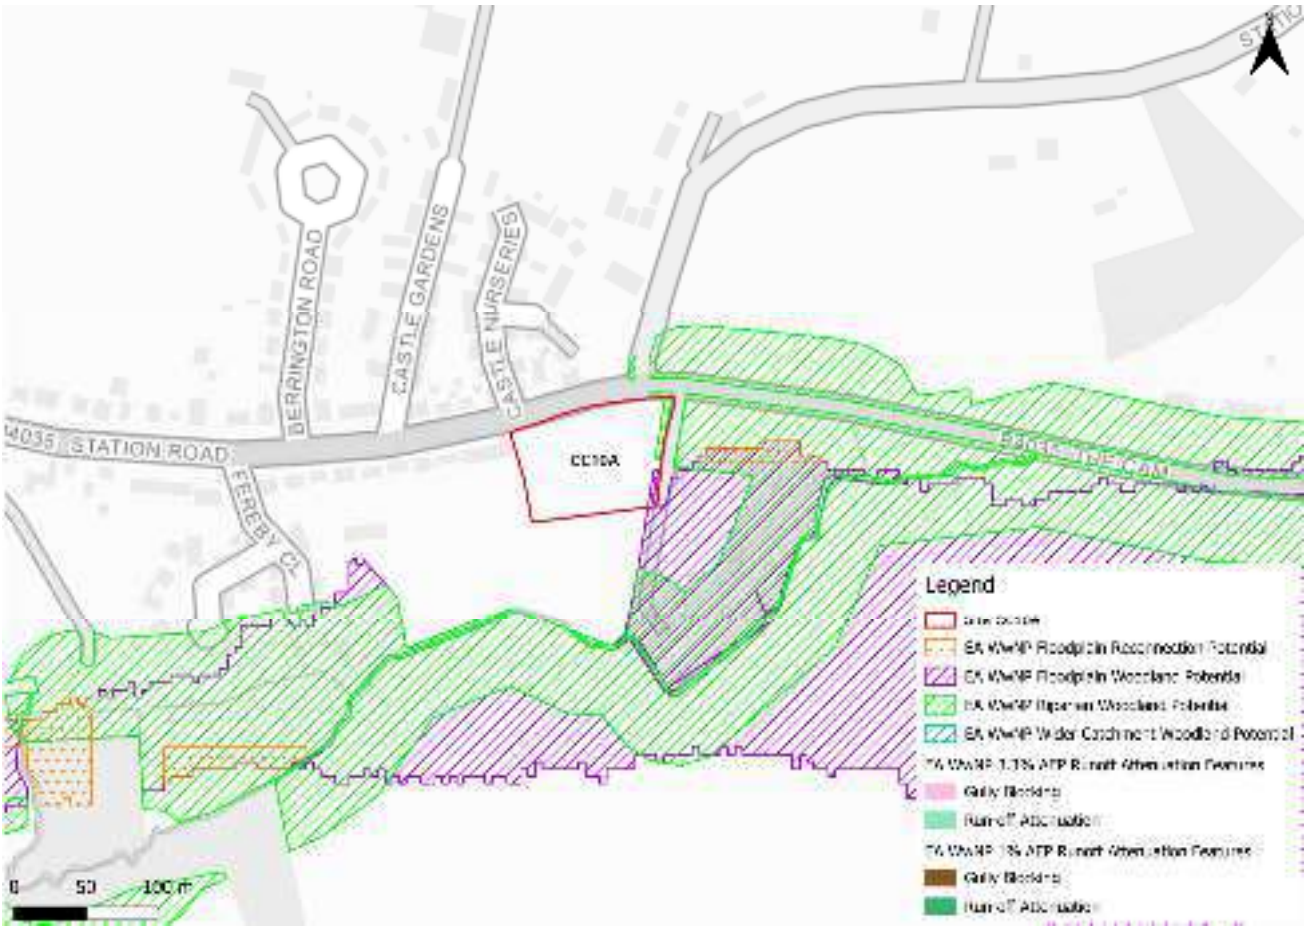

Figure 2-4: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warnings and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The floodplain of The Cam including the southern boundary of the site are located within a FAA, namely the ' River Stour in South Warwickshire' FAA (Figure 2-5).

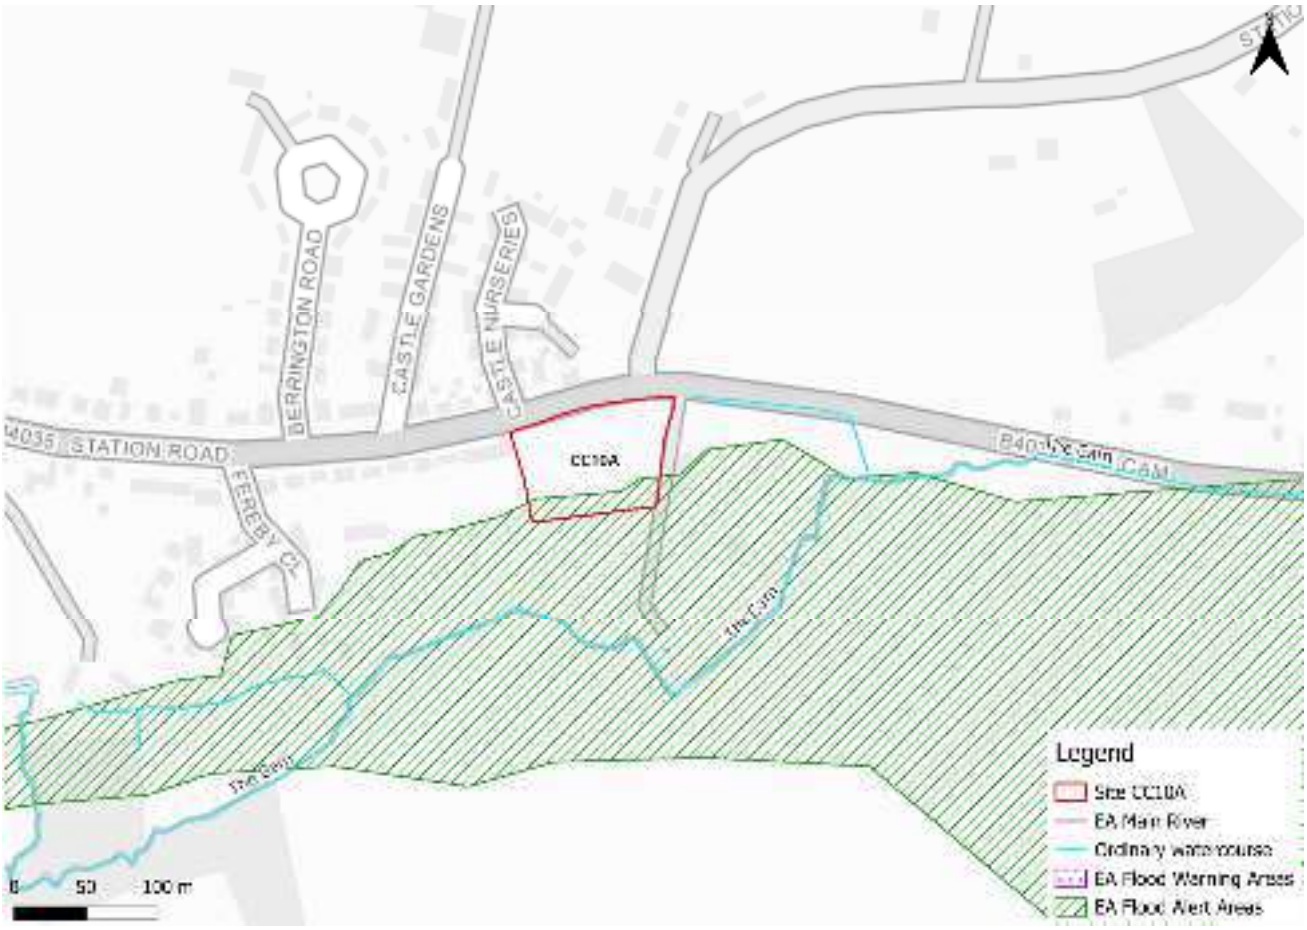

Figure 2-5: Flood warnings and alerts

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes are available during a flood event via existing routes to Station Road (Figure 2-6).

Figure 2-6: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site is at risk from flooding from The Cam ordinary watercourse.
  - The risk from The Cam is based on the EA's NNM and not detailed modelling which is considered to be the most up to date information on fluvial risk to the site and surrounding area. However, the NNM does not contain depth or hazard information, therefore risk cannot be robustly defined at this stage.
- Mitigation:
  - The risk area should remain as open greenspace that is designed to mitigate floodwater. This can provide a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits.
  - All development should be directed to Flood Zone 1 outside of the climate change risk area. However, this will limit the number of plots available on the site.
  - Were development in the risk area to be considered, the EA will likely expect detailed modelling of The Cam to be carried out at the site-specific FRA stage

to robustly inform on present day and future risk to the site, including flood depths and hazards.
    - EA flood alerts should continue to be in place to ensure early evacuation of site users before an extreme flood event occurs.
- Access and escape:
    - Based on current information, safe access and escape routes are available via Station Road.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (May 2026), the site is at significant risk of surface water flooding as shown in Table 3-1 and Figure 3-1 and also the depth map in Figure 3-2. Maximum flood depths are greater than 0.3m in the centre and east of the site.

The provision of safe access and escape routes via Station Road will require further investigation at the FRA stage.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
32	16	7	45

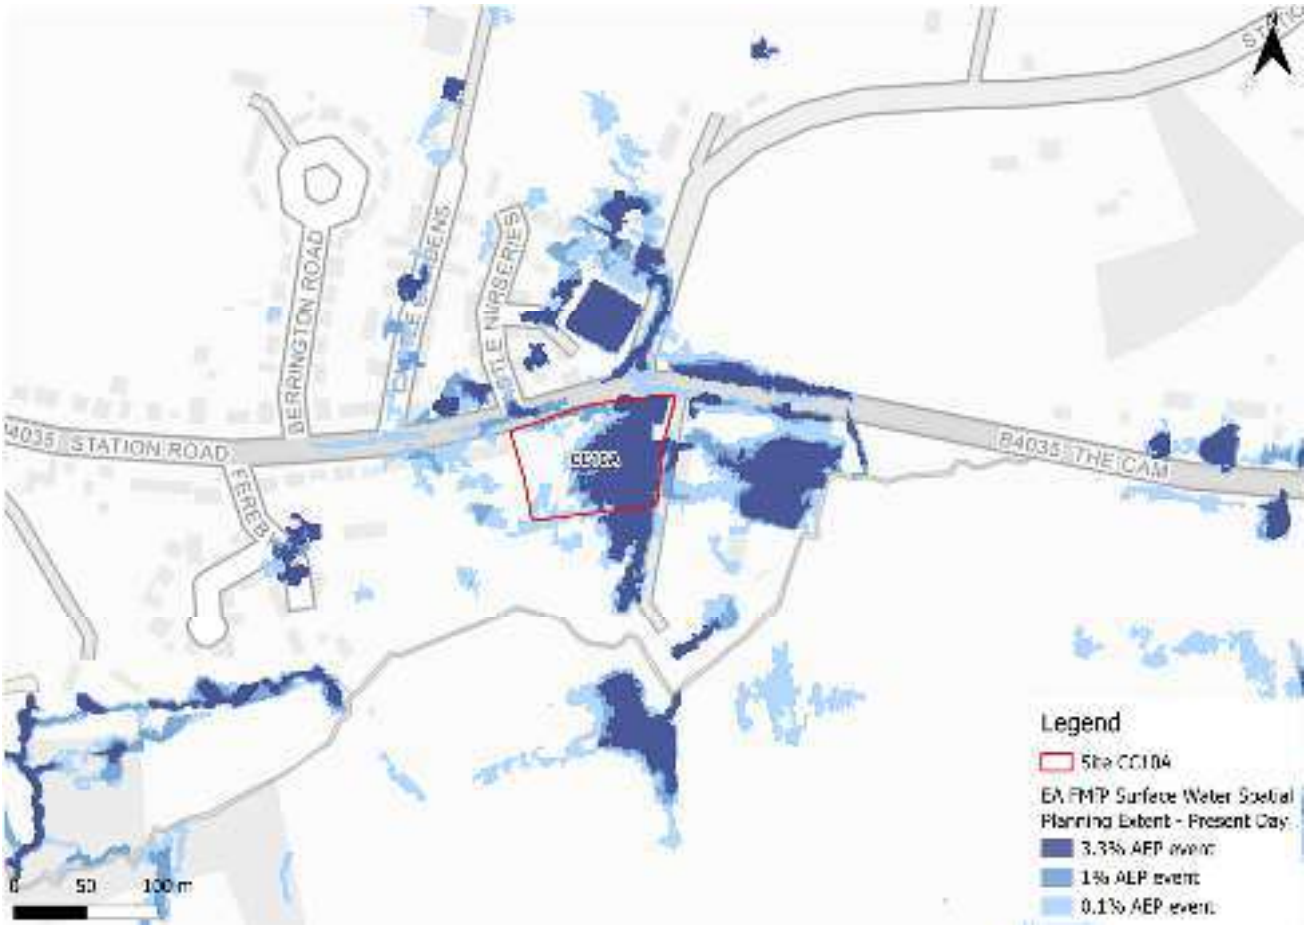

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

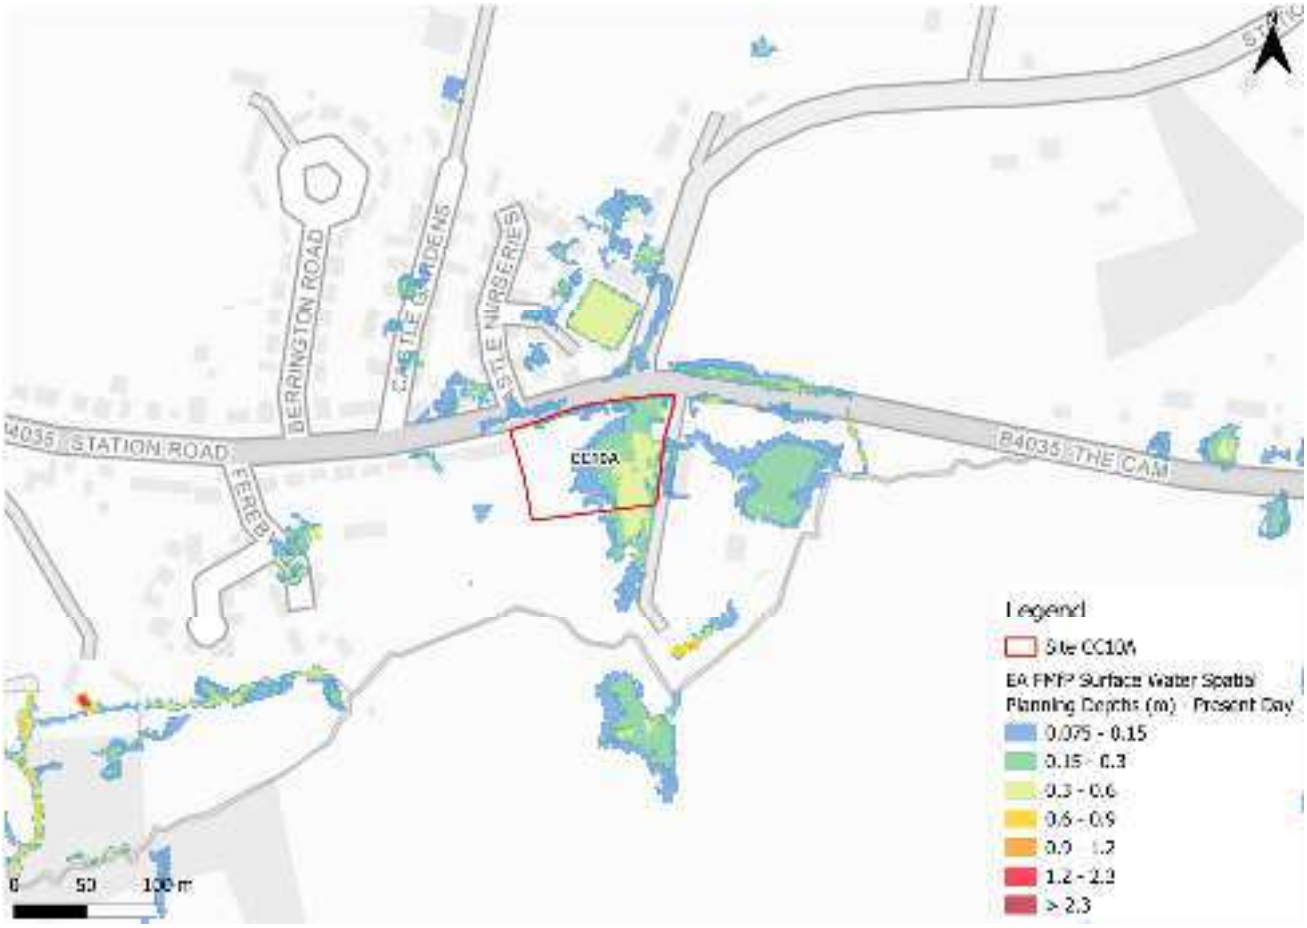

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows there to be a moderate flood hazard in the east of the site. Access via Station Road is low hazard and therefore should remain a viable route (Figure 3-3). There are differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping. However, updated surface water hazard information should be confirmed at the site-specific FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day medium risk surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRAs should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is now included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Avon Warwickshire management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Avon Warwickshire Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. The site is at significant additional risk from surface water climate change.

Flood depths of greater than 0.3m increase in extent across the site (Figure 3-5).

Safe access and escape routes would likely remain achievable via Station Road.

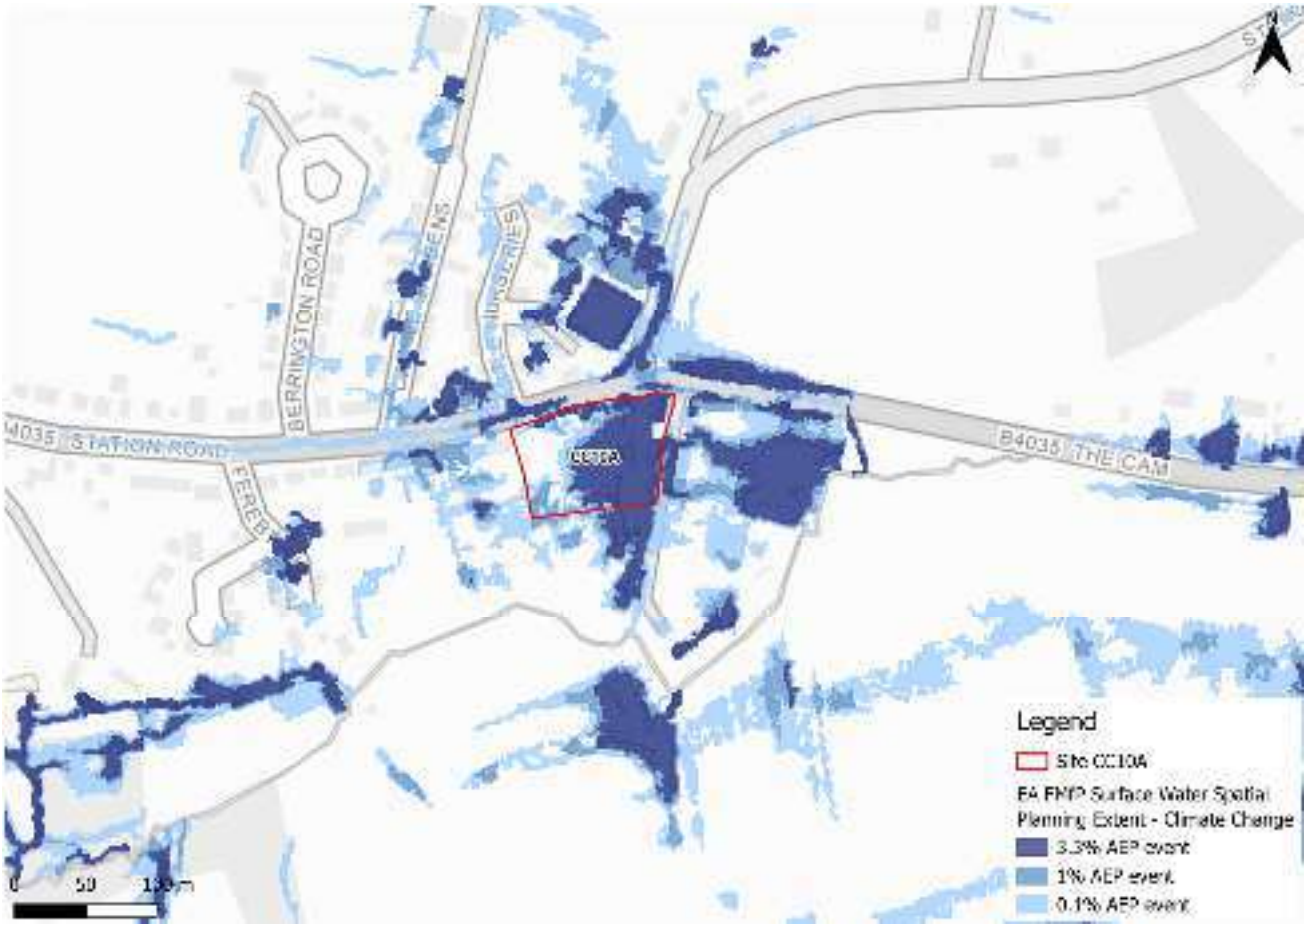

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

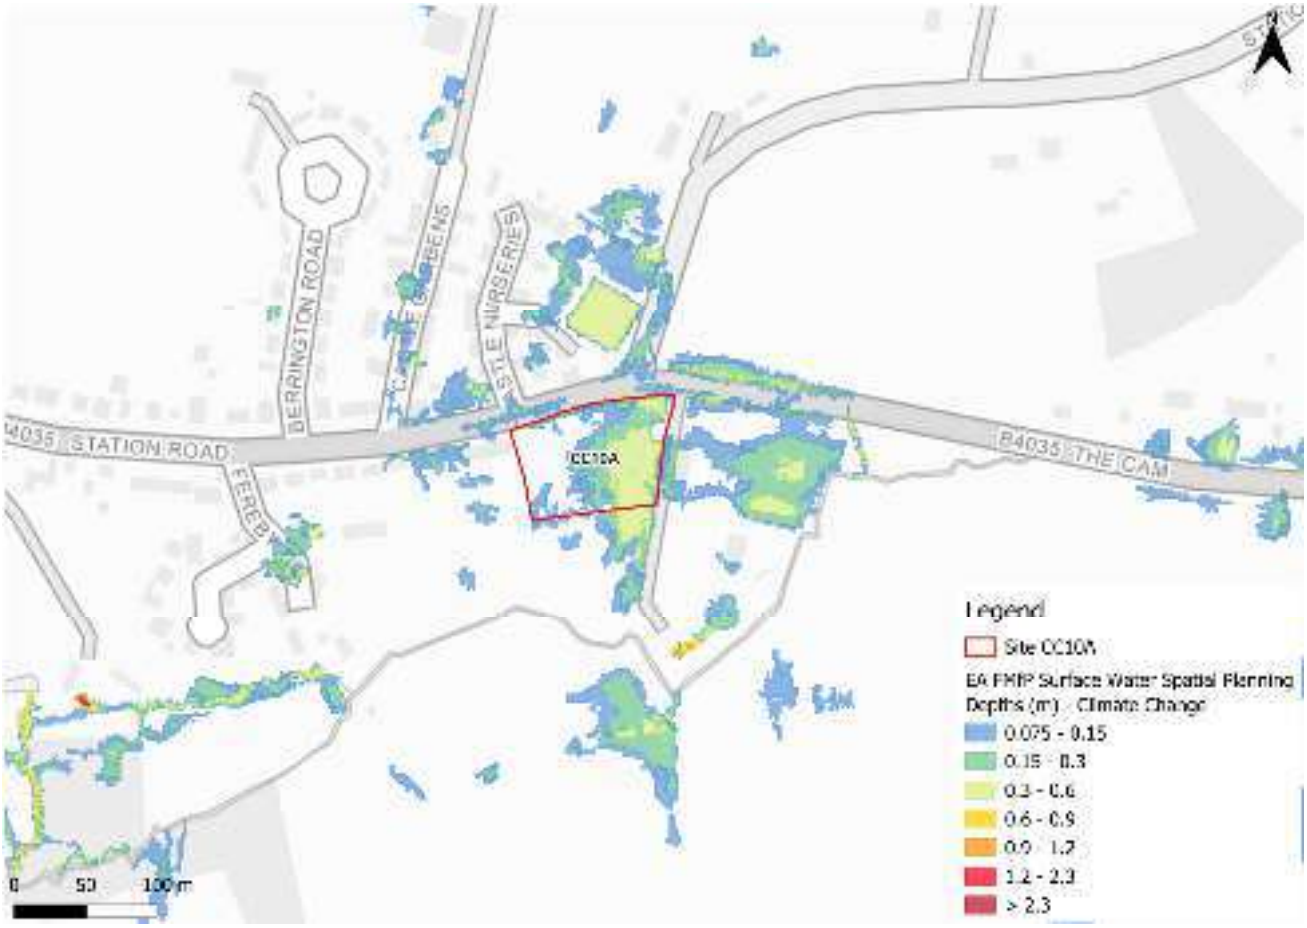

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is mainly categorised as moderate and significant (Figure 3-6).

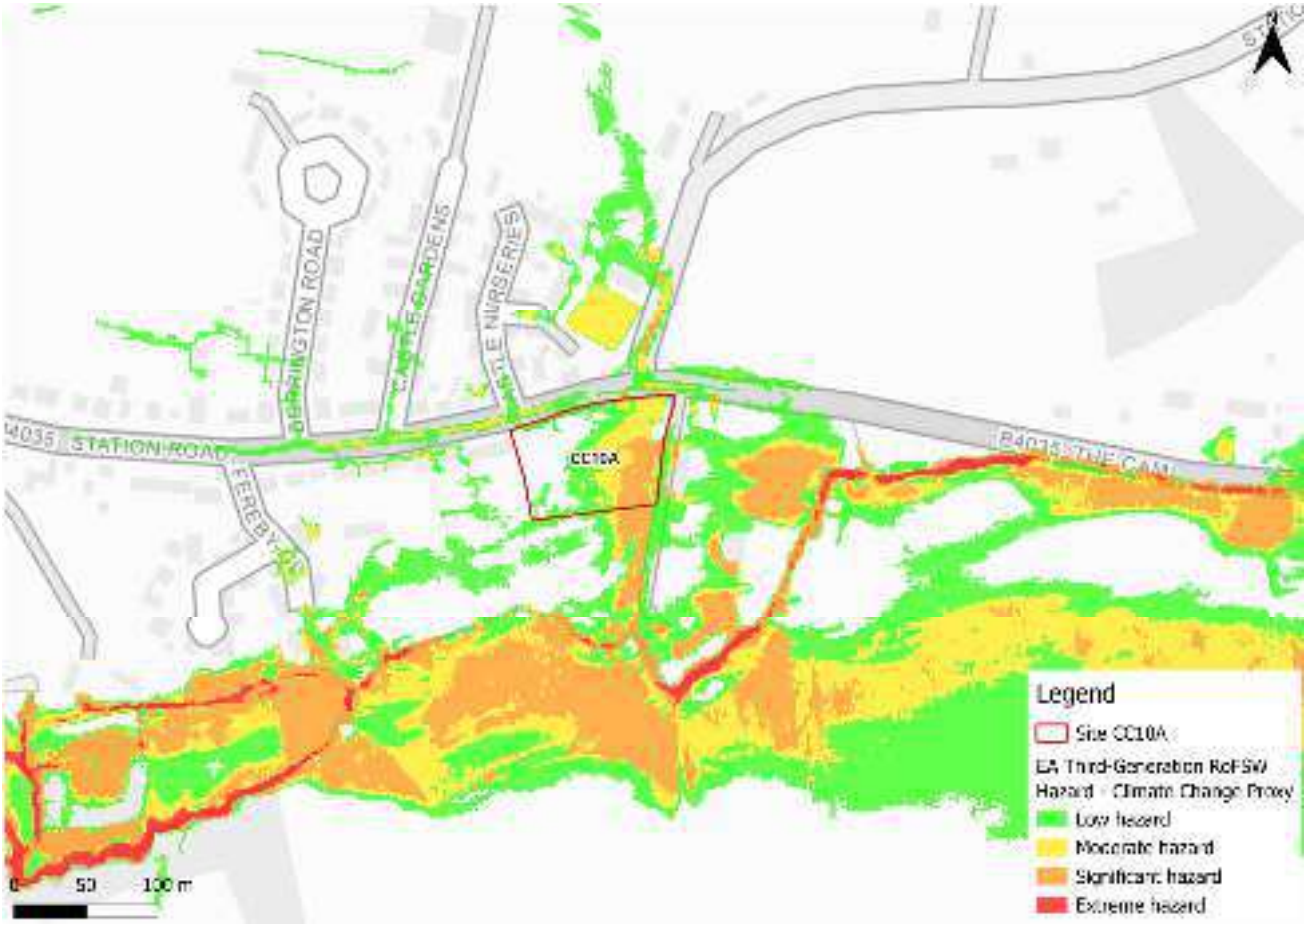

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day low risk surface water flood hazard as a proxy for climate change

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There are 22 recorded sewer flooding incidents within the Campden & Vale Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is significant, with 45% of the site being within the 3.3% AEP surface water flood extent. Only 32% of the site is outside of the 0.1% AEP flood extent and considered low risk.
- Risk to the site is shown to increase within the site when considering the impact of climate change.
- Much of the risk area coincides with the fluvial risk area and should be safeguarded for flood storage.
- Safe access and escape routes may be achievable via Station Road.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within one catchment, namely, the Knee Bk - source to conf Blockley Bk catchment. This catchment is ranked as a high sensitivity catchment. Planning considerations for all sites can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications. The site is shown to be at no risk of groundwater emergence.

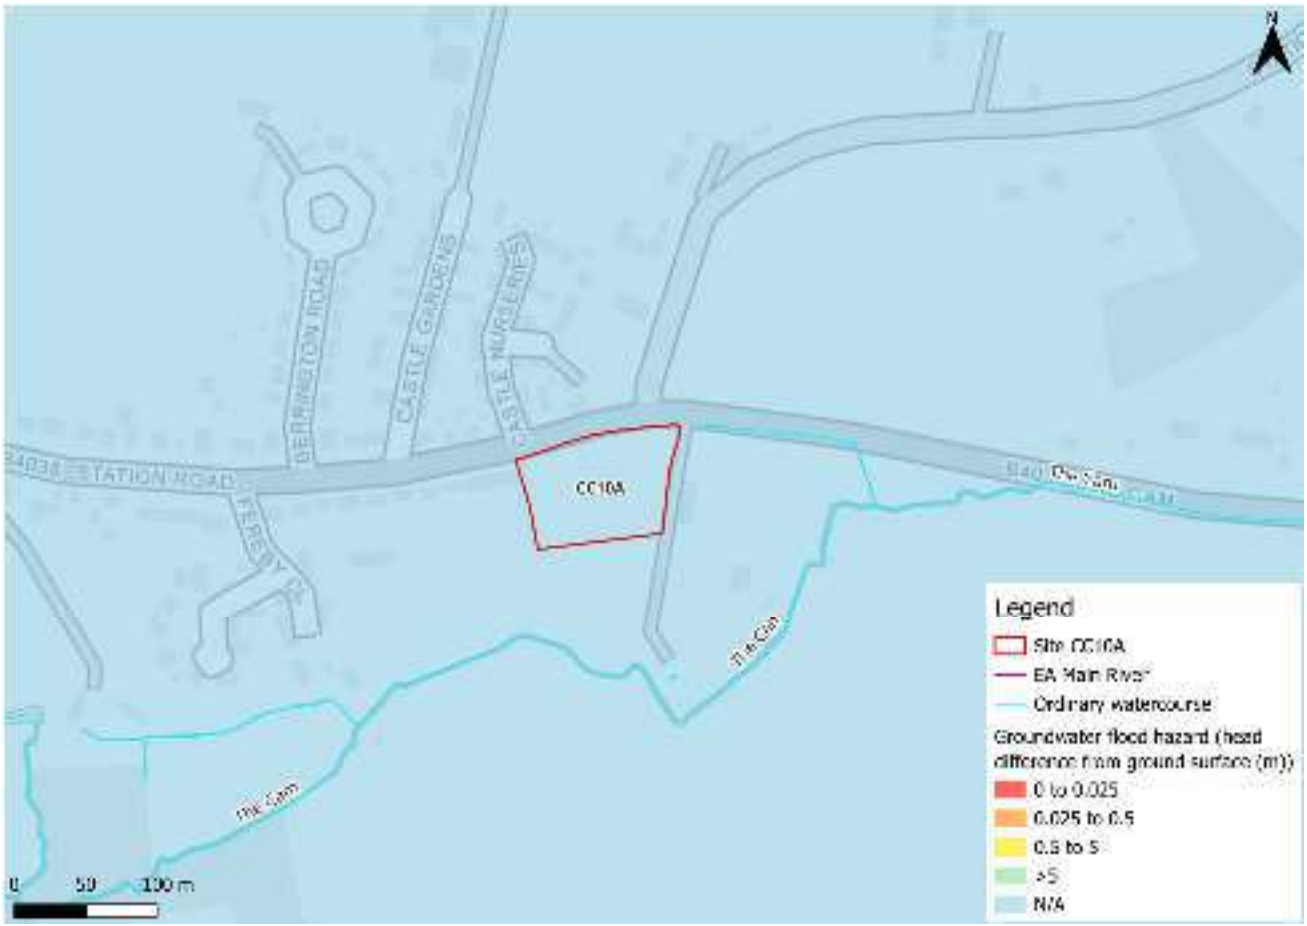

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is mudstone, siltstone, limestone and sandstone (Figure 5-2) which will have variable permeability and porosity. There is no record of superficial deposits in the area.

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There is no potential residual risk to the site.

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is required to pass part b) of the exception test as it is proposed for more vulnerable residential development and is located within Flood Zone 3a. Based on current available information, it is unlikely this site could pass the Exception Test, unless all development can be directed to Flood Zone 1 whilst accounting for climate change. Were new information to made available, the Exception Test should be reapplied.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- The site should remain as open greenspace, which can provide a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits.
- All development should be directed to Flood Zone 1 outside of the climate change risk area.
- Were development in the risk area to be considered, the EA will likely expect detailed modelling of The Cam to be carried out at the site-specific FRA stage to robustly inform on present day and future risk to the site, including flood depths and hazards.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site BK11. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site BK11

- Location: Former Station Road Allotments
- Existing site use: Allotments
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 1.46
- Watercourse: N/A
- Environment Agency (EA) flood model: N/A
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of surface water flood extent, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

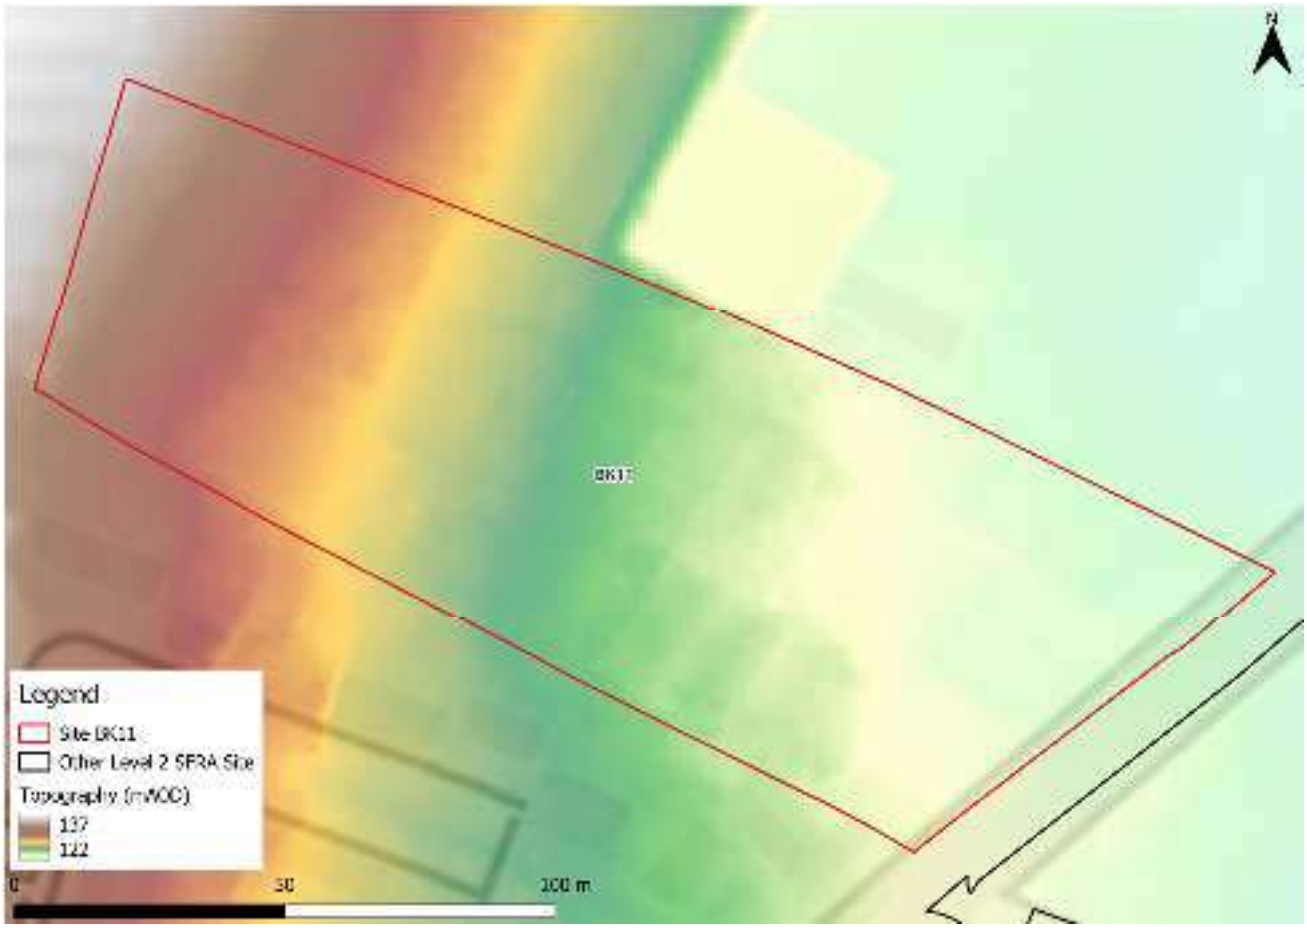

Figure 1-3: Topography

The topography of the site slopes from west to east towards the floodplain of Blockley Brook (Figure 1-3).

This page is intentionally left blank

2.2 Impacts from climate change

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Based on the Flood Map for Planning - Flood Zones plus Climate Change dataset, the site is not shown to be at risk when considering climate change.

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There are no recorded flooding incidents within the Blockley Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. The are no potential areas which could benefit the site.

2.5 Emergency planning

2.5.1 Flood warnings and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The site is not located within a FAA.

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes are available during a flood event via Station Road to the south of the site (Figure 2-2).

Figure 2-2: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site is located within Flood Zone 1 and is not shown to be at additional risk when considering climate change.
- Access and escape:
  - Based on current information, safe access and escape routes are available via Station Road to the south of the site.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (May 2026), the site is at nominal risk of surface water flooding as shown in Table 3-1 and Figure 3-1. In the 1% AEP event, surface water flood depths are shown to be less than 0.15 m (Figure 3-2).

Safe access and escape routes are achievable via Station Road to the south of the site.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
90	9	1	0

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows the medium risk event to not impact the site (Figure 3-3). There are therefore clear differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping. Updated surface water hazard information should be confirmed at the site-specific FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day medium risk surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRAs should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is now included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Avon Warwickshire management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Avon Warwickshire Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. The site is not shown to be at significant additional risk from surface water climate change. The flow path through the centre of the site becomes more prominent in the 1% AEP and 0.1% AEP events.

Flood depths in the 1% AEP event are shallow, not exceeding 0.3m (Figure 3-5). Safe access and escape routes would likely remain achievable via Station Road to the south of the site.

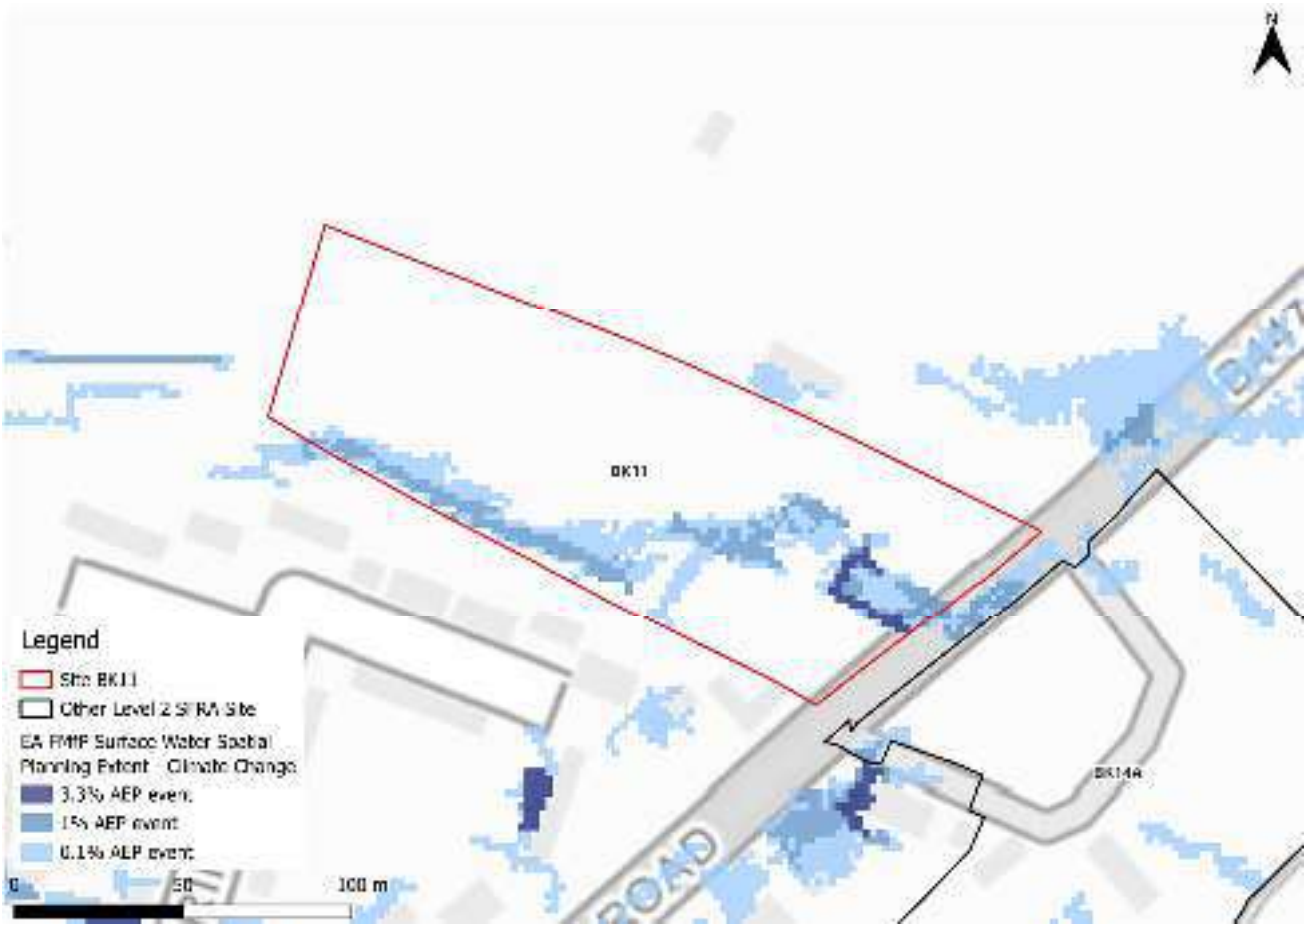

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 0.1% AEP event flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, the low risk event is shown to not impact the site (Figure 3-6). This reinforces the clear differences present between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping.

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day 0.1% AEP event surface water flood hazard[1] as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There is one recorded sewer flooding incidents within the Blockley Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 90% of the site being outside of the 0.1% AEP surface water flood extent.
- Risk to the site is shown to slightly increase in extent within the site when considering the impact of climate change, however depths remain largely very shallow.
- Flood depths are shallow and it should be possible to manage the risk onsite. Topographic flow paths should be considered and included in site design and ideally left in place to flood naturally when required.
- The drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or

betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.

- Safe access and escape routes would likely be achievable via Station Road when considering surface water risk.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within one catchment, namely, the Blockley Bk - source to conf Knee Bk catchment. This catchment is ranked as a low sensitivity catchment. Planning considerations for all sites can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications.

The entire site is within an area where there is no risk of groundwater emergence. Infiltration SuDS may therefore be appropriate at this site.

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is mudstone, siltstone, limestone and sandstone (Figure 5-2) which will have variable permeability and porosity. There is no record of superficial deposits in the area.

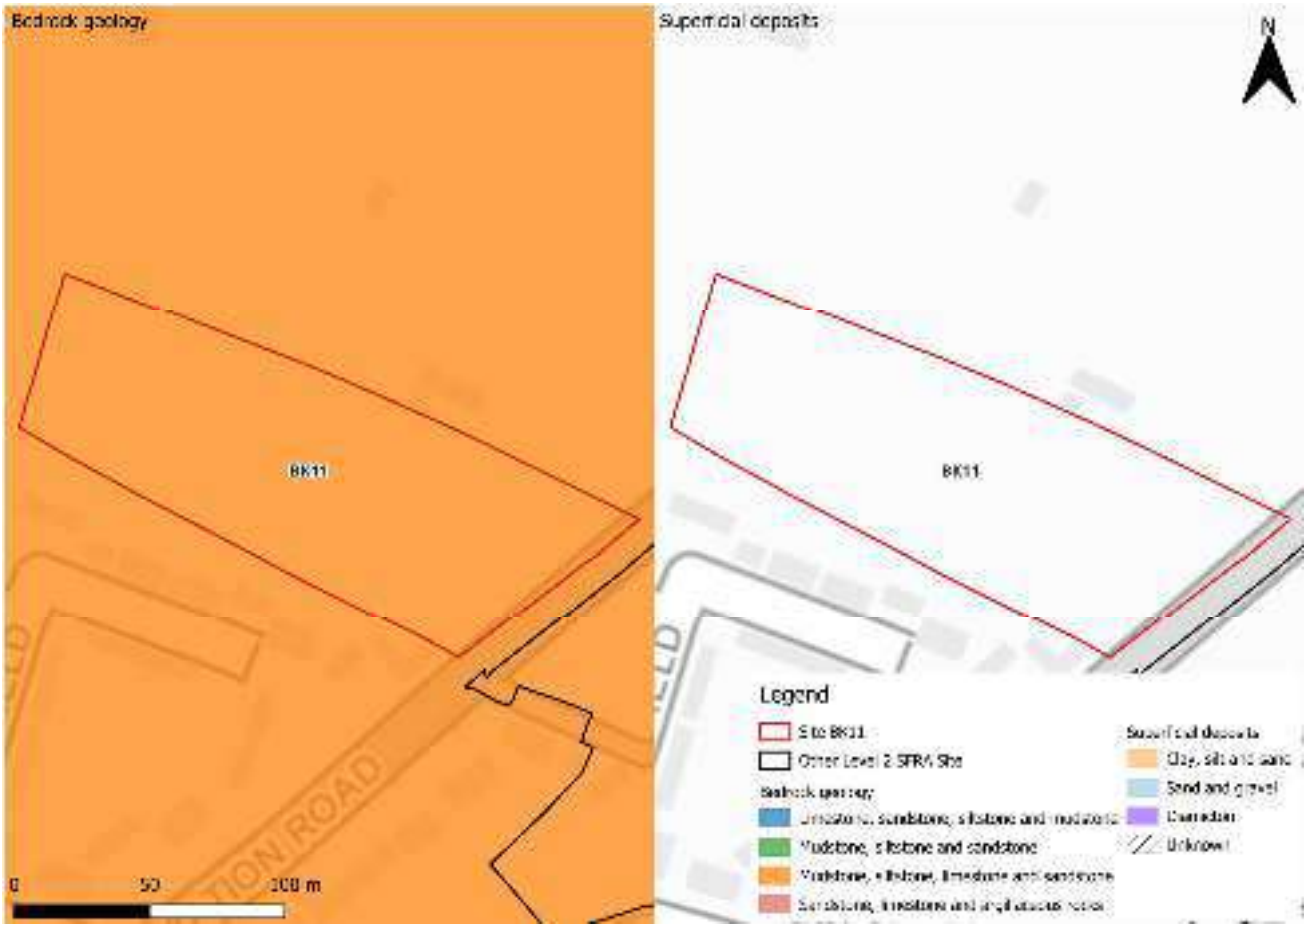

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There is no potential residual risk to the site.

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is not required to pass part b) of the exception test, as it is not located within Flood Zone 3a, however it must still be proven that the development can be safe for its lifetime, which is generally considered to be 100 years for residential development.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be appropriate to develop this site for more vulnerable purposes given its location within Flood Zone 1 and nominal surface water flood risk.
- A drainage strategy should ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site F39C/F52. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site F39C/F52

- Location: Land west of Terminus Cottage and Station Cottage
- Existing site use: Open greenspace, car park
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 3.33
- Watercourse: Unnamed ordinary watercourse
- Environment Agency (EA) flood model: N/A
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of surface water flood extent, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

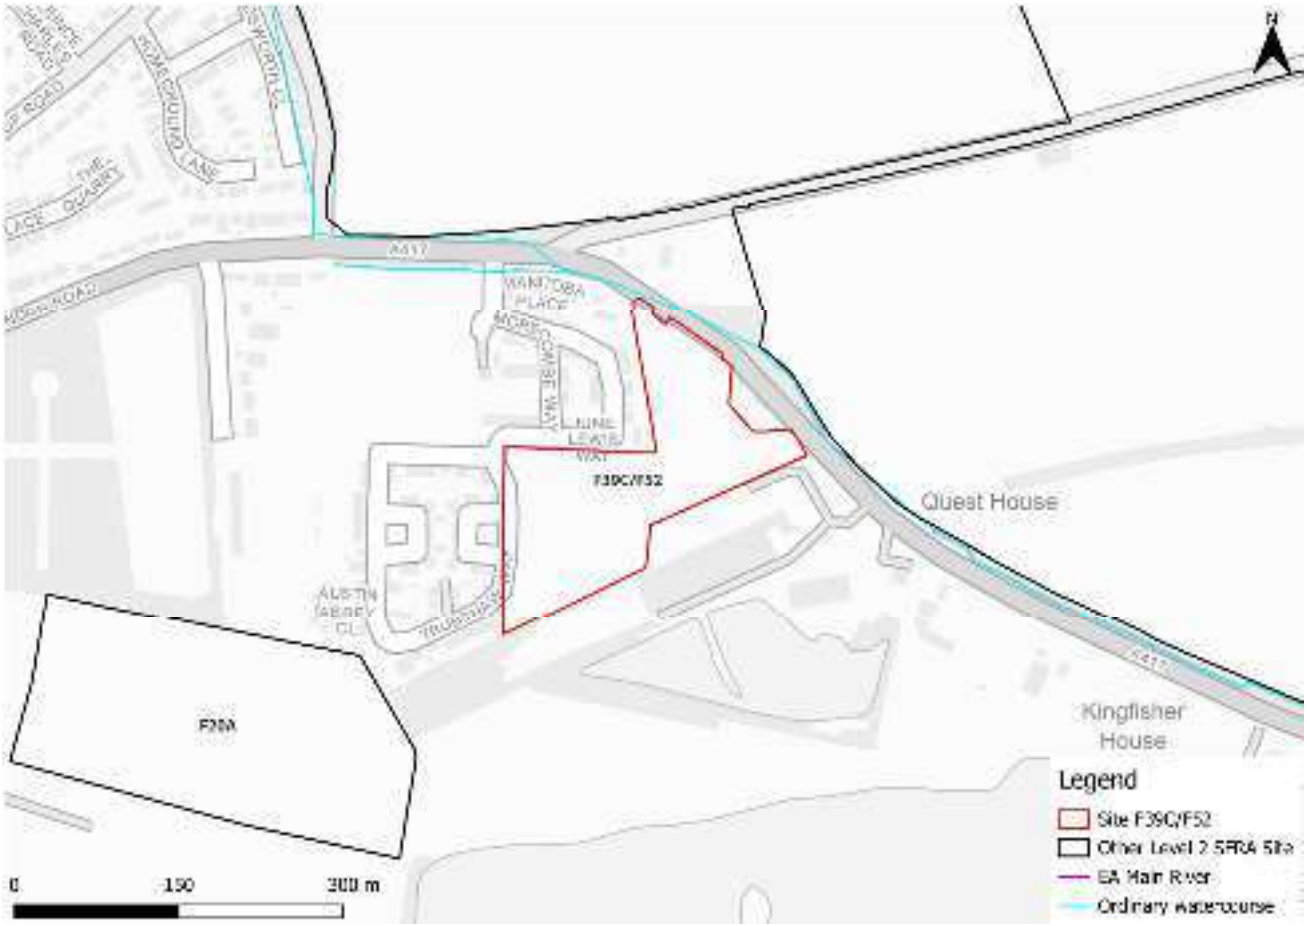

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

Figure 1-3: Topography

The topography is generally consistent across the site, with some areas of higher elevation within northwest (Figure 1-3).

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the percentage areas of the site within each flood zone are stated in Table 2-1 and can be viewed on Figure 2-1. The Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

The site is located within Flood Zone 1 and therefore at low risk of flooding from rivers. There is an unnamed ordinary watercourse adjacent to the northeastern boundary of the site. The EA's New National Model (NNM) does not cover this watercourse, therefore the potential fluvial risk posed to the site cannot be assessed. This should be considered as part of a site-specific FRA.

Table 2-1: Present day flood risk based on percentage area of site at risk

Flood Zone 1 (% area)	Flood Zone 2 (% area)	Flood Zone 3a (% area)	Flood Zone 3b (% area)
100	0	0	0

Figure 2-1: Present day risk

2.2 Impacts from climate change

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Based on the Flood Map for Planning - Flood Zones plus Climate Change dataset, the site is not shown to be at risk when considering climate change.

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There are no recorded flooding incidents within the Blockley Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-2 shows the site and wider area could benefit from riparian tree planting. Tree planting can help to slow the flow to benefit areas downstream. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

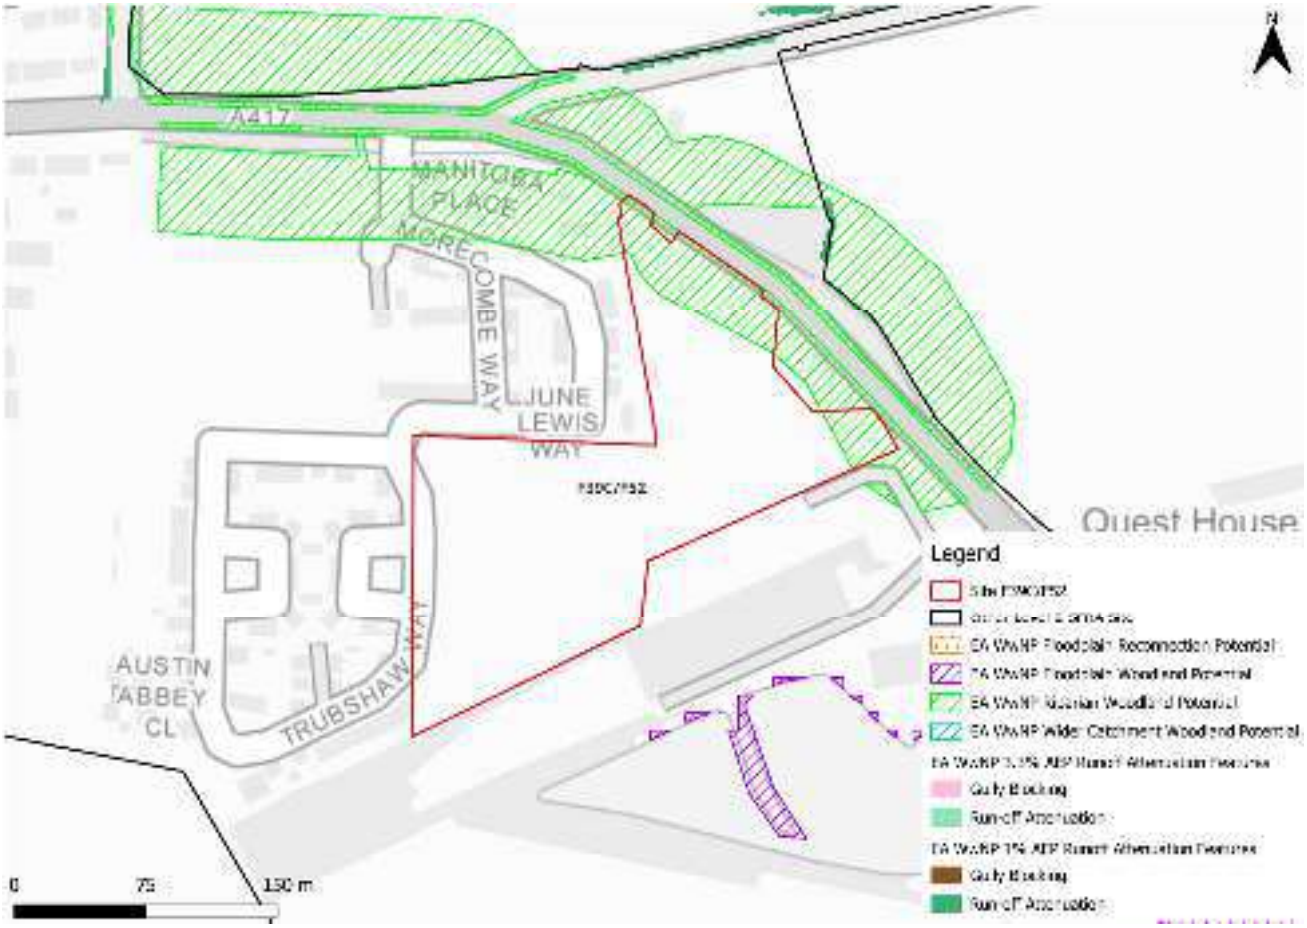

Figure 2-2: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warnings and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The site is not located within a FAA.

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes are available during a flood event via the A417 to the east and north of the site (Figure 2-3).

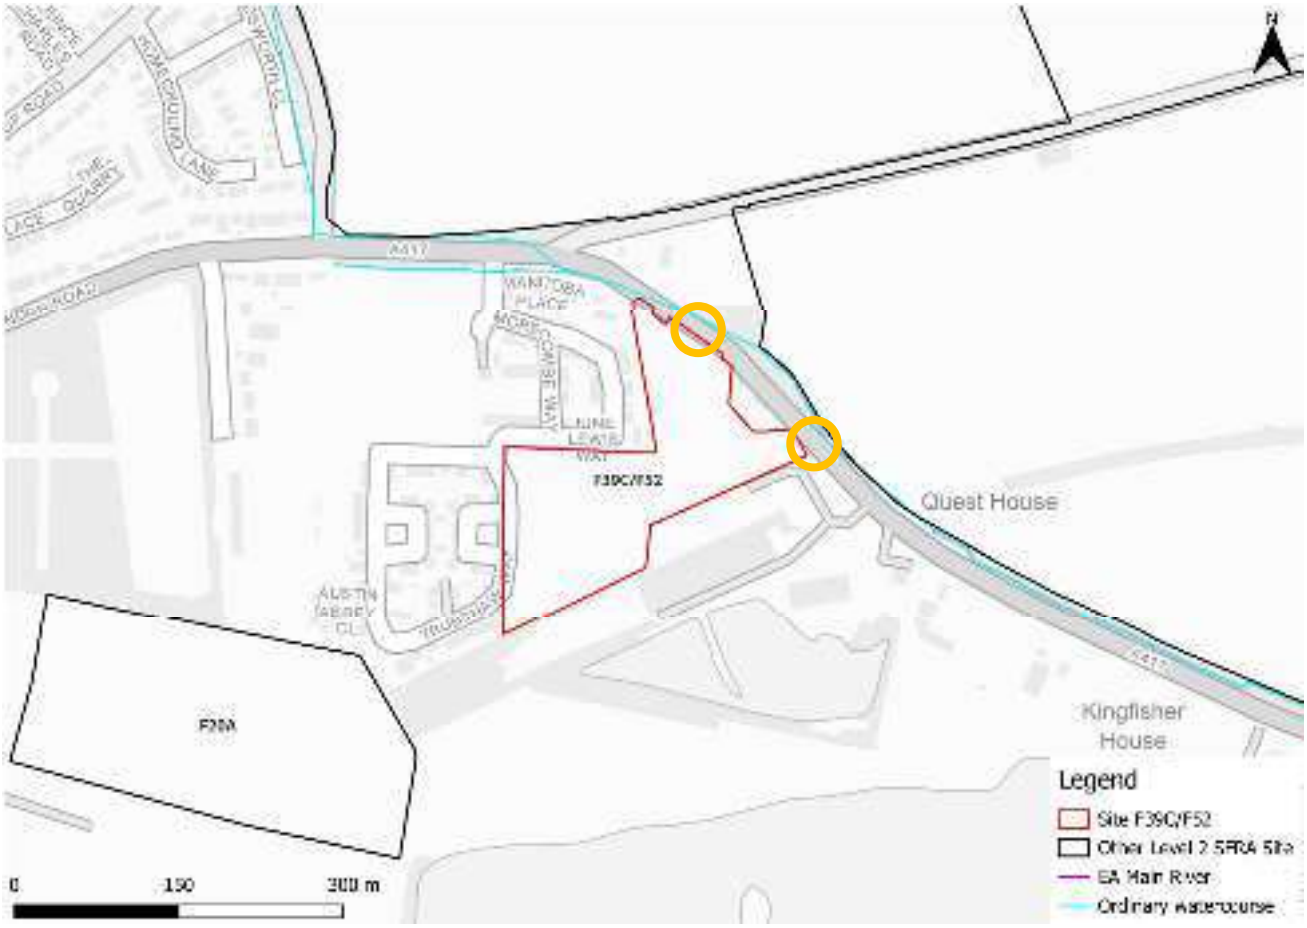

Figure 2-3: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site is located wholly within Flood Zone 1 and therefore at low risk of flooding from rivers.
  - The site is not shown to be at increased risk from fluvial flooding in the future, based on the EA's Flood Zones plus Climate Change dataset.
  - The potential fluvial risk posed by the unnamed ordinary watercourse to the site cannot be assessed given no modelling is available. This should be considered as part of a site-specific FRA.
- Access and escape:
  - Based on current information, safe access and escape routes are available via the A417 to the north and east of the site.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (May 2026), surface water risk is largely very low (Table 3-1). Surface water risk is present onsite as areas of scattered ponding in topographic low spots, with an area of ponding in the 3.3% AEP event in the north of the site (Figure 3-1). In the 1% AEP event, surface water flood depths are shown to be between 0.3 and 0.6 m within the area of ponding in the north of the site (Figure 3-2). Depths within the remaining onsite risk areas are shallow.

Safe access and escape routes would likely be achievable via the A417 to the east of the site.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
82	11	4	3

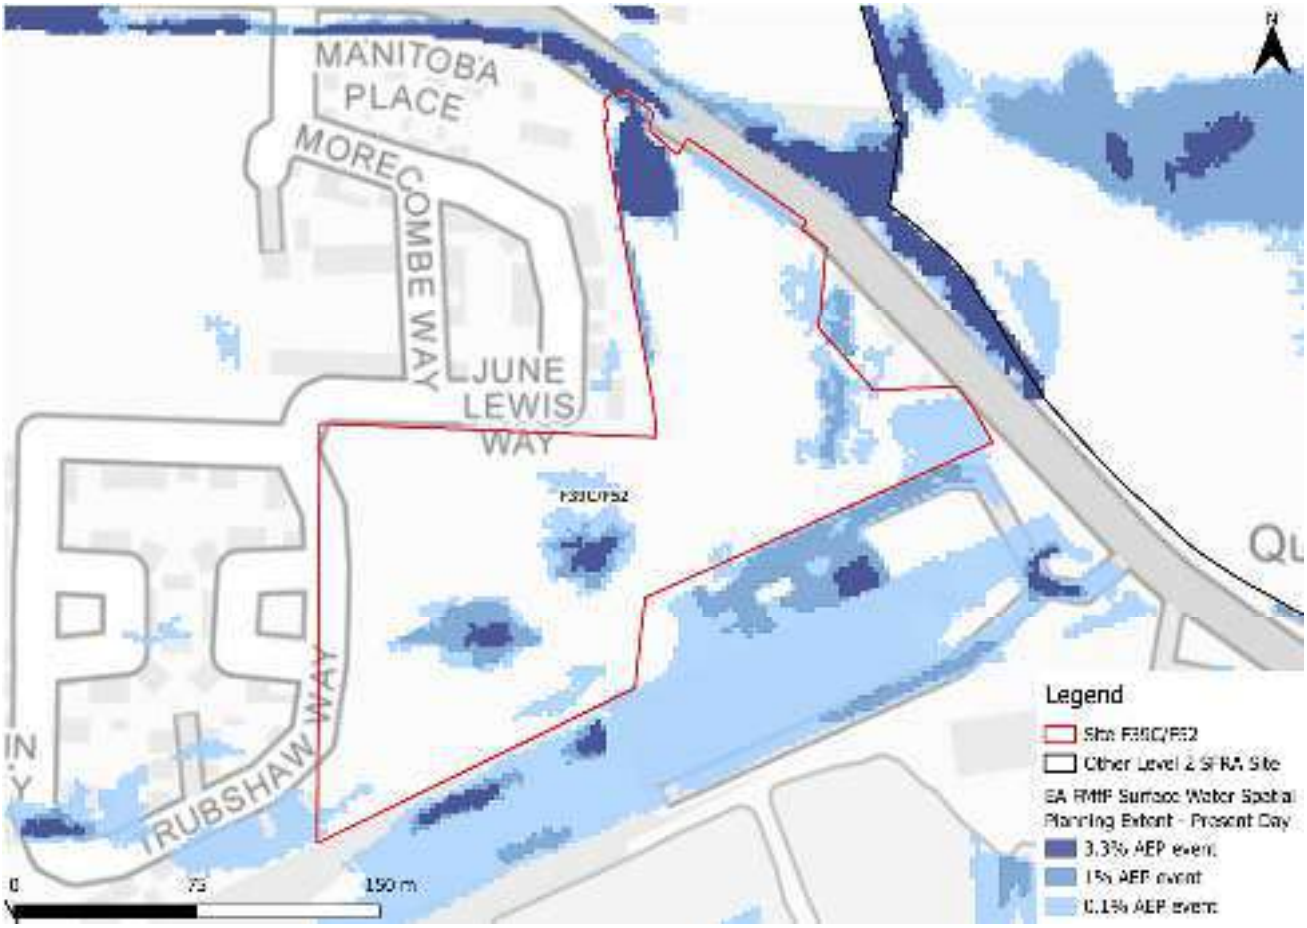

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

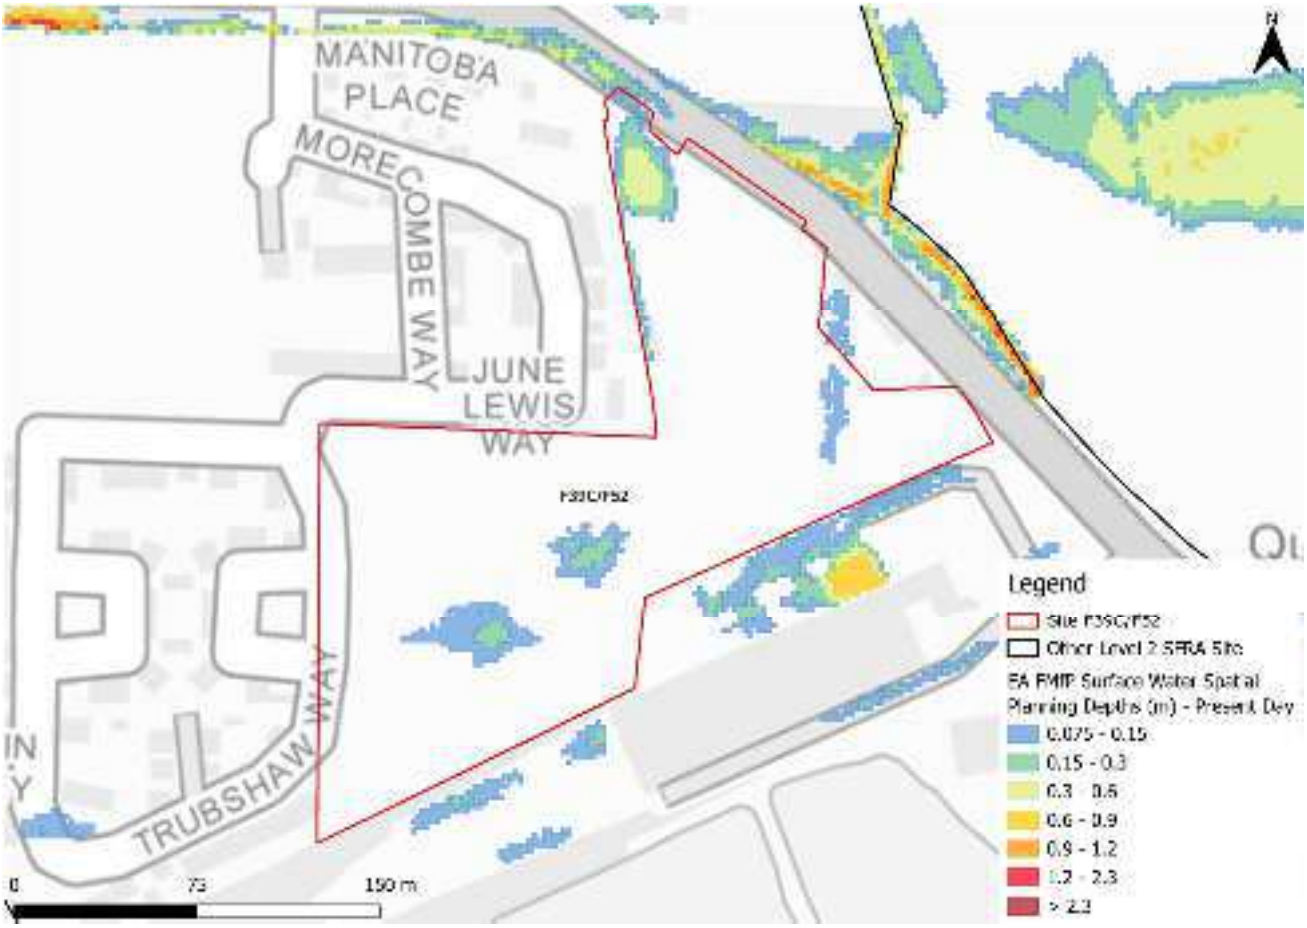

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows the medium risk event to not impact the site (Figure 3-3). There are therefore clear differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping. Update surface water hazard information should be confirmed at the site-specific FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

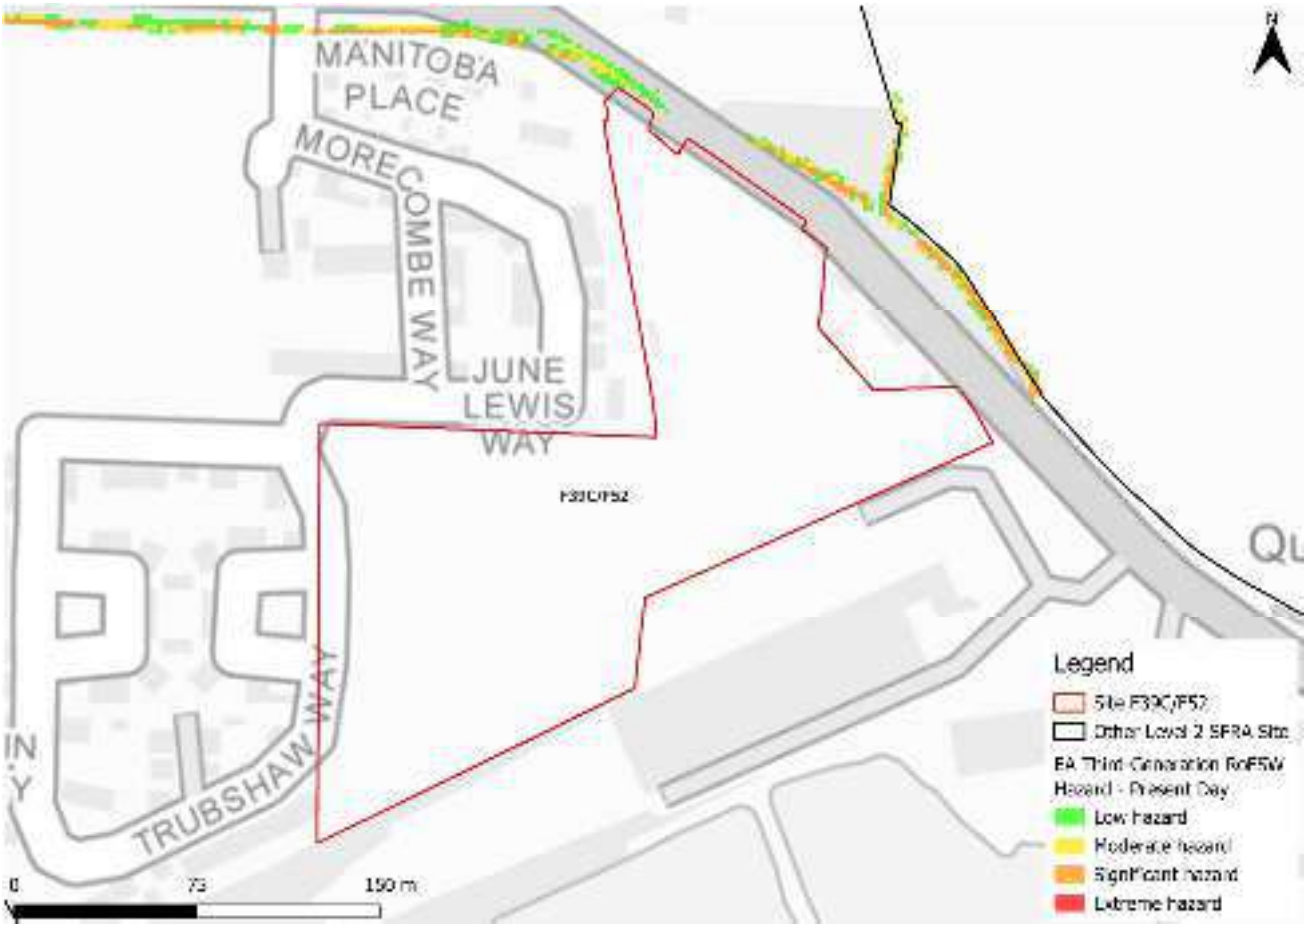

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day medium risk surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRAs should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is now included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Gloucestershire and the Vale management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Gloucestershire and the Vale Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. The site is not shown to be at significant additional risk from surface water climate change. There are some additional areas of ponding within the 0.1% AEP event, particularly within the east of the site.

Flood depths in the 1% AEP event are shown to remain at between 0.3 and 0.6 m within the north of the site (Figure 3-5). Safe access and escape routes would likely remain achievable via the A417 to the east of the site.

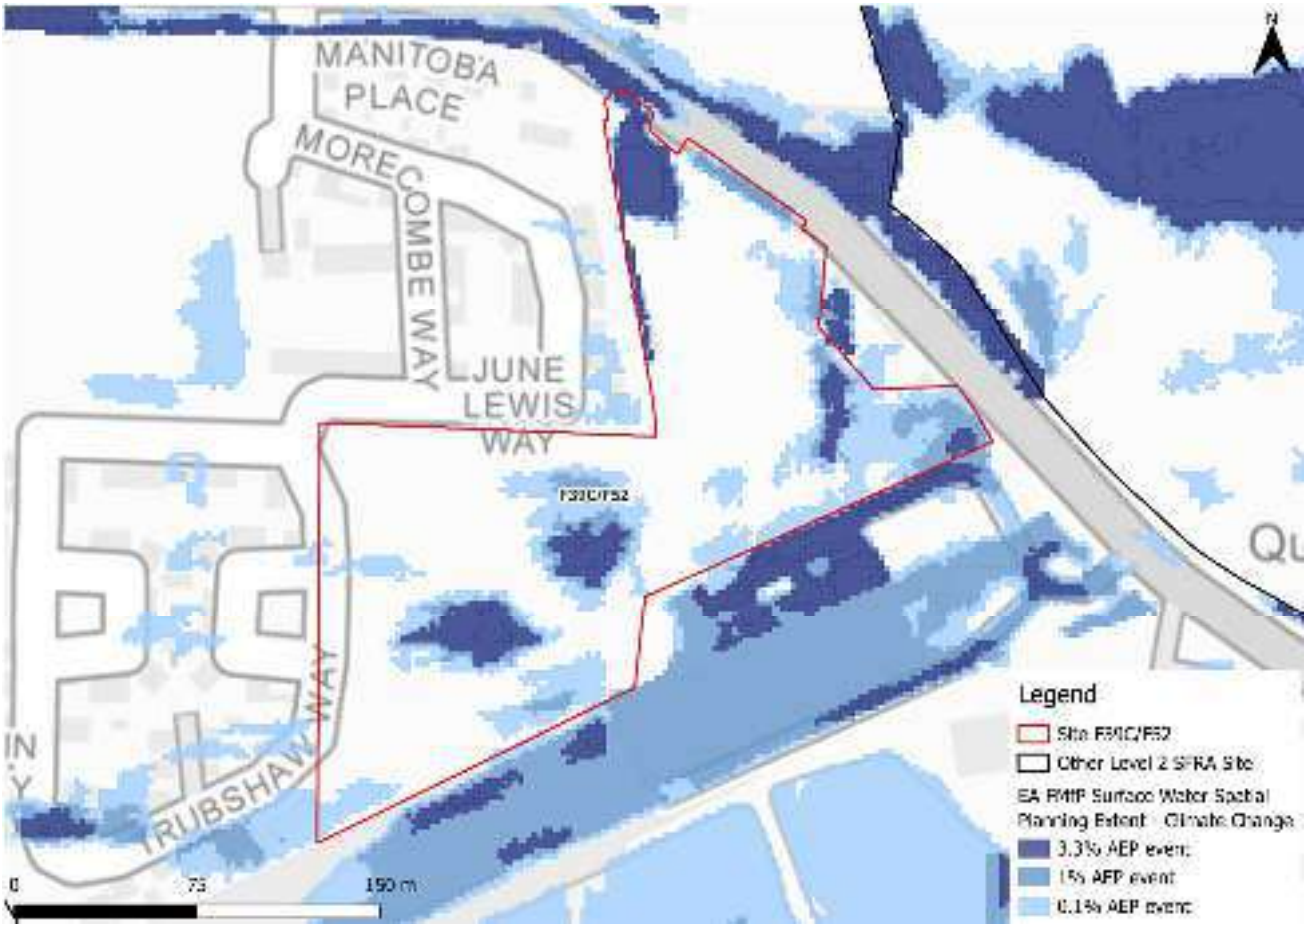

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

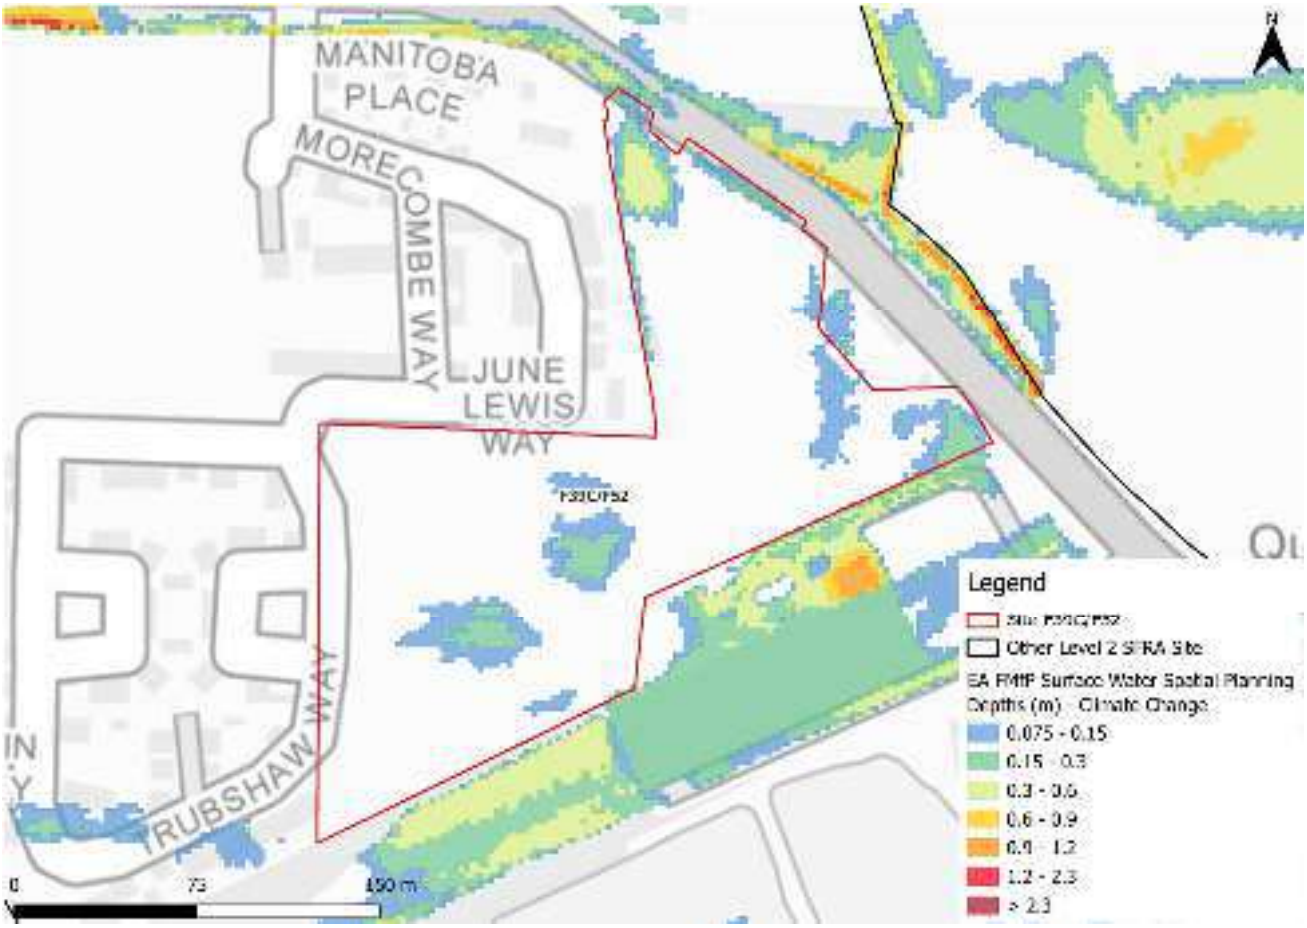

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 0.1% AEP event flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is categorised as 'moderate' within the north of the site (Figure 3-6).

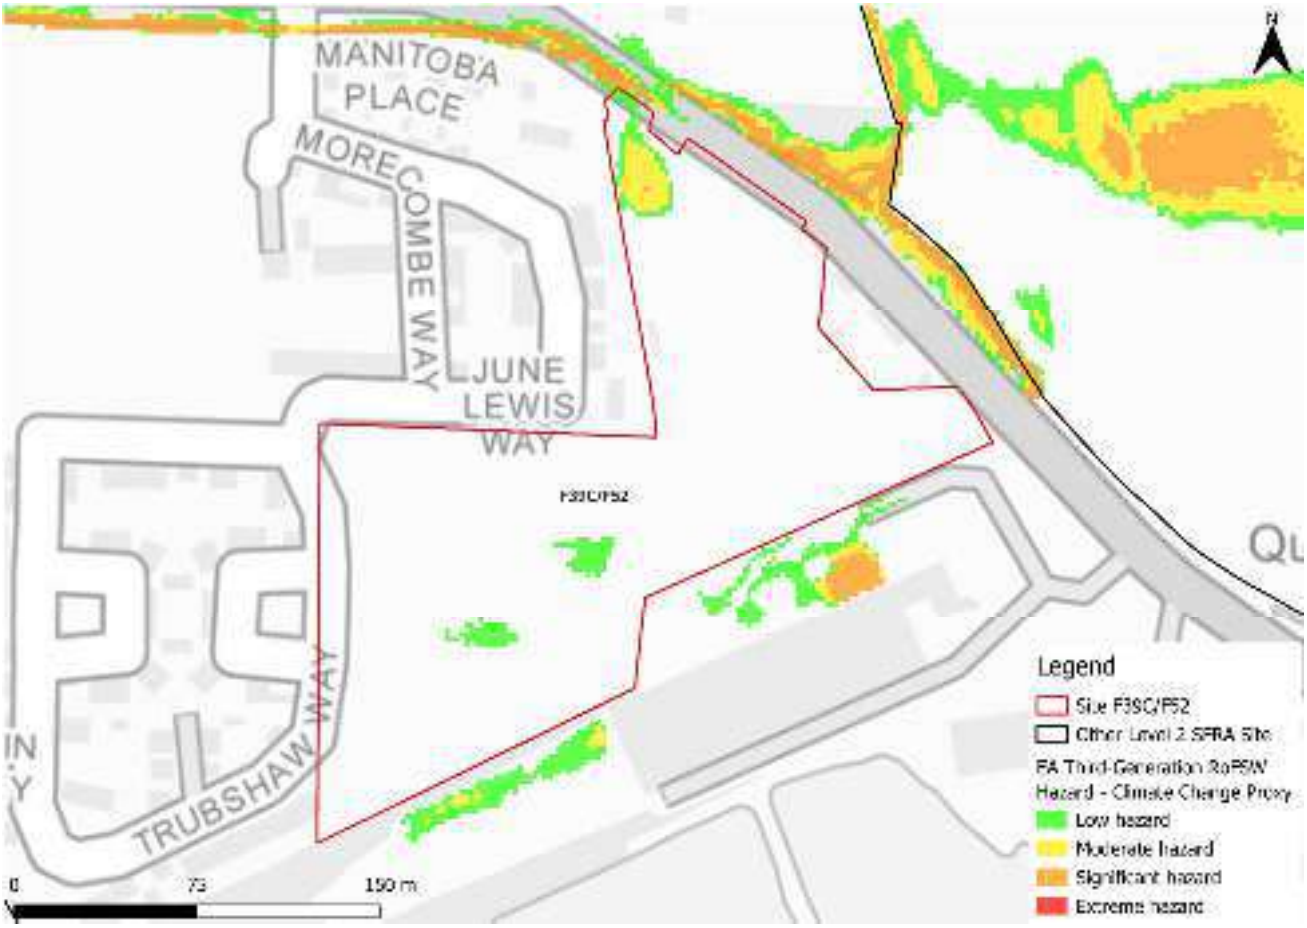

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day 0.1% AEP event surface water flood hazard[1] as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There are five recorded sewer flooding incidents within the Lechlade, Kempsford & Fairford South Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 72% of the site being outside of the 0.1% AEP surface water flood extent. Surface water risk is present onsite as areas of scattered ponding in topographic low spots
- Risk to the site is shown to slightly increase in extent within the site when considering the impact of climate change, however depths remain largely very shallow.
- A drainage strategy would be required to ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.

- Topographic low spots should be considered and included in site design and ideally left in place to flood naturally when required.
- Safe access and escape routes would likely be achievable via the A417 to the east of the site.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within one catchment, namely, the Thornhill Ditch and tributaries at Cotswolds Water Park catchment. This catchment is ranked as a high sensitivity catchment. Planning considerations for sites at high sensitivity to the cumulative impacts of development can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications.

The entire site is within an area where there is a risk of groundwater flooding to both surface and subsurface assets. Infiltration SuDS would therefore be unsuitable at this site.

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is mudstone, siltstone, limestone, sandstone and argillaceous rocks (Figure 5-2) which will have variable permeability and porosity. There is no record of superficial deposits in the area. Infiltration SuDS at this site are unlikely to be an option, though the drainage strategy for the site should fully investigate water table levels and ground conditions in both dry and wet conditions.

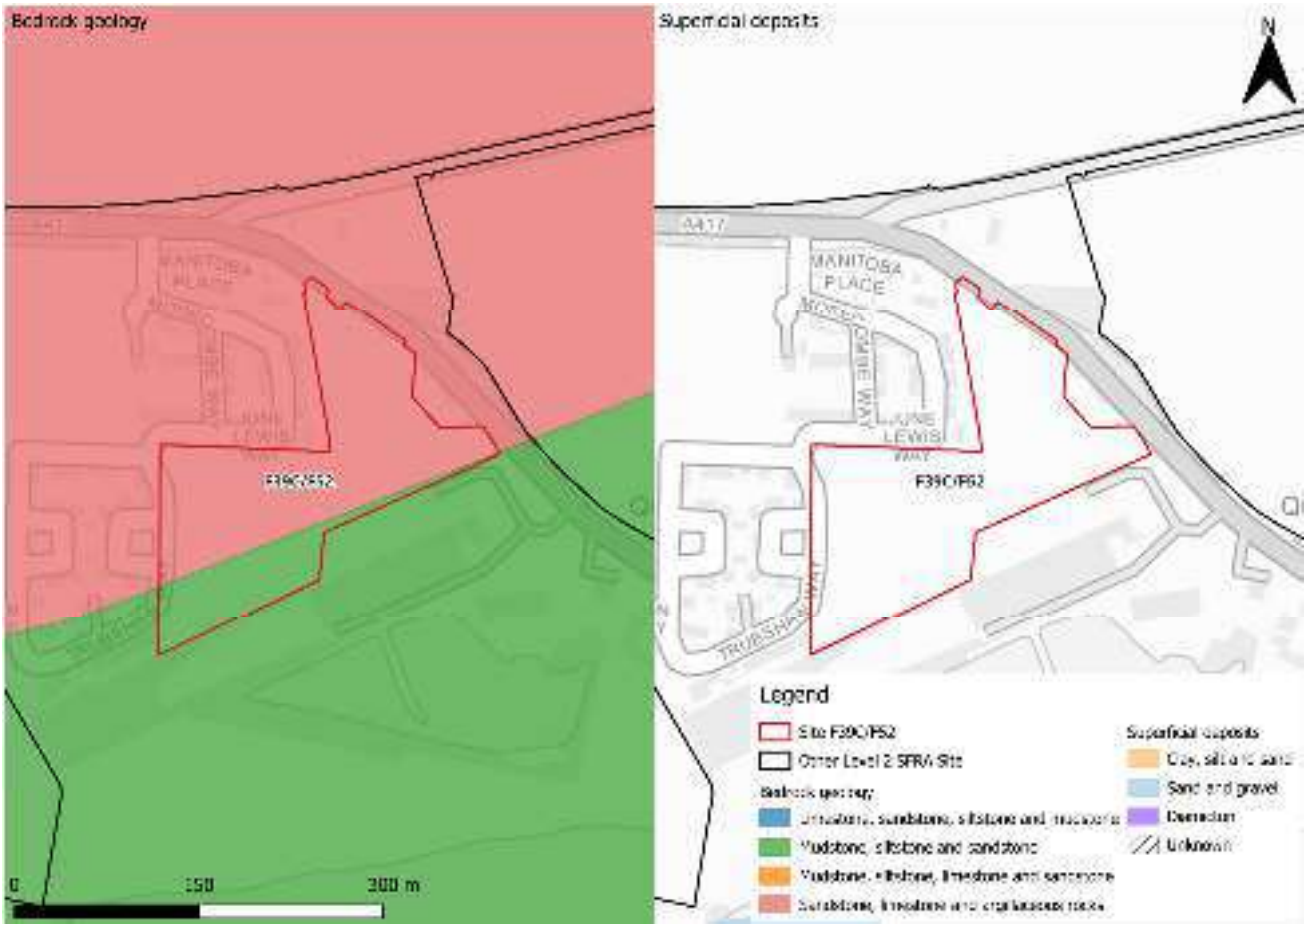

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There are no defences in place along the unnamed ordinary watercourse. However, the watercourse is culverted beneath the A417 adjacent to the site, as indicated by the blue circle in Figure 6-1. There is a potential residual risk of a blockage of this culvert. This risk should be investigated at the site-specific FRA stage.

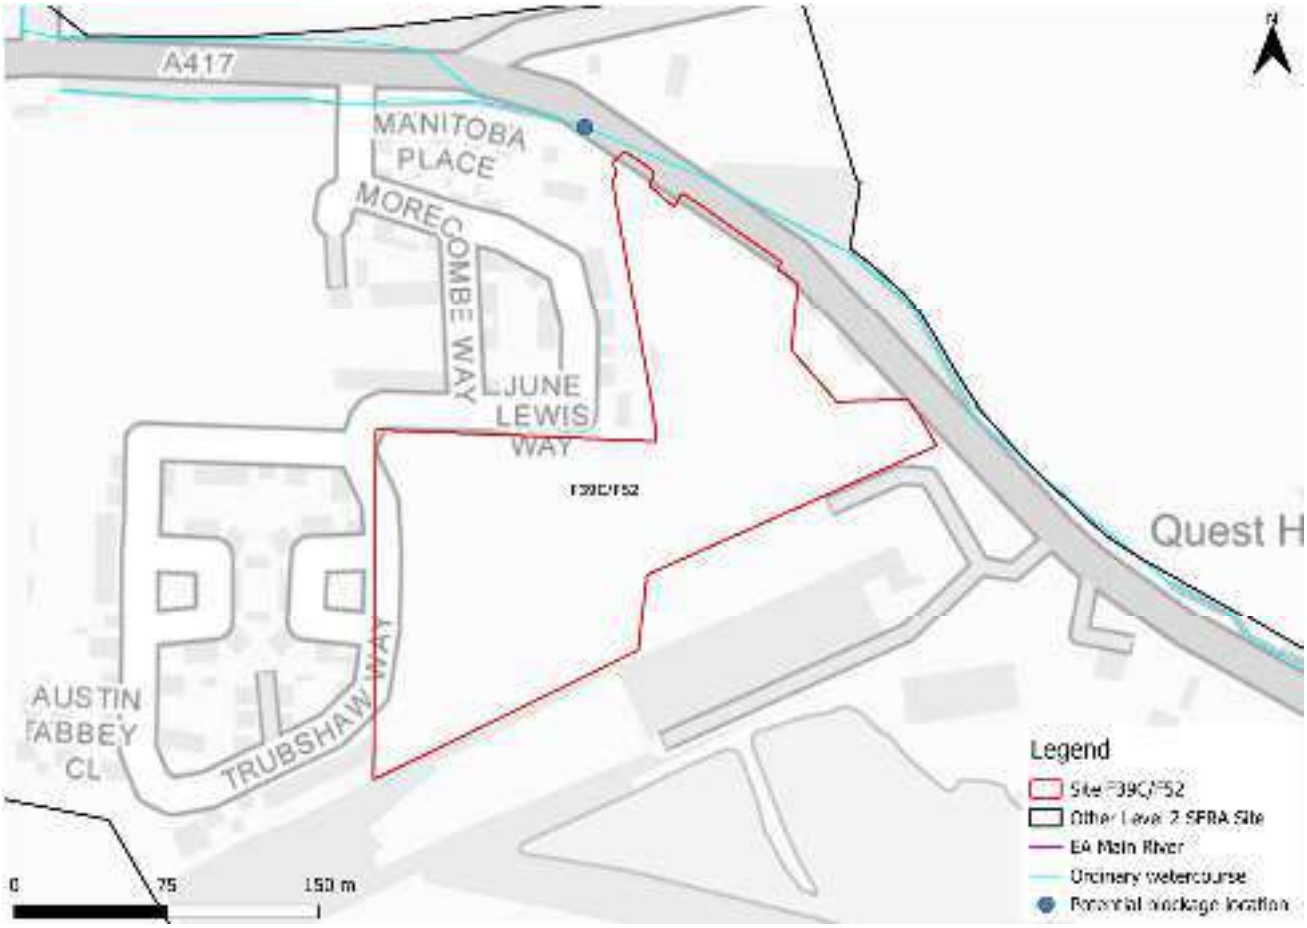

Figure 6-1: Potential blockage location

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is not required to pass part b) of the exception test, as it is not located within Flood Zone 3a, however it must still be proven that the development can be safe for its lifetime, which is generally considered to be 100 years for residential development.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be appropriate to develop this site for more vulnerable purposes given its location within Flood Zone 1 and nominal surface water flood risk.
- Modelling of the unnamed ordinary watercourse adjacent to the site must be carried out to robustly define the risk to the site for both present day and with climate change.
- A drainage strategy should ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WCAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

Contract

JBA Project Manager	Mike Williamson
Address	Phoenix House, Lakeside Drive, Centre Park, Warrington, WA1 1RX
JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Jo Corbett of Cotswold District Council. Rosie Holmes of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken between June and July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for the strategic extension to the north-east of Fairford site. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Strategic extension to the north-east of Fairford

- Location: Fairford
- Existing site use: Agricultural land
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Mixed use
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 72.8
- Watercourse: River Coln, unnamed ordinary watercourses
- Environment Agency (EA) flood model: No detailed model available
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of surface water flood extents, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

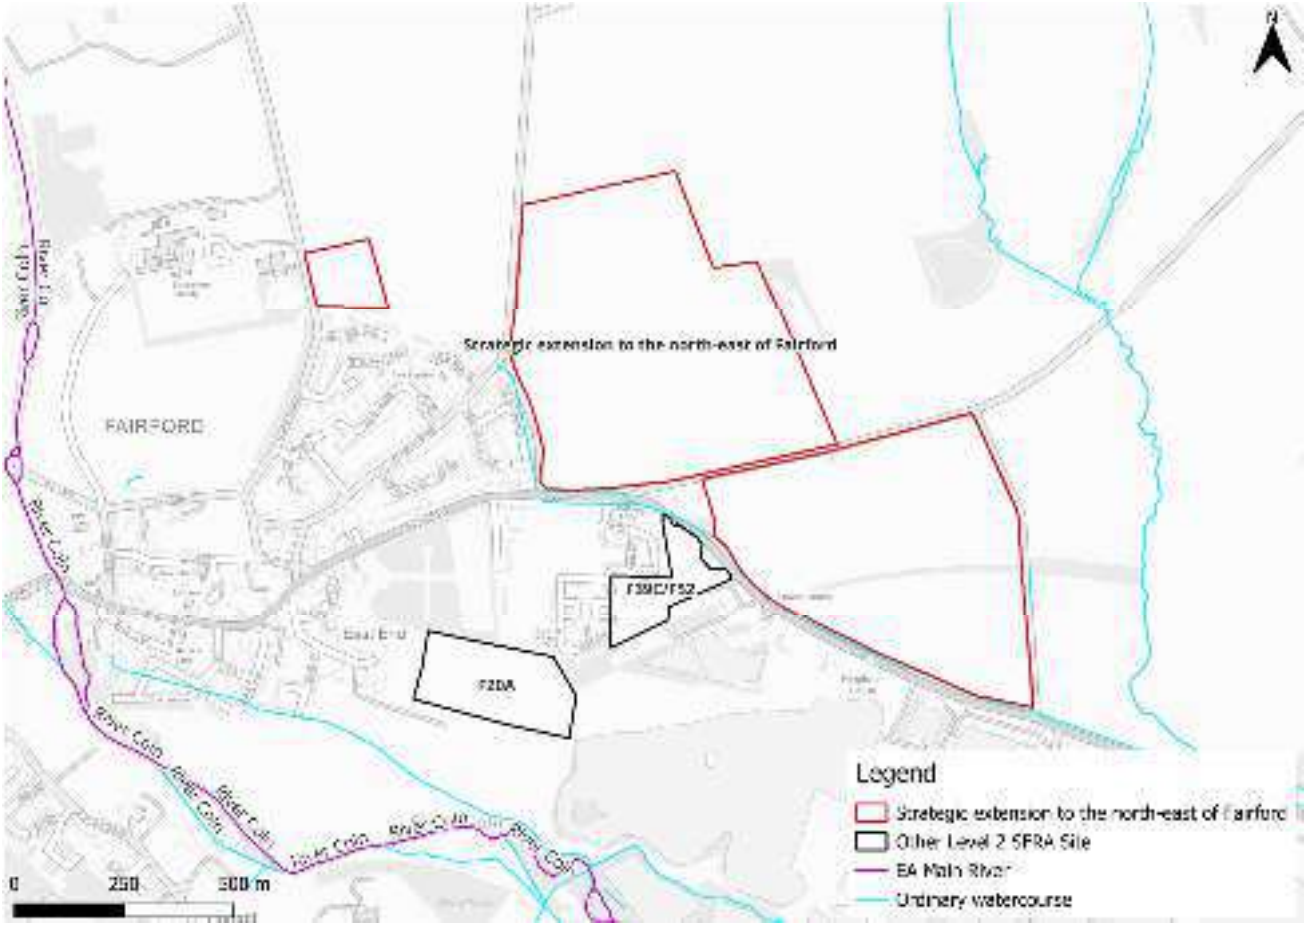

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

There are areas of higher elevation in the north of all three site parcels, with the land sloping down towards the south, sloping towards the River Coln floodplain to the southwest of the parcels (Figure 1-3).

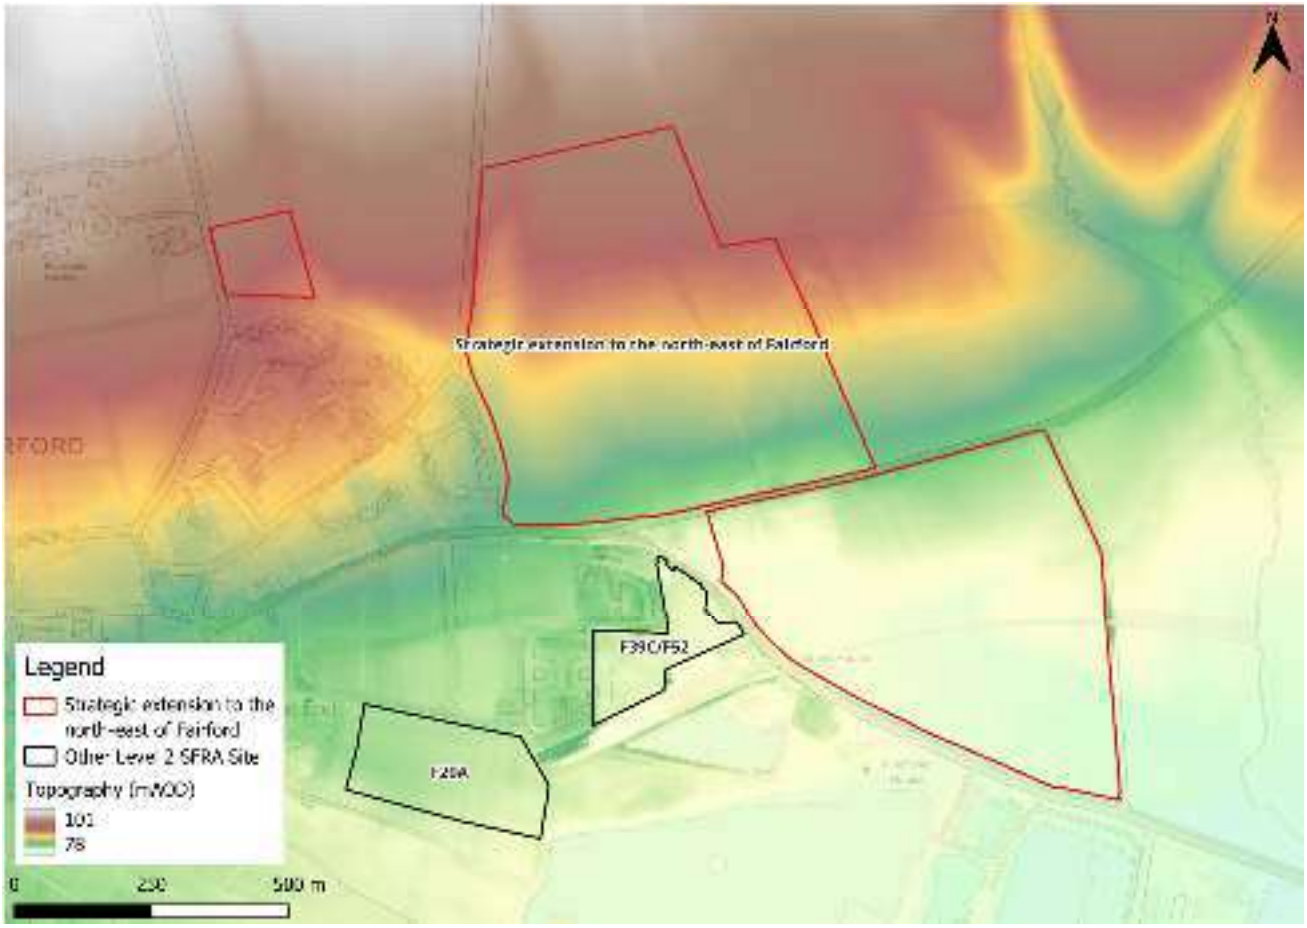

Figure 1-3: Topography

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the majority of the site is located within Flood Zone 1 and therefore at low risk of flooding from rivers (Figure 2-1), but for a small area on the southern boundary of the southern site parcel that is in Flood Zone 2. Risk comes from the River Coln to the southwest. Please note, the Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

There is no detailed model for the River Coln and the ordinary watercourses are unmodelled. The EA's New National Model (NNM) also does not include the ordinary watercourses. Flood depths and hazards cannot therefore be assessed.

Figure 2-1: Present day risk

2.2 Impacts from climate change

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Gloucestershire and the

Vale Management Catchment. The central allowance within this catchment is 26% on peak flows (Table 2-1). There is no local detailed model for the River Coln or the ordinary watercourses through the site, therefore the required event cannot be assessed.

Table 2-1: Modelled climate change allowances for peak river flows within the Gloucestershire and the Vale Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	11	17	33
2050s	11	19	43
2080s	26	41	84

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Figure 2-2 shows the Flood Map for Planning - Flood Zones plus Climate Change dataset which includes the central allowance for the 2080s epoch. This represents the impact of climate change on Flood Zone 3a and Flood Zone 2 combined. This shows a slight increase in risk compared to present day at the southern site parcels southwestern boundary though nothing significant.

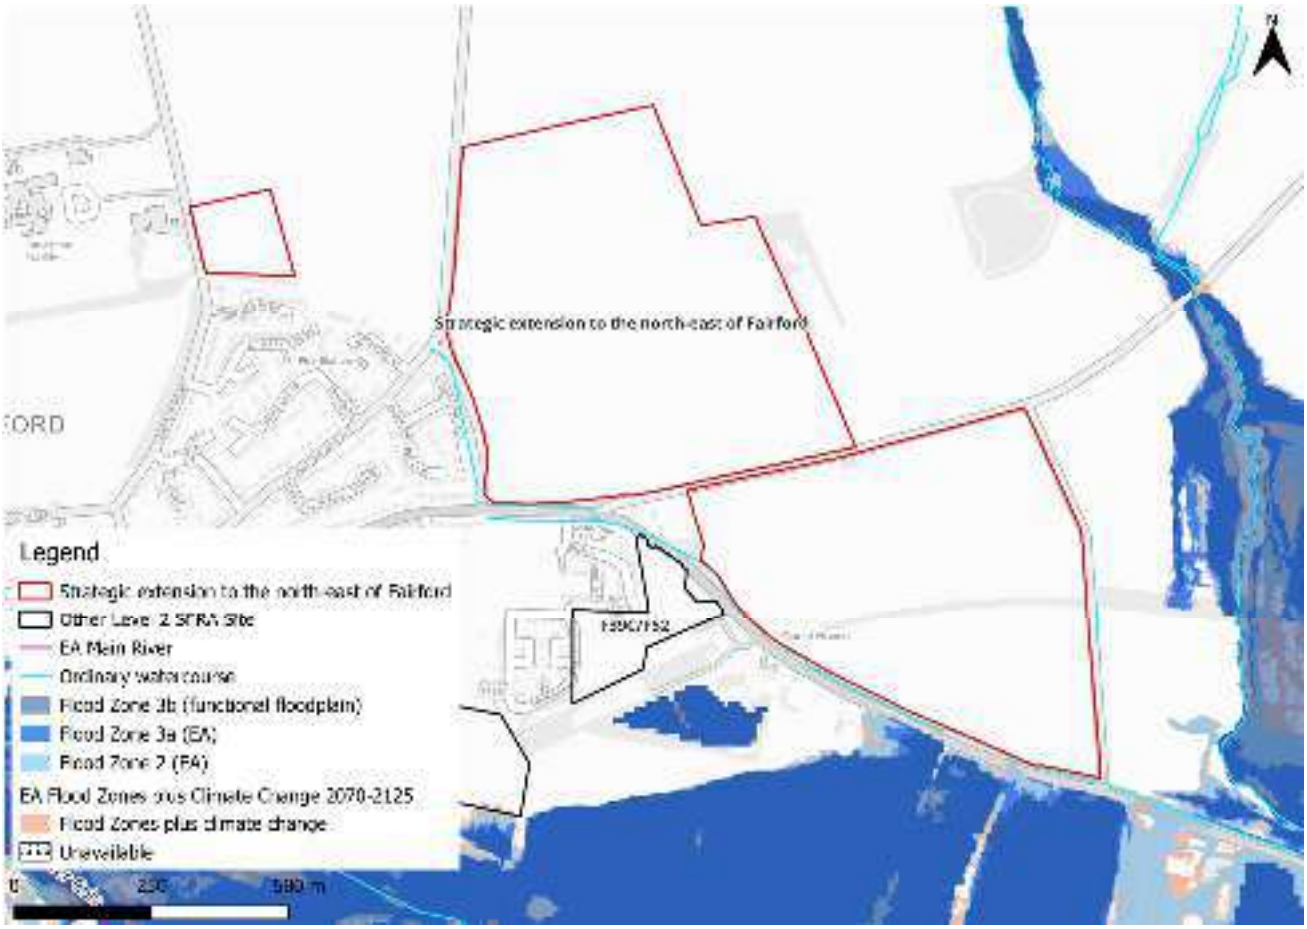

Figure 2-2: EA Flood Zones plus Climate Change

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been six recorded flooding incidents within the Siddington & Cerney Rural Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. **Error! Reference source not found.** shows that the floodplains of the ordinary watercourses near the site could benefit from riparian and floodplain tree planting. Tree planting can help to slow the flow to benefit areas downstream. There is also potential for floodplain reconnection on the ordinary watercourse to the east. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

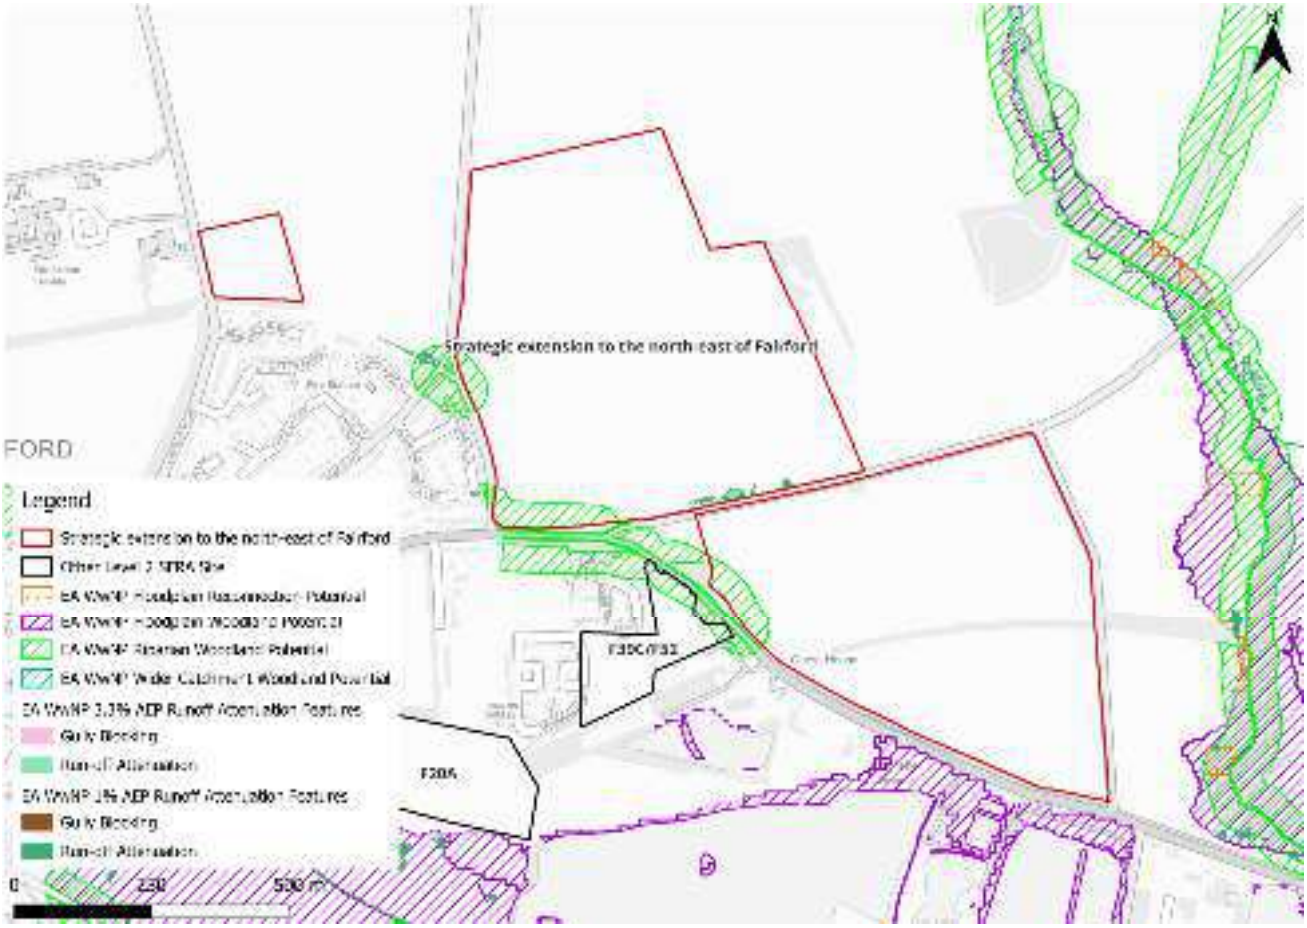

Figure 2-3: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warning and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The site is not located within a FAA.

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes could likely be achieved during a flood event via multiple locations surrounding the site (Figure 2-4).

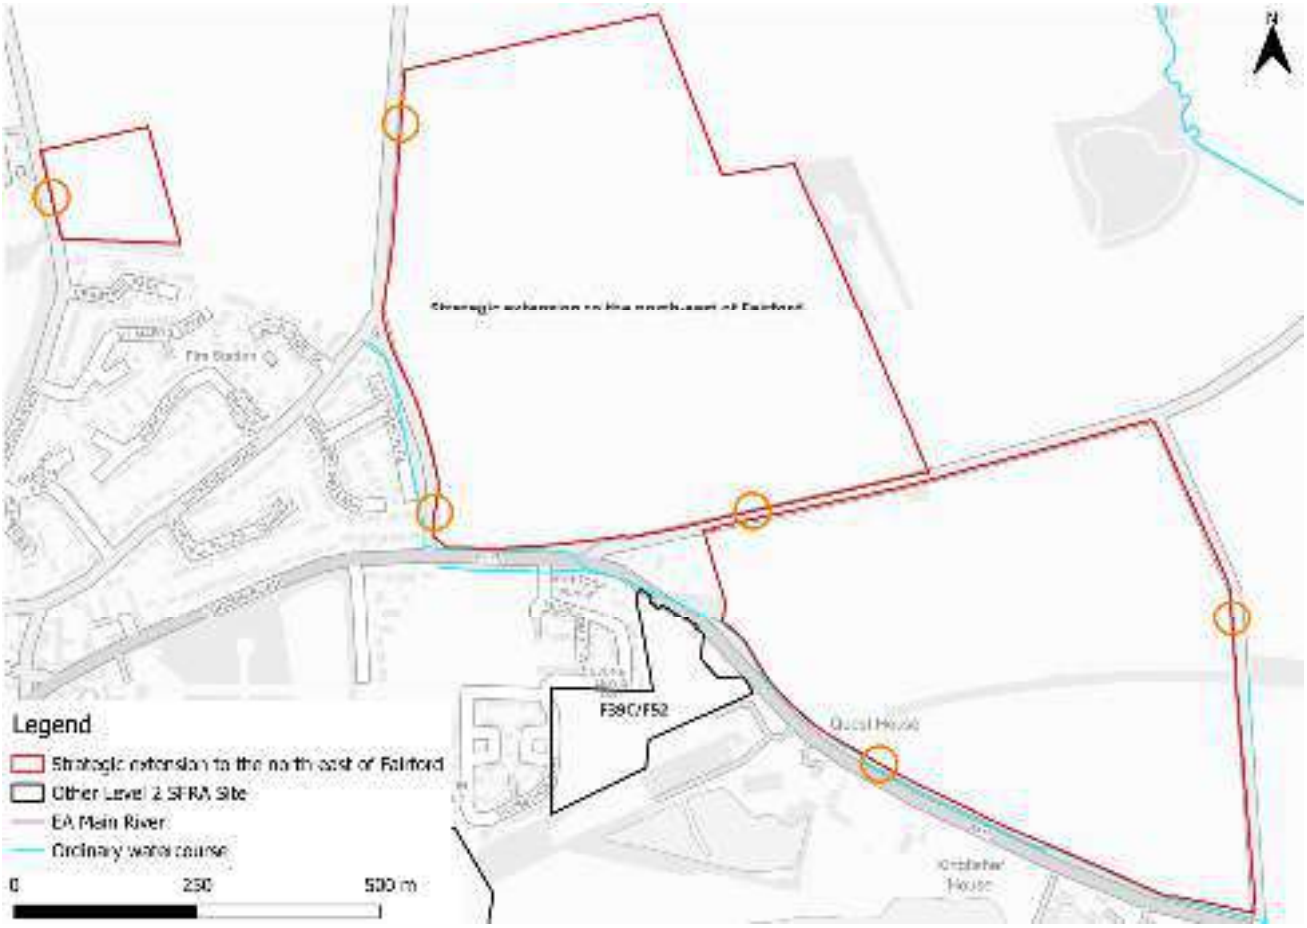

Figure 2-4: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site is located mostly within Flood Zone 1 and therefore at low risk of flooding from rivers.
  - The unnamed ordinary watercourses are unmodelled. Potential risk from these watercourses should be assessed at the FRA stage.
- Mitigation:
  - No development buffers should be in place along the ordinary watercourses in the form of blue green corridors, which can provide a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits. This is reflected in the WwNP mapping showing potential for riparian tree planting along each watercourse.
- Access and escape:
  - Based on current information, safe access and escape routes appear achievable via multiple locations surrounding each site parcel.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents map (May 2026), surface water risk across the northern site parcels is nominal, but for some ponding along the southern boundary of the larger northern site parcel, as shown in Figure 3-1. However, there is a surface water flow path through the centre of the southern site parcel.

Greatest surface water flood depths in the 1% AEP event are not significant at between 0.3 and 0.6m (Figure 3-2). Safe access and escape routes appear to be achievable via multiple locations.

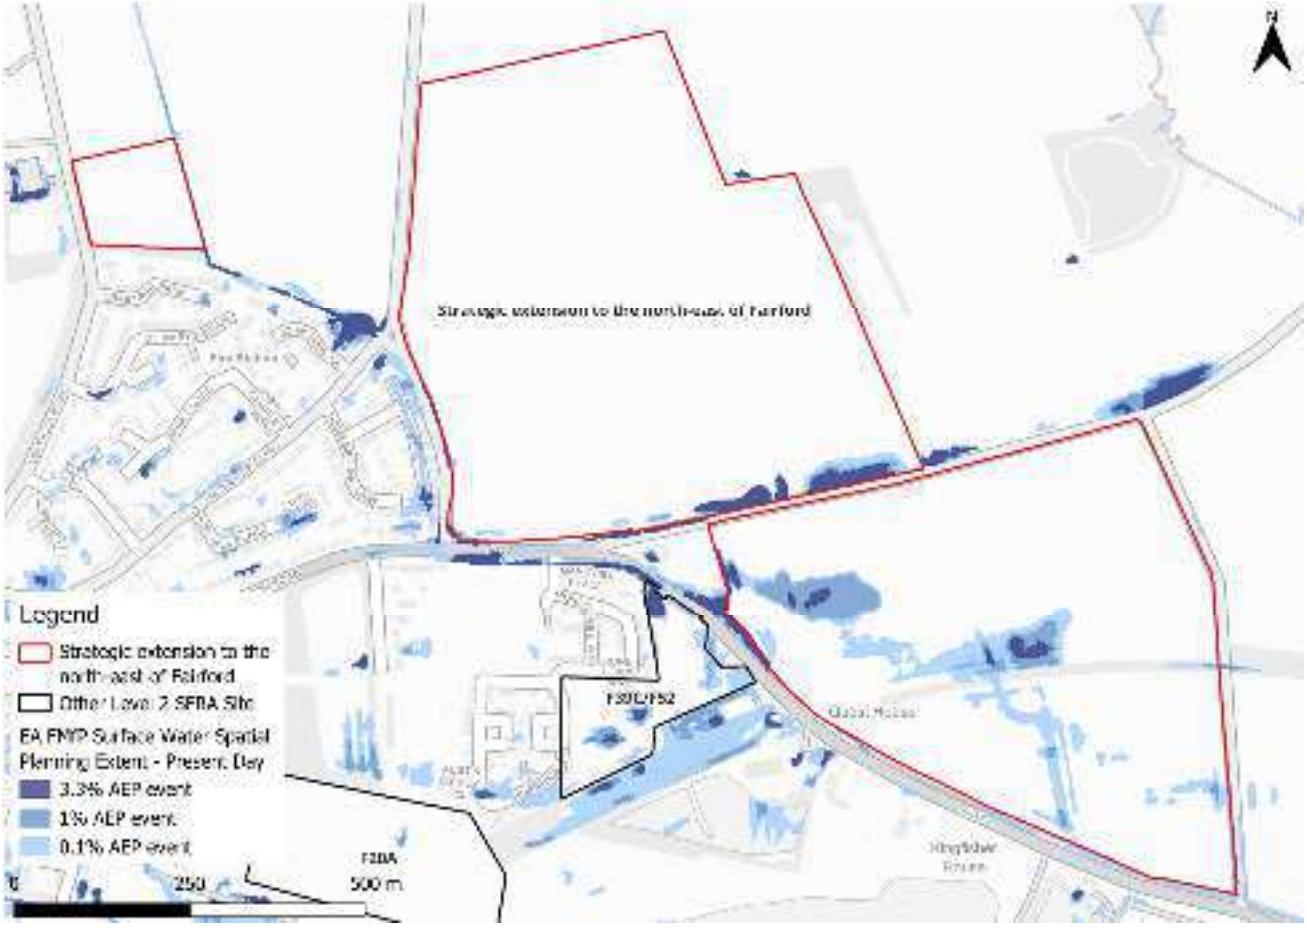

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

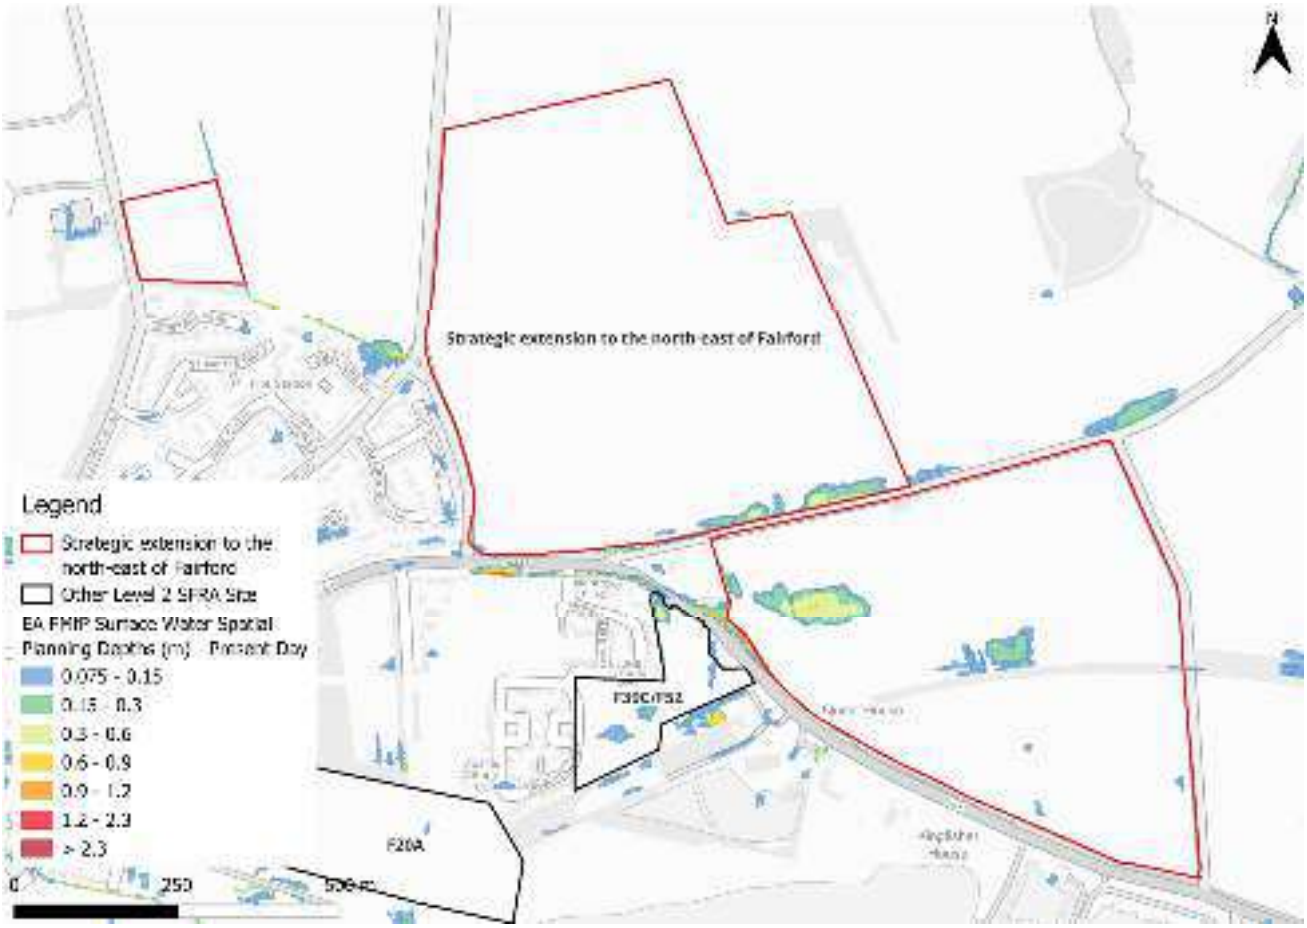

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third-generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows there to be low to moderate flood hazards along the southern boundary of the larger northern site parcel though no risk in the southern parcel (Figure 3-3). There are differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping whereby the RoFSW shows a much smaller area to be at risk. Given the differences between the two datasets, the hazard information should be discounted and assessed further at the FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day 1% AEP event surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Gloucestershire and the Vale management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-1: Peak rainfall intensity allowances for the Gloucestershire and the Vale Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. Surface water risk is shown to increase across each site parcel, particularly in the southern parcel, when considering climate change. Flood depths are shown to largely remain at between 0.3 and 0.6m (Figure 3-5). Safe access and escape routes would likely remain achievable via several locations.

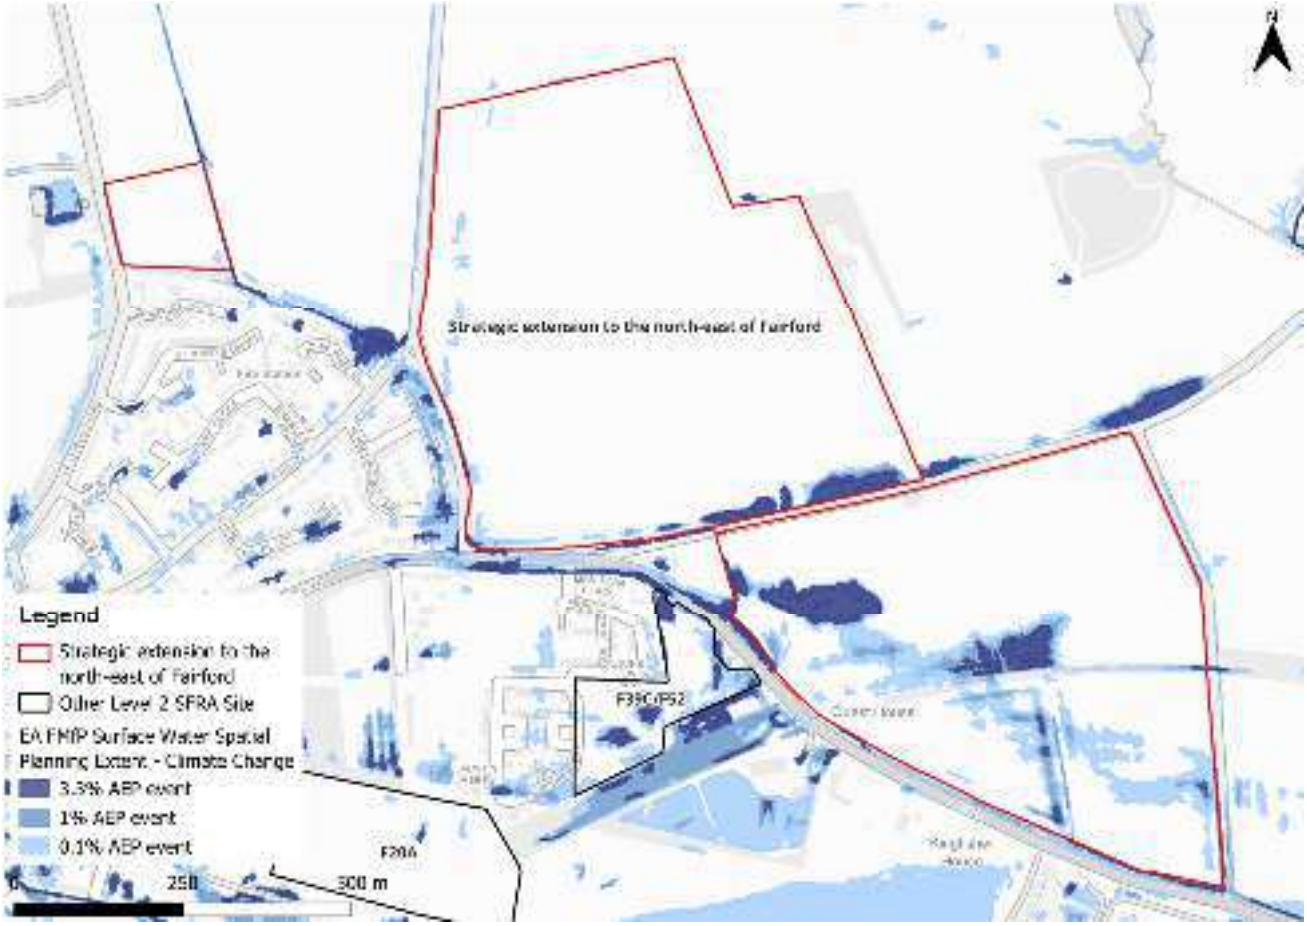

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event surface water flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is categorised as 'significant' in some areas (Figure 3-6).

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day 0.1% AEP event surface water flood hazard as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There have been no recorded sewer flooding incidents within the Siddington & Cerney Rural Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk is predominantly low and outside of the 0.1% AEP surface water flood extent. However, there is some risk in the southern site parcel and along the southern boundary of the larger northern parcel.
- Risk to the site is not shown to increase significantly when considering the impact of climate change.
- Topographic low spots and surface water flow paths should be considered and included in site design and left in place to flood naturally when required.
- The drainage strategy for each site parcel must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield

runoff rates or betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance

- Safe access and escape routes would likely be achievable via multiple locations.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within one catchment, namely the Coln catchment. This has been identified as a high sensitivity catchment. Planning considerations for sites at high sensitivity to the cumulative impacts of development can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications. The larger site parcels are located within an area where there is a risk of groundwater emergence to surface and subsurface assets. In these areas, groundwater may emerge at significant rates in this area and has the capacity to flow overland and/or pond within any topographic low spots. Infiltration SuDS may not be achievable at any site parcel.

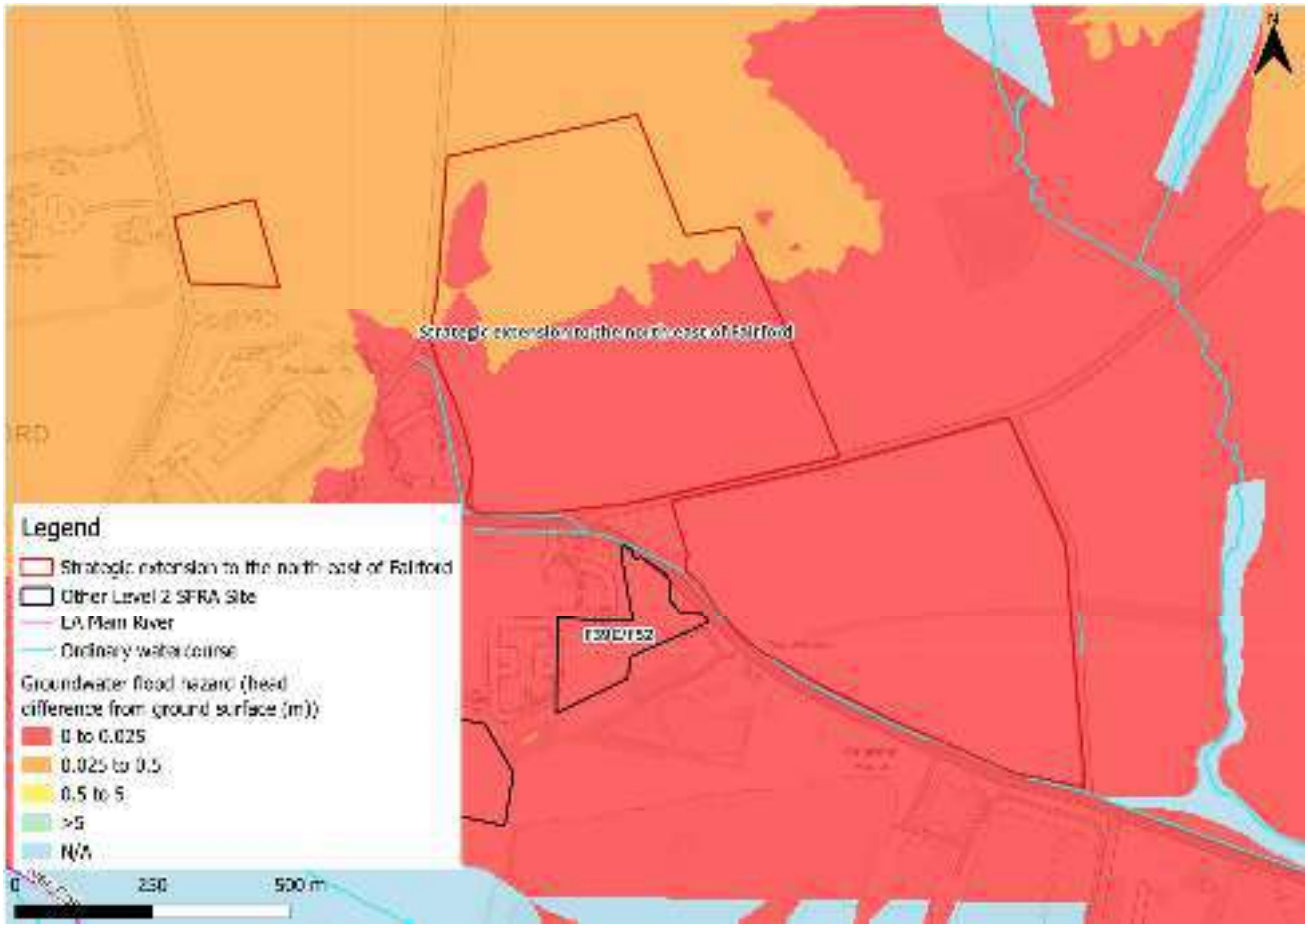

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The majority of the underlying bedrock within the site is sandstone, limestone and argillaceous rocks, with an area of the site being mudstone, siltstone and sandstone (Figure 5-2). Sandstone and limestone can have high permeability and porosity, increasing infiltration rates, though the permeability of limestone can vary widely. There is no record of superficial deposits at the site.

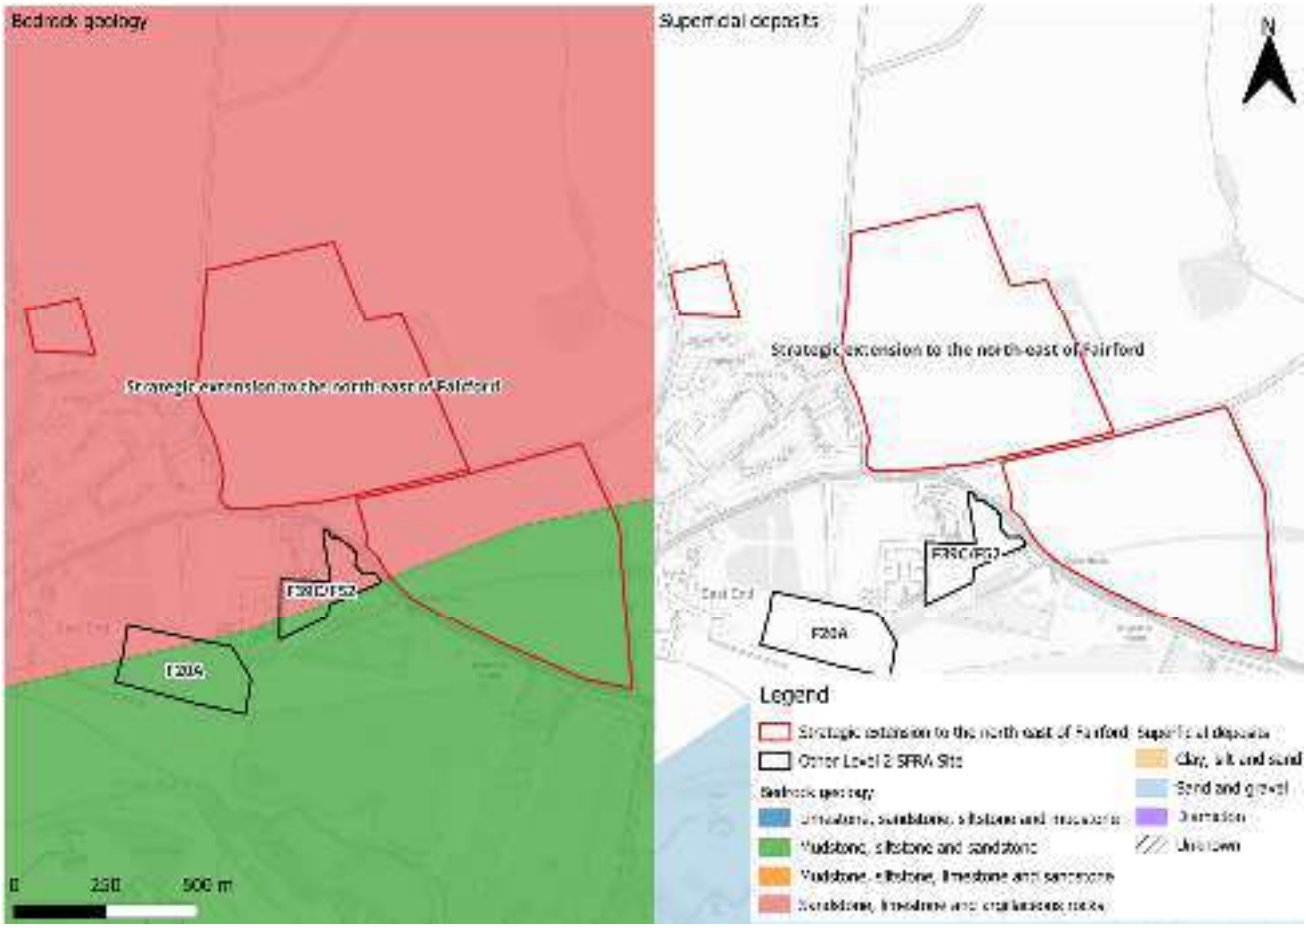

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There does not appear to be any residual risk to the site from asset blockage or defence breach.

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is not required to pass part b) of the exception test, as it is not located within Flood Zone 3a, however it must still be proven that the development can be safe for its lifetime, which is generally considered to be 100 years for residential development.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be possible to develop these site parcels for mixed uses, including for residential, given its location largely within Flood Zone 1 and nominal surface water risk.
- Ideally, no development buffers should be in place along the unnamed ordinary watercourses in the form of blue green corridors, which can provide a flood storage function as well as providing BNG, ecological, amenity, social, and wellbeing benefits.
- Potential risk from the ordinary watercourses should be assessed at the FRA stage.
- Groundwater conditions must be investigated further through the site-specific FRA. This should be assessed through percolation testing in both wet and dry weather conditions across each site parcel.
- Safe access and escape routes appear achievable from several locations, based on current information.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WCAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

JBA Project Manager	Mike Williamson
Address	Phoenix House, Lakeside Drive, Centre Park, Warrington, WA1 1RX
JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Jo Corbett of Cotswold District Council. Laura Thompson-Jones of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken between June and July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site F53A. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site F53A

- Location: Land at Totterdown Hill, Horcott
- Existing site use: Agricultural land
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 12.8
- Watercourse: N/A
- Environment Agency (EA) flood model: N/A
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of surface water flood extents, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

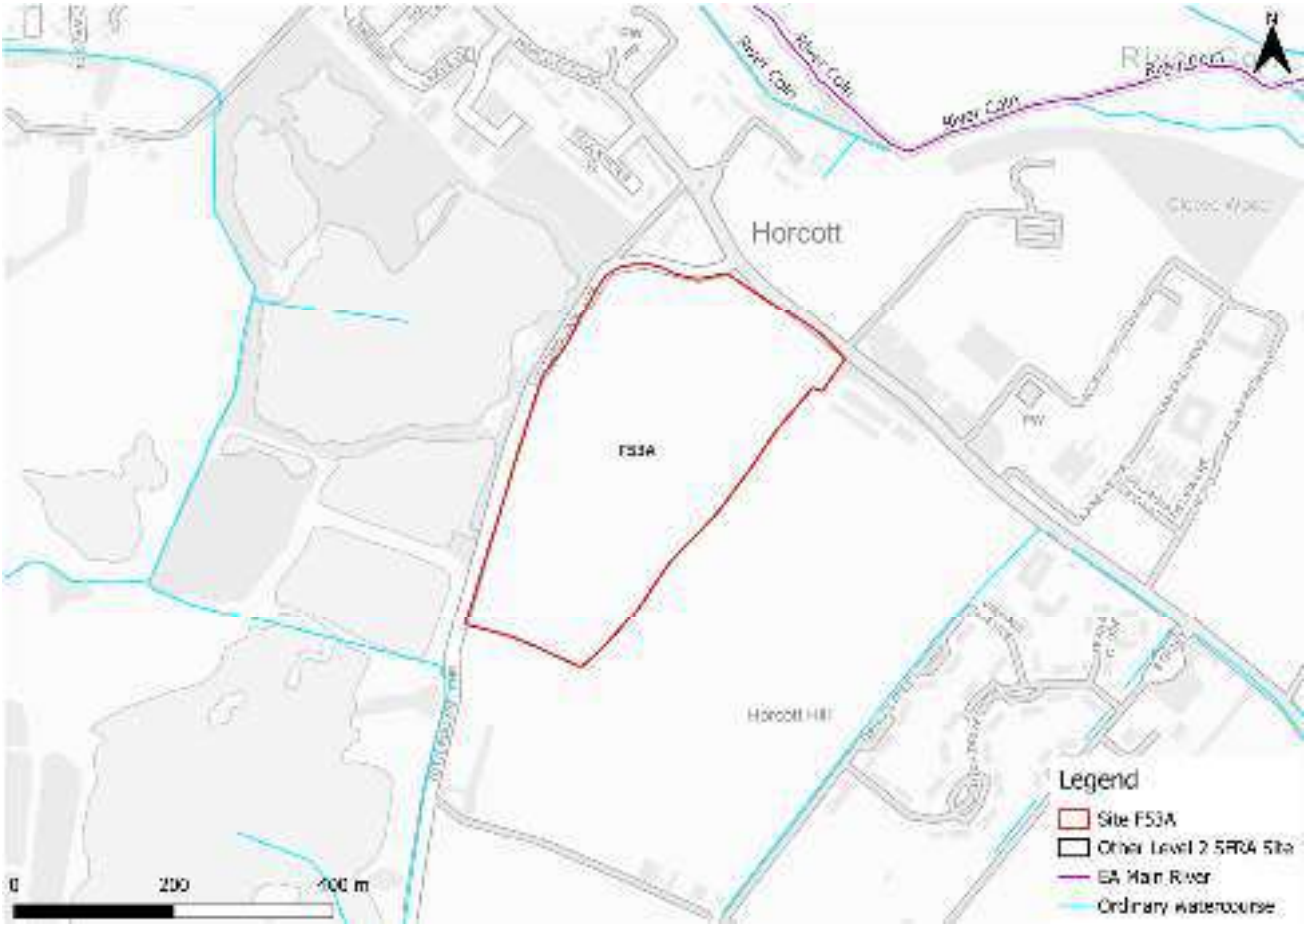

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

The site slopes from east to west, towards Horcott Lakes (Figure 1-3).

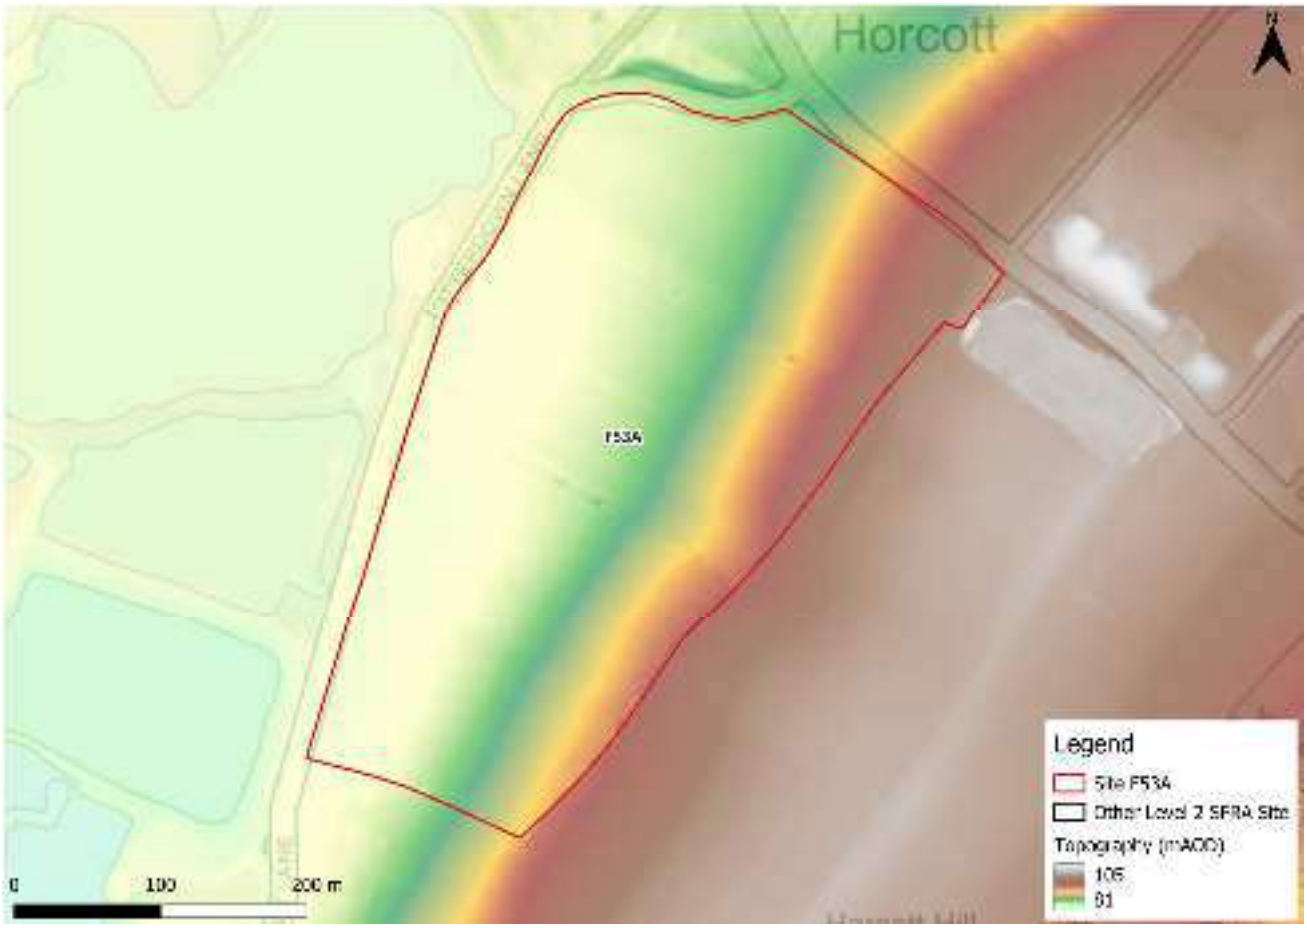

Figure 1-3: Topography

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the site is wholly located within Flood Zone 1 and therefore at low risk of flooding from rivers (Figure 2-1). Please note, the Flood Map for Planning does not consider flood defence infrastructure (Section 2.4). The flood zones to the west of the site cover the existing lakes.

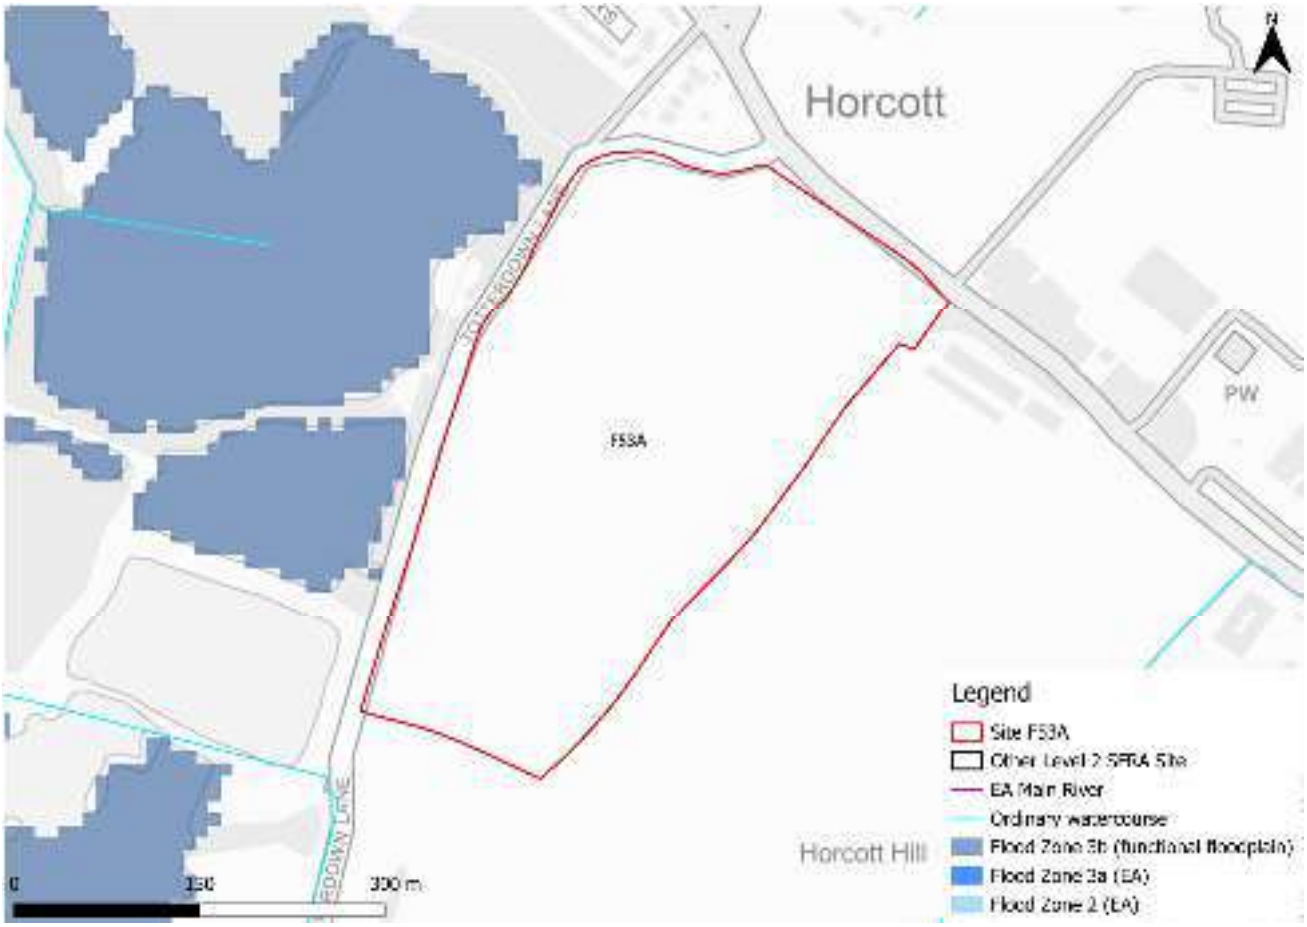

Figure 2-1: Present day risk

2.2 Impacts from climate change

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Gloucestershire and the Vale Management Catchment. The central allowance within this catchment is 21% on peak flows (Table 2-1).

Table 2-1: Modelled climate change allowances for peak river flows within the Gloucestershire and the Vale Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	11	17	33
2050s	11	19	43
2080s	26	41	84

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Based on the EA's Flood Map for Planning - Flood Zones plus Climate Change dataset, the site is not shown to be at increased risk of fluvial flooding when considering climate change.

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been 13 recorded flooding incidents within the Lechlade, Kempsford & Fairford South Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-2 shows that the almost the entire site, and wider area, could benefit from wider catchment tree planting. Tree planting can help to slow the flow to benefit areas downstream. There are also opportunities for run-off attenuation features where it may be possible to temporarily store water and attenuate flooding during high flows. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

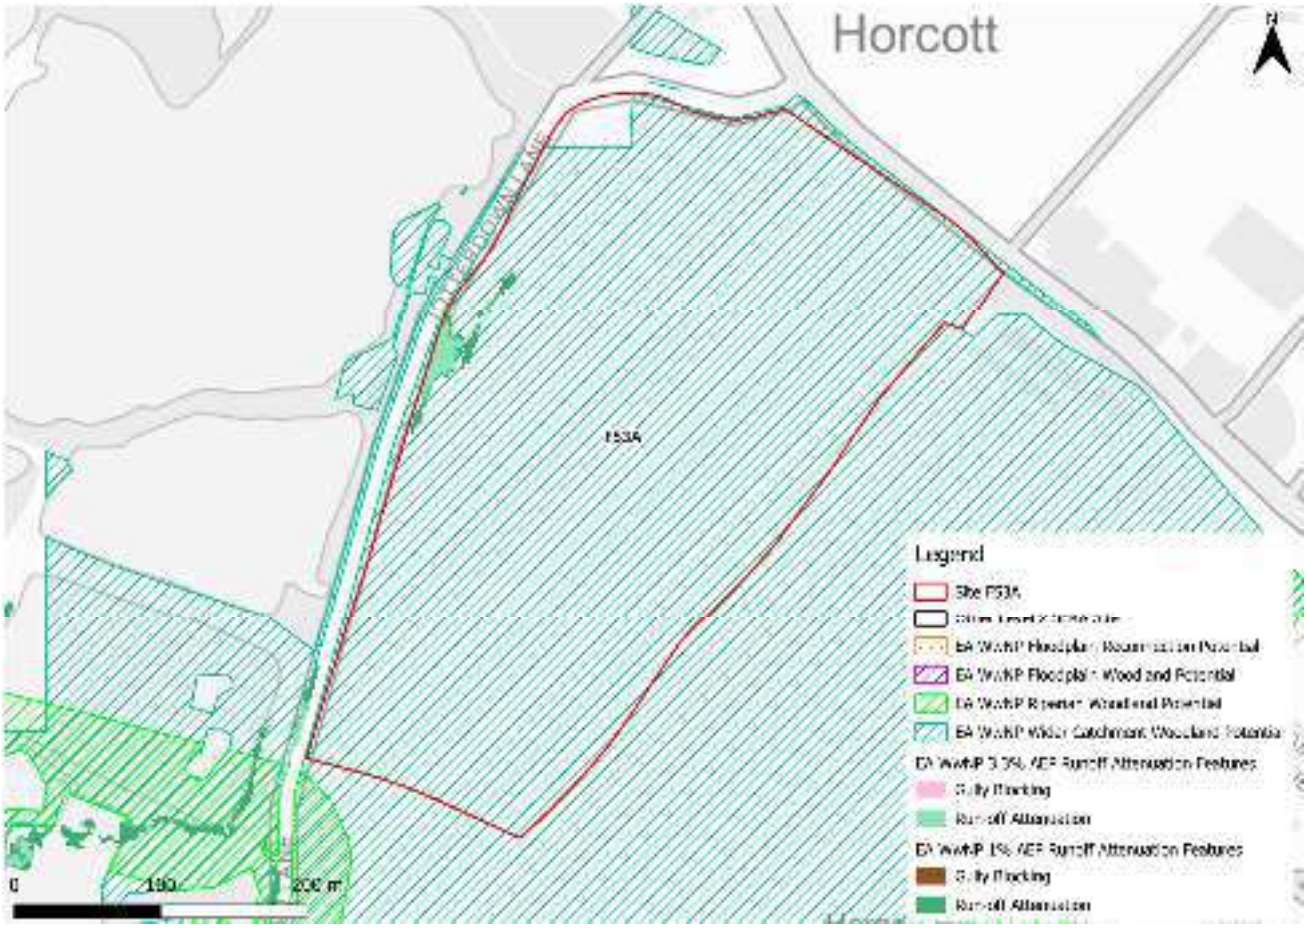

Figure 2-2: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warning and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The site is not located within a FAA.

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes are available during a flood event via Totterdown Lane to the west of the site or Horcott Road to the north (Figure 2-3).

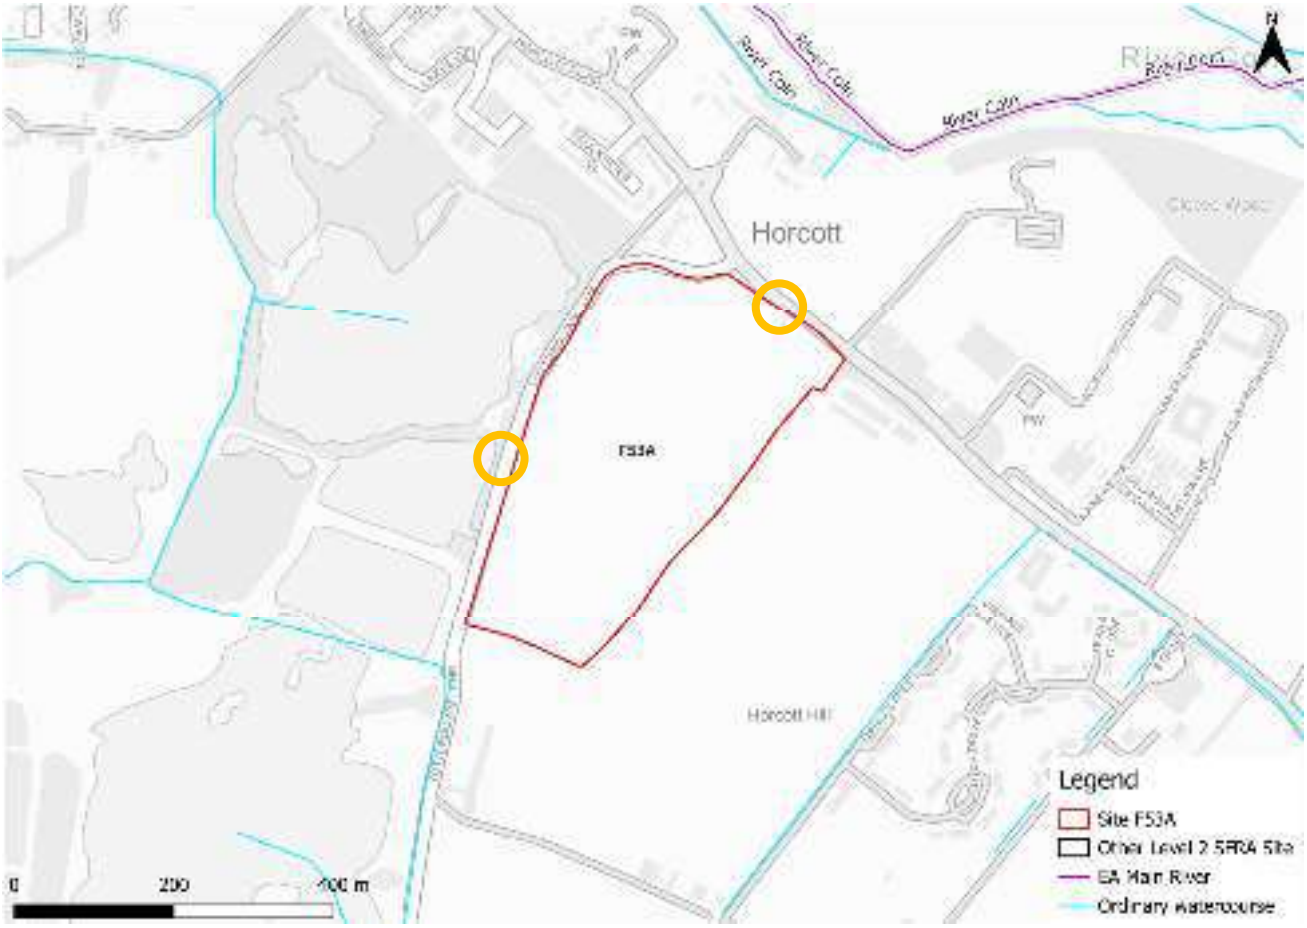

Figure 2-3: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site is located wholly within Flood Zone 1 and therefore at low risk of flooding from rivers.
  - The site is not shown to be at increased risk from fluvial flooding in the future, based on the EA's Flood Zones plus Climate Change dataset.
- Access and escape:
  - Based on current information, safe access and escape routes appear achievable via Totterdown Lane to the west of the site or Horcott Road to the north.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents map (May 2026), surface water risk across the site is generally low, as shown in Table 3-1 and Figure 3-1.

There is a significant area of ponding within the southwest of the site, behind the Totterdown Lane raised road infrastructure. Greatest flood depths within this area in the 1% AEP event are between 0.6 and 0.9 m immediately behind the road embankment (Figure 3-2).

Safe access and escape routes would ideally need to be made available via the north of the site.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
88	2	1	9

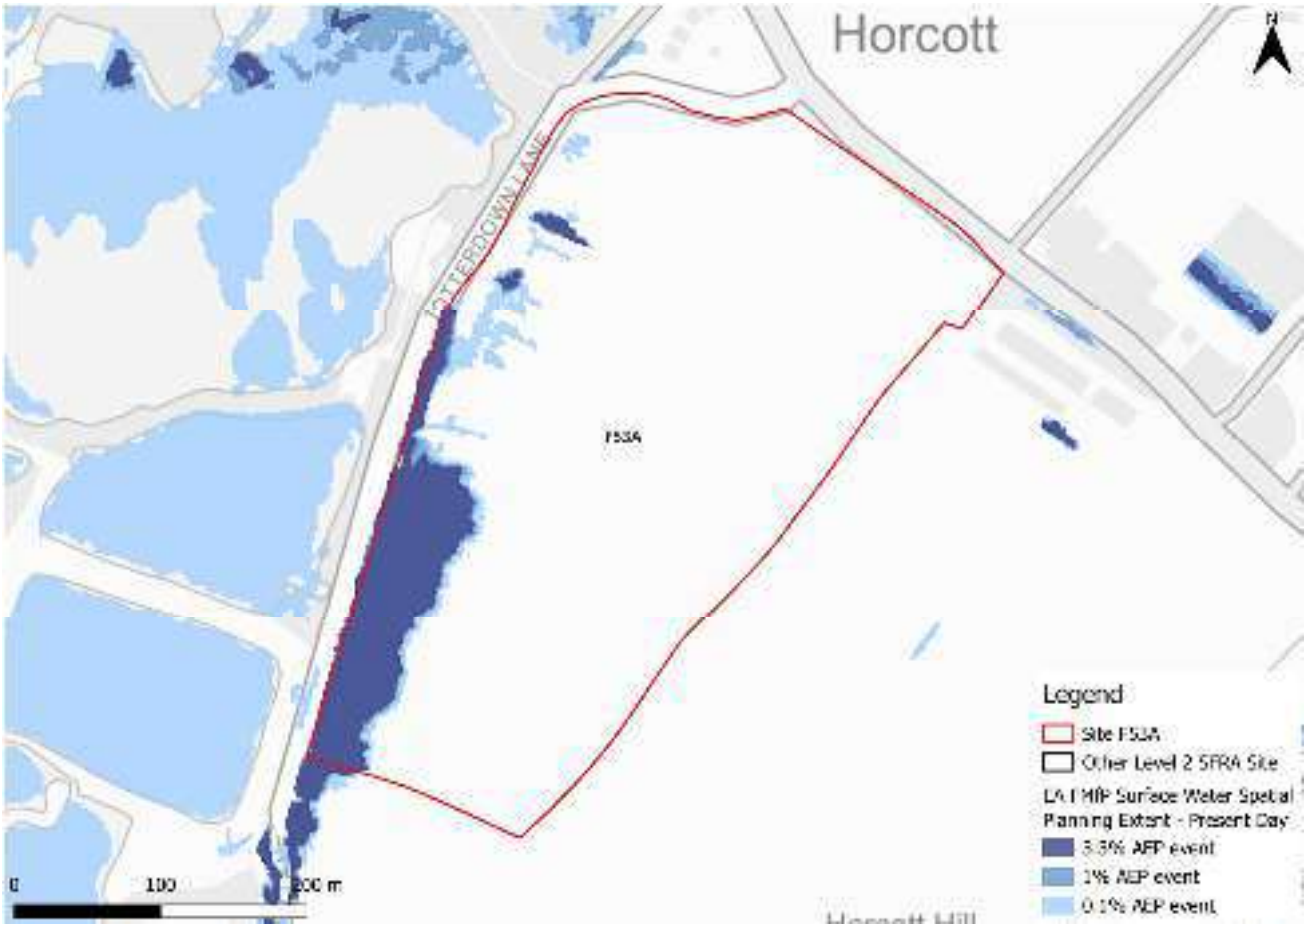

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

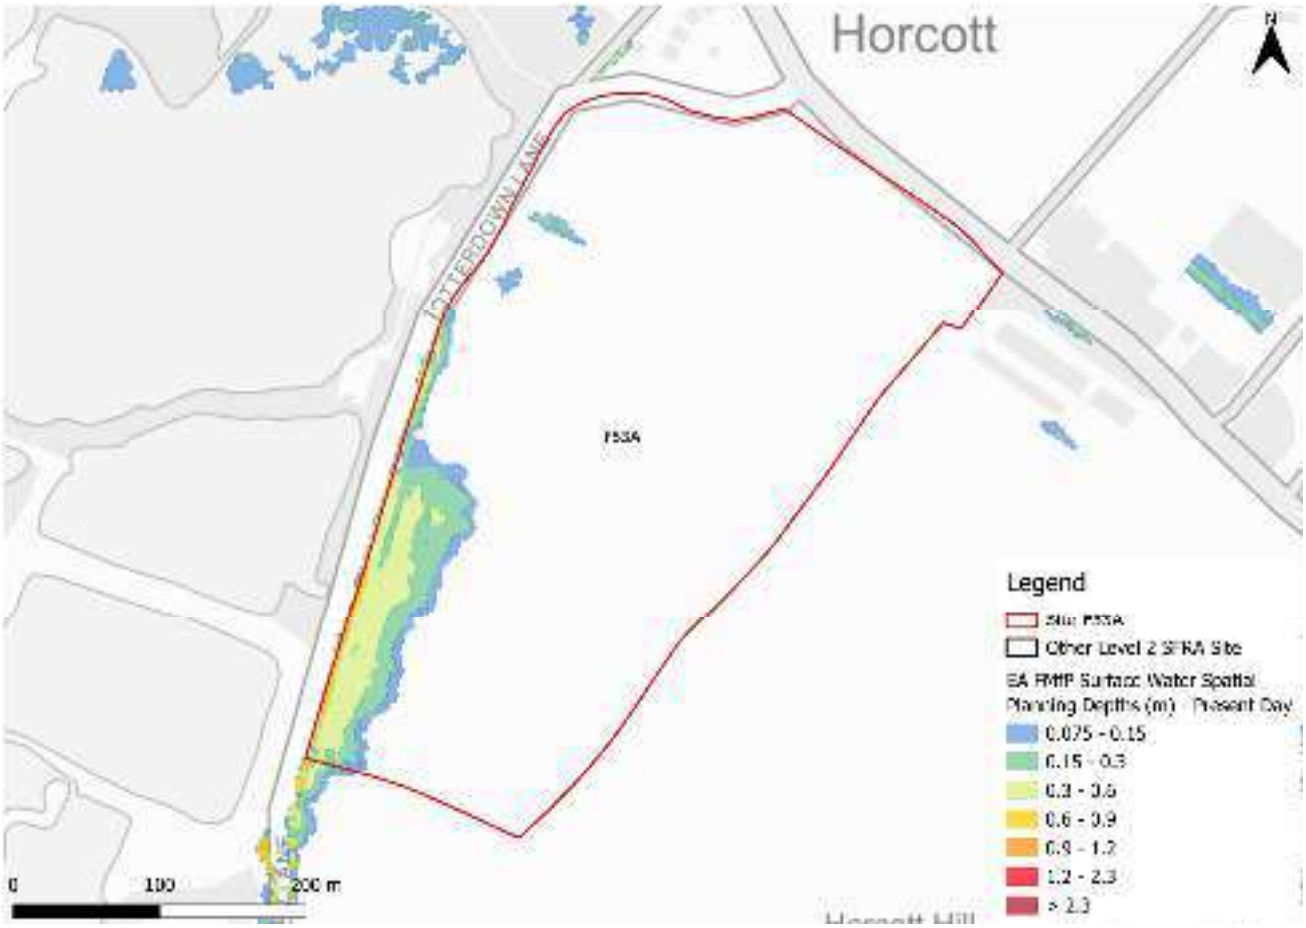

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows flood hazard to be 'significant' (Figure 3-3). There are some differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping whereby the RoFSW shows a much larger area to be at risk. Given the differences between the two datasets, the hazard information should be discounted and assessed further at the FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

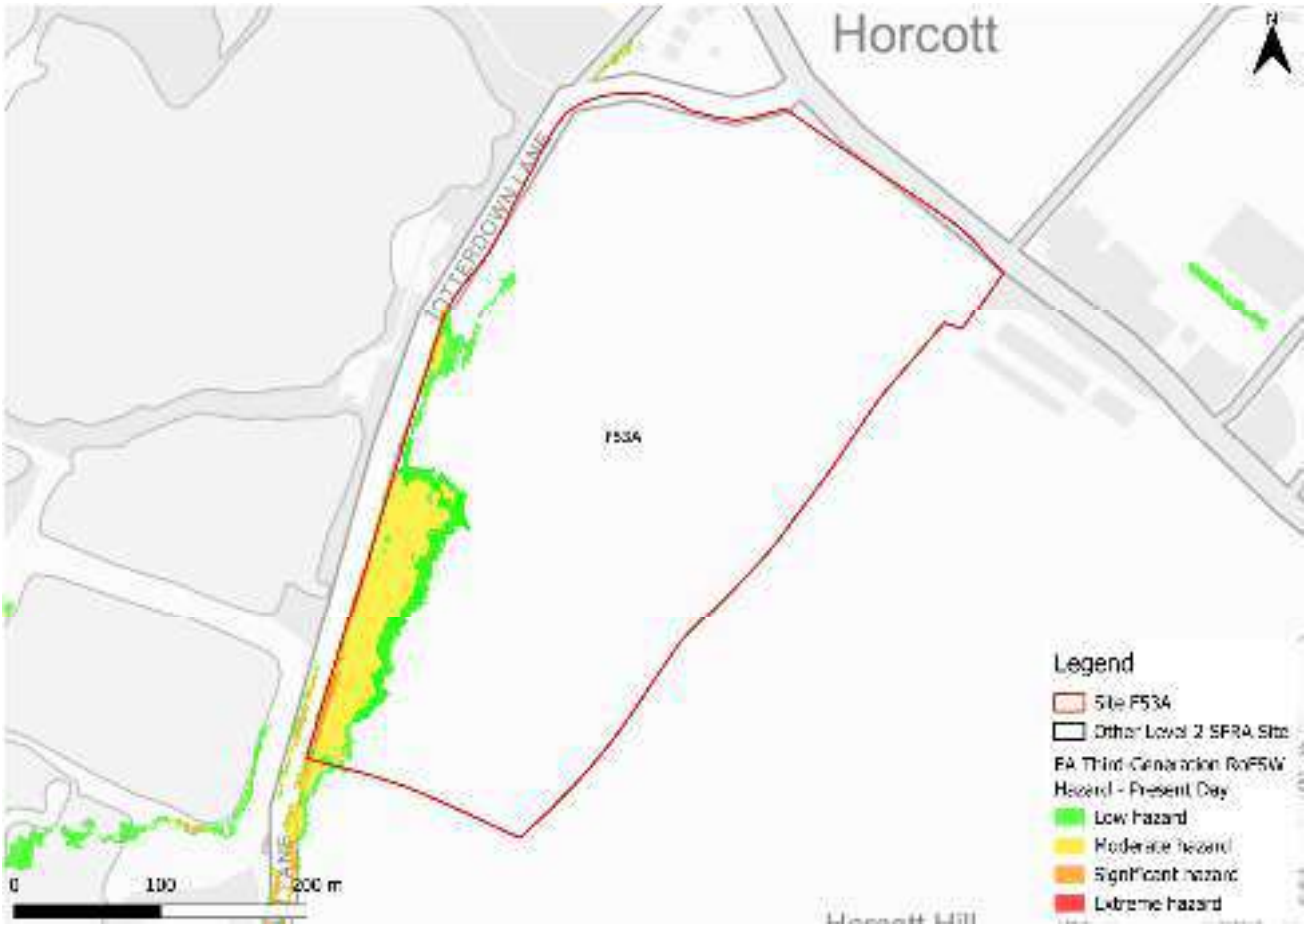

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day 1% AEP event surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Gloucestershire and the Vale management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Gloucestershire and the Vale Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. Surface water risk across the site is not shown to increase significantly when considering climate change. Flood depths are shown to remain at between 0.6 and 0.9 m immediately behind the road embankment (Figure 3-5). Safe access and escape routes would likely remain achievable if provided via the south or west of the site.

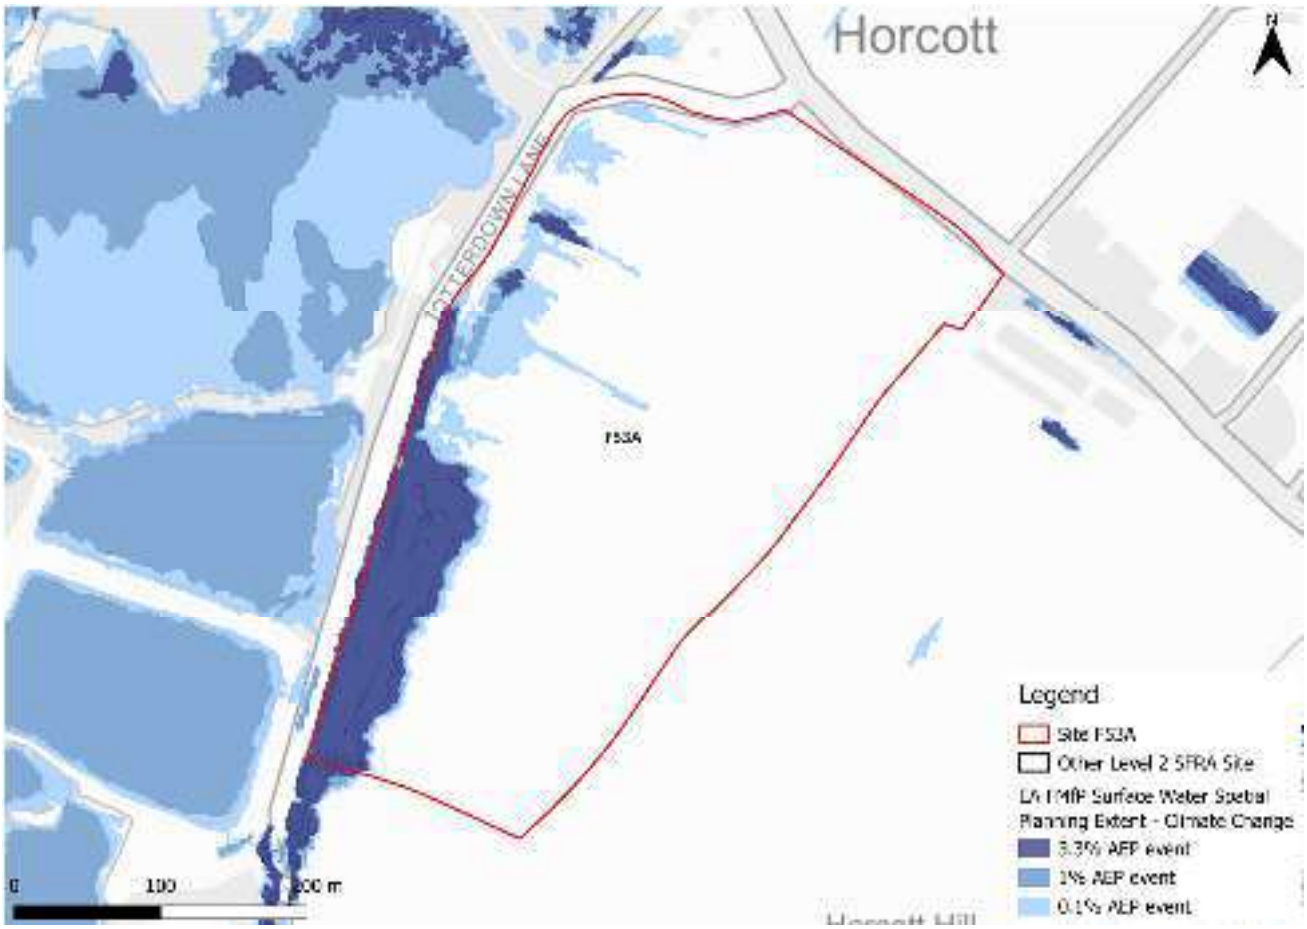

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

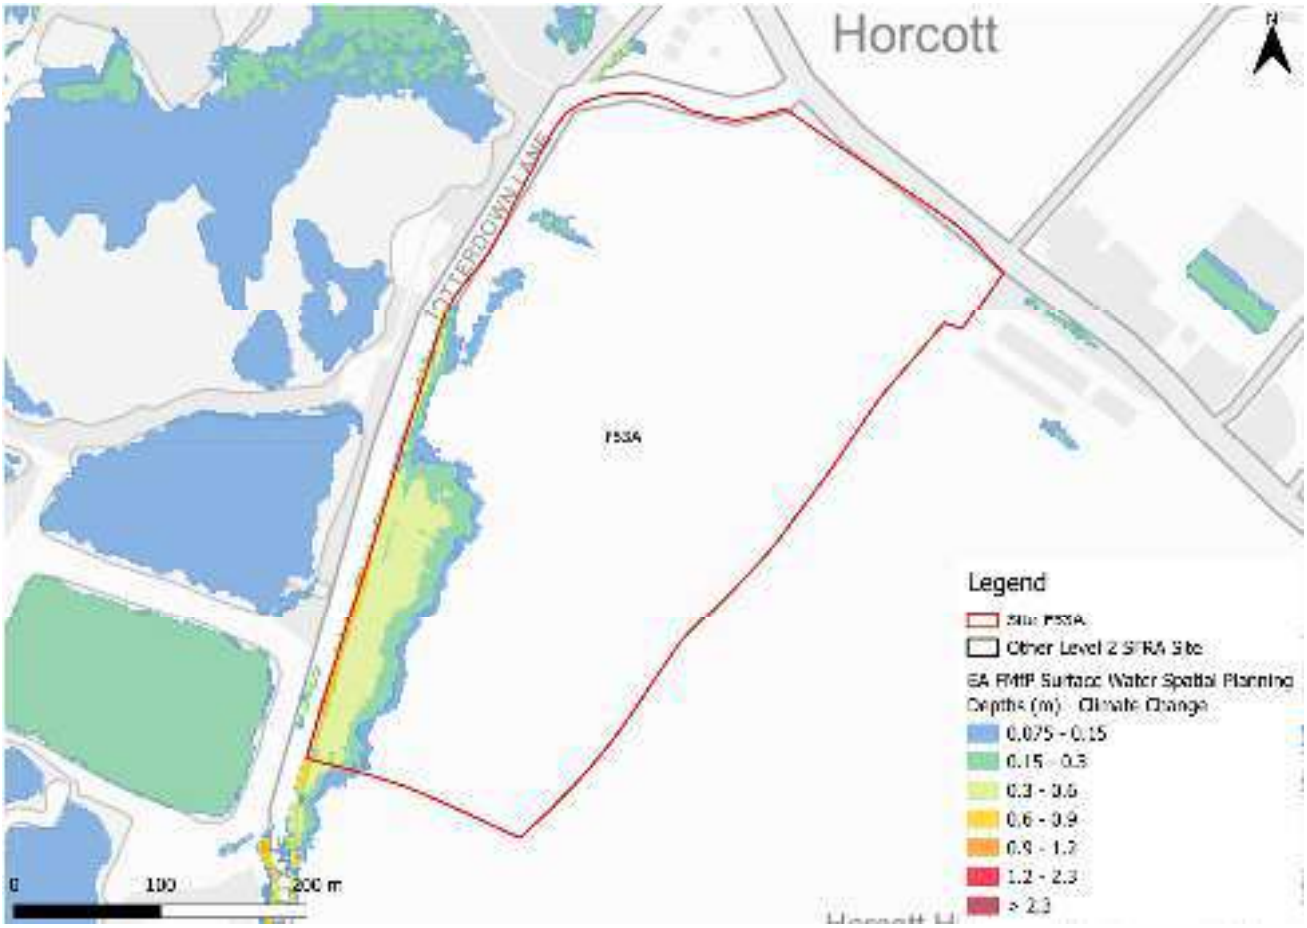

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event surface water flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is categorised as 'significant' (Figure 3-6).

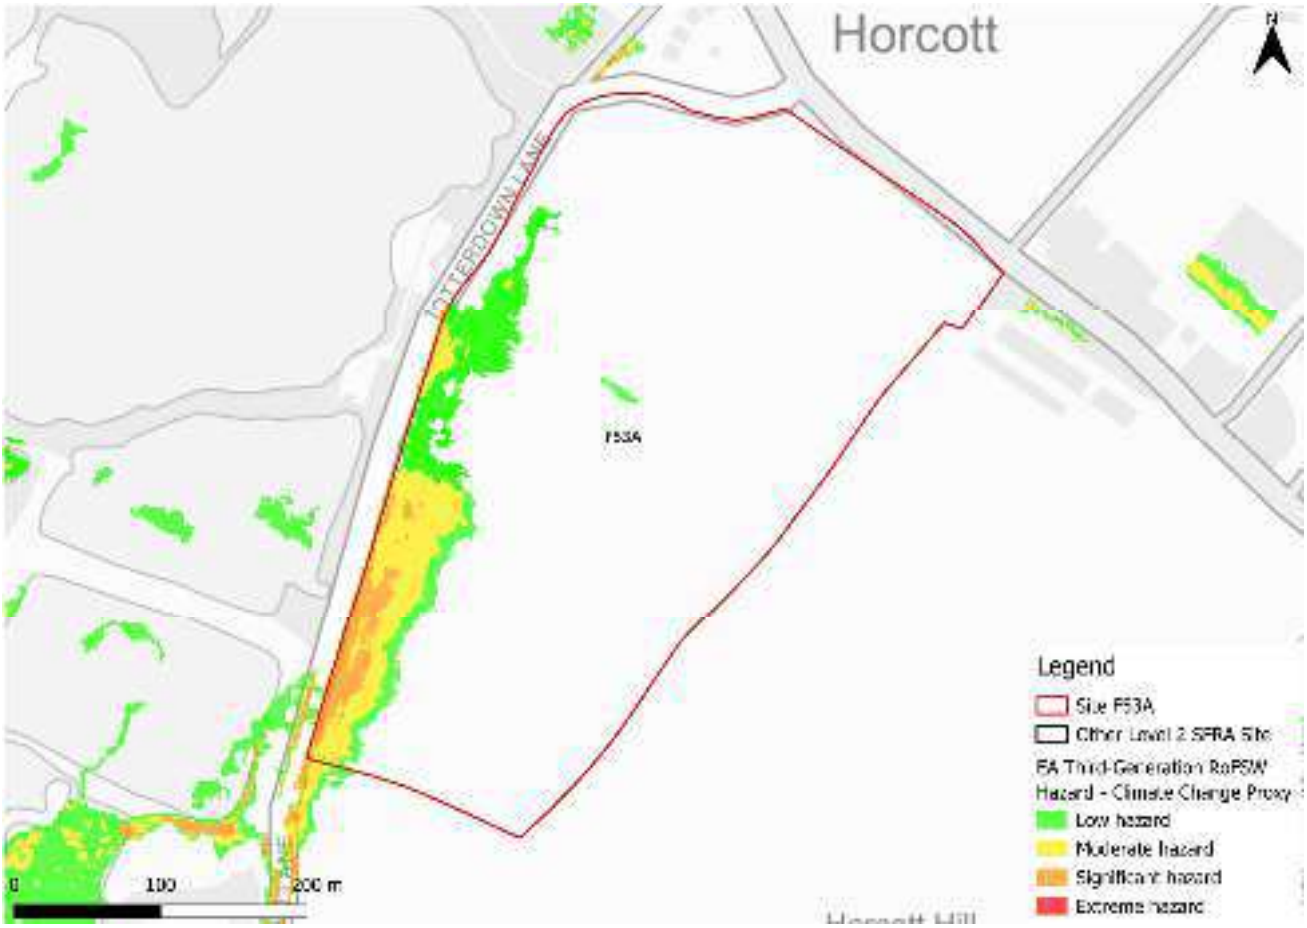

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day 0.1% AEP event surface water flood hazard as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There have been five recorded sewer flooding incidents within the Lechlade, Kempsford & Fairford South Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 88% of the site being outside of the 0.1% AEP surface water flood extent. Surface water risk is confined to a significant area of ponding within the southwest of the site.
- Development should avoid the area shown to be at surface water risk within the southwest of the site. Ideally, this area would be utilised as open green space, providing a flood storage function as well as providing Biodiversity Net Gain (BNG), ecological, amenity, social, and wellbeing benefits.
- Risk to the site is not shown to increase significantly in extent within the site when considering the impact of climate change.

- The drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.
- Safe access and escape routes would likely be achievable via Horcott Road to the north of the site, and the northern end of Totterdown Lane.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within a low sensitivity catchment, namely Dudgrove Brook. Planning considerations for all sites can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications.

The eastern half of the site is located within an area where there is no risk of groundwater emergence. Infiltration SuDS may be an appropriate option in this area. Within the western half of the site, there is a risk of groundwater emergence to both surface and subsurface assets. This area includes the area of surface water flood risk. Infiltration SuDS would not be suitable within this area of the site.

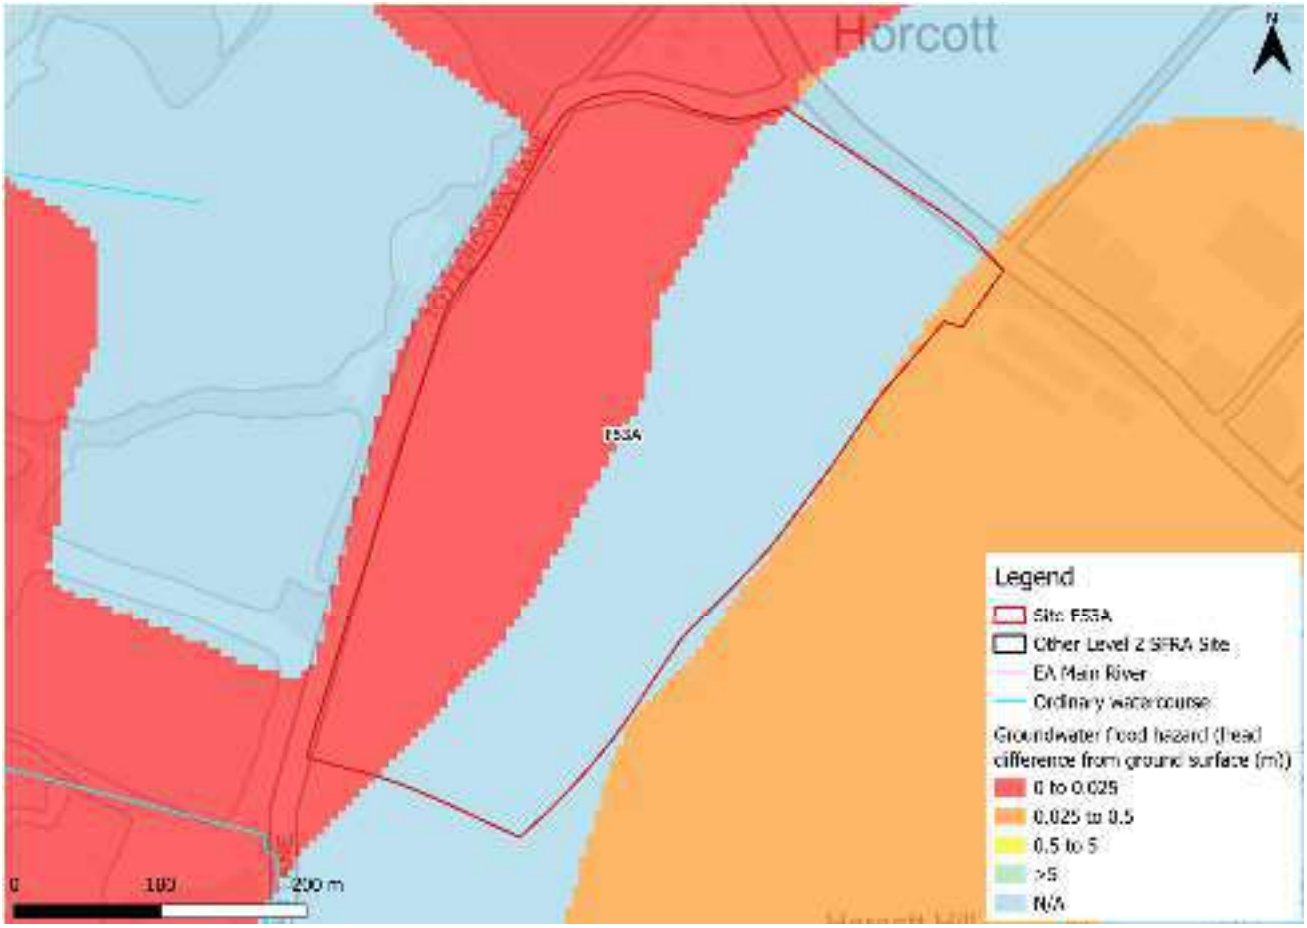

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is mudstone, siltstone and sandstone (Figure 5-2). Mudstone and siltstone generally have a low permeability and low level of porosity, reducing infiltration rates. The superficial deposits within the site are sand and gravel, which generally have a high porosity.

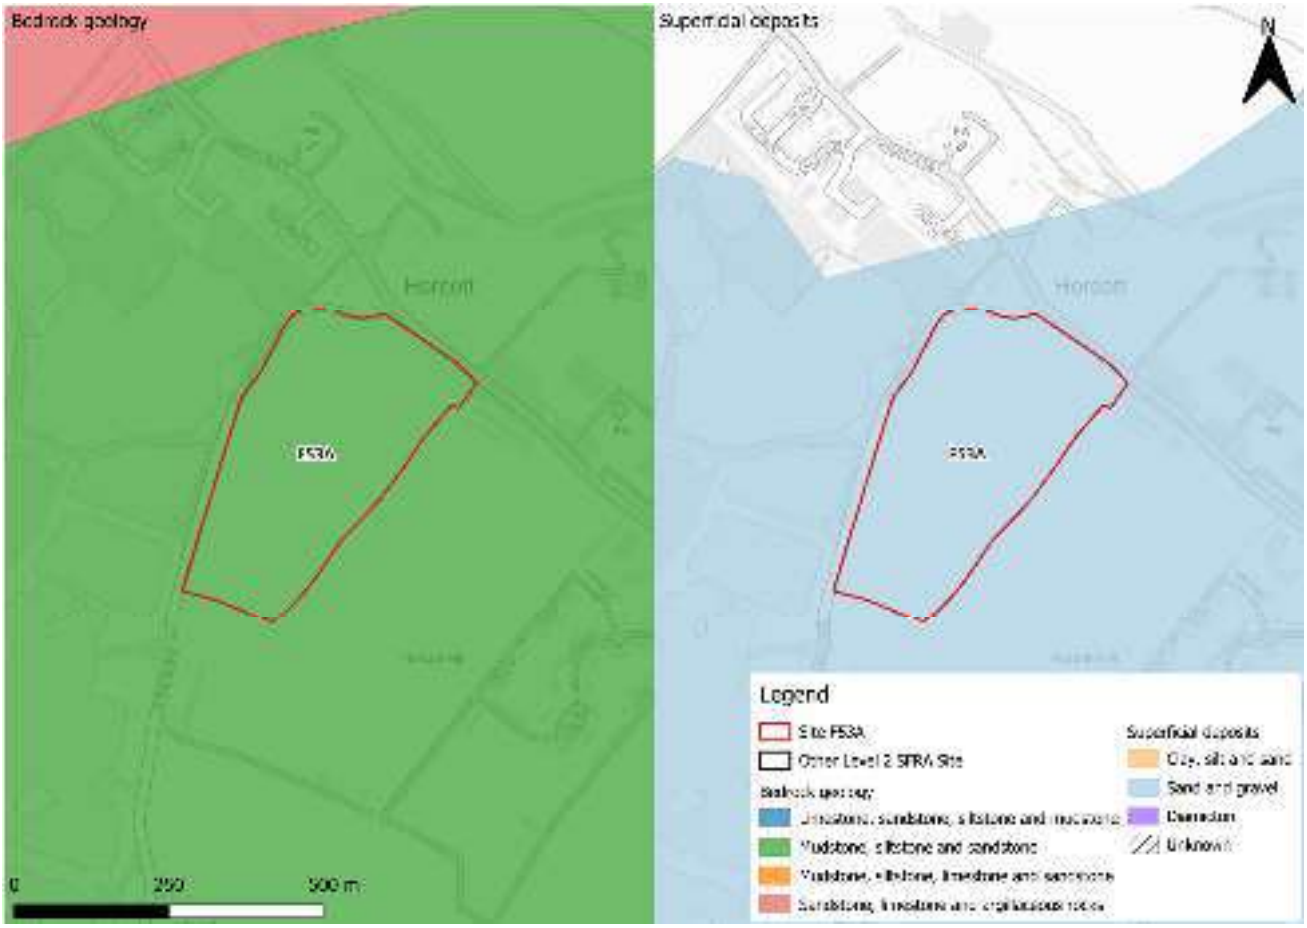

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There is no potential residual risk to the site.

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is not required to pass part b) of the Exception Test, as it is not located within Flood Zone 3a, however it must still be proven that the development can be safe for its lifetime, which is generally considered to be 100 years for residential development.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be possible to develop this site for mixed use given its location within Flood Zone 1 and surface water risk confined to a distinct area of ponding within the south of the site.
- The area of the site shown to be at surface water flood risk would ideally be utilised as open greenspace to provide a flood storage function as well as providing BNG, ecological, amenity, social, and wellbeing benefits.
- A drainage strategy must be in place to manage surface water flood risk and runoff rates.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for the strategic extension to the south west of Kemble site. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Strategic extension to the south west of Kemble

- Location: Kemble
- Existing site use: Agricultural land
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 86.1
- Watercourse: N/A
- Environment Agency (EA) flood model: N/A
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of surface water flood extents, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

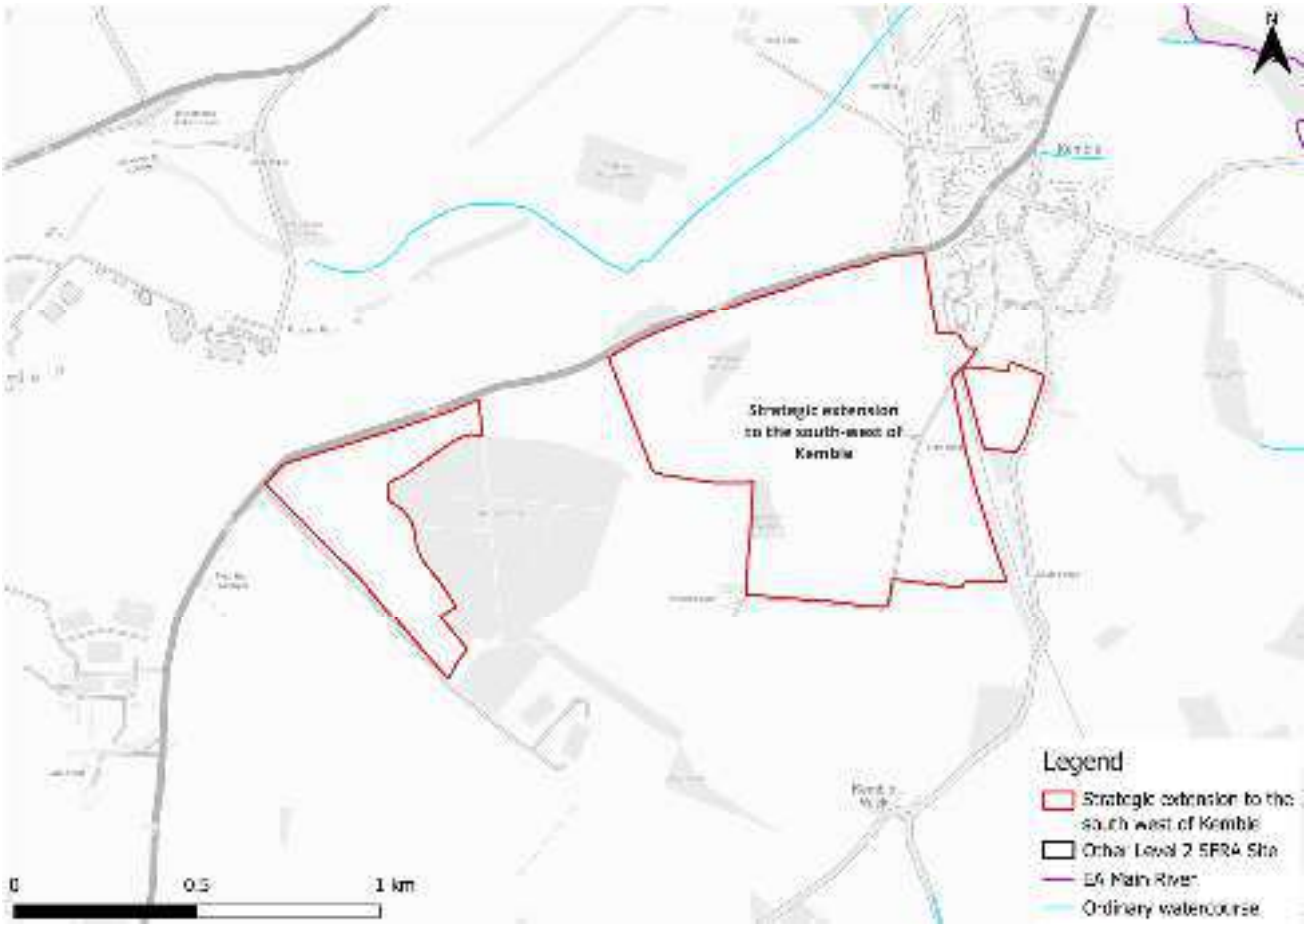

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

The larger site parcel in the east slopes southwards towards the Flagham Brook floodplain. The smaller site parcel to the east slopes eastwards (Figure 1-3).

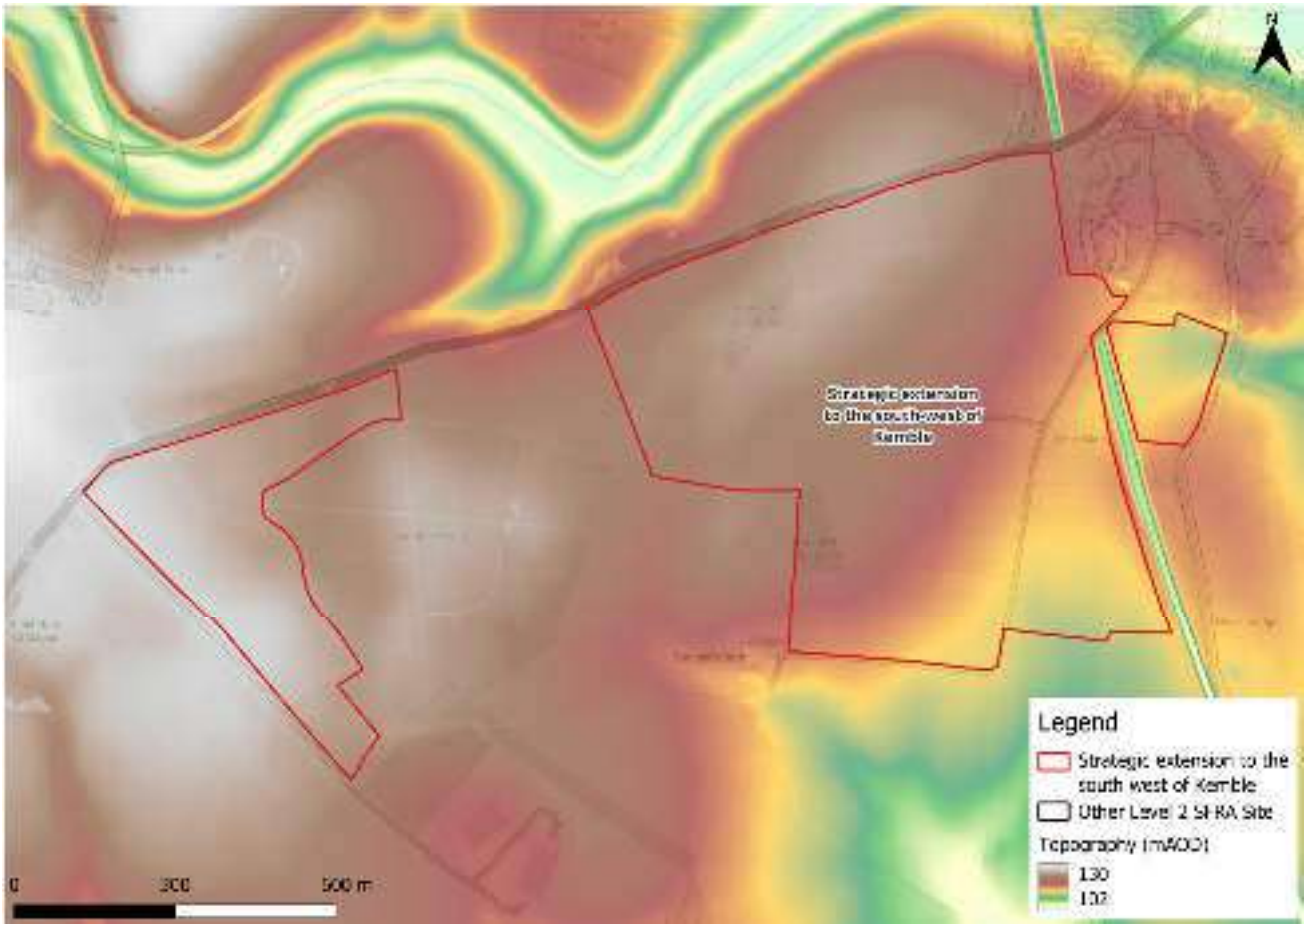

Figure 1-3: Topography

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the site is wholly located within Flood Zone 1 and therefore at low risk of flooding from rivers, as shown in Figure 2-1. Please note, the Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

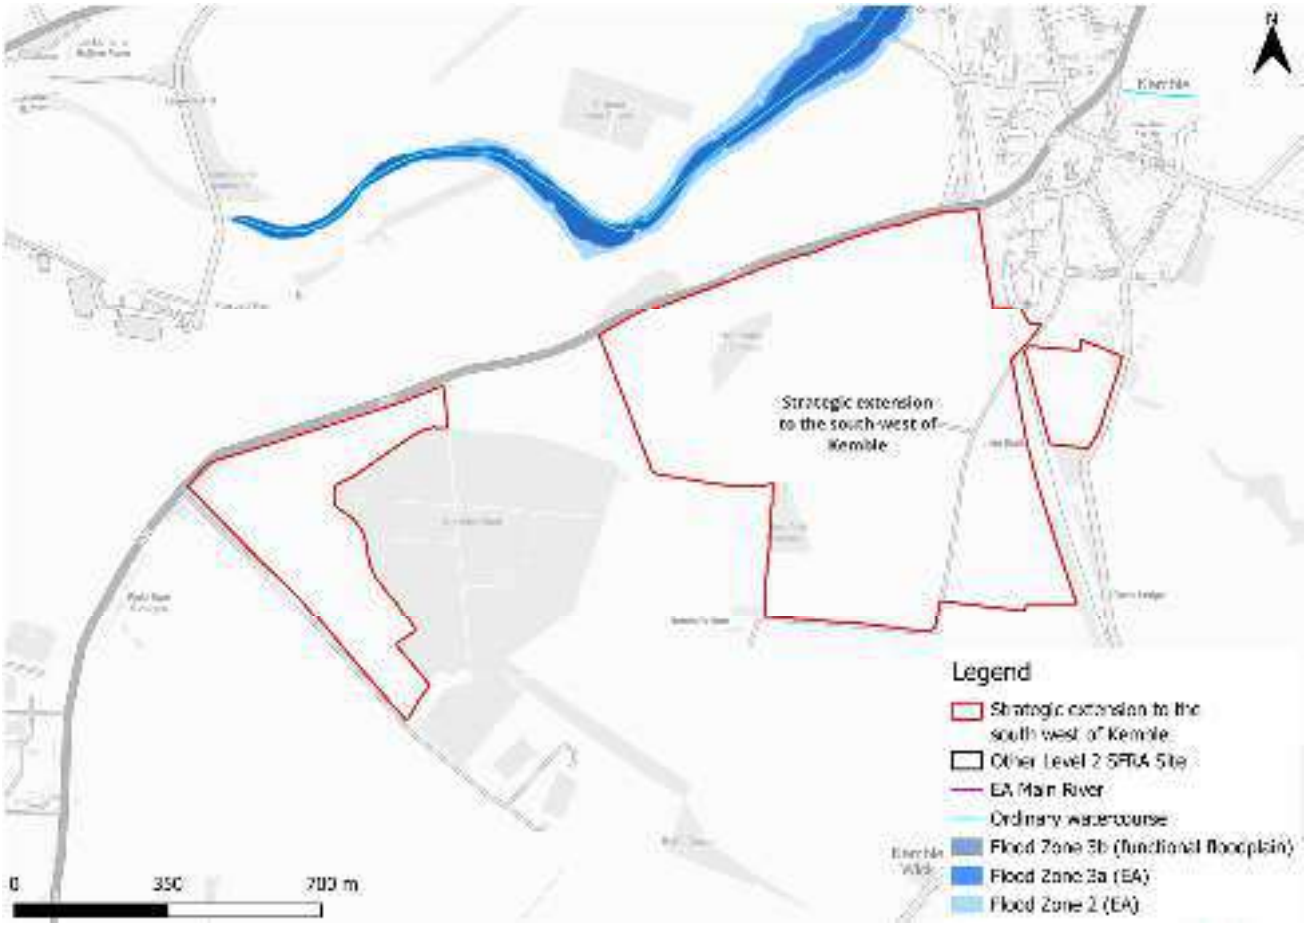

Figure 2-1: Present day risk

2.2 Impacts from climate change

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Gloucestershire and the Vale Management Catchment. The central allowance within this catchment is 21% on peak flows (Table 2-1).

Table 2-1: Modelled climate change allowances for peak river flows within the Gloucestershire and the Vale Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	11	17	33
2050s	11	19	43
2080s	26	41	84

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Based on the EA's Flood Map for Planning - Flood Zones plus Climate Change dataset, the site is not shown to be at increased risk of fluvial flooding when considering climate change.

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been ten recorded flooding incidents within the Kemble Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-2 shows that there are opportunities within the site for run-off attenuation features, where it may be possible to temporarily store water and attenuate flooding during high flows. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

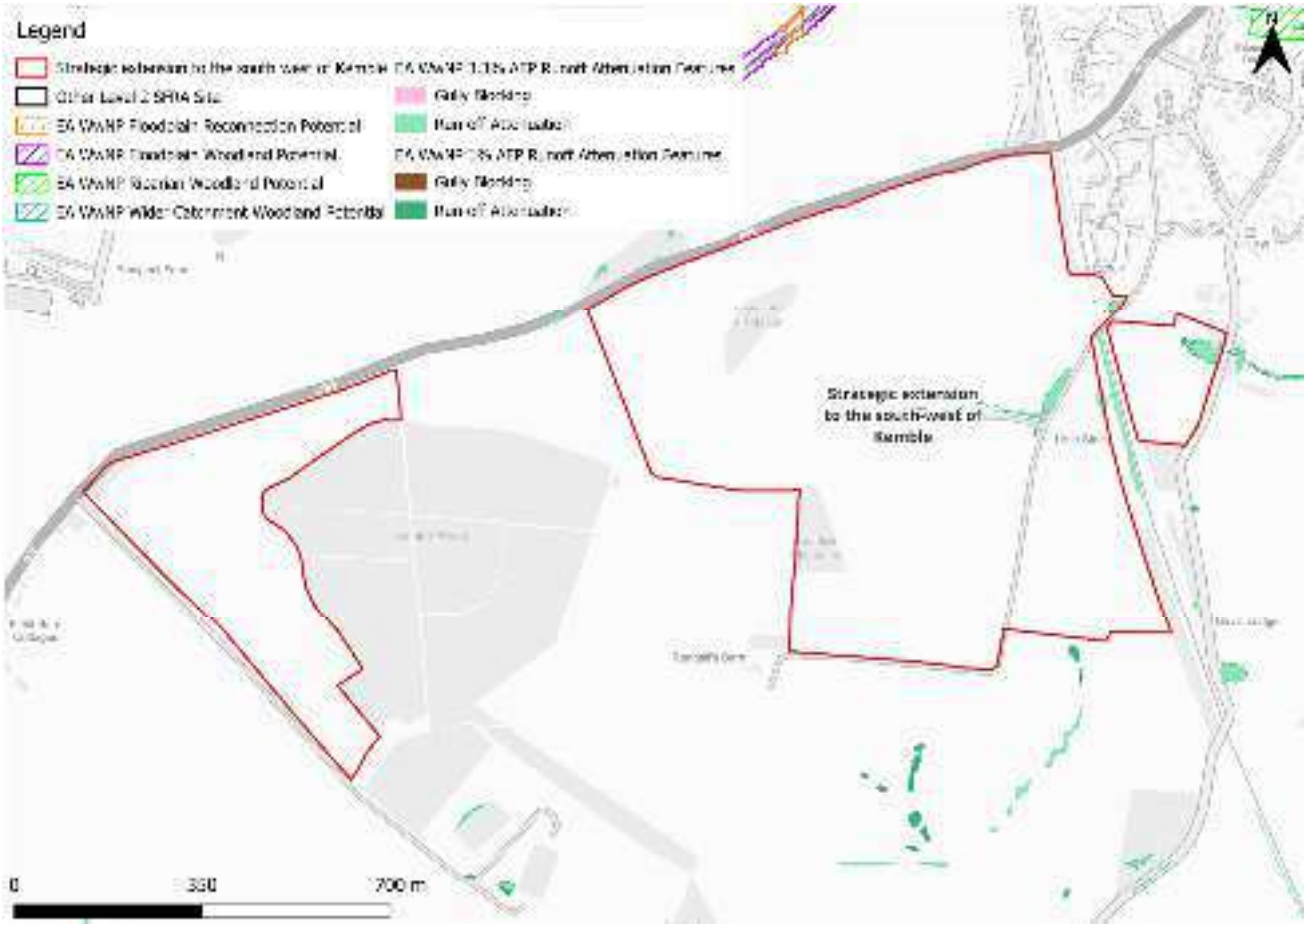

Figure 2-2: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warning and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The site is not located within a FAA.

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes could likely be achieved during a flood event via multiple locations surrounding the site (Figure 2-3).

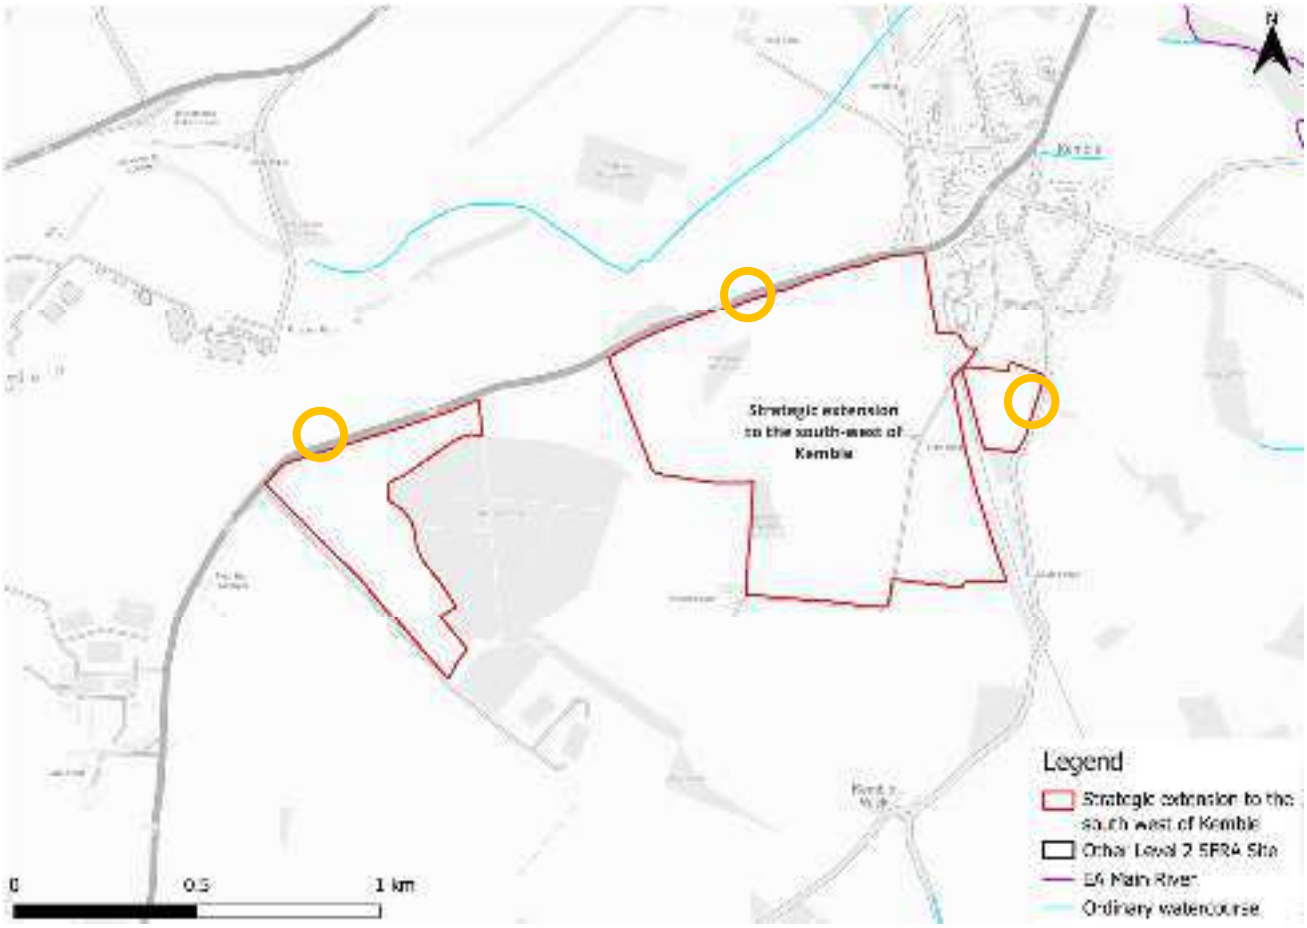

Figure 2-3: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site is located wholly within Flood Zone 1 and therefore at low risk of flooding from rivers.
  - The site is not shown to be at increased risk from fluvial flooding in the future, based on the EA's Flood Zones plus Climate Change dataset.
- Access and escape:
  - Based on current information, safe access and escape routes appear achievable via multiple locations surrounding the site.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents map (May 2026), the site is predominantly at low risk of surface water flooding as shown in Figure 3-1. Surface water risk is present across all site parcels as areas of scattered ponding in topographic low spots. There is a greater extent of ponding within the east of the largest site parcel along the hardstanding road through the site.

Greatest surface water flood depths in the 1% AEP event are between 0.6 and 0.9 m within a small area of ponding in the eastern site parcel (Figure 3-2).

Safe access and escape routes are achievable via multiple locations surrounding the site.

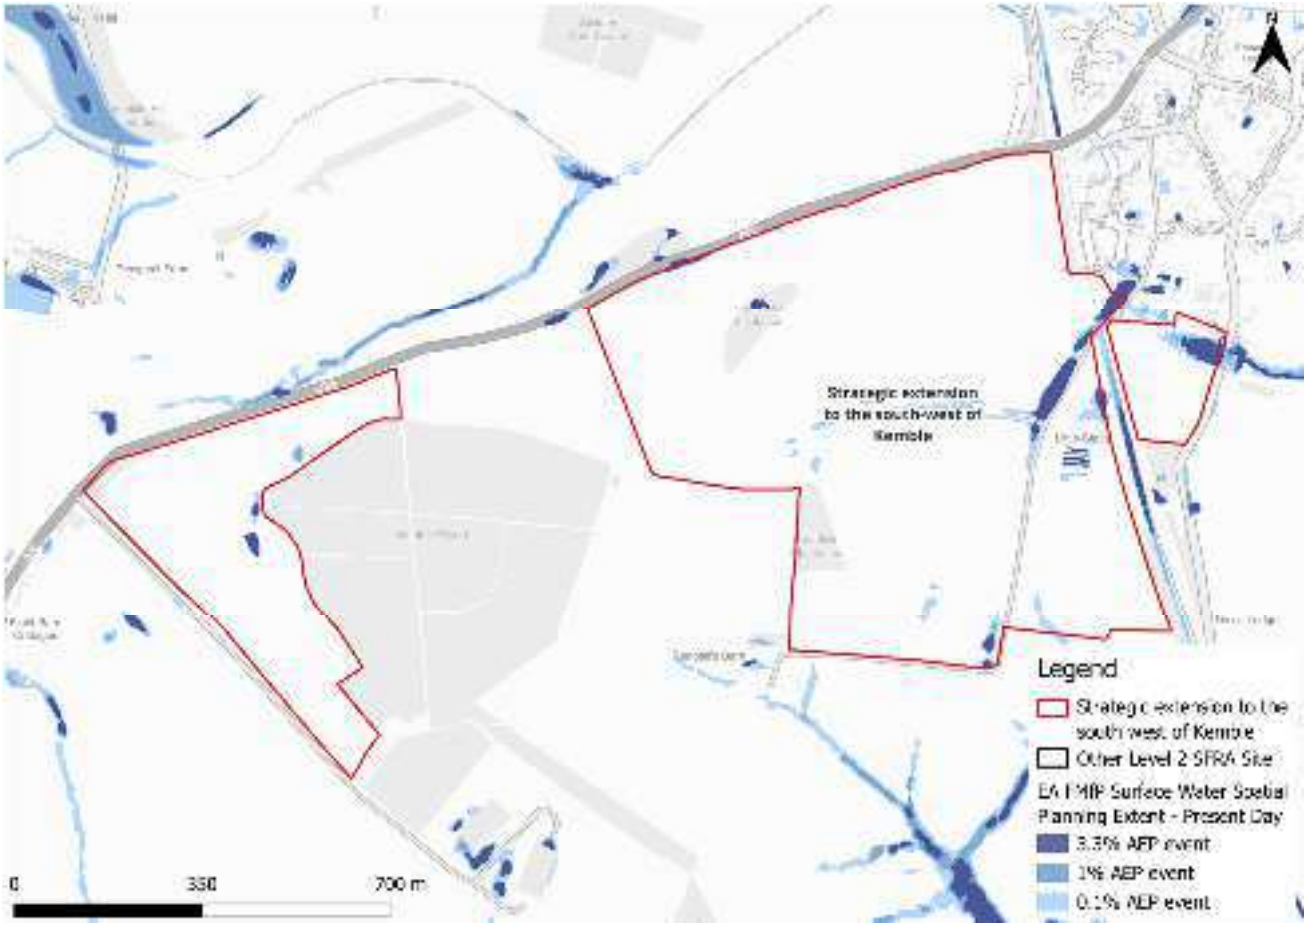

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

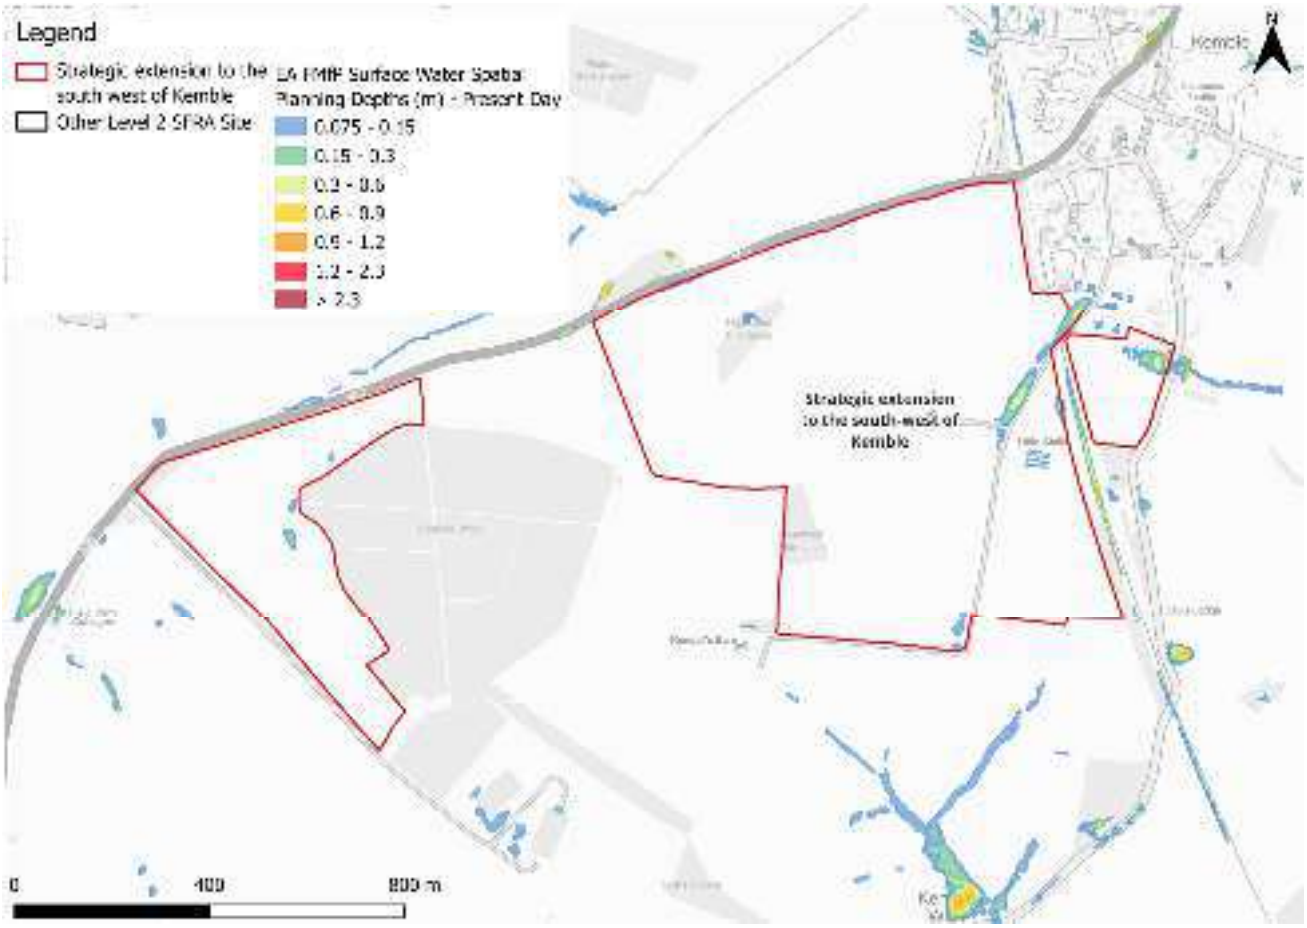

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows there to be some small areas of 'significant' flood hazard within the eastern site parcel (Figure 3-3). There are some differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping. Given the differences between the two datasets, the hazard information should be discounted and assessed further at the FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

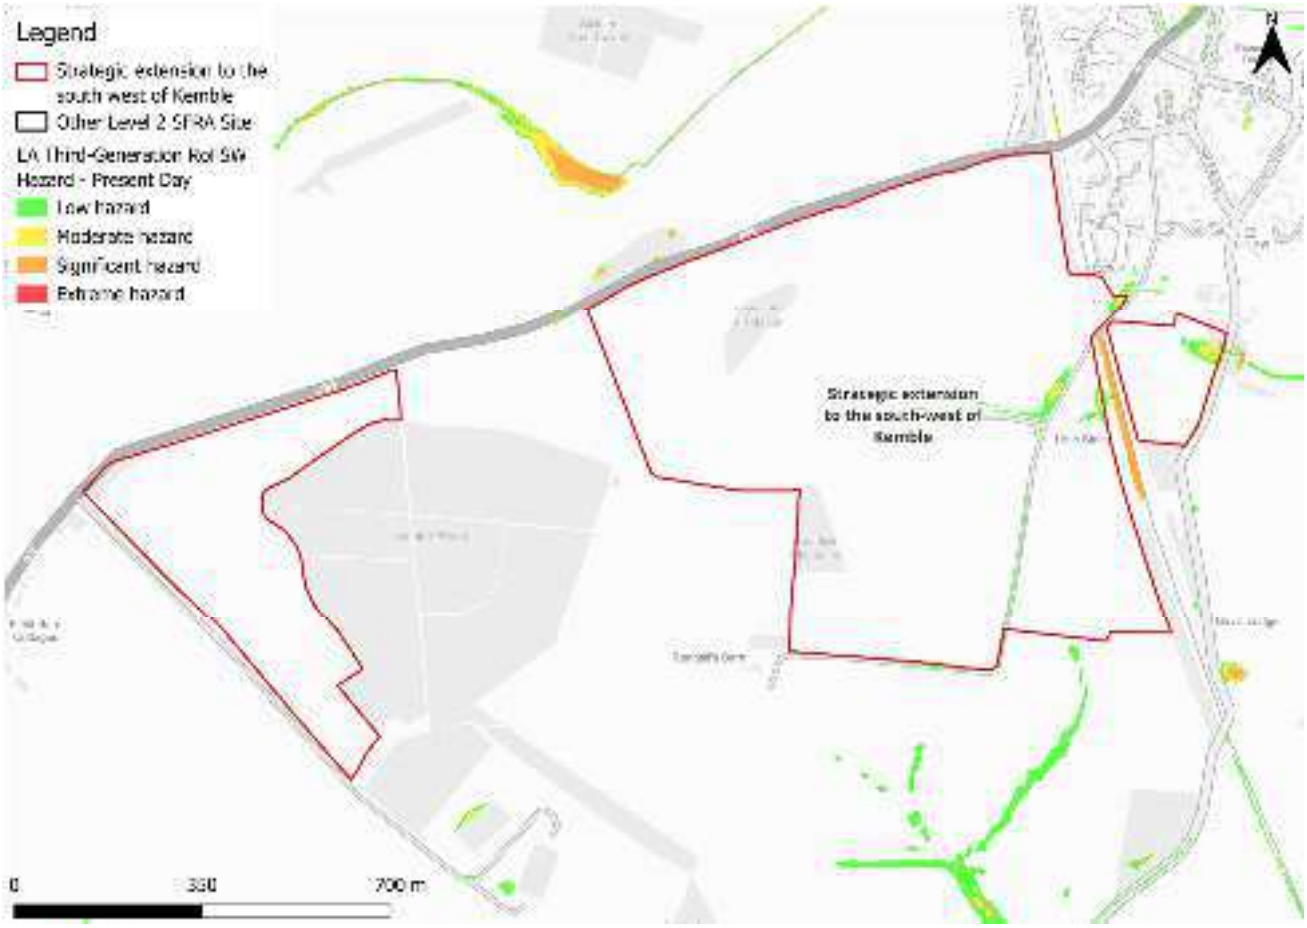

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day 1% AEP event surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Gloucestershire and the Vale management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-1: Peak rainfall intensity allowances for the Gloucestershire and the Vale Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. There is a slightly greater extent of flooding within the areas of ponding onsite in all events. However, surface water flood risk is not shown to increase significantly with climate change. Flood depths in the 1% AEP event are shown to increase to remain at between 0.6 and 0.9 m within the eastern site parcel (Figure 3-5).

Safe access and escape routes would likely remain achievable via several locations surrounding the site.

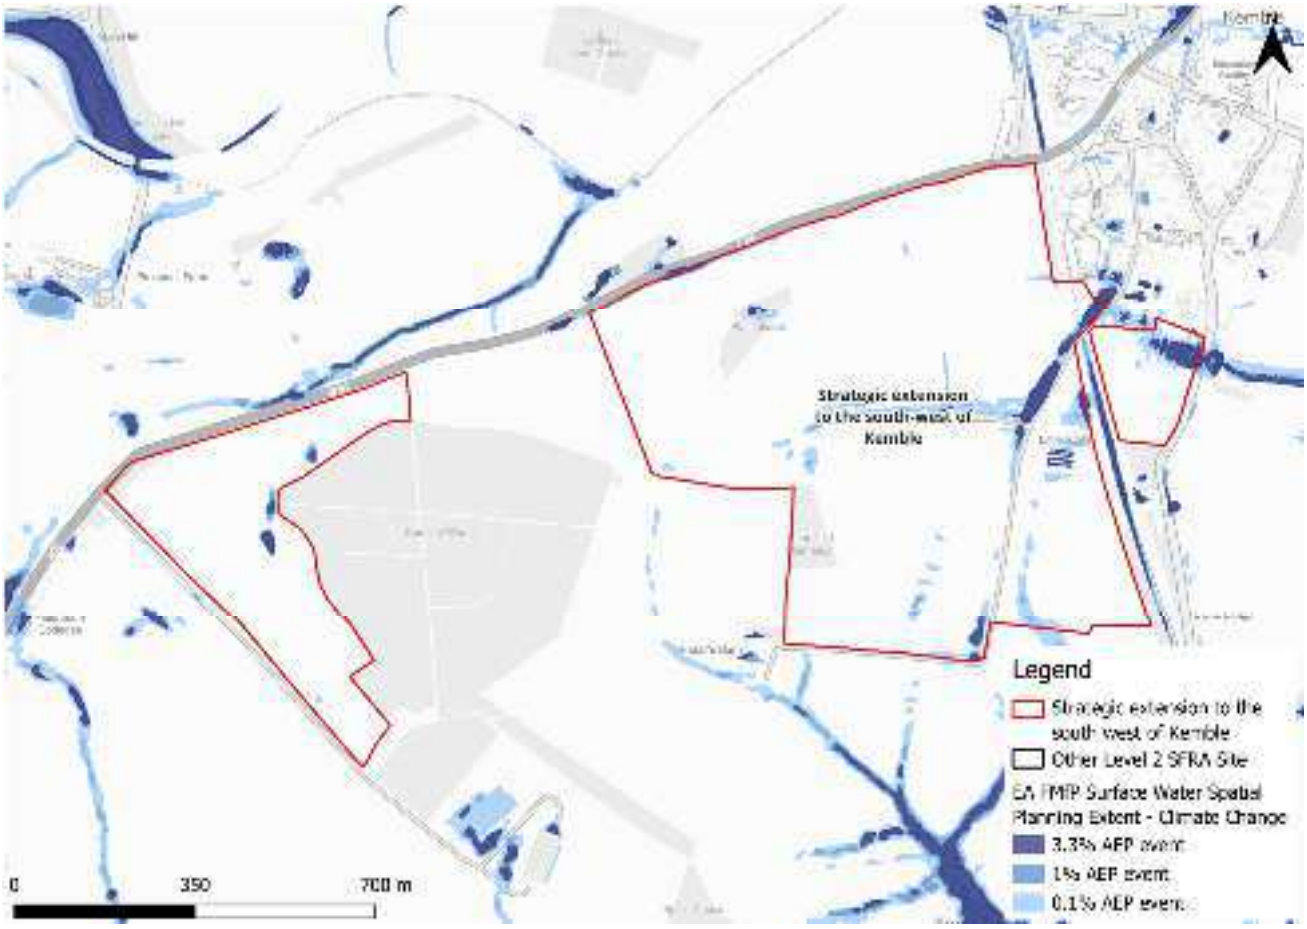

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

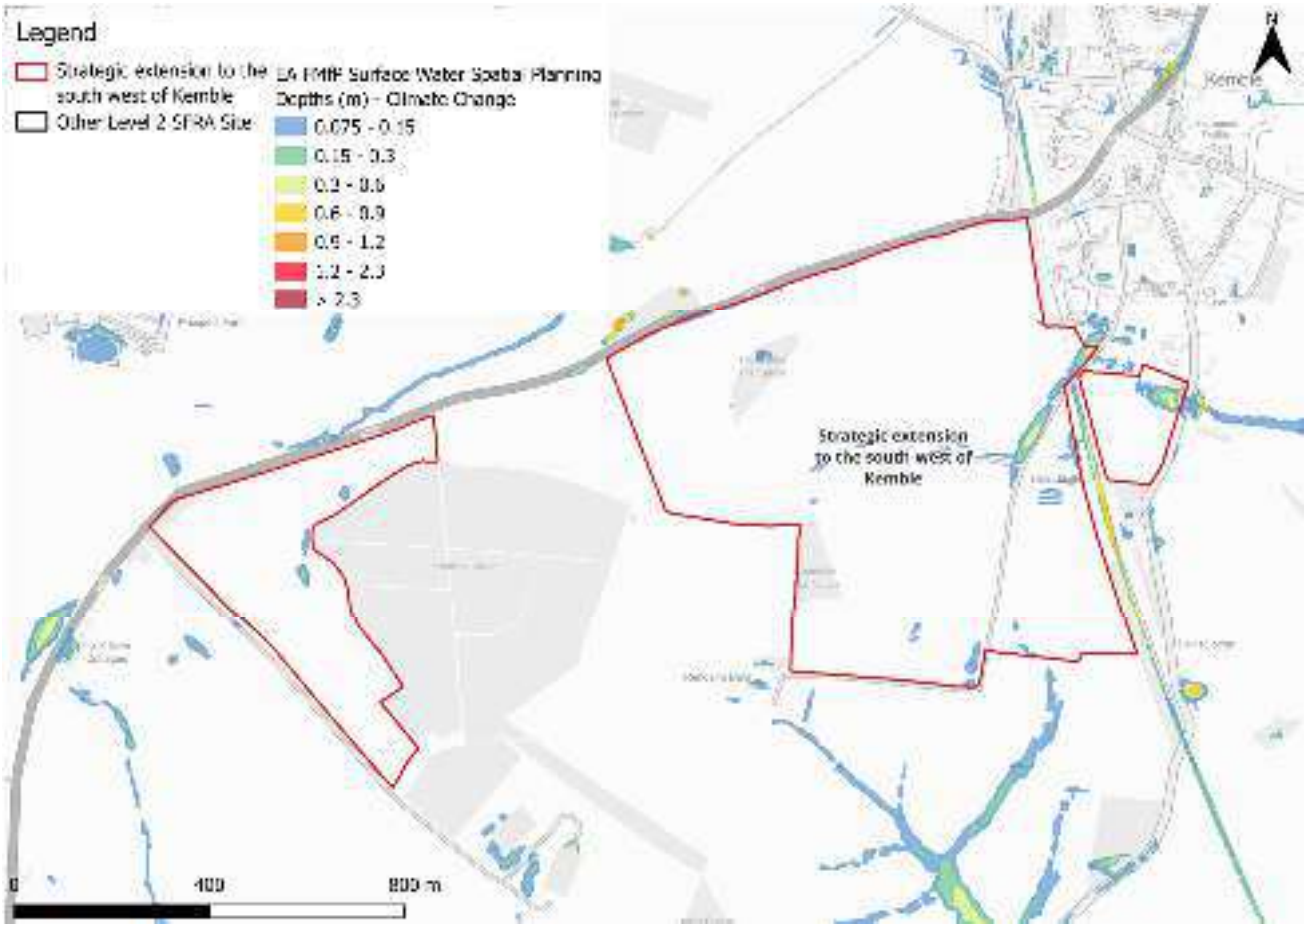

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event surface water flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is categorised as 'significant' in some areas (Figure 3-6).

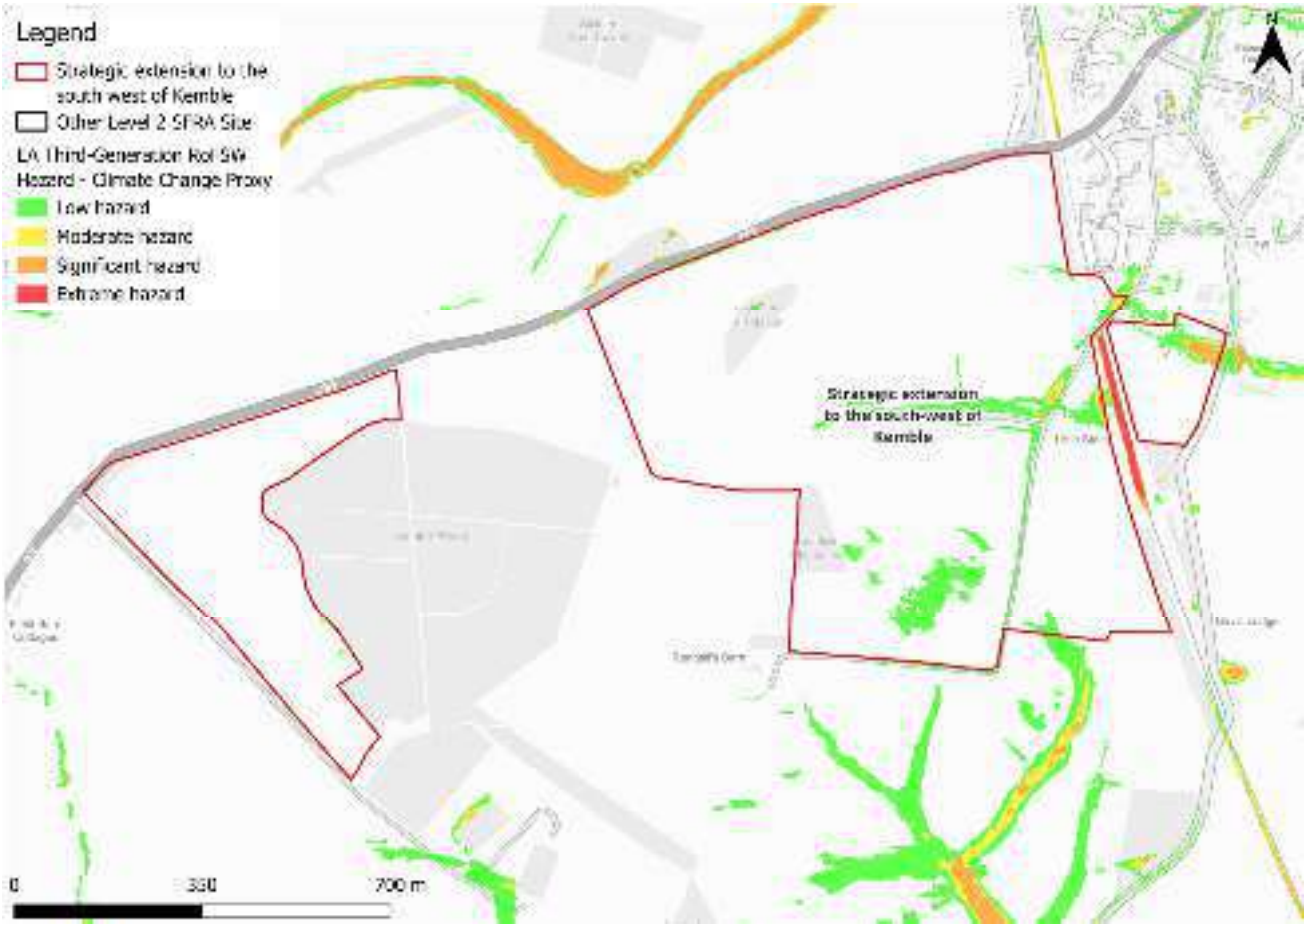

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day 0.1% AEP event surface water flood hazard as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There have been six recorded sewer flooding incidents within the Kemble Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with the majority of each site parcel being outside of the 0.1% AEP surface water flood extent. Surface water risk is present as areas of scattered ponding within topographic low spots.
- The areas of ponding should be considered and included in site design and ideally left in place to flood naturally when required.
- Risk to the site parcels is not shown to increase significantly in extent within the site when considering the impact of climate change.
- A drainage strategy must be carried out at each site parcel to ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.

- Safe access and escape routes would likely be achievable via multiple locations when considering surface water risk.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within three catchments, two of which are ranked as high sensitivity, and one ranked as low sensitivity. Planning considerations for sites at high sensitivity to the cumulative impacts of development can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications.

The majority of the site parcels are located within an area where there is a risk of groundwater emergence to surface and subsurface assets and there is the possibility of groundwater emerging at the surface locally.

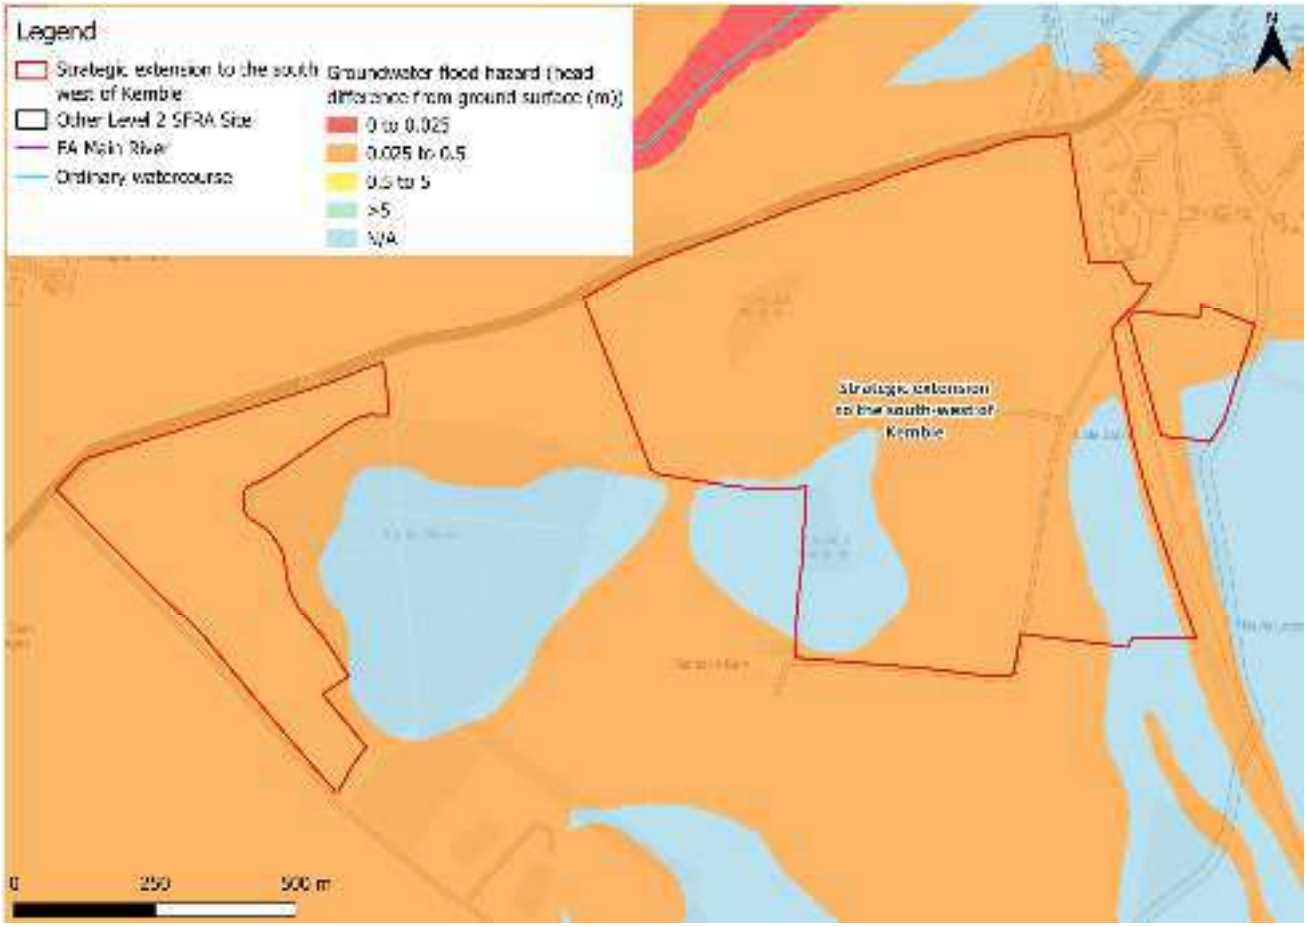

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is sandstone, limestone and argillaceous rocks (Figure 5-2). Sandstone and limestone generally have a high permeability and high level of porosity, increasing infiltration rates. There is no record of superficial deposits in the area.

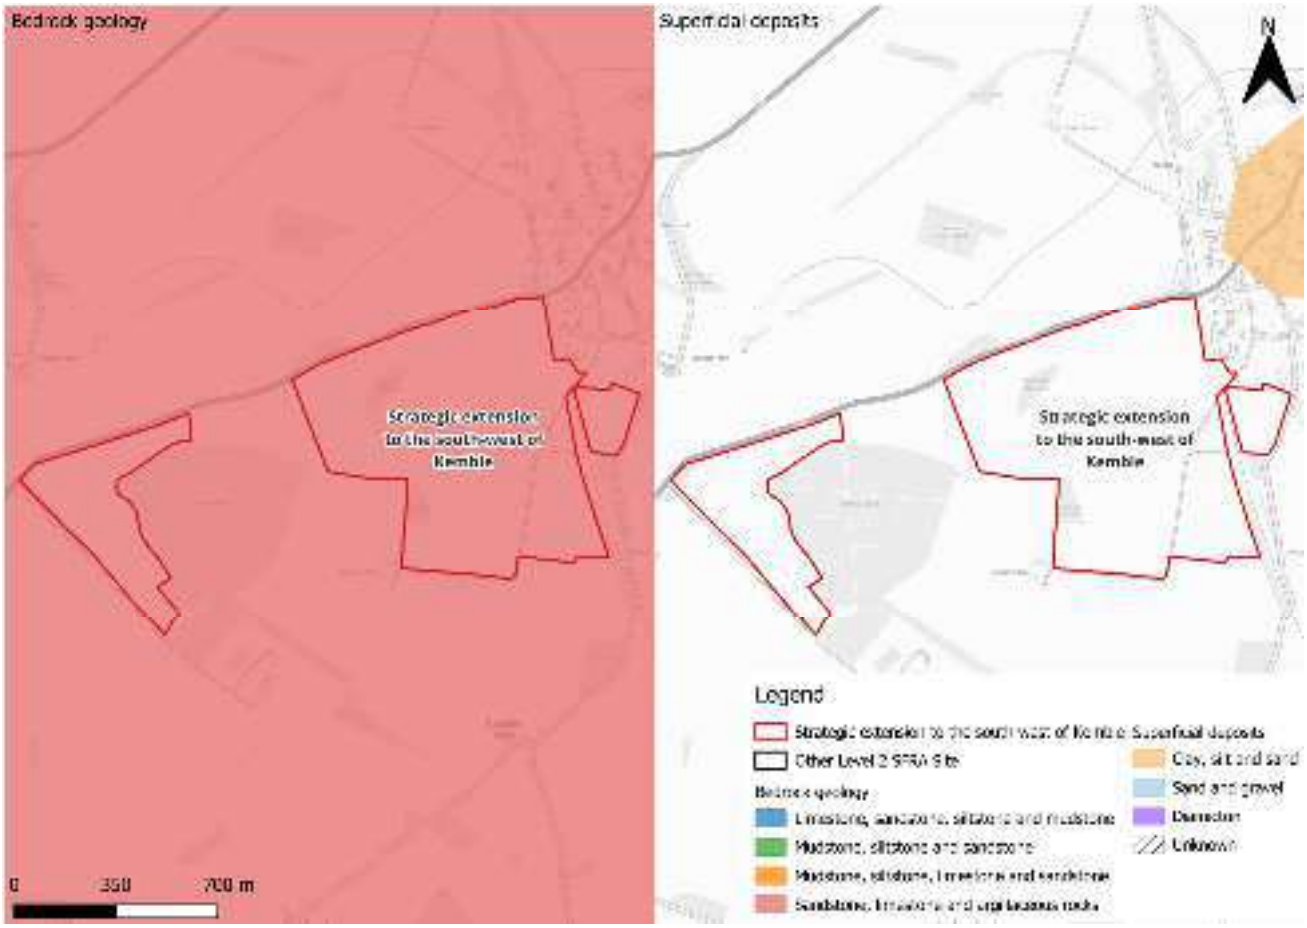

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There is no potential residual risk to the site.

6.1 Flood risk from reservoirs

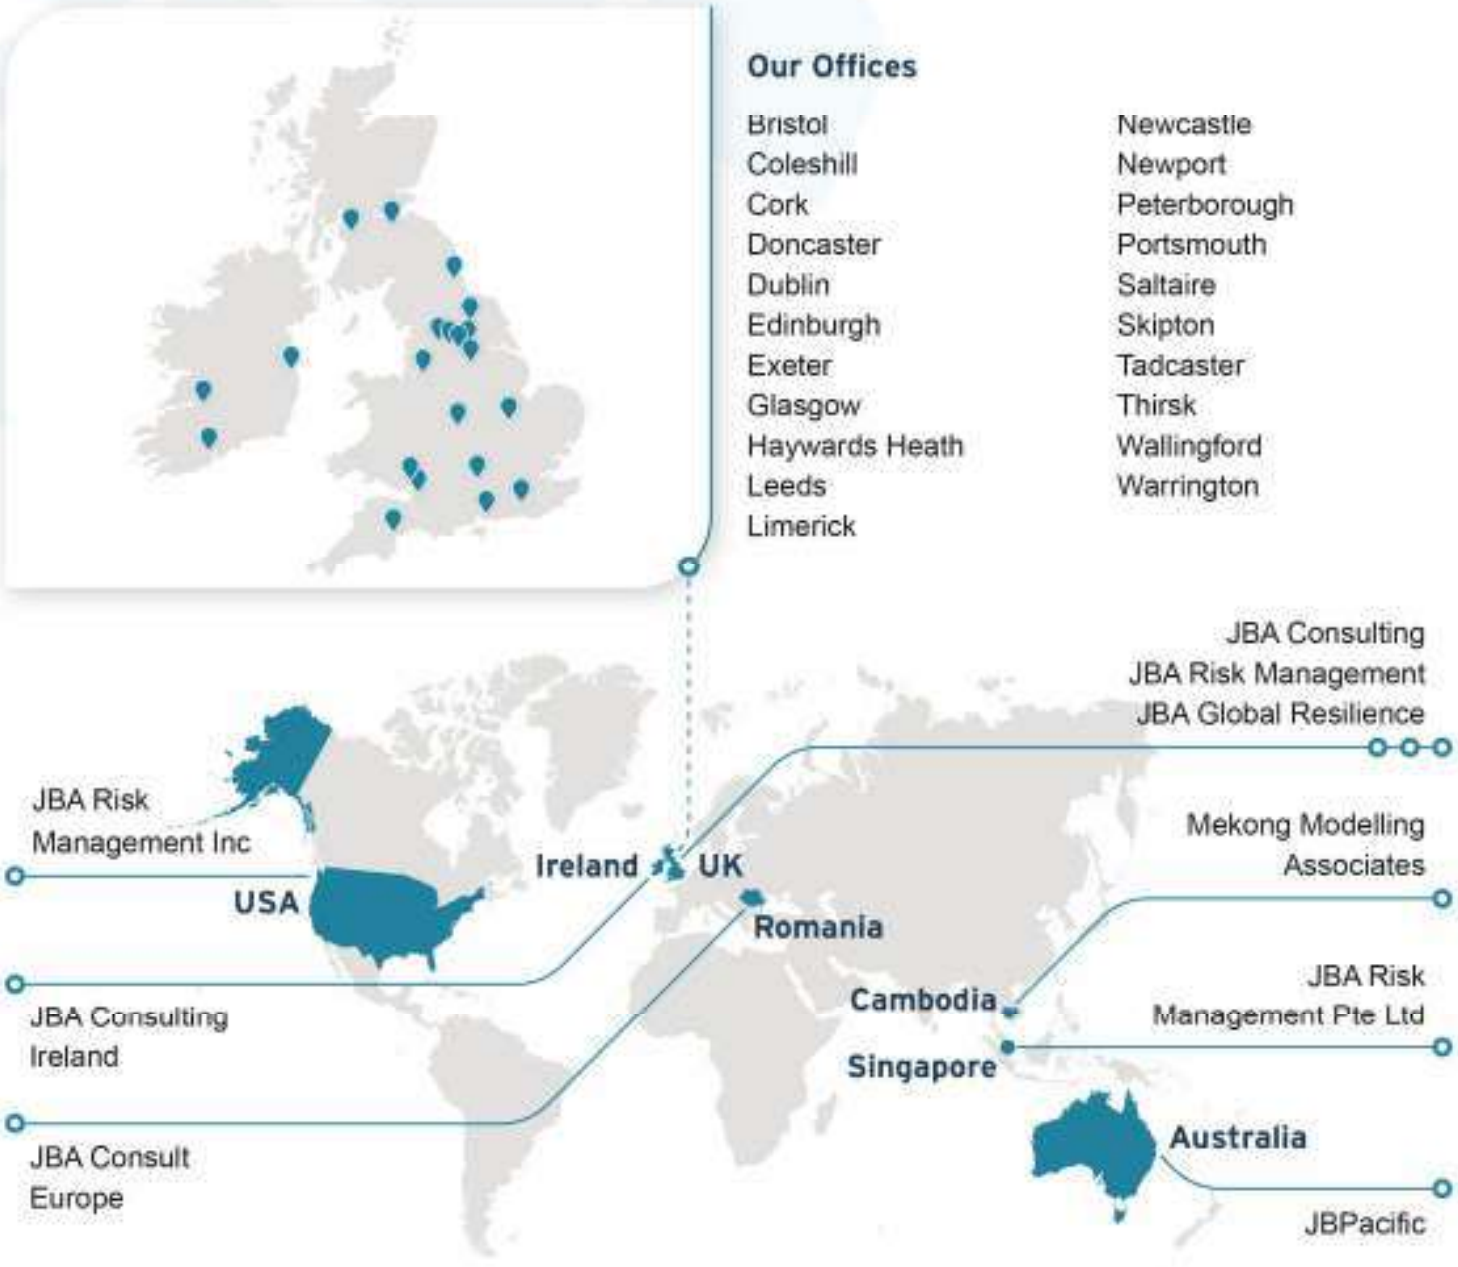
The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is not required to pass part b) of the exception test, as it is not located within Flood Zone 3a, however it must still be proven that the development can be safe for its lifetime, which is generally considered to be 100 years for residential development.

7.2 Main recommendations and site-specific FRA requirements



Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be appropriate to develop each site parcel for more vulnerable purposes given the location within Flood Zone 1 and nominal surface water flood risk.
- A drainage strategy will be required for each site parcel which should ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site L33. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site L33

- Location: Land south of Ferrers Park
- Existing site use: Agricultural
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 10.02
- Watercourse: N/A
- Environment Agency (EA) flood model: N/A
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of surface water flood extent, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

The topography of the site slopes from west to east towards the floodplain of the River Leach to the southwest of the site (Figure 1-3). There is a large topographic low spot along the western boundary adjacent to Station Road.

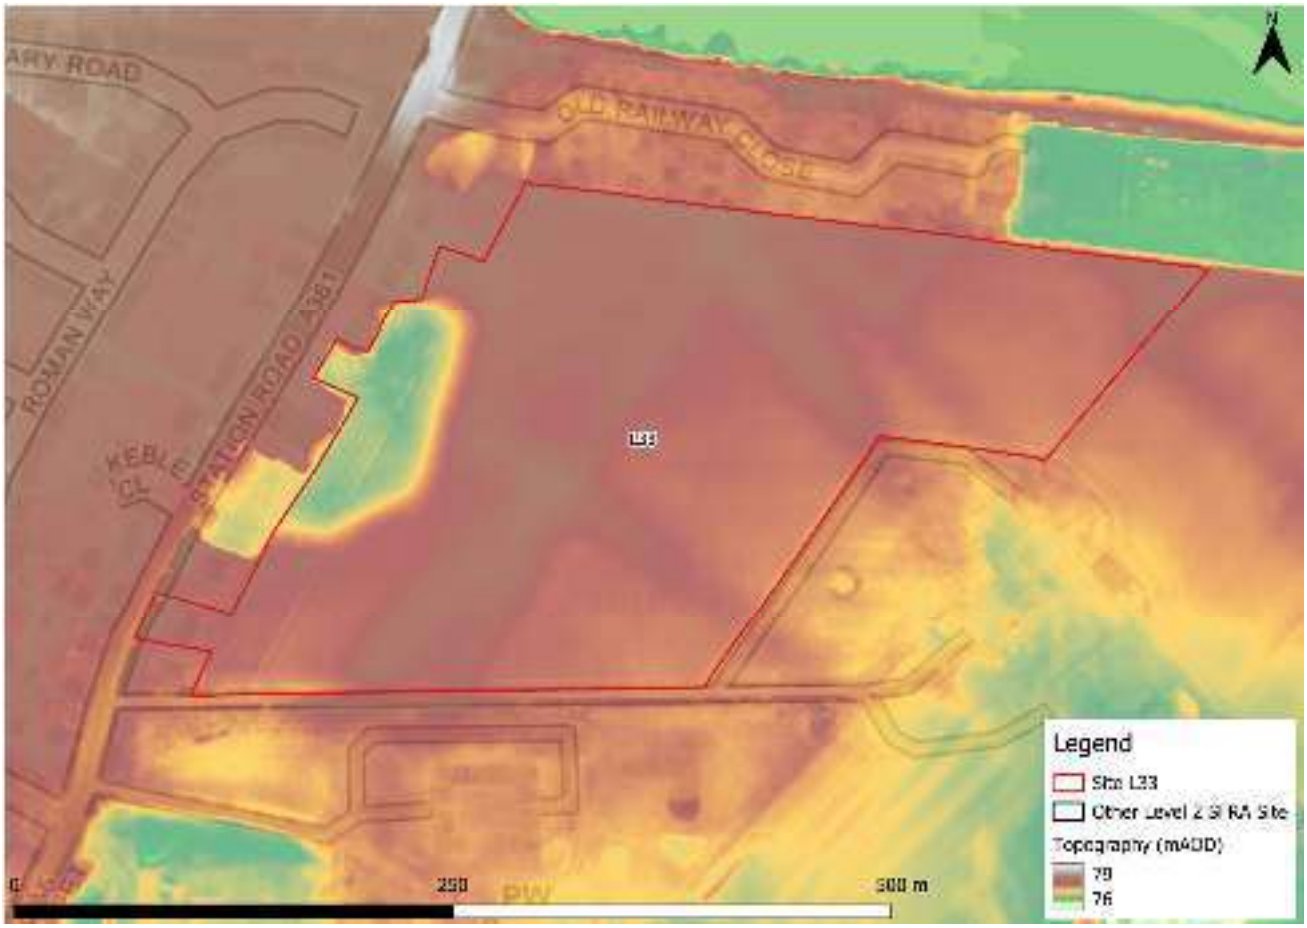

Figure 1-3: Topography

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the site is wholly located within Flood Zone 1 and therefore at low risk of flooding from rivers. The percentage areas of the site within each flood zone are stated in Table 2-1 and can be viewed on Figure 2-1. The Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

Table 2-1: Present day flood risk based on percentage area of site at risk

Flood Zone 1 (% area)	Flood Zone 2 (% area)	Flood Zone 3a (% area)	Flood Zone 3b (% area)
100	0	0	0

Figure 2-1: Present day risk

2.2 Impacts from climate change

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Based on the Flood Map for Planning - Flood Zones plus Climate Change dataset, the site is not shown to be at additional risk from climate change.

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There are no recorded flood incidents on or near the site.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-2 shows that the almost the entire site, and wider area, could benefit from wider catchment tree planting. Tree planting can help to slow the flow to benefit areas downstream. There are also opportunities for run-off attenuation features where it may be possible to temporarily store water and attenuate flooding during high flows. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

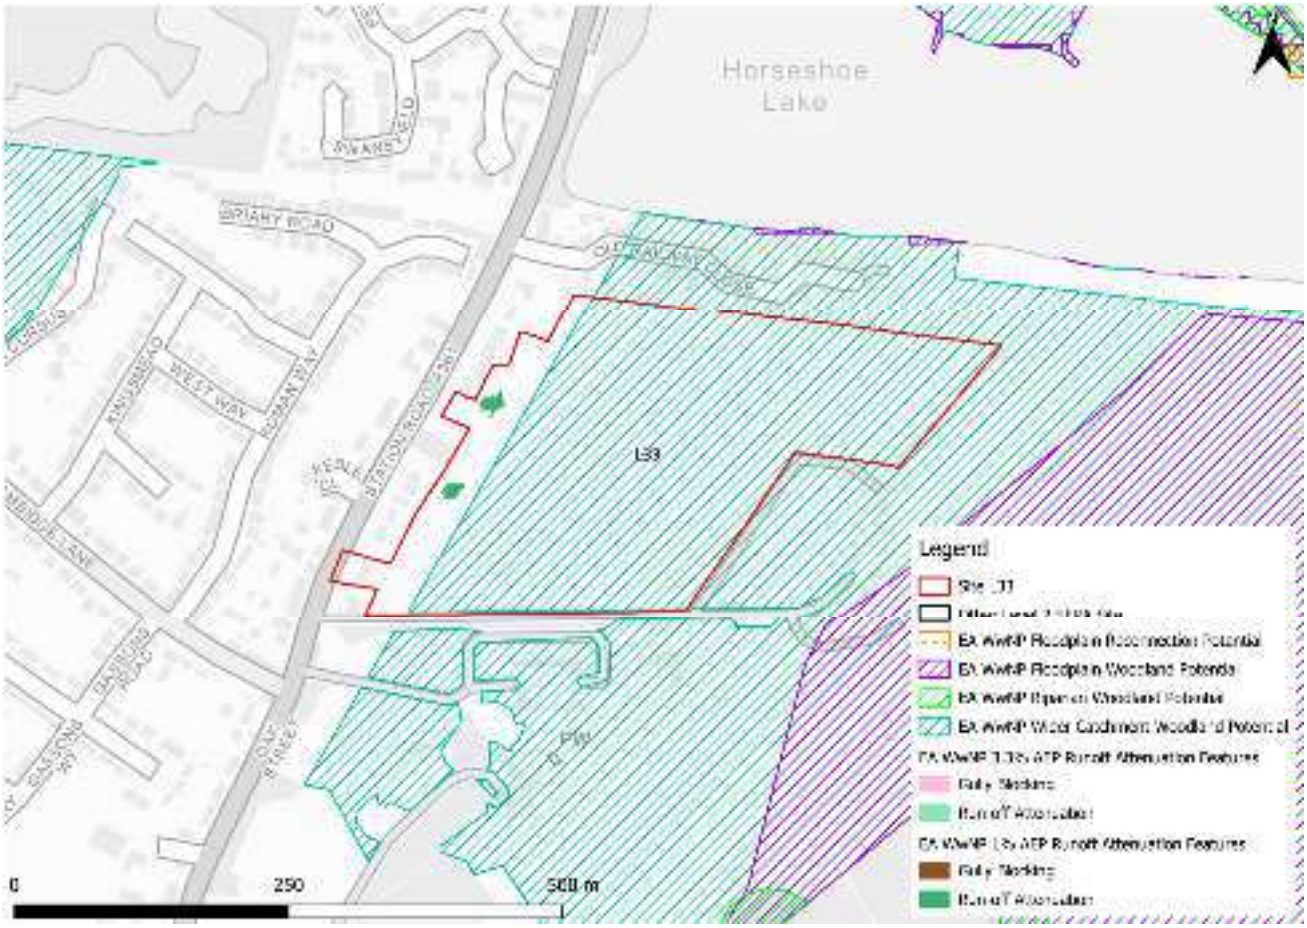

Figure 2-2: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warnings and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The site is not located within a FAA.

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes are available during a flood event via Station Road to the south of the site (**Error! Reference source not found.**).

Figure 2-3: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site is located wholly within Flood Zone 1 and therefore at low risk of flooding from rivers.
  - The site is not shown to be at increased risk from fluvial flooding in the future, based on the EA's Flood Zones plus Climate Change dataset.
- Access and escape:
  - Based on current information, safe access and escape routes are available via Station Road to the southwest of the site.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (May 2026), the site is at nominal risk of surface water flooding with a few isolated areas of ponding, as shown in Table 3-1 and Figure 3-1. Greatest surface water flood depths in the 1% AEP event are between 0.15 and 0.3 m (Figure 3-2). Safe access and escape routes are achievable via Station Road to the south-east of the site.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
96	2	1	1

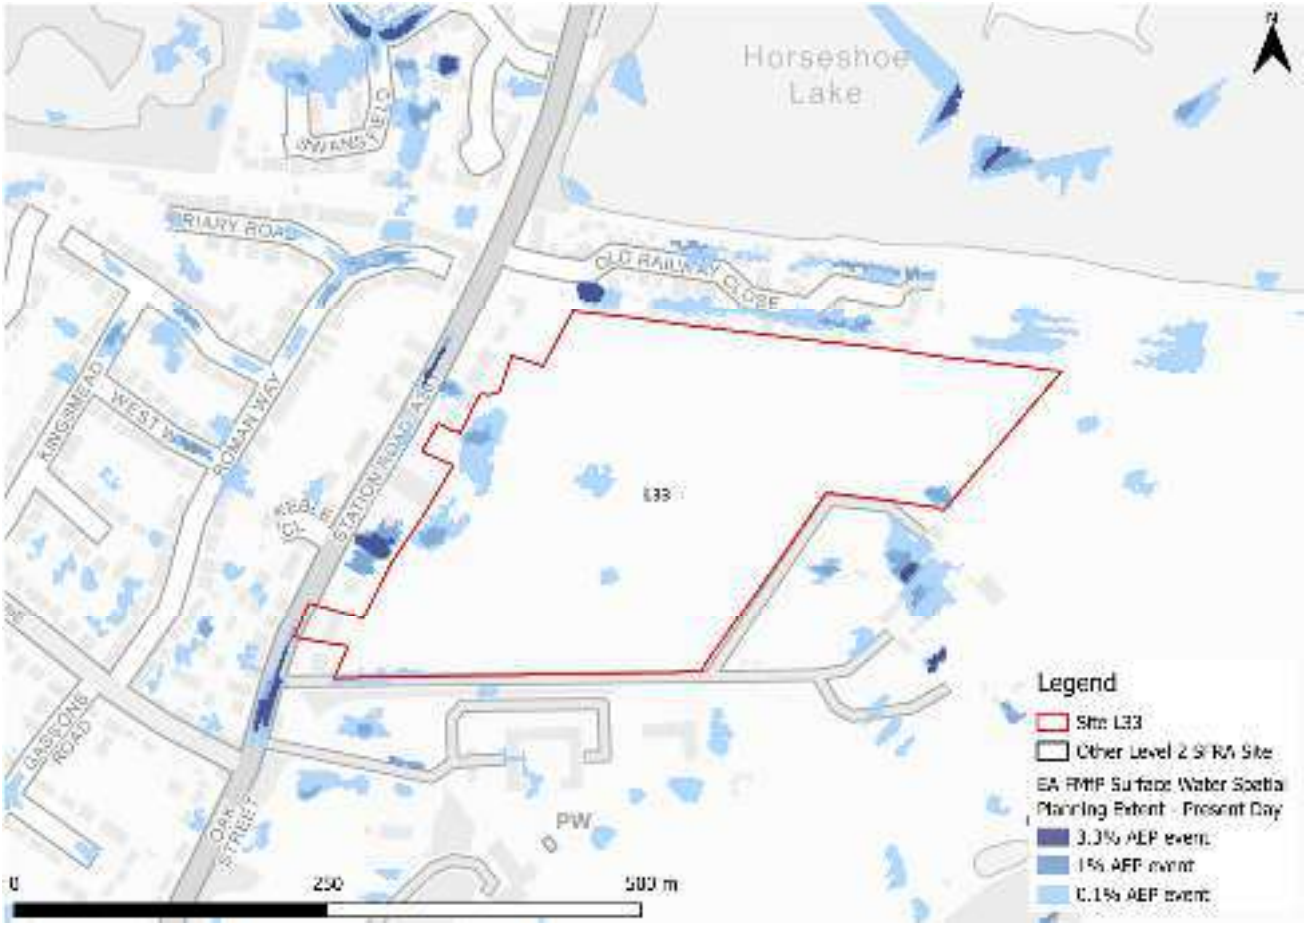

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

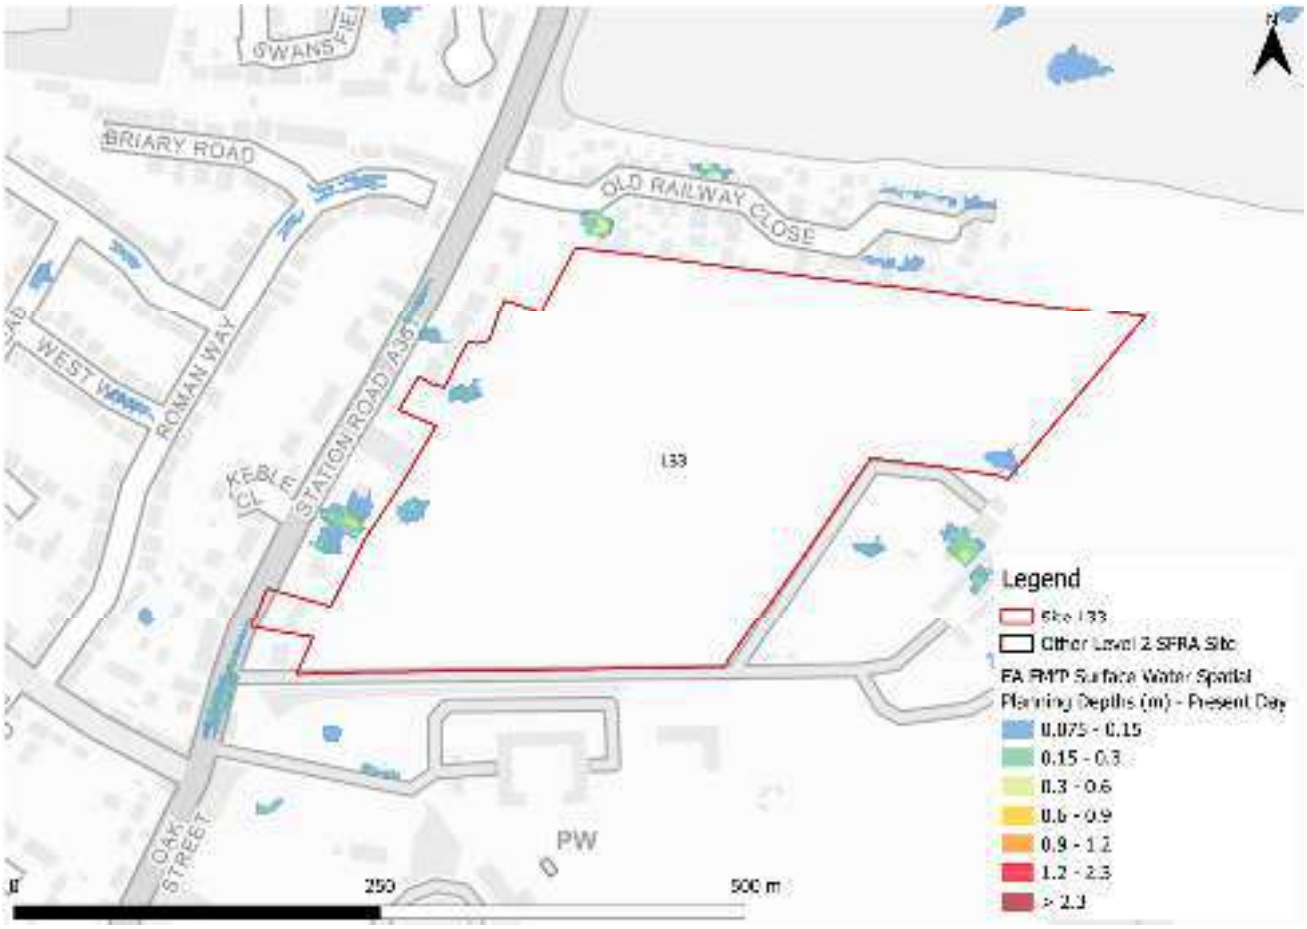

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows there to be 'low' to 'moderate' flood hazard (Figure 3-3). Updated surface water hazard information should be confirmed at the site-specific FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

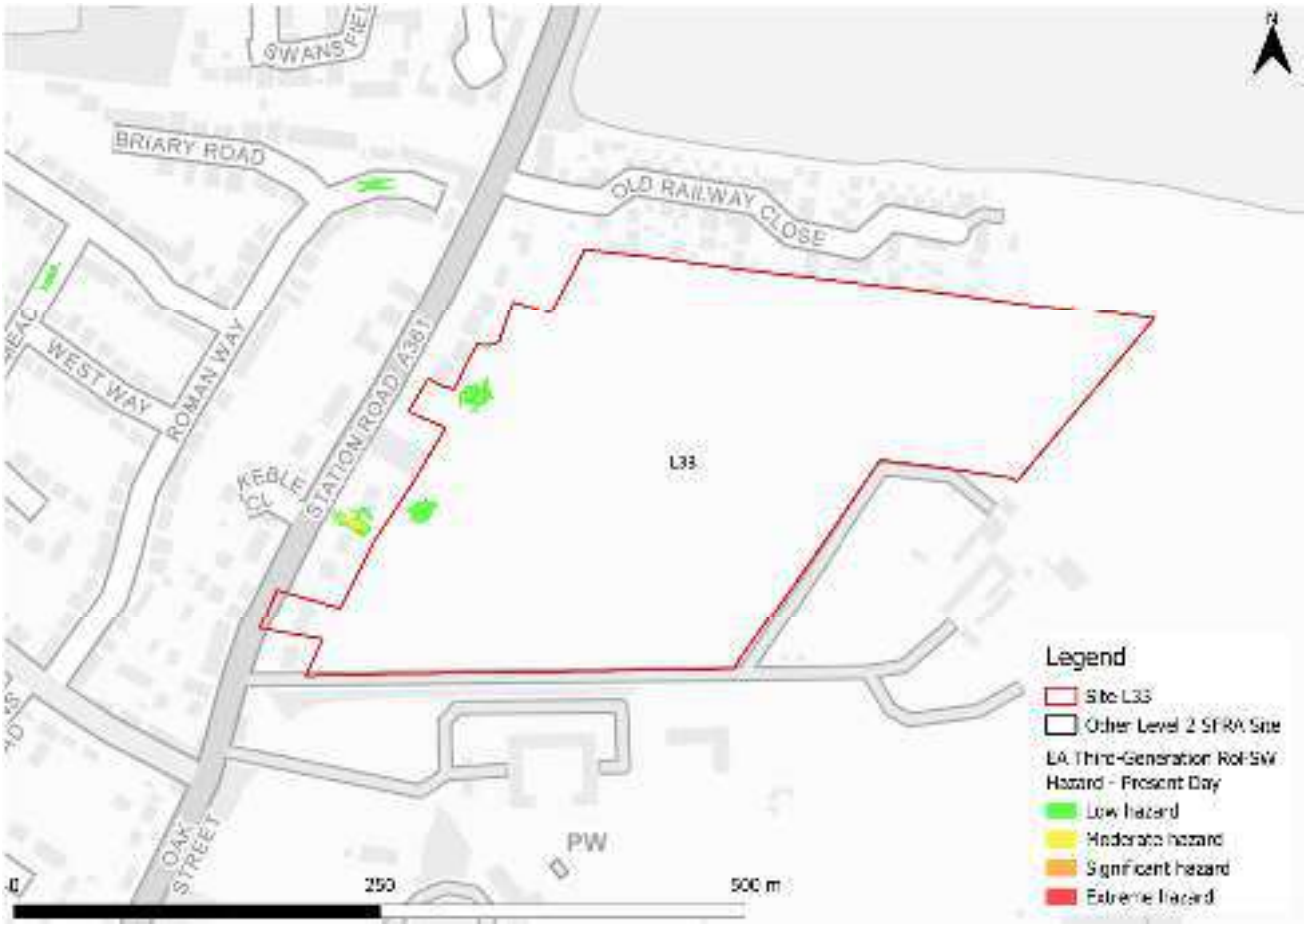

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day medium risk surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRAs should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is now included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Gloucestershire and the Vale management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Gloucestershire and the Vale Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. The site is not shown to be at significant additional risk from surface water climate change. The topographic low spot of the site becomes more prominent in the 1% AEP and 0.1% AEP events.

Flood depths are shown to reach between 0.3 and 0.6 m (Figure 3-5). Safe access and escape routes would likely remain achievable.

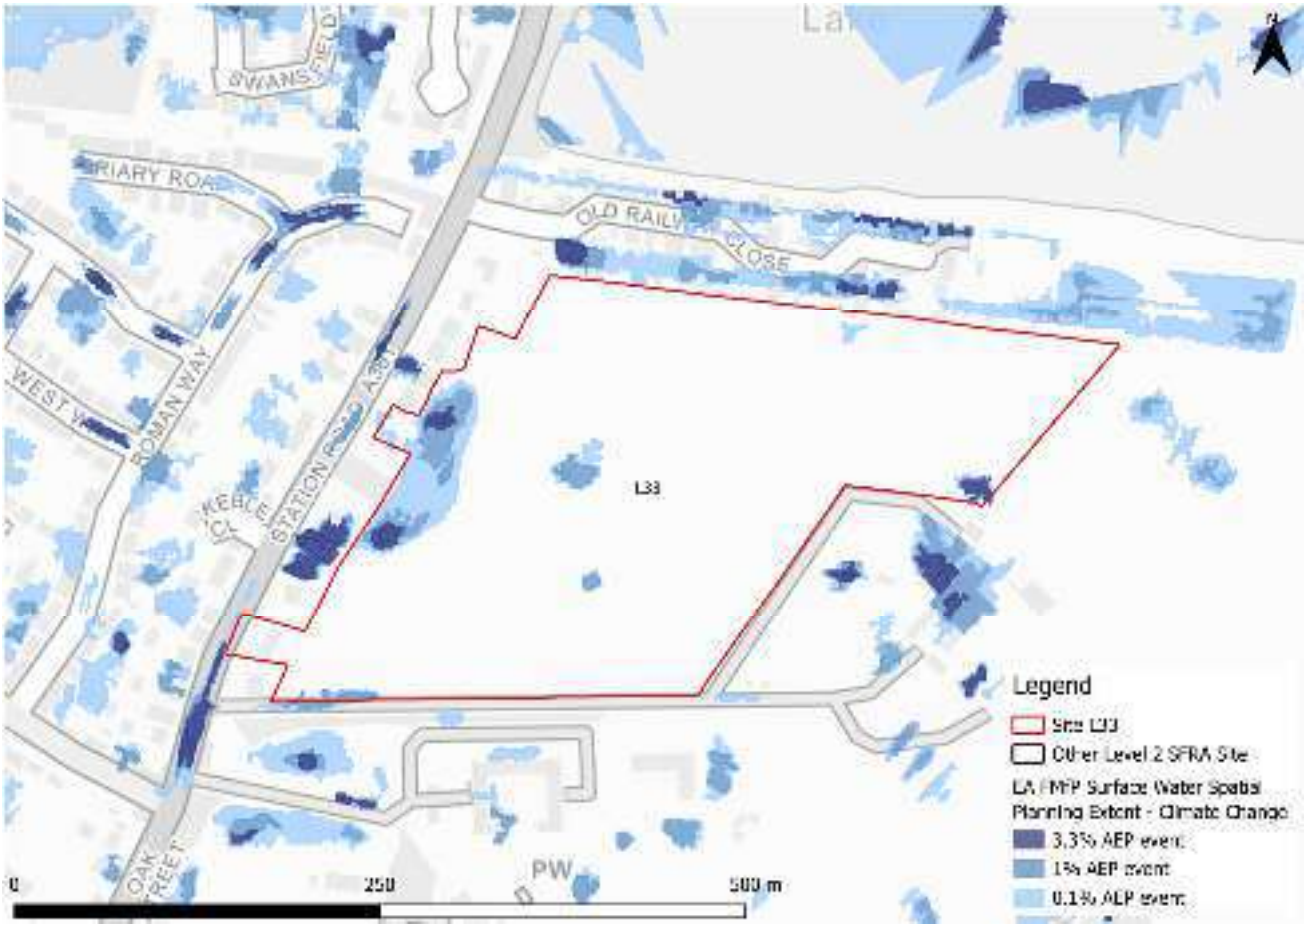

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

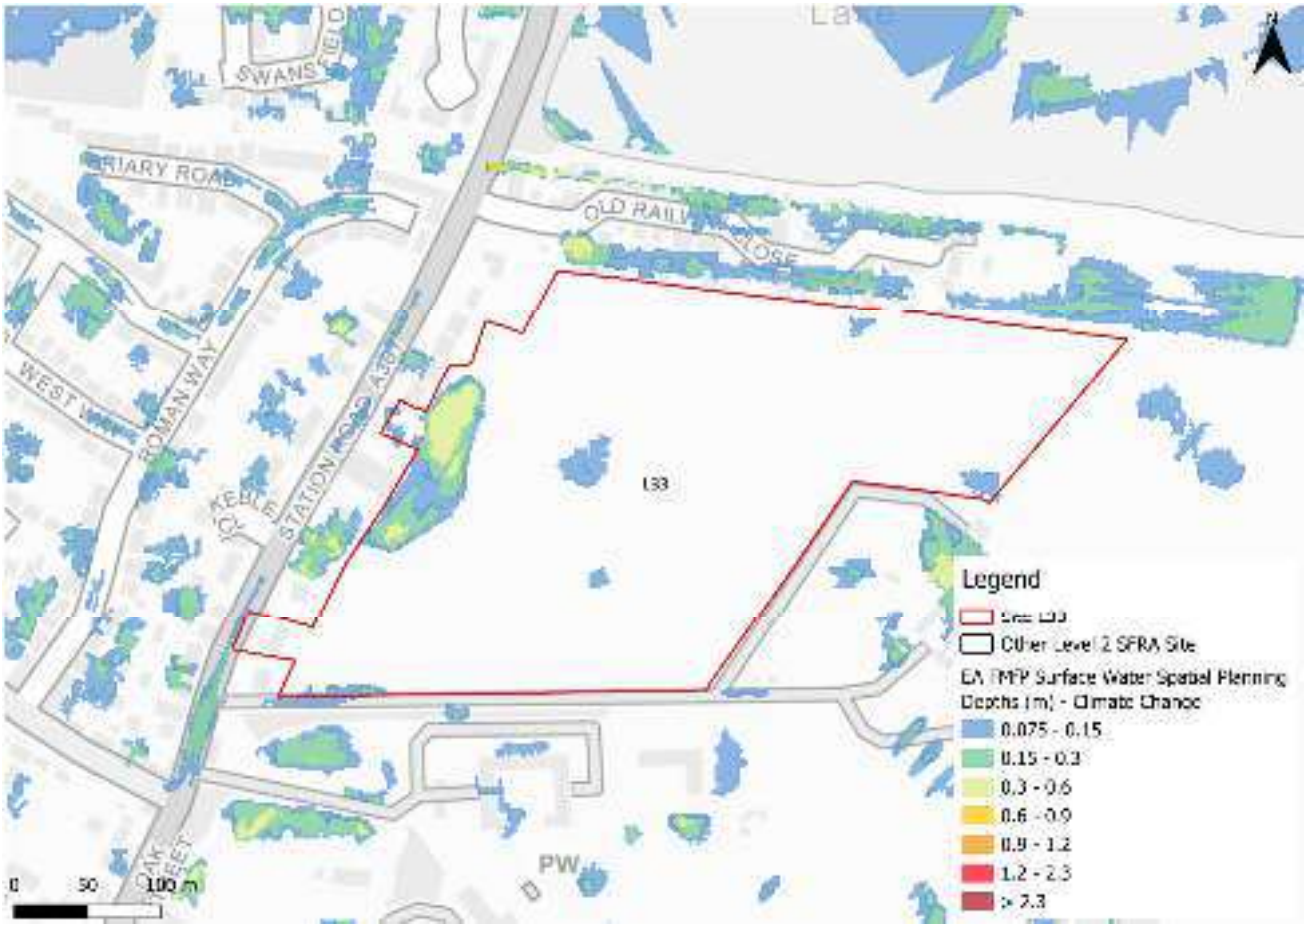

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 0.1% AEP event flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is mainly categorised as 'moderate' (**Error! Reference source not found.**).

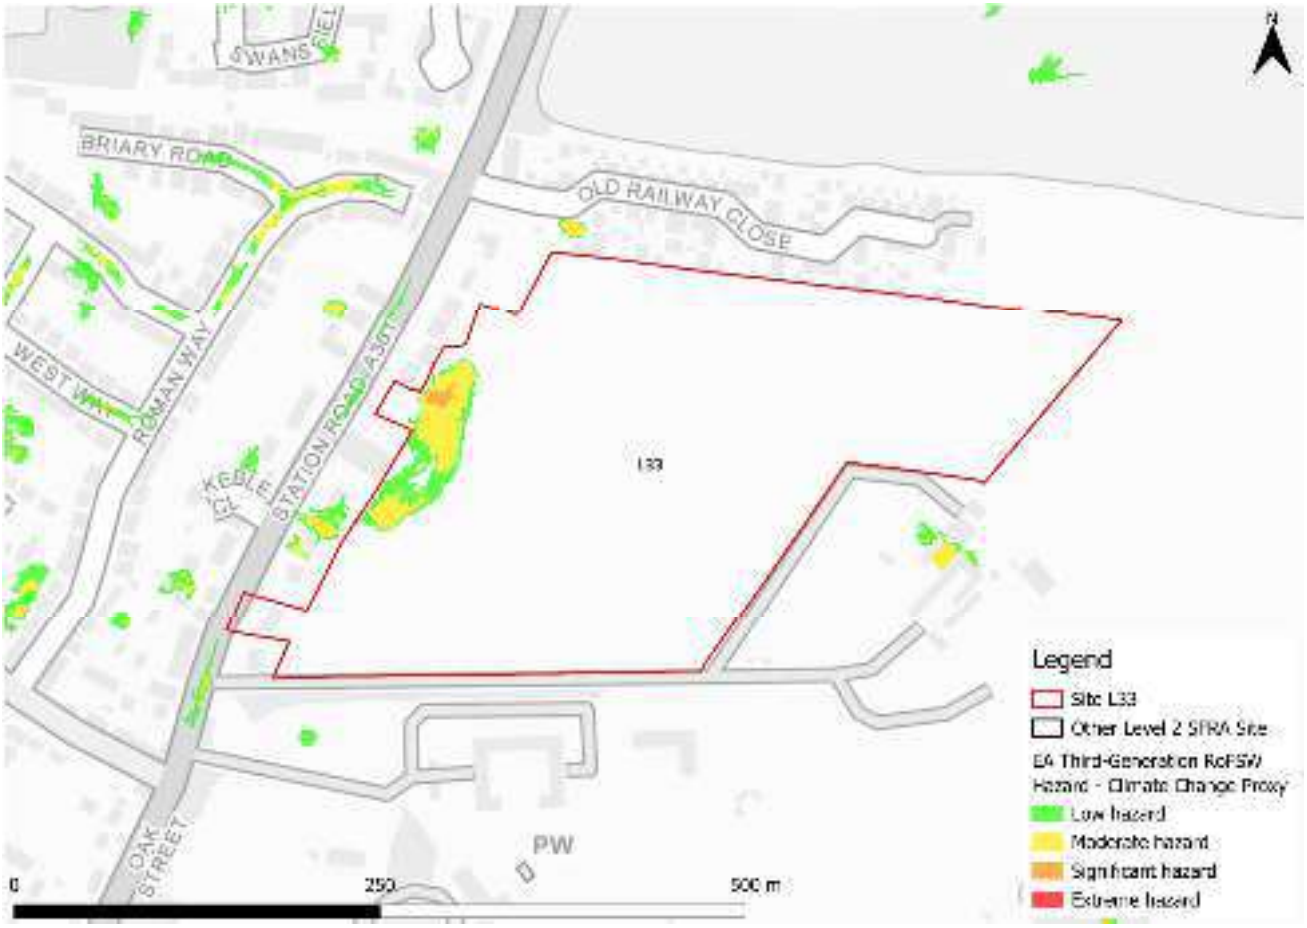

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day 0.1% AEP event surface water flood hazard[1] as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There have been five recorded sewer flooding incidents within the Lechlade, Kempsford & Fairford South Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 96% of the site being outside of the 0.1% AEP surface water flood extent.
- Risk to the site is shown to slightly increase in extent within the site when considering the impact of climate change, however depths remain largely shallow.
- The topographic low spot in the west of the site should be considered and included in site design and ideally left in place to flood naturally when required.
- The drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or

betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.

- Safe access and escape routes would likely be achievable via Station Road when considering surface water risk.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within one catchment, namely, the Blockley Bk - source to conf Knee Bk catchment. This catchment is ranked as a low sensitivity catchment. Planning considerations for all sites can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications. The map shows the site is at risk of groundwater emergence to both surface and subsurface assets where groundwater may emerge at significant rates in this area and has the capacity to flow overland and/or pond within any topographic low spots. Infiltration SuDS are unlikely to be possible at this site. Any drainage strategy should include for detailed investigations into water table levels and ground conditions in both dry and wet conditions

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is mudstone, siltstone, and sandstone (Figure 5-2). Mudstone and siltstone generally have a low permeability and low levels of porosity. Superficial deposits include sand and gravel which have a high permeability. Infiltration SuDS at this site may not be an option though the drainage strategy for the site should fully investigate.

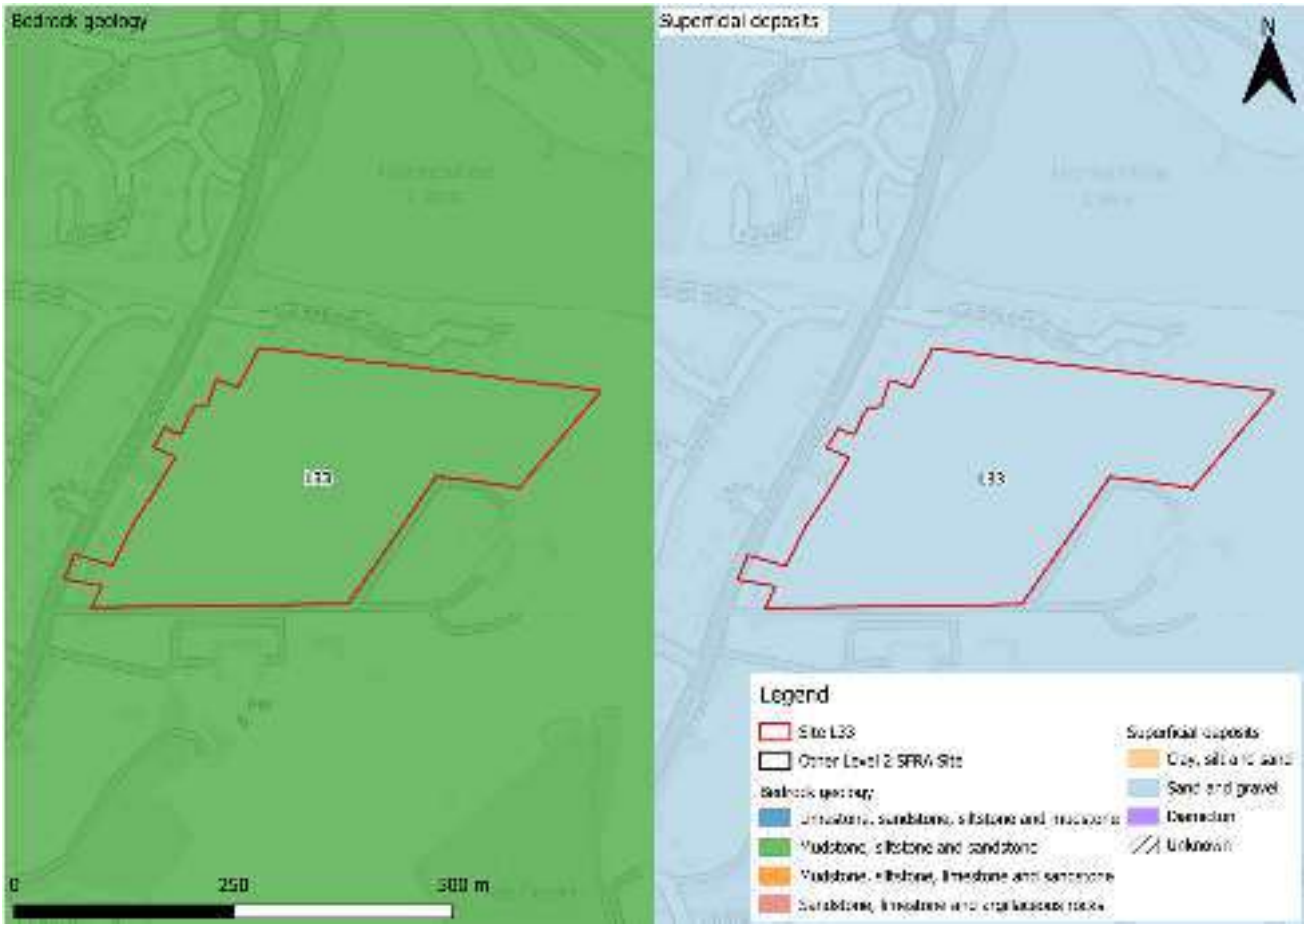

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There does not appear to be any potential residual risk to the site.

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is not required to pass part b) of the exception test, as it is not located within Flood Zone 3a, however it must still be proven that the development can be safe for its lifetime, which is generally considered to be 100 years for residential development.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be possible to develop this site for residential use given its location within Flood Zone 1 and surface water risk confined to a distinct area of ponding within the west of the site.
- A drainage strategy should ensure there is no increase in surface water flood risk elsewhere as a result of new development. The topographic low area should be included in site design. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

Carbon Footprint

The format of this report is optimised for reading digitally in pdf format. Paper consumption produces substantial carbon emissions and other environmental impacts through the extraction, production and transportation of paper. Printing also generates emissions and impacts from the manufacture of printers and inks and from the energy used to power a printer. Please consider the environment before printing.

Accessibility

JBA aims to align with governmental guidelines on accessible documents and WCAG 2.2 AA standards, so that most people can read this document without having to employ special adaptation measures. This document is also optimised for use with assistive technology, such as screen reading software.

Contract

JBA Project Manager	Mike Williamson
Address	Phoenix House, Lakeside Drive, Centre Park, Warrington, WA1 1RX
JBA Project Code	2025s1921

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Jo Corbett of Cotswold District Council. Laura Thompson-Jones of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken between June and July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site R607. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site R607

- Location: Land north of London Road
- Existing site use: Agricultural
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 1.06
- Watercourse: N/A
- Environment Agency (EA) flood model: N/A
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of surface water flood extent, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

There is a topographic low spot in the centre of the site (**Error! Reference source not found.**).

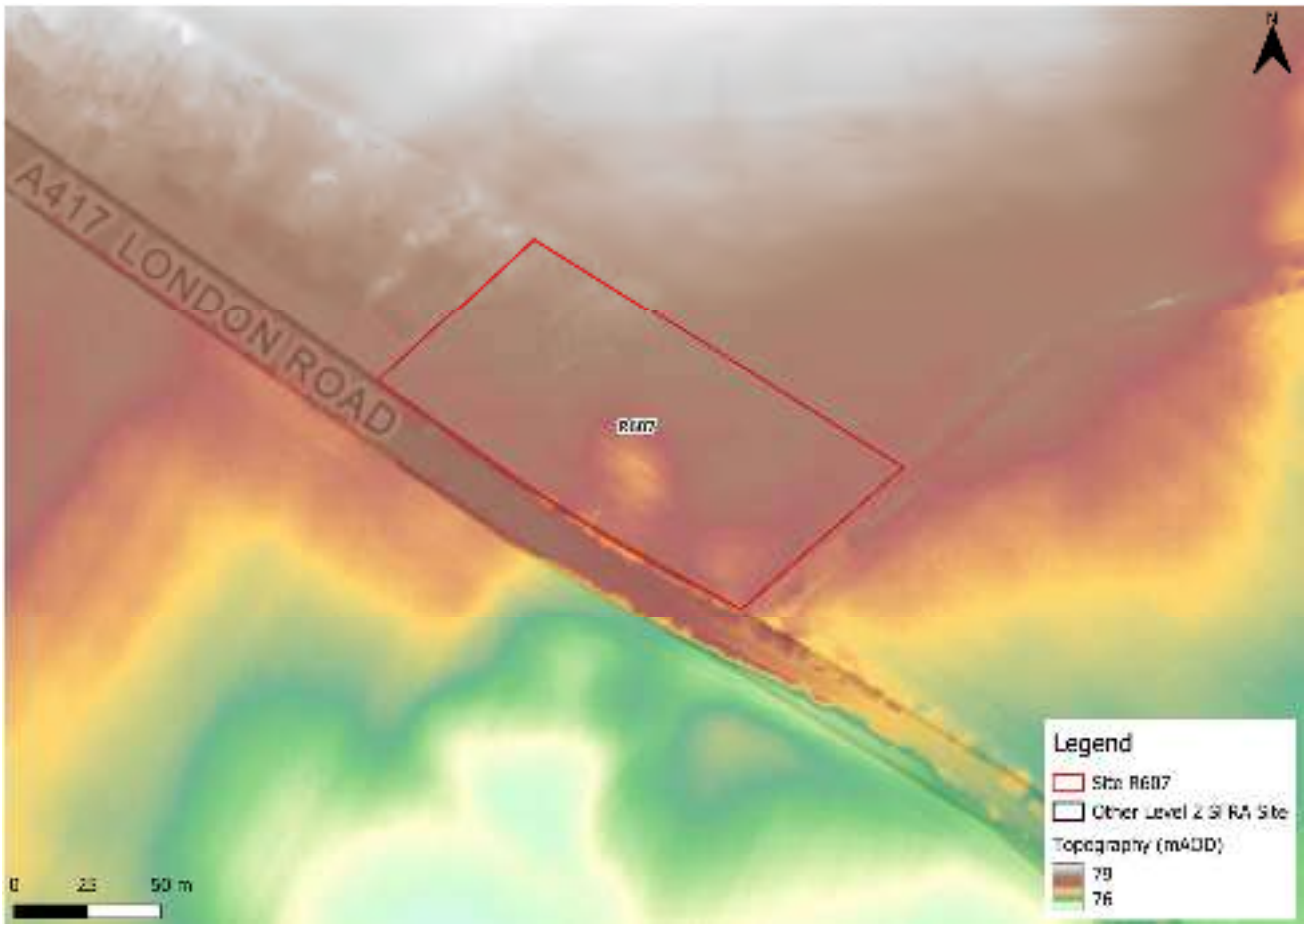

Figure 1-3: Topography

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the percentage areas of the site within each flood zone are stated in Table 2-1 and can be viewed on Figure 2-1. The Flood Map for Planning does not consider flood defence infrastructure (Section 0).

The site is wholly located within Flood Zone 1 and therefore at low risk of flooding from rivers.

Table 2-1: Present day flood risk based on percentage area of site at risk

Flood Zone 1 (% area)	Flood Zone 2 (% area)	Flood Zone 3a (% area)	Flood Zone 3b (% area)
100	0	0	0

Figure 2-1: Present day risk

2.2 Impacts from climate change

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Based on the Flood Map for Planning - Flood Zones plus Climate Change dataset, the site is not shown to be at risk when considering climate change.

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been 11 recorded flooding incidents within the Ampneys & Hampton Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Then dataset shows that the site would not likely benefit from NFM.

2.5 Emergency planning

2.5.1 Flood warnings and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The site is not located within a FAA.

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes are available during a flood event via London Road to the southwest of the site (**Error! Reference source not found.**).

Figure 2-2: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site is located wholly within Flood Zone 1 and therefore at low risk of flooding from rivers.
  - The site is not shown to be at increased risk from fluvial flooding in the future, based on the EA's Flood Zones plus Climate Change dataset.
- Access and escape:
  - Based on current information, safe access and escape routes are available via London Road to the southwest of the site.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extent map (May 2026), there is an area of surface water ponding in the centre of the site within the topographic low spot, as shown in Table 3-1 and Figure 3-1. Greatest surface water flood depths in the 1% AEP event are between 0.3 and 0.6 m (Figure 3-2). Safe access and escape routes are achievable via London Road to the south-west of the site.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
89	4	1	6

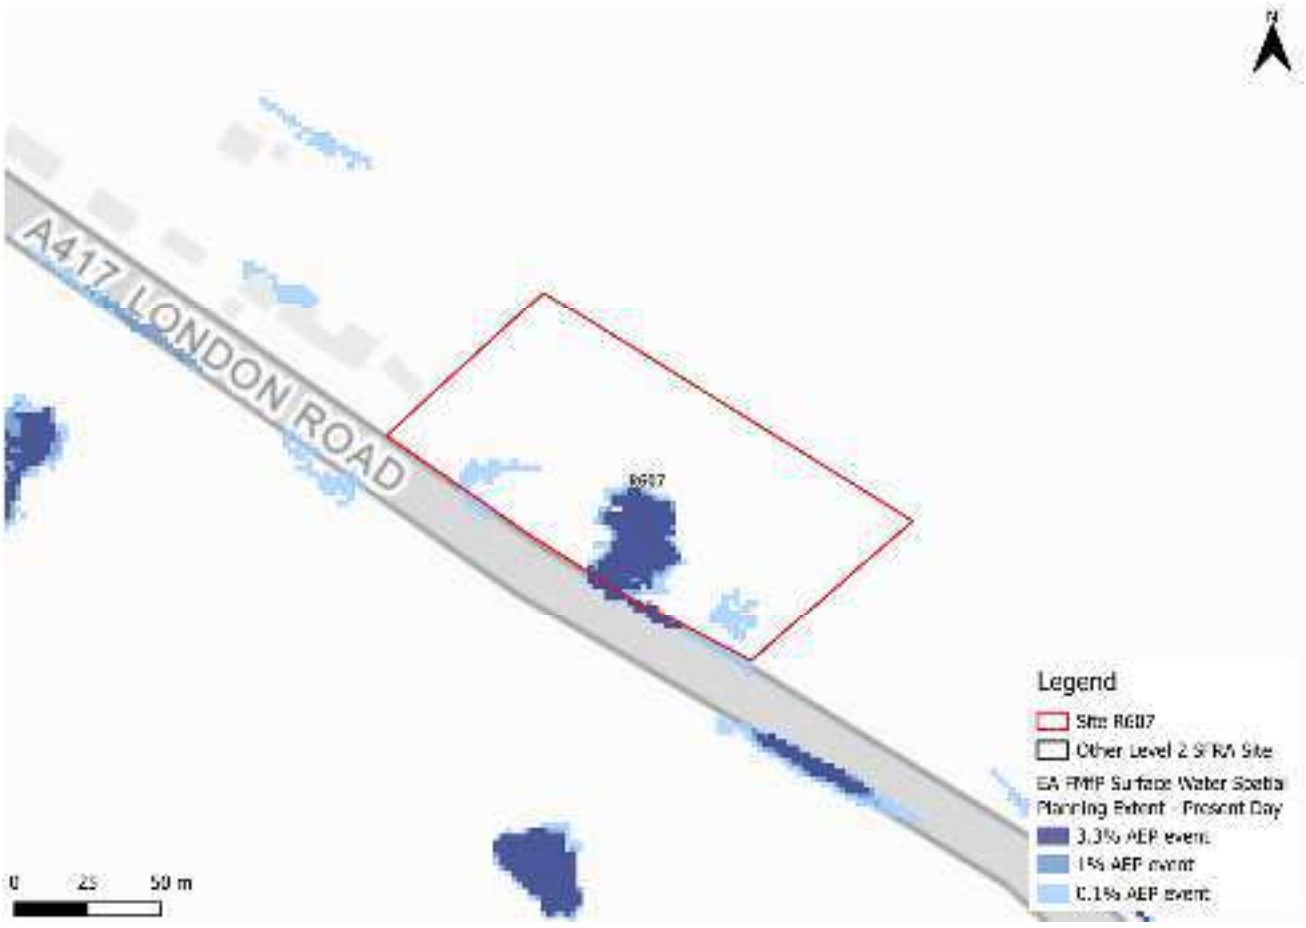

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

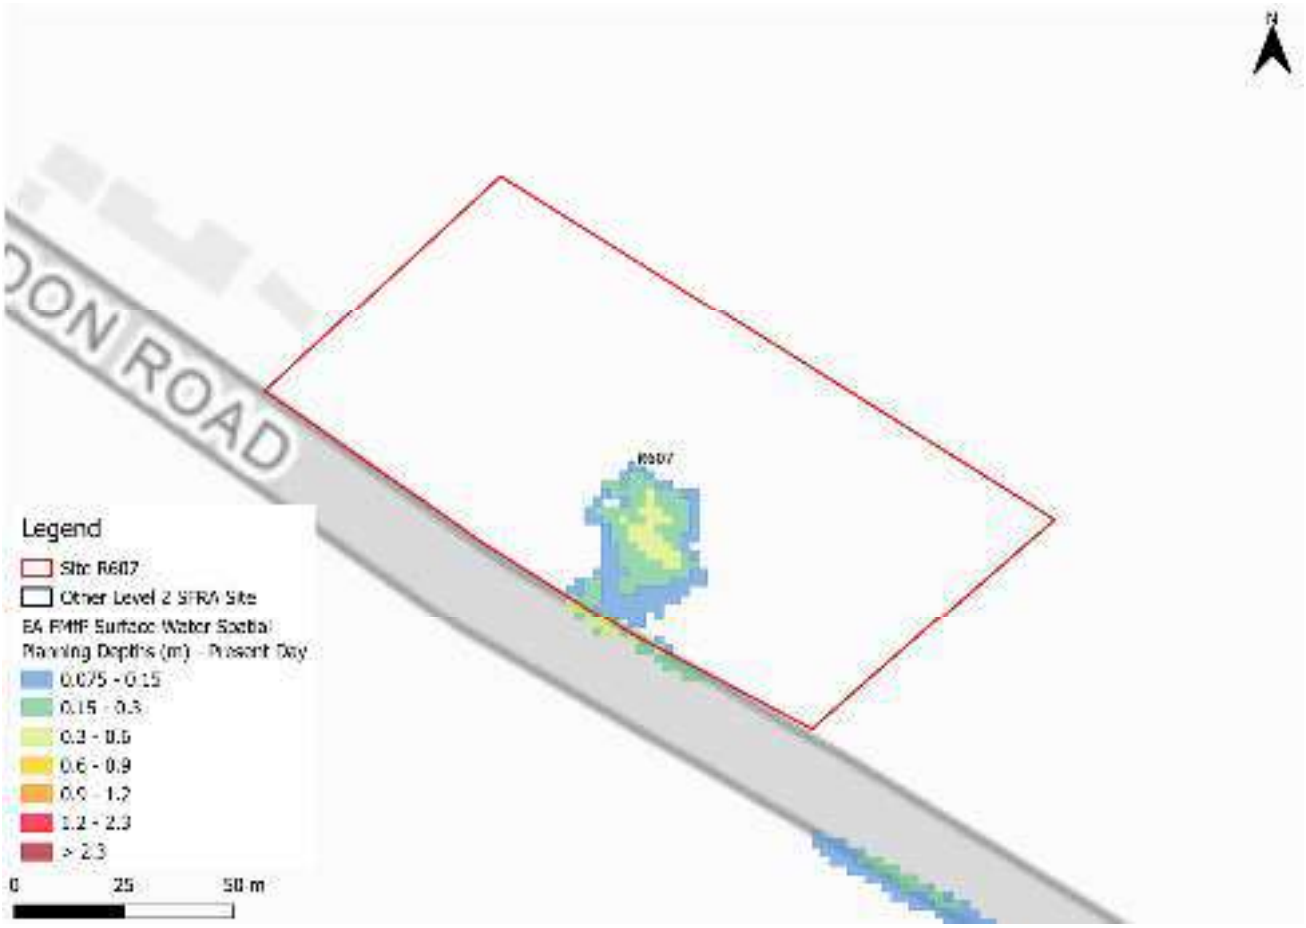

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows there to be no areas of flood hazards. Therefore, there are clear differences between the Flood Map for Planning - Surface Water Spatial Planning map and the third generation RoFSW hazard mapping. Updated surface water hazard information should be confirmed at the site-specific FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRAs should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is now included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Gloucestershire and the Vale management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

Table 3-2: Peak rainfall intensity allowances for the Gloucestershire and the Vale Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-3 shows the surface water flood extents for the 2070s upper end climate change scenario. The site is not shown to be at significant additional risk from surface water climate change. Flood depths are shown to remain between 0.3 and 0.6 m (Figure 3-4). Safe access and escape routes would likely remain achievable.

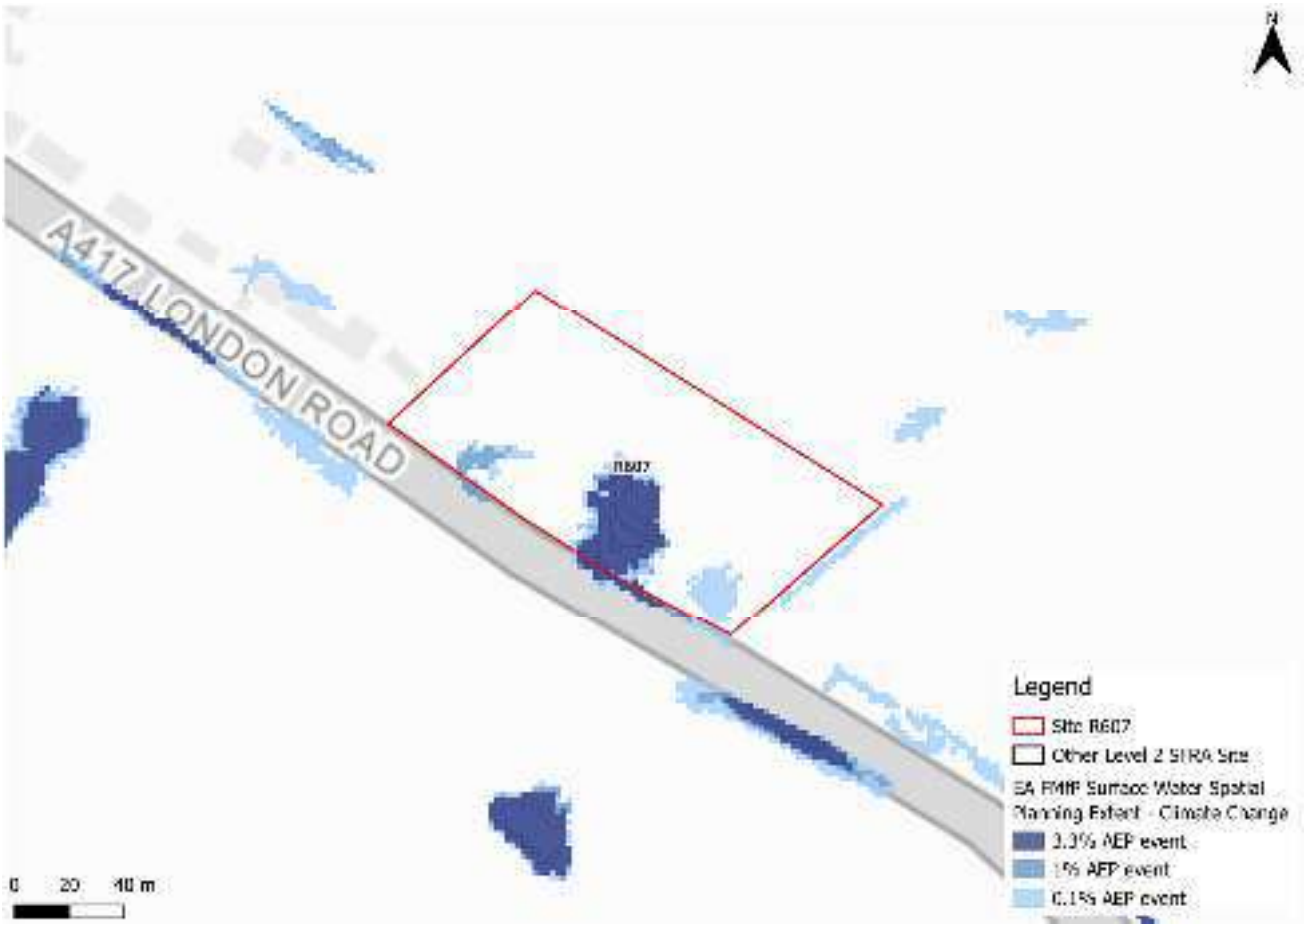

Figure 3-3: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

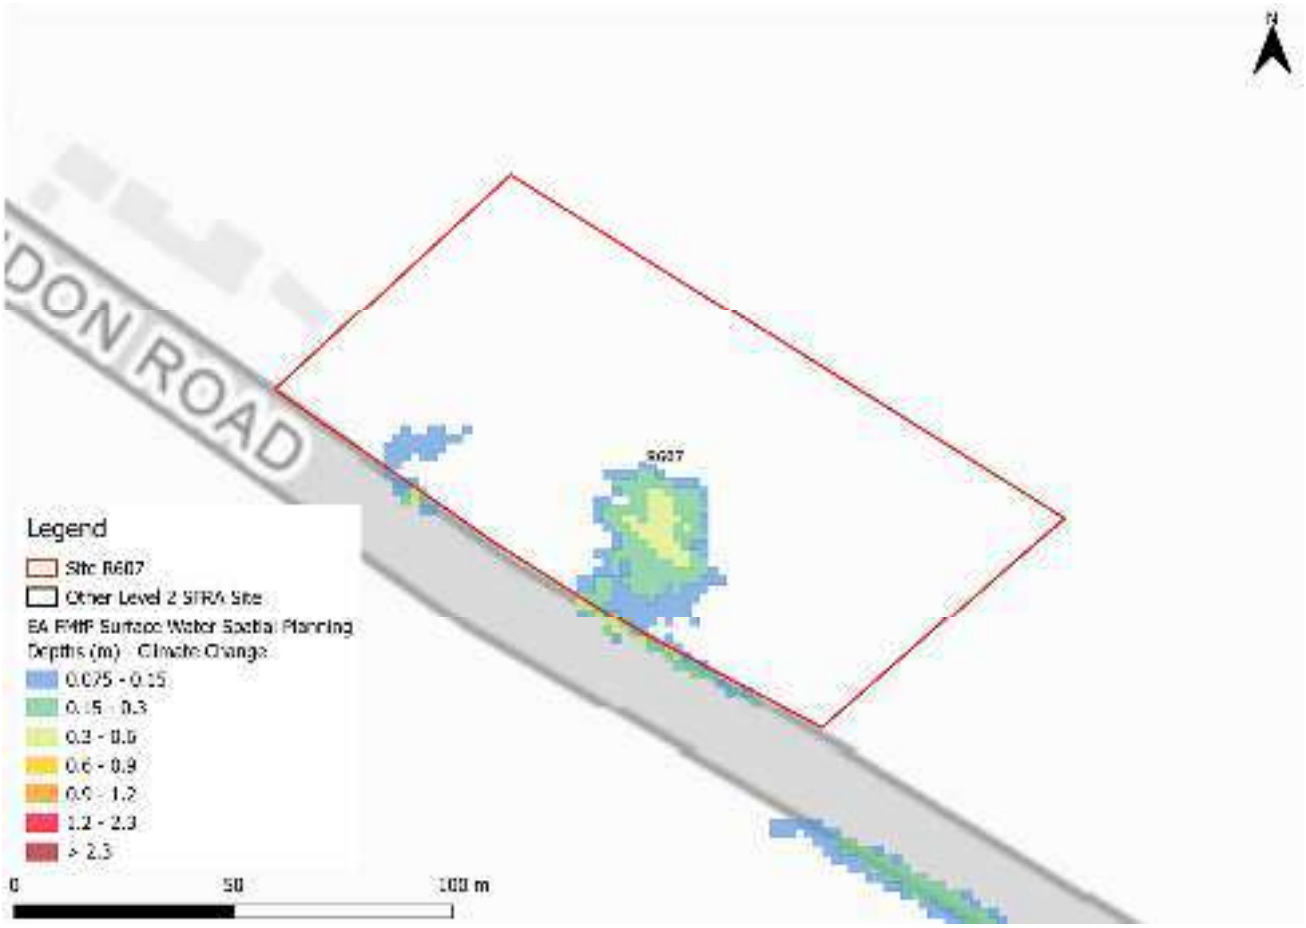

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is categorised as 'moderate' (**Error! Reference source not found.**).

Figure 3-5: Third generation - Risk of Flooding from Surface Water map present day 0.1% AEP event surface water flood hazard[Error! Bookmark not defined.] as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There are no recorded sewer flooding incidents nearby the site nor within The Ampneys & Hampton Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is predominantly low, with 88% of the site being outside of the 0.1% AEP surface water flood extent, but for an area of ponding in the topographic low spot.
- Risk to the site is shown to increase in extent when considering the impact of climate change with two additional areas of ponding, however depths remain largely shallow.
- The topographic low spots should be considered and included in site design and ideally left in place to flood naturally when required.
- The drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or

betterment should apply. The developer should consult the LLFA and follow local and National SuDS guidance.

- Safe access and escape routes would likely be achievable via London Road when considering surface water risk.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within one catchment, namely, the Blockley Bk - source to conf Knee Bk catchment. This catchment is ranked as a low sensitivity catchment. Planning considerations for all sites can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications. The map shows the site is at risk of groundwater emergence to both surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.

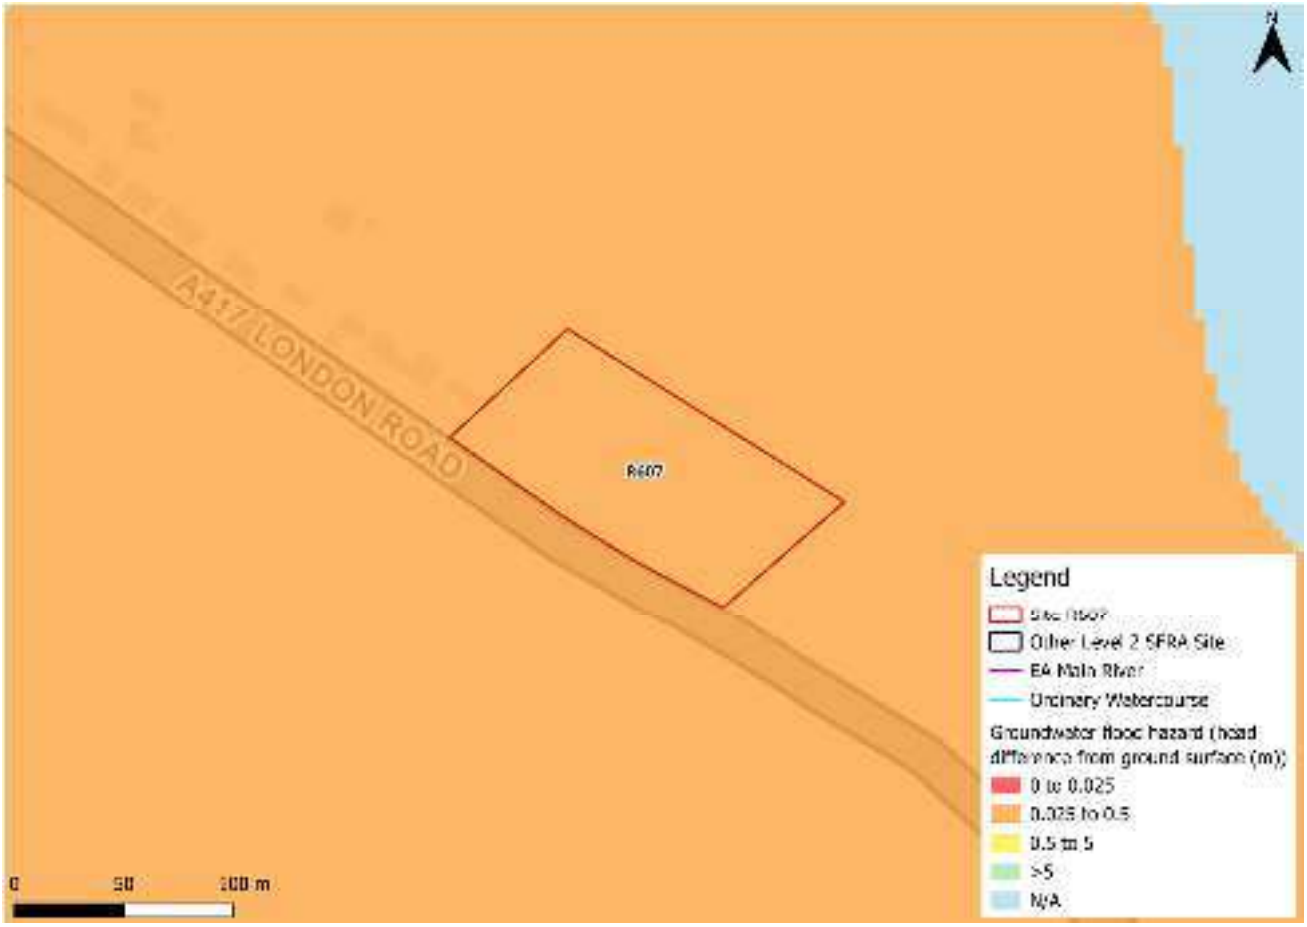

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is sandstone, limestone, and argillaceous rocks (Figure 5-2). Sandstone generally has a high permeability and high levels of porosity, whereas limestone generally has high porosity levels but low permeability. There are no superficial deposits at the site. Infiltration SuDS at this site may not be an option though the drainage strategy for the site should fully investigate water table levels and ground conditions in both dry and wet conditions.

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets.

There is no potential residual risk to the site.

6.1 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is not required to pass part b) of the exception test, as it is not located within Flood Zone 3a, however it must still be proven that the development can be safe for its lifetime, which is generally considered to be 100 years for residential development.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be possible to develop this site for residential use given its location within Flood Zone 1 and surface water risk confined to a distinct area of ponding in the present day and two additional areas potentially in the future.
- A drainage strategy should ensure there is no increase in surface water flood risk elsewhere as a result of new development. The topographic low area should be included in site design. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

This report describes work commissioned by Cotswold District Council by an instruction dated 28 May 2026. The Client's representative for the contract was Jo Corbett of Cotswold District Council. Laura Thompson-Jones of JBA Consulting carried out this work.

Purpose and Disclaimer

Jeremy Benn Associates Limited ("JBA") has prepared this Report for the sole use of Cotswold District Council and its appointed agents in accordance with the Agreement under which our services were performed.

JBA has no liability for any use that is made of this Report except to Cotswold District Council for the purposes for which it was originally commissioned and prepared.

No other warranty, expressed or implied, is made as to the professional advice included in this Report or any other services provided by JBA. This Report cannot be relied upon by any other party without the prior and express written agreement of JBA.

JBA disclaims any undertaking or obligation to advise any person of any change in any matter affecting the Report, which may come or be brought to JBA's attention after the date of the Report.

The methodology adopted and the sources of information used by JBA in providing its services are outlined in this Report. The work described in this Report was undertaken between June and July 2026 and is based on the conditions encountered and the information available during the said period. The scope of this Report and the services are accordingly factually limited by these circumstances.

The conclusions and recommendations contained in this Report are based upon information provided by others and upon the assumption that all relevant information has been provided by those parties from whom it has been requested and that such information is accurate.

1 Background

This is a Level 2 Strategic Flood Risk Assessment (SFRA) site screening report for Local Plan Site W4B. The content of this report assumes the reader has already consulted the 'Cotswold Level 1 SFRA' (2026) and the 'Cotswold Level 2 SFRA Main Report' (2026) and is therefore familiar with the terminology used in this report.

1.1 Site W4B

- Location: Land between Colin Lane and future Heritage Railway
- Existing site use: Agricultural land
- Existing site use vulnerability: Less vulnerable
- Proposed site use: Residential
- Proposed site use vulnerability: More vulnerable
- Site area (ha): 1.8
- Watercourse: Unnamed ordinary watercourse
- Environment Agency (EA) flood model: No detailed model available
- Summary of requirements from Level 2 SFRA scoping stage:
    - Assessment of surface water flood extents, depths and hazards
    - Assessment of all other sources of flood risk
    - Assessment of flood risk management measures and natural flood management

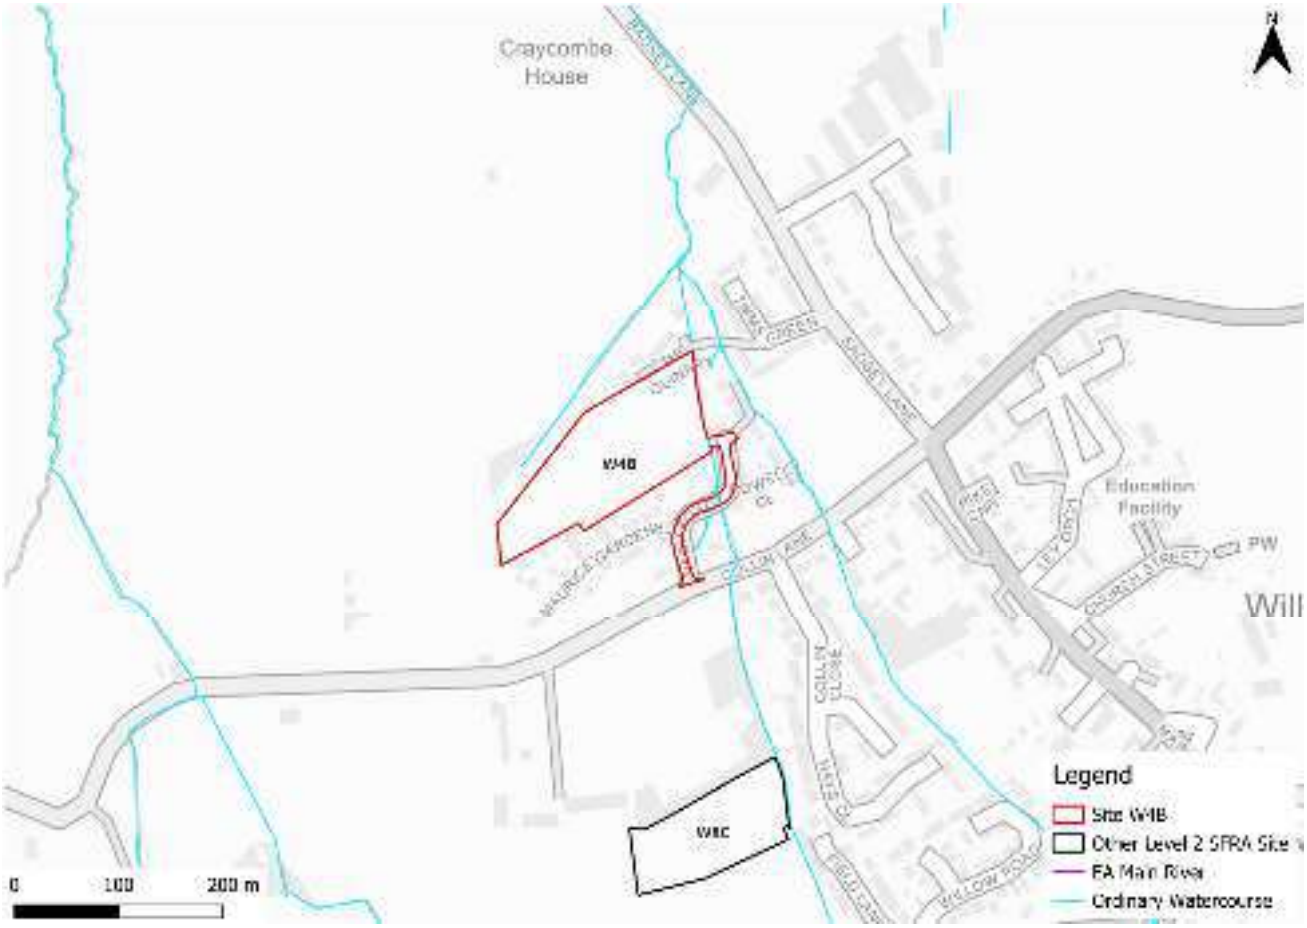

Figure 1-1: Site location boundary

Figure 1-2: Aerial photography

The site is located at a lower elevation than the surrounding areas, with the highest elevation at the south of the site, sloping towards the River Churn floodplain to the west and the Ampney Brook floodplain to the east (Figure 1-3).

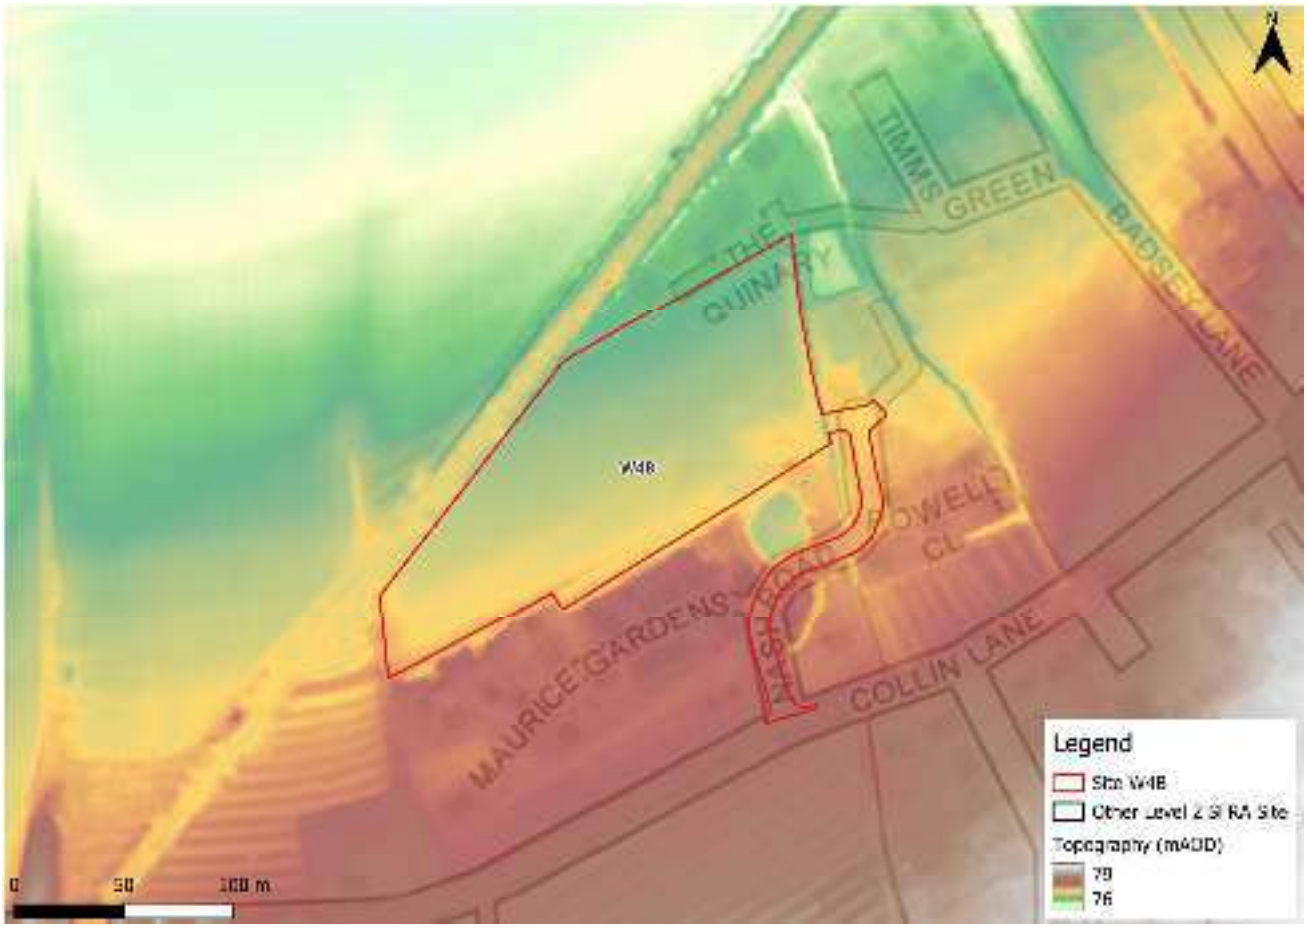

Figure 1-3: Topography

2 Flood risk from rivers

2.1 Existing risk

2.1.1 Flood Map for Planning and functional floodplain

Based on the EA's Flood Map for Planning (accessed May 2026) and Flood Zone 3b (functional floodplain), as updated through the Cotswold Level 1 SFRA, the site is wholly located within Flood Zone 1 and therefore at low risk of flooding from rivers. The percentage areas of the site within each flood zone are stated in Table 2-1 and can be viewed in Figure 2-1. Please note, the Flood Map for Planning does not consider flood defence infrastructure (Section 2.4).

There are several unnamed, unmodelled ordinary watercourses around the site. The EA's New National Model (NNM) does not cover these watercourses; therefore, the potential fluvial risk posed to the site cannot be assessed. This should be considered as part of a site-specific FRA.

Table 2-1: Present day flood risk based on percentage area of site at risk

Flood Zone 1 (% area)	Flood Zone 2 (% area)	Flood Zone 3a (% area)	Flood Zone 3b (% area)
100	0	0	0

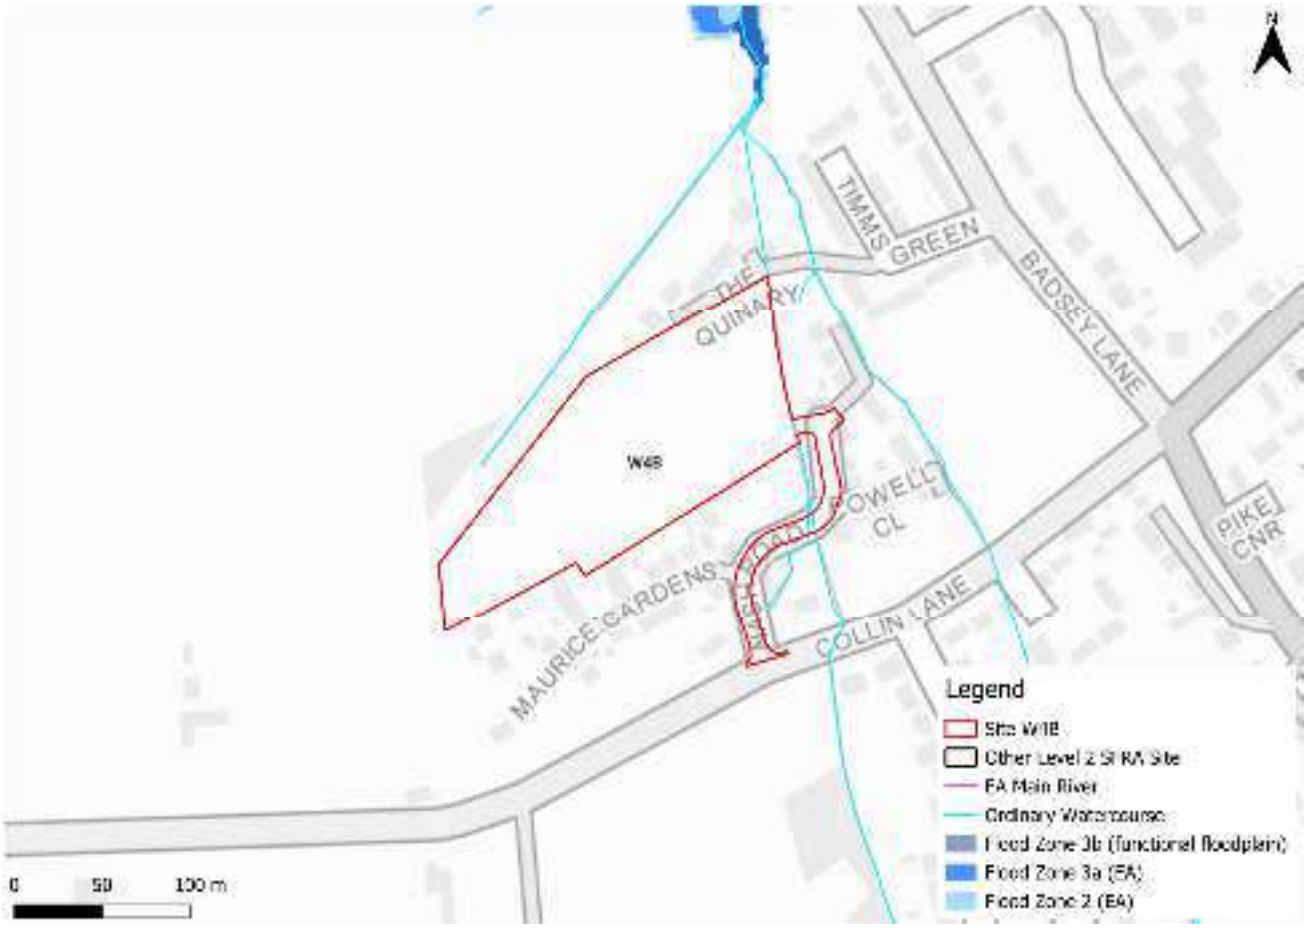

Figure 2-1: Present day risk

2.2 Impacts from climate change

The EA's SFRA guidance states that SFRAs should assess the central allowance for the 2080s epoch for peak river flows. The site is located within the Avon Warwickshire Management Catchment. The central allowance within this catchment is 21% on peak flows (Table 2-2). There is no local detailed model for the unnamed watercourses through the site, therefore the required event cannot be assessed.

Table 2-2: Modelled climate change allowances for peak river flows within the Avon Warwickshire Management Catchment

Epoch	Central (%)	Higher (%)	Upper (%)
2020s	7	12	22
2050s	8	14	31
2080s	21	32	59

2.2.1 Flood Map for Planning - Flood Zones plus Climate Change

Based on the EA's Flood Map for Planning - Flood Zones plus Climate Change dataset, the site is not shown to be at increased risk of fluvial flooding when considering climate change.

2.3 Historic flood incidents

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. There are no recorded historic flood events within the vicinity of the site, according to these datasets. The LLFA provided its historic floods register. There have been ten recorded flooding incidents within the Campden & Vale Ward within which the site is located.

2.4 Flood risk management

2.4.1 Flood defences

The site does not benefit from any formal engineered flood defences, according to the EA's spatial flood defences dataset.

2.4.2 Working with Natural Processes

The EA's Working with Natural Processes (WwNP) dataset has been interrogated to identify opportunities for Natural Flood Management (NFM) to reduce flood risk to the site and surrounding areas. Figure 2-2 shows that the site and wider area could benefit from riparian tree planting. Tree planting can help to slow the flow to benefit areas downstream. There are also opportunities for run-off attenuation features where it may be possible to temporarily store water and attenuate flooding during high flows. The WwNP mapping is broadscale and indicative. Further investigation is required for any land shown to have potential for WwNP.

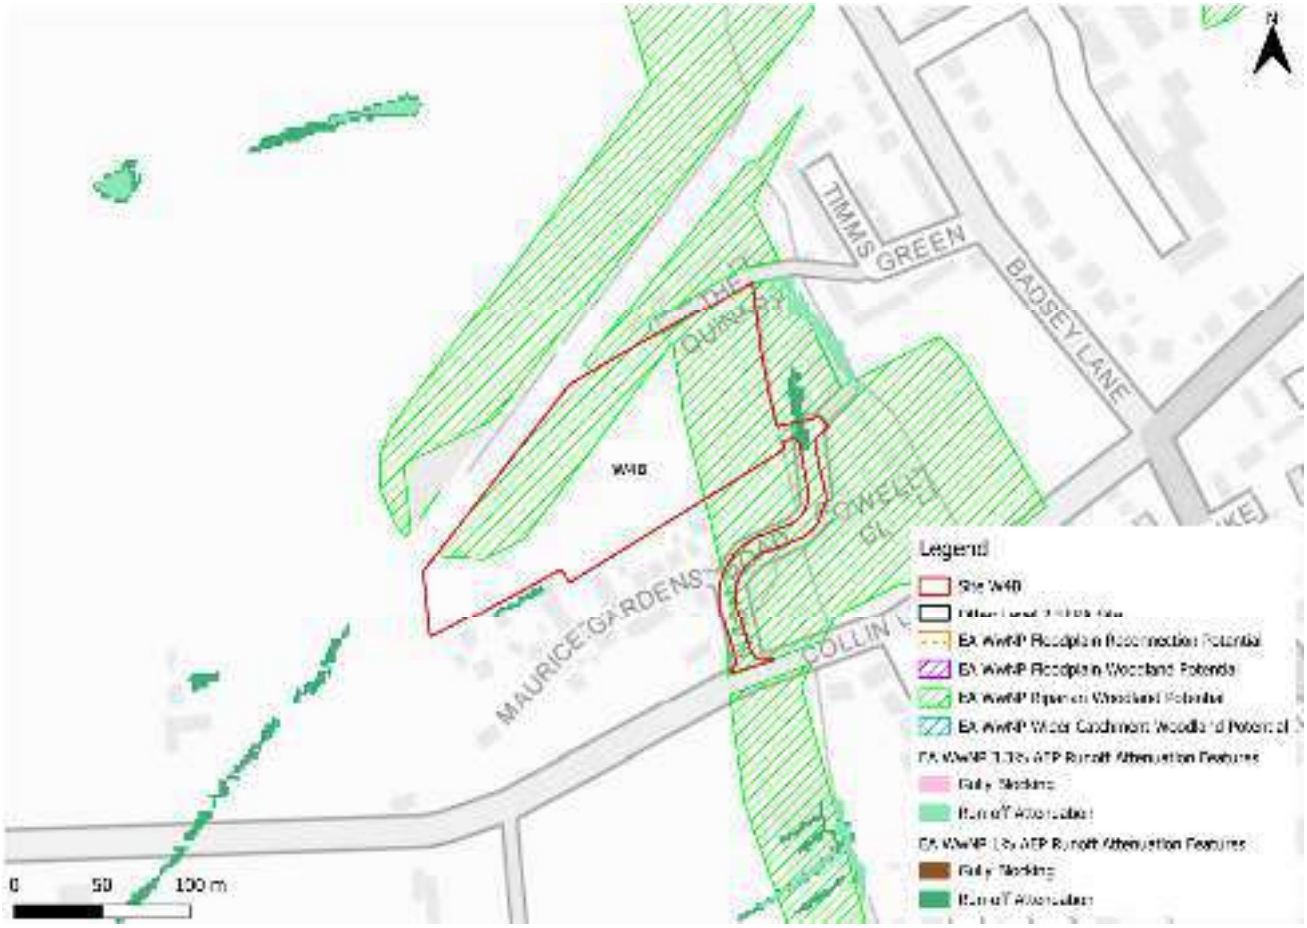

Figure 2-2: Working with Natural Processes

2.5 Emergency planning

2.5.1 Flood warning and alerts

The EA operates a Flood Warning Service for properties located within a Flood Warning Area (FWA) for when a flood event is expected to occur. The site is not located within a FWA.

Flood alerts may be issued before a flood warning for properties located within a Flood Alert Area (FAA) to provide advance notice of the possibility of flooding. A flood alert may be issued when there is less confidence that flooding will occur in a FWA. The site is not located within a FAA.

2.5.2 Access and escape routes

Based on the Flood Map for Planning, safe access and escape routes are available during a flood event via Nash Road and Collin Lane to the south of the site, and via The Quinary to the north of the site (Figure 2-3). However, risk from the ordinary watercourses must be quantified.

Figure 2-3: Potential access and escape routes

2.6 Observations, mitigation options, site suitability, sequential approach to development management - fluvial

- Observations:
  - The site is located wholly within Flood Zone 1 and therefore at low risk of flooding from rivers.
  - The site is not shown to be at increased risk from fluvial flooding in the future, based on the EA's Flood Zones plus Climate Change dataset.
- Mitigation:
  - The potential fluvial risk posed by the ordinary watercourses cannot be assessed given no modelling is available. This should be considered as part of a site-specific FRA.
- Access and escape:
  - Based on current information, safe access and escape routes appear achievable via Nash Road, Collin Lane and The Quinary.

3 Flood risk from surface water

3.1 Existing risk

3.1.1 Flood Map for Planning - Surface Water Spatial Planning Extents and Depths Present Day

Based on the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Extents map (May 2026), there is surface water risk across the site, as shown in Table 3-1 and Figure 3-1.

There are several flow paths across the site. There is also a surface water flow path along the eastern boundary of the site, which is confined to the channel of the unnamed ordinary watercourse.

Greatest surface water flood depths in the 1% AEP event are shallow, at between 0.3 and 0.6 m (Figure 3-2). Safe access and escape routes may be challenging to achieve and should be assessed in detail at the FRA stage.

Table 3-1: Existing surface water flood risk based on percentage area at risk based on the Flood Map for Planning - Surface Water Spatial Planning dataset

Less than 0.1% AEP event (% area)	0.1% AEP event (% area)	1% AEP event (% area)	3.3% AEP event (% area)
64	24	4	8

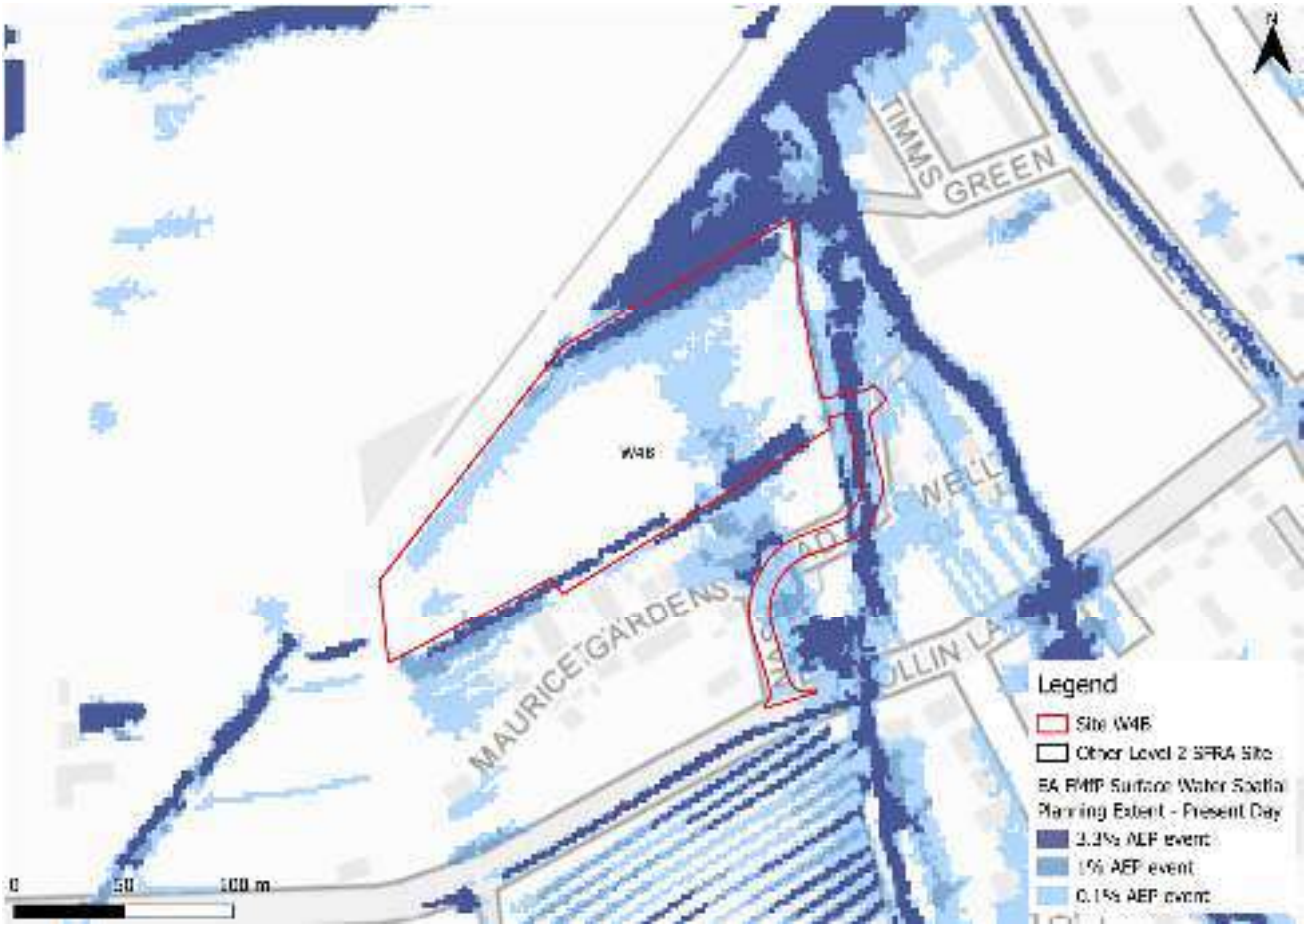

Figure 3-1: Flood Map for Planning - Surface Water Spatial Planning Extents Present Day

Figure 3-2: Flood Map for Planning - Surface Water Spatial Planning Present Day 1% AEP event surface water flood depths (m)

3.1.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning data does not include hazard information suitable for planning purposes. Therefore, this Level 2 SFRA considers the third generation Risk of Flooding from Surface Water (RoFSW) hazard mapping in addition to the Flood Map for Planning - Surface Water Spatial Planning extents and depths, as the best available information.

The RoFSW map shows flood hazard to be 'low' to 'moderate' (Figure 3-3) though the RoFSW does not represent the same risk as the Flood Map for Planning - Surface Water Spatial Planning map whereby the RoFSW shows a much smaller area to be at risk. Given the differences between the two datasets, the hazard information should be discounted and assessed further at the FRA stage.

Note: the Flood Map for Planning - Surface Water Spatial Planning data does not map flooding less than 0.075m (7.5cm) in depth. Therefore, where the map may show no flooding, there may be shallow flooding up to a depth of 0.075m. In contrast, the third generation RoFSW does not map flooding with a hazard rating of less than 0.575.

Figure 3-3: Third generation - Risk of Flooding from Surface Water map present day 1% AEP event surface water flood hazard[1]

3.2 Impacts from climate change

3.2.1 Flood Map for Planning - Surface Water Spatial Planning extents and depths

The EA's climate change allowance guidance states that SFRA's should assess the upper end peak rainfall allowance for the 2070s epoch. This dataset is included in the EA's national scale Flood Map for Planning - Surface Water Spatial Planning Climate Change dataset (May 2026). The peak rainfall intensity allowances for the Avon Warwickshire management catchment are shown in Table 3-2. The allowance for the 0.1% AEP event is not stated in the EA guidance.

1 Based on Section 7.5 Hazard rating. What is the Risk of Flooding from Surface Water map? Report version 2.0. April 2019. Environment Agency.

Table 3-2: Peak rainfall intensity allowances for the Avon Warwickshire Management Catchment

Return period	Central allowance 2070s (% increase)	Upper end allowance 2070s (% increase)
3.3%	25	35
1%	25	40

Figure 3-4 shows the surface water flood extents for the 2070s upper end climate change scenario. Surface water risk is shown to increase in extent across the site when considering climate change, particularly within the 0.1% AEP event. Flood depths, however, are shown to remain mainly shallow at between 0.3 and 0.6 m (Figure 3-5). Safe access and escape routes will be challenging to achieve.

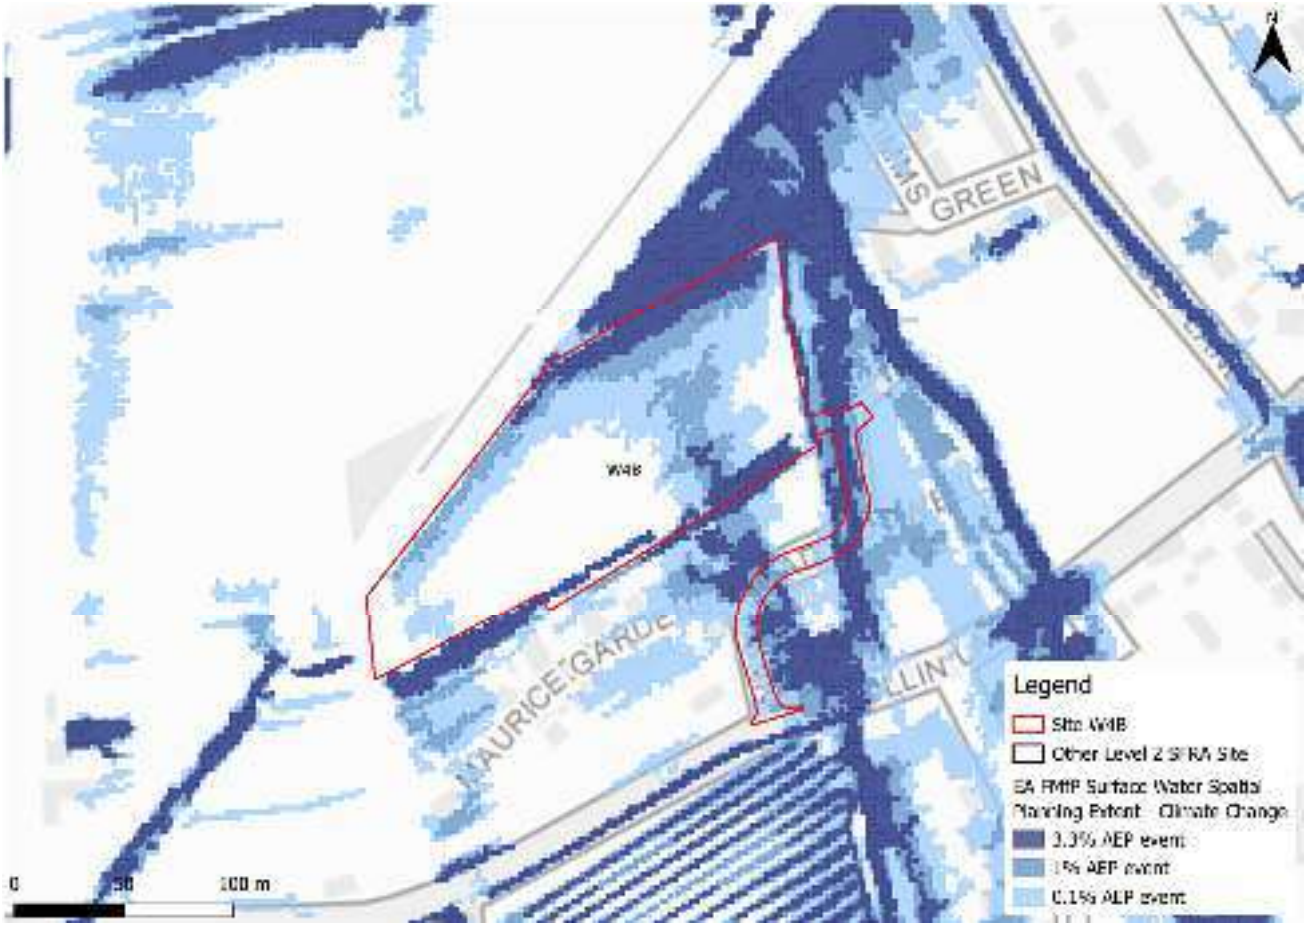

Figure 3-4: Flood Map for Planning - Surface Water Spatial Planning Extents Climate Change

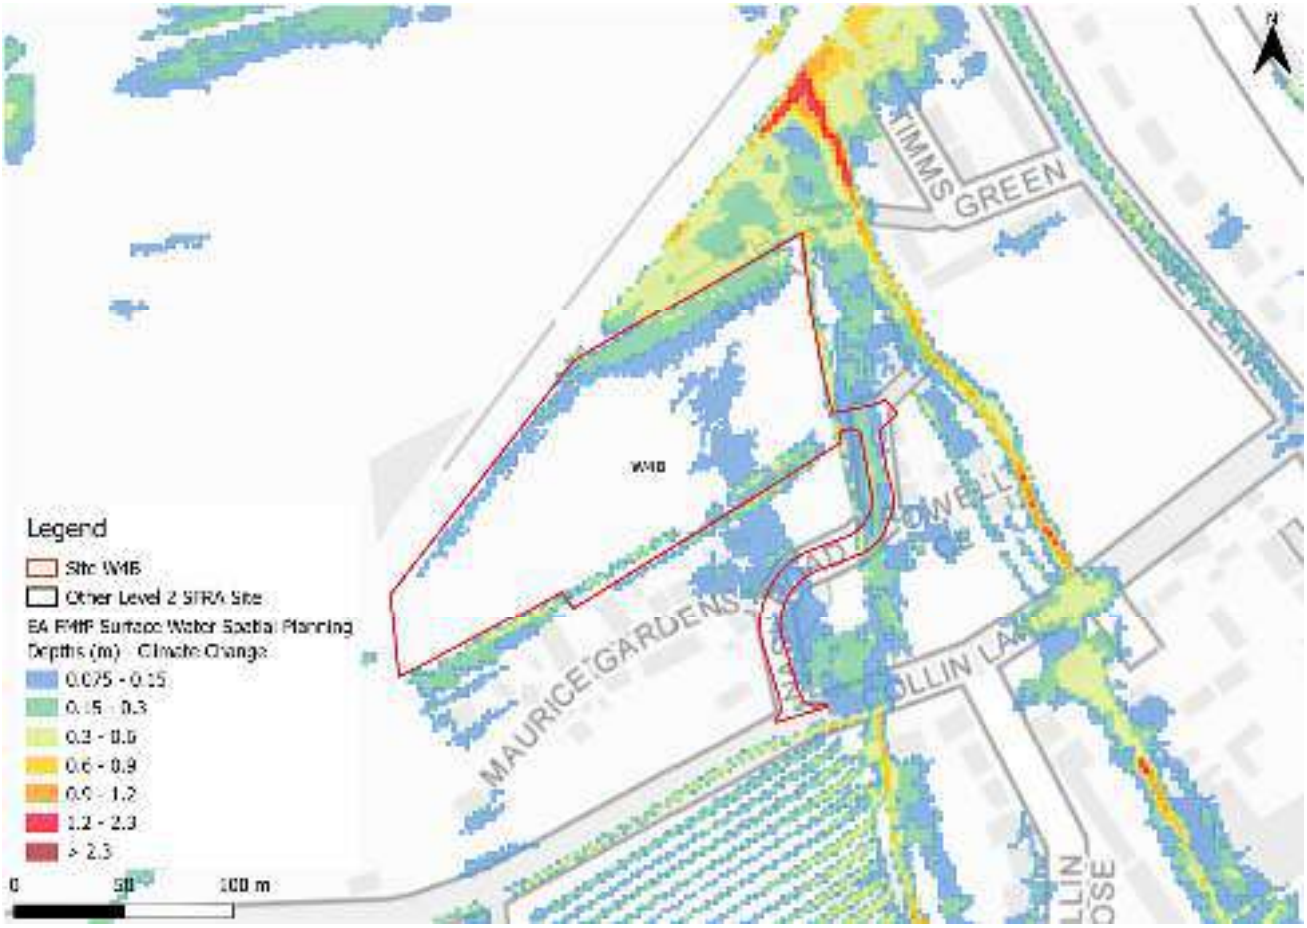

Figure 3-5: Flood Map for Planning - Surface Water Spatial Planning Climate Change 1% AEP event surface water flood depths (m)

3.2.2 Risk of Flooding from Surface Water - Third Generation Hazard

At the time of writing, the EA's latest Flood Map for Planning - Surface Water Spatial Planning Climate Change data does not include hazard information suitable for planning purposes. This Level 2 SFRA therefore considers the low risk RoFSW surface water event as a conservative proxy for the RoFSW medium risk event plus climate change, as the best available information to assess surface water flood hazards. The impact of climate change on surface water flood hazards should be considered at the site-specific FRA stage.

Using the RoFSW low risk event as a proxy, surface water flood hazard in the medium risk event is mainly categorised as 'low' (Figure 3-6).

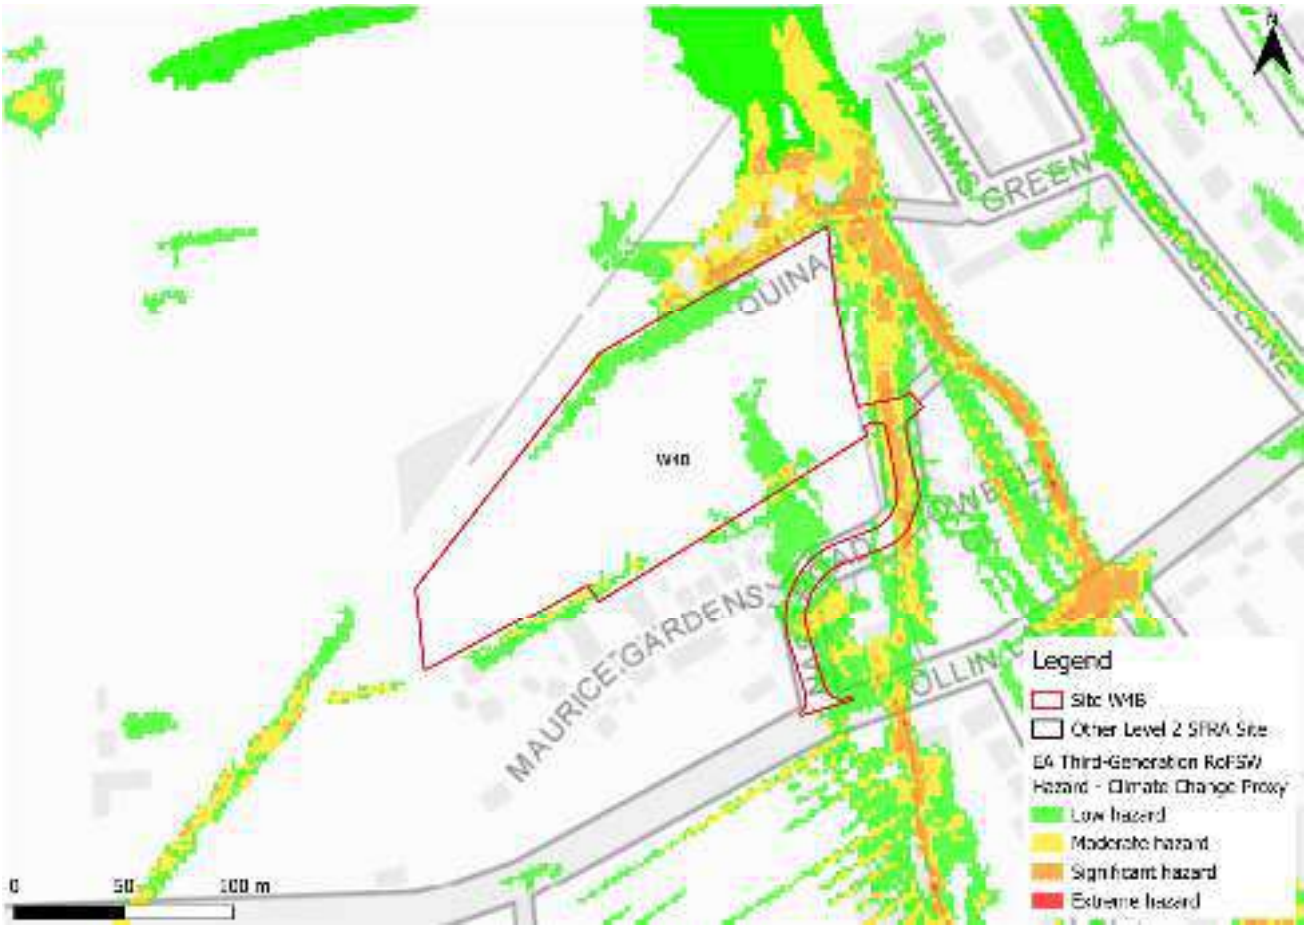

Figure 3-6: Third generation - Risk of Flooding from Surface Water map present day 0.1% AEP event surface water flood hazard as a climate change proxy

3.3 Sewer flood risk

The water companies provided their historic risk registers which were aggregated by ward. There have been 22 recorded sewer flooding incidents within the Campden & Vale Ward.

3.4 Observations, mitigation options, site suitability, sequential approach to development management - surface water

- Current risk to the site is widespread across the site, with over a third of the site at risk.
- Risk to the site is shown to increase in extent within the site when considering the impact of climate change.
- However, depths are mainly shallow and therefore it may be possible to mitigate surface water flood risk onsite. Ideally, the flow paths would be left in place to flood naturally. However, this would likely limit the number of plots available on the site.
- A drainage strategy must ensure there is no increase in surface water flood risk elsewhere as a result of new development. Greenfield runoff rates or betterment

should apply. The developer should consult the LLFA and follow local and National SuDS guidance.

- Safe access and escape routes may be challenging to achieve and should be investigated at the FRA stage.

4 Cumulative impacts assessment and high risk catchments

4.1 Level 1 cumulative impacts assessment

A cumulative impact assessment was completed through the Cotswold Level 1 SFRA (2026), which aimed to identify catchments sensitive to the cumulative impact of new development. This site is located within a high sensitivity catchment, namely Bretforton Bk - source to conf Broadway-Badsey Bk catchment. Planning considerations for sites at high sensitivity to the cumulative impacts of development can be found in Appendix F of the Level 1 SFRA. Cumulative impacts of development should also be considered as part of a site-specific FRA.

5 Groundwater, geology and SuDS suitability

Risk of groundwater emergence is assessed in this SFRA using JBA's 5m Groundwater Emergence Map. Figure 5-1 shows the map covering this site and the surrounding areas. Table 5-1 explains the risk classifications.

The entire site is located within an area where there is no risk of groundwater emergence. Infiltration SuDS should therefore be possible at this site.

Figure 5-1: JBA 5m Groundwater Emergence Map

Table 5-1: Groundwater Hazard Classification

Groundwater head difference (m)*	Class label
0 to 0.025	Groundwater levels are either at very near (within 0.025m of) the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to both surface and subsurface assets. Groundwater may emerge at significant rates and has the capacity to flow overland and/or pond within any topographic low spots.
0.025 to 0.5	Groundwater levels are between 0.025m and 0.5m below the ground surface in the 100-year return period flood event. Within this zone there is a risk of groundwater flooding to surface and subsurface assets. There is the possibility of groundwater emerging at the surface locally.
0.5 to 5	Groundwater levels are between 0.5m and 5m below the ground surface in the 100-year return period flood event There is a risk of flooding to subsurface assets, but surface manifestation of groundwater is unlikely.
>5	Groundwater levels are at least 5m below the ground surface in the 100-year return period flood event. Flooding from groundwater is not likely.
N/A	No risk. This zone is deemed as having a negligible risk from groundwater flooding due to the nature of the local geological deposits.
*Difference is defined as ground surface in mAOD minus modelled groundwater table in mAOD.	

The underlying bedrock within the site is mudstone, siltstone, limestone and sandstone (Figure 5-2). Mudstone and siltstone generally have a low permeability and low level of porosity, reducing infiltration rates. There is no record of superficial deposits in the area.

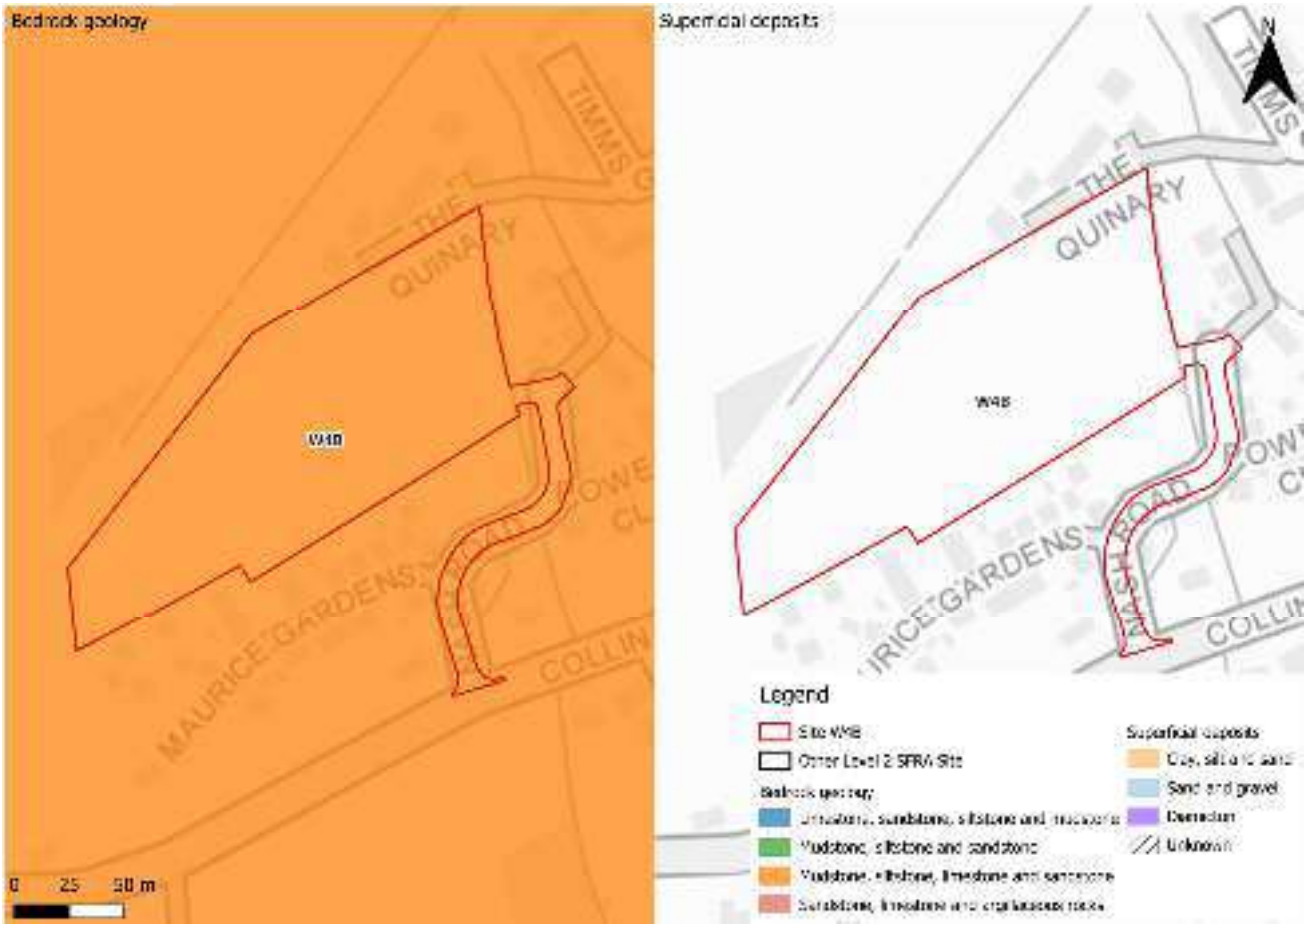

Figure 5-2: BGS Geology - Bedrock and superficial deposits

6 Residual risk

Although a site may be afforded some protection from defences and / or drainage infrastructure, there is always a residual risk of flooding from asset failure i.e. defence breaches, or blockages of culverts or drainage assets. Residual risk at this site comes from the potential blockage or structural failure of the culverts beneath the field in the south of the site.

6.1 Potential blockage

A blockage or structural failure of the culverted section of the ordinary watercourses may cause water in the channel to back up and cause flooding to the site, depending on the severity of the blockage and magnitude of the flood event. Culvert course, capacity and condition surveys may be required, including for consultation with the culvert owner.

Figure 6-1 indicates the location of the primary culvert. The potential residual risk to the site following a blockage of this asset should be assessed through the site-specific FRA.

Figure 6-1: Potential blockage location

6.2 Flood risk from reservoirs

The EA's Reservoir Flood Maps (RFM) (2021) show where water may go in the unlikely event of a reservoir or dam failure. The site is not modelled to be at risk from reservoir flooding.

7 Overall site assessment

7.1 Can part b) of the Exception Test be passed?

This site is not required to pass part b) of the Exception Test, as it is not located within Flood Zone 3a, however it must still be proven that the development can be safe for its lifetime, which is generally considered to be 100 years for residential development.

7.2 Main recommendations and site-specific FRA requirements

Based on the evidence presented in the Level 1 SFRA (2026) and this Level 2 SFRA:

- It should be possible to develop this site for residential uses based on fluvial flood risk.
- Modelling of the ordinary watercourses will be required to robustly define potential risk to the site for both present day and with climate change.
- However, surface water risk is prevalent across the site with safe access and escape routes appearing challenging to achieve. A drainage strategy will be required to ensure there is no increase in surface water flood risk elsewhere as a result of new development. Plot number may be limited by the surface water risk. Greenfield runoff rates or betterment should apply with consideration of local and national SuDS guidance.
- The site-specific FRA should be carried out in line with the latest versions of the NPPF; FRCC-PPG; EA online guidance; the CDC Local Plan, and national and local SuDS policy and guidelines.
- Throughout the FRA process, consultation should be carried out with, where applicable, the local planning authority; the lead local flood authority; emergency planning officers; the Environment Agency; the water companies; the highways authorities; and the emergency services.

1 Introduction

A Level 2 Strategic Flood Risk Assessment (SFRA) is required by Cotswold District Council (CDC) as all identified potential development sites cannot be allocated outside the areas of medium and high fluvial and / or surface water flood risk, as identified through the Level 1 SFRA (2026).

The Level 1 SFRA entailed the flood risk screening of 173 potential development site allocations across the Cotswold authority area. Of these, 34 were shown to be at medium or high flood risk from fluvial and or surface water sources yet considered important to the Council's new Local Plan. A Level 2 SFRA scoping study was undertaken in June 2026. As part of the scoping study, 22 sites were identified to require a detailed Level 2 SFRA assessment, with the remaining 12 sites identified to be at nominal risk. For these sites, a brief assessment of risk has been undertaken and included in a nominal risk report.

This Level 2 SFRA consists of the following documents:

- This main report introducing and summarising the Level 2 SFRA processes and methodologies,
- 22 detailed site assessment reports,
- A nominal risk report covering the 12 sites shown to be at nominal risk of flooding.

This Level 2 SFRA has been prepared with full consideration of the latest government and Environment Agency (EA) guidance on flood risk and planning policy, namely:

- National Planning Policy Framework (NPPF) 2025,
- Flood Risk and Coastal Change Planning Practice Guidance (FRCC-PPG) 2025,
- How to Prepare a Strategic Flood Risk Assessment guidance 2026,
- Strategic Flood Risk Assessments A Good Practice Guide 2021, and
- Flood Risk Assessments: Climate Change Allowances 2022.

1.1 SFRA future proofing

At the time of writing, this Level 2 SFRA has assessed and considered flood risk in the Cotswold authority area using available data at a specific point in time. The Level 2 SFRA has been future proofed as far as possible, though the reader should always confirm with the source organisation (CDC) that the latest information is being used when decisions concerning development and flood risk are being considered.

At the time of writing, the proposed reforms and further changes to the NPPF are ongoing. The consultation window closed on 10 March 2026. The draft consultation version contains amendments to the structure of the NPPF, in addition to additional changes to reflect the recent updates to the Flood Risk and Coastal Change Planning Practice Guidance (FRCC-PPG). The FRCC-PPG (September 2025), alongside the NPPF (February 2025), is referred

to throughout this SFRA, being the current primary development and flood risk policy and guidance available at the time of finalisation of this SFRA.

The EA's SFRA guidance states a review of an SFRA should be carried out when there are changes to:

- The predicted impacts of climate change on flood risk,
- Detailed flood modelling - such as from the EA or Lead Local Flood Authority (LLFA),
- The local plan or relevant local development documents,
- Local flood management schemes,
- Local flood risk management strategies, and
- National planning policy or guidance.

The SFRA should also be reviewed after a significant flood event. It is in an authority's interest to keep the SFRA as up to date as possible. Ideally, the SFRA should be kept as a 'live' entity and continually updated when new information becomes available. The EA requests for reports and maps to be published online and be easily updatable, when required.

2 Level 2 SFRA requirements

The aim of a Level 2 SFRA is to build on the findings of a Level 1 SFRA, focussing on identified sites or communities at high and medium flood risk that are considered important to Local Plan development. This allows the SFRA process to be time efficient using detailed modelling techniques only where they are required in the Level 2 assessment. These locations usually include significant development and / or regeneration areas that are at medium or high risk of flooding from main rivers, ordinary watercourses, the sea, or surface water whilst also accounting for the impacts of climate change. Flood risk data such as modelled flood extents, depths, velocities and hazards are used to assess the suitability of these areas for development. Appropriate mitigation techniques and sustainable site layouts can then be informed.

This detailed information should support further application of the sequential test, the sequential approach to development management, inform on whether sites can pass the exception test, where applicable, and allow for flood risk indicators to be produced for use in the Sustainability Appraisal of the Local Plan.

EA guidance states a Level 2 SFRA should:

- *"Be detailed enough for you to identify which development allocation sites have the least risk of flooding,*
- *Contain the information needed to apply the exception test, if relevant,*
- *Enable you to decide if development can be made safe without increasing flood risk elsewhere."*

It should allow the local planning authority to:

- *"Apply the sequential test by identifying the severity and variation in risk within medium and high flood risk areas,*
- *Establish whether proposed allocations or windfall sites, on which your local plan will rely, are capable of being made safe throughout their lifetime without increasing flood risk elsewhere,*
- *Apply the exception test, where relevant."*

A site-specific flood risk assessment (FRA) will be required at the planning application stage which will assess risk to each site in greater detail than this Level 2 SFRA. The Level 2 SFRA is a strategic assessment that is not intended to replace the requirements of a site-specific FRA.

2.1 Objectives

In accordance with the latest national planning policy and flood risk guidance, the requirements of CDC, and with consideration of the limitations stated in Chapter 5, the key objectives of this Level 2 SFRA are to:

- Assess present day flood risk from all sources (fluvial, surface water, groundwater, sewers, canals, and reservoirs),

- Assess the impacts of climate change on fluvial and surface water flood risk,
- Document residual risk, including locations potential defence breaches and culvert blockages, where applicable,
- Assess detailed modelled outputs including flood depths, velocities, and hazards, where information is available,
- Assess existing flood warnings and alerts and advise on required emergency planning procedures and safety of potential site access and escape routes in times of flood,
- Account for the potential cumulative impacts of development,
- Provide site-specific advice on mitigation options i.e. developable / non-developable areas; blue / green infrastructure and open spaces; maintenance of fluvial and / or surface water flow routes and topographic depressions; land raising and compensatory storage; advice on minimum finished floor levels; and appropriate SuDS techniques,
- Assess any catchment-wide or strategic solutions, e.g. upstream opportunity areas for flood management (storage solutions) to mitigate against the risk of flooding downstream and elsewhere using Natural Flood Management (NFM) and Working with Natural Processes (WwNP) datasets,
- Demonstrate whether the second part of the exception test (part b) can be passed for the potential development site allocations, where applicable,
- Provide recommendations for additional and future work requirements following on from or to supplement the Level 2 SFRA i.e. further fluvial or surface water modelling including for climate change, modelling of site layout / design options including provisions for safe access and escape routes, development optioneering (land raising, compensatory storage, flow routes / rates), groundwater assessments, drainage strategies, site-specific FRA requirements.

3 Available data and information

The data and information described in this chapter has been used in the Level 2 SFRA to assess the risk to each site.

3.1 EA models

The following local detailed EA flood models have been used within this assessment:

- Daglingworth 2016 model
- Thames (MRL to St Johns) 2014 model
- Churn (Baunton to Siddington) 2011 model

3.2 EA open data

Additional to the EA modelling information, the following datasets available from the EA's Open Data have been considered in the Level 2 SFRA:

- Most recent LIDAR digital terrain model (DTM) data
- Flood Map for Planning Flood Zones 2 and 3
- Flood Map for Planning Water Storage Areas (note: the potential storage areas at Baunton and Abbey Way and South of Abbey Way Bridge have been removed from the Cotswold Local Plan. However, these areas remain within the functional floodplain).
- Flood Map for Planning - Surface Water Spatial Planning Flood Extents for 3.3%, 1%, 0.1% and 1% Annual Exceedance Probability (AEP) present day events
- Flood Map for Planning - Surface Water Spatial Planning Flood Depths for 3.3%, 1%, 0.1% and 1% Annual Exceedance Probability (AEP) present day events
- Flood Map for Planning - Surface Water Spatial Planning Flood Extents for 3.3%, 1%, 0.1% and 1% Annual Exceedance Probability (AEP) climate change (2070s 'Upper End' allowance) events
- Flood Map for Planning - Surface Water Spatial Planning Flood Depths for 3.3%, 1%, 0.1% and 1% Annual Exceedance Probability (AEP) climate change (2070s 'Upper End' allowance) events
- Third generation Risk of Flooding from Surface Water (RoFSW) hazards for 3.3%, 1% and 0.1% AEP events
- Spatial Flood Defences
- Historic Flood Map
- Recorded Flood Outlines
- Flood Warning Areas
- Flood Alert Areas
- Reservoir Flood Map
- Working with Natural Processes:
    - Riparian Woodland Potential

- Wider Catchment Woodland Potential
- Floodplain Woodland Potential
- Floodplain Reconnection Potential
- Runoff Attenuation Features 3.3% AEP
- Runoff Attenuation Features 1% AEP.

3.3 Other datasets

Other datasets and information used include:

- JBA 5m Groundwater Emergence Map,
- Functional floodplain dataset - as updated through the Level 1 SFRA (2026),
- OS MasterMap Water Network
- OS OpenMap Local base mapping
- LLFA flood incident records
- Thames Water historic flood incidents record
- Severn Trent Water historic flood incidents record
- British Geological Survey (BGS) Geology 625k dataset

4 Methodology

This chapter presents the methodology used in each stage of the Level 2 SFRA. The site-specific reports contain further information.

4.1 Assessing fluvial flood risk

Flood risk from fluvial sources is assessed using the most recent version of the EA's Flood Map for Planning (downloaded May 2026), and the EA's detailed local models, namely the Daglingworth 2016, Thames (MRL to St Johns) 2014, and Churn (Baunton to Siddington) 2011 models.

4.1.1 Functional floodplain

The functional floodplain was updated through the Level 1 SFRA and is assessed at each site, where applicable. Note: the potential storage areas at Baunton and Abbey Way and South of Abbey Way Bridge have been removed from the Cotswold Local Plan. However, these areas remain within the functional floodplain.

4.1.2 Climate change

EA SFRA guidance states that the SFRA should assess the effects of climate change on all sources of flooding, including the functional floodplain, to help inform the sequential approach to development. For rivers, the central allowance for the 2080s is recommended for assessment in SFRAs, as stated in the EA's Climate Change Allowance Guidance.

Each EA model domain is located within the Gloucestershire and the Vale management catchment. The percentage uplift on peak flows for the central allowance (2080s) in this catchment is 26%. However, the modelled climate change allowance in each model includes for a 30% uplift for the 1% AEP event, which reflects the required uplift for the Cotswold management catchment. The modelled climate change outputs may therefore be underestimating future risk.

Table 4-1 lists the peak river flow allowances for each management catchment within Cotswold district. The modelled fluvial climate change outputs have been assessed against each potential site allocation, where applicable.

The potential impacts of climate change on the functional floodplain have also been assessed to produce a 'future functional floodplain' flood extent, as updated through the Level 1 SFRA.

Table 4-1: Peak river flow allowances for the management catchments within Cotswold district

Management Catchment	Allowance category	Total potential change (%) anticipated for '2020s' (2015 to 2039)	Total potential change (%) anticipated for '2050s' (2040 to 2069)	Total potential change (%) anticipated for '2080s' (2070 to 2125)
Cotswolds	Upper end	31	43	82
Cotswolds	Higher Central	17	21	43
Cotswolds	Central	11	13	30
Gloucestershire and the Vale	Upper end	33	43	84
Gloucestershire and the Vale	Higher Central	17	19	41
Gloucestershire and the Vale	Central	11	11	26
Avon Warwickshire	Upper end	22	31	59
Avon Warwickshire	Higher Central	12	14	32
Avon Warwickshire	Central	7	8	21
Severn Vale	Upper end	34	52	94
Severn Vale	Higher Central	20	28	53
Severn Vale	Central	14	19	37
Avon Bristol and North Somerset Streams	Upper end	27	38	71
Avon Bristol and North Somerset Streams	Higher Central	15	19	39
Avon Bristol and North Somerset Streams	Central	10	12	26

4.2 Assessing surface water flood risk

4.2.1 Extents

Surface water flood extents have been assessed using the EA's Flood Map for Planning Surface Water Spatial Planning Extents, published May 2026.

4.2.2 Depths and hazards

The Flood Map for Planning - Surface Water Spatial Planning Present Day Depths dataset has been used to assess surface water flood depths. Surface water flood hazards have been assessed using the EA's third generation RoFSW mapping, as no suitable hazard data was available at the time of undertaking this Level 2 SFRA.

4.2.3 Climate change

EA climate change guidance states that for SFRAs, the upper end allowance on peak rainfall for the 2070s should be modelled for the 3.3% and 1% AEP events. For Cotswold district, this entails the allowances as shown in Table 4-2

Table 4-2: Peak rainfall allowances for the management catchments within Cotswold district

Management Catchment	Allowance category	Total potential change (%) anticipated for '2070s' (2061 to 2125) 3.3% AEP	Total potential change (%) anticipated for '2070s' (2061 to 2125) 1% AEP
Cotswolds	Upper end	35	40
Gloucestershire	Upper end	35	40
Avon Warwickshire	Upper end	35	40
Severn Vale	Upper end	35	40
Avon Bristol and North Somerset Streams	Upper end	40	45

The EA released the Flood Map for Planning - Surface Water Spatial Planning Climate Change Extent and Depths datasets in May 2026, which includes the modelled 2070s upper end peak rainfall intensity allowances. This dataset has been used to assess the impact of climate change on surface water flooding to each site. The allowance for the 0.1% AEP event is not stated by the EA.

4.3 Residual risk

Paragraph 004 of the FRCC-PPG states the requirement in plan making to account for residual flood risks from flood risk management infrastructure. For this Level 2 SFRA, this involves the consideration of potential defence breach locations and blockage or failure of drainage assets, such as culverts.

For sites shown to be at residual risk, the FRCC-PPG includes the following information:

- Areas of residual risk should be included in the sequential approach to risk avoidance when sequential testing or through development management,
- Where avoidance is not shown to be feasible through appropriate sequential testing, flood resistance and resilience measures should be in place, including for

finished floor levels to be place above the design flood level plus a minimum of 600mm,

- Adequate flood warning and emergency plans should be available to site users. Residual risks will need to be safely managed to ensure people are not exposed to hazardous flooding. This includes the ability of residents and site users to safely access and escape a building during the design flood and to evacuate before an extreme flood event which is defined as the 0.1% AEP event with an allowance for climate change this event is not available in the EA models),
- The likelihood of defences keeping pace with climate change should be considered e.g. is funding available and what are the funding options (e.g. Community Infrastructure Levy, planning obligations / S106 agreements, or Partnership Funding). This should inform the nature of residual risk to be considered and whether new development can remain safe for its lifetime,
- Local planning authorities should use information on identified residual risk to state in strategic policies their preferred mitigation strategy for ensuring development will be safe throughout its lifetime in relation to urban form, risk management and where flood mitigation measures are likely to have wider sustainable design implications,
- A site-specific FRA will be required for all sites modelled to be at residual risk. the FRAs would need to show that appropriate emergency plans, evacuation procedures and flood response infrastructure are in place to manage the residual risk associated with an extreme flood event.

4.4 Assessing flood risk from reservoirs

The EA's SFRA guidance requests for the assessment of risk from reservoir dam failure using the EA's Reservoir Flood Map (RFM). This Level 2 SFRA assess potential reservoir flood risk in both a 'dry day' and 'wet day' scenario. The 'dry day' scenario shows the flood extents if a reservoir were to fail and release the water held when local rivers are at normal levels, whereas the 'wet day' assumes the local rivers have already overflowed their banks.

The RFM shows the credible worst-case scenarios from dam failure. If a site is shown to be at risk, the SFRA should assess if the design or maintenance of the reservoir would need improving. This will require contacting the reservoir owner(s) to ascertain the flood risk in more detail and whether the proposed development could affect the reservoir's risk designation, it's design category or how it is operated.

CDC may be required, as category 1 responders, to access more detailed information about reservoir risk and reservoir owners using the online Resilience Direct System.

4.5 Assessing flood risk from canals

The Thames and Severn Canal flows past several potential site allocations. Given canals are controlled and managed features, the risk of flooding from a canal is considered low. The recommendation therefore is for any sites located near to the Thames and Severn Canal and situated at a lower elevation, as identified in the site reports, to be subject to a

more detailed assessment at the FRA stage in consultation with the canal owner, the Cotswold Canals Trust.

4.6 Assessing risk from groundwater emergence

Susceptibility of areas to groundwater emergence is appraised using JBA's national 5m Groundwater Flood Map which is more robust than the BGS dataset. In creating this map, modelling was carried out to show how and where groundwater levels would rise following prolonged periods of rainfall, considering factors such as topography, groundwater recharge volumes and spatial variations in aquifer storage and transmission properties. The model outputs were validated against recorded groundwater levels for past flood events and checked against areas historically affected by groundwater flooding. The high-resolution maps make it easier for users to pinpoint and report risks from groundwater emergence.

4.7 Assessing risk from sewers

Thames Water provided their historic flood event register at the postcode district level. Severn Trent Water provided theirs at the unit postcode level. The site reports flag where a sewer flooding incident has occurred within the postcode district or unit. Developers should contact the relevant wastewater undertaker directly for more specific details at the FRA stage.

4.8 Assessing historic flood risk

The EA's Historic Flood Map (HFM) and Recorded Flood Outlines (RFO) datasets have been considered. Gloucestershire County Council LLFA historic flood records have also been considered. Details on historic flooding have been documented within the site-specific reports where applicable.

4.9 Access and escape routes and emergency planning

The EA's Flood Warning Areas and Flood Alert Areas have been reviewed and mapped against each potential site allocation. Potential access and escape routes have been documented for each site, identified where they are modelled to stay dry or experience non-hazardous to life flooding. Liaison with emergency planners and the local resilience forum may be required at the site-specific FRA stage.

4.10 Cumulative impacts

A joined-up approach should be adopted between developers at the FRA stage for any clusters of sites to ensure possible flood risk mitigation at one site does not increase risk to a neighbouring or downstream site as a result of loss of floodplain storage, the deflection or constriction of flood flow routes, or through inadequate management of surface water. Paragraph 049 of the FRCC-PPG states that site-specific flood risk assessments should assess cumulative impacts and demonstrate how mitigation measures have addressed

them. The site-specific reports recommend for any clusters of sites at significant risk to be combined into a wider drainage strategy and masterplanning process.

4.11 Working with Natural Processes

The EA's national Working with Natural Processes mapping dataset has been assessed as to whether there is any potential for NFM measures that could benefit potential site allocations. This includes for tree planting, enhancing floodplain connectivity and attenuation of runoff through gully blocking and other runoff attenuation features.

5 Limitations

This Level 2 SFRA has been prepared under limitations associated within the availability and quality of data. These limitations have been subject to consultation with Council officers, the EA, and the LLFA whereby alternative approaches have been agreed to enable the Level 2 SFRA to be prepared using available existing information. The limitations include the following:

- The latest available EA flood models are not up to date with the latest hydrology. Therefore, they may not be fully representative of current hydrological conditions. Model survey and digital terrain model data will also not be based on the latest information, given updates to the national LIDAR datasets in June 2026. The EA models used in the assessment are listed in Section 3.1. Any future SFRA update may look to update the EA models with the latest information that is available at the time, including up to date hydrology inputs, channel and bank survey, LIDAR terrain data, and using the latest modelling software to update and run the models. The local plan timetable and budget constraints meant the models could not be updated through this SFRA.
- The EA models do not include for the latest climate change allowances associated with the Gloucestershire and the Vale management catchment. Therefore, there may be a small underestimation in future risk in the modelled locations. The local plan timetable and budget constraints meant the models could not be updated through this SFRA.
- Several sites being assessed are at risk of flooding from rivers though a local detailed EA model is not available for a more robust assessment of the risk. Therefore, flood risk can only be assessed using the Flood Map for Planning which is based on the New National Model. Depth, hazard and velocity information is unavailable for assessment in these areas.
- The recently published Flood Map for Planning Surface Water Spatial Planning dataset does not include useable flood hazard information. Therefore, the third generation Risk of Flooding from Surface Water hazard mapping has been used as the best available information.

Definitions

Term	Description
Abstraction Point	The location where water is either taken or extracted from either a surface or groundwater waterbody.
Agricultural Management	The farming techniques and practices used to produce food and manage livestock.
Abstraction Licencing Strategy	The Abstraction Licencing Strategy sets out the Environment Agency's approach to managing new and existing abstraction and impoundments within their river management catchments.
Asset Management Plan (AMP) Period	Price limit periods in the water sector are sometimes known as Asset Management Plan (AMP) periods. The current period (2025-30) is commonly known as AMP 8 because it is the eighth price review period since privatisation of the water industry in 1989. AMP periods are five years in duration and begin on 1 April in the years ending in 0 or 5. Every five years the industry submits a Business Plan to OfWAT for a Price Review (PR). These plans set out the companies' operational expenditure (OPEX) and capital expenditure (CAPEX) required to maintain service standards, enhance service (for example where sewer flooding occurs), to accommodate growth and to meet environmental objectives defined by the Environment Agency. OfWAT assesses and compares the plans with the objective of ensuring what are effectively supply monopolies and operating efficiently.
Aquifer	An aquifer is a rock and/or sediment body that holds groundwater.
Determinand	In a water quality assessment, a water sample may be tested to determine one or more properties of the sample or the environment it is taken from. The properties measured are called determinands. A determinand defines both the result that is measured (for example a concentration of ammonia), and the method for carrying out the measurement, including its unit.
Domestic purposes	As defined by Section 218 of the Water Industry Act 1991.
Dry Weather Flow	Dry weather flow is the average daily flow of wastewater to a wastewater treatment works during a period without rain.
Drainage and Wastewater Management Plan (DWMP)	Drainage and Wastewater Management Plans are statutory documents that all sewerage undertakers must produce at least every five years. They must address the current capacity, future demands and resilience of the drainage and sewerage system; the measures which will allow statutory obligations to be met and their likely sequence and timing;

Term	Description
	and the relevant environmental risks and how these will be mitigated.
Effluent	Effluent discharge is the liquid waste produced from residential, commercial and industrial processes.
Environmental Flow Indicator	The Environmental Flow Indicator (EFI) is the proportion of natural flows that are required to support the environment of a waterbody.
Environmental Permit	A legal authorisation issued by the EA allowing water companies to treat and / or discharge wastewater under controlled and monitored conditions. Environmental Permits are defined by the Environmental Permitting (England and Wales) Regulations 2016.
Groundwater Body	A Groundwater Body is the management unit under the Water Framework Directive which represents a distinct body of groundwater with its own hydrogeological characteristics.
Lead Local Flood Authority	A county council or unitary authority which leads in managing local flood risks (i.e., risks of flooding from surface water, ground water and ordinary (smaller) watercourses). Their duties are outlined in the Flood and Water Management Act.
Natural Flood Management	Natural flood management is the use of natural processes to reduce the risk of flooding and coastal erosion.
Per Capita Consumption	The per capita consumption is the average volume of water used by one person in a day. It is defined as the sum of the measured household consumption of clean water and unmeasured household consumption of clean water divided by the total household population. This is often expressed in litres per person per day (l/p/d).
Permitted Headroom	The difference between the volume of treated wastewater a treatment works is allowed to discharge under its environmental permit, and volume it currently discharges. It can be used to estimate the number of properties that could be connected to a WwTW catchment before a flow permit is exceeded.
Pollution load	The total amount of pollutants found in wastewater.
Storm Overflow 'rainfall target' (EA, 2023)	Storm overflows will not be permitted to discharge above an average of 10 rainfall events per year by 2050. "The EA will apply an industry standard measure to translate rainfall events to discharges from Storm Overflows. This means that any discharge from a Storm Overflow within a maximum of 12 hours will be counted as related to one rainfall event for the purposes of the target. For long duration discharges that occur beyond the initial 12-hour period, it will be counted as an additional rainfall event for the subsequent 24 hours and each 24 hours after that for the purposes of the target. When an overflow has ceased to discharge for a 24-

Term	Description
	hour period, the counting mechanism will reset."
Sustainable Drainage Systems (SuDS)	Sustainable drainage systems are drainage solutions that provide a natural alternative to the direct channelling of surface water through an artificial network of pipes and sewers to nearby watercourses.
Technically Achievable Limit (TAL)	The concentrations that effluent can be realistically treated to using the best available technology. For phosphates this is 0.25mg/l and nitrates 10mg/l (Nutrient Neutrality & Habitats Regulations Assessment Update letter, 2022).
Waterbodies	Water bodies constitute areas of water – both salt and fresh, large and small – which are distinct from one another in various ways. All surface waters (including rivers, lakes, estuaries and stretches of coastal water) and groundwaters have been divided up into discrete units called water bodies. Water bodies are the basic unit that are used to assess the quality of the water environment and to set targets for environmental improvements.
Water Framework Directive (WFD)	The Water Framework Directive is a river basin management planning system which was implemented to help protect and improve the ecological health of the UK's rivers, lakes, estuaries and coastal and groundwaters.
Water Framework Directive Classification Status	Rivers, lakes, estuaries and coastal waters can be awarded one of five WFD statuses: High, Good, Moderate, Poor or Bad Groundwater can be awarded one of two statuses: Good or Poor.
Water Framework Directive – Reasons for not achieving good (RNAG)	Where a WFD element is classified as being at less than good status, a reason for the failure to meet the good status is attributed, including the sector deemed responsible or a pressure affecting a biological element.
Water Framework Directive objectives	The Water Framework Directive objectives are set out in Regulation 12 and Regulation 8 of the Water Environment Regulations 2017.
Water Industry National Environment Programme	The Water Industry National Environment Programme is the programme of work in which water companies in England must meet their obligations from environmental legislation and UK government policy.
Water Resource Management Plan (WRMP)	Water Resource Management Plans are statutory documents that all water companies must produce at least every five years. They set out how the water company intends to achieve a secure water supply for their customers while protecting and enhancing the environment.
Water Resource Zone (WRZ)	A Water Resource Zone is an area in which the abstraction and distribution of water is self-contained and is used to meet

Term	Description
	demand within that area.
Water Treatment Works (WTW)	A Water Treatment Works is the place where raw water is treated to bring it up to a potable standard so it can be delivered in to the drinking water supply.
Wastewater Treatment Works (WwTW)	A Wastewater Treatment Works receives flows from the sewerage system and treats it so it can be discharged back into a river. They may also be called Sewage Treatment Works (STWs) or Water Recycling Centres (WRCs).

Executive Summary

JBA Consulting was commissioned by Cotswold District Council (CDC) to undertake a Stage 2 Water Cycle Study (WCS) for Buckinghamshire. The purpose of the WCS is to form part of a comprehensive and robust evidence base to inform the preparation of the emerging Local Plan for Cotswold District.

New homes require the provision of clean water, safe disposal of wastewater and protection from flooding. The allocation of large numbers of new homes in certain locations may result in the capacity of existing available infrastructure being exceeded, a situation that could potentially cause service failures to water and wastewater customers, adverse impacts to the environment, or high costs for the upgrade of water and wastewater assets being passed on to the bill payers.

In addition to increased housing demand, future climate change presents further challenges to the existing water infrastructure network, including increased intensive rainfall events and a higher frequency of drought events. Sustainable planning for water must now take this into account.

Water resources

Water resources in England are under considerable pressure. The Environment Agency has stated that "the scale of the challenge we face increases with time, and by 2050, we are looking at a shortfall of nearly 5 billion litres of water per day between the sustainable water supplied available and the expected demand."

Climate change is predicted to increase pressure on water resources, increasing the potential for a supply-demand deficit in the future, and making environmental damage from over abstraction of water resources more likely. Furthermore, the delivery of water and wastewater services and the heating of water in the home require high energy inputs and therefore contribute directly to emissions of greenhouse gases.

It is important that new development does not result in an unsustainable increase in water abstraction. This can be done in a number of ways from reducing the water demand from new houses through to achieving water neutrality in a region by offsetting a new developments water demand by improving efficiency in existing buildings.

The National Water Resources Framework sets the objective to reduce the average per capita water consumption in the UK to 110 l/p/d by 2050. This is now part of the Environmental Improvement Plan and water companies WRMPs. Within Defra's Plan for Water is the commitment to review Building Regulations and a target of 100 l/p/d in severely water stressed areas is suggested.

The Future Homes Hub, who are supporting Defra to produce a roadmap to greater water efficiency proposed a staged reduction in PCC, with a target of 100 l/p/d in water stressed areas in place from 2025, and a reduced target of 90 l/p/d in place by 2030 (depending on market conditions and customer acceptance).

This study recommends that as a minimum the proposed new Building Regulations target of 100 l/p/d outlined in Defra's Plan for Water be adopted across the study area. This should be achieved using a fittings-based approach.

This should be supported by the requirement for non-household development to achieve three credits in the assessment category WAT01 of the Building Research Establishment Environmental Assessment Methodology (BREEAM) UK New Construction Standard.

The Water Industry National Environment Programme (WINEP) is a set of actions that the EA have requested all 20 water companies operating in England to complete in a particular AMP as part of their environmental commitments. A number of investigations are planned or underway to ensure that abstraction of water from both groundwater and rivers, is not leading to unsustainable reductions in flow. Development and population growth can increase abstraction, and so CDC have an opportunity to contribute to these actions indirectly by pursuing policies that promote water efficiency in new development.

Water supply and wastewater services within the study area are provided by Bristol Water, Severn Trent, Thames Water and Wessex Water. Cotswold district is located across several water resource zones, but predominantly in Thames Water's SWOX Water resource Zone (WRZ).

Water supply

Water supply within the study area is provided predominantly by Thames Water, with small areas served Bristol Water and Severn Trent Water.

TW provided a site-by-site assessment of potential allocations in their supply area. This identified 15 sites where further modelling by TW would definitely be required, and a further 20 where modelling may be required, in both cases, upgrades to the water supply network may be needed to accommodate development.

Upgrades to the local supply network would be funded as part of the developer Infrastructure Charge. Early engagement between developers, CDC and the water companies is recommended to ensure upgrades are in place prior to occupation

Wastewater network and storm overflows

Thames Water is the primary wastewater provider and the designated sewerage undertaker for the study area. Wessex Water, and Severn Trent Water also operate within small parts of the area.

Development in areas where there is limited wastewater network capacity will increase pressure on the network, increasing the risk of a detrimental impact on customers, and increasing the likelihood of storm overflow operation. Early engagement with developers, Thames Water, Wessex Water and Severn Trent Water is required, and modelling of the network may be required at the planning application stage.

Where network capacity constraints are identified, network reinforcement may be required which would be funded as part of the developer infrastructure charge. It may be necessary for development sites to be phased in line with the provision of any network upgrades.

The drainage network includes 14 storm overflows that are likely to serve the study area. Storm overflow performance is generally poor with nine of these overflows currently exceeding the threshold for investigation. The poorest performing of these is at Avening Wastewater Treatment Works (WwTW), with a 3-year operation average of 128 spills per year.

2024 was a particularly bad year, in part because it was a wetter than average year. This was not the case in 2023 and 2025 when many of the storm overflows also operated well above the threshold.

Further development in catchments where there are poorly performing overflows increase the risk of storm overflow operation due to increased sewage flows and surface runoff.

There are opportunities through the planning system to ease pressure on the wastewater network by separating foul and storm flow in existing combined systems and not allowing new surface water connections. Surface water can also be better managed by retrofitting SuDS in existing residential areas, and in new development, ensuring SuDS are incorporated into designs at the master planning stage to maximise the potential benefits.

Wastewater treatment

There are 25 WwTWs that are within the Cotswold district or outside but serving a population within Cotswold district. Of these, twelve are expected to serve growth during the Local Plan period.

Five WwTW are expected to have capacity for growth during the plan period and will not require further upgrades for capacity. Seven WwTWs are expected to exceed their permit limit during the Local Plan period or be close to their permit limit by the end of the plan period.

Where an increase in capacity may be required, sufficient time is needed for the water company to plan and deliver the upgrade scheme. This would typically be planned for delivery in the next AMP period. i.e., a need to upgrade a WwTW would be identified in DWMP28 for inclusion in the PR29 business plan and delivered between 2030 and 2035.

There may therefore be a constraint to growth at WwTWs that are already at their permit limit and do not have upgrades planned within this AMP period. Beyond 2030, there should be sufficient time once the Local Plan is adopted for water companies to provide additional capacity where required. It is strongly advised that CDC discuss the phasing of potential allocations with TW, STW and WW early in the Local Plan period to allow infrastructure upgrades to be planned to provide capacity when it is required.

The odour screening assessment identified eight potential allocations that are close enough to a WwTW that an odour impact assessment would be recommended. This would be funded by the developer.

Water quality and environmental impact

An increase in the discharge of effluent from WwTW as a result of development and growth in the area in which they serve can lead to a negative impact on the quality of the receiving

watercourse. Under the Water Framework Directive (WFD), a watercourse is not allowed to deteriorate from its current WFD classification (either as an overall watercourse or for individual elements assessed).

It is Environment Agency (EA) policy to model the impact of increasing effluent volumes on the receiving watercourses. Where the scale of development is such that a deterioration is predicted, a variation to the environmental permit may be required for the WwTW to improve the quality of the final effluent, so that the increased pollution load will not result in a deterioration in the water quality of the watercourse. This is known as ‘no deterioration’ or ‘load standstill’. The need to meet river quality targets is also taken into consideration when setting or varying a permit.

The EA’s Reasons for Not Achieving Good (RNAG) dataset indicates that sewage treatment, the urban and transport sectors (urban development), as well as agriculture and rural land management, are the main reasons for watercourses not achieving good status in this area.

Growth during the Local Plan period is predicted to cause a significant deterioration in water quality downstream of seven WwTWs (six have a greater than 10% deterioration in one or more determinands, and one has a deterioration in WFD class).

With the exception of Ampney St Peter, Fairford and Moreton-In-Marsh WwTWs, all of these deteriorations can be prevented by upgrades to treatment processes.

At Ampney St Peter, Fairford and Moreton-In-Marsh WwTWs, a greater than 10% deterioration is predicted for Ammonia and BOD which is not prevented in the modelling scenario where upgrades to WwTWs are applied.

This is because these WwTWs are situated in an area where the current WFD classification for ammonia is "High" (i.e., the best water quality) and is operating either beyond or close to the technically achievable limit.

Under these circumstances, a high percentage deterioration in water quality is expected, and as there is no theoretical room for further improvement at the WwTW, the TAL scenario does not predict an improvement in water quality and the percentage deterioration compared to the baseline remains high. No change in WFD classification is predicted, and High status is maintained for Ammonia and BOD. The WCS therefore does not consider this a constraint to growth.

The water quality modelling indicates that growth alone will not prevent good ecological status being prevented in the future should improvements in upstream water quality be made.

Where a WwTW is shared with a neighbouring authority, coordination of growth plans in collaboration with Thames Water, Severn Trent Water and Wessex Water provide is essential to ensure that infrastructure is in place prior to development to prevent a breach of the environmental permit.

Within the WRZs serving growth over the Local Plan period and downstream of the district, there are 45 Sites of Special Scientific Interest (SSSIs) associated with waterbodies that

are affected by surface water abstraction, identified as a significant water management issue, alongside 4 Ramsar sites, 11 Special Areas of Conservation (SACs) and 6 Special Protection Areas (SPAs). In addition, 290 groundwater-dependent terrestrial ecosystems (GWDTEs) are located within groundwater bodies where abstraction-related impacts on flows have also been identified as significant water management issues.

The water quality modelling results were used to identify the predicted deterioration in water quality in waterbodies adjacent to designated sites downstream of WwTWs serving growth during the Local Plan period. The results show there are no significant deteriorations adjacent to environmental sites that cannot be prevented by improvements in treatment to TAL with the exception of the Cotswold Water Park SSSI downstream of Ampney St Peter WwTW.

As noted above, Ampney St Peter is in the upper catchment discharging to a waterbody with High WFD status for Ammonia. Current performance of the WwTW is at or exceeding the technically achievable limit so there is no theoretical room for further improvement at the WwTW, the TAL scenario does not predict an improvement in water quality and the percentage deterioration compared to the baseline remains 14%. It remains at High WFD status.

SuDS are required on all development sites. Their design should consider both water quantity and water quality and site level investigations should be undertaken to define the most appropriate SuDS types for each specific development. Opportunities exist for these SuDS schemes to offer multiple benefits of flood risk reduction, amenity value and biodiversity.

CDC should be consulted at an early stage of development to ensure that SuDS are implemented and designed in response to site characteristics and policy factors. In the wider area, opportunities exist to implement Natural Flood Management (NFM) techniques to achieve multiple benefits of flood risk, water quality and habitat creation.

1 Introduction

1.1 Terms of reference

JBA Consulting was commissioned by Cotswold District Council (CDC) to update the Water Cycle Study (WCS) to support their Local Plan review. This will provide an assessment of the impact of the growth options on water infrastructure and the water environment.

The purpose of the WCS is to form part of a comprehensive and robust evidence base to inform the delivery of the new Local Plan, which will set out where and how development will take place during the plan period (2025 to 2043) and will be used to inform decisions on the location of future development.

Unmitigated future development and climate change can adversely affect the environment and water infrastructure capability. A WCS will provide the required evidence, together with a strategy to ensure that planned growth occurs within environmental constraints, with the appropriate infrastructure in place in a timely manner so that planned allocations are deliverable.

1.2 Impacts of development on the water cycle

Figure 1.1 shows the main elements that comprise the Water Cycle. The natural water cycle describes the continuous transfers of water around the planet, from atmosphere to surface and back via evaporation, transpiration and precipitation, and the various flows and storage processes that occur. The artificial water cycle looks at the availability of water resources for human consumption, its treatment and supply to homes and business, its use and consequently the generation of wastewater. It then looks at how wastewater is taken away, treated, and finally what happens when it is returned to the environment.

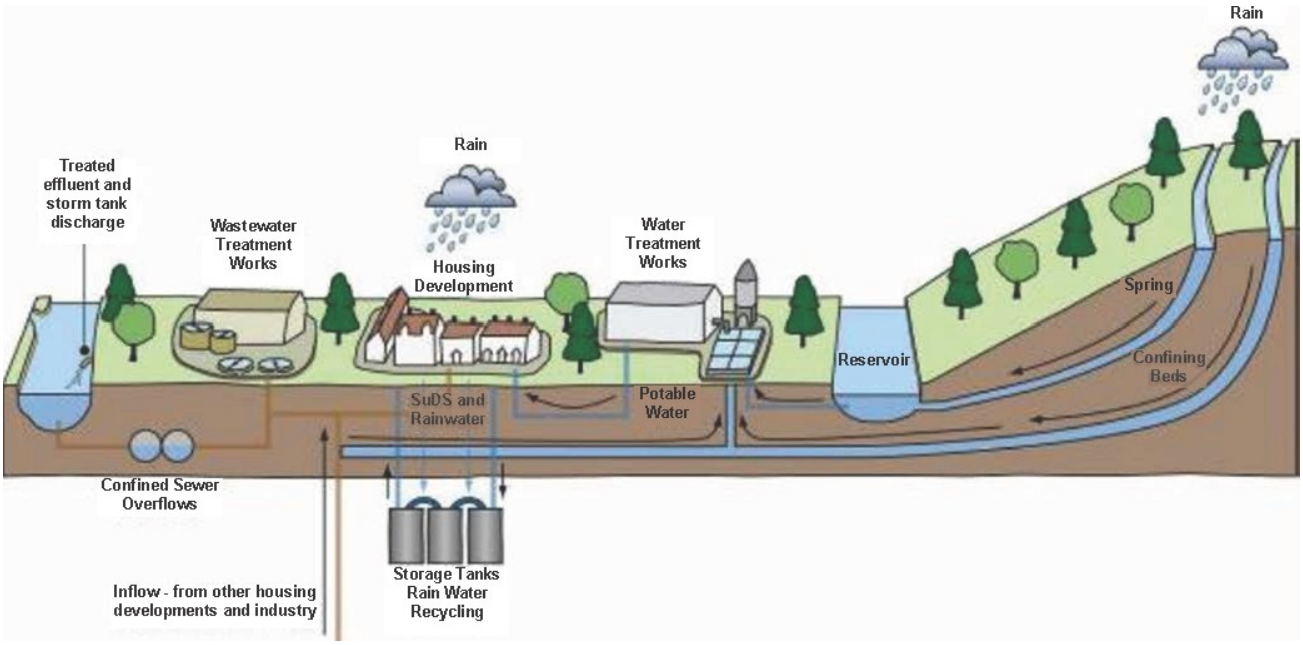

Figure 1.1 The Water Cycle

New homes require the provision of clean water, safe disposal of wastewater and protection from flooding. It is possible that allocating large numbers of new homes at some locations may result in the capacity of the existing available infrastructure being exceeded, in the absence of further investment from water companies. This situation could potentially lead to service failures to water and wastewater customers, have adverse impacts on the environment or cause the high cost of upgrading water and wastewater assets being passed on to bill payers. Climate change presents further challenges such as increased intensity and frequency of rainfall and a higher frequency of drought events that can be expected to put greater pressure on the existing infrastructure.

As statutory undertakers water companies, including Bristol Water, Severn Trent, Thames Water and Wessex Water are legally obliged to plan for and accommodate new residential development. The water companies do this by, for example, taking forward projection of growth and incorporating them into their asset management plan cycles and their long-term plans including their Water Resource Management Plan and Drainage and Wastewater Management Plan.

1.3 Structure of the WCS

The report contains the following chapters:

Chapter 2 - Legislative and policy framework

This section provides a comprehensive summary of relevant national, regional and local policies relating to environmental and water management that should be considered by CDC.

Chapter 3 - Future growth in Cotswold District

This section outlines how the district is expected to grow during the plan period. It updates the information provided in the previous WCS with the latest forecast from CDC and neighbouring authorities. It also contains information on how water demand has been calculated within the WCS.

Chapter 4 - Water resources

This chapter assesses water resources in the Cotswolds, examining how Local Plan growth will affect water supply and demand while avoiding shortages and environmental impacts.

Chapter 5 - Water supply infrastructure

This section examines how growth and new development can place additional demand on existing water supply infrastructure. The assessment draws on input from Severn Trent Water, Thames Water, Wessex Water and Bristol Water regarding infrastructure capacity and impacts during the CDC Local Plan period.

Chapter 6 - Wastewater collection

This section examines how new development could affect existing wastewater infrastructure. It highlights that new developments increase demand for sewerage services, potentially requiring upgrades to existing treatment works or new wastewater treatment facilities, and may also influence storm overflows. The assessment draws on input from Severn Trent, Thames Water and Wessex Water.

Chapter 7 - Wastewater treatment

This chapter presents the results of the wastewater treatment works flow capacity assessment, based on the predicted growth throughout the CDC local plan period. Where results suggest an upgrade to treatment processes may be required in order to accommodate growth, this will also be stated. This chapter also assesses the performance of storm tank overflows within the district and highlights where potential local plan allocations lie within a wastewater treatment works odour buffer zone.

Chapter 8 - Water quality

This chapter presents the environmental baseline and contains the modelling assessing the impact of growth during the Local Plan period on water quality.

Chapter 9 - Environmental opportunities and constraints

This section examines the impacts of development on environmentally designated sites, with a particular focus on the effects of water abstraction on sensitive aquatic and groundwater-dependent ecosystems.

Chapter 10 - Conclusions and recommendations

Conclusions and recommendations from each section of the report are collated into two tables.

1.4 Study area

The study area is the administrative area of Cotswold District Council (CDC) that covers Moreton-in-Marsh, Bourton-on-the-Water, Cirencester and Tetbury, see Figure 1.2. Cotswold District has a population of 90,800 (Office for National Statistics, 2022). and encompasses the Cotswold Area of Outstanding Natural Beauty (AONB).

Significant watercourses within the study area are the River Thames, Coln, Churn, Dikler, Evenlode, Windrush, Leach and Ampney Brook.

Some of the keys transport routes passing through the study area are the A429, A40, A417, A419 and A433.

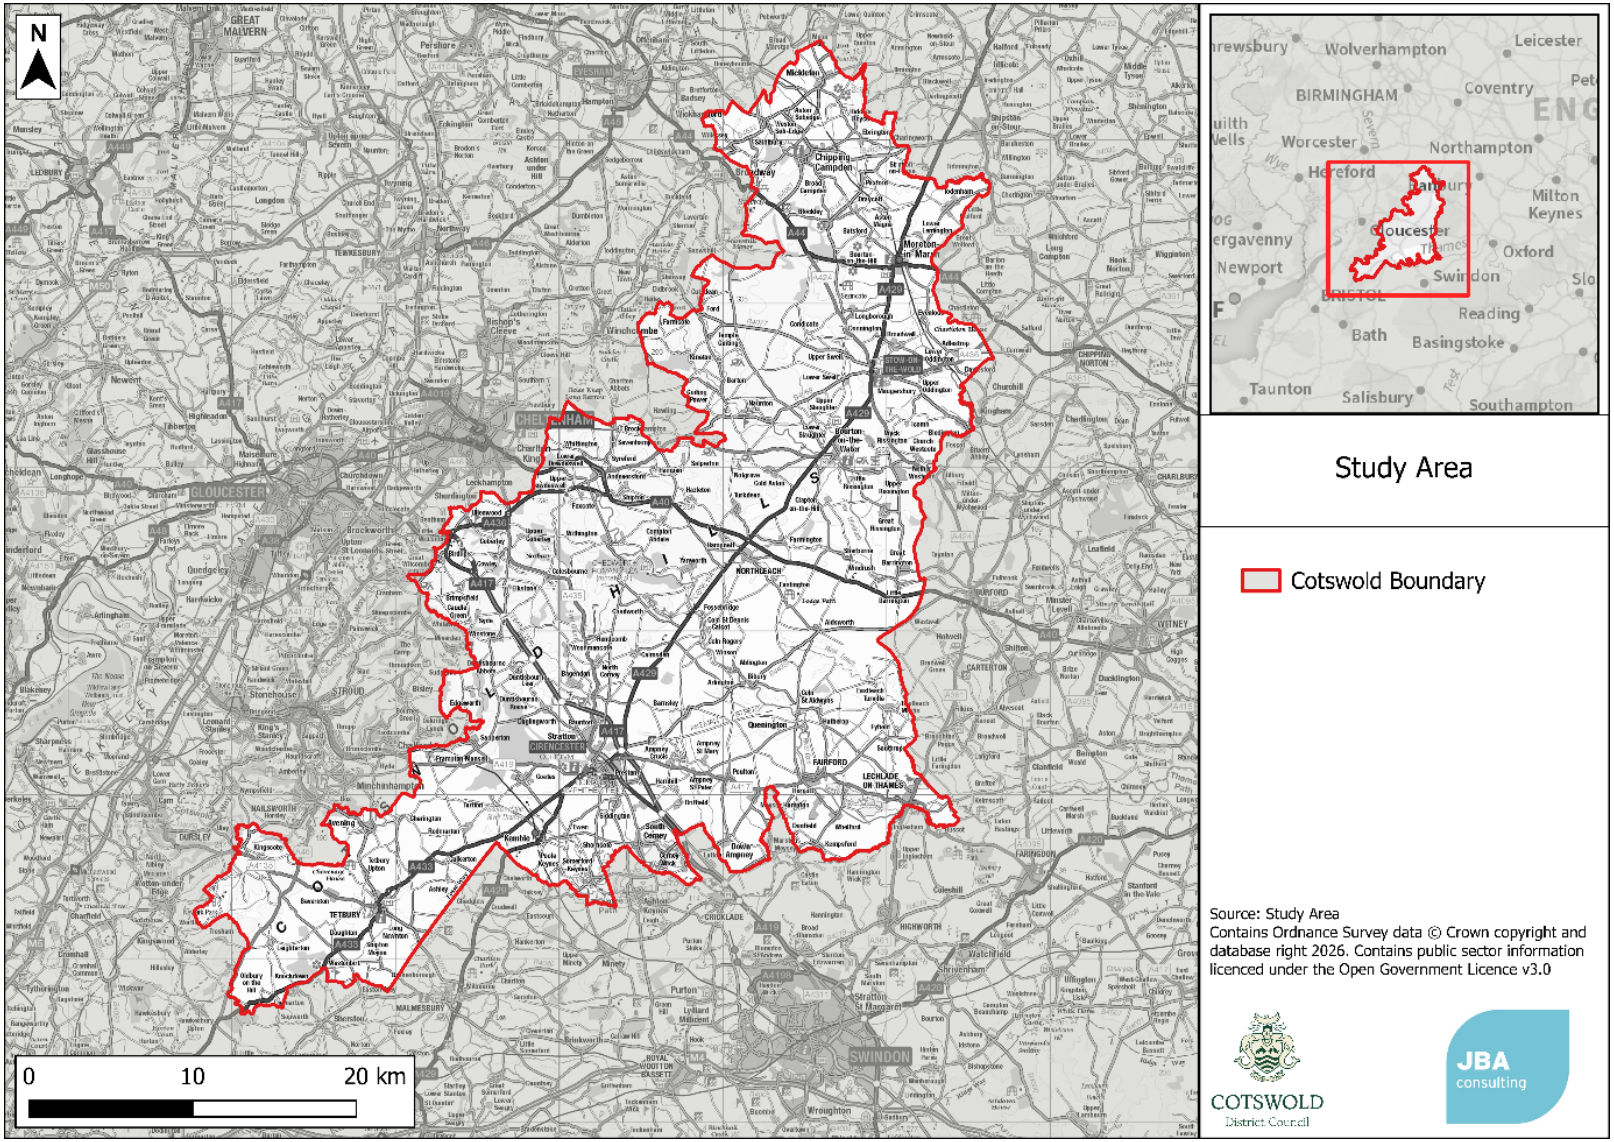

Figure 1.2 Study area

1.5 Authorities responsible for Water Resources and Wastewater Management in Cotswold District

1.5.1 Introduction

Preparation of a WCS requires significant engagement with stakeholders within the Local Planning Authority area, with water and wastewater utilities, with the Environment Agency and Natural England, and where there may be cross-boundary issues, with neighbouring local authorities. This section forms a record of engagement for the WCS.

Table 1.1 Responsibilities of authorities within Cotswold District

Authority Name	Key Responsibilities of different authorities
Environment Agency (EA)	The EA are the environmental regulators in the UK. Their responsibilities are within water quality, flood risk and administrating water abstraction licences. They are a statutory consultee for many development plan documents and for some planning applications. They advise on environmental and infrastructure capacity issues across the water cycle.
Natural England (NE)	Natural England are the Government's advisors on the natural environment, which they have a responsibility to protect and enhance. In a WCS they may provide information on the conservation objectives, and guidance on, the protection of designated sites.
Bristol Water, Severn Trent Water, Wessex Water and Thames Water.	Bristol Water, Severn Trent Water and Thames Water are the water suppliers for the Cotswold district; therefore, they have a statutory duty under the Water Industry Act to maintain an efficient and economical system of water supply within their areas and supply households with a reliable and sufficient water supply.
Severn Trent Water, Thames Water and Wessex Water	Severn Trent Water, Thames Water and Wessex Water are the sewerage undertakers for the district. This means they have a duty under the Water Industry Act to provide, improve and extend a system of public sewers (for both domestic and trade flows) so as to cleanse and maintain those sewers (and any lateral drain), to ensure that the area that they serve is effectually drained. There is also a duty to make provision for the emptying of those sewers, normally through sewage treatment works or where appropriate through discharges direct to watercourses.

1.6 Record of engagement

1.6.1 Detailed study engagement

An inception meeting was held with Cotswold District Council. Further discussions were held with Severn Trent Water (STW), Thames Water (TW) and Wessex Water (WW) and the Environment Agency (EA) as the project progressed, and results emerged. The EA provided their water quality model for the area.

Neighbouring authorities that shared wastewater infrastructure were contacted by CDC to obtain an estimate of growth in areas that would be served by those Wastewater Treatment Works (WwTW). This allowed a quantum of growth to be understood.

2 Policy and legislation

2.1 Introduction

The following sections introduce several national, regional, and local policies that must be considered by the Local Planning Authority (LPA), water companies and developers during the planning stage. Key extracts from these policies are presented as well as links to the full text. Whilst care has been taken to ensure that the information presented in this report was up to date at the time of writing, policy and guidance can change rapidly and the reader should ensure that the most up to date information is sought.

2.2 Plan-making

The National Planning Policy Framework (2025) was originally published in 2012, as part of reforms to make the planning system less complex and more accessible, to protect the environment and to promote sustainable growth.

Local Plans are the primary mechanism by which plan-led spatial planning is implemented in England. Local Plans must be prepared by Local Planning Authorities (LPAs) and include:

- Strategic policies which set out the "overall strategy for the pattern, scale and design duality of places", including for the provision of infrastructure, transportation and community facilities.
- Non-strategic policies, which "set out more detailed policies for specific areas, neighbourhoods or types of development. This can include allocating sites, the provision of infrastructure and community facilities at a local level."

Under the Localism Act (HM Government, 2011) new rights were provided to allow local communities to come together and shape the development and growth of their area by preparing Neighbourhood Development Plans, or Neighbourhood Development Orders, where the ambition of the neighbourhood is aligned with strategic needs and priorities for the area. Neighbourhood Plans can make non-strategic policies, aligned to the strategic policies of the Local Plan. As neighbourhoods draw up their proposals, Local Planning Authorities are required to provide technical advice and support to communities.

2.3 Water and the Planning System

2.3.1 National Planning Policy Framework and water

The NPPF provides guidance to planning authorities to take account of flood risk and water and wastewater infrastructure delivery in their Local Plans. Key paragraphs include:

- Paragraph 34: “Plans should set out the contributions expected from development. This should include setting out the levels and types of affordable housing provision required, along with other infrastructure (such as that needed

for education, health, transport, flood and water management, green and digital infrastructure). Such policies should not undermine the deliverability of the plan."

- Paragraph 158: "Plans should take a proactive approach to mitigating and adapting to climate change, taking into account the long-term implications for flood risk, coastal change, water supply..."
- Paragraph 180e: "…preventing new and existing development from contributing to, being put at unacceptable risk from, or being adversely affected by, unacceptable levels of soil, air, water or noise pollution or land instability. Development should, wherever possible, help to improve local environmental conditions such as air and water quality, taking into account relevant information such as river basin management plans".

2.3.2 Planning Practice Guidance overview

Planning Practice Guidance (PPG) was originally issued in 2014 by the Department for Communities and Local Government, with the intention of providing guidance on the application of the NPPF. The individual guidance documents are updated periodically. The following guidance documents are particularly relevant to a WCS:

- Water Supply, Wastewater and Water Quality (HM Government, 2019)
- Housing - Optional Technical Standards (HM Government, 2015)
- Flood Risk and Coastal Change (HM Government, 2025)

2.3.3 PPG - Water Supply, Wastewater and Water Quality

Two key passages from the PPG (Para 002) provide an overview of what needs to be considered plan-making authorities, and provide a basis for the work contained in a WCS or IWMS:

"Early discussions between strategic policy-making authorities and water and sewerage companies can help to ensure that proposed growth and environmental objectives are reflected in company business plans. Growth that requires new water supply should also be reflected in companies' long-term water resources management plans. This will ensure that the necessary infrastructure is funded through the water industry's price review."

"Strategic policy-making authorities will also need to consider the objectives in the government's 25 Year Environment Plan to reduce the damaging abstraction of water from rivers and groundwater, and to reach or exceed objectives for rivers, lakes, coastal and ground waters that are specially protected."

A summary of the advice for plan-makers and for planning applications is contained below but it is recommended that the full text is reviewed.

Plan-making considerations - Infrastructure (Para 005)

- Identification of suitable sites for new or enhanced infrastructure, including the location of existing and proposed development.

- Consider whether new development is appropriate near to water and wastewater infrastructure (for example due to odour concerns).
- Phasing new development so that water and wastewater infrastructure will be in place when needed. Infrastructure should also be in place before any environmental effects occur on designated sites of importance for biodiversity.

Plan-making considerations - Water quality (Para 006)

- How to help protect and enhance local surface water and groundwater in ways that allow new development to proceed and avoids costly assessment at the planning application stage.
- The type or location of new development where an assessment of the potential impacts on water bodies may be required.
- Whether measures to improve water quality, (e.g., SuDS schemes) can be used to address water quality in addition to flood risk.

Plan-making considerations - Wastewater (Para 007)

- The sufficiency and capacity of wastewater infrastructure.
- The circumstances where wastewater from new development would not be expected to drain to a public sewer (such as via a package treatment sewage treatment works or septic tank).
- The capacity of the environment to receive effluent from development without preventing statutory objectives being met.
- Early engagement with the LPA, the EA, and relevant water and sewerage companies can help establish whether any particular water and wastewater issues need to be considered.

Considerations for planning applications - Water supply (Para 016)

Water supply planning would normally be addressed through the LPA's strategic policies and reflected in the water companies WRMPs. Water supply is therefore unlikely to be a consideration for most planning applications. However, some exceptions might include:

- Large developments not identified in plans that are likely to require a large volume of water; and/or
- significant works required to connect the water supply; and/or
- where a plan requires enhanced water efficiency in new development as part of a strategy to manage water demand locally.

Considerations for planning applications - Water quality (Para 016)

Water quality is only likely to be a significant planning concern where a proposal would:

- Involve physical modifications to a water body such as flood storage areas, channel diversions and dredging, removing natural barriers, construction of new locks, new culverts, major bridges, new barrages or dams, new weirs, and removal of existing weirs; and/or
- indirectly affect water bodies, for example:

- As a result of new development such as the redevelopment of land that may be affected by contamination, mineral workings, water and wastewater treatment, waste management facilities and transport scheme including culverts and bridges.
- Result in runoff into surface water sewers that drain directly, or via a combined sewer, into sensitive waterbodies e.g., waterbodies with a local, national or international habitat designation.
- Through a lack of adequate infrastructure to deal with wastewater.
- Through a local of adequate infrastructure to deal with wastewater where development occurs in an area where there is strategic water quality plan e.g., a nutrient management plan, River Basin Management Plan, Water Cycle Study, Diffuse Water Pollution plan or sewerage undertakers' drainage strategy which set out strategies to manage water quality locally and help deliver new development.

2.3.4 PPG - Housing - Optional Technical Standards

This guidance advises planning authorities on how to gather evidence to set optional requirements, including for water efficiency. It states that “all new homes already must meet the mandatory national standard set out in the Building Regulations (of 125 litres /person /day). Where there is a clear local need, local planning authorities can set out Local Plan policies requiring new dwellings to meet the tighter Building Regulations optional requirement of 110 litres/person/day. Planning authorities are advised to consult with the EA and water companies to determine where there is a clear local need, and also to consider the impact of setting this optional standard on housing viability. Viability is reviewed in section 0.

2.4 Water and design

2.4.1 Building regulations

The Building Regulations (2010) Part G was amended in early 2015 to require that all new dwellings must ensure that the potential water consumption must not exceed 125 litres/person/day, or 110 litres/person/day where required under planning conditions (see Section 2.3.4).

The Environmental Improvement Plan 2025 (discussed in 0) contains a commitment to consider a new standard for new homes in England of 105 litres per person per day (l/p/d) and 100 l/p/d where there is a clear local need, such as in areas of serious water stress. Whilst this new standard is only under consideration, it demonstrates the direction of travel for water efficiency standards, and it is highly likely that this or a similar standard will be adopted.

2.4.2 Building Research Establishment

The Building Research Establishment (BRE) publish an internationally recognised environmental assessment methodology for assessing, rating, and certifying the sustainability of a range of buildings.

New homes are most appropriately covered by the Building Research Establishment Environmental Assessment Methodology (BREEAM) UK New Construction: Residential (2015) and commercial, leisure, educational facilities and mixed-use buildings by the BREEAM UK New Construction (2026).

Using independent, licensed assessors, BREEAM assesses criteria covering a range of issues in categories that evaluate energy and water use, health and wellbeing, pollution, transport, materials, waste, ecology, and management processes.

In the BREEAM New Construction Residential, 400 credits are available across 11 categories and lead to a star rating. 18 credits are available for water efficiency and water recycling. A greater number of credits are awarded for homes using water efficient fittings (with the highest score achieving 100l/p/d or less), and further credits are awarded for the percentage of water used in toilet flushing that is either sourced from rainwater or from grey water.

The BREEAM New Construction Standard awards credits across nine categories, four of which are related to water: water consumption, water monitoring, leak detection and water efficient equipment. This leads to a percentage score and a rating from “Pass” to “Outstanding”.

Through the Local Plan, the Council has the opportunity to seek BREEAM status for all new, residential, and non-residential buildings.

2.4.3 Energy and Water

18% of the UK’s domestic energy usage is for water heating (Department for Energy Security and Net Zero, 2025) If less water was being used within the home, for instance through more water efficient showers, less water would need to be heated, and overall domestic energy usage would be reduced.

The government recently published the results of a 2023 consultation on The Future Homes and Buildings Standards which involved changes to Part 6, Part L (conservation of fuel and power) and Part F (ventilation) of the Building Regulations for dwellings and non-domestic buildings and seeking evidence on previous changes to Part O (overheating). Water efficiency and water scarcity were out of scope for this consultation. However, there is an important link between water use and energy use, and therefore between water use and the whole-life carbon cost of developments.

2.4.4 Viability

The evidence for the costs of meeting the optional 110l/p/d water efficiency target in new homes indicate that the costs are minimal:

- A 2014 study into the cost of implementing sustainability measures in housing found that meeting a standard of 110 litres per person per day would cost only £12 (at 2023 prices) for a four-bedroom house (EC Harris, 2014).
- The Committee on Climate Change report - UK Housing: Fit for the Future - stated that the cost of "requiring all homes in England to be built to 110 l/p/d is possible under Part G of regulations and would be no additional cost." (Committee on Climate Change, 2019)
- Heating water accounts for 17% of energy used in the home (Department for Energy Security & Net Zero, 2025) This would cost a 2-3 person, 3-bed household an average of £352 per year in energy at 2023 costs (British Gas, 2023). Water efficiency is therefore not only viable but of positive economic benefit to both private homeowners and tenants.

There is less evidence available on the costs of going below 110l/p/d. The Sussex North Water Neutrality Strategy (JBA Consulting, 2022) found that the additional cost to meet 85l/p/d using water efficient fittings would be between £349 and £431 per dwelling, or £1,049 to £1,531 where white-goods appliances would not otherwise have been installed in the dwelling (2022 prices).

2.5 The Water Industry

2.5.1 The Water Industry in England

Water and sewerage services in England and Wales are provided by eleven Water and Sewerage Companies (WaSCs) and five 'water-only' companies. The central legislation relating to the industry is the Water Industry Act 1991. The companies operate as regulated monopolies within their supply regions, although very large water users and developments are able to obtain water and/or wastewater services from alternative suppliers - known as inset agreements.

The Water Act 2014 aims to reform the water industry to make it more innovative and to increase resilience to droughts and floods. Key measures that could influence the future provision of water and wastewater services include:

- Non-domestic customers being able to switch their water supplier and/or sewerage undertaker;
- New businesses being able to enter the market to supply these services;
- Measures to promote a national water supply network; and
- Enabling developers to make connections to water and sewerage systems.

The water industry is primarily regulated by three regulatory bodies:

- **Economic regulation:** Water Service Regulation Authority (Ofwat) are the economic regulator. They have a statutory duty to protect the interests of consumers, ensuring water companies carry out their functions (customer service standards, environmental rules, drinking water standards etc) and can finance

them. Part of this role is setting the limits on pricing of water and sewerage services.

- **Environmental regulation:** The EA are the environmental regulator. They are responsible for monitoring the impact of the water industry (as well as others) on the environment and issuing permits for abstraction of water and discharge of wastewater.
- **Drinking water regulation:** Finally, the Drinking Water Inspectorate implement standards for drinking water and can take enforcement measures against water companies if those standards are not met.

As a result of the Independent Water Commission, the Government have announced that Ofwat would be abolished and replaced by a new regulator taking responsibility for water functions across Ofwat, Environment Agency, Natural England and Drinking Water Inspectorate (UK Government, 2025). This is described in more detail in Section 2.5.7.

2.5.2 Planning and funding of the water industry

The water industry works on a five-year cycle called the Asset Management Plan period or AMP periods. Every five years a water company submits a Business Plan to Ofwat for a Price Review. These plans set out the companies' operational expenditure (OPEX) and capital expenditure (CAPEX) required to maintain service standards, enhance service (for example where sewer flooding occurs), to accommodate growth and to meet environmental objectives defined by the Environment Agency. Ofwat assesses and compares the plans with the objective of ensuring what are effectively supply monopolies are operating efficiently, and that the company is meeting its obligations. It then sets the allowable price increase for consumers based on the retail prices index, the business plan, and taking into consideration affordability for consumers.

The current AMP period is AMP 8 (2025-2030), and the price of water for this period was set by Ofwat in 2024 in a process referred to as Price Review 24 (PR24). The new price came into effect in April 2025. The next price review will be 2029 (PR29) and will set prices from 2030 to 2035, coming into effect in April 2030. This system gives stability in pricing. Within this price review process there may also be incentives and penalties on the water company for exceeding or failing to meet targets.

When considering investment requirements to accommodate growing demand, water companies are required to ensure a high degree of certainty that additional assets will be required before funding them. Longer term growth is, however, considered by the companies in their internal asset planning processes and in their 25-year Strategic Direction Statements and WRMPs.

The Water Industry National Environment Programme (WINEP) is a set of actions that are defined by the EA and given to all water companies operating in England for completion during a particular AMP period. The aim of the programme is to support the objectives in the Environment Act, Water Framework regulations, Habitats regulations and other environmental objectives. Examples of typical actions could include investigations into the

sustainability of an abstraction, a reduction in an abstraction to support river flows, or new permit limits at a WwTW.

Water and wastewater infrastructure requires significant lead-times to plan, obtain planning and other permissions, finance and construct. The time required to provide new or upgraded infrastructure to serve a development or a larger spatial plan is highly locally specific.

Table 2.1 is provided as an indicative guide to lead-times.

Table 2.1: Indicative lead-times (years) for new infrastructure to serve development

Scale of development	Water supply	Water resources	Wastewater network	Wastewater treatment
Minor	1	N/A	1	N/A
Major	1-3	5-10	1-5	3-5
Strategic / Plan	3-5	10-20	5-10	5-10

2.5.3 Planning for Water

Water resource management plans

Water Resource Management Plans (WRMPs) are 25-year strategies that water companies are required to prepare, with updates every five years. In reality, water companies prepare internal updates more regularly. WRMPs are required to assess:

- Future demand (due to population and economic growth);
- Future water availability (including the impact of sustainability reductions);
- Demand management and supply-side measures (e.g., water efficiency and leakage reduction, water transfers and new resource development);
- How the company will address changes to abstraction licences;
- How the impacts of climate change will be mitigated;
- where necessary, the requirements for developing additional water resources to meet growing demand and describe how the balance between water supply and demand will be balanced over the period 2015 to 2040;
- Using cost-effective demand management, transfer, trading and resource development schemes to meet growth in demand from new development and to restore abstraction to sustainable levels; and
- In the medium to long term, that sufficient water continues to be available for growth and that the supply systems are flexible enough to adapt to climate change.

Thames Water's final WRMP is published here. Severn Trent Water's revised WRMP is published here. Bristol Water's final WRMP is published here.

Drought Plan

Linked to the WRMP is a water company's drought plan. This is a requirement under the Water Industry Act 1991 (as amended by the water Act 2003). A water company must state how it will maintain a secure water supply and protect the environment during dry weather and drought. The plan will contain:

- **Drought triggers** - these are points where a water company will take action to manage supply and demand. They are based on monitoring of rainfall levels, river flows, groundwater levels, and reservoir stocks.
- **Demand management actions** - how a water company will reduce demand for water during a drought. Actions that save water before taking more water from the environment must be prioritised. These could include:
    - reducing leakage;
    - carrying out water efficiency campaigns with customers;
    - reducing mains pressure; and
    - restricting water use, for example through temporary use band which limit hosepipe and sprinkler use.
- **Supply management actions** - how a water company will maintain water supply during a drought. Actions that have the least effect on the environment must be prioritised. This could include:
    - carrying out engineering work to improve its supply;
    - transferring water in bulk from other water companies;
    - using drought permits and drought orders to abstract more water;
    - using desalination - permanent or temporary plants; and
    - using tankers to supply customers with water directly.
- **Extreme drought management actions** - the actions it could take in an extreme drought. These could delay the need to use emergency restrictions standpipes and rota cuts.
- **Communicating during a drought** - a water company must set out how it will communicate in a clear and timely way during a drought with customers, partners or other stakeholders.
- **Environmental assessment, monitoring and mitigation** - a drought plan must include:
    - an environmental assessment;
    - an environmental monitoring plan for each supply management action; and
    - details of mitigation measures the company plans to take for each supply management action.
- **End of a drought** - a water company must explain how it will identify when a drought is over or ending and the actions it will take during this stage, communicate this information to customers, and review its performance.

Regional water resource planning

Water resource planning is taking an increasingly regional focus, recognising the need for collaboration between water companies and sectors in order to address the challenges of climate change, increasing demand for water and protecting the water environment. Five regional groupings having been formed, including the Water Resources South East (WRSE) group which covers most of Cotswold District. An advisory group consisting of their regulators (Environment Agency and Ofwat) and Defra regularly attend meetings of WRSE.

WRSE published their final regional plan in 2025 which will inform the next round of company WRMPs to be published in 2028/9.

The West Country Water Resources (WCWR) group covers the south-west area of the Cotswold that is supplied by Bristol Water. WCWR published their draft regional plan in January 2023

The Water Resources West (WRW) group covers the north area and areas along the western boundary of Cotswold District that is supplied by Severn Trent. WRW published their final regional plan in June 2025.

2.5.4 Planning for Wastewater

21st Century Drainage

The UK Water Industry Research (UKWIR) "21st Century Drainage" programme has brought together water companies, governments, regulators, local authorities, academics, and environmental groups to consider how planning can help to address the challenges of managing drainage in the future. These challenges include climate change, population growth, urban creep and meeting the Water Framework Directive.

The group recognised that great progress has been made by the water industry in its drainage and wastewater planning over the last few decades, but that, in the future, there needs to be greater transparency and consistency of long-term planning. The Drainage and Wastewater Management Plan (DWMP) framework (Water UK, 2018) sets out how the industry intends to approach these goals. Companies were required to published finalised DWMPs in 2023 to inform their business plans for the 2024 Price Review.

Drainage and Wastewater Management Plans (DWMPs)

Drainage and Wastewater Management Plans (DWMPs) are consistently structured plans delivered at three spatial scales; company-wide, regional groupings and individual wastewater catchments. The framework defines drainage to include all organisations and all assets which have a role to play in drainage, although, as the plans will be water company led, it does not seek to address broader surface water management within catchments.

The first cycle of DWMPs were published in 2023, following a consistent national framework, to inform their business plans for the 2024 Price Review.

The Environment Agency has set out new guidance for the second cycle of DWMPs to be published for public consultation in 2027.

LPAs and LLFAs are recognised as key stakeholders and are invited to join, alongside other stakeholders, the Strategic Planning Groups (SPGs) organised broadly along river basin district catchments.

DWMPs aim to provide more transparent and consistent information on sewer flooding risks and the capacity of sewerage networks and treatment works, and this should be taken into account in SFRAs, Water Cycle Studies, as well as in site-specific FRAs and Drainage Strategies.

Thames Water's final DWMP, including interactive mapping, is published here and is reviewed in detail for the study area in sections 6.3.1.

Severn Trent Water's final DWMP, including interactive mapping, is published here and is reviewed in detail for the study area in sections 6.3.2.

Wessex Water's final DWMP, including interactive mapping, is published here, and is reviewed in detail for the study area in sections 6.3.3.

2.5.5 Developer Contributions and connection charges

A significant part of water company business is the interface with developers to facilitate connection to the public water supply and sewerage systems, through their developer services functions. Developments with planning permission have a right to connect to the public water and sewerage systems, where this is for domestic use. However, there is no guarantee that the capacity exists to serve a development.

Developers may requisition a water supply connection or sewerage system, or alternatively, self-build and offer them for adoption by the water company or sewerage undertaker. Self-build and adoption are usually practiced for assets within the site boundary, whereas requisitions are normally used where an extension of upgrading the infrastructure requires construction on third party land. The cost of requisitions is shared between the water company and developer as defined in the Water Industry Act 1991.

The above arrangements are third party transactions, because the Town and Country Planning Act Section 106 agreements and Community Infrastructure Levy agreements may not be used to obtain funding for water or wastewater infrastructure.

Ofwat published revised charging rules covering how water and wastewater companies may charge customers for new connections. (Ofwat, 2021) These rules have applied to all companies in England since April 2018. The key changes are listed below.

- **Increased transparency** - More charges will be fixed and published on water company websites. This will provide greater transparency to developers and will also allow alternative connection providers to offer competitive quotations more easily.
- **Fixed infrastructure charges** - There will be a fixed infrastructure charge for water and one for wastewater.
- **Revised approach to network reinforcement costs** - The costs of network reinforcement will no longer be charged directly to the developer in their

connection charges. Instead, the combined costs of all of the works required on a company's networks, over a five-year rolling period, will be covered by the infrastructure charges paid for all new connections.

- **Updated definition of network reinforcement -** The definition of network reinforcement has changed and will now apply only to works required as a direct consequence of the increased demand due to a development. Where the water company has not been notified of a specific development, for example when developing long-term strategic growth schemes, the expenditure cannot be recovered through infrastructure charges.

Thames Water publish their charging arrangements annually here. These include incentives to encourage good design by developers, including:

- £2,500 per property for designing rainwater or greywater harvesting technologies in the development
- £3,200 per property for water neutral developments (does not add additional water demand pressures to its water resource zone supply needs)
- £280 per property for reducing the surface water run-of leaving the property into the sewerage network.

Severn Trent Water (STW) publish their charging arrangements annually on their website.

For the period 1 April 2026 to 31 March 2027 the infrastructure charges per property are as follows:

- £385.36 water infrastructure charge
- £499.62 sewerage infrastructure charge
- £48.65 water environmental component
- £43.11 waste environmental component

The environmental component charges are used to fund environmental incentives to encourage good design by developers, including water efficiency and flood prevention incentives for home builders.

Water efficiency incentives can be applied for where developers can demonstrate they have built a premises with a domestic water usage of 100l/p/d or less and specified criteria are met. The incentives offered are:

- Water usage of 100 litres per person per day or less: £250 per property,
- Water usage of 90 litres per person per day or less: £300 per property,
- Water usage of 85 litres per person per day or less: £350 per property.

Severn Trent will also allow non-household premises with domestic usage only to apply for the 100 l/p/d water efficiency incentive.

Severn Trent also offer incentives for flood prevention measures. Where specified conditions are met, the following incentives are offered:

- Installation of a rain garden: £100 per property,
- Use of permeable surfaces for driveways or parking spaces that attenuate water to the sewer network: £150 per property,

- Use of permeable surfaces for driveways or parking spaces that infiltrate and do not connect to the network: £275 per property.

Wessex Water publish their charging arrangements annually here. These include discounted charges based on the separation of surface water run-off produced by the development to encourage good design by developers. This is based upon the development having no separation, surface water attenuation or full surface water separation.

Bristol Water publish their charging arrangements annually here. There is a discount on the charge to encourage good design by developers based on water usage, including:

- 75% reduction is 95 litres/person/day is achieved.
- 50% reduction of the infrastructure charge if 100 litres/person/day is achieved.
- 0% reduction of infrastructure charge if the current Building Regulation standard of 110 litres/person/day is achieved.

2.5.6 Water companies and the planning system

Water companies are currently not statutory consultees to planning applications, although they do monitor planning applications and respond to potentially significant applications, or where requested to do so by the LPA. Defra are intending to consult on making water companies statutory consultees for some applications (Department for Environment, Food & Rural Affairs, 2023).

Where a water company is concerned that a new development may impact upon their service to customers or the environment (for example by causing foul sewer flooding or pollution) they may request the LPA to impose a Grampian condition, whereby the planning permission cannot be implemented until a third-party secures the necessary upgrading or contributions.

Defra has issued National Policy Statements (NPSs) on Nationally Significant Infrastructure Projects (NSIPs) for wastewater (Department of Environment, Food & Rural Affairs, 2012) and water (Department of Environment, Food & Rural Affairs, 2023), to be used as the primary basis when considering applications for Development Consent Orders (DCOs).

2.5.7 The Independent Water Commission

The Independent Water Commission was set up in October 2024 to provide recommendations to government on reforms to the water sector. The objectives are to ensure a sufficiently robust and stable regulatory framework in order to:

- attract the investment needed for the future;
- speed up infrastructure delivery; and
- restore confidence in the sector.

Chaired by Sir John Cunliffe, the resulting report which was published in June 2025 is often referred to as the 'Cunliffe Report'.

The full report can be found on the gov.uk website. It contains 88 recommendations centred around seven themes:

- Chapter one: Strategic direction for the water system.
- Chapter two: Planning.
- Chapter three: Legislative framework.
- Chapter four: Regulator reform.
- Chapter five: Regulation reform.
- Chapter six: Company structures, ownership, governance, and management.
- Chapter seven: Infrastructure and asset health.

It should be noted that the recommendations in the Cunliffe report are not mandatory, and the government will respond to the report in due course. In the meantime, these recommendations should be treated with the caution.

A simplification of the water planning system is recommended, with a comprehensive systems planning framework for England and Wales with responsibility for integrated and holistic water system planning. It goes on to recommend a review and update to the current legal framework, along with clearer targets to allow water companies to be held to account.

Chapter four of the Cunliffe report is designed to restore the confidence of both the public and regulated water companies in the regulatory framework. It recommends that the UK government should establish a new integrated regulator in England. This should combine the functions of Ofwat, DWI, and water functions from the EA and Natural England (NE). Changes were also recommended to economic and environmental regulations, including strengthening abstraction permitting.

Following the recommendations set out in the Cunliffe Report, the government announced that Ofwat would be abolished and replaced by 'a new, single, powerful regulator' with the objective of cutting water pollution in England's rivers, lakes and seas, and protecting families from large increases in their water bills.

The new regulator will take responsibility for the water functions across Ofwat, EA, NE and Drinking Water Inspectorate. During the transition to the new regulator, Ofwat will remain in place, and following its creation, the EA and NE will retain their non-water role.

Until there is more information on the role of the new regulator and which other recommendations will be adopted by government, the LPA should assume the current regulatory environment will continue.

2.5.8 A New Vision for Water: White Paper

On 20 January 2026 A New Vision for Water white paper was presented to Parliament by the Secretary of State for Environment, Food & Rural Affairs. The white paper responds to the 88 recommendations made in the Cunliffe Report and puts forward a "*once-in-a-generation plan to transform the water system for good*".

Changes proposed in the white paper include:

- Expanding the price review system to capture the 25-year planning horizon with further details provided in five-year periods.
- A Chief Engineer will sit inside the new single water regulator. Their job will be to bring back hands-on checks of water infrastructure.
- The regulator will introduce a new inspection approach for water companies, requiring health checks on pipes, pumps, and other assets. Self-monitoring will come to an end.
- Where companies fall short, a new Performance Improvement Regime will give the regulator the power to act fast and fix failures so that underperforming water companies recover faster, protecting customers and the environment and giving stability to investors.
- The price control process will reflect a focus on maintenance and resilience. Ringfenced budgets will ensure there's enough funding for maintenance and renewal alongside building new assets.
- Improve joined-up regional planning by requiring regional plans that will set out investment priorities to meet national objectives.
- Work with existing groups such as catchment partnerships to design a new regional planning framework with Defra, set to be implemented in 2027.
- Confirms the roll out of smart metering and mandatory efficiency labels on white goods.

Recommendations in the Cunliffe Report that the white paper does not pick up include:

- Updated legislation to provide a clear framework for approving nature based solutions.
- Mandatory SuDS for new developments in England.

It should be noted that white papers set out the Government's proposals for future legislation, providing a basis for further consultation and discussion to allow final changes to be made before a Bill is formally presented to Parliament. The white paper states that a 2026 Transition Plan will set out the path to this new system and a new water reform Bill will bring forward the legislation needed to enable the system to take effect.

2.6 Flood Risk and Surface Water

2.6.1 Flood and Water Management Act 2010

The Flood and Water Management Act (FWMA) aims to improve both flood risk management and the way water resources are managed (HM Government, 2010).

The FWMA has created clearer roles and responsibilities and helped to define a more risk-based approach to dealing with flooding. This included the creation of a lead role for LAs, as LLFAs, designed to manage local flood risk (from surface water, ground water and ordinary watercourses) and to provide a strategic overview role of all flood risk for the EA.

The content and implications of the FWMA provide considerable opportunities for improved and integrated land use planning and flood risk management by LAs and other key

partners. The integration and synergy of strategies and plans at national, regional, and local scales, is increasingly important to protect vulnerable communities and deliver sustainable regeneration and growth.

Schedule 3 of the FWMA 2010 will provide a framework for the approval and adoption of drainage systems, a SuDS Approving Body (SAB) within unitary and county councils, and national standards on the design, construction, operation, and maintenance of SuDS for the lifetime of the development. The previous government affirmed its commitment for enacting Schedule 3. However, it is currently unknown whether the new government intends to do this or what the proposed timescales would be.

2.6.2 Local Flood Risk Management Strategy (LFRMS)

Local Flood Risk Management Strategies set out how Lead Local Flood Authorities (LLFA) will manage local flood risk from surface water runoff, groundwater and ordinary watercourses, for which they have a responsibility as LLFA. They also set out the work that other Risk Management Authorities are doing to manage flood risk within the area.

Gloucestershire County Council's Local Flood Risk Management Strategy (2014) sets out the following objectives:

- improve our understanding of local flood risk;
- put in place plans to manage these risks;
- avoid inappropriate development and ensure new development does not increase flooding elsewhere;
- increase public awareness of flooding and encourage local communities to take action;
- ensure close partnership working and co-ordination with other risk management authorities in Gloucestershire, and;
- support response to, and recovery from, flooding incidents.

2.6.3 Strategic Flood Risk Assessment (SFRA)

All LPAs are required, under NPPF, to prepare a SFRA, which forms a key part of the evidence base for their Local Plan. The SFRA must consider flood risks from all sources, collating up-to-date flood risk data and in some cases developing new flood risk modelling. The SFRA is used to inform the Sequential Test, by which Local Plan allocations should be sequentially selected to direct development towards areas of lower flood risk, taking into consideration the vulnerability to flooding of the proposed land use. Cotswold District Council's current Level 1 SFRA was published in 2023 (which can be found here). At the time of writing, a new Level 1 and 2 SFRA for Cotswold District Council is being prepared.

2.6.4 Surface Water Management Plan

Surface Water Management Plans (SWMPs) outline the preferred surface water management strategy in a given location and establish a long-term action plan to manage surface water. SWMPs are undertaken, when required, by LLFAs in consultation with key

local partners who are responsible for surface water management and drainage in their area. Gloucestershire County Council has published SWMPs for four locations but these cover areas outside of Cotswold District. (Which can be found here).

2.6.5 Sustainable Drainage Systems

From April 2015, LPAs were given the responsibility for ensuring that sustainable drainage is implemented on all major developments, including developments of ten or more homes, or commercial developments creating 1,000m^2 of new floor space.

Previously SuDS guidance was developed by Defra to sit alongside the NPPF PPG and provide non-statutory standards as to the expected design and performance for SuDS.

As of July 2025, the Defra National standards for sustainable drainage systems (SuDS) were brought in to comply with the principles of surface water drainage design.

The national standards contain two sets of standards. The first type (standard one) is known as the hierarchy standard and sets the criteria for the prioritisation of final surface water runoff destinations. The other standards (standards two to seven) detail the minimum design criteria that SuDS should satisfy alongside how they are to be appropriately built, maintained, and operated.

These National Standards form a material consideration for LPAs when assessing planning applications. These standards aim to reflect and reinforce good practice and use of SuDS, reflecting the four pillars of SuDS design. All appropriate planning applications should demonstrate how the national standards have been met in the site design (principle ten).

Standard one: runoff destinations

Runoff from development shall be discharged to the following final destinations, to the maximum extent practicable, in accordance with the below hierarchy:

- Priority one: collected for non-potable use (rainwater harvesting)
- Priority two: infiltrated to ground
- Priority three: discharged to an above ground surface water body
- Priority four: discharged to a surface water sewer, or another piped surface water drainage system
- Priority five: discharged to a combined sewer.

Non-potable use

There is potential for rainwater harvesting for non-potable uses to decrease the water demand from new developments and help improve water efficiency.

Rainwater harvesting shall be considered in all circumstances where any of the following apply:

- There is a demand for non-potable water and available contributing catchment area that will deliver safe and efficient water savings.
- Examples include industrial, commercial, horticultural, educational, public sector, residential and multiple-occupancy buildings.

- There is a need for landscape irrigation.
- The development is in an area identified as seriously water stressed.

Gloucestershire County Council are the LLFA and play a key role in ensuring that the proposed drainage schemes for all new developments comply with technical standards and policies in relation to SuDS. Further information on surface water drainage can be found here.

An updated version of the Construction Industry Research and Information Association (CIRIA) SuDS Manual was published in 2015. The guidance covers the planning, design, construction and maintenance of SuDS for effective implementation within both new and existing developments. The guidance is relevant for a range of roles with the level of technical detail increasing throughout the manual. The guidance does not include detailed information on planning requirements, SuDS approval and adoption processes and standards, as these vary by region and should be checked early in the planning process. The manual itself can be found on the CIRIA website (ciria.org).

CIRIA also published 'Guidance on the Construction of SuDS' (C768) (ciria.org), which contains detailed guidance on all aspects of SuDS construction, with specific information on each SuDS component available online as a downloadable chapter, free to CIRIA members.

Thames Water provides guidance on their website through their Surface Water Management Programme available here. Applications for projects should be made through their website.

Wessex Water provides their SuDS and surface water sewer adoption requirements here.

Severn Trent Water provides SuDS guidance on their website including:

- General Design Manual,
- Landscape Specification,
- Planting Schedule,
- Landscape Maintenance Guidance,
- Flow Control Chamber Details,
- Sewer Connection Detail, and
- Gully Abandonment Detail.

2.6.6 Design and Construction Guidance

The Design and Construction Guidance (water.org.uk) forms part of a new Codes for Adoption covering the adoption of new water and wastewater infrastructure by water companies. The Design and Construction Guidance contains details of the water sector's approach to the adoption of SuDS, which meet the legal definition of a sewer. This replaces the formerly voluntary Sewers for Adoption. The new guidance came into force in April 2020 and compliance by water companies in England is mandatory.

The previous standards, up to and including Sewers for Adoption Version 7, included a narrow definition of sewers to mean below-ground systems comprising of gravity sewers

and manholes, pumping stations, and rising mains. This excluded the adoption of SuDS by water companies, except for below-ground storage comprising of oversized pipes or chambers.

The new guidance provides a mechanism for water companies to secure the adoption of a wide range of SuDS components which are now compliant with the legal definition of a sewer. There are however several non-adoptable components such as green roofs, pervious pavements, and filter strips. These components may still form part of a drainage design so long as they remain upstream of the adoptable components.

The Design and Construction Guidance states that the drainage layout of a new development should be considered at the earliest stages of design. It is hoped that the new guidance will lead to better managed and more integrated surface water systems which incorporate amenity, biodiversity, and water quality benefits.

2.7 Environmental Protection and Biodiversity

2.7.1 The Environment Act 2021

The Environment Act (HM Government, 2021) came into UK law in November 2021 with the aim of protecting and enhancing the environment. The Act has objectives to improve air and water quality, biodiversity, waste reduction, and resource efficiency. The implementation of the policies within the Environment Act has begun, and legally binding environmental targets are being developed. This will be enforced by the Office for Environmental Protection (OEP). More information is available on the OEP website (theoep.org.uk).

The Environment Act (Part 5) contains policies concerning improvements to the water environment. These policies have the following aims:

- Effective collaboration between water companies through statutory water management plans;
- Minimise the damage that water abstraction may cause on environment; and
- Modernise the process for modifying water and sewerage company licence conditions.

Further to this, there is specific legislation regarding storm overflows aiming to reduce the discharge of untreated sewage into waterways. This plan includes requirements for water companies to:

- Report on the discharges from storm overflows;
- Monitor the quality of water potentially affected by discharges;
- Progressively reduce the harm caused by storm overflows; and
- Report on elimination of discharges from storm overflows.

2.7.2 25-year Environment Plan

The Environmental Improvement Plan (EIP) is the first revision of the 25-year environment plan (25YEP) published in 2018 and updated in 2023. It contains ten goals which are shown in Figure 2.1. The government must review and revise the plan, if needed, every five years to ensure continued progress against the ten 25YEP goals.

Of particular importance to a WCS is Goal 3 - Clean and plentiful water.

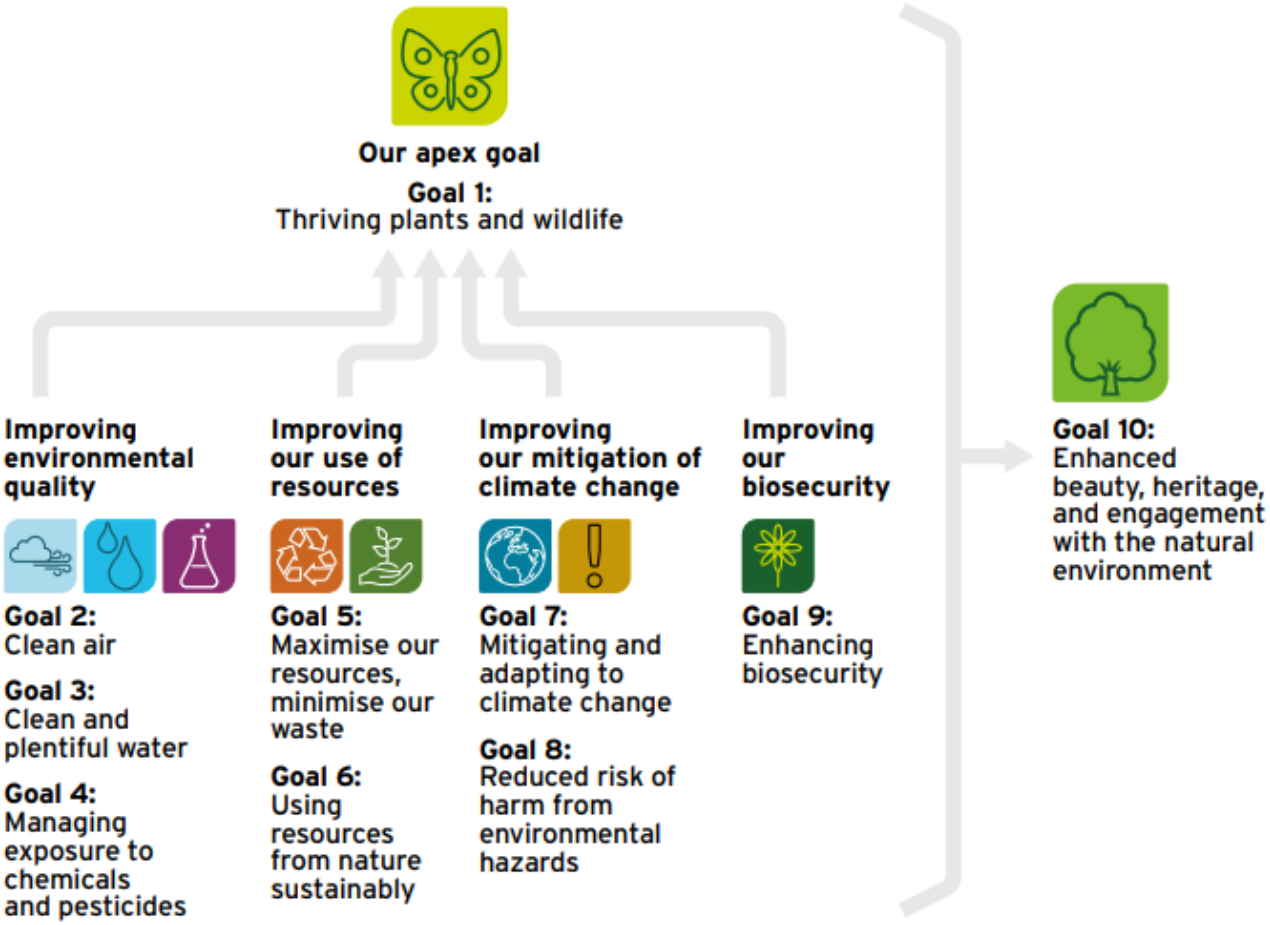

Figure 2.1 The 10 Environmental Improvement Plan goals

Under Goal 3 - Clean and plentiful water, there are eight sets of targets and commitments relating to different aspects of the water environment:

- "Reduce nitrogen, phosphorus, and sediment pollution from agriculture into the water environment by at least 40% by 2038, compared to a 2018 baseline, with an interim target of 10% by 31 January 2028, and 15% in catchment containing protected sites in unfavourable condition due to nutrient pollution by 2028.
- Reduce phosphorus loadings from treated wastewater by 50% by 2028 and 80% by 2038 against a 2020 baseline.
- Halve the length of rivers polluted by harmful metals from abandoned mines by 2038, against a baseline of around 1,500km (approximately 930 miles).

- Reduce the use of public water supply in England per head of population by 20% from the 2019-20 baseline, 2038, with interim targets of 9% by 2027 and 14% by 2032, and to reduce leakage by 20% 2027 and 30% by 2032.
- Restore 75% of our water bodies to good ecological status.
- Require water companies to have eliminated all adverse ecological impact from sewage discharges at all sensitive sites by 2035, and at all overflows by 2050.
- Target a level of resilience to drought so that emergency measures are needed only once in 500-years."

To deliver these goals, the EIP outlines action across these areas:

- Improving wastewater infrastructure and water company environmental performance;
- Reducing pressures on the water environment from agriculture;
- enabling the sustainable use of water for people, business and the environment;
- Tackling pressures from chemicals and pollutants;
- Restoring natural function and iconic water landscapes; and
- Joined-up management of the water system.

Progress towards delivering the EIP will be monitored annually.

2.7.3 Defra Plan for Water

Defra's Plan for Water (Department for Environment, Food & Rural Affairs, 2023) provides further detail on the actions towards achieving Goal 3 of the EIP23 It promotes an integrated approach to water management as the foundation of the plan. While many of the actions contained within the Plan for Water are outside of the responsibilities of areas of influence of the LPAs, the following summarises those actions that LPAs should have regard to:

- Require standardised SuDS in new housing developments in 2024, subject to final decisions on scope, threshold, and process following consultation in 2023.
- Designate all chalk catchments as water stressed and high priority under the sewer overflows reduction plan, driving action to improve water management.
- The plan reflects the predicted four billion litre per day (4,000 ml/d) gap between supply and demand across England and contains measures to both boost supply and reduce demand. Of interest to LPAs is the plan to reduce demand which will address half of the gap.
- A key component in reducing demand for water is improving water efficiency and there is a target under the Environment Act to reduce the use of public water supply in England per head of population by 20% by 2038. A road map on water efficiency in new developments and retrofits has been developed with ten actions to improve water efficiency:
    - **Action one -** Implement schedule 3 to the Flood and Water Management Act 2010. The 2024 consultation will consider rainwater harvesting in developing the statutory SuDS National Technical Standards.

- **Action two -** Review the Water Supply (Water Fittings) Regulations 1999, the Water Supply (Water Quality) Regulations 2016 and/or any other relevant legislation to address wasteful product issues with toilets and enable new water efficient technologies.
- **Action three -** Develop clear guidance on ‘water positive’ or ’net zero water’ developments and roles for developers and water companies.
- **Action four -** Review water efficiency options in planning, building regulations and through voluntary schemes for non-household buildings.
- **Action five -** Work with Ofwat to ensure the water industry can play a central role in retrofitting water efficient products in households, businesses, charities and the public sector.
- **Action six -** Work across government to integrate water efficiency into energy efficiency advice and retrofit programmes.
- **Action seven -** Review the Building Regulations 2010, and the water efficiency, water reuse and drainage standards including considering a new standard for new homes in England of 105 l/p/d and 100 l/p/d where there is a clear local need.
- **Action eight -** Mandatory water efficiency labelling scheme.
- **Action nine -** Investigate dual pipe systems (rainwater harvesting) and water reuse options for new housing development as part of the review of the planning framework.
- **Action ten -** Enable innovative water efficiency approaches in buildings, including technologies and approaches to funding and maintenance.

2.7.4 Biodiversity Net Gain

Biodiversity net gain (BNG) is designed to contribute to the recovery of nature while developing land. The principle is that the natural environment is in measurably better state after development than it was before. The Environment Act 2021 has, since 2024 required all planning permissions granted in England to achieve 10% BNG.

Defra publishes a biodiversity metric tool, the latest version of which must be used for calculating the BNG deriving from a proposed development.

2.7.5 Local Nature Recovery Strategy

The Environment Act (HM Government, 2021) also established a duty to prepare, by March 2025, Local Nature Recovery Strategies (LNRS), recognising that England is one of the most nature-depleted countries in the world. Gloucestershire County Council are the authority responsible for preparing the LNRS In the study area. They are tasked with working with local partners to agree priorities for nature recover and identify "practical, achievable proposals" (Department for Environment Food & Rural Affairs, 2023) to address these priorities. The LNRS should also co-ordinate with neighbouring strategies to form a national Nature Recovery Network.

There is a close linkage with BNG, as developments proposing to create, enhance or recover habitat in locations mapped by the LNRS receive a higher value in the biodiversity metric calculator than in other locations.

2.7.6 Storm Overflow Reduction Plan

The Environment Act 2021 placed a legal duty on water companies to progressively reduce the adverse impacts of discharges from storm overflows. The storm overflow discharge reduction plan sets the following targets:

- By 2035, water companies will have: improved all overflows discharging into or near every designated bating water; and improved 75% of overflows discharging to high priority sites.
- By 2050, no storm overflows will be permitted to operate outside of unusually heavy rainfall or to cause any adverse ecological harm.

There is also an expectation that water companies ensure their infrastructure keeps pace with increasing external pressures, such as urban growth and climate change, without these pressures leading to greater numbers of discharges.

2.7.7 The Water Framework Directive (WFD) and Water Environment Regulations

Introduction

The European Union WFD 2000 is currently transposed into English and Welsh law by the Water Environment Regulations 2017. They apply to all waterbodies (watercourses, canals, lakes, estuaries and coastal waters), with the objective of meeting Good Ecological Status (GES) or, where heavily modified, Good Ecological Potential (GEP). To meet GES or GEP, a water body must achieve a good or high score for all elements - in the case of surface water, these are biological, physico-chemical, specific pollutants and hydromorphology. These elements are shown in Figure 2.2, which is from the webpage on how to use the Catchment Data Explorer (environment.data.gov.uk). UK policy remains to meet GES or GEP for all waterbodies by 2027.

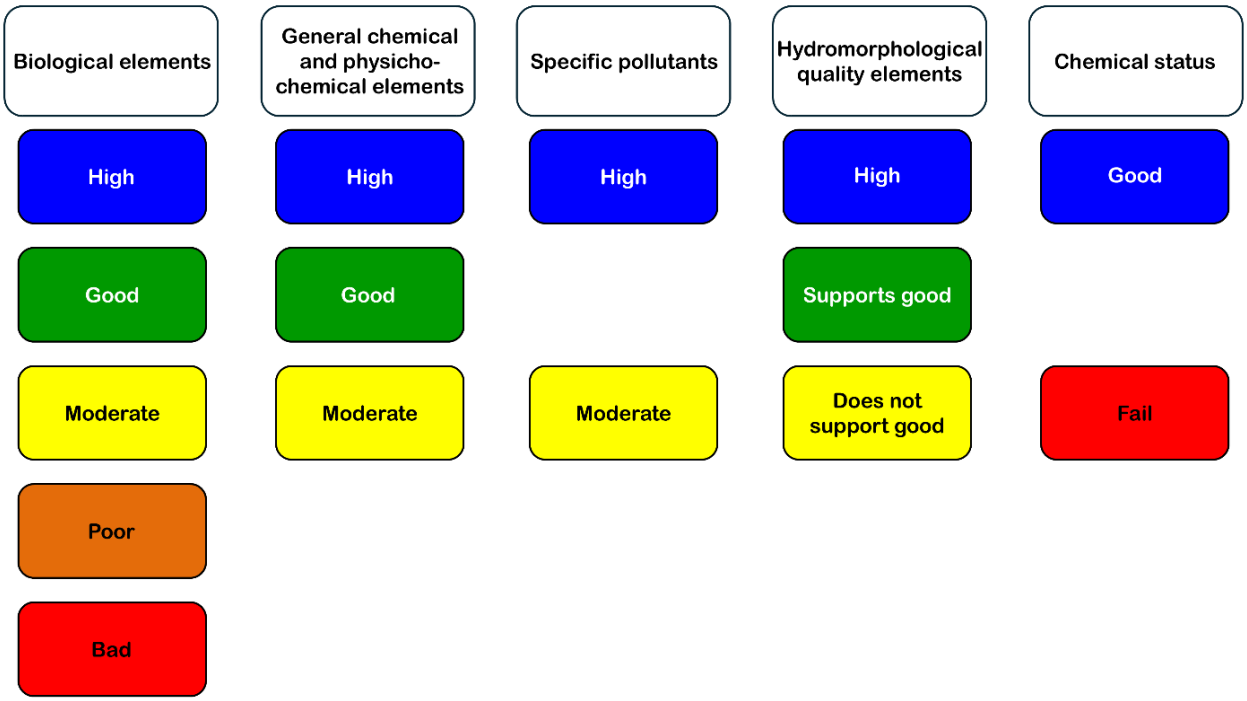

Figure 2.2: Status classification for surface water (EA, 2023)

Chemical Status is separately assessed. The WFD and the EA recognise a group of ubiquitous chemicals which are persistent, bioaccumulative or toxic (uPBT), and without which over 90% of England's waterbodies would achieve Good Chemical Status. Mercury, Perfluorooctanesulfonic acid (PFOS) and Polybrominated diphenyl ethers (PBDE) are the most ubiquitous causes of failures. Due to the persistent nature of these chemicals, the date for getting all waterbodies to Good Chemical Status is set for 2063.

River Basin Management Plans

River Basin Management Plans (RBMP) are required under the WFD and document the baseline classification of each waterbody in the plan area, the objectives, and a programme of measures to achieve those objectives. Cotswold District falls within the Thames RBMP (2022). The third cycle RBMPs were published in 2022. A primary WFD objective is to ensure 'no deterioration' in environmental status, therefore all water bodies must meet the class limits for their status class as declared in the Anglian and Thames River Basin Management Plan. Another equally important objective requires all water bodies to achieve good ecological status. Future development needs to be planned carefully so that it helps towards achieving the WFD and does not result in further pressure on the water environment and compromise WFD objectives. The WFD objectives as outlined in the updated RBMPs are summarised below:

- Preventing deterioration of the status of surface waters and groundwater.
- Achieving objectives and standards for protected areas.
- Aiming to achieve good status for all water bodies.
- Reversing any significant and sustained upward trends in pollutant concentrations in groundwater.

- Cessation of discharges, emissions and losses of priority hazardous substances into surface waters.
- Progressively reducing the pollution of groundwater and preventing or limiting the entry of pollutants.

LPAs must have regard to the WFD as implemented in the RBMP. It is of primary importance when assessing the impact of additional wastewater flows on local river quality.

Alongside the RBMP documents, the data behind them can be explored further using the Catchment Data Explorer (environment.data.gov.uk) and map viewer (environment.maps.arcgis.com).

Protected Area Objectives

The Water Environment Regulations specify that areas requiring special protection under other EU Directives, and waters used for the abstraction of drinking water, are identified as protected areas. These areas have their own objectives and standards.

Some areas may require special protection under more than one piece of European Union-derived legislation or may have additional (surface water and/or groundwater) objectives. In these cases, all the objectives and standards must be met.

The types of protected areas are:

- Areas designated for the abstraction of water for human consumption (Drinking Water Protected Areas);
- Areas designated for the protection of economically significant aquatic species (Freshwater Fish and Shellfish);
- Bodies of water designated as recreational waters, including Bathing Waters;
- Nutrient-sensitive areas, including areas identified as Nitrate Vulnerable Zones under the Nitrates Directive or areas designated as sensitive under Urban Waste Water Treatment Regulations; and
- Areas designated for the protection of habitats or species where the maintenance or improvement of the status of water is an important factor in their protection including relevant National sites.

2.7.8 Conservation of Habitats Regulations 2017 (as amended)

The Conservation of Habitats and Species Regulations 2010 (commonly referred to as the Habitats Regulations) consolidated the Conservation (Natural Habitats, &c.) Regulations 1994 and transposed the EU Habitats Directive in England and Wales which was aimed at protecting plants, animals and habitats that make up the natural environment. The regulations were further amended in 2017.

The Habitats Regulations define the requirement for a Habitats Regulations Assessment (HRA) to be carried out. The purpose of this is to determine if a plan or project may affect the protected features of a “habitats site”. These include:

- A Special Area of Conservation (SAC) or candidate SAC.
- A Site of Community Importance (SCI).

- A site hosting a priority natural habitat type or priority species protected in accordance with Article 5(4) of the Habitats Directive.
- A Special Protection Area (SPA) or potential SPA.
- Ramsar sites.

All plans and projects (including planning applications) which are not directly connected with, or necessary for the conservation management of a habitat site require consideration of whether the plan or project is likely to have significant effects on that site.

This is referred to as the "Habitats Regulations Assessment screening" and should take into account the potential effects of both the plan/project itself and in combination with other plans or projects.

Part 6 of the conservation of Habitats and Species Regulations 2017 states that where the potential for likely significant effects cannot be excluded, a competent authority must make an appropriate assessment of the implications of the plan or project for that site, in view of the site's conservation objectives.

The competent authority may agree to the plan or project only after having ruled out adverse effects on the integrity of the habitats site.

If adverse effects cannot be rules out, and where there are no alternative solutions, the plan or project can only proceed if there are imperative reasons of over-riding public interest and if the necessary compensatory measures can be secured.

The "People over Wind" ECJ ruling (C-323/17) clarifies that when making screening decisions for the purposes of deciding whether an appropriate assessment is required, competent authorities cannot take into account any mitigation measures. This must be part of the appropriate assessment itself.

The implementation of the Conservation of Habitats Regulations have had particular significant implications in two areas related to water and planning:

- Nutrient Neutrality. Natural England (NE) has identified a number of catchment areas where Habitats Sites are in unfavourable condition due to eutrophication (an excess of the nutrients phosphorous and/or nitrogen in water). NE have advised that developments in these catchments must demonstrate that they do not cause harm, and that one way to do this is to introduce mitigation measures in the catchment area which offset the additional nutrients emitted as a result of the development, an approach known as nutrient neutrality. There are no parts of the study area which are currently within a nutrient neutrality catchment area, however NE may designate additional areas in the future.
- Water Neutrality. Natural England (NE) has issued a position statement that it cannot be concluded with sufficient certainty that groundwater abstractions in the Arun Valley, West Sussex are causing no adverse effect on Habitats Sites. NE have advised that developments in Sussex North Water Resource Zone must demonstrate that they do not cause harm, and that one way to do this is to introduce mitigation measures in the zone which offset the additional water consumed as a result of the development, an approach known as water

neutrality. There are no parts of the study area which are currently within a water neutrality zone, however NE may designate additional areas in the future.

Both nutrient and water neutrality designations have resulted in significant impacts on the granting of planning permission in the designated areas.

2.7.9 Wildlife and Countryside Act

Sites of Special Scientific Interest (SSSI) are designated and legally protected under the Wildlife and Countryside Act 1981, Section 28G places a duty to take reasonable steps, consistent with the proper exercise of the authority's functions, to "further to the conservation and enhancement of the flora, fauna or geological or physiographical features by reason of which the site is of special scientific interest." (HM Government, 1981).

The Government's 25-year Environment Plan has a target of "restoring 75% of our one million hectares of terrestrial and freshwater protected sites to favourable condition, securing their wildlife value for the long term." In line with this, and the Wildlife and Countryside Act 1981, Local Authorities should look put forward options that contribute to conservation or restoration of favourable condition, and at the very least must not introduce policies that hinder the restoration of favourable condition by increasing existing issues.

A site is said to be in "favourable condition" when the designated feature(s) within a unit are being adequately conserved and the results from monitoring demonstrate that the feature(s) in the unit are meeting all the mandatory site-specific monitoring targets set out in the favourable condition targets (FCT).

2.7.10 Ramsar

The Convention on Wetlands of International Importance, more commonly known as the Ramsar convention, aims to protect important wetland sites. Member counties commit to:

- 'Wise use' (ramsar.org) of all their wetlands, defined under the convention as 'the maintenance of their ecological character, achieved through the implementation of ecosystem approaches, within the context of sustainable development';
- Designating sites for the Ramsar list of 'Wetlands of International Importance' (Ramsar Sites) and their conservation; and
- Cooperating on transboundary wetlands and other shared interests.
- In the UK, Ramsar Sites are designated by the Joint Nature Conservation Committee (JNCC).

In general, the designation of UK Ramsar sites is underpinned through prior notification of these areas as SSSIs. Additionally, the NPPF states, (Paragraph 194), that Ramsar sites should be given the same protection in the planning process as sites designated under the European Union Habitats Directive.

2.7.11 Bathing Water Regulations

The Bathing Water Directive was first published in 2006 and are currently transposed into English and Welsh law through the Bathing Water Regulations 2013. The aims of the

directive are the protection of public health whilst bathing, standardisation of publicly available water quality information and to improve management practices at bathing waters.

The UK has over 600 designated bathing waters defined as areas of inshore waters designated for public swimming, these areas are typically characterised by large numbers of swimmers and visitors per year. The Environment Agency are required to monitor water quality at these sites regularly (usually weekly) throughout the Bathing Water season, between 15th May and 30th September.

Water quality standards are based on the incidence of potentially harmful bacteria, E. coli and intestinal enterococci and are categorised as 'excellent', 'good', 'sufficient' or 'poor' on the basis of bacteria levels. Sites are rated annually and on a short-term basis in response to any temporary pollution incidents.

Achieving compliance with the Bathing Water Directive has driven some £2.5bn of investment by UK water companies since the early 1990s to reduce the impact of sewerage systems and treated wastewater discharges. Measures have included storage and surface water management to reduce storm overflow spills, moving or extending effluent outfalls and improving wastewater treatment, including ultra-violet (UV) treatment of final effluent.

In contrast to some other European nations, the UK has not previously designated stretches of river as bathing waters. However, following consultation (gov.uk), 27 proposed sites were added to a list of designated bathing waters from the 2024 bathing season. Consultation on the designation of a further 13 proposed bathing water sites was completed in March 2026. At the time of writing, analysis of the responses and supporting evidence are currently under review. Across England there are numerous campaigns by NGOs and members of the public to designate other stretches of river. Defra has published guidance on applying for bathing water status, including a requirement for at least 100 bathers per day during the season.

2.7.12 Environmental Permitting Regulations

Environmental permitting is a process used to manage and regulate activities which may cause harm to the environment. The Environmental Permitting Regulations 2016 were introduced in order to streamline a wide-ranging number of environmental permitting laws under one set of regulations. These include permits for emissions to air, water and land, and cover a range of industrial sectors and waste management streams.

Of particular relevance to this study are the regulations for permitting sewage effluent discharges to surface waters and groundwaters, known as water discharge activities.

- The regulations are used to permit discharges from water company and private WwTW, and for sewer overflows.
- The EA will usually object to applications for a new private Package Treatment Plan (PTP) or septic tank where it is feasible to connect the development to a public sewerage system. A general rule of 30m per dwelling is used to define a reasonable distance from the site boundary to a public sewer. Hence a

development of ten homes should connect to a public sewer within 300m of the boundary, unless there are significant barriers, such as a river or motorway.

- Where an existing or new development treats its own wastewater, a PTP must be installed if the discharge is directly to surface water. Where the discharge is to ground, a PTP or septic tank may be used, but must be connected to a suitably designed drainage field.

2.7.13 Groundwater protection

Under the regulations, the EA have published a set of position statements on protecting groundwater from various activities (Environment Agency, 2018). The position statements that are relevant to this study with regard to discharges to groundwaters, include surface water drainage and the use of SuDS, discharges from contaminated surfaces (e.g., lorry parks) and from treated sewage effluent.

The EA also maintain a set of maps of Source Protection Zones (SPZs) to help identify high risk areas within which pollution prevention measures should be implemented. The SPZs show the risk of contamination to public water supplies from activities that may cause pollution in the area, the closer the activity, the greater the risk:

- **Zone 1 (Inner protection zone)** This zone is designed to protect against the transmission of toxic chemicals and water-borne disease. It indicates the area in which pollution can travel to the borehole within 50 days from any point within the zone and applies at and below the water table. There is also a minimum 50 metre protection radius around the borehole.
- **Zone 2 (Outer protection zone)** This zone indicates the area in which pollution takes up to 400 days to travel to the borehole, or 25% of the total catchment area, whichever area is the largest. This is the minimum length of time the Environment Agency think pollutants need to become diluted or reduce in strength by the time they reach the borehole.
- **Zone 3 (Total catchment)** This is the total area needed to support removal of water from the borehole, and to support any discharge from the borehole.
- **Zone of special interest** This is defined on occasions, usually where local conditions mean that industrial sites and other polluters could affect the groundwater source even though they are outside the normal catchment.

2.8 Summary of key new and emerging policy and legislation

The policy and legislation covering the water environment, water and wastewater services and planning is wide and frequently changing. The new and emerging policy and legislation below have been identified as particularly important for consideration in the development of the Local Plan:

- In July 2024 a new Government was formed and committed to reform the planning system, including a new standardised method of calculating local housing need.

- The Water (Special Measures) Act 2025, which received Royal Assent in February 2025, gives regulators stronger powers to act swiftly against water companies that harm the environment or fail customers. It allows Ofwat to ban executive bonuses if firms fall short on environmental, customer service, or financial standards. Other measures include automatic penalties to speed up enforcement, independent monitoring of all sewage outlets, and mandatory real-time reporting of emergency overflows within an hour of a spill.
- The Storm Overflow Assessment Framework (SOAF) was updated in 2025. This guidance builds on the implementation of the SOAF during the PR19 period (2020 to 2025) to improve and make the process more effective. Changes since the first framework include: a reduction in the trigger threshold for high spill frequency overviews to reflect requirements to improve storm overflow performance; linking to the most up to date process for water quality modelling investigations; and updates to related documentation including that on the process of the cost benefit assessment.
- The Independent Water Commission report (AKA The Cunliffe Report) recommended a simplification of the water planning system is recommended, with a comprehensive systems planning framework for England and Wales with responsibility for integrated and holistic water system planning. In response, the government announced that Ofwat would be abolished and replaced by 'a new, single, powerful regulator'.
- As of July 2025, the Defra National standards for SuDS were brought in to comply with the principles of surface water drainage design.
- Schedule 3 of the Flood and Water Management Act will designate LLFAs as SuDS Approval Bodies (SABs) with a duty to adopt new SuDS and removing the automatic right to connect to public sewers. The previous Government affirmed its commitment for enacting Schedule 3; however, it is currently unknown whether the current Government intends to do this or what the proposed timescales would be.
- Defra has recently consulted on a revised national water efficiency standard for new homes of 105 l/p/d or 100 l/p/d where there is a clear local need.
- All developments are now expected to demonstrate at least a 10% biodiversity net gain.

3 Future growth in Cotswold District

3.1 Growth in Cotswold District

The current Local Plan, covering the period from 2011 to 2031, was adopted in August 2018 by the Cotswold District Council (CDC) (Cotswold District Council, 2018). Prior to July 2025, the Council was preparing a partial update of the adopted Local Plan (the Local Plan Partial Update (LPPU)). In July 2025 Full Council voted to combine the Partial Update and Development Strategy and Sites Allocation Plan into a single Full Local Plan Update. The adoption of the next plan is anticipated in the winter of 2027 (Cotswold District Council, 2025).

For the purpose of this report, the local plan period will be 2025- 2043 although at the time of writing CDC are exploring the avenue of shortening it to 2026- 2043 prior to the Regulation 19 consultation.

The following section summarises expected growth across CDC during the plan period. This generates a forecast that can be used to estimate the volume of water and wastewater required in the future and assess the impact of the resulting pressure on water infrastructure.

The forecast consists of:

- **Allocations** - sites specifically defined in the Local Plan review.
- **Committed sites** - sites which have been granted planning permission.
- **Recent completions** - sites completed in the last year (2023/24) that may not yet appear in flow data provided by water companies. This does not include completions prior to April 2023 as these are already represented in baseline water company flow data.
- **Windfall** - sites that have not been specifically identified in the Local Plan, normally comprised of previously developed sites that have unexpectedly come available.
- **Neighbouring authority growth** - growth located outside of the district, but which will be served by infrastructure within or shared with the study area.

The government establishes specific housing needs for each council annually to ensure that housing development aligns with the unique demographic, economic, and social requirements of different regions. By setting tailored housing targets, the government can better manage population growth, support local economies, and provide adequate housing for communities.

In December 2024, the government increased the annual housing requirement for Cotswold District to 1,036 homes.

Table 3.1 All potential growth in Cotswold district by wastewater treatment works catchment

WwTW	Potential housing	Employment space (m^2)
Ampney St Peter STW	5,062	109,000
Andoversford STW	109	0
Blockley (WRW)	65	0
Bourton-on-the-Water STW	934	0
Broadwell STW	198	0
Chipping Campden (WRW)	198	0
Cirencester STW	11,600	252,912
Fairford STW	2,018	42,000
Honeybourne (WRW)	1,412	0
Lechlade STW	220	0
Moreton-in-Marsh STW	4,302	51,000
Tetbury STW	336	0
No public sewerage in the vicinity	153	0
Total	**26,607**	**454,912**

3.2 Windfall

An estimate of Windfall during the Local Plan period was provided by CDC, broken down by parish. This has been assigned to the appropriate WwTW as shown in Table 3.2.

Table 3.2 All potential windfall in Cotswold district by wastewater treatment works catchment

WwTW	Potential housing
Andoversford STW	47
Blockley (WRW)	0
Bourton-on-the-water STW	501
Broadwell STW	57
Cirencester STW	1,300
Fairford STW	206
Honeybourne (WRW)	7
Lechlade STW	52
Moreton-in-marsh STW	266
Tetbury STW catchment	55
Total	**2,491**

3.3 Growth outside of Cotswold District

3.3.1 General approach

Where growth within a neighbouring Local Planning Authority (LPA) area may be served by infrastructure within or shared with Cotswold district, the LPA were contacted as part of a Duty to Cooperate request to provide information on:

- The latest growth forecast (housing and employment) for the local plan area.
- Details of future growth within the catchments of WwTW which serve part of their council area and Cotswold district.

3.3.2 Cheltenham

Heyden WwTW serves a population in both Cotswold district and Cheltenham. There is not expected to be any growth in this catchment from CDC within the Local Plan period. This WwTW has not been assessed further.

3.3.3 Stratford-on-Avon

Nethercote WwTW serves a population in both Cotswold district and Stratford-upon-Avon District. There is not expected to be any growth from either Cotswold district or Stratford-upon-Avon District Council at this WwTW within the Local Plan period. This WwTW has not been assessed further.

3.3.4 Wiltshire

Didmarton WwTW serves a population in both Cotswold district and Wiltshire. Wiltshire Council provided the location and size of future housing development sites from their Neighbourhood Plan and outlined permissions. There is not expected to be any growth from either Cotswold district or Wiltshire Council at this WwTW within the Local Plan period. This WwTW has not been assessed further.

3.3.5 Wychavon

Wychavon District Council provided the allocated sites from the draft South Worcestershire Development Plan. There is one site within the Honeybourne WwTW catchment, which serves Cotswold District and would be serving the proposed allocations.

Table 3.3 Growth from Wychavon using infrastructure shared with Cotswold district

WwTW	Proposed number of dwellings	Potential employment space (m^2)	Period
Honeybourne	None identified	31	Up to 2041

3.3.6 Neighbouring authorities with no shared wastewater infrastructure

The following LPAs share a boundary with Cotswold district but do not share any wastewater infrastructure:

- South Gloucestershire
- Stroud
- Swindon
- Tewkesbury
- West Oxfordshire
- Vale of White Horse

3.4 Growth and water demand

3.4.1 Water demand from housing

The estimate of water demand from each housing site was based on the number of houses, and per capita consumption and average occupancy statistics taken from the relevant water supply companies Water Resource Management Plan (WRMP24) tables. The base year 2024/25 was used and was assumed to stay the same throughout the plan period. This represents the baseline "business-as-usual" scenario, not accounting for water efficient design and supply and demand measures from the water companies' WRMPs.

3.4.2 Water demand from employment sites

Demand from employment sites was calculated assuming a rate of 100l/d per employee. Where the forecast number of employees for a site was not specified by CDC, employment floorspace and assumed density based on employment use classes was used to calculate an indicative number of employees for a site. Table 3.4 below outlines the assumed densities of employment space derived from the Homes and Communities Agency (2015) Employment Density Guide third edition. This guide pre-dates recent changes in working practices including the Covid-19 pandemic and technological changes to support working from home and automation.

Table 3.4: Employment use classes and assumed densities used to calculate water demand.

Use class	Description	Density (m^2/employee)
B1	Offices (assumed)	32
B1a	Offices	8
B1b	Research and development space	40
B1c	Light industrial	47
B2	Industrial and manufacturing	36
B8	Storage and distribution	70

Use class	Description	Density (m^2/employee)
Mixed B	Mixed	32.75
B1, B2, B8	Mixed	38
Mixed A	Mixed	15

3.4.3 Business as usual Water Demand Forecast

The impact of planned growth across the CDC's Local Plan Review period on water demand is summarised in Figure 3.1 below, displaying demand from each source of growth outlined in Table 3.1 and from neighbouring authorities. Additional water demand from planned development in CDC is forecast to grow by 9.78 Ml/d across the five-water industry Asset Management Plan (AMP) periods spanning the Local Plan period.

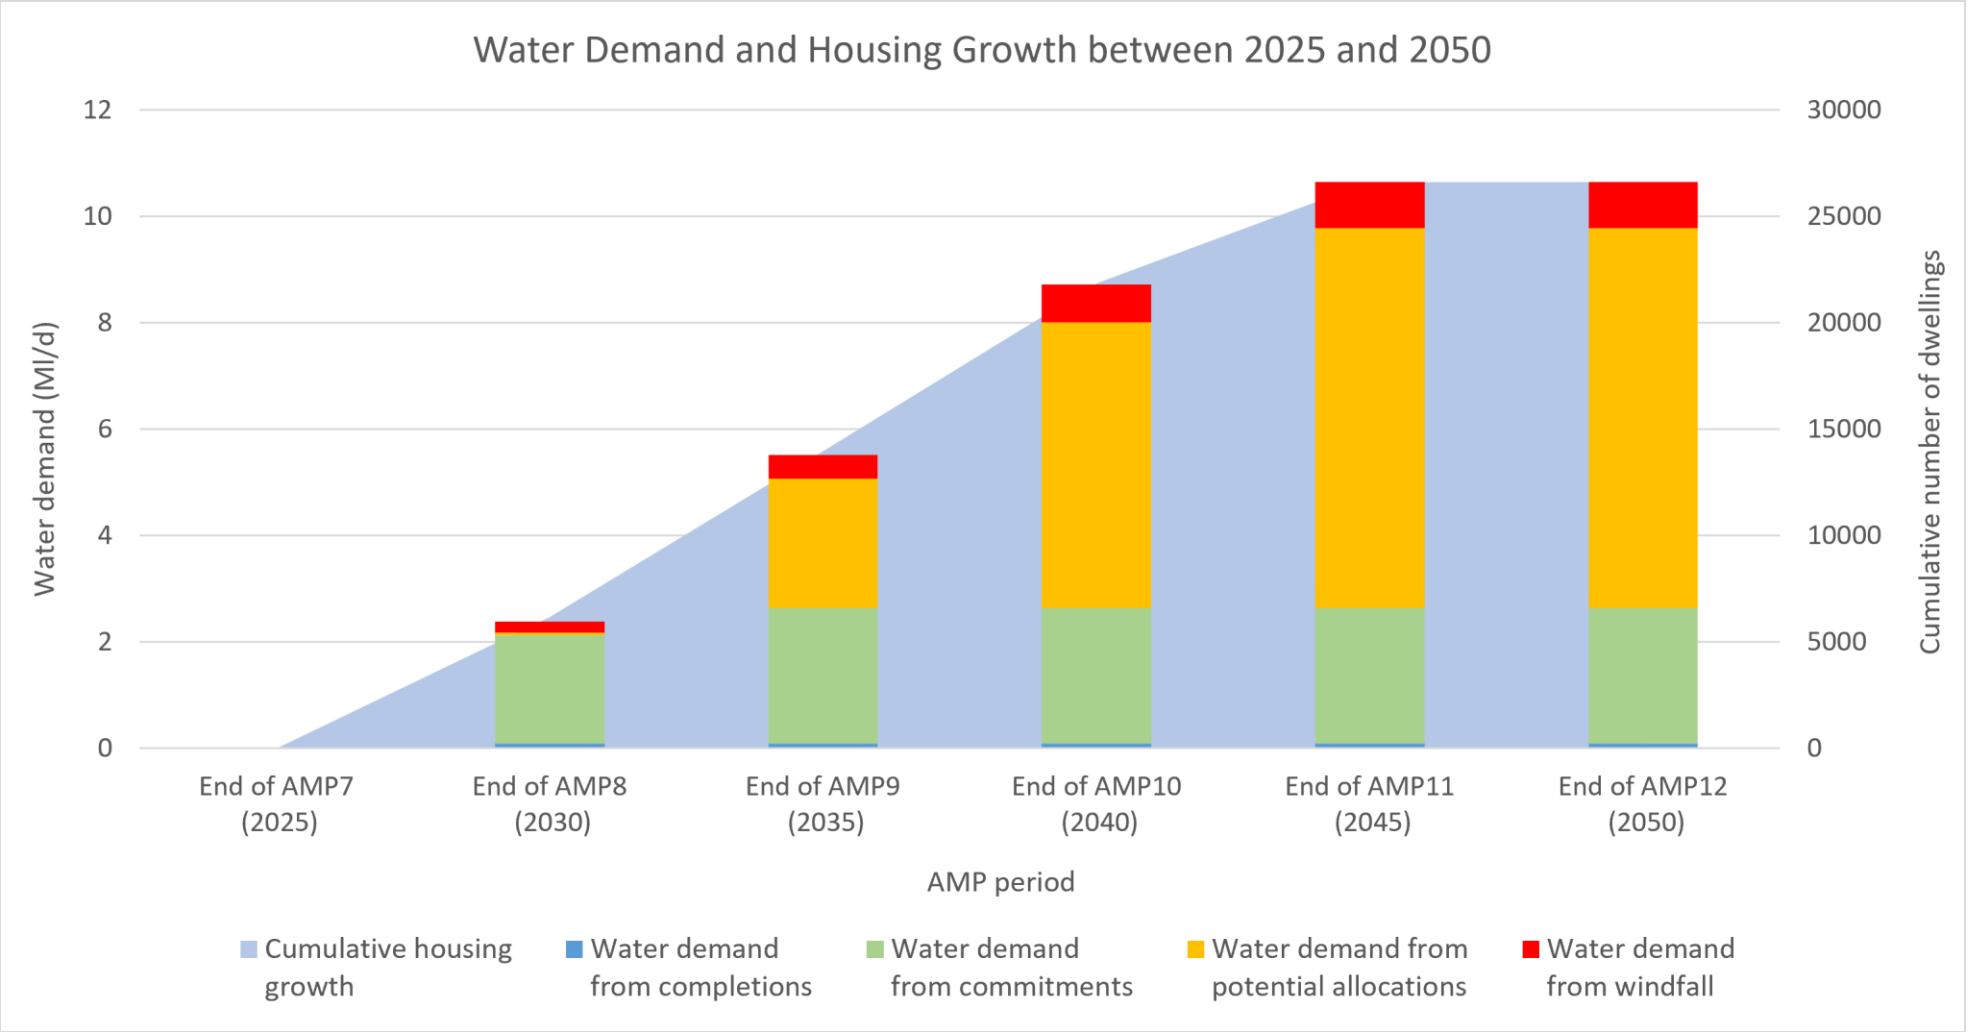

Figure 3.1: Cumulative water demand driven by additional dwellings forecast across the Local Plan period

4 Water resources

4.1 Introduction

4.1.1 Objectives

The aim of the water resources assessment is to ensure that sufficient water is available in the region to serve the proposed level of growth, and that it can be abstracted without a detrimental impact on the environment, both during the plan period and into the future. The assessment characterises the study area, identifying the key surface water and groundwater bodies, and local geology. It highlights the pressures on water resources in the region, identifies existing constraints on abstraction, and provides evidence for adopting tighter water efficiency targets.

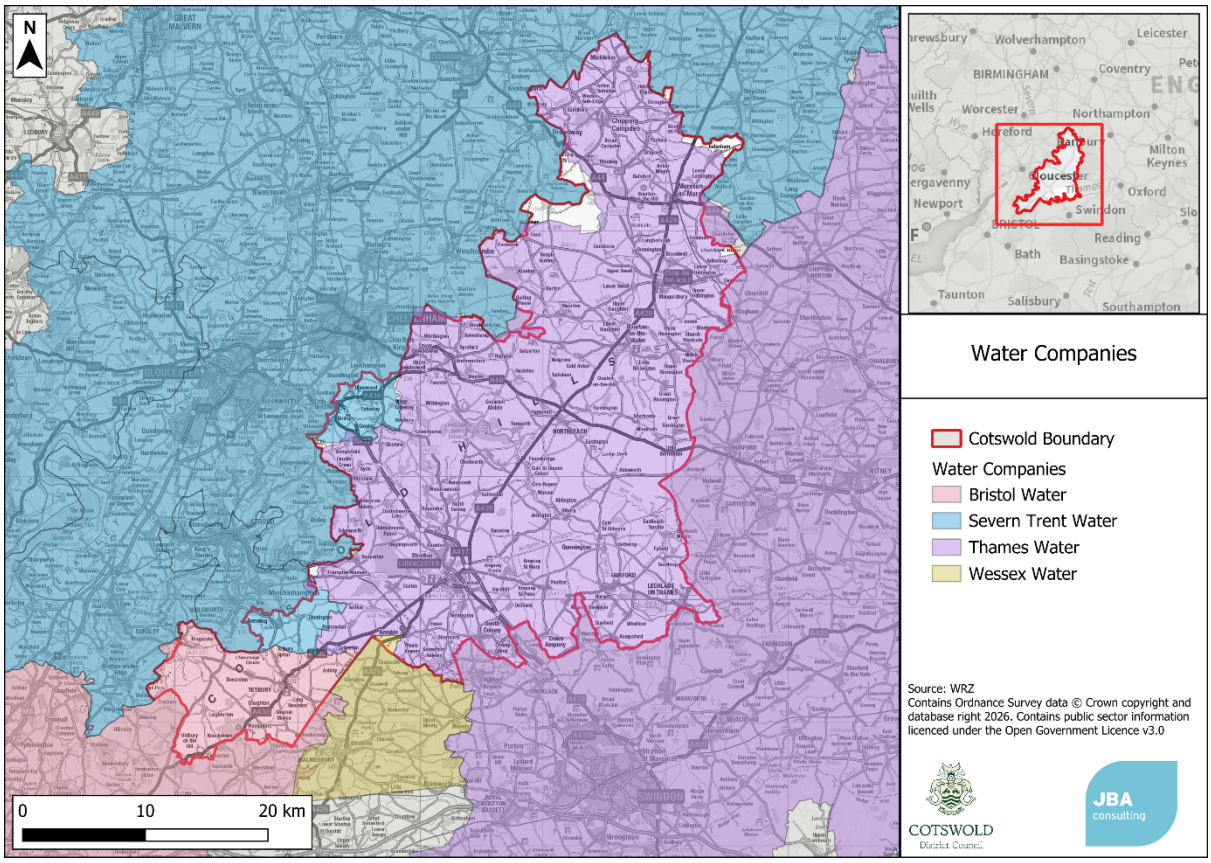

Figure 4.1 Water supply areas

4.1.2 Water resources in England

It is important to set water resources in Cotswold District within the context of the overall national picture.

The EA (Environment Agency, 2024) published a summary of England's revised draft regional and water resources management plans (gov.uk) which includes their view

on the overall state of water resources in the UK and the challenges the country faces. They state that:

'In England, our climate is changing, our population is growing, and as a nation we want an improved environment along with a thriving economy, enabled by resilient water supplied. Action is required now to meet these objectives'.

'The scale of the challenge we face increases with time, and, by 2050, we are looking at a shortfall of nearly 5 billion litres of water per day between the sustainable water supplied available and the expected demand.'

'Demand reductions are crucial, particularly in the short term. The Environment Act 2021 sets a target to reduce the use of public water supply in England, per head of population, by 20% by 2037-38 from the 2019-20 baseline.'

'Government will be looking to water companies to act quickly and take significant steps forward on installing smart meters and delivering on their wider water efficiency commitments and reducing leakage. This will happen alongside the introduction of a mandatory water label which will enable water efficient decisions across the country. The government has also committed to review water efficiency requirements of building regulations which will be a key action to ensure new homes are water efficient.'

There have been several important documents published in recent years, all highlighting the growing awareness and concern about this issue. The National Water Resources Framework led to the creation of the regional water resources planning groups and defined the objective to achieve an average household water efficiency of 110l/p/d by 2050 (including existing housing).

The Government's EIP published in January 2023 contains a roadmap for improving water efficiency in new developments and retrofits. This contains an action to review Building Regulations (2010) and consider a new standard for new homes in England of 105 l/p/d and 100 l/p/d where there is a clear local need, such as in areas of serious water stress. Whilst this is not current policy, it is likely that a tighter standard than the 110l/p/d will be adopted in Building Regulations early in the Local Plan period.

4.2 Characteristics of the study area

4.2.1 Introduction

This section aims to review the geological and hydrogeological setting of the Cotswolds (the "study area") and the aquifer properties of the groundwater bodies, which will both supply and receive water discharges from the area and be affected by continued development.

4.2.2 Topography

The topography of the study area is shown in Figure 4.2 below. The southern and eastern sections of the district are relatively flat river floodplains (green), which extend into river valleys orientated north to south through the district with the highest elevations in the north (red and white). The river valley basins range between 75-80 mAOD which increase to at maximum 265mAOD in the north. Therefore, the majority of overland surface water (and consequently groundwater) will flow from the northern district boundary towards the south, with minor exceptions where smaller river valleys are orientated south to north towards the Stroud and Cheltenham districts.

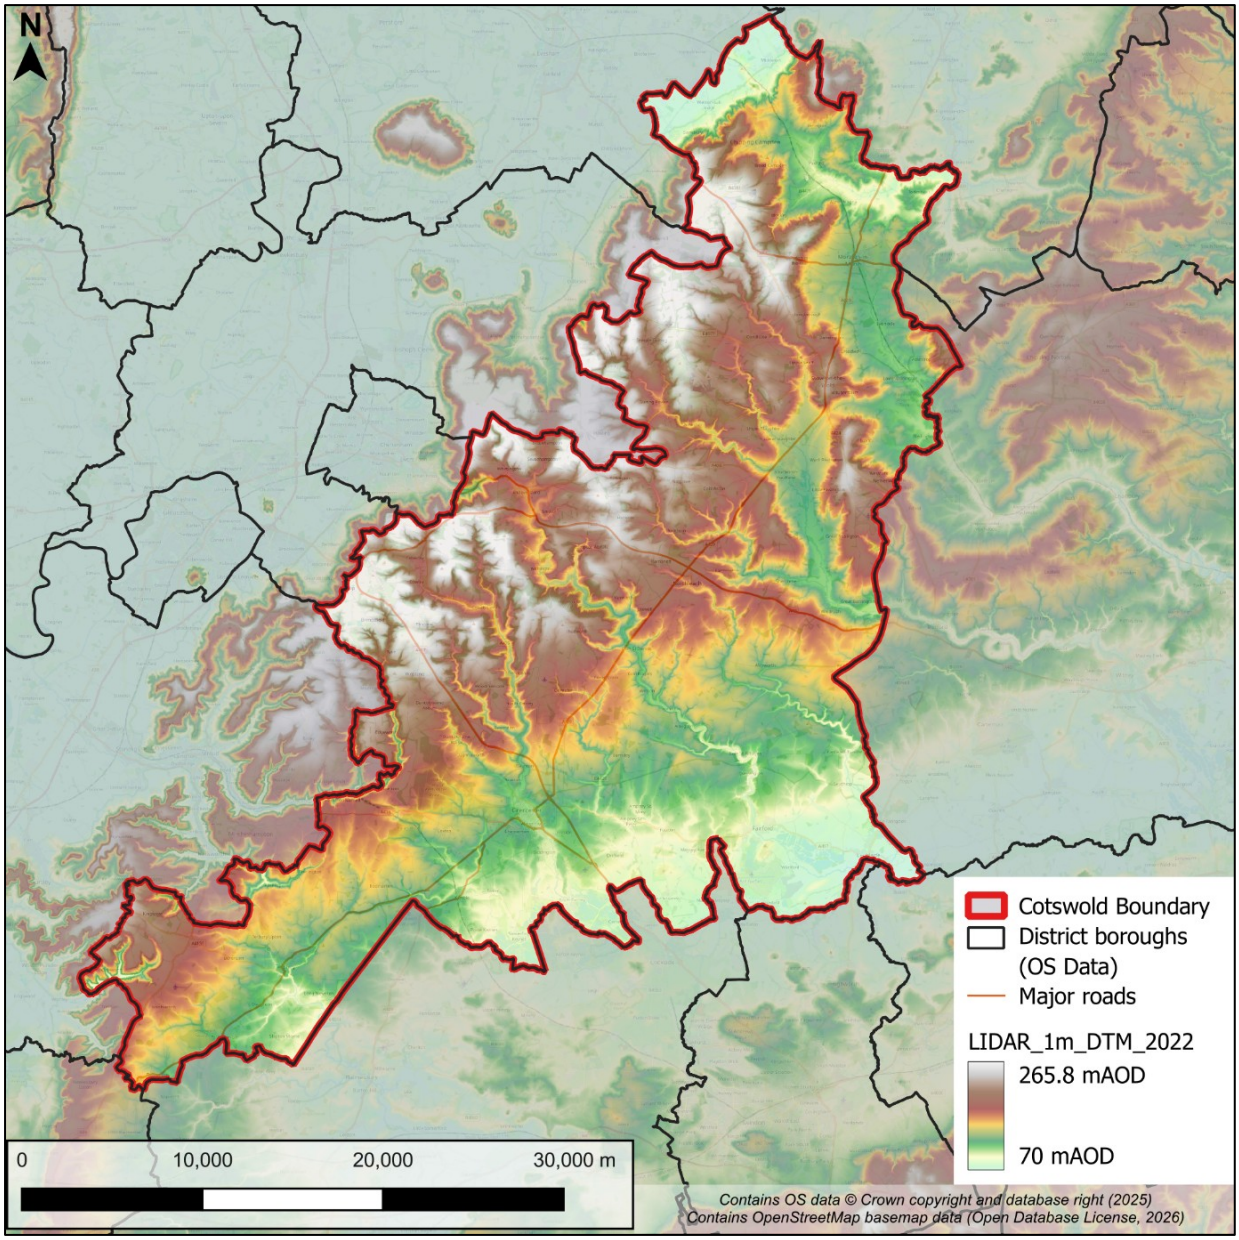

Figure 4.2- Cotswolds topography

4.2.3 Catchment

There are ten EA gauging stations identified from the UK Hydrometric Register (2008) within the study area, which can be seen in Figure 4.3. The Baseflow Index (BFI) of these rivers and the standard average annual rainfall (SAAR) given by the gauge data is summarised in Table 4.1 below. The BFI represents the proportion of total streamflow made up of baseflow (groundwater input); the higher the BFI, the more reliant on short term surface water flow (rainfall) the river is.

Table 4.1: River Base Flow Index and Standard Annual Average Rainfall within study area

River name	Gauging Station	Base Flow Index (BFI)[3]	SAAR period 1941 - 1970	SAAR period 1961 - 1990	SAAR period 1991 - 2020
River Eye	Windrush at Bourton on the Water (Station: 39142)	0.94	801 mm/yr	799 mm/yr	918 mm/yr
River Eye	Dikler at Bourton on the Water (Station: 39143)	0.83	794 mm/yr	759 mm/yr	867 mm/yr
River Leach	Leach at Priory Mill Lechlade (Station: 39042)	0.80	776 mm/yr	736 mm/yr	823 mm/yr
River Coln	Coln at Fossebridge (Station: 39109)	0.9	816 mm/yr	832 mm/yr	938 mm/yr
River Coln	Coln at Bibury (Station: 39110)	0.92	818 mm/yr	821 mm/yr	914 mm/yr
River Coln	Coln at Fairford (Station: 39143)	0.93	814 mm/yr	808 mm/yr	898 mm/yr
Ampney and Poulton Brooks	Ampney Brook at Ampney St Peter	0.77	836 mm/yr	809 mm/yr	873 mm/yr

River name	Gauging Station	Base Flow Index (BFI)[3]	SAAR period 1941 - 1970	SAAR period 1961 - 1990	SAAR period 1991 - 2020
	(Station: 39099)				
River Churn	Churn at Perrott's Brook (Station: 39108)	0.88	878 mm/yr	855 mm/yr	945 mm/yr
River Churn	Churn at Cirencester (Station: 39073)	0.91	879 mm/yr	854 mm/yr	927 mm/yr
River Churn	Churn at Cerney Wick (Station: 39035)	0.84	860 mm/yr	833 mm/yr	896 mm/yr
River Thames	Thames at Ewen (Station: 39071)	0.69	887 mm/yr	815 mm/yr	873 mm/yr

The high baseflow index of the rivers in the study area (between 0.69-0.91) reflects that these rivers are highly reliant on groundwater flow for their water supply rather than shorter term rainfall and surface water flow. It should be noted however that due to the highly permeable, karstic nature of the limestones in the Cotswolds, these BFI values are limited in representing the rapid nature of groundwater to the rivers via subsurface voids and cave systems; a higher BFI assumes the groundwater is slower with delayed flow to rivers, but karstic limestone will behave more rapidly like surface water.

The SAAR is the average rainfall across a catchment over a 30-year period derived from the National River Flow Archive[1]. Annual rainfall has generally increased over the three periods, which matches trends across the UK. The Cotswolds receives slightly less rain than the majority of the southwest of the UK according to 50-year datasets[2].

1 River gauge and rainfall data available at: https://nrfa.ceh.ac.uk/data/search
2 50 year average annual rainfall data across the UK available at: https://www.arcgis.com/apps/dashboards/d29ad7056f3548eb8affeb1c0ad50106

4.2.4 Surface water hydrology

Several Environment Agency-designated main rivers flow through the Cotswold district study area, forming a critical component of the district's hydrological infrastructure.

Surface waterbodies in and around the study area are shown in Figure 4.3. They are summarised here:

- The source of the River Thames can be found near Kemble, and it runs south-east through Somerford Keynes and then along the eastern boundary of the Cotswold District. The River Churn, Ampney Brook, River Coln, River Leach, River Windrush, and the River Evenlode are all tributaries to the River Thames, the sources of each can be found in the Cotswold District.
- The River Churn begins in Coberly, running south through Cirencester and then through South Cerney where it begins to join the River Thames.
- Ampney Brook begins just east of Cirencester, outside of Ampney Crucis and runs south through Down Ampney.
- Brockhampton, in the west of the district, is where the source of the River Coln is. The River Coln then runs south-east towards and through Fairford and then east towards Lechlade where it joins the River Thames.
- The River Leach begins in Northleach, running south-east, around the west and south of Aldsworth and towards Eastleach. The River Leach joins the River Thames just south-east of Lechlade.
- The source of the River Windrush can be found to the east of Taddington (Gloucestershire) where it flows south through Guiting Power, and then east towards Bourton-on-the-Water where it is joined by the River Dikler. The River Windrush then runs south towards Windrush where it is joined by the Sherbourne Brook before running east towards Oxfordshire.
- The River Evenlode runs south from Moreton-in-Marsh, through Evenlode and towards Bledington.

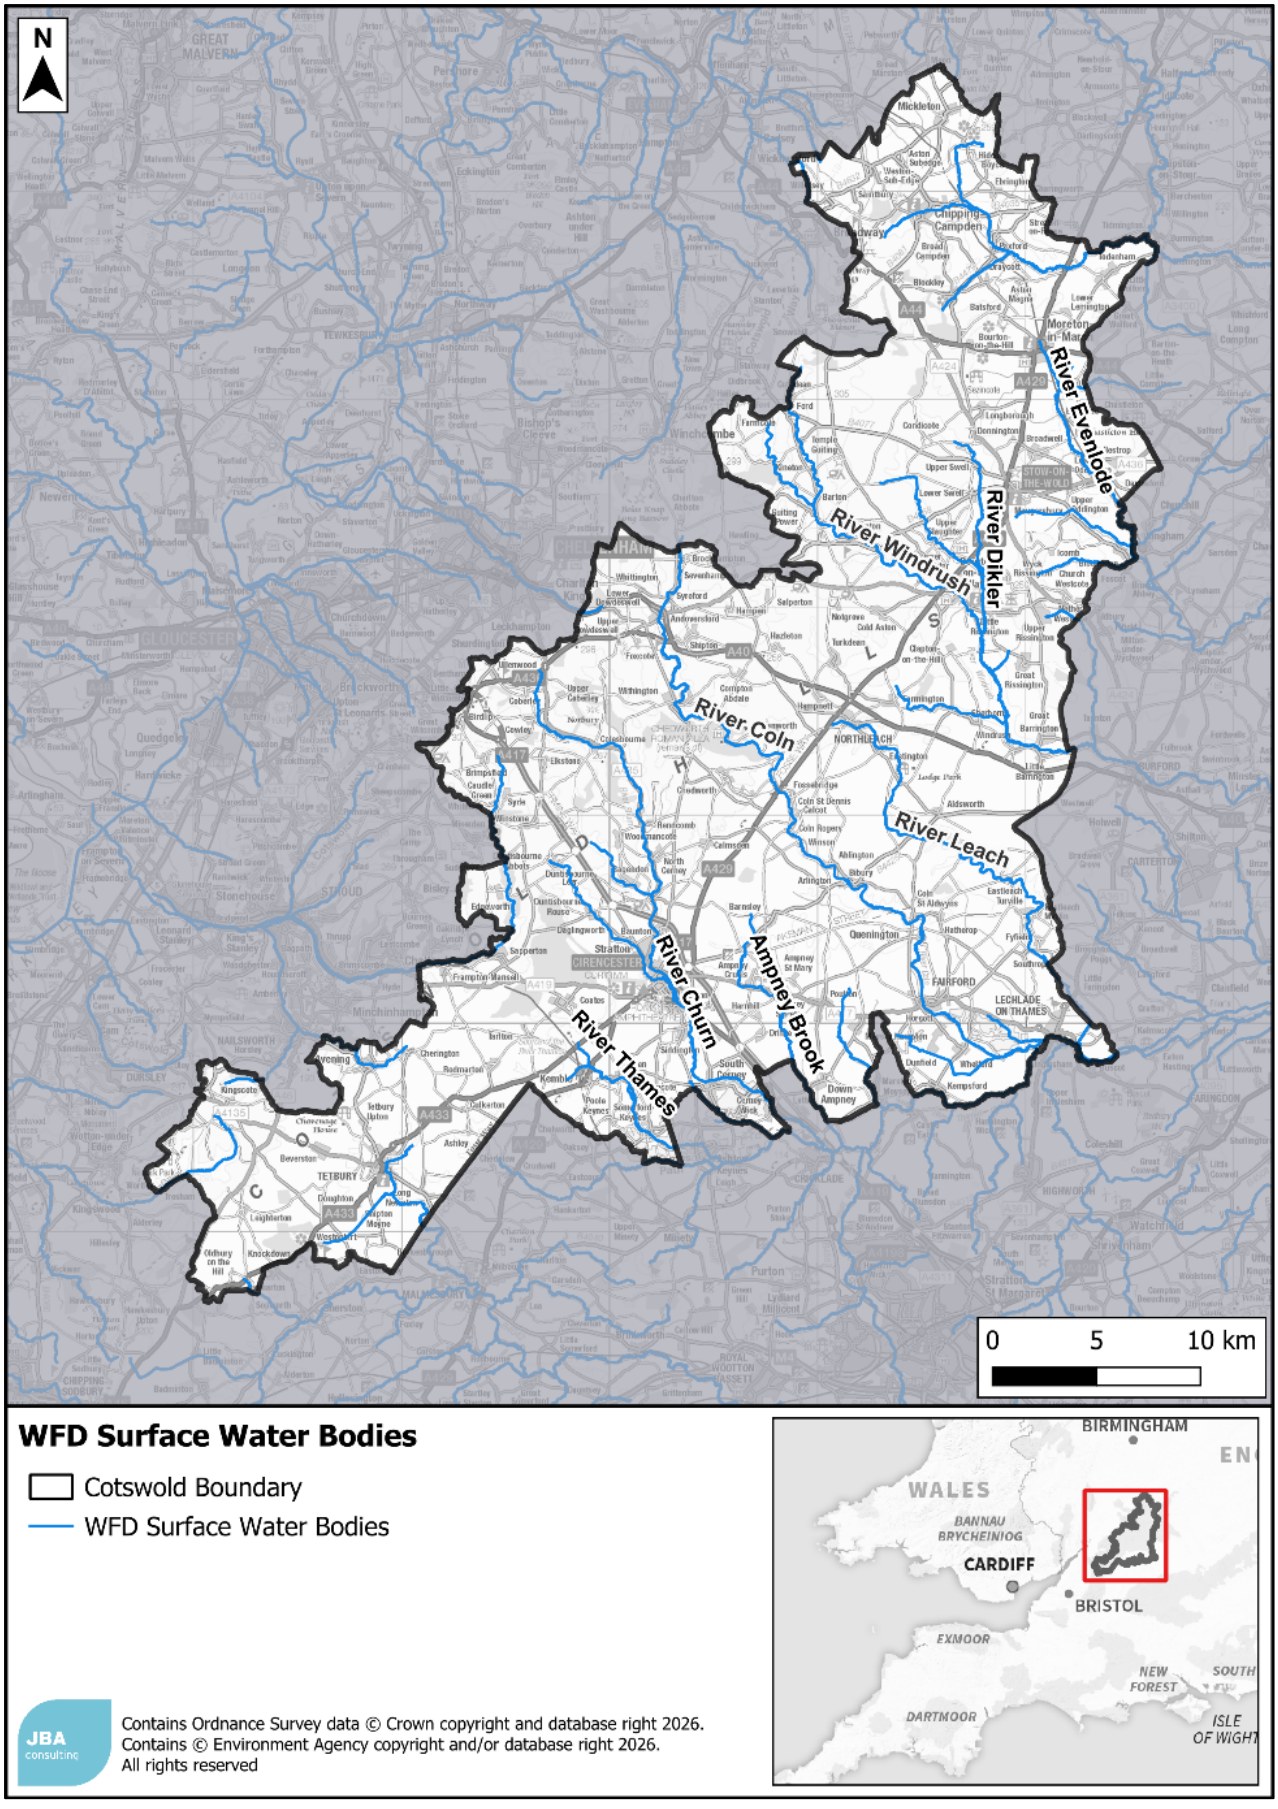

Figure 4.3 Surface waterbodies in and around Cotswold District

4.2.5 Groundwater hydrology

A WFD groundwater body represents a distinct body of groundwater flow with a coherent flow unit including recharge and discharge areas with little flow across the boundaries. Groundwater bodies are shown in Figure 4.4 below.

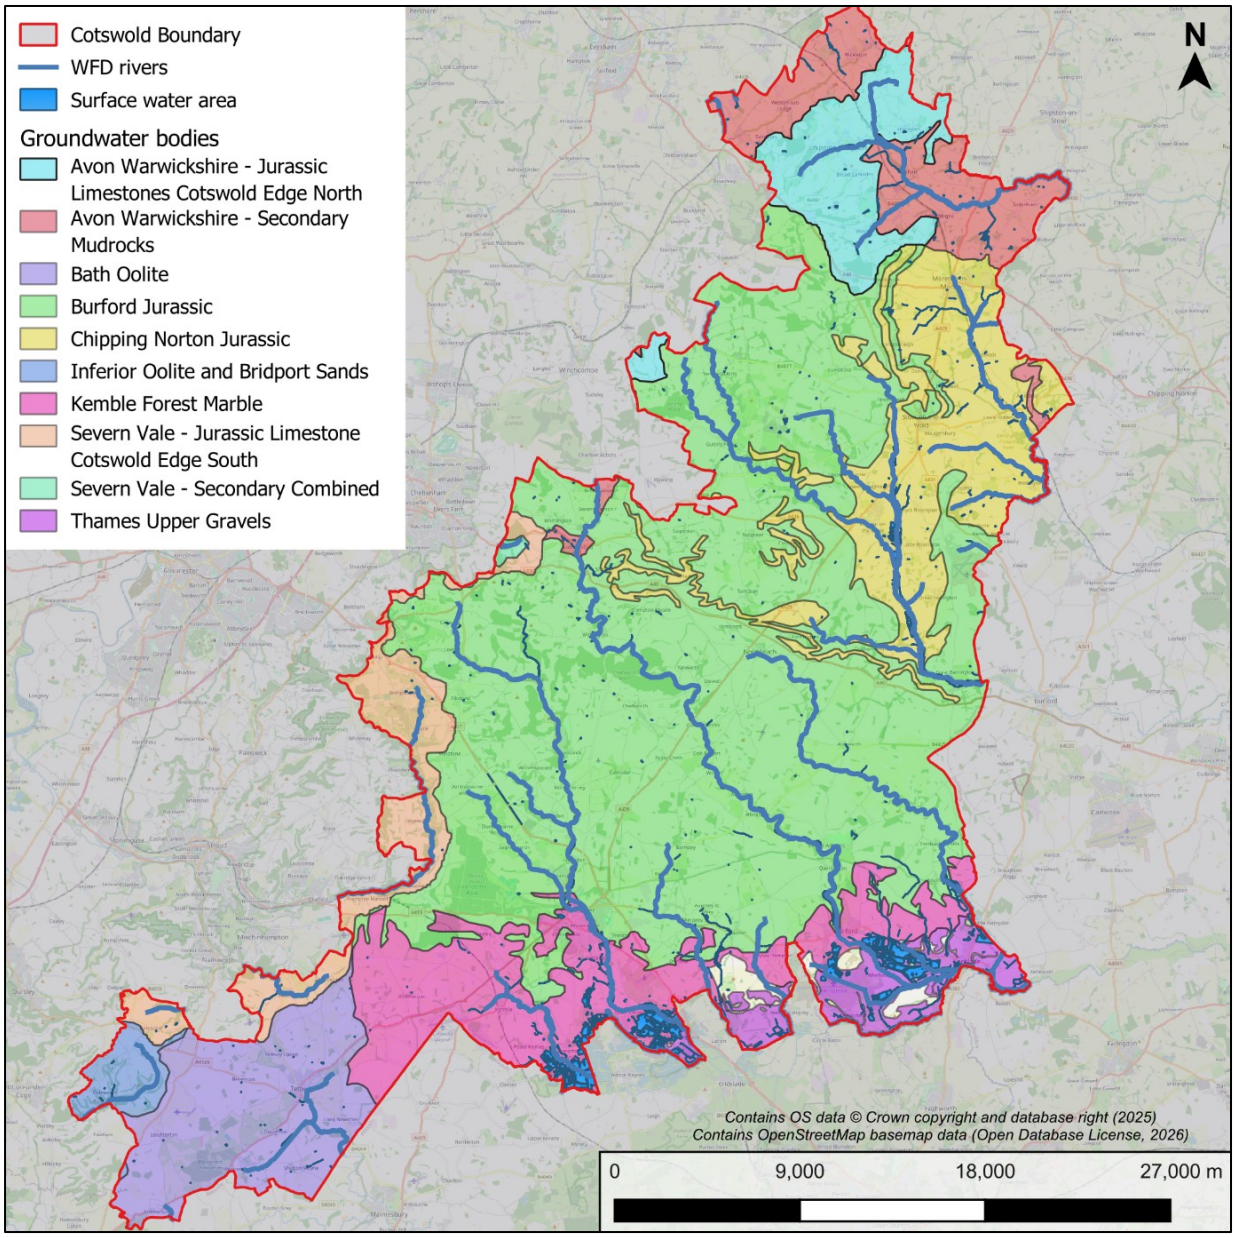

Figure 4.4 Groundwater bodies in Cotswold District

The majority of the study area is covered by the Burford Jurassic groundwater body. A band of Kemble Forest Marble lies to the south of the study area, with the furthest southern section underlain by the Bath Oolite. A small area to the southeast is part of the Thames Upper Gravels groundwater body. To the east, there is a section of the Chipping Norton Jurassic, while small areas to the north are covered by the Avon Warwickshire – Secondary Mudrocks and Avon Warwickshire – Jurassic Limestones (Cotswold Edge North) groundwater bodies.

WFD classification of the groundwater bodies Figure 4.4 can be found in Table 4.2.

Table 4.2: WFD status of groundwater bodies in the study area.

Groundwater bodies	Waterbody ID	Quantitative status	Chemical status	Overall status
Warwickshire Avon - Jurassic Limestones Cotswold Edge North	GB40901G304400	Good	Good	Good
Severn Vale - Jurassic Limestone Cotswold Edge South	GB40901G305700	Good	Good	Good
Inferior Oolite and Bridport Sands	GB40901G305800	Poor	Poor	Poor
Bath Oolite	GB40901G805500	Poor	Poor	Poor
Severn Vale - Secondary Combined	GB40902G204900	Good	Good	Good
Warwickshire Avon - Secondary Mudrocks	GB40902G990900	Good	Good	Good
Burford Jurassic	GB40601G600400	Poor	Poor	Poor
Chipping Norton Jurassic	GB40602G600300	Poor	Poor	Poor
Kemble Forest Marble	GB40602G600500	Poor	Poor	Poor
Upper Thames Gravels	GB40603G000200	Poor	Poor	Poor

Quantitative status of poor means that the water bodies failed the quantitative groundwater balance test, indicating the total existing abstraction may not be sustainable in the long term. This failure is associated with abstraction for agricultural and rural land management, as well as public water supply. Poor chemical status is associated with agriculture, rural and urban land management, point, and diffuse sources of pollution.

4.3 Geology

4.3.1 Summary

The geology of catchments is an influencing factor in water runoff from the ground surface, and how appropriate the type of SuDS is for a development due to the variations in the permeability of surface material and bedrock stratigraphy.

Information on the geology of the study area has been derived from 1:625,000 British Geological Survey geology mapping (BGS online map viewer), BGS Solid & Drift Geology Map, and BGS online borehole archive.

The geology underlying the study area is summarised in Table 4.3 below.

Table 4.3: Stratigraphy of lithologies underlying the study area

Age	Group	Unit	Description	Thickness (m)
Quaternary	Topsoil	Soilscape 3 (>60% of study area)	Shallow lime-rich soils over chalk or limestone with arable grassland landcover*. Particularly vulnerable to leaching of nitrate and pesticides to groundwater; surface capping and erosion of chalk soils on steeper slopes, linked with eutrophication and silting of chalk streams and their gravel spawning beds	0.2-0.9m***
Quaternary	Topsoil	Soilscape 18 (~20% study area,	Slowly permeable seasonally wet slightly acid but base-rich loamy and clayey soils*. Landcover is seasonally wet arable grassland and some woodland. Main risks are associated with overland flow from compacted or poached fields.	0.3 - 0.4m***
Quaternary	Topsoil	Soilscape 9	Lime-rich loamy and clayey soils with impeded drainage*. Landcover is arable pastures and "classic chalky boulder clay ancient woodlands"*.	Unknown (limited shallow borehole records)
Quaternary	Topsoil	Soilscape 5	Freely draining lime-rich loamy soils with landcover of herb-rich chalk and limestone pastures and deciduous woodlands.	0.3- 0.9m
Quaternary	Topsoil	Soilscape 22	Loamy soils with naturally high groundwater, landcover of arable grassland, wet meadows and woodlands*. Limited extent around rivers especially in the south (Cirencester).	0.1-0.4m
Quaternary	Topsoil	Soilscape 20	Loamy and clayey floodplain soils with naturally high groundwater*. Limited extent around existing rivers.	Variable, 0.15-0.4m

Age	Group	Unit	Description	Thickness (m)
Quaternary	Topsoil	Soilscape 8	Slightly acid loamy and clayey soils with impeded drainage*.	Unknown (limited borehole records due to sparse patches of soil)
Quaternary	Superficial deposits (1:625,000 scale) (in age order)	Alluvium	Unconsolidated clay, silt, sand and gravel river deposits.**	4-6m***
Quaternary	Superficial deposits	River Terrace deposits	Undifferentiated sands and gravels locally with lenses of silt, clay or peat.	3-5m***
Quaternary	Superficial deposits	Till	Over consolidated, unsorted clay, sand, gravel, boulders**	4-7m***
Quaternary	Superficial deposits	Glacial Sand and gravel	Sand and gravel with rare clay interbeds**	3-7m***
Quaternary	Superficial deposits	Landslip (undifferentiated rock)	Variable rock, earth and debris material dependant on the nature of the upslope material and type of slip failure.	Highly variable and dependent on slope gradient.
Middle Jurassic	Bedrock (1:625,000	Kellaways Formation and Oxford Clay Formation	Silicate grey mudstone with local thin beds of siltstone and sandstone and nodules of argillaceous limestone.	50-70m (Oxford Clays, northeast**)

Age	Group	Unit	Description	Thickness (m)
	scale) (in age order)	(undifferentiated)		
Middle Jurassic	Bedrock	Great Oolite group	Variety of mudstone-dominated and ooidal, bioclastic and fine-grained limestone formations consisting of sandstone, limestone and argillaceous rocks.	60-90m**
Middle Jurassic	Bedrock	Inferior Oolite group	(Specific to the Cotswolds-Weald area, varies across the UK) Varied succession of ooidal, peloidal, sandy, ferruginous and shelly limestones, with subordinate sandstone, lime-mudstone and mudstone beds.	10-20m (south Cotswolds) 20-106m (north Cotswolds)**
Triassic	Bedrock	Lias group	Predominantly grey, well bedded, marine calcareous mudstone and silty mudstone with thin beds of limestone (lower part), thick siltstone and sandstone beds (upper part) and some ironstone (middle part).	120m (Whitby Mudstone member)** Generally less than 300m (Lias Group)**

**BGS Online Lexicon of Named Rock Units

***BGS Borehole Records

4.3.2 Topsoil

Soil classification by the Soil Landscapes Online Viewer (DEFRA, 2022) has classified the soils throughout the study area into seven types (see Table 4.3). Soilscapes 3, which covers the majority of the area across the east, is described as shallow lime-rich soils over chalk or limestone with arable grassland landcover. This soil is noted to be particularly vulnerable to leaching of nitrate and pesticides to groundwater; surface capping and erosion of chalk soils on steeper slopes, which is linked with eutrophication and silting of chalk streams and their gravel spawning beds.

Soilscape 18 is the second dominant soil type in the Cotswolds, described as slowly permeable, seasonally wet and slightly acidic but base-rich loamy and clayey soils. The landcover is seasonally wet arable grassland and some woodland with main risks associated with overland flow from compacted or poached fields.

The remaining four soil types are limited in their extent and patchy in areas directly adjacent to rivers and the river valley basins. The are generally all lime rich, loamy soils associated with floodplains.

4.3.3 Artificial (Made) ground

The BGS GeoIndex indicates that Artificial Made Ground is very sparse across the study area and found in relatively small patches underlying existing building footprints. The most concentrated area of made ground according to the BGS data is across South Cerney and surrounding Ashton Keynes, which represents the quarries which have now been filled with water to form reservoirs, rather than artificial fill material. Made Ground will be associated with all building footprints and roads within the study area and be highly variable in thickness. Open-source data of building footprints alone (not including roads, or surrounding infrastructure or the BGS data) make up less than 0.1% of the total study area, which is an underestimate of Made Ground. This can be seen in Figure 4.5, which provides the distribution of made ground across the study area.

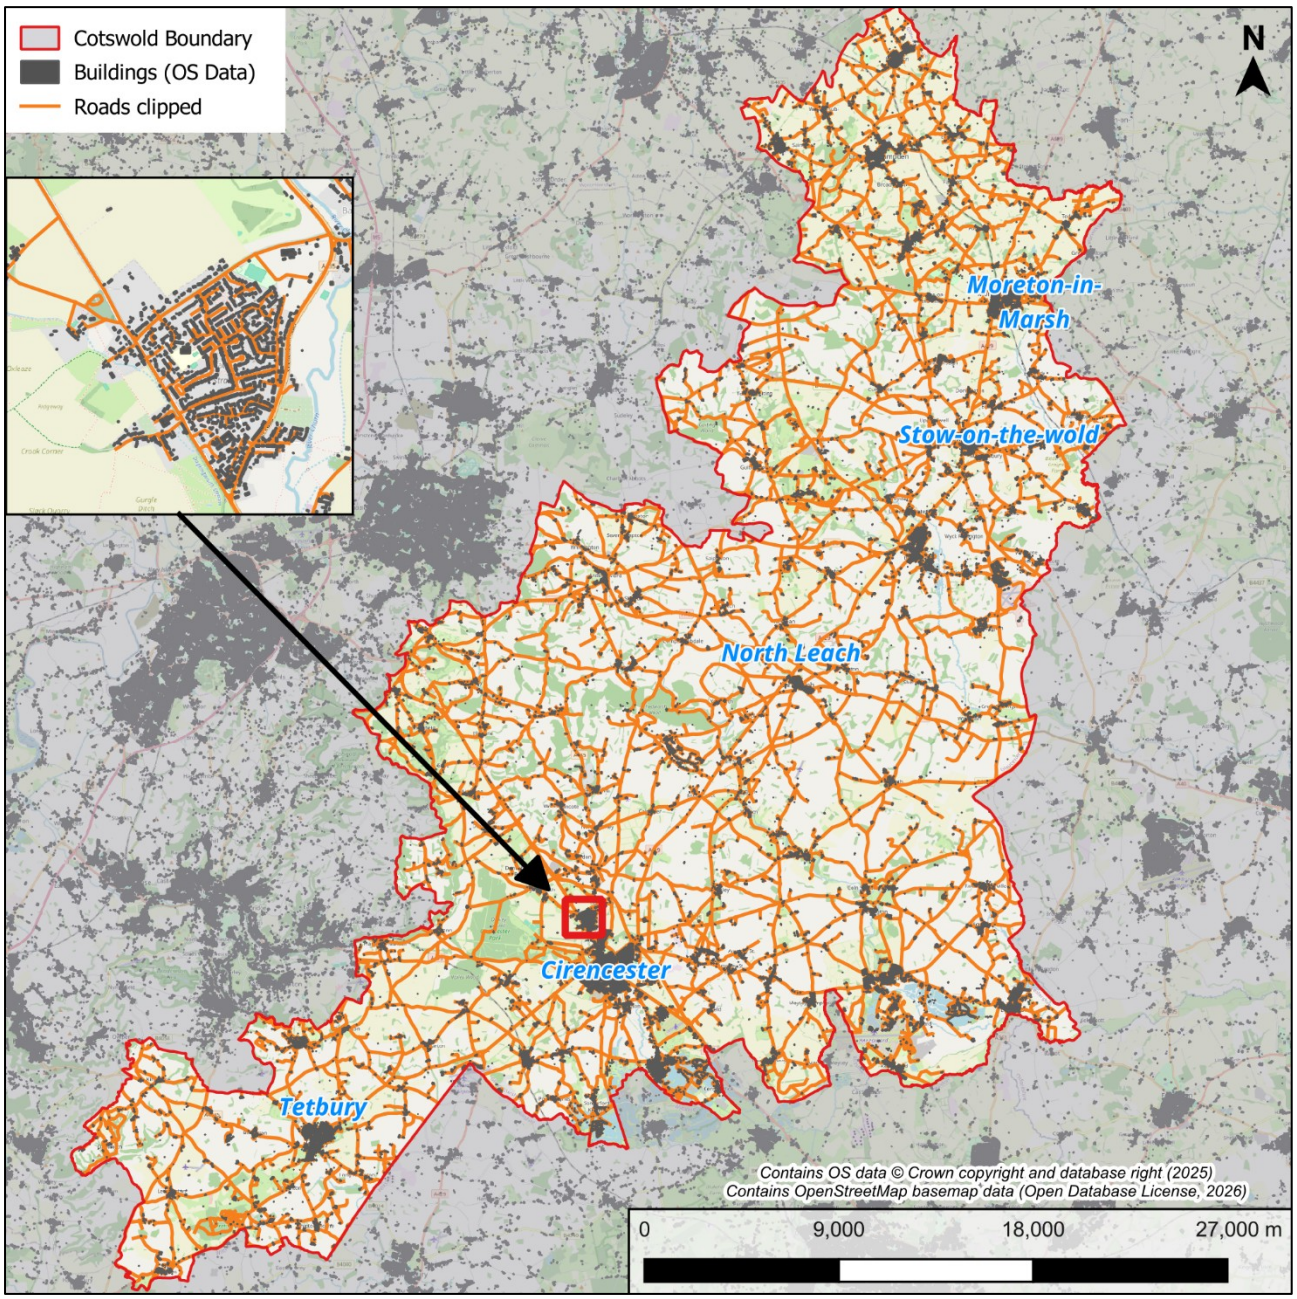

Figure 4.5- Artificial land cover

4.3.4 Superficial geology

The superficial deposits of the study area and the surrounding local area are shown in Figure 4.6. The BGS GeoIndex (1:625k) indicates that the main superficial deposits in the study area comprise Alluvium, Till, Glacial Sand and gravel, River Terrace deposits, and Landslip (undifferentiated rock).

- The Alluvium is limited to the inner river valleys in the centre and south of the study area is generally between 4-6m thick (BGS historical borehole records) and consists of sands, silts and clays with some bands of gravel. It is deposited by a glacier and often found on valley floors. The most extensive deposits are found

along the River Churn near Cirencester (south), the River Coln (especially around Burton-on-the-water) and the River Eye.

- The Till (Devensian) found only in the northeast of the study area (around Moreton-in-marsh) consists of over consolidated, unsorted clays, sand, gravel and boulders of varying sizes. The limited borehole records in this area indicate thicknesses of between 4-7m (the majority are deep wells recording stratigraphy after 20mbgl) and are concentrated in bulb-like floodplain areas around the River Evenlode source and upper course.
- The glacial sand and gravel deposits are very localised to patches near the source of the River Knee Bk (northwest of Chipping Campden), the River Evenlode (north of Crawthron Wood) and Ozelworth Bk (underlying Newark Park). These deposits are between 3-7m thick beds of sand and gravel.
- The River Terrace deposits, concentrated in a east to west orientated band across the south of the study area, comprise undifferentiated fluvial sands and gravels with clasts of Jurassic limestone (beneath this layer) and some alluvium (above this layer). It lines the slopes in elevated benches of the wider river basin valleys as remnants of former floodplains. These deposits are generally between 3 and 5m thick, thinning towards existing river channels where the river has incised the valley.
- The Landslip ("undifferentiated rock") deposits line the southwest border of the study area and are described as highly variable rock, earth and debris dependant on the type of slip failure and upslope material. In these areas of the Cotswolds, these deposits are likely made of weak Jurassic limestone bedrock, mudstone and sandstone formed by ancient rotational landslips, which have mixed the inferior oolite limestone (see Section 4.3.5) into the weaker Charmouth and Whitby mudstones which underlie the limestone. Thicknesses will be highly variable and characterised by hummocky terrain on upper slopes in the study area.

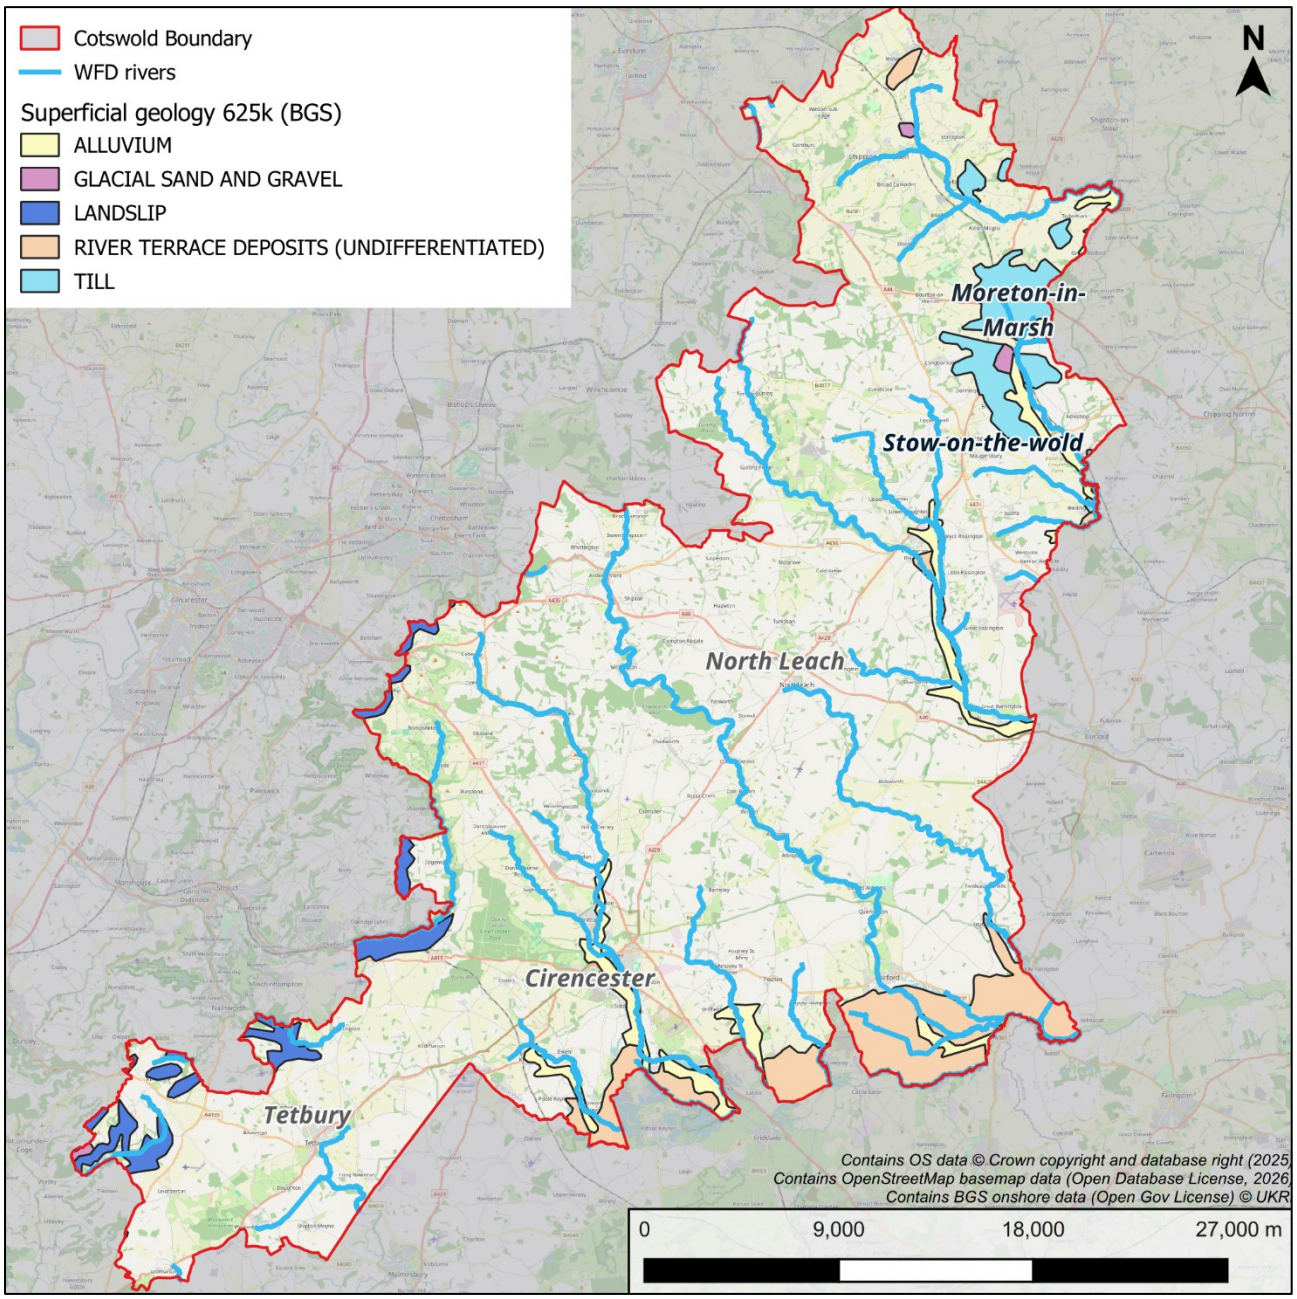

Figure 4.6- Superficial geology of the Cotswolds

4.3.5 Bedrock geology

The BGS 1:625k geology mapping shows that the bedrock geology of the study area comprises four main bedrock lithologies, predominantly the Great Oolite group (limestone) across the majority of the area, bordered by the Kellaways Clay formation to the south, the Inferior Oolite Group across the northern half of the area (roughly outlines the river valleys) and the Lias group across the northeast. These are shown in Figure 4.7 below.

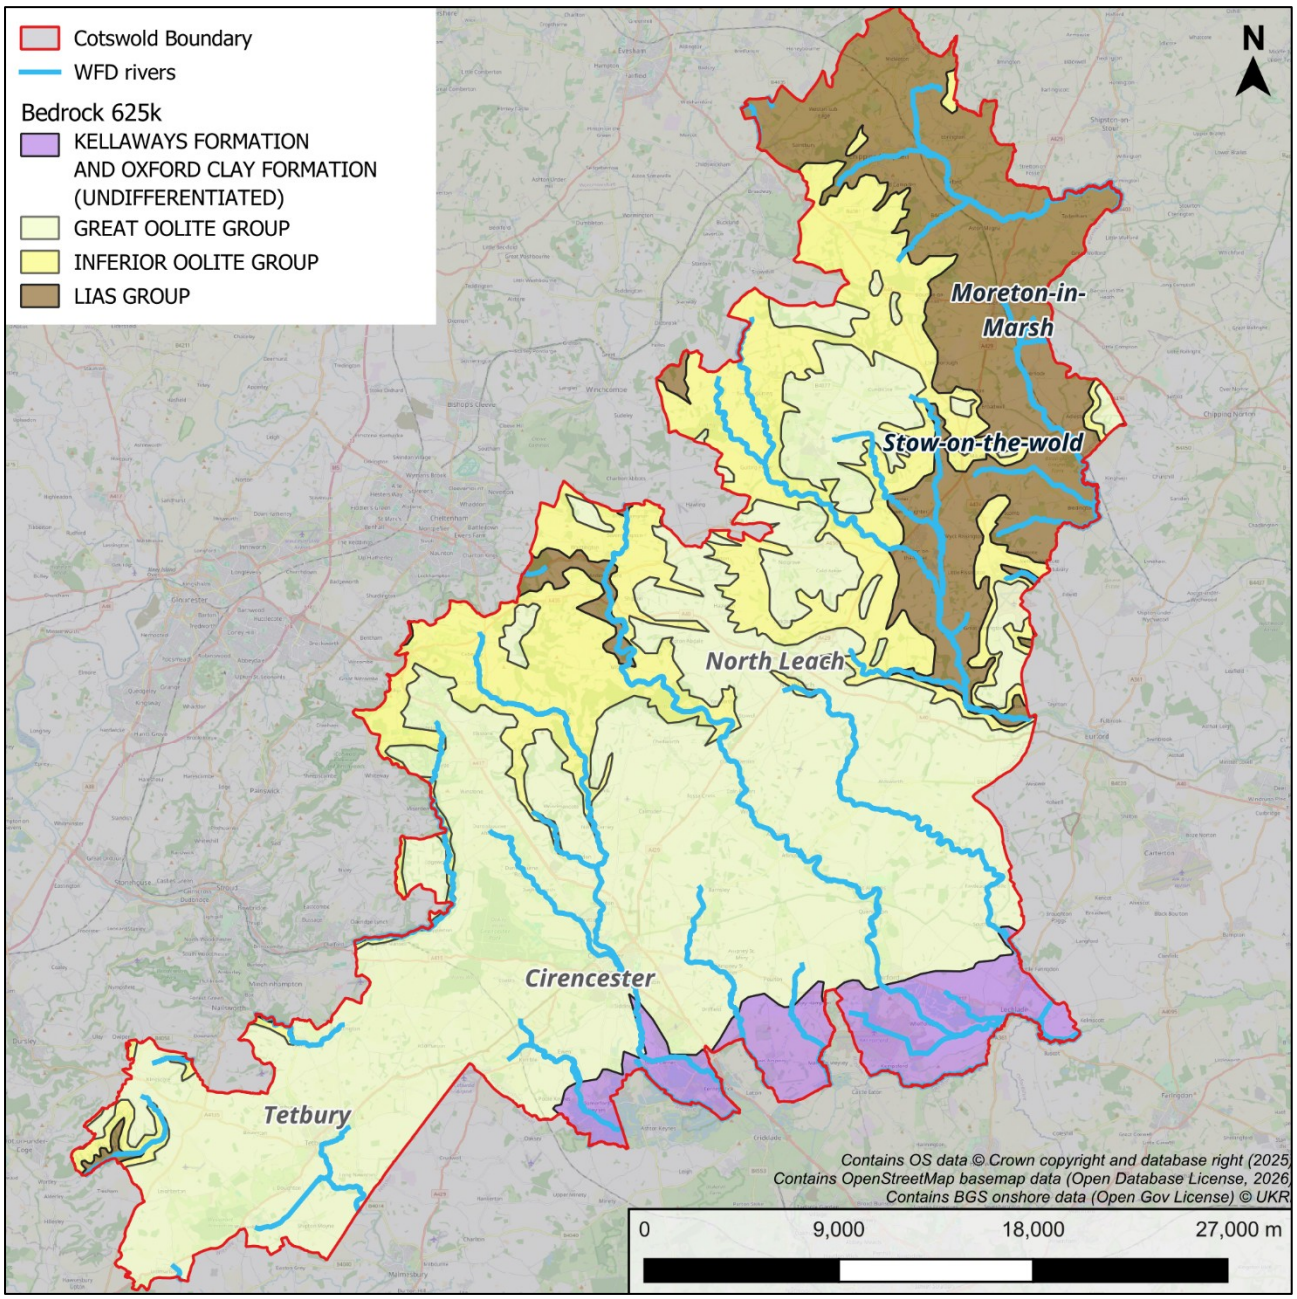

Figure 4.7- Bedrock geology of the Cotswolds

The Greater Oolite Group bedrock across the majority of the study area is a mixture of different 'hard' limestones and argillaceous rock formations alternating with clay, the majority of which capable of forming large conduit and fracture systems underground. The Inferior Oolite group also consists of limestones but is more ferruginous and underlies the greater oolite group. The Lias Group underlying this in the northeast is also a limestone group, but in contrast comprises predominantly mixed mudstones, limestone and marl formations. The Kellaway Clays and Oxford Clays Group (undifferentiated) is the youngest formation on top of the Oolite Limestones, which in the Cotswolds comprises primarily Oxford Clays (BGS 1:50k mapping).

4.3.6 Mining risk areas

There are no development high risk areas (DHRA) within the Cotswolds district boundary according to the mining layout data from the Mining Remediation Authority. There are also no mapped mine shafts, adits or gutter pits within the Cotswolds according to the BGS dataset. However, due to the karstic nature of the bedrock limestones, it is very likely that underground conduits and cave systems are widespread and due to not being 'man-made' are underrepresented in the BGS database.

4.4 Hydrogeology

4.4.1 Aquifer classification

Table 4.4 summarises the Environment Agency's (EA) hydrogeological classification of the bedrock and superficial deposits underlying the study area.

Table 4.4: Hydrogeology of Cotswold District

Drift/Bedrock	Unit	Environment Agency Aquifer Classification
Superficial (drift) deposits	Alluvium	Secondary A aquifer (moderately productive)
Superficial (drift) deposits	River Terrace deposits	Secondary A aquifer (moderately productive)
Superficial (drift) deposits	Till	Secondary undifferentiated aquifer
Superficial (drift) deposits	Glacial Sand and gravel	Non aquifer (unproductive)
Superficial (drift) deposits	Landslip (undifferentiated rock) Mass Movement Deposit	Non aquifer (unproductive)
Bedrock	Kellaways Formation and Oxford Clay Formation (undifferentiated)	Non aquifer (unproductive)
Bedrock	Great Oolite group	Principal Aquifer (highly productive)
Bedrock	Inferior Oolite group	Principal Aquifer (highly productive)
Bedrock	Lias Group	Secondary undifferentiated aquifer

Explanation of aquifer classes (from Environment Agency website):

- Principal aquifers - "may support water supply and/or baseflow to rivers on a strategic scale."
- Secondary A aquifers - "permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of baseflow to rivers."

- Secondary B aquifers - "predominantly lower permeability layers which may store and yield limited amounts of groundwater."
- Secondary undifferentiated aquifers: "It is not possible to apply either a Secondary A or B definition because of the variable characteristics of the rock type"

4.4.2 Aquifer vulnerability

The BGS's groundwater vulnerability mapping indicates underlying bedrock units of the majority of the study area as high risk combined with soluble rock risk. This correlates with the underlying Oolite Limestone and Inferior Oolite Limestone bedrocks, which underlie the majority of the Cotswolds, with limited protection from superficial deposits. There are some patches of medium and medium to low risk in areas to the northeast (e.g. Moreton-on-marsh) which correlates to where superficial deposits along the river are found, and the transition to the Lias Group (overlying the more vulnerable limestones). Due to the lack of widespread natural cover from superficial deposits and impermeable bedrock, this results in a medium-high pollution risk to groundwater from surface activities across the Cotswolds. Additional measures over and above good practice pollution prevention requirements to ensure that groundwater isn't impacted will be required, especially across the centre and southwest.

4.4.3 Groundwater source protection zones

Source Protection Zones (SPZs) are used to protect areas of vulnerable groundwater that are used for abstraction and where water quality is of high importance (such as drinking water abstractions). SPZs are categorised into three zones, 1-3, with 1 being most sensitive to pollution, and 3 representing the lowest risk but still within the groundwater catchment of the abstraction. These are identified and shown in 9.5.4, alongside the guidance from the EA.

4.5 Availability of water resources

4.5.1 Abstraction Licensing Strategy

The Environment Agency working through the Catchment Abstraction Management Strategy (CAMS) process, prepare an Abstraction Licensing Strategy (ALS) for each sub-catchment in a river basin. The strategy sets out how water resources are managed within England and contributes to the implementation of the WFD. The ALS report provides information on the resources available and what conditions might apply to new licences. The licences require abstractions to stop or reduce when a flow or water level falls below a specific threshold, as a restriction to protect the environment and manage the balance between supply and demand for water users.

All new licences, and some existing licences are time limited, allowing for periodic review of the area as circumstances may have changed since the licence was first issued. The duration is generally twelve years, but shorter licences may be granted if they are based on

resource assessment and environmental sustainability grounds. In some cases, future plans or changes may mean that the EA will grant a shorter time limited licence, so it can be re-assessed following the change. If a licence is only required for a short time, it can be granted either as a temporary licence or with a short time limit. If a licence is considered to pose a risk to the environment it may be granted with a short time limit while monitoring is carried out. The licences are then replaced with a changed licence, revoked or renewed near to the expiry date.

The ALS are important in terms of the Water Resource Management Plan (WRMP) as this helps to determine the current and future pressures on water resources and how the supply and demand will be managed by the relevant water companies. An abstraction license is needed from the Environment Agency if abstraction is above 20m^3/ day (4,400 gallons) a day from:

- rivers or streams
- reservoirs, lake or pond
- canal
- spring or
- an underground source

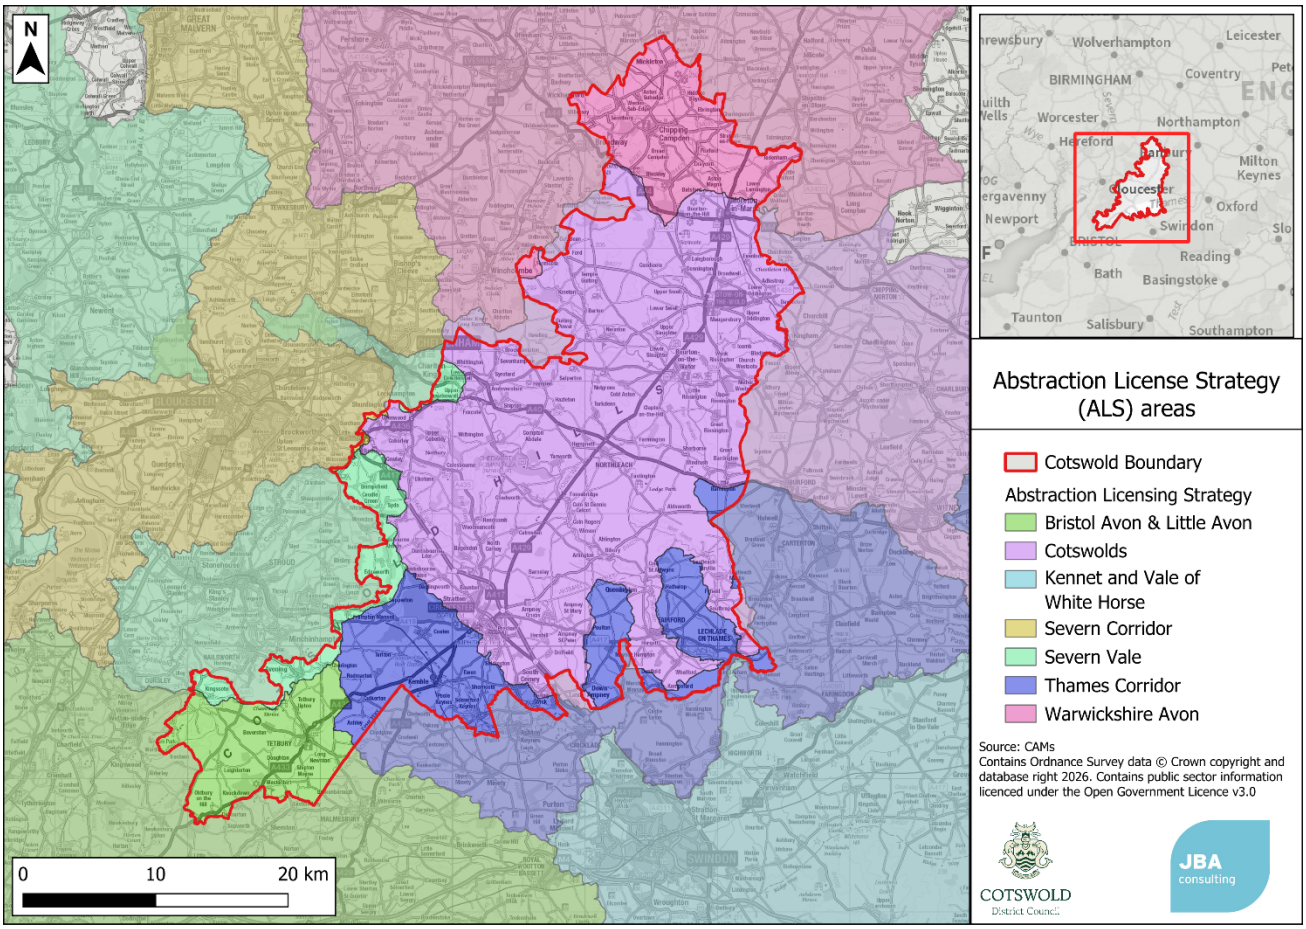

Figure 4.8 Abstraction License Strategy (ALS) areas within Cotswold district

4.5.2 Resource availability assessment

In order to abstract surface water, it is important to understand what water resources are available within a catchment and where abstraction for consumptive purposes may pose a risk to resources or the environment. The Environment Agency has developed a classification system which shows:

- the relative balance between the environmental requirements for water and how much has been licensed for abstraction;
- whether there is more water available for abstraction in the area; and
- areas where abstraction may need to be reduced.

The availability of water for abstraction is determined by the relationship between the fully licensed (all abstraction licences being used to full capacity) and recent actual flows (amount of water abstracted in the last six years) in relation to the Environmental Flow Indicator (EFI). Results are displayed using different water resource availability colours, further explained in Table 4.5

Table 4.8. In some cases, water may be scarce at low flows, but available for abstraction at higher flows. Licences can be granted that protect low flows, this usually takes the form of a "Hands-off Flow" (HOF) or Hands-off Level (HOL) condition on a licence. The assessment is performed at Assessment Points (APs), which are usually significant points on a river such as a confluence or gauging station.

Groundwater availability as a water resource is assessed similarly, unless better information on principle aquifers is available or if there are local issues that need to be considered.

Table 4.5: Implications of surface water resource availability colours.

Water Resource Availability Colour	Implications for Licensing
BLUE- High hydrological regime	There is more water than required to meet the needs of the environment. Due to the need to maintain the near pristine nature of the water body, further abstraction is severely restricted.
GREEN-Water available for licensing	There is more water than required to meet the needs of the environment. Licences can be considered depending on local/downstream impacts.
YELLOW-Restricted water available for licensing	Fully Licensed flows fall below the Environmental Flow Indicator (EFI). If all licensed water is abstracted there will not be enough water left for the needs of the environment. No new consumptive licences would be granted. It may also be appropriate to investigate the possibilities for reducing fully licensed risks. Water may be

Water Resource Availability Colour	Implications for Licensing
	available via licence trading.
RED- Water not available for licensing	Recent Actual flows are below the Environmental Flow Indicator (EFI). This scenario highlights water bodies where flows are below the indicative flow requirement to help support Good Ecological Status. No further licences will be granted. Water may be available via licence trading.
GREY-HMWBs (and /or discharge rich water bodies)	These water bodies have a modified flow that is influenced by reservoir compensation releases, or they have flows that are augmented. There may be water available for abstraction in discharge rich catchments.

Water resource availability is assessed under four different flow conditions:

- At Q95 conditions - very low flows which are exceeded 95% of the time
- At Q70 conditions - low flows which are exceeded 70% of the time
- At Q50 conditions - median flows which are exceeded 50% of the time
- At Q30 conditions - high flows which are exceeded 30% of the time

4.6 ALS Overviews

4.6.1 Bristol Avon, Axe and North Somerset (Bristol Avon and Little Avon)

Significant tributaries in the ALS area include the Tetbury and Sherston Avon and the Bristol Frome from the Cotswolds. The Little Avon rises at Horton, on the edge of the Cotswolds (Environment Agency, Gov.uk, 2012).

There are no Assessment Points (AP) within the overlapping area of the ALS and the Cotswold boundary. The ALS report mapping shows that within the overlap area water resources are available less than 30% of the time and water resources are available at least 30% of the time.

At Q30 and Q50, 'water is available for licensing' and at Q70 and Q95 there is 'restricted water availability for licensing' in the overlap area.

4.6.2 Severn Vale

To the southeast of the Severn Vale ALS are the Cotswold Hills which are composed of Jurassic limestones that form the basis for the Cotswold principal aquifer. This feeds into the springs and watercourses in the Cotswold Hills. There are no Assessment Points (AP) within the overlapping area of the ALS and the Cotswold boundary.

The Severn Vale ALS is split into two groundwater management units (GWMUs) nominally; Cotswold North and Cotswold South. The area in Cotswold South that overlaps with the LPA boundary is listed as 'restricted water available GWMU' at Q30, Q50 and Q70. At Q95 the overlap area is partially in a 'restricted water available' area and a 'water not available' area. There is a reliable resource in this area less than 30% of the time.

The Severn Vale-Jurassic Limestone Cotswold Edge South, the groundwater body within the South Cotswold GWMU, is listed to be in 'good quantitative status not at risk of deterioration' (Environment Agency B, 2022). The ALS report states that:

"Resources are available from this unit for further groundwater development. New groundwater licences from this unit will be granted with a Hands-off Flow (HoF) condition to be measured at Ebley Mill gauging station. The condition will offer the same level of protection as the surface water HoF on the River Frome. This is required as the surface water and groundwater in this area is extremely well connected."

It should be noted that there will still be license restrictions:

"Any application will be subject to the assessment of impacts on existing water users, groundwater dependent terrestrial ecosystems, surface water level and flow impacts. This is to ensure that no deterioration of the water environment is allowed to occur. Opportunities to reduce fully licensed risks will be taken where surface water body deterioration is a risk. In these locations, time limited license renewals will require changes to reflect historic usage to manage the risk of future deterioration to the environment."

4.6.3 Thames Corridor

The Thames ALS covers 2,700 km^2 encompassing both tidal and non-tidal watercourses. The River Thames is a major abstraction source for the south of England as well as being highly valued for navigational and recreational uses. The River Thames originates from the Cotswold Hills, from where it flows towards and through London. There are no Assessment Points (AP) within the overlapping area of the ALS and the Cotswold boundary.

The majority of the ALS has 'restricted water available' at Q30, including the LPA boundary overlap area. Water availability at Q50, Q75 and Q95 has 'water not available' across the whole ALS area. Additionally, consumptive abstraction is available across the whole ALS area for 'less than 30% of the time' (Environment Agency C, 2019).

4.6.4 Warwickshire Avon

The Warwickshire Avon covers a small portion to the north of the LPA boundary. The Warwickshire Avon ALS area covers 2900 km^2 with agriculture being a major land use in the area. There are no Assessment Points (AP) within the overlapping area of the ALS and the LPA boundary.

At Q30, Q50 and Q75 there is water available for abstraction in the overlap area of the LPA boundary and the ALS, apart from an area close to Moreton in Marsh that has 'water not available for abstraction' across all scenarios. At Q95 the larger area has 'restricted water

available' with the area close to Moreton-in-Marsh still having 'water not available for abstraction' (Environment Agency D, 2023).

4.6.5 Cotswold

The Cotswold ALS area covers most of the LPA boundary. The ALS area covers 1200 km^2 with main rivers such as River Churn, Ampney Brook and the River Coln to the west, and the Rivers Leach, Windrush, and Evenlode to the northeast running through it.

Seven APs are present within the overlap area of the LPA boundary and the ALS area:

- Assessment point 1, Upper Churn
- Assessment point 2, Lower Churn
- Assessment point 3, Ampney Brook
- Assessment point 4, Upper Coln and Unconfined Oolites
- Assessment point 5, Lower Coln
- Assessment point 6, Leach
- Assessment point 7, Upper Windrush and Unconfined Oolites

Assessment points 1,2, and 3 have HoF restrictions to protect from over-abstraction. Assessment point 1 has a HoF of 9.8 Ml/d to "protect AP2". AP2 has a HoF restriction of 8.3 Ml/d, and AP3 a restriction of 7.9 Ml/d. APs 4-7 do not have a specific HoF but have additional restrictions. The additional restrictions are listed as Thames Q50 HoF (182 days). This means that for 182 days of a year, there is a HoF restriction of water abstraction at Q50.

At Q30 the whole ALS area has restricted water availability. As for the area at Q50, Q75 and Q90, 'water is not available' for licensing. Consumptive abstraction is available at least 30% of the time.

4.6.6 Overview of water resource availability in Cotswold District

Figure 4.9 shows the water resource availability across Cotswold district under different flow conditions. This gives an indication of whether there are sufficient water resources to support a healthy ecology and sustainable abstraction, and how much water might be available for additional future licencing, and under what conditions. Existing abstraction licences held by Severn Trent Water for public supply are considered within this assessment, so a "red" rating does not indicate that water is not available for public supply, only that there is no additional water available for abstraction. Severn Trent Water's abstraction is evaluated as part the Water Resources Management Plan process.

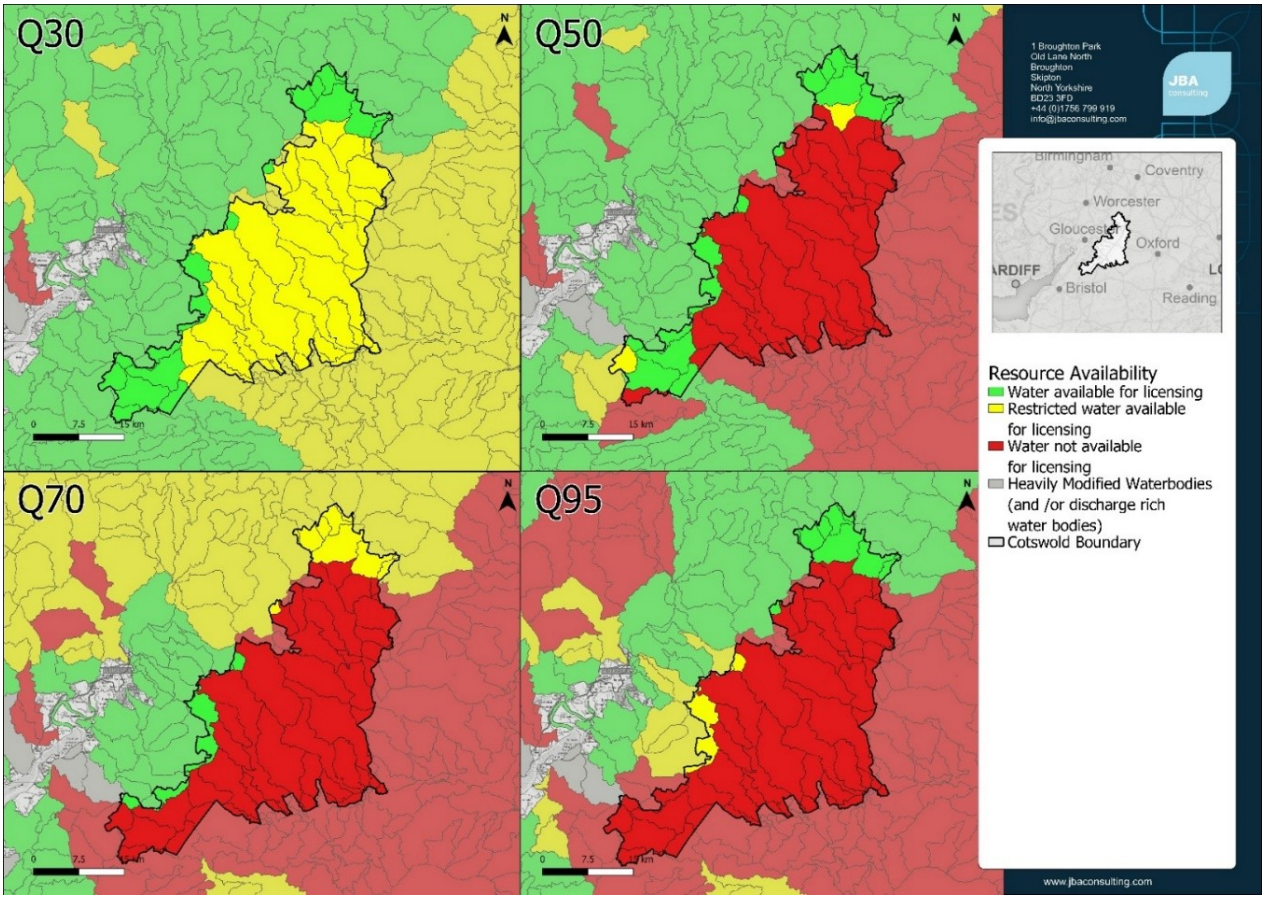

Figure 4.9 Water resources availability in Cotswold District

Figure 4.9 shows that within most of Cotswold District there is restricted water available for licensing at the 30% exceedance flow. There is no water available for licensing at the 50%, 70% and 95% exceedance flows across the vast majority of the district.

4.7 Water resources planning

4.7.1 National Water Resources Framework

An updated National Water Resources Framework was published in 2025 replacing the previous 2020 framework. The first framework described the scale of the challenge facing water resources in the UK and led to the creation of the five regional planning groups. It also set an objective for per capita consumption to be reduced to 110l/p/d on average across the UK (including existing housing). The new National Framework:

- sets out the pressures and challenges for the water environment to 2055 and beyond;
- sets the ambition for a sustainable abstraction regime and a protected and improved water environment;
- explores potential new demands for water;
- sets greater ambition for integrated, joined-up planning between water using sectors and with drainage and wastewater planning;

- proposes actions and expectations for different sectors to rise to the challenge of planning for and improving the resilience of water supplies; and
- provides a steer for regional water resources groups to evolve and continue to innovate.

The framework states that by 2055 England will need up to an additional 5 billion litres of water per day for public water supply, increased from the previous 2020 publication due to updated demand forecasts and additional reductions for the environment.

As well as the challenges of an increasing population, the 2025 Framework also outlines the challenge from non-household growth, and emerging sectors such as data centres which can require significant amounts of water for cooling servers, with large centres consuming millions of litres daily. Concrete production accounts for 9% of global industrial water withdrawals. Agriculture is significant with spray irrigation expected to increase due to the changing climate.

The new National Framework for Water Resources outlines next steps to improve water planning across all sectors. These include: continuing the Environment Agency's strategic assessment of national water challenges; developing multi-sector plans through regional water resource groups; evaluating and identifying new solutions via regulators like RAPID; expanding engagement with other water-using sectors; and strengthening local planning efforts through groups like Water Abstractor Groups and Catchment Partnerships.

Of relevance to the WCS is the strengthening of local water resources planning which includes supporting farmers to establish Water Abstractor Groups (WAGs) and to "identify, screen and prioritise collaborative 'local resource option' solutions to improve water supply resilience".

4.7.2 The regional plans

Water resource planning is taking an increasingly regional focus. The primary objective of water resources planning is to ensure that there are always enough supplies available to meet anticipated demands, under various weather conditions, but in particular in dry and very dry conditions.

Cotswold district is predominantly within the Water Resources South East (WRSE) region, with small areas to the west within the Water Resources West Region.

The WRSE final Regional Plan for the South East of England was published in June 2025. WRSE is an alliance of the six water companies which cover the South East of England: Affinity Water, Portsmouth Water, SES Water, Southern Water, South East Water and Thames Water. WRSE is one of five regional groups across England, each of which has produced a strategic water resources plan. The primary objective of water resources planning is to ensure that there are always enough supplies available to meet anticipated demands, under various weather conditions, but in particular in dry and very dry conditions.

The challenges facing the region are set out in the report:

"The South East faces some of the most significant challenges to water resources in the future. Most of the region is already classified as water stressed and its population is set to grow, with major growth corridors planned in some areas. The impact of climate change will be felt acutely in the region, bringing changes to the amount and pattern of rainfall which are likely to, in turn, change the types of droughts we face in the future."

"Of all the regions, the National Framework identified that the South East faces the greatest pressures on public water supplies. If surplus water can be made available, we will still need to develop options to supply more water, equivalent to all new water resource options and transfers currently selected in company WRMPs, as well as achieving ambitious efficiency reductions. If surplus water cannot be accessed, demand will need to be reduced or further resources developed."

"The scale of the deficits we have forecast is very significant, and requires significant action and investment on the part of our member companies, the Government and customers to ensure that water supplies will be protected into the future, whilst at the same time ensuring greater protection for the environment. This is the outcome that our regional plan seeks to achieve."

The Water Resources South East (WRSE) plan covers a period out to 2075 and seeks to:

- Ensure there is enough water for a growing population and to support economic growth.
- Improve the environment by leaving more water in the region's rivers, streams and underground sources.
- Increase the region's resilience to severe drought and other extreme shocks and stresses.
- Addresses the impacts of climate change on demand for water and how much is available.

The plan forecasts that if no action were taken, by 2075 in a 1 in 500-year drought there would be a deficit of between 1.2 billion and 3 billion litres of water per day (based on the least and most challenging planning scenarios). The need for additional water is driven by:

- The need to improve the environment (47%)
- The challenges of climate change (6%)
- Population growth and non-household growth (32%)
- Increasing resilience to extreme drought events (15%)

The majority of the water used in the region goes into the public water supply, with only 3% going into non-public supply. The breakdown of the non-public supply is shown in Figure 4.9.

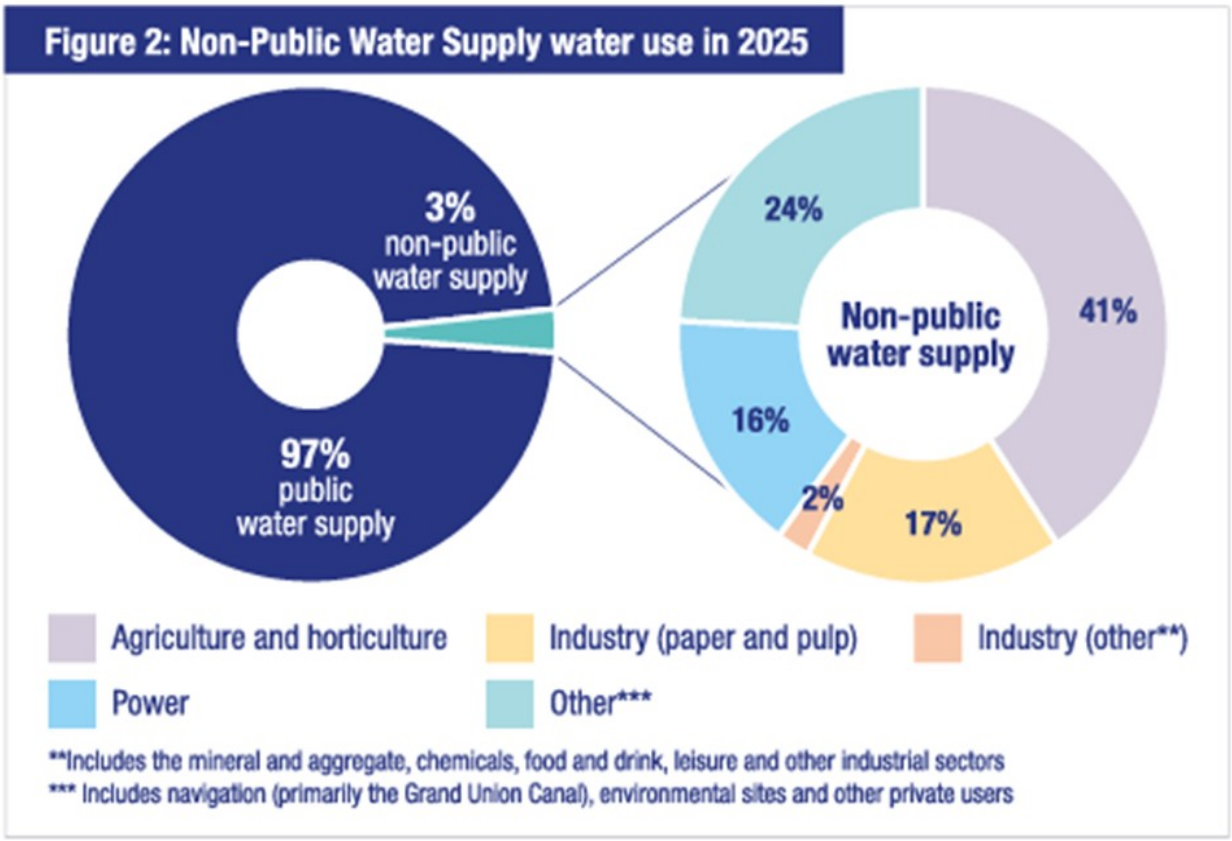

Figure 4.9 Non-public water supply water use in 2025

(WRSE, 2025)

The regional plan contains a mix of demand management and new supply options. The majority of the total water needed in the first 15 years of the regional plan period will come from reducing how much water is used (demand management), and how much is wasted through leakage. The plan also outlines longer term water resource options including transfers of water into the southeast and between water companies, new reservoirs, water recycling schemes and desalination plants and additional storage.

- By 2035 the regional plan proposes to:
- Complete the construction of one new reservoir in Hampshire and start to build one new reservoir in Oxfordshire (SESRO) and one in Kent.
- Develop an inter-regional water transfer scheme using the Grand Union Canal to transfer water from the midlands to the southeast.
- Develop six water recycling schemes in London, Kent, West Sussex, Hampshire and the Isle of Wight.
- Develop six groundwater schemes across the region to store extra water in these sources.

Between 2035 and 2075 the plan proposes to:

- Complete the construction of the new reservoirs in Oxfordshire and Kent and construct new reservoirs in West Sussex and East Sussex.
- Build six desalination plants in Kent and West Sussex.

- Develop eleven groundwater schemes across the region.
- Develop three more water recycling schemes in Kent, West Sussex and East Sussex.
- Develop new transfers from new strategic sources of water (such as reservoirs) to move more water around the southeast.

A small area of Cotswold district is within the Water Resources West (WRW) area. The Water Resources West Final Regional Plan (2025–2085) sets out a long-term strategy to secure water supplies for approximately 18 million people across the North West and Midlands of England, including cross-border catchments with Wales. Developed under the National Framework for Water Resources, the plan addresses key challenges such as climate change, population growth, and environmental pressures by promoting a “best value” approach that integrates demand management, leakage reduction, nature-based solutions, and new infrastructure. It identifies nationally significant projects to enhance connectivity between water company zones and improve resilience through inter-regional transfers, while safeguarding ecosystems via Strategic Environmental Assessment (SEA) and Habitat Regulations compliance.

As only a small area of Cotswold district is covered, this plan has not been reviewed in detail in the WCS.

Cotswold Canal is mentioned within the regional report in parallel with the Severn to Thames Transfer (STT).

"The Severn to Thames Transfer (STT) project is a proposed raw water transfer from the River Severn to the River Thames to support the South East of England with additional water during drought events. The scheme would supply water for Affinity Water, Southern Water and Thames Water customers. The capacity of STT is up to 500 Ml/d, with the raw water transferred to the River Thames via either a direct pipeline or pipelines using sections of a restored Cotswold canal. From work undertaken to date, the favoured option is a direct pipeline. This would be subject to future consultation. Water for transfer would be provided either from flows in the River Severn (when available), or when there is insufficient river water available, additional support sources of water could be provided by Severn Trent and United Utilities." (Water Resources West, 2025)

4.8 Water Resource Management Plans

4.8.1 Introduction

WRMPs are 50-year strategies that water companies are required to prepare, with full updates every five years (see Section 3.5.3 for further details).

When new development within an LPA is being planned, it is important to ensure that there are sufficient water resources in the area to cover the increase in demand without risk of shortages in the future or during periods of high demand, and without causing a negative impact on the waterbodies from which water is abstracted.

The aim of this assessment was to compare the future additional demand as a result of development proposed within the new Local Plan, with the demand accounted for by Severn Trent Water within their WRMPs.

WRZs are defined by the EA as areas in which the management of supply and demand is largely self-contained and where the supply infrastructure is linked such that customers within the zone experience the same risk of supply failure. Within a WRZ a customer may receive their water from anywhere within the zone, and not necessarily from the nearest source. Cotswold district is mostly located within Thames Water's Swindon and West Oxfordshire (SWOX) WRZ as seen in Figure 4.10 below. Small areas in the south west are served by Severn Trent Water's Forest and Stroud WRZ and Bristol Water.

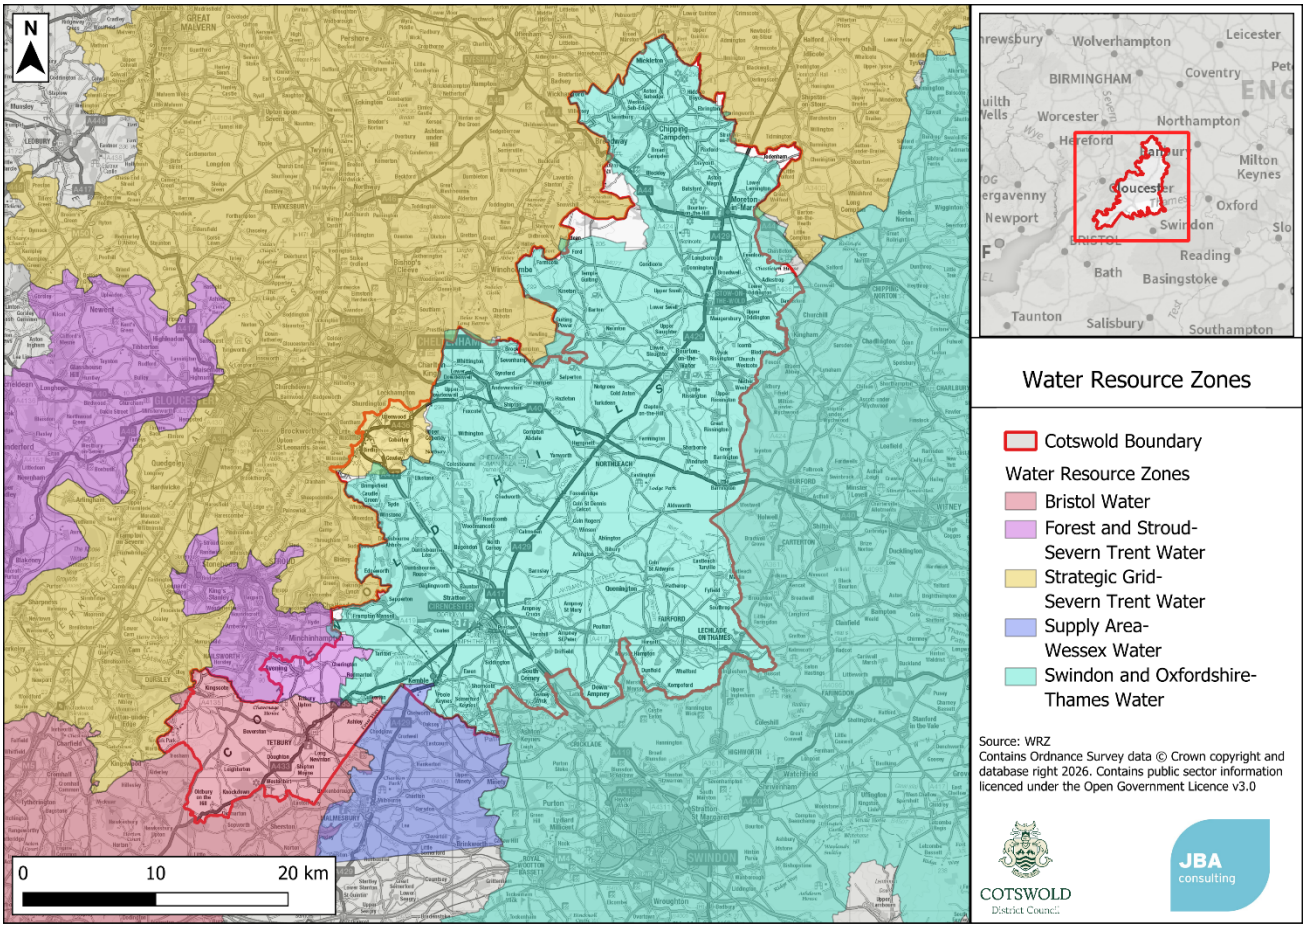

Figure 4.10 Water Resource Zones in and around Cotswold district

4.8.2 Severn Trent Water's WRMP24

Severn Trent Water's WRMP24 (Severn Trent Water, 2024) predicts that if no action is taken, they will see a future supply/demand deficit of 290Ml/d by 2040, growing to 600Ml/d by 2050. Since WRMP19, the EA has updated its water scarcity status assessment and has designated Severn Trent as being in a seriously water stressed area.

The key challenges identified in the WRMP for the region Severn Trent Water supplies are:

- **Climate change** - longer, drier summers and more extreme rainfall events in winter.
- **Population growth** - an increase of 1.1 million people over the next 25 years, and 2.6 million people over the next 60 years.
- **Leakage** - currently around 21% of water supply is lost through leakage.
- **Value for customers** - change requiring investment could increase bills for customers.
- **Environmental Improvement** – reductions in amount permitted for abstraction to meet Water Framework Directive needs and future environmental destination ambition.

Severn Trent Water's preferred plan focuses on halving leakage by 2045 and implementing universal household metering by 2035, supported by enhanced water efficiency measures to reduce consumption. It also includes no/low regret water supply options for the next five to ten years and long-term infrastructure to address environmental and climate challenges, ensuring security of supply under regulatory scenarios.

4.8.2.1 Demand side options

To meet their reduction in leakage goal, Severn Trent Water has planned a number of interventions, including active leakage control, mains renewal, pressure management, reducing trunk mains leakage, and household water metering. Halving leakage by 2045 is predicted to result in a benefit of 121 million litres per day.

Severn Trent Water also plan to install 1.1 million new smart meters and proactively upgrade over 600,000 existing meters by 2035. They also aim to start upgrading the remaining non-smart meters to Advanced Metering Infrastructure (AMI) in 2025.

These initiatives are also complemented by proactive water efficiency activities to help customers reduce their water consumption. This includes the provision of free and subsidised products, as well as providing advice through continuing with their site visits, online interactive sessions, and work with schools.

Water Labelling is a government-led initiative aimed at promoting water-saving by encouraging the use of more efficient fittings and appliances in homes, when replacing existing products. Severn Trent Water have committed to supporting the rollout of the programme and highlighting it to customers through targeted messaging.

4.8.2.2 Supply side options

Severn Trent Water's preferred plan includes a mix of supply-side schemes that complement its demand management efforts.

From AMP8 (2025-2030), the expansion of multiple Water Treatment Works (WTWs) is planned. This includes Shelton WTWs, which is thought to provide an increase of 18 million litres per day.

Several Water transfers were also mentioned in the WRMP24, such as between Birmingham to Wolverhampton (AMP10 20235-2040), which was not included in the 2019

WRMP. By transferring water between WRZs that need water it can help reduce pressure on reservoirs and abstraction sites.

In AMP11 (2040-2045) and AMP 12 (2045-2050), Severt Trent Water has plans to start work on new WTWs and water sources. This includes a new source in Manchester and East Cheshire, expecting to provide a benefit of 5 million litres per day.

The WRMP24 and linked documents can be found on Severn Trent Water's website (severntrent.com).

4.8.3 Thames Water

The Thames Water supply region is organised into six WRZs. Cotswold district is served from the Swindon and Oxfordshire (SWOX).

Thames Water's WRMP24 highlights major pressures on future water resources, driven by population growth, climate change and increasing drought risk. The London and Thames Valley region is one of the most densely populated areas of the UK with over 10 million people living and working in the area and this figure forecast to grow to over 12 million by 2050 and 13 million by 2075. Climate change predictions estimate that water availability could reduce by up to 185.8 Ml/d by 2070 and require an additional 320 Ml/d to maintain resilience to a one in 500-year drought.

Approximately 60% of the water supply across the Thames Valley region is from groundwater sources in the upper Kennet Valley and the Cotswolds. The remaining 40% is abstracted from surface water sources (mostly supplied from large storage reservoirs supplied from the River Thames and River Lee). A desalination water treatment works on the River Thames (Tideway) is also used to supplement water supplies during periods of high demand and/ or drought conditions. In developing the WRMP, Thames Water have worked with the Environment Agency, Natural England and other environmental organisations to develop a plan to reduce environmental abstractions, which is identified as the largest driver of investment in the plan.

If no action is taken, Thames Water predict that they could face a water shortfall of over 1 billion litres of water per day by 2050. To address this, WRMP24 sets out demand reduction measures such as leakage reduction, improved water efficiency through smart metering, innovation, new tariffs and temporary drought restrictions. It also identifies a range of supply side options including desalination, water recycling, regional transfers, a new reservoir, groundwater enhancements and Aquifer Storage and Recovery, alongside work with WRSE to strengthen connectivity across the South East.

The WRMP also identifies the need for a Strategic approach to planning future water supply. Strategic Resource Options (SROs) for Buckinghamshire include surface water abstraction at Medmenham (24 Ml/d by 2050) and an interzonal transfer from Henley to SWOX (5 Ml/d by 2042).

4.8.4 Population and household growth

The growth forecast used in the WRMP24 planning tables does not break down the WRZ forecast into individual LPAs. It is not therefore possible to directly compare the WRMP24 forecast with the housing need. Instead, the percentage growth in the number of households is used.

The baseline number of households in CDC was taken from the Office for National Statistics (ONS) household projections for England (ONS.gov.uk) - 2022 based forecast. The housing need for CDC calculated using the Standard Method and added to the 2025 baseline number of households. This results in a 42% increase in the number of households during the plan period.

Table 4.4 shows the household growth accounted for in each water company's WRMP. SWOX is predicted to have an increase in the number of households of 24%, Strategic Grid is expected to grow by 11% and Bristol Water's WRZ by 13%.

The growth accounted for in WRMP24 is significantly lower as a percentage than the housing need. A WRMP must be based on published plans at the time of writing, and so can often be out of date. This is particularly true at the time of writing, where the WRMP forecasts are several years old, and many LPAs have seen an increase to their housing need due to changes in the way this is calculated. WRMPs are updated every five years, and so there is an opportunity for the WRMP to adapt to higher growth levels in WRMP29.

Table 4.6 Comparison of household growth forecasts over the plan period

Forecast	Number of households - 2025	Number of households - 2043	Increase in households	Percentage change
Local Plan	42,796	60,704	17,918	42%
Bristol Water	572,860	647,450	74,590	13%
Strategic Grid	2,451,200	2,717,240	266,220	11%
SWOX	488,750	606,540	117,790	24%

4.9 Water Industry National Environment Programme (WINEP) Measures

There are seven water resource related WINEP actions on surface waterbodies in the study area listed in Table 4.7. Groundwater bodies listed are in Appendix B alongside an explanation of the driver codes used for each action.

Table 4.7 Surface water resources WINEP actions within the study area

4.10 Water demand reduction

4.10.1 Water efficiency

It is widely recognised that the climate is changing. Climate change is predicted to increase pressure on water resources, increasing the potential for a supply-demand deficit in the future, and making environmental damage from over abstraction of water resources more likely. Furthermore, the delivery of water and wastewater services and the heating of water in the home require high energy inputs and therefore contribute directly to emissions of greenhouse gases. Water efficiency therefore reduces energy use and carbon emissions.

It is important therefore that new development does not result in an unsustainable increase in water abstraction. This can be done in a number of ways from reducing the water demand from new houses through to achieving ‘water neutrality’ in a region by offsetting a new development's water demand by improving efficiency in existing buildings.

It is for Local Authorities to establish a clear need to adopt the tighter water efficiency target through the building regulations. This should be based on existing sources of evidence such as:

- the EA classification of water stress;
- Water resource management plans produced by water companies;
- RBMPs which describe the river basin district and the pressure that the water environment faces. These include information on where water resources are contributing to a water body being classified as ‘at risk’ or ‘probably at risk’ of failing to achieve good ecological status, due to low flows or reduced water availability;
- Defra Plan for Water;

- consultations with the local water and sewerage company, the EA and catchment partnerships; and
- consideration of the impact on viability and housing supply of such a requirement.

This evidence is laid out below.

4.10.2 Water stress

Water stress is a measure of the level of demand for water (from domestic, business and agricultural users) compared to the available freshwater resources, whether surface or groundwater. Water stress causes deterioration of the water environment in both the quality and quantity of water and consequently restricts the ability of a waterbody to achieve a 'good' status under the WFD.

The EA has undertaken an assessment of water stress across the UK. This defines a water stressed area as where:

- the current household demand for water is a high proportion of the current effective rainfall which is available to meet that demand; or
- the future household demand for water is likely to be a high proportion of the effective rainfall available to meet that demand.

In the EA's assessment, the Thames Water, Severn Trent Water and Wessex Water supply regions are classified as being in areas of serious water stress. The Cotswold District Council area is therefore classified as a water stressed area.

4.10.3 Environmental Improvement Plan

Through their Plan for Water[3] Defra has signalled their intention to review the water efficiency standards for new homes, including consideration of a new national 105 l/p/d standard and 100 l/p/d where there is a clear local need.

The Future Homes Hub (futurehomes.org.uk) was established to 'facilitate the collaboration needed within and beyond the new homes sector to help meet the climate and environmental challenges ahead'. It consists of representatives from the building industry, regulators, water companies, and environmental groups. Defra asked them to support them in the creation of the roadmap towards greater water efficiency. They have proposed a road map for water efficient homes in England and set out a framework for the homebuilding sector to work in partnership with other stakeholders such as the water sector, local authorities and regulators to deliver it. The proposed roadmap is shown in Figure 4.11 below and outlines a staged approach to reducing per capita consumption. It also allows for

3 Plan for Water: our integrated plan for delivering clean and plentiful water, Department for Environment, Food & Rural Affairs (2023). Accessed online at: https://www.gov.uk/government/publications/plan-for-water-our-integrated-plan-for-delivering-clean-and-plentiful-water/plan-for-water-our-integrated-plan-for-delivering-clean-and-plentiful-water on: 06/11/2025.

a tighter figure of 90 l/p/d by 2025 in seriously water stressed areas to enable sustainable growth.

Figure 4.11: Future Homes Hub proposed water efficiency roadmap.

Cotswold district is classified as a water stressed area on the roadmap and this supports a tighter water efficiency standard than the 110 l/p/d target in the building regulations

The Environment Act 2021 (and Environmental Improvement Plan 2023 (EIP)) introduces a National Water Target that requires 20% reduction in public water supply in England per head of population by 2038, against a 2019 to 2020 baseline — with interim targets of 9% by 2027 and 14% by 2032. These targets cannot be achieved by new development alone. This guidance is aimed to complement other demand management measures, including leakage reduction, to support delivery of these targets alongside sustainable growth and nature recovery. The government has an ambition to tighten Building Regulations water efficiency standards.

4.10.4 Environmental obligations

Section 9 identifies protected sites in the region that may be sensitive to changes in river flow or groundwater levels and therefore could be impacted by increases in abstraction (either from surface water or groundwater) to support growth in Cotswold District.

Natural England have a "plan-led" approach to water scarcity through which they are robustly responding to WRMPs and negotiating licence changes with the EA. The third element of their approach is to provide advice to LPAs on water efficiency, encouraging LPAs to adopt more stringent water efficiency targets.

4.10.5 Consideration of viability and feasibility

Any water efficiency target adopted has to be feasible: i.e., do the products exist that allow a particular standard to be met, and viable, i.e., can the standard be achieved without making the development financially unviable.

In the Anglian Water area in the east of England, a shared standard for water efficiency has been defined. Whilst this standard goes beyond what is currently recommended in this region, Annex C of this Shared Standard provides useful examples of products that are available on the market that can achieve an efficiency standard of 85l/p/d based on the capacity and flow rates they deliver.

The Future Homes Hub provides some indicative costs for achieving different water efficiency targets. It states that there is no additional cost to achieve 110l/p/d. The cost of achieving 100l/p/d is estimated to be £350 per unit (Future Homes Hub, 2024).

Research undertaken for the devolved Scottish and Welsh governments by the Energy Saving Trust indicated potential annual savings on water and energy bills for householders of approximately £31 per year as a result of water efficiency measures that would allow a target of 100l/p/d to be met (Energy Saving Trust, 2020). Water efficiency is therefore not only viable but of positive economic benefit to both private homeowners and tenants. In addition, financial incentives are available from the water companies to developers to encourage water-efficient design.

Research published by Building Research Establishment (BRE) on the delivery of sustainable buildings reports that the cost of achieving lower BREEAM ratings incurs little or no additional cost and targeting higher BREEAM ratings incurs a typical cost of less than 2% above the baseline for that development. The same study reports that the cost of achieving 3 credits in WAT01 (a 40% reduction in water consumption for baseline) would be £13,361 and payback could be achieved between 1 and 2.5 years depending on the price of water (BRE, 2018).

Research by Water UK (Water UK, 2022), found that the average household of four could save £472 per year by making small changes to save water. These changes include fixing leaks, taking shorter showers, washing clothes at lower temperatures, and only using appliances when full.

4.10.6 Water company advice

Severn Trent Water

Severn Trent Water have published a number of water-saving tips on their website (stwater.co.uk). At home, they recommend changes like switching from baths to showers and installing dual-flush toilets or water displacement devices such as Hippo bags to reduce flush volume. For the garden, they suggest reusing domestic wastewater for watering plants and setting up a water butt to collect rainwater. They also provide advice on saving water at work and checking for leaks.

Severn Trent Water offers a range of incentives to developers to adopt water efficient fixtures and fittings which achieve per capita consumption of 100l/p/d or less (see also section 2.4).

Thames Water

Thames Water provides some recommendations for reducing water use on their website. For the garden they recommend watering plants during the early morning or late evening; allowing lawns to turn golden during dry periods due to the ability of grass to recover quickly; reusing water from paddling pools or washing-up for plants; and using a watering can instead of a hosepipe.

Around the home, suggestions include avoiding unnecessary water use by keeping a jug of cold water in the fridge rather than running the tap; postponing activities such as car washing during hot weather and using a bucket instead of a hose. Thames Water also promotes the use of eco-settings on washing machines and dishwashers to reduce both water and energy consumption.

Thames Water also offer water efficiency incentives where developers can demonstrate they have built a premises with a domestic water usage of 100l/p/d or less and have met the specified criteria as detailed in section 2.5.5.

Bristol Water

Bristol Water's website provides a number of water saving tips and advice such as taking shorter showers and reducing bath water levels. It also suggests running washing machines and dishwashers on full loads. Bristol Water also encourage people to check for leaks, use dual-flush toilets correctly, and install water-saving devices such as tap aerators, showerheads, and cistern-saving products.

Bristol Water provides advice on longer-term water-saving measures, including switching to a water meter, collecting rainwater with water butts, and adopting water-efficient gardening practices. It also provides seasonal advice, such as protecting pipes during winter and using water carefully during summer activities.

Bristol Water also encourages improved water efficiency by offering various incentives to developers to promote good design including reduced infrastructure charges if ≤110 litres/person/day is achieved (see section 2.5.5).

4.10.7 Summary of evidence for tighter efficiency standard

Water resources in England are under considerable pressure. The Environment Agency has stated that "the scale of the challenge we face increases with time and, by 2050, we are looking at a shortfall of nearly 5 billion litres of water per day between the sustainable water supplied available and the expected demand."

The strategic direction in the UK set out in the new National Water Resources Framework is to attain an average household water efficiency of 110 l/p/d by 2050. There would also be a positive economic impact for residents in terms of reduced energy and water bills.

Part G of Building regulations currently states that new build housing should achieve a minimum of 125 l/p/d. A tighter target of 110l/p/d is allowed if the local authority can establish a clear need based on available evidence. Many LPAs are now going further than this. The Written Ministerial Statement (WMS) by the former Secretary of State for Levelling Up, Housing and Communities (DLUHC) states that:

"…in areas of serious water stress, where water scarcity is inhibiting the adoption of Local Plans or the granting of planning permission for homes, I encourage local planning authorities to work with the Environment Agency and delivery partners to agree standards tighter than the 110 litres per day that is set out in current guidance."

Cotswold district is in an area classified by the Environment Agency as being under serious water stress.

The WCS recommends that the Council adopts a policy requiring a water efficiency target of 100l/p/d in their Local Plan and allow for a reduction in this target to 90l/p/d from 2030.

This should be achieved using a fittings-based approach and supported by an equivalent non-household target where development will aim to achieve full credits in the BREEAM water calculator with a minimum of 3 credits in WAT01.

This should be aligned with a robust enforcement approach to ensure that correct fixtures and fittings are being installed at site level.

4.10.8 Water neutrality concept

Water neutrality is a relatively new concept for managing water resources, but one that is receiving increased interest as deficits in future water supply/demand are identified. The definition adopted by the Government and the Environment Agency (Environment Agency, 2009) is:

"For every development, total water use in the wider area after the development must be equal to or less than total water use in the wider area before development"

It is useful to also refer to the refined definition developed by Ashton:

"For every new significant development, the predicted increase in total water demand in the region due to the development should be offset by reducing demand in the existing community, where practical to do so, and these water savings must be sustained over time" (Booth and Charlesworth, 2014)**.**

This definition states the need to sustain water saving measures over time, and the wording "predicted increase in total water demand" reflects the need for water neutrality to be designed in at the planning stage.

Both definitions refer to water use in the region or "wider area", and the extent of this area should be appropriate to local authority boundaries, water resource zones, or water abstraction boundaries depending on what is appropriate for that particular location. For instance, if a development site is in an area of water stress relating to a particular abstraction source, offsetting water use in a neighbouring town that is served by a different water source will not help to achieve water neutrality.

In essence water neutrality is about accommodating growth in a region without increasing overall water demand.

Water neutrality can be achieved by:

- reducing leakage from the water supply networks;
- making new developments more water-efficient;
- "offsetting" new demand by retrofitting existing homes with water-efficient devices;
- encouraging existing commercial premises to use less water;

- implementing metering and tariffs to encourage the wise use of water; and
- education and awareness-raising amongst individuals.

Suggestions for water-efficiency measures are listed in

Table 4.8: below.

Table 4.8: Consumer water efficiency measures, adapted from Booth and Charleswell 2014.

Topic	Measures
Educational and promotional campaigns	Encourage community establishments (e.g., schools, hospitals) to carry out self-audits on their water use. Deliver water conservation message to schools and provide visual materials for schools. Building awareness with homeowner/ tenants
Water-efficient measures for toilets	Cistern displacement devices to reduce volume of water in cistern. Retro-fit or replacement dual flush devices Retro-fit interruptible flush devices Replacement low-flush toilets
Water-efficient measures for taps	Tap insert, such as aerators. Low flow restrictors Push taps Infrared taps
Water-efficient measures for showers and baths	Low-flow shower heads Aerated shower heads Low-flow restrictors Shower timers Reduced volume baths (e.g., 60 litres) Bath measures
Rainwater harvesting and water reuse	Large-scale rainwater harvesting Small-scale rainwater harvesting for example with a water butt, or rainwater tank for toilet flushing. Grey water recycling
Water efficient measures addressing outdoor use	Hosepipe flow restrictions Hosepipe siphons Hose guns (trigger hoses) Drip irrigation systems Mulches and composting
Commercial properties	Commercial water audits Rainwater recycling Grey water recycling Optimising processes Provide water efficiency information to all newly metered businesses

Topic	Measures
Metering	Promote water companies' free meter option Compulsory metering (in water stressed areas) Smart metering (to engage customer with their consumption) Provide interactive websites that allow customers to estimate the savings associated with metering (environmental and financial) Innovative tariffs (seasonal, peak, rising block) Customer supply pipe leakages- supply pipe repair and replacement
Other	Household water audits, including DIY or with help of plumber. Seek and fix internal leaks and/ or dripping taps. Water efficient white goods, including washing machines and dishwashers. Ask customers to spot and report leaks

Many interventions are designed to reduce water use if operated in a particular way and so rely on the user being aware and engaged with their water use. The educational aspect is therefore important to ensure that homeowners, community establishments and businesses are aware of their role in improving water efficiency.

4.10.9 Rainwater Harvesting and Greywater Recycling

Rainwater harvesting

Rainwater recycling or rainwater harvesting (RwH) is the capture of water falling on buildings, roads or pathways that would normally be drained via a surface water sewer, infiltrate into the ground or evaporate. In the UK this water cannot currently be used as a drinking water supply as there are strict guidelines on potable water, but it can be used in other systems within domestic or commercial premises.

Systems for collection of rainwater can be simple water butts attached to a drainpipe on a house, or it could be a complex underground storage system, with pumps to supply water for use in toilet flushing and washing machines. By utilising rainwater in this way there is a reduced dependence on mains water supply for a large proportion of the water use in a domestic property.

Benefits of RwH

- RwH reduces the dependence on mains water supply – reducing bills for homeowners and businesses.
- Less water needs to be abstracted from river, lakes and groundwater.
- Stormwater is stored in a RwH system reducing the peak runoff leaving a site providing a flood risk benefit (for smaller storms).
- By reducing surface water flow, RwH can reduce the first flush effect whereby polluted materials adhering to pavement surfaces during dry periods are removed by the first flush of water from a storm and can cause pollution in receiving watercourses.

Challenges of RwH

- Dependency on rainfall can limit availability of harvested rainwater during drought and hot weather events.
- Increased capital (construction) costs to build RwH infrastructure into new housing (£900 to £3,000 for a small-scale domestic system) (Waterwise, 2020).
- Payback periods are long as the cost of water is low so there is little incentive for homeowners to invest.

Greywater Recycling

Greywater refers to water that has been 'used' in the home in appliances such as washing machines, showers and hand basins. Greywater recycling or greywater harvesting (GwH) is the treatment and re-use of this water in other systems such as for toilet flushing. By their nature, GwH systems require more treatment and are more complex than RwH systems, and there are limited examples of their use in the UK.

Greywater re-use refers to systems where wastewater is taken from source and used without further treatment. An example of this would be water from a bath or shower being used on plants in the garden. This sort of system is easy to install and maintain. However, as mentioned above the lack of treatment to remove organic matter means the water cannot be stored for extended periods.

Greywater recycling refers to systems where wastewater undergoes some treatment before it is used again. These systems are complex and require a much higher level of maintenance than RwH or greywater re-use systems.

Domestic water demand can be significantly reduced by using GwH, and unlike with a RwH system where the availability of water is dependent on the weather, the source of water is usually constant (for instance if it is from bathing and showering). However, the payback period for a GwH system is usually long, as the initial outlay is large, and the cost of water relatively low.

Viability of greywater systems for domestic retrofit applications is therefore currently limited. However, communal systems may offer more opportunities where the cost can be shared between multiple households particularly on larger new build developments, or in new settlements.

Eddington case study

The North-West Cambridge development at Eddington incorporates the UK's largest communal rainwater harvesting system, designed to address water stress in the East of England. The development took place between 2013 and 2018, with a strong focus on water efficiency. Rainwater is collected from roofs and public spaces, stored in Brook Leys Lake, treated, and distributed via a separate network for non-potable uses such as toilet flushing, laundry, and irrigation. The system was intended to reduce mains water consumption for these uses by up to 50%, lowering average demand from around 150 litres per person per day (l/pp/d). The aim was to reduce water consumption to approximately 80

l/pp/d, in line with local planning policy (Greater Cambridge A, 2025), although there is no official council source confirming that this target has been achieved.

In addition to reducing potable water demand, the design integrates SuDS, to help manage surface water and support biodiversity.

4.10.10 Energy and water use

18% of the UK's domestic energy usage is for water heating (HM Government, 2022). If less water was being used within the home, for instance through more water efficient showers, less water would need to be heated, and overall domestic energy usage would be reduced.

In 2020-2021 the Government consulted on a Future Homes Standard that will involve changes to Part L (conservation of fuel and power) of the Building Regulations for new dwellings (HM Government, 2019). However, this does not identify the role of water efficiency in the home in also reducing energy usage.

4.11 Conclusions and recommendations

Water supply and wastewater services within the study area are provided by Bristol Water, Severn Trent, Thames Water and Wessex Water. Cotswold district is located across several water resource zones, but predominantly in Thames Water's SWOX WRZ.

It is widely recognised that the climate is changing. In response, CDC declared a climate emergency in 2019. Climate change is predicted to increase pressure on water resources, increasing the potential for a supply-demand deficit in the future, and making environmental damage from over abstraction of water resources more likely. Furthermore, the delivery of water and wastewater services and the heating of water in the home require high energy inputs and therefore contribute directly to emissions of greenhouse gases. Water efficiency therefore reduces energy use and carbon emissions.

It is important that new development does not result in an unsustainable increase in water abstraction. This can be done in a number of ways from reducing the water demand from new houses through to achieving water neutrality in a region by offsetting a new developments water demand by improving efficiency in existing buildings.

The WINEP is a set of actions that the EA have requested all 20 water companies operating in England to complete in a particular AMP as part of their environmental commitments. A number of investigations are planned or underway to ensure that abstraction of water from both groundwater and rivers, is not leading to unsustainable reductions in flow. Development and population growth can increase abstraction, and so CDC have an opportunity to contribute to these actions indirectly by pursuing policies that promote water efficiency in new development.

The National Water Resources Framework sets the objective to reduce the average per capita consumption in the UK to 110 l/p/d by 2050. This is now part of the Environmental Improvement Plan and water companies WRMPs. Within Defra's Plan for Water is the

commitment to review Building Regulations and a target of 100 l/p/d in severely water stressed areas is suggested.

The Future Homes Hub, who are supporting Defra to produce a roadmap to greater water efficiency propose a stages reduction in PCC, with a target of 100 l/p/d in water stressed areas in place from 2025, and a reduced target of 90 l/p/d in place by 2030 (depending on market conditions and customer acceptance).

This study recommends that as a minimum the proposed new Building Regulations target of 100 l/p/d outlined in Defra's Plan for Water be adopted across the study area. This should be achieved using a fittings-based approach. The target would be subject to viability testing by the LPA.

This should be supported by the requirement for non-household development to achieve three credits in the assessment category WAT01 of the Building Research Establishment Environmental Assessment Methodology (BREEAM) UK New Construction Standard.

5 Water supply infrastructure

5.1 Introduction

An increase in water demand due to growth can exceed the hydraulic capacity of the existing supply infrastructure. This is likely to manifest itself as low pressure at times of high demand. An assessment is required to identify whether the existing infrastructure is adequate or whether upgrades will be required. The time required to plan, obtain funding and construct major pipeline works can be considerable and therefore water companies and planners need to work closely together to ensure that the infrastructure is able to meet growing demand.

Water supply companies make a distinction between supply infrastructure, the major pipelines, reservoirs and pumps that transfer water around a WRZ, and distribution systems, smaller scale assets which convey water around settlements to customers. This outline study is focused on the supply infrastructure. It is expected that developers should engage early with the Developer Services functions of the water and wastewater companies local to their site, and fund water company impact assessments and modelling of the distribution systems to determine requirements for local capacity upgrades to the distribution systems.

In addition to the work undertaken by water companies, there are opportunities for the local authority and other stakeholders to relieve pressure on the existing water supply system by increasing water efficiency in existing properties. This can contribute to reducing water consumption targets and help to deliver wider aims of achieving water neutrality.

A cost-effective solution can be for local authorities to co-ordinate with water supply companies and "piggyback" on planned leakage or metering schemes, to survey and retrofit water efficient fittings into homes (Waterwise, 2009). This is particularly feasible within property owned or managed by local authorities, such as social housing.

Severn Trent Water were not able to provide comments on the potential allocations within the timetable of the Local Plan evidence base and expect to respond during the consultation period.

5.2 Location of existing supply infrastructure

No development is permitted within a specified distance of water mains. For example, there should be no building, planting or other heavy earth works within a minimum of 4m of trunk and raw water trunk mains. For other mains there is a minimum of 2-3m no dig exclusion zone, unless mains are to be diverted. The costs of diverting mains would need to be met by the developer.

A guide to working near Severn Trent Water's assets can be found here: Guidance-for-working-near-our-assets (stwater.co.uk). Local Authorities can obtain free infrastructure maps from Severn Trent Water as well as supplying infrastructure information under a non-disclosure agreement.

Thames Water and Bristol Water have also have guidance for working near their assets which can be found on their websites here:

- Working near our pipes (thameswater.co.uk)
- Landowner Resources (bristolwater.co.uk)

It is recommended that developers engage with the relevant water supply company early in the planning process to ensure that any direct impacts on the water supply network are addressed early.

5.3 TW assessment of impact on supply network

5.3.1 Methodology

TW were sent a list of the Cotswold Local Plan potential site allocations in August 2025 TW gave the sites a red, amber, green (RAG) value based on the estimated water demand of the development. Five sites, now within the potential local plan allocations were not included in the initial list of sites sent to TW to assess.

The following criteria were applied to the potential allocations.

GREEN	AMBER	RED
On the information provided we do not envisage infrastructure concerns in relation to this development/s. There may be a requirement for hydraulic modelling and potential small scale network upgrades.	On the information provided, hydraulic modelling will be required, and it is likely network upgrades or supply system upgrades will be required.	On the information provided, hydraulic modelling will be required, and it is anticipated that extensive upgrades to the local water network and strategic supply system will be necessary.

5.3.2 Results

Of the 55 potential allocations, 52 are located within the SWOX WRZ. TW gave 15 sites a red assessment, 20 amber and 12 green. Five sites were not assessed. The location of these sites is shown in Figure 5.1. The complete list of sites and their RAG scores can be found in Appendix F.

A red or amber assessment does not imply that a site could or should not be developed, merely that additional infrastructure may be required in order to accommodate it.

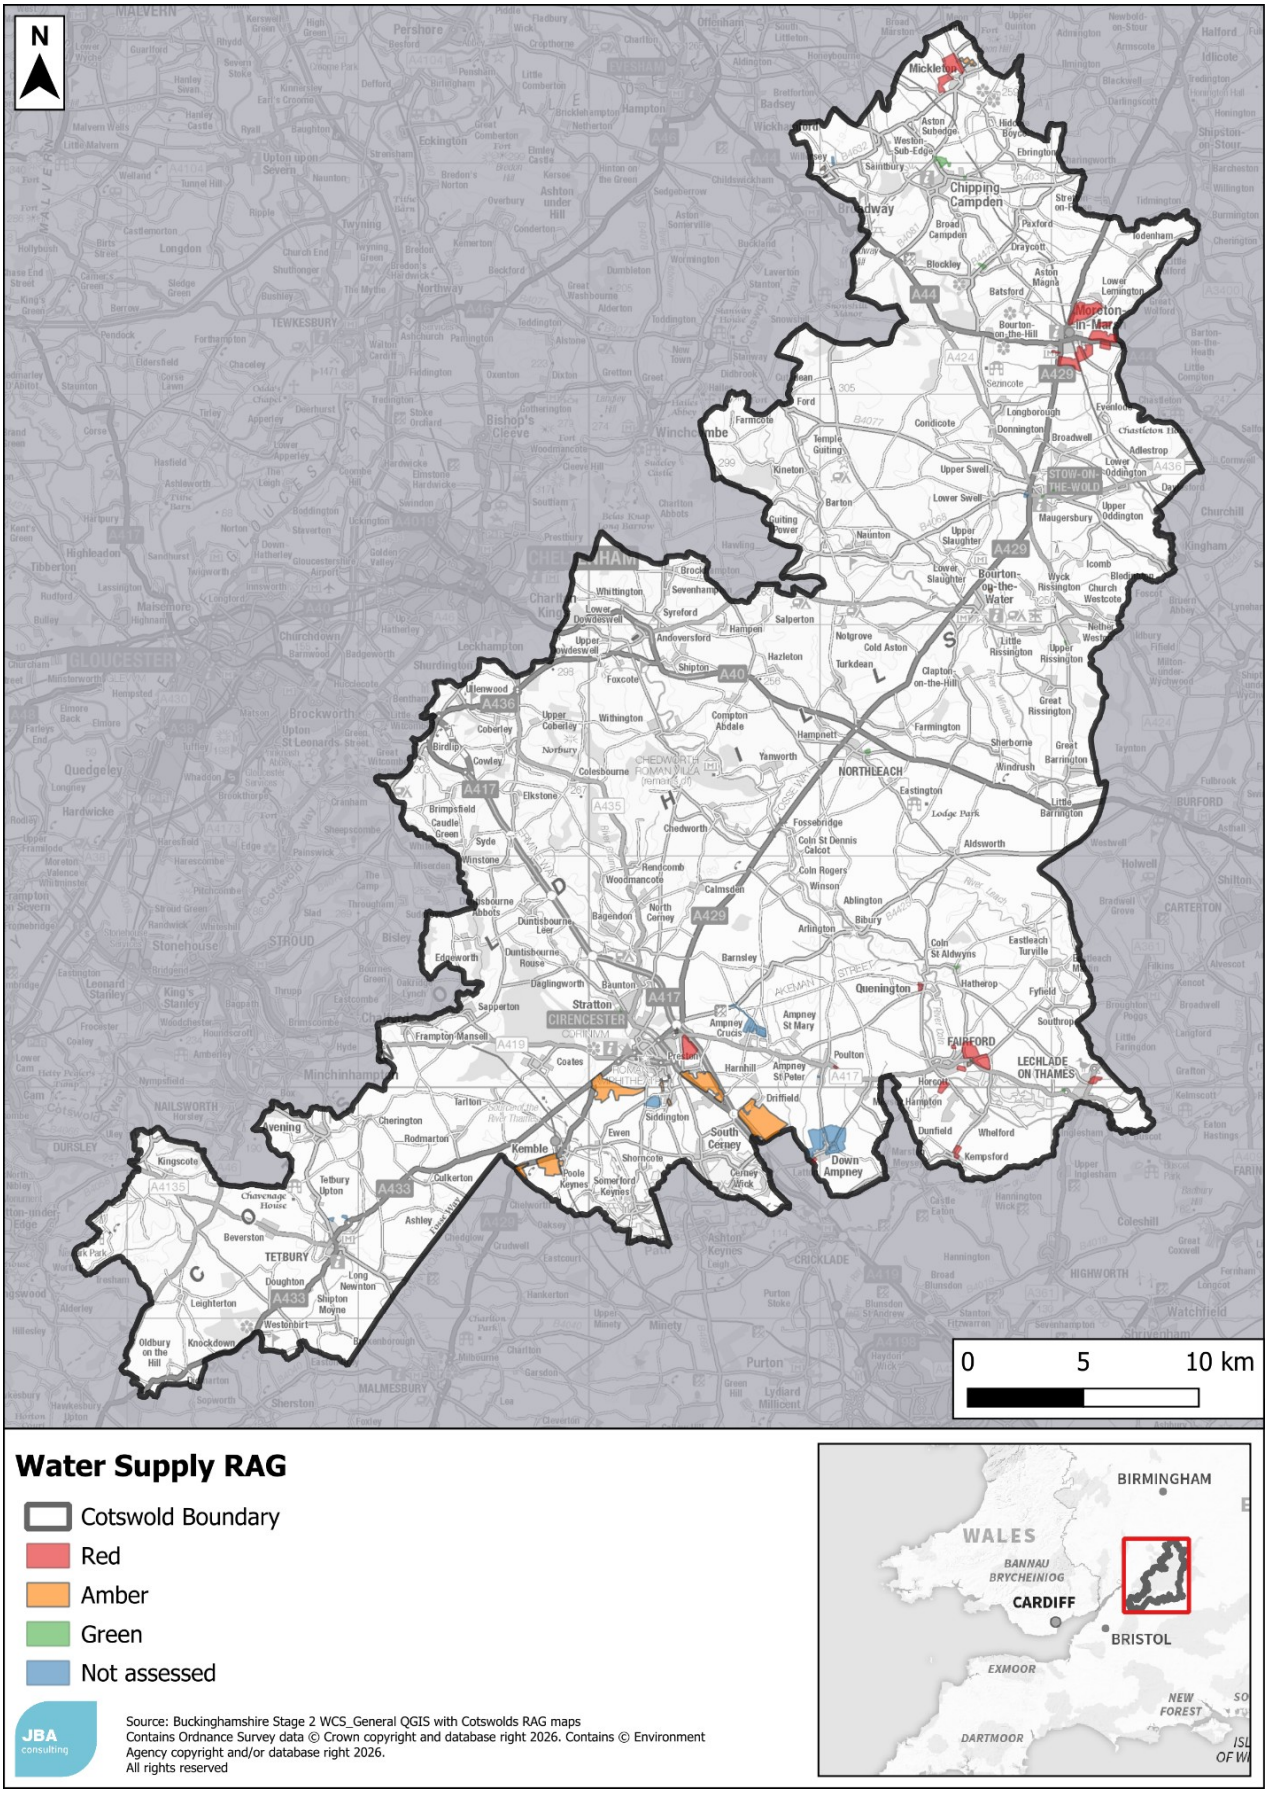

Figure 5.1: Water supply network RAG (Thames Water)

5.4 Conclusion and recommendations

TW provided a site-by-site assessment of potential allocations in their supply area. This identified 15 sites where further modelling by TW would definitely be required, and a further 20 where modelling may be required, in both cases, upgrades to the water supply network may be needed to accommodate development.

Upgrades to the local supply network would be funded as part of the developer Infrastructure Charge. Early engagement between developers, BDBC and the water companies is recommended to ensure upgrades are in place prior to occupation.

Recommendations for water supply infrastructure are provided in Table 5.1.

Table 5.1: Recommendations for water supply infrastructure.

CDC and developers should engage early with water companies to ensure supply infrastructure is in place prior to occupation.	Thames Water and Bristol Water and CDC developers	Ongoing
Developers should engage early with water companies to ensure that the capacity of distribution systems is adequate prior to development coming forward.	Thames Water and Bristol Water and developers	Ongoing

6 Wastewater collection

6.1 Sewerage undertaker

Thames Water is the main water and wastewater company that serves as the sewerage undertaker for the study area, see Figure 6.1. The role of the sewerage undertaker includes the collection and treatment of wastewater from domestic and commercial premises. In some areas, it also includes the drainage of surface water from building curtilages to combined or surface water sewers. It excludes, unless adopted by the sewerage undertaker, systems that do not connect directly to the wastewater network, e.g., SuDS or highway drainage.

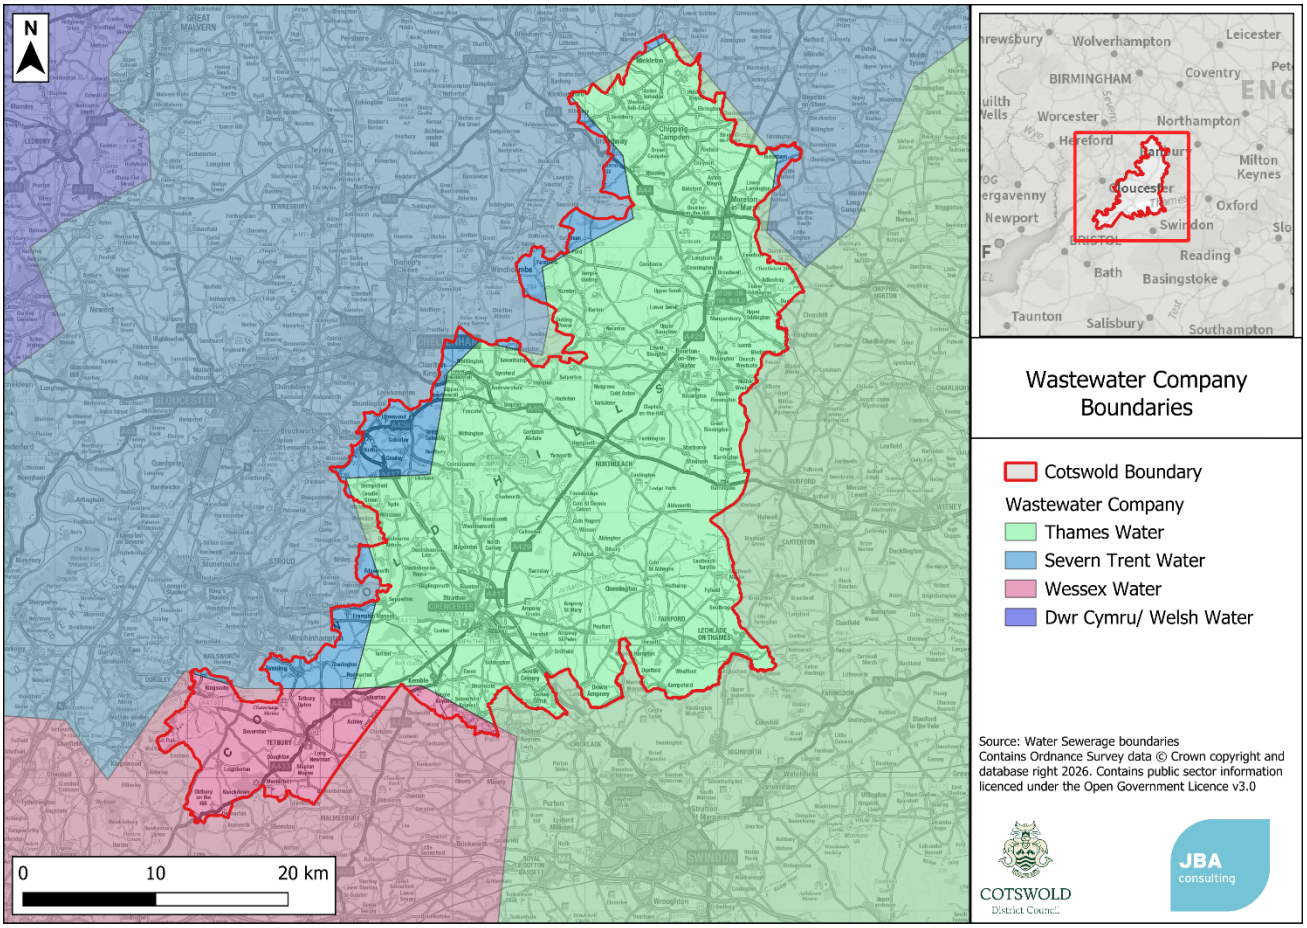

Figure 6.1 Wastewater Companies in Cotswold District

Increased wastewater flows into collection systems due to growth in populations or per-capita consumption can lead to an overloading of the infrastructure, increasing the risk of sewer flooding and, where present, increasing the frequency of discharges from storm overflows. Seasonal and yearly variations in weather and infiltration can reduce headroom at WwTW.

Headroom at WwTW can be eroded by growth in population or per-capita consumption, requiring investment in additional treatment capacity. As the volumes of treated effluent rises, even if the effluent quality is maintained, the pollutant load discharged to the receiving

watercourse will increase. In such circumstances the EA as the environmental regulator, may tighten effluent consents to achieve a 'load standstill', i.e., ensuring that as effluent volume increases, the pollutant discharged does not increase. Again, this would require investment by the water company to improve the quality of the treated effluent. Consents can also be tightened to prevent a deterioration in water quality due to growth, or to achieve environmental objectives.

In combined sewerage systems, or foul systems with surface water misconnections, there is potential to create headroom in the system, thus enabling additional growth, by the removal of surface water connections and reducing infiltration. This can most readily be achieved during the redevelopment of brownfield sites which have combined sewerage systems, where there is potential to discharge surface waters via SuDS to groundwater, watercourses or surface water sewers.

6.2 Sewerage system capacity assessment

New residential developments add pressure to existing sewerage systems. An assessment is required to identify the available capacity within the existing wastewater network, and the potential to upgrade overloaded systems to accommodate future growth. The scale and cost of upgrading works may vary significantly depending upon the location of the development in relation to the network itself and the receiving WwTW.

It may be the case that an existing sewerage system is already working at its full capacity, and further investigations must be carried out to define which solution is necessary to implement an increase in its capacity. New infrastructure may be required if, for example, a site is not served by an existing system. Such new infrastructure will normally be secured through private third-party agreements between the developer and utility provider.

Sewerage Undertakers must consider the growth in demand for wastewater services when preparing their five-yearly Strategic Business Plans (SBPs) which set out investment for the next Asset Management Plan (AMP) period. Typically, investment is committed to provide new or upgraded sewerage capacity to support allocated growth with a high certainty of being delivered. Additional sewerage capacity to service windfall sites, smaller infill development or to connect a site to the sewerage network across third party land is normally funded via developer contributions, as third-party arrangements between the developer and utility provider.

6.3 Drainage and Wastewater Management Plan (DWMP)

6.3.1 Thames Water DWMP

Thames Water's DWMP outlines their strategy for addressing future challenges in wastewater services, detailing the necessary investments to expand, enhance, and sustain wastewater systems and drainage networks over the next 25 years. The overall vision of the DWMP is ‘to identify future catchment risks to our drainage and wastewater treatment systems and develop sustainable, efficient solutions to address them.’ With the aim to deliver in three areas:

- Customers and communities – fair charges for the services we provide, improved health and wellbeing, increased amenity, and a resilient service.
- Drainage and wastewater services – reduce sewer flooding and achieve 100% Sewage Treatment Works (STW) compliance.
- The environment – restore river health, increase biodiversity, environmental net gain.

Thames Water's DWMP includes Catchment Strategic Plans (CSPs) for each Thames regional Flood and Coastal Committee (TRFCC) area. The study area falls under the Swindon and Oxfordshire (SWOX) (Level 2) CSP, which then falls into one of the 382 planning catchments (Level 3). Initial risk-based screening found that 77% of the L3 catchments in this CSP were vulnerable to growth and climate change, warranting long-term planning. 7% of properties are forecast to be at risk of internal hydraulic sewer flooding in a 1 in 50-year storm by 2050. With no action, by 2050 Thames Water predict that 44% of L3 catchments will have storm overflow discharge of greater than 10 discharges per year on average by 2050.

The targets for catchments in this CSP are to:

- Reduce the number of customers at risk of internal and external hydraulic sewer flooding up to a 1 in 50-year storm by 100%.
- Reduce storm discharges (where overflows are present) to <10 in an average year by 2050
- Achieve 100% STW permit compliance

6.3.2 Severn Trent DWMP

The Severn Trent DWMP explains that "the overall objective of DWMP is to provide visibility of the current and future challenges, outline what strategic interventions are best to mitigate these future pressures and inform the appropriate pace of investment to meet the long term aims".

Severn Trent Water's Drainage and Wastewater Management Plan (DWMP) outlines eight key goals:

- Secure future water supply
- Promote efficient water use
- Provide a high-quality, affordable service
- Reduce the risk of flooding and pollution
- Protect and enhance the environment
- Support a circular economy
- Make a positive social impact
- Maintain a safe, inclusive workplace

The region contains 2,647 storm overflows, with 1,097 predicted to become high priority by 2050, as they activate more than 10 times annually, exceeding national guidelines. Severn Trent aims to address 39% of harmful storm overflows and 26% of those that exceed the annual activation limit by 2030, aligning with the Storm Overflow Discharge Reduction Plan.

Reducing the frequency of storm overflow operations will involve upgrading wastewater treatment works (WwTWs) and sewer systems to ensure overflows occur only during extreme rainfall.

A Baseline Risk and Vulnerability Assessment (BRAVA) evaluated the risk of sewer flooding for various climate change scenarios (no temperature change, and 2°C or 4°C increases). Currently, around 112,000 properties (2.58% of connected properties) are at risk of flooding. Without WwTW upgrades, this could increase by 39% (to 155,998 properties) by 2050 under a 2°C rise in temperature.

The DWMP identifies investment opportunities to reduce flooding and storm overflow spills, such as separating surface water from combined sewers and improving pollutant screening. There is also a focus on maximising nature-based solutions, like Sustainable Drainage Systems (SuDS), to sustainably manage surface water and reduce its impact on the sewer network.

Overall, the plan emphasises reducing storm overflow events, upgrading WwTWs, and developing sustainable water management strategies like SuDS

6.3.3 Wessex Water DWMP

Wessex Water's DWMP outlines their strategy to manage current and future challenges to drainage and wastewater systems while increasing investment in infrastructure and environmental protection. In addition to the national planning goals, six objectives specific to Wessex Water were established in the DWMP process:

- Reducing groundwater infiltration
- Promoting sustainable drainage
- Expanding partnership opportunities
- Improving river water quality
- Reducing the risk of flow compliance failures at water recycling centres
- Minimizing the risk of blockages

To achieve these objectives, protect public health, and enhance the environment, Wessex Water plans the following investments by 2030:

- Continue maintaining and operating assets to high standards
- Invest £1.4 billion to upgrade water recycling centres, meet stricter treatment standards, and support population growth
- Spend £550 million to improve the performance of 148 storm overflows
- Implement nature-based solutions where they provide the best value
- Allocate nearly £100 million to monitor the water quality impacts of treatment works and storm overflow discharges
- Increase investment to reduce groundwater infiltration into sewers and manholes.

Wessex Water's DWMP contains an assessment of risk at catchment level, which has been carried out using a Baseline Risk and Vulnerability Assessment (BRAVA), including how

risk is anticipated to change over the next 5, 10 and 25 years. Overall, BRAVA results showed predicted flooding in 2050 to be 57% higher than 2025 for the 1 in 30-year event.

6.4 Methodology

Severn Trent Water, Thames Water and Wessex Water were provided with a list of the sites and forecast housing numbers. Using this information, they were asked to assess each site using the range of datasets they hold.

A red assessment does not mean that a site cannot or should not be developed (unless stated in the comments) and instead reflects the requirement for extensive new infrastructure to order to accommodate the site. It should be remembered that the water companies have a statutory duty to serve new development under the Water Industry Act 1991.

6.5 Results

Overview

The scores and comments from each sewerage undertaker are contained in the three section below. Figure 6.2 shows the RAG assessments applied to each of the potential allocations. These scores are also summarised in Appendix F.

6.5.1 Thames Water

The following red/amber/green scoring was applied by TW to each potential allocation based on the expected impact of the wastewater network.

GREEN	AMBER	RED
On the information provided we do not envisage infrastructure concerns in relation to this development/s	On the information provided modelling may be required to understand the impact of development	On the information provided, modelling will be required, and it is anticipated that upgrades to network will be necessary.

12 sites were given a "red" assessment by TW, indicating that upgrades to the network are likely to be necessary. 23 sites were given a green assessment and could be accommodated without upgrades to the network. Four sites were not assessed by TW.

The location of these sites, and their RAG assessment is shown in Figure 6.2.

6.5.2 Severn Trent Water

STW carried out a desktop assessment of the 3 sites in their area. Five of these were given a "green" assessment indicating a low level of impact on the wastewater network. Seven sites were given an amber assessment indicating a medium level of concern (reflecting either historic flooding or capacity constraints at sewer pumping stations). One site (the strategic site at Honeybourne) was given a red assessment. This was due to the size of the

development, and the scale of additional infrastructure required to serve this site. In this case an additional pump station and an increase in the rising main may be required in order to serve this site. Other sites within this wastewater catchment have been given an amber assessment. The cumulative impact of these sites should be considered, and the larger strategic site being developed first would change the rating of the other sites to red as capacity would be used up. The scores and accompanying comments are contained in

Table 6.1.

STW provided the following general comment:

"As a water company we have an obligation to provide water supplies and sewage treatment capacity for future development. It is important for us to work collaboratively with Local Planning Authorities to provide relevant assessments on the impacts of future developments and to provide advice regarding policy wording on other relevant areas such as water efficiency, Sustainable Drainage Systems (SuDS), biodiversity, and blue green infrastructure. Where more detail is provided on site allocations, we will provide specific comments on the suitability of the site with respect to the water and sewerage network. In the instances where there may be a concern over the capacity of the network, we may look to undertake modelling to better understand the potential risk. For most developments there is unlikely to be an issue connecting. However, where an issue is identified, we will look to discuss in further detail with the Local Planning Authority. Where there is sufficient confidence that a development will go ahead, we will look to complete any necessary improvements to provide additional capacity.

For most new development provided the surface water in managed sustainably through use of a SuDS the additional foul only flows will have a negligible impact on existing sewer performance, but where there are pre-existing capacity constraints additional capacity improvements may be required.

Where subsequent detailed modelling indicates capacity improvements are required such work will be phased to align with development occupancy with capacity improvement works will be funded by Severn Trent Water. However, whilst Severn Trent have a duty to provide additional capacity to accommodate planned development, we also have a requirement to manage our assets efficiently to minimise our customers' bills. Consequently, to avoid potential inefficient investment we generally do not provide additional capacity until there is certainty that the development is due to commence. Where development proposals are likely to require additional capacity upgrades to accommodate new development flows it is highly recommended that potential developers contact Severn Trent as early as possible to confirm flow rates and intended connection points. This will ensure provision of additional capacity can be planned into our investment programme to ensure development is not delayed.

Table 6.1 Severn Trent Water comments on potential allocations

Site	Potential impact on sewerage infrastructure	Known network constraints
BK14A	Low	No known network constraints downstream of the proposed development sites.
W7A2/W7C	Medium	Historic flooding incidents downstream of the site.
BK11	Low	No known network constraints downstream of the proposed development sites.
CC66B	Low	Historic flooding incidents downstream of the proposed site. - on the downstream line there are no Sewage Pumping Stations.
CC68	Medium	Historic flooding incidents downstream of the proposed site. - on the downstream line there are no Sewage Pumping Stations.
CC10A	Low	Historic flooding incidents downstream of the proposed site. - in the nearby network there is only 1 SPS that could be impacted. As the site is in close proximity to the works and a gravity sewer that leads to the works, the site will more than likely not impact the Sewage Pumping Station.
MK2B/C	Medium	There is a chain of sewage pumping stations to the works that could be impacted by this proposed development.
W4B	Medium	Site would likely be served by two pumping stations and there are historic flooding incidents downstream of site.
Strategic Site	High	Served by two small pumping stations which are likely not have the capacity to accept flows from an additional 1000+ dwellings. A development of this size could necessitate pumping station and rising main upsize.
MK11A	Medium	There is a chain of sewage pumping stations to the works that could be impacted by this proposed development.
MK7	Low	There is a chain of sewage pumping stations to the works that could be impacted by this proposed development.

Site	Potential impact on sewerage infrastructure	Known network constraints
CCNE1	Medium	Historic flooding incidents downstream of the proposed site. Small pumping station near the proposed site, however depending on the type of employment a new pumping station that serves the site may be needed.
W7A	Medium	Site would likely be served by two pumping stations and there are historic flooding incidents downstream of site.

6.5.3 Wessex Water

Wessex Water provided comments on the two potential allocations within their area:

Table 6.2 Wessex Water comments on potential allocations

Site	Foul network	Infiltration comments
T31B - Land adjacent to Blind Lane	There is a potential connection point in Lowfield Road. However our records are incomplete in this location and the diameter of the closest public foul sewer is unknown. If the development was to proceed a review will be needed to identify the most appropriate point of connection into the existing network. This can be done prior to planning submission through Wessex Water's pre-planning enquiry service.	Based on an initial review, the site has high potential for infiltration and is likely to be suited to infiltration SuDS. Considering infiltration and the appropriate use of SuDS at an early stage of the design is important to embed suitable SuDS, and ultimately reduce surface water runoff from new development.

Site	Foul network	Infiltration comments
T71A - Land north-west of Highfield Cottage	Foul sewers in the new development to the south of the proposed development site have not been offered for adoption by Wessex Water and remain private. There is no clear point of connection into the public sewer network. If the development was to proceed a review will be needed to identify the most appropriate point of connection into the existing network. This can be done prior to planning submission through Wessex Water's pre-planning enquiry service.	Based on an initial review, the site has low potential for infiltration and will require alternative SuDS consideration. Considering infiltration and the appropriate SuDs at an early stage of the design is important to embed suitable SuDS, and ultimately reduce surface water runoff from new development.

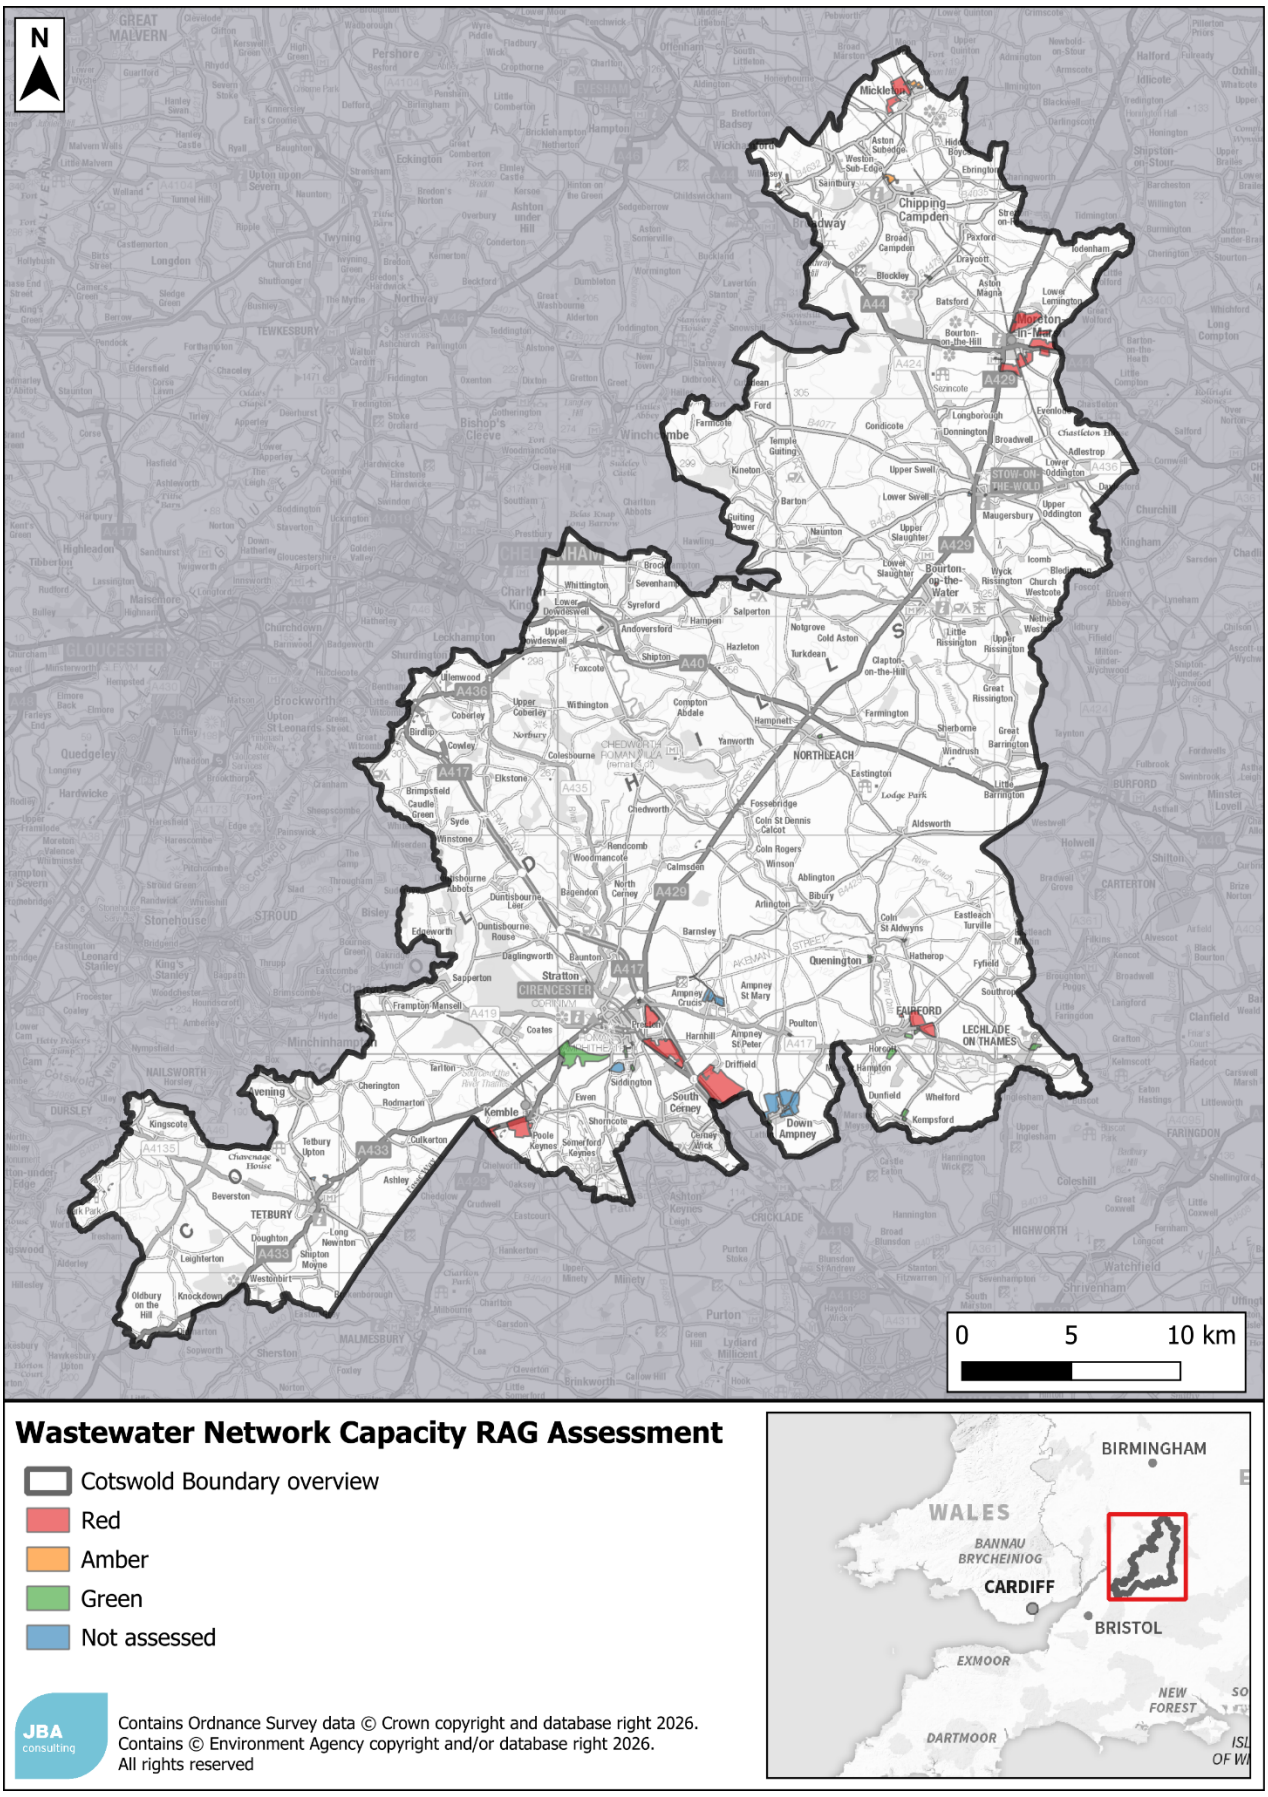

Figure 6.2: Wastewater Network RAG Assessment of Local Plan Allocations

6.6 Storm overflows

6.6.1 Background

Storm overflows are an essential component in the sewer network. However, when they operate, they can cause environmental damage. They occur on combined sewer systems where the sewer takes both foul flow (sewage from homes and offices) and rainwater runoff. In normal conditions (Figure 6.3), all of this flow passed through the sewer network and is treated at a wastewater treatment works.

In periods of exceptional rainfall (Figure 6.4), the capacity in a combined sewer may be used up by the additional flow from rooftops and storm drains. Once the capacity is exceeded, wastewater would back up into homes, businesses and on to roads. A storm overflow acts as a relief valve, preventing this from happening.

Storm overflows become problematic when they operate frequently in moderate or light rainfall, or for long periods as a result of groundwater infiltration in the sewerage system – possibly in breach of their permit.

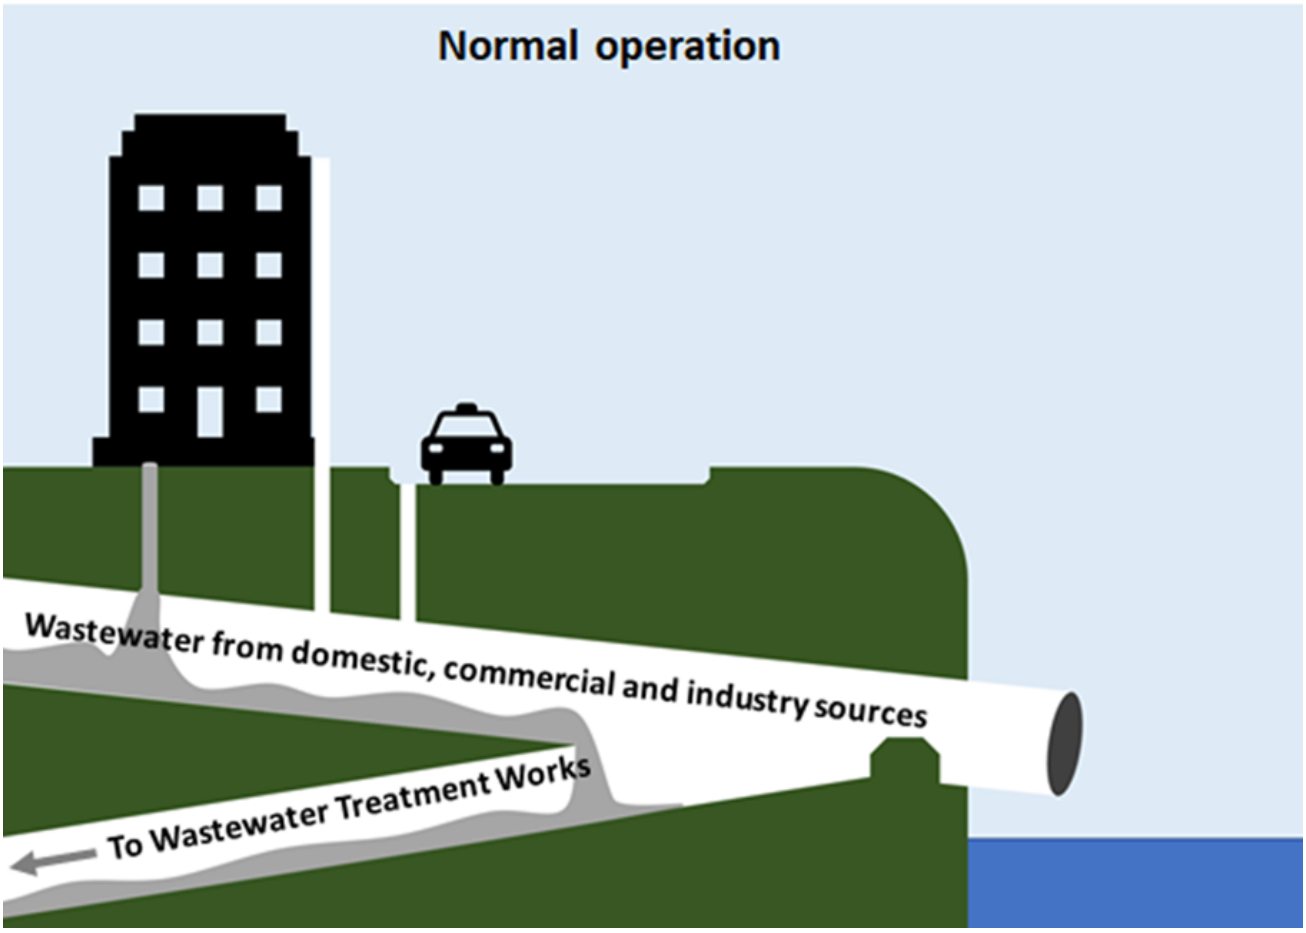

Figure 6.3: Storm overflow operation in normal conditions.

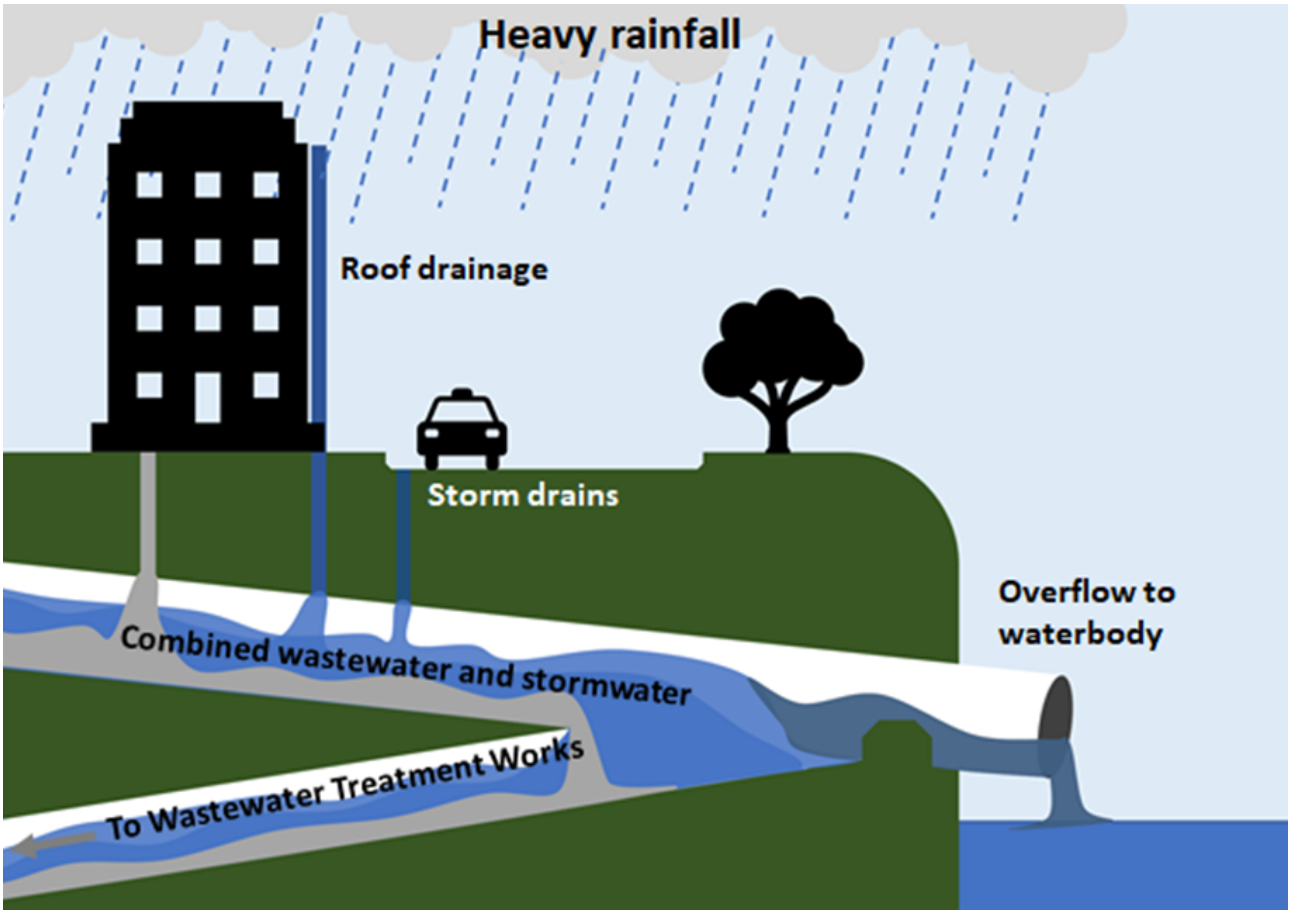

Figure 6.4: Storm overflow operation in exceptional rainfall.

6.6.2 Storm overflow assessment

The Environment Act now requires water companies to report and monitor storm overflows as well as reduce the harm caused to the rivers they discharge to. There are 9 network storm overflows and 20 WwTW storm tank overflow (including those located outside of the borough but at WwTW serving potential growth) present in Cotswold district, the location of these are shown in Table 7.5 and Figure 7.4. Storm tank overflows at WwTWs are assessed in Section 0.

There are 14 network storm overflows in the study area, and 14 WwTW storm tank overflows.

Unmitigated development within Cotswold District could cause the frequency or duration of operation of storm overflows to increase. There are opportunities through the planning system to ease pressure on the wastewater network by separating foul and storm flow in existing combined systems and not allowing new surface water connections. Surface water can also be better managed by retrofitting SuDS in existing residential areas, and in new development, ensuring SuDS are incorporated into designs at the master planning stage to maximise the potential benefits.

Details of the storm overflows in and around the study area are presented in Table 6.4.

The Storm Overflow Taskforce has agreed a long-term goal to end the damaging pollution caused by the operation of storm overflows. An important component of this is the monitoring of overflows, and a target has been set to monitor the frequency and duration of operation at all storm overflows by 2023. This is called Event Duration Modelling (EDM). The EDM dataset (which contains performance data on the 16,791 storm overflows monitored in 2022) has been used to provide information on storm overflows in the district. Severn Trent Water have confirmed that work is underway to investigate storm overflows with the long-term aim of reducing the number of operations of the storm overflows.

The Storm Overflow Assessment Framework (SOAF) 2025 set a threshold of 30 operations in a year (based on 1 year's data, 20 if based on 2 year's data, and 10 if based on 3 year's), above which a storm overflow should be investigated. The Environment Agency state that a revised SOAF methodology will be realised to coincide with the Environment Act obligation on storm overflows, which will require all overflows to ensure that they are not causing adverse ecological harm. The overflows identified in the district were assessed on the average number of operations over three years.

The Storm Overflow Reduction Plan which was published in August 2022 sets an objective that "storm overflows will not be permitted to discharge above an average of 10 rainfall events per year by 2050". 10 of the 17 monitored network storm overflows are operating on average above 10 times per year so require investigation under the Storm Overflow Assessment Framework 2025 and action to meet the long-term target. In this report storm overflows associated with WwTWs have been moved to the section on wastewater treatment.

Unmitigated development within Cotswold district could cause the frequency or duration of operation of storm overflows to increase.

There are opportunities through the planning system to ease pressure on the wastewater network by separating foul and storm flow in existing combined systems and not allowing new surface water connections. Surface water can also be better managed by retrofitting SuDS in existing residential areas, and in new development, ensuring SuDS are incorporated into designs at the master planning stage to maximise the potential benefits.

Table 6.3: Criteria used for RAG assessment of network and WwTW storm overflows.

Sewer Overflows RAG Score	Number of operations per year (average of available data)	Commentary
Green	0-4	Overflow is currently operating within the long-term (2050) target. Need to ensure that this is maintained in the long-term considering upstream development, climate change and urban creep.
Amber	5-9	An investigation is not required at present, but improvements may be needed in the network and/or catchment to meet the long-term target.
Red	10+	The overflow may already be operating beyond the threshold which would trigger an investigation. Upstream development could further increase the discharge frequency, so mitigation should be required prior to significant development.

6.6.3 Results

There nine storm overflows on the network that are currently operating above the threshold for investigation. These are shown in Table 6.4 and Figure 6.5.

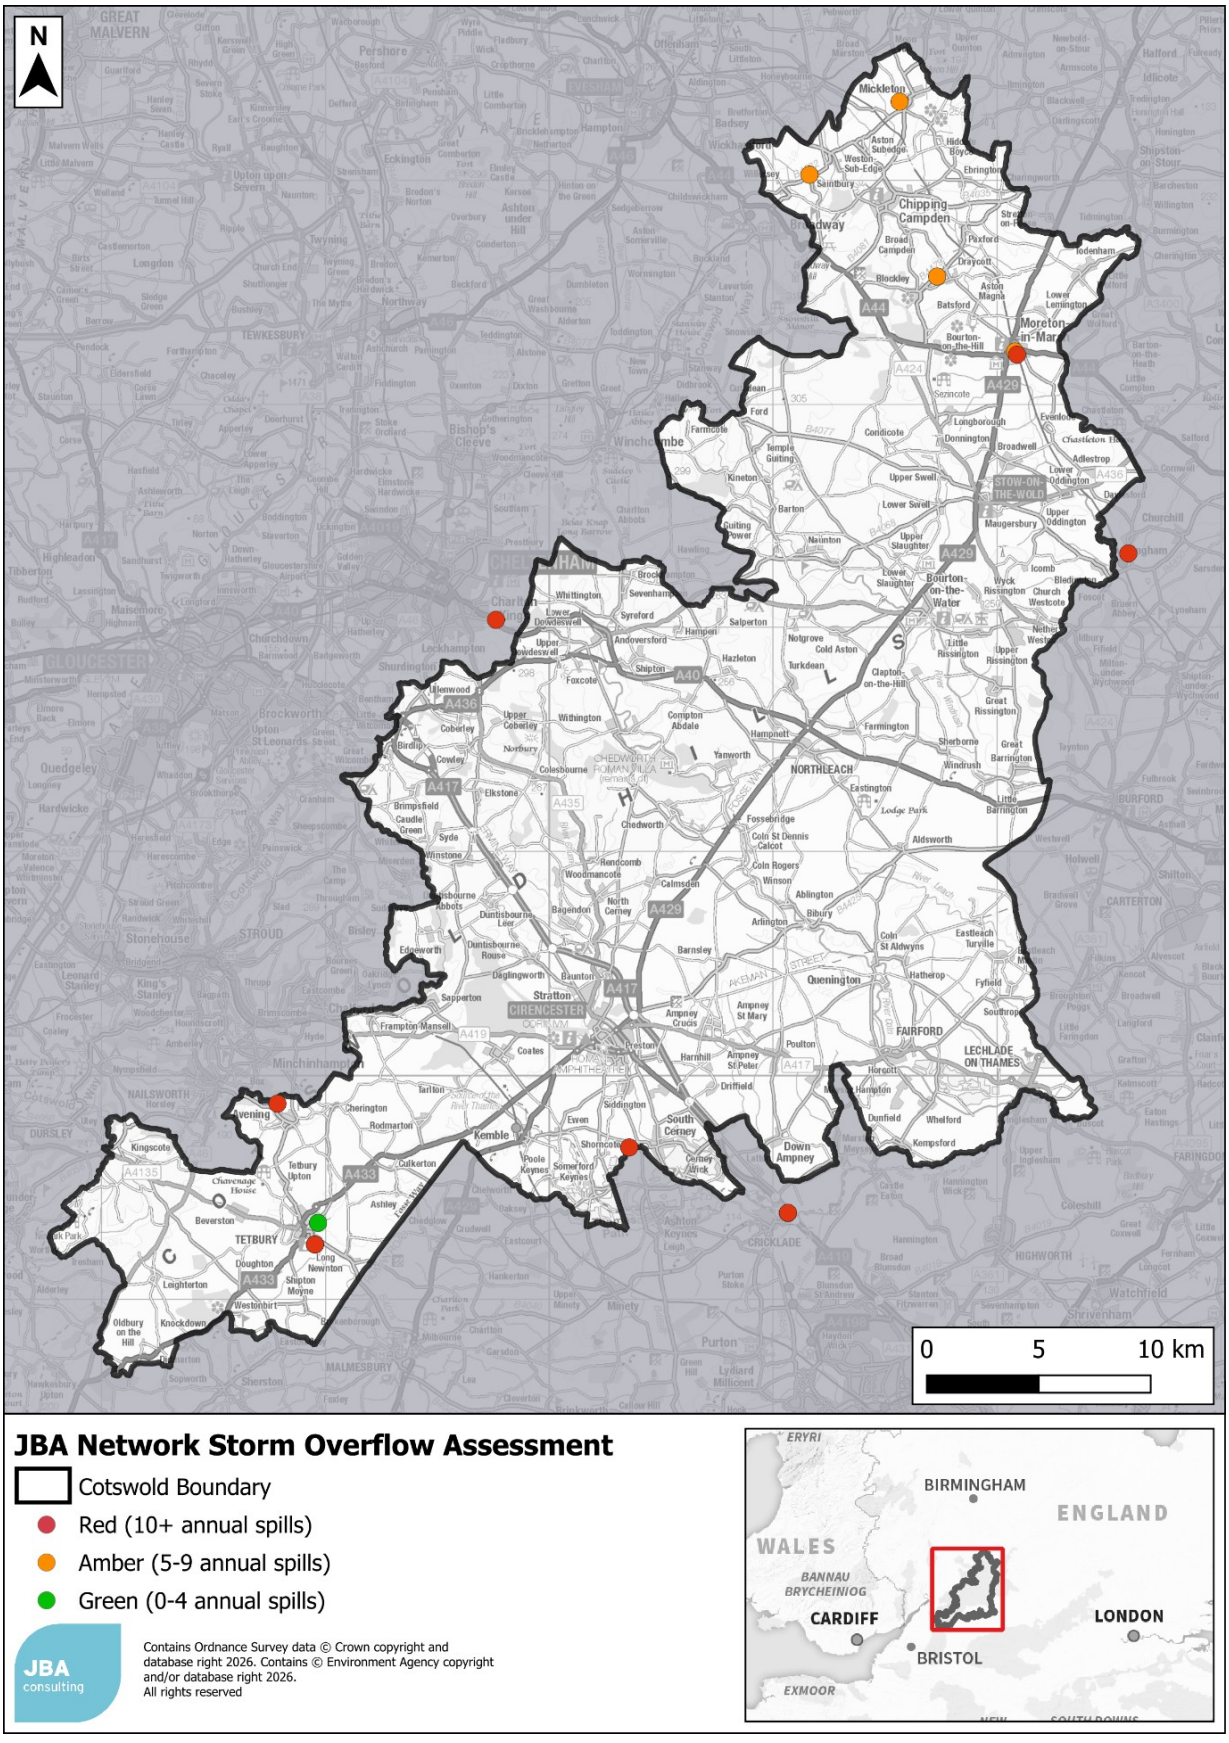

Figure 6.5: Network storm overflow RAG assessment

Figure 6.6 below shows the forecast annual average number of spills from 2025 to 2050, based on data from the National Storm Overflows Plan (NSOP) published by Water UK. Based on the NSOP, it is predicted that spills (from baseline) will be reduced by 20% in 2030 and 84% in 2050.

Additionally, the NSOP indicates that 75% of priority sites are expected to be improved under the NSOP, with all priority sites forecast to be addressed by 2045. To achieve these improvements, the planned interventions comprise a mix of approaches, with 29% involving nature-based solutions and 71% relying on traditional engineering methods. Additionally, five of the eight storm overflows are planned to be upgraded using either nature-based or mixed solutions to enhance their performance.

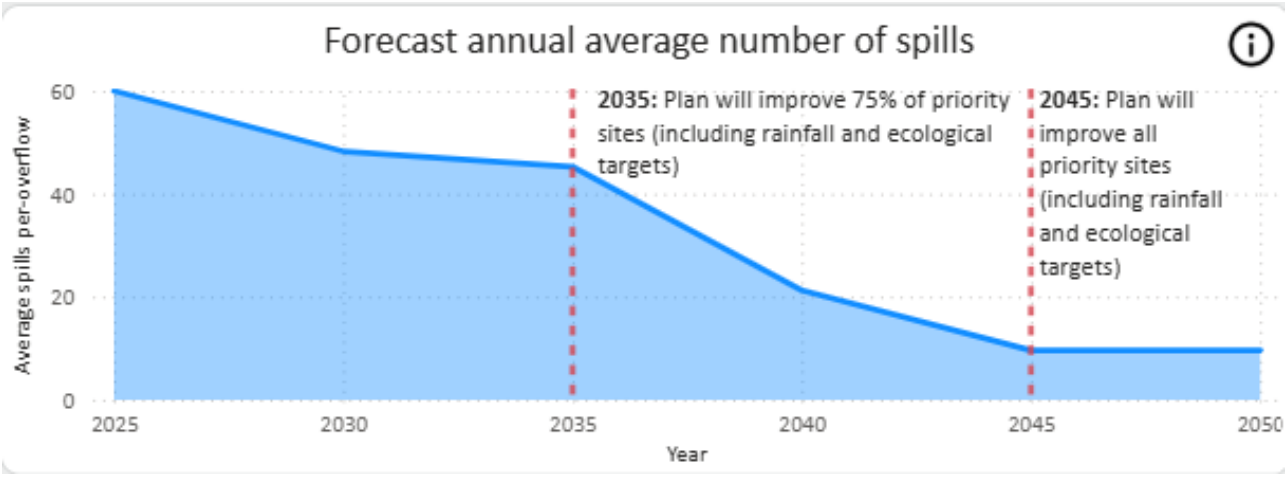

Figure 6.6 Forecast annual average number of spills in Cotswold district council © Water UK 2024

6.6.4 Surface water disposal

Management of surface water is an important feature of new development as the increased coverage of impermeable area on a site can increase the rainwater flowing off the site. The introduction of these flows to the public sewerage system can increase the risk of flooding for existing residents. It is therefore vital that surface water flows are managed sustainably, avoiding connections into the foul or combined sewerage system and where possible directed back into the natural water systems.

STW provided the following policy recommendation for the Local Plan:

New developments shall demonstrate that all surface water discharges have been carried out in accordance with the principles laid out within the drainage hierarchy, whereby a discharge to the public sewerage system is avoided where possible.

The drainage hierarchy is summarised in 9.6.1.

6.7 Conclusions and recommendations

Thames Water is the primary water and wastewater provider and the designated sewerage undertaker for the study area. Wessex Water, and Severn Trent Water also operate within small parts of the area.

Development in areas where there is limited wastewater network capacity will increase pressure on the network, increasing the risk of a detrimental impact on customers, and increasing the likelihood of storm overflow operation. Early engagement with developers, Thames Water, Wessex Water and Severn Trent Water is required, and modelling of the network may be required at the planning application stage.

Where network capacity constraints are identified, network reinforcement may be required which would be funded as part of the developer infrastructure charge. It may be necessary for development sites to be phased in line with the provision of any network upgrades.

The drainage network includes 14 storm overflows that are likely to serve the study area. Storm overflow performance is generally poor with nine of these overflows currently exceeding the threshold for investigation. The poorest performing of these is at Avening WwTW, with a 3- year operation average of 128 spills per year.

2024 was a particularly bad year, in part because it was a wetter than average year. This was not the case in 2023 and 2025 when many of the storm overflows also operated well above the threshold.

Further development in catchments where there are poorly performing overflows increase the risk of storm overflow operation due to increased sewage flows and surface runoff.

There are opportunities through the planning system to ease pressure on the wastewater network by separating foul and storm flow in existing combined systems and not allowing new surface water connections. Surface water can also be better managed by retrofitting SuDS in existing residential areas, and in new development, ensuring SuDS are incorporated into designs at the master planning stage to maximise the potential benefits.

Table 6.5 Recommendations for wastewater collection

Action	Responsibility	Timescale
Early engagement between CDC and Severn Trent Water is required to ensure that where strategic infrastructure is required, it can be planned in by STW, TW or WW and will not lead to any increase in discharges from sewer overflows.	CDC, STW, TW, WW	Ongoing
Take into account wastewater infrastructure constraints in phasing development in partnership with the sewerage undertaker.	CDC, STW, TW, WW	Ongoing
Developers will be expected to work with the sewerage undertaker closely and early in the planning promotion process to develop an Outline Drainage Strategy for sites. The	CDC, STW, TW, WW	Ongoing

Action	Responsibility	Timescale
Outline Drainage strategy should demonstrate the wastewater assets required, their locations including points of connection to the public foul sewerage, whether the site drainage will be adopted by the water company and if any sewer requisitions will be required.		
Developers will be expected to demonstrate to the LLFA that surface water from a site will be disposed using a SuDS with connection to surface water sewers seen as the last option. New connections for surface water to foul sewers will be resisted by the LLFA.	CDC, LLFA, developers	Ongoing

7 Wastewater treatment

7.1 Introduction

Thames Water (TW), Severn Trent Water (STW) and Wessex Water (WW) provide wastewater services for development in Cotswold District. Most wastewater companies refer to their wastewater processing plants as Wastewater Treatment Works (WwTW). They may also be referred to as Sewage Treatment Works (STW) in some documents and data sources.

Sites already allocated in the adopted local plan, or already in the planning system (commitments) as well as an allowance for windfall, were assigned to a WwTW using the sewerage drainage area boundaries provided by the sewerage undertaker to set a baseline for WwTW capacity. Actual connection of a development site to a particular WwTW may be different and will depend on the capacity of the receiving works, and the local sewer network.

Very small developments in rural areas may be suitable for on-site treatment and discharge. However, the Environment Agency will not usually permit this where there is a public sewerage system within a distance calculated as 30m per dwelling. There is therefore a localised risk to water quality if all of these small developments were to be served by septic tanks, especially where there are clusters of small-scale new development. It needs to be noted that the Environment Agency have stated they 'would also object to a proposal which included septic tanks if they were within a 'sewered area''.

7.2 Wastewater Treatment Works Flow Permit Assessment

New residential developments and new employment land add pressure to the existing treatment works. An assessment is required to identify the available capacity within the existing WwTWs, and the potential to upgrade overloaded systems to accommodate future growth. The scale and cost of upgrading works may vary significantly depending upon the location of the development in relation to the network itself and the receiving WwTW.

The Environment Agency is responsible for regulating sewage discharge releases via a system of Environmental Permits (EPs). Monitoring for compliance with these permits is the responsibility of both the EA and the plant operators. Figure 7.1 summarises the different types of wastewater releases that might take place, although precise details vary from works to works depending on the design.

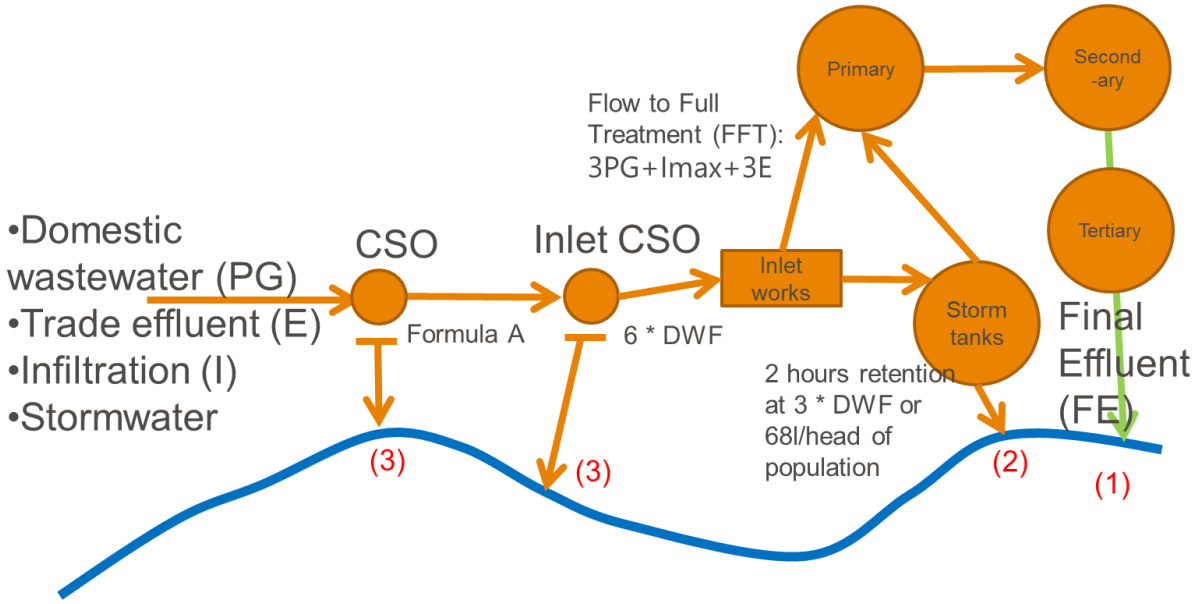

Figure 7.1: Overview of typical combined sewerage system and WwTW discharges.

During dry weather, the final effluent from the WwTW should be the only discharge (1). With rainfall, the storm tanks fill and eventually start discharging to the watercourse (2) and Combined Sewer Overflows (CSOs) upstream of the storm tanks start to operate (3). The discharge of storm sewage from treatment works is allowed only under conditions of heavy rain or snow melt, and therefore the flow capacity of treatment systems is required to be sufficient to treat all flows arising in dry weather and the increased flow from smaller rainfall events. After rainfall, storm tanks should be emptied back to full treatment as soon as reasonably possible, freeing their capacity for the next rainfall event.

Environmental permits are used alongside water quality limits as a means of controlling the pollutant load discharged from a WwTW to a receiving watercourse. Sewage flow rates must be monitored for all WwTWs where the permitted discharge rate is greater than 50 m^3/day in dry weather.

Permitted discharges are based on a statistic known as the Dry Weather Flow (DWF). As well as being used in the setting and enforcement of effluent discharge permits, the DWF is used for WwTW design, as a means of estimating the ‘base flow’ in sewerage modelling and for determining the flow at which discharges to storm tanks will be permitted by the permit (Flow to Full Treatment, FFT).

WwTW Environmental Permits also consent for maximum concentrations of pollutants, in most cases Suspended Solids (SS), Biochemical Oxygen Demand (BOD) and Ammonia (NH4). Some works (usually the larger works) also have permits for Phosphorous (P). These are determined by the Environment Agency with the objective of ensuring that the receiving watercourse is not prevented from meeting its environmental objectives, with specific regard to the Chemical Status element of the Water Framework Directive (WFD) classification.

Increased domestic population and/or employment activity can lead to increased wastewater flows arriving at a WwTW. Where there is insufficient headroom at the works to treat these flows, this could lead to failures in flow consents.

Areas not covered by WwTW catchments may not have an existing public sewer system. Where this is the case, small developments in more rural areas may be suitable for on-site treatment and discharge, however the Environment Agency will not usually permit this where there is a public sewerage system within a distance calculated as 30m per dwelling from any part of the site boundary.

7.2.1 Methodology

Thames Water provided a RAG assessment of their assets using the following criteria:

GREEN - On the information provided we do not envisage infrastructure concerns in relation to the capacity at the STW	AMBER We are aware of capacity concerns at the STW and a scheme is planned to accommodate future growth, or we are likely to have to carry our further assessment, but do not envisage a significant issue	RED We are aware of capacity concerns at the STW and there isn't currently a scheme planned to accommodate future growth. Futher assessment is definitely required and may involve extensive upgrade works

A parallel assessment of WwTW capacity was carried out using measured flow data supplied by the water companies. The process was as follows:

- Severn Trent Water, Wessex Water and Thames Water provided their DWF data for WwTW serving the study area, JBA then calculated 80th percentile exceedance flow statistic for each WwTW.
- Development sites within the growth scenario including windfall and neighbouring authority growth were assigned to a WwTW using the sewerage drainage area boundaries.
- For each site, the future DWF was calculated using the occupancy rates and per-capita consumption values obtained from the WRMPs (Section 4.8), and the assumption that 95% of water used is returned to sewer. Permitted headroom was used as a substitute for actual designed hydraulic capacity for each WwTW being assessed.
- For employment sites, wastewater demand was estimated based on the predicted number of new employees. Floor space, employment use types, and employment densities were used to estimate the number of employees.
- The current and estimated future flow was then compared to the permitted flow obtained from the Environment Agency “Consented Discharges to Controlled Waters with Conditions” database.

- Headroom (expressed as the number of homes that could be accommodated before the permit is exceeded) was estimated by calculating the difference between the current and permitted flow and using the occupancy and per capita consumption for the WRZ the sewer catchment is in to provide an estimate for the number of houses.
- A red/amber/green score was then assigned to each WwTW based on whether it was likely to exceed its permitted flow.
- An amber score was given where there was less than 10% headroom remaining.

Table 7.1: Per capita consumption values used in water demand calculations.

Water Company and Water Resource Zone	Average occupancy (persons per household)	Per capita domestic consumption (m^3/person/day)	Per capita employment consumption (m^3/person/day)
Thames Water- SWOX	2.5	0.139	0.1
Severn Trent Water- Forest and Stroud	2.3	0.170	0.1
Bristol Water- Bristol Water WRZ	2.3	0.1439	0.1

7.2.2 Results

TW provided a RAG assessment the WwTWs operated by them which can be seen in

Table 7.3. Two WwTWs (Ampney St Peter and Moreton-in-Marsh WwTWs) were given a "red" rating indicating a known capacity issue with no upgrade scheme currently planned.

An amber assessment was given to Andoversford, Bourton-on-the-Water and Fairford indicating a known capacity issue, but where a scheme was already planned.

Severn Trent Water were not able to provide comments on the potential allocations within the timetable of the Local Plan evidence base and expect to respond during the consultation period.

Wessex Water provided comments on the two potential allocations in their area.

Table 7.2 Wessex Water comments on potential allocations

Site	Wastewater treatment comments
T31B - Land adjacent to Blind Lane T71A - Land north-west of Highfield Cottage	The development site is located within the Tetbury Water Recycling Centre (WRC) catchment. The WRC does have some headroom and we anticipate that the works will be able to accommodate the additional flows from this development.

JBA carried out an independent assessment of capacity at WwTW in the study area which can be seen in Table 7.4. This can differ from water company assessments as the water company has access to information and long-term plans unavailable to the WCS. The JBA assessment also takes a conservative view of WwTW headroom scoring any WwTW as amber where there is less than 10% headroom remaining at the end of the plan period.

Cirencester was given a Green assessment by TW. The JBA headroom assessment (has given this WwTW amber assessment as there is less than 10% capacity left by the end of the Local Plan period.

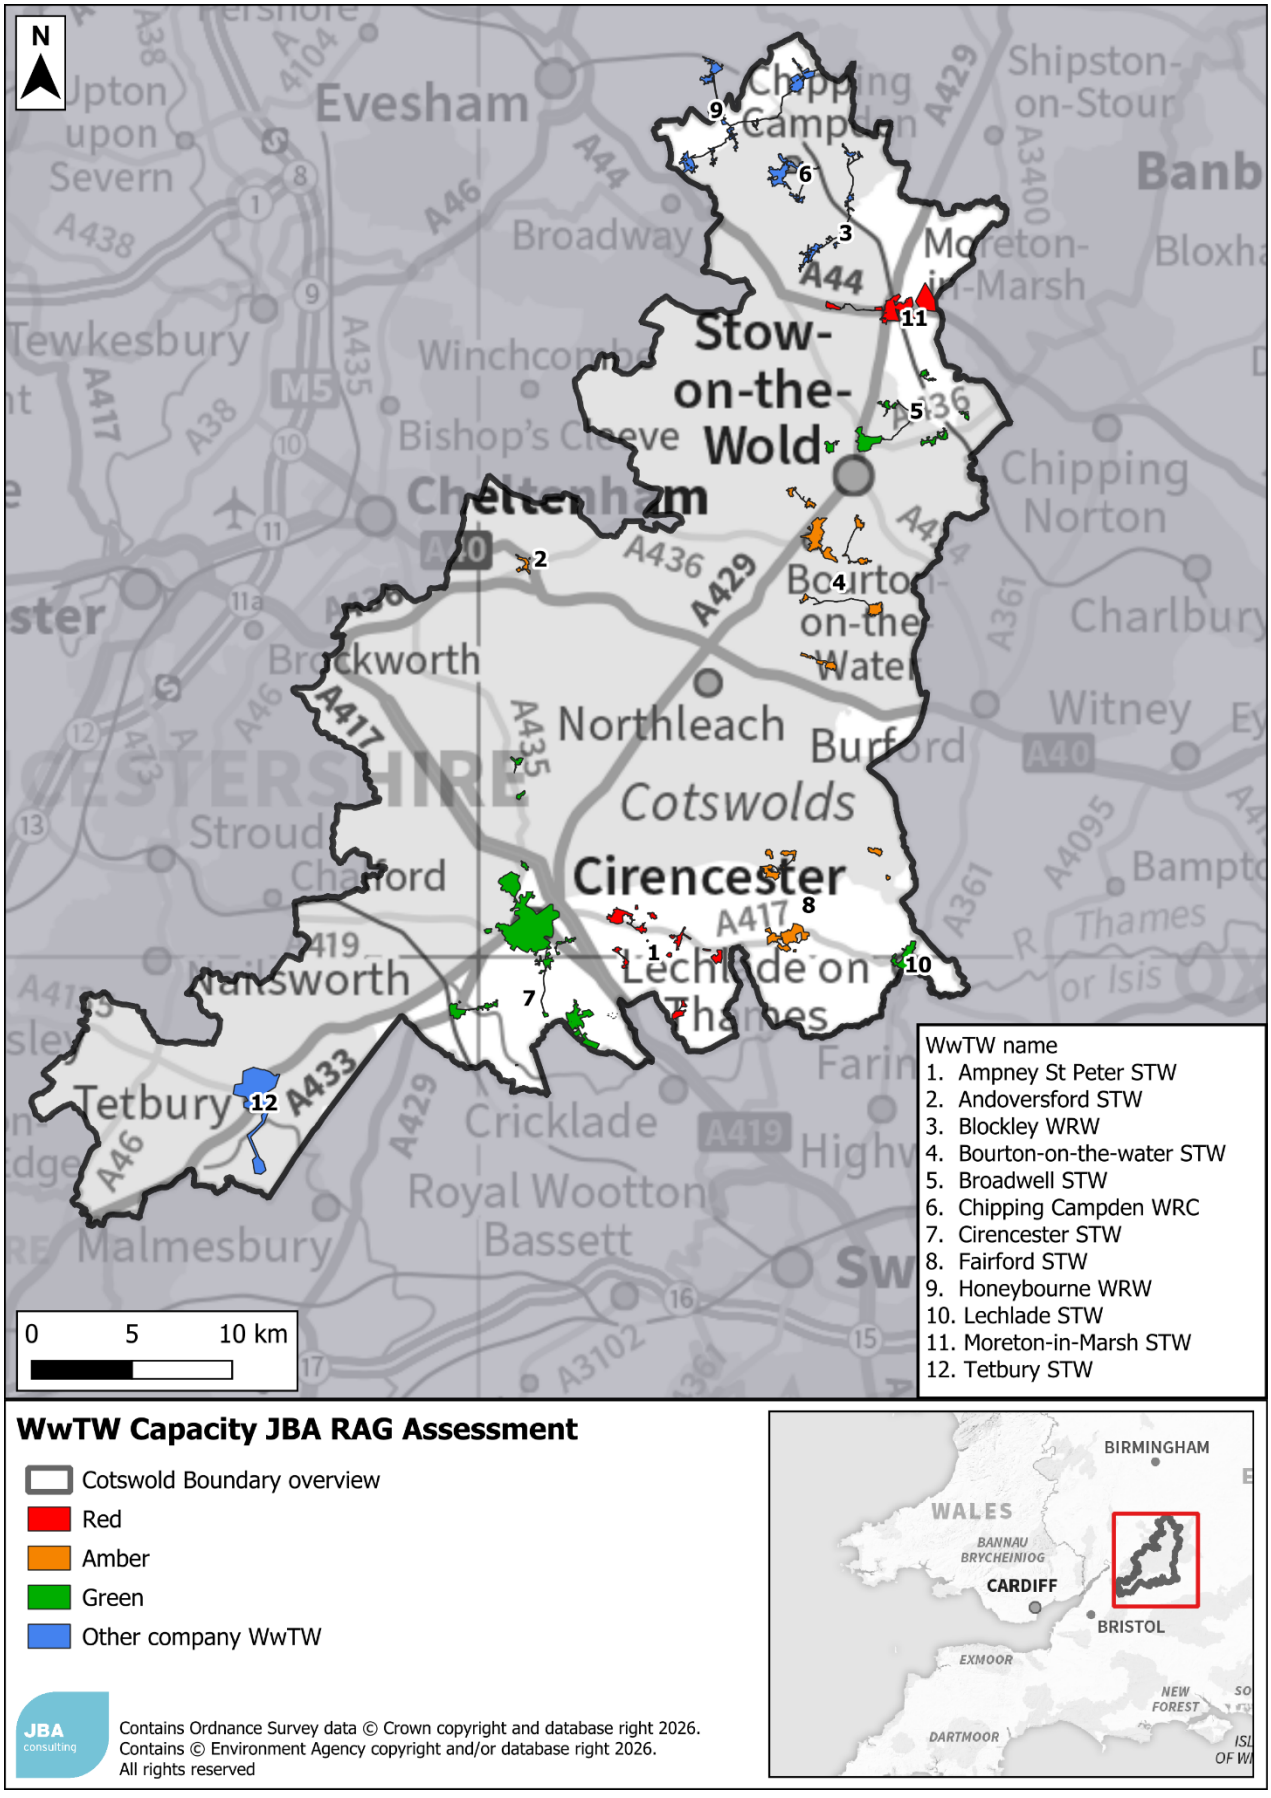

Figure 7.2 TW WwTW assessment

There are 12 WwTWs expected to serve growth during the Local Plan period. Table 7.4 contains a summary of the expected growth and the predicted remaining capacity by the end of the plan period. Seven WwTWs are expected to be close to or exceeding their permit limit by the end of the plan period. An increase in flow permit, and/or upgrades to treatment capacity will be required at these WwTW.

Where a WwTW is likely to exceed its permit, the permit would be reviewed by the EA and if a higher flow consent was agreed, a tighter permit limit for substance concentrations is very likely to be required. In some cases, this may not be technically feasibly possible if that means concentrations tighter than the Technically Accepted Limit (TAL) which is 0.25 mg/l for phosphate for example.

In addition to hydraulic capacity, it is important to consider water quality considerations which are discussed in Sections 8 and 9.3. For WwTW that need upgrading, typically around five years is required for permit changes to be agreed, funding obtained for the next AMP and major works upgrades to be completed. It is therefore important for CDC to engage early with Severn Trent Water, Thames Water and Wessex Water, to ensure that any required infrastructure is in place prior to development being occupied.

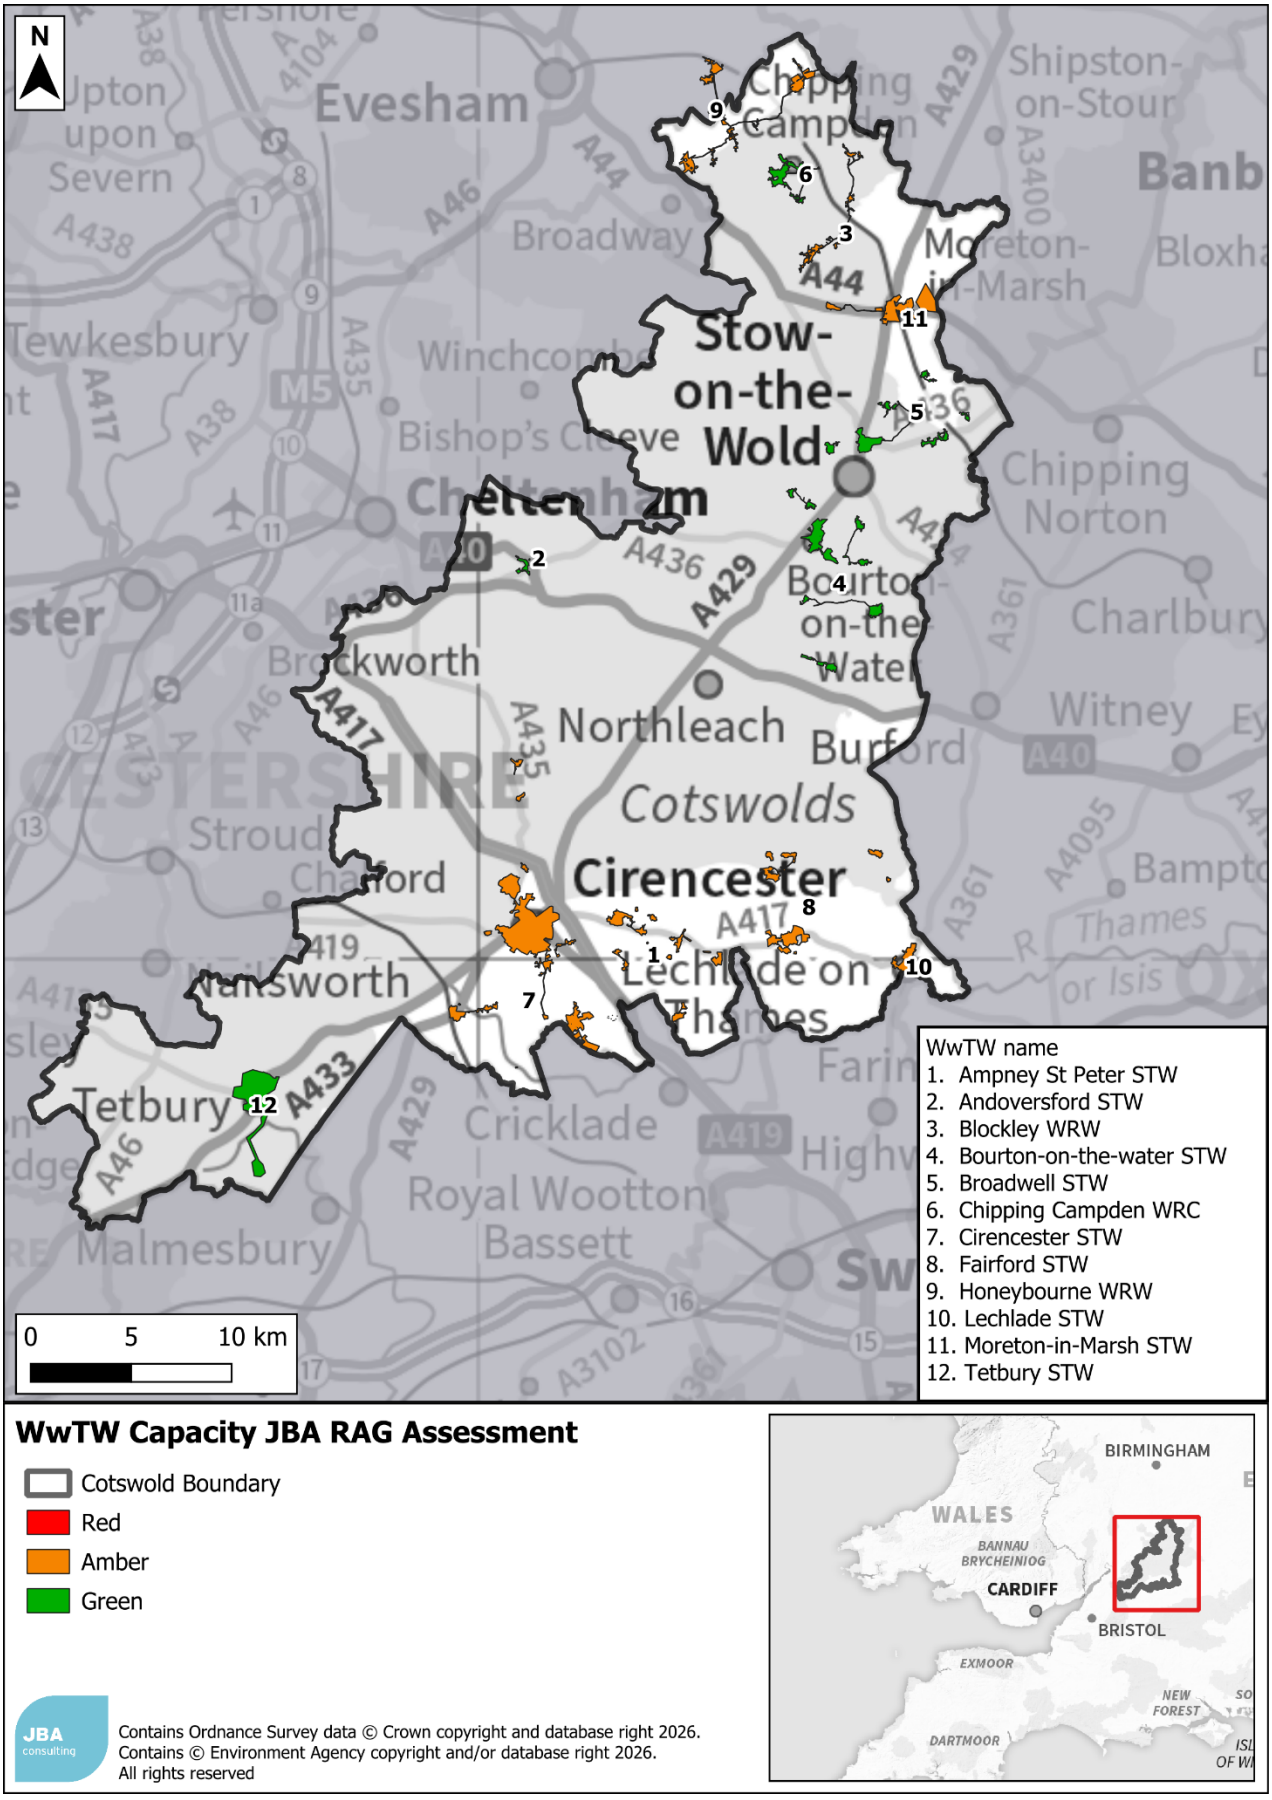

Figure 7.3 JBA headroom assessment

7.3 Storm tank overflows

7.3.1 Overview

There are 14 storm tank overflows within the Cotswold district area. Table 7.5 and Figure 7.4 present the performance of storm tank overflows at WwTWs, also referred to as Sewage Treatment Works (STW), in Cotswold District.

Where a storm tank overflow is operating in periods of moderate or light rainfall, or even in dry conditions it indicates either an infiltration problem within the network, or that the WwTW or its storm tanks are undersized for the population served. Further development within a catchment that has a poorly performing storm tank overflow is likely to exacerbate the issue.

It is important that development does not increase this frequency. The local plan can contribute to this by encouraging the use of SuDS to divert storm water away from the sewer network, reducing the volume that reaches the WwTW. This opportunity is greatest at brownfield sites connected to existing combined sewerage systems.

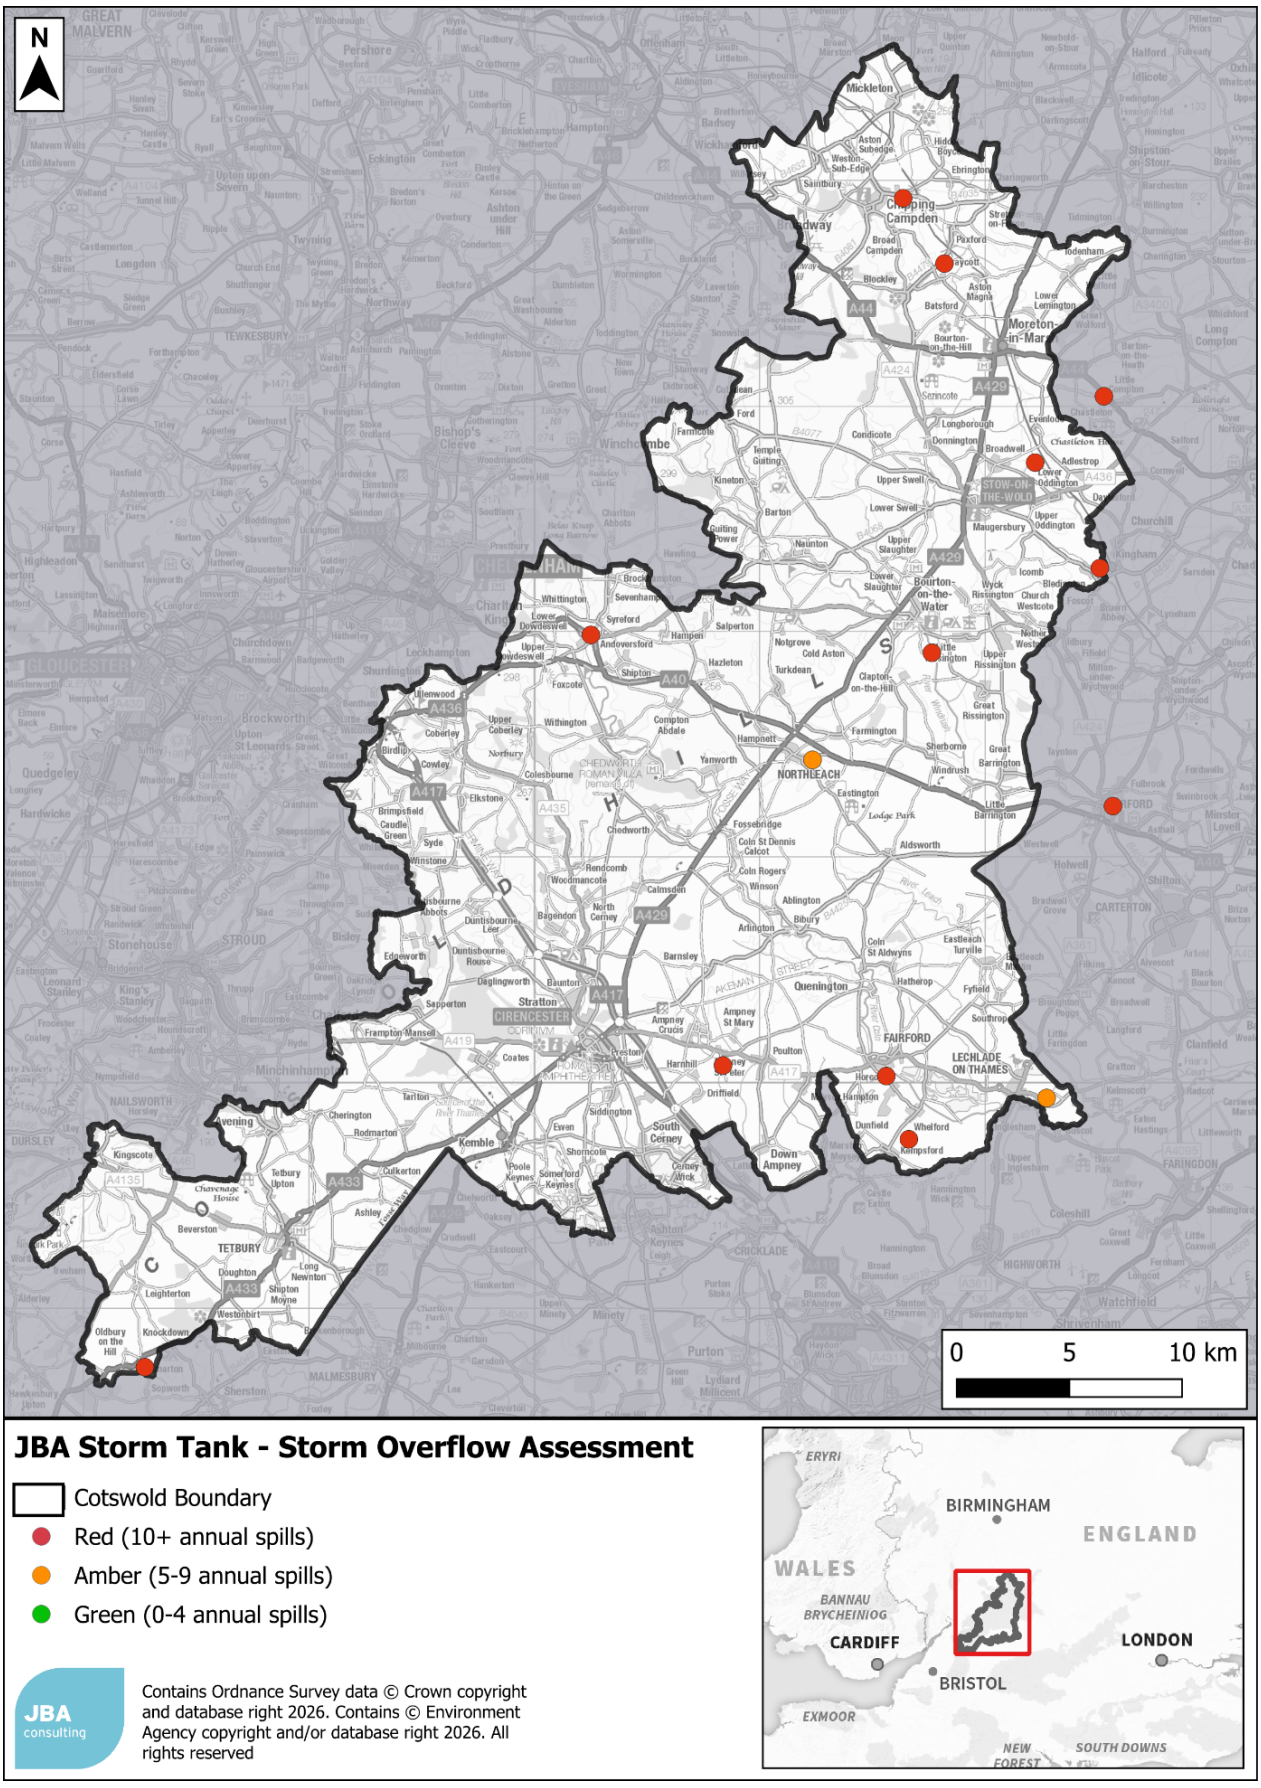

Figure 7.4 WwTW storm tank overflow RAG assessment

Table 7.5 WwTW EDM RAG data

7.3.2 Results

With the exception of Kempsford STW and Northleach STW, all of the storm tanks at WwTWs exceed the threshold for investigation.

The highest spill average occurs at Cirencester WwTW with a three-year average of 175 spills. The lowest number of spills occurs at Honeybourne STW with 36 spills.

7.4 Wastewater treatment works odour assessment

7.4.1 Introduction

WwTW have a typical range where odour is experienced. Where developments encroach upon this range, there may become a cause for nuisance and complaints from residents. Managing odour at WwTW can add considerable capital and operational costs, particularly when retro fitted to existing WwTW. National Planning Policy Guidance recommends that plan makers consider whether new development is appropriate near to sites used (or proposed) for water and wastewater infrastructure, due to the risk of odour nuisance.

7.4.2 Methodology

SUs recommend that an odour assessment may be required if the site of a proposed development is close to a WwTW and is encroaching closer to the WwTW than existing urban areas.

A Geographic Information System (GIS) assessment was carried out to identify areas that the SU considers may be at risk from odour nuisance due to encroachment on an existing WwTW. For Thames Water, this is defined as development sites less than 800m from the WwTW and encroaching closer to the WwTW than existing urbanised areas. For Wessex Water, Bristol Water and Severn Trent Water 400m from the WwTW is the threshold. If there are no existing houses close to a WwTW it is more likely that an odour impact assessment is needed.

7.4.3 Results

Allocations have been provided by CDC, and either a 400m or 800m (Thames Water only) buffer created to determine which sites may be affected by nuisance odour.

Sites that fall within the 800m or 400m buffer from WwTWs are listed in Table 7.6 and graphically in Figure 7.5.

Table 7.6 Allocations that are within the 800m and 400m buffer from WwTWs

7.5 Conclusions and recommendations

There are 25 WwTWs that are within the Cotswold district or outside but serving a population within Cotswold district. Of these, twelve are expected to serve growth during the Local Plan period.

Five WwTW are expected to have capacity for growth during the plan period and will not require further upgrades for capacity. Seven WwTWs are expected to exceed their permit limit during the Local Plan period, or be close to their permit limit by the end of the plan period.

Where an increase in capacity may be required, sufficient time is needed for the water company to plan and deliver the upgrade scheme. This would typically be planned for delivery in the next AMP period. i.e., a need to upgrade a WwTW would be identified in DWMP28 for inclusion in the PR29 business plan and delivered between 2030 and 2035.

There may therefore be a constraint to growth at WwTWs that are already at their permit limit and do not have upgrades planned within this AMP period. Beyond 2030, there should be sufficient time once the Local Plan is adopted for water companies to provide additional capacity where required. It is strongly advised that CDC discuss the phasing of potential allocations with TW, STW and WW early in the Local Plan period to allow infrastructure upgrades to be planned to provide capacity when it is required.

The odour screening assessment identified eight potential allocations that are close enough to a WwTW that an odour impact assessment would be recommended. This would be funded by the developer.

8 Water quality

8.1 Introduction

An increase in the discharge of effluent from Wastewater Treatment Works (WwTW) because of development and growth in the area in which they serve can lead to a negative impact on the quality of the receiving watercourse. Under the Water Framework Directive (WFD), a watercourse is not allowed to deteriorate from its current WFD classification (either as an overall watercourse or for individual elements assessed).

It is Environment Agency (EA) policy to model the impact of increasing effluent volumes on the receiving watercourses. Where the scale of development is such that a deterioration is predicted, a variation to the Environmental Permit (EP) may be required for the WwTW to improve the quality of the final effluent, so that the increased pollution load will not result in a deterioration in the water quality of the watercourse. This is known as "no deterioration" or "load standstill". The need to meet river quality targets is also taken into consideration when setting or varying a permit.

The Environment Agency operational instructions on water quality planning and no-deterioration are currently being reviewed. Previous operational instructions (Environment Agency d, 2012) (now withdrawn) set out a hierarchy for how the no-deterioration requirements of the WFD should be implemented on inland waters. The potential impact of development should be assessed in relation to the following objectives:

- Could the development cause a greater than 10% deterioration in water quality? This objective ensures that all the environmental capacity is not taken up by one stage of development and there is sufficient capacity for future growth.
- Could the development cause a deterioration in WFD class of any element assessed? This is a requirement of the Water Framework Directive to prevent a deterioration in class of individual contaminants. The "Weser Ruling" (European Court of Justice, 2015) by the European Court of Justice in 2015 specified that individual projects should not be permitted where they may cause a deterioration of the status of a water body. If a water body is already at the lowest status ("bad"), any impairment of a quality element was considered to be a deterioration. Emerging practice is that a 3% limit of deterioration is applied.
- Could the development alone prevent the receiving watercourse from reaching Good Ecological Status (GES) or Potential? Is GES possible with current technology or is GES technically possible after development with any potential WwTW upgrades.

The overall WFD classification of a water body is based on a wide range of ecological and chemical classifications. This assessment focuses on three physico-chemical quality elements; Biochemical Oxygen Demand (BOD), Ammonia, and Phosphate as set out in the EA guidance (Environment Agency e, 2014).

BOD – Biochemical Oxygen Demand

BOD is a measure of how much organic material – sewage, sewage effluent or industrial effluent – is present in a river. It is defined as the amount of oxygen taken up by micro-organisms (principally bacteria) in decomposing the organic material in a water sample stored in darkness for 5 days at 20°C. Water with a high BOD has a low level of dissolved oxygen. A low oxygen content can have an adverse impact on aquatic life.

Ammonia

Nitrogen is an essential nutrient required by all plants and animals for the formation of amino acids. In its molecular form nitrogen cannot be used by most aquatic plants, and so it is converted into other forms. One such form is ammonia (NH_3). This may then be oxidized by bacteria into nitrate (NO_3) or nitrite (NO2). Ammonia may be present in water in either the unionized form NH_3 or the ionized form NH_4. Taken together these forms care called Total Ammonia Nitrogen.

Although ammonia is a nutrient, in high concentrations it can be toxic to aquatic life, in particular fish, affecting hatching and growth rates.

The main sources in rivers include agricultural sources, (fertilizer and livestock waste), residential sources (ammonia containing cleaning products and septic tank leakages), industrial processes and WwTWs.

Phosphate

Phosphorus is a plant nutrient and elevated concentrations in rivers can lead to accelerated plant growth of algae and other plants. Its impact on the composition and abundance of plant species can have adverse implications for other aspects of water quality, such as oxygen levels. These changes can cause undesirable disturbances to other aquatic life such as invertebrates and fish.

Phosphorus (P) occurs in rivers mainly as Phosphate (PO_4), which are divided into Orthophosphates (reactive phosphates), and organic Phosphates.

Orthophosphates are the main constituent in fertilizers used in agriculture and domestic gardens and provide a good estimation of the amount of phosphorus available for algae and plant growth and is the form of phosphorus that is most readily utilized by plants.

Organic phosphates are formed primarily by biological processes and enter sewage via human waste and food residues. Organic phosphates can be formed from orthophosphates in biological treatment processes or by receiving water biota.

Although it is phosphorus in the form of phosphates that is measured as a pollutant, the term phosphorus is often used in water quality work to represent the total phosphorus containing pollutants.

8.2 Water quality modelling

SIMCAT is used by the EA to model water bodies and identify where permit changes are needed to prevent deterioration or improve water quality as well as supporting decision making to guide development to locations where environmental deterioration will be reduced. SIMCAT is a 1D model which represents inputs from both point-source effluent discharges and diffuse sources, and the behaviour of solutes in the river.

SIMCAT can simulate inputs of discharge and water quality data and statistically distribute them from multiple effluent sources along the river reach. It uses the Monte Carlo method for distribution that randomly models up to 2,500 boundary conditions. The simulation calculates the resultant water quality as the calculations cascade further downstream.

Once the distribution results have been produced, an assessment can be undertaken on the predicted mean and ninetieth percentile concentrations or loads compared to the Environmental Quality Standards.

Within SIMCAT, the determinands modelled were Biochemical Oxygen Demand (BOD), ammonia) and phosphorus. In fresh waterbodies, phosphate is usually the limiting nutrient for algal growth. However, in marine environments, nitrogen is considered to be the limiting nutrient. The methodology followed is summarised in Figure 8.1. In this flow chart, all of the questions in the top row must be answered.

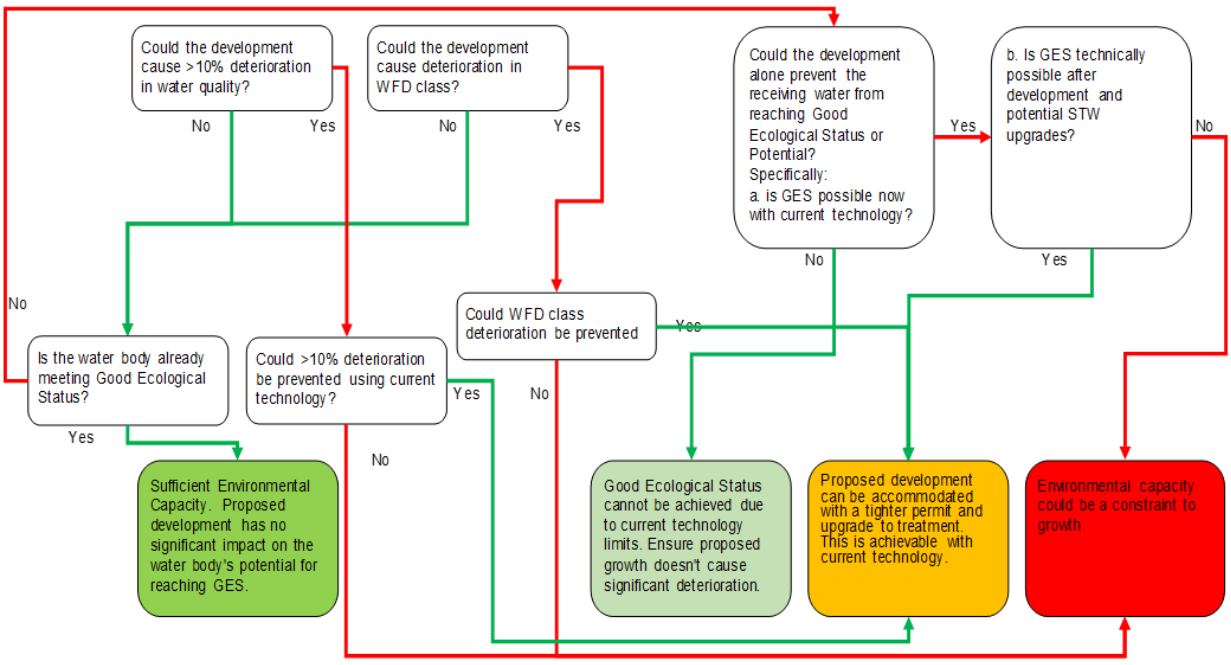

Figure 8.1: Water quality impact assessment following EA guidance.

Where modelling indicated, growth may lead to a deterioration in the watercourse, or where the watercourse is not currently meeting at least a 'Good' class for each determinant, the models were used to test whether this could be addressed by applying stricter discharge limits. In such cases, a Technically Achievable Limit (TAL) was considered.

The EA advised that the following permit values are achievable using treatment at TAL, and that these values should be used for modelling all WwTW potential capacity irrespective of the existing treatment technology and size of the works:

- Ammonia (90%ile): 1 mg/l.
- BOD (90%ile): 5 mg/l.
- Phosphorus (mean): 0.25 mg/l.

This assessment did not take into consideration whether it is feasible to upgrade each existing WwTW to TAL due to constraints of costs, timing, space, carbon costs etc.

8.2.1 Methodology

The study area is covered by the three SIMCAT models developed by the EA (Severn, Thames and Bristol Avon). These models have been largely based on observed flow and quality data for the period 2014-2020. A widespread update of the models, and the resultant recalibration were not within scope of this project. It was therefore agreed with the EA to update just the effluent flow at WwTW receiving growth in the study area. Consequently, the modelling work presented should be used to identify areas at risk of water quality deterioration, but not for permit setting.

Flow data from the last three years for each WwTW in the study area was supplied by the sewerage undertakers and used to update the model. Some of the WwTW in the study area already had upgrades completed in AMP7 or planned in AMP8, which would be expected to improve water quality at those locations. These were therefore factored into the model by applying the updated permit limit where it was less than the current discharge in the model. The model was then run in its updated form to set a 2024 baseline.

Additional effluent flow from growth during the Local Plan period was added to current flow at WwTW receiving growth and the model re-run as a future scenario.

STW were unable to provide flow data within the timescale of the Stage 2 WCS. At these three WwTWs, an uplift was made to the data provided in the 2025 WCS based on a comparison of flows at TW WwTWs in the 2025 WCS and the data provided for this study. The data has since been provided and in each case is a lower flow than the assumption used in the water quality modelling resulting in a conservative assessment.

No deterioration test

The results from the baseline and future versions of the model were compared to assess the predicted percentage deterioration for each of the modelled determinands. WFD targets for each river reach were provided by the EA and used to determine if there was a risk of a class deterioration.

Where a deterioration of 10% or greater was predicted or a change in class (considered to be a significant deterioration under WFD) a further test was conducted to see if this deterioration could be prevented by upgrades to treatment processes. This used another version of the model with each WwTW set to operate at their TAL.

Good ecological status assessment

Where treatment at TAL and reductions in diffuse sources in the present day could improve water quality to achieve GES, it is important to understand whether this could be compromised as a result of future growth within the catchment.

Guidance from the EA suggests breaking this down into two questions:

a. Is GES possible now with current technology?
b. Is GES technically possible after development and any potential WwTW upgrades?

If the answer to questions a) and b) are both 'Yes' or both 'No' then the development can be assessed as having no significant impact on the water bodies potential for reaching GES, i.e., the development alone is not preventing GES from being achieved.

If the answer to a) is 'Yes' and the answer for b) is 'No' then development is having a significant impact, i.e., before development GES could be achieved with upstream improvements, and after growth the additional effluent from growth prevents GES being achieved.

The possible answers are summarised in Table 8.1.

Run type 9 within SIMCAT was used which assumes that upstream flow at each treatment works is at GES. This simulates improvements being made in upstream water quality. The water quality of the discharge from each WwTW in order to maintain GES is then calculated by the model.

Table 8.1 Possible GES assessment results

Predicted to achieve GES after growth	Could achieve GES today with improvements in upstream water quality? (a)	Could achieve GES in the future with improvements in upstream water quality? (b)	Assessment Result
YES	N/A	N/A	GREEN - Sufficient environmental

Predicted to achieve GES after growth	Could achieve GES today with improvements in upstream water quality? (a)	Could achieve GES in the future with improvements in upstream water quality? (b)	Assessment Result
			capacity. Proposed development has no significant impact on the water body's potential for meeting GES.
NO	YES	YES	AMBER - Proposed development can be accommodated with a tighter permit and upgrade to treatment. This is achievable with current technology.
NO	NO	NO	YELLOW - GES cannot be achieved due to current technology limits. Ensure proposed growth doesn't cause significant deterioration.
NO	YES	NO	RED - Environmental capacity could be a constraint to growth.

If good ecological status is predicted to be achieved within the receiving waterbody following growth during the plan period, a green assessment is given. In this case, it can be said that there is environmental capacity to accommodate growth.

Where GES is not currently being achieved but could be achieved if upstream water quality were improved, then an amber score is given – growth could be accommodated without preventing a waterbody achieving GES in the future.

Where GES cannot be achieved either today or in the future, despite upgrades in treatment processes, and improvements in upstream water quality, then a yellow assessment is given – and it can be said that GES cannot be achieved due to the limits of current technology. Growth alone is not predicted to prevent GES being achieved in the future.

Should GES be achievable today, but not in the future due to growth, a red assessment would be given, and it can be said that environmental capacity could be

a constraint to growth, i.e., growth alone could prevent good ecological status being achieved in the future.

8.2.2 Results

The first test applied compares the future scenario to the baseline and assesses whether a significant deterioration in water quality occurs – either a 10% deterioration in water quality or a deterioration in WFD class. Where, a significant deterioration is predicted, the TAL scenario then assesses whether this deterioration could be prevented by improvements in treatment processes.

Where a 'green' score is given, deterioration was less than 10% for each determinand, and no change in WFD class is predicted. Where an 'amber' assessment is given, a 10% deterioration or change in WFD class is predicted, but this could be prevented by improvements in treatment technology. In these cases, upgrades may therefore be required at that WwTW or at WwTW upstream.

A 'red' assessment would be given where a significant deterioration in water quality is predicted, and it cannot be prevented by improvements in treatment processes.

In this assessment, improvements in treatment processes have been modelled by assuming the WwTW is operating at TAL. It has not investigated the feasibility of upgrading individual WwTW. This should be performed by the sewerage undertakers who have the detailed knowledge of their assets, and the EA who are responsible for setting permit limits at WwTWs.

At seven of the twelve WwTWs serving growth a 10% deterioration in water quality is expected. In the case of Cirencester a deterioration in WFD class from Good to Moderate is expected. Both of these are considered to be a significant deterioration in water quality.

With the exception of Ampney St Peter, Fairford and Moreton-In-Marsh WwTWs, all of these deteriorations can be prevented by upgrades to treatment processes.

Ampney St Peter, Fairford and Moreton-In-Marsh WwTWs, are situated in the upper catchment where the current WFD classification for ammonia and BOD is "High" (i.e., the best water quality). The WwTW is also currently operating either beyond or close to the technically achievable limit. Under these circumstances, a high percentage deterioration in water quality is expected, and as there is no theoretical room for further improvement at the WwTW, the TAL scenario does not predict an improvement in water quality and the percentage deterioration compared to the baseline remains high.

Despite a large percentage deterioration, the resulting water quality remains "High" status for ammonia and BOD.

The EA published guidance in 2012, explaining how the no deterioration requirements of the Water Framework Directive should be implemented. This guidance was subsequently withdrawn and has not been replaced. This indicated

that should it not feasible to keep deterioration within 10%, "no deterioration" should be assessed based on the class limit immediately downstream of the discharge. At each of the five WwTWs where deterioration could not be kept within 10%, no change in WFD classification was predicted and High status would be maintained for ammonia. The WCS therefore does not consider this a constraint to growth in this catchment.

Appendix C shows the water quality results graphically. The first set of maps in Appendix C show the modelled results if wastewater discharges were increased by the volume predicted during the Local Plan. They show the result at the point of mixing (i.e., where the WwTW discharges) and the results downstream in the river. These are colour coded based on whether deterioration is greater (red) or less than (amber) 10%. Areas where no deterioration is predicted are coloured green.

The second set of maps in Appendix C show the modelled results in the TAL scenario, where each WwTW has been upgraded to the technically achievable limit. This shows areas where deterioration could not be prevented. In each case this is less than 10%.

Table 8.3 shows the results of the GES assessment. At three WwTWs (Ampney St Peter, Blockley, and Cirencester) Good Ecological Status is not currently being met in the baseline, and upgrades to the technically achievable limit would not allow this to be met. Growth alone does not therefore prevent good ecological status being achieved in the future. These have been given a "yellow" rating. At ten WwTW, GES is not currently being achieved, but it could be achieved with upgrades to treatment processes (alongside catchment improvements). These have been given an "amber" rating.

8.3 Summary of WFD status

The WFD aims to ensure 'no deterioration' in the environmental status of rivers and sets objectives to improve rivers to meet 'good' status. LPAs must have regard to the WFD and associated statutory objectives as implemented in the EA's RBMPs.

Figure 8.2 shows the ecological status WFD classification (2022) for waterbodies in Cotswold district. This is broken down into the determinands usually assessed in WCSs for each of the waterbodies that are predicted to receive additional effluent from growth during the plan period. The overall WFD status is not available for Cycle 3, though it is made of Ecological and Chemical status, which are further broken down into sub-elements, the measurement of which is prioritised for each waterbody based on its characteristics and risk, hence not all elements are reported for each river.

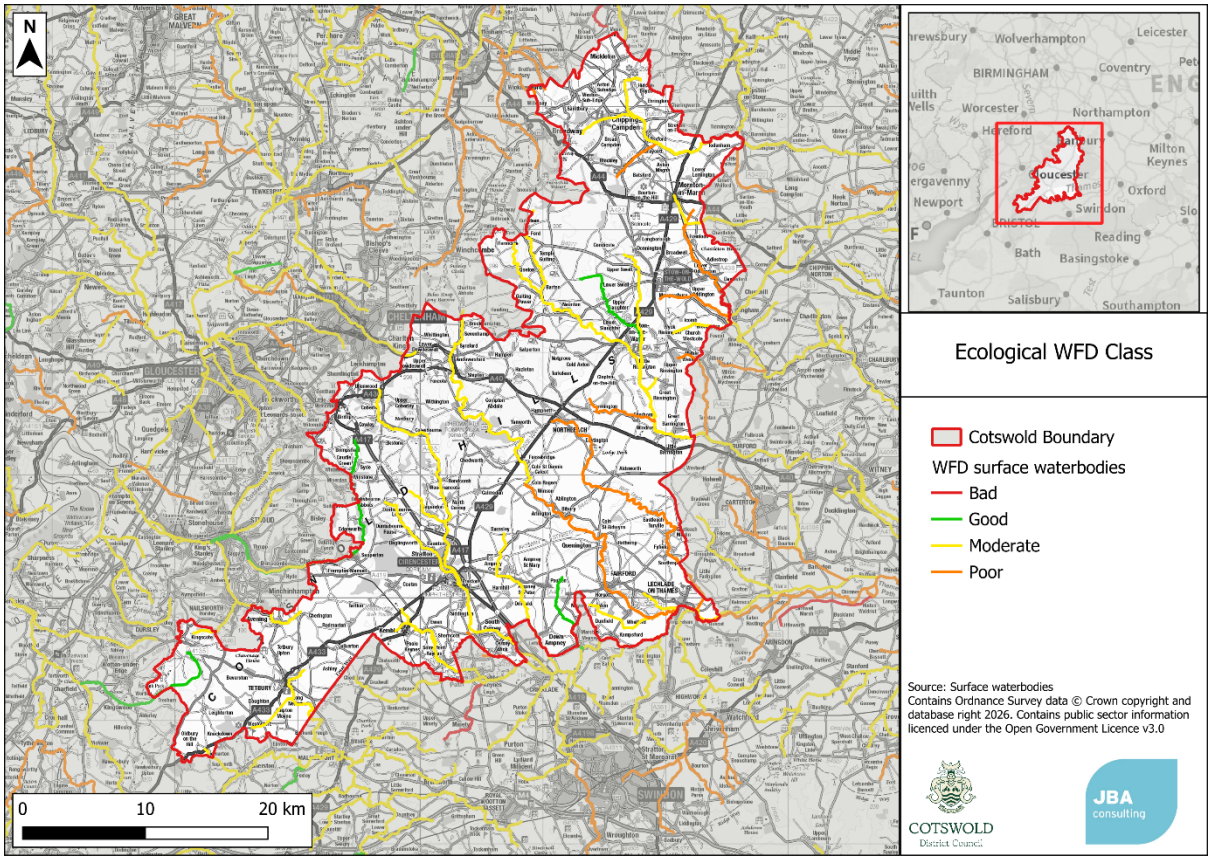

Figure 8.2 WFD Ecological Classification

8.4 Reasons for not achieving good

The latest WFD assessment data indicates that watercourses within Cotswold district exhibit a range of overall statuses, including 'good', 'moderate', 'poor', and 'bad'. The EA's Reasons for Not Achieving Good (RNAG) dataset indicates that the sewage discharge (intermittent and continuous), urban and transport sectors (urban development), as well as agriculture and rural land management, are the main reasons for watercourses not achieving good status in this area. However, there are

also several instances in the borough where no sector is responsible, or the sector is under investigation.

8.5 WINEP

There are 89 actions from the Water Industry National Environment Programme (WINEP) that relate to water quality in the study area. These are listed in Appendix B.

8.6 Priority substances

As well as the physico-chemical water quality elements (BOD, Ammonia, Phosphate etc.) addressed above, a watercourse can fail to achieve GES due to exceeding permissible concentrations of hazardous substances. Currently there are 45 priority substances, of which 21 are priority hazardous substances. Such substances may pose risks both to humans (when contained in drinking water) and to aquatic life and animals feeding in aquatic life. These substances are managed by a range of different approaches, including international bans on manufacturing and use, targeted bans, selection of safer alternatives and end-of-pipe treatment solutions. There is considerable concern within the UK water industry that regulation of these substances by setting permit values which require their removal at wastewater treatment works will place a huge cost burden upon the industry and its customers, and that this approach would be out of keeping with the 'polluter pays' principle.

The following points consider how the planning system might be used to manage priority substances:

- **Industrial sources** – while this report covers potential employment sites, it does not consider the type of industry and therefore likely sources of priority substances are unknown. It is recommended that developers discuss potential uses which may be sources of priority substances from planned industrial facilities at an early stage with the EA and, where they are seeking a trade effluent consent, with the SU.
- **Agricultural sources** - there is limited scope for the planning system to change or regulate agricultural practices. UK water companies are involved in a range of 'Catchment-based Approach' schemes aimed at reducing diffuse sources of pollutants, including agricultural pesticides.
- **Surface water runoff sources** - some priority substances e.g., heavy metals, are present in urban surface water runoff. It is recommended that future developments manage these sources by using SuDS that provide water quality treatment, designed following the CIRIA SuDS Manual. This is covered in more detail in Sections 9.6. Retrofitting of SuDS to existing highways systems would also be recommended, where opportunity and funding allows, in order to treat heavy metal, microplastic and hydrocarbon contaminants present in highways runoff.

- **Domestic wastewater sources** - some priority substances are found in domestic wastewater as a result of domestic cleaning chemicals, detergents, pharmaceuticals, pesticides, or materials used within the home. Whilst an increase in the population due to housing growth could increase the total volumes of such substances being discharged to the environment, it would be more appropriate to manage these substances through regulation at source, rather than through restricting housing growth through the planning system.

No further analysis of priority substances has been undertaken as part of this study.

8.7 Conclusions and recommendations

The EA's Reasons for Not Achieving Good (RNAG) dataset indicates that sewage treatment, the urban and transport sectors (urban development), as well as agriculture and rural land management, are the main reasons for watercourses not achieving good status in this area.

Growth during the Local Plan period is predicted to cause a significant deterioration in water quality downstream of seven WwTWs (six have a greater than 10% deterioration in one or more determinands, and one has a deterioration in WFD class).

With the exception of Ampney St Peter, Fairford and Moreton-In-Marsh WwTWs, all of these deteriorations can be prevented by upgrades to treatment processes.

At Ampney St Peter, Fairford and Moreton-In-Marsh WwTWs, a greater than 10% deterioration is predicted for Ammonia and BOD which is not prevented in the modelling scenario where upgrades to WwTWs are applied.

This is because these WwTWs are situated in an area where the current WFD classification for ammonia is "High" (i.e., the best water quality) and is operating either beyond or close to the technically achievable limit.

Under these circumstances, a high percentage deterioration in water quality is expected, and as there is no theoretical room for further improvement at the WwTW, the TAL scenario does not predict an improvement in water quality and the percentage deterioration compared to the baseline remains high. No change in WFD classification is predicted, and High status is maintained for Ammonia and BOD. The WCS therefore does not consider this a constraint to growth.

The water quality modelling indicates that growth alone will not prevent good ecological status being prevented in the future should improvements in upstream water quality be made.

Where a WwTW is shared with a neighbouring authority, coordination of growth plans in collaboration with Thames Water, Severn Trent Water and Wessex Water provide is essential to ensure that infrastructure is in place prior to development to prevent a breach of the environmental permit.

9 Environmental opportunities and constraints

9.1 Introduction

Development has the potential to cause an adverse impact on the environment through several routes, such as worsening of air quality, pollution to the aquatic environment, or disturbance to wildlife. Of relevance in the context of a WCS is the impact of development on the aquatic environment.

A source-pathway-receptor approach can be taken to investigate the risk and identify where further assessment or action is required.

9.2 Impact of abstraction

9.2.1 Overview

Abstraction of water within a catchment, either from groundwater or surface water sources, is necessary to provide a public water supply, for industrial processes and for agriculture. When the volume of water being abstracted becomes too high, it can cause environmental damage by reducing river flow or lowering the water table.

Changes in river flow can impact sensitive ecosystems, for example trout require a clean gravel bed to lay their eggs. A reduction in river flow can cause sediment to build up, blocking the spaces the fish require to lay their eggs impacting their reproductive cycle. Changes in groundwater levels can also affect the flow regime in rivers and can cause drying of wetland sites.

The precise location of abstraction points for public water supply in England is not available for reasons of national security. Furthermore, water demand within a WRZ can be met by sources located anywhere within that WRZ, or from a neighbouring WRZ if the transfer between WRZs is used to provide some of the water available for use. It is therefore not possible, in all but the simplest of WRZs, to trace an impact of an individual development site back to a particular water abstraction and therefore to an environmental impact. The assessments in this report therefore rely on information in the public domain.

9.2.2 Methodology

Cotswold district is served by Bristol Water (BW), Severn Trent Water (STW), Thames Water (TW), and Wessex Water (WW) via five WRZ. These WRZs are:

- Bristol Water (Single Zone)
- Forest and Stroud (Severn Trent Water)
- Strategic Grid (Severn Trent Water)
- Swindon and Oxfordshire- SWOX (Thames Water)
- Supply Area (Wessex Water)

Abstraction either from surface water sources or from groundwater sources can occur anywhere within these zones. However, the impact of the abstraction could be felt outside of the WRZ within the same groundwater body, or downstream in surface waterbodies. In both cases this could be well outside the LPA boundary.

Groundwater Dependent Terrestrial Ecosystems

Figure 9.1 shows a schematic of how Groundwater Dependent Terrestrial Ecosystems (GWDTEs) were identified. The LPA boundary is within a WRZ. Water abstracted anywhere within that WRZ could be used to serve growth within the LPA. In the diagram below, there are two abstraction points. Abstraction 1 could impact an area outside of both the LPA boundary and the WRZ. However, there are no protected sites within that groundwater body. Abstraction 2 also impacts an area both within and outside of the LPA boundary. Protected site A is within the WRZ but may not be impacted directly by an abstraction. Protected site B is outside of the WRZ and outside of the groundwater body containing an abstraction and is therefore unlikely to be impacted by growth. Protected site C is within a groundwater body containing an abstraction, hence there is a risk that an increase in abstraction could impact this site.

The location of abstraction points within the study area is not known, and so the approach must be taken that GWDTE anywhere within the combined extent of the WRZ and groundwater bodies overlapping the WRZ could be impacted by an increase in abstraction.

A further check was done on whether abstraction may already be an issue in those GWDTEs. The WFD records "Significant Water Management Issues" (SWMIs) in each water body. These are the pressures on the water environment that put our ability to achieve the environmental objectives of the WFD most at risk.

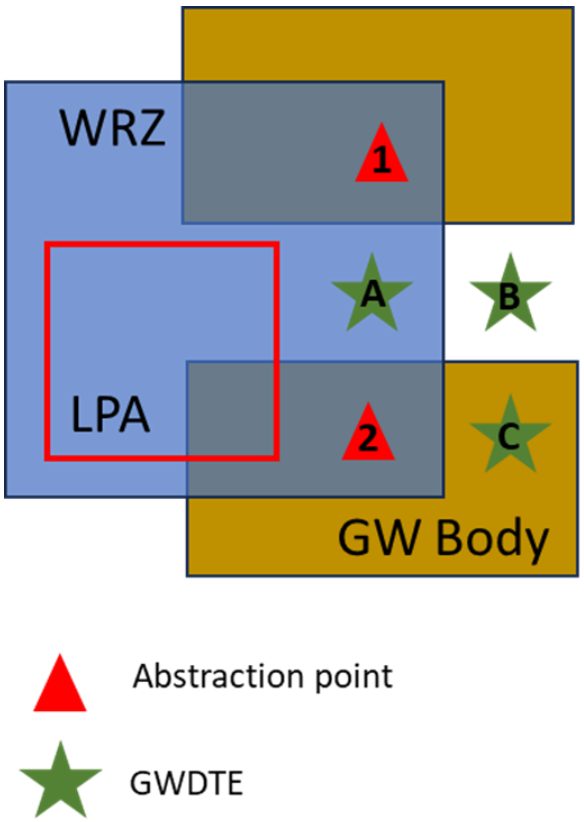

Figure 9.1: Definition of groundwater study area.

The steps taken to identify GWDTEs that may be impacted by abstraction to serve Cotswold district were as follows:

- Define study area for Cotswold district - based on extent of WRZ and WFD Groundwater bodies that overlap with the WRZs.
- Identify GWDTE within the study area using the EA's GWDTE dataset.
- Identify GWDTEs that are within groundwater bodies with flow identified as a SWMI.

Surface water based ecosystems

Figure 9.2 shows a schematic of how protected sites on surface waterbodies were identified. As in the groundwater example, water could be abstracted from anywhere within the WRZ. Protected site A is downstream of an abstraction and so could be impacted by changes in river flow resulting from the abstraction. Protected site B whilst further downstream in the river basin, it is on a tributary not connected with the WRZ, so abstraction is unlikely to have an impact. Protected site C is upstream of the abstraction so would not be impacted.

As with the groundwater abstractions, the location of surface water abstractions was not available to inform this study. The approach was therefore taken that any protected site directly on a waterbody that flows through or is downstream of the WRZ could be impacted by abstraction. Protected sites upstream or on tributaries that have not flowed through the WRZ are ignored.

In order to identify protected sites that may be at risk, Flood Zone 2 from the Risk of Flooding from Rivers and the Sea mapping was used to define an area that was either adjacent to a river or could be reasonably expected to receive surface water from a river.

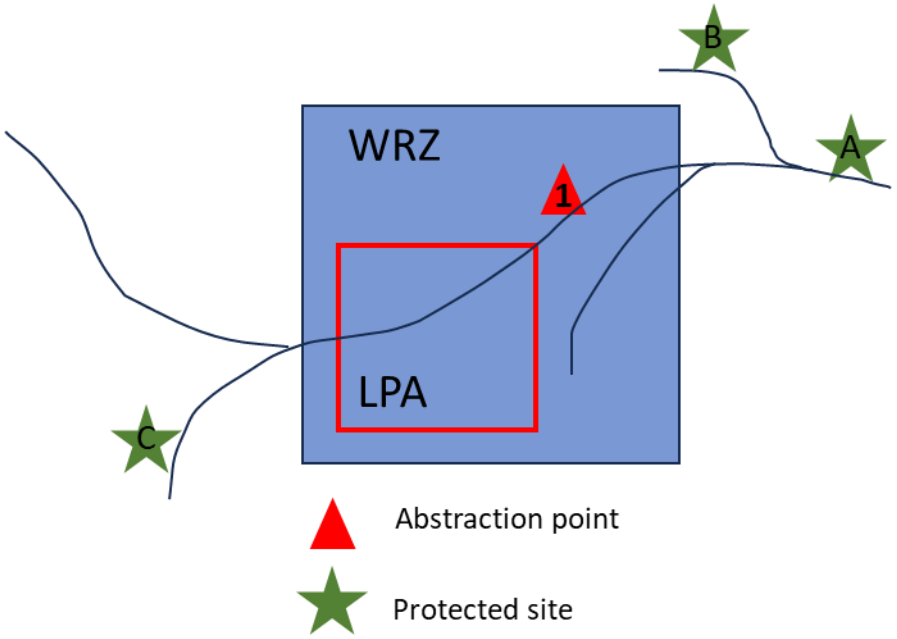

Figure 9.2: Definition of surface water study area.

9.2.3 Results

9.2.3.1 Surface water assessment

There are 45 SSSIs that are adjacent to waterbodies within the WRZs serving growth across the Local Plan period and downstream of Cotswold District (based on Flood Zone 2). There are also 4 Ramsar sites, 11 Special Areas of Conservation (SACs) and 6 Special Protection Area (SPA) sites.

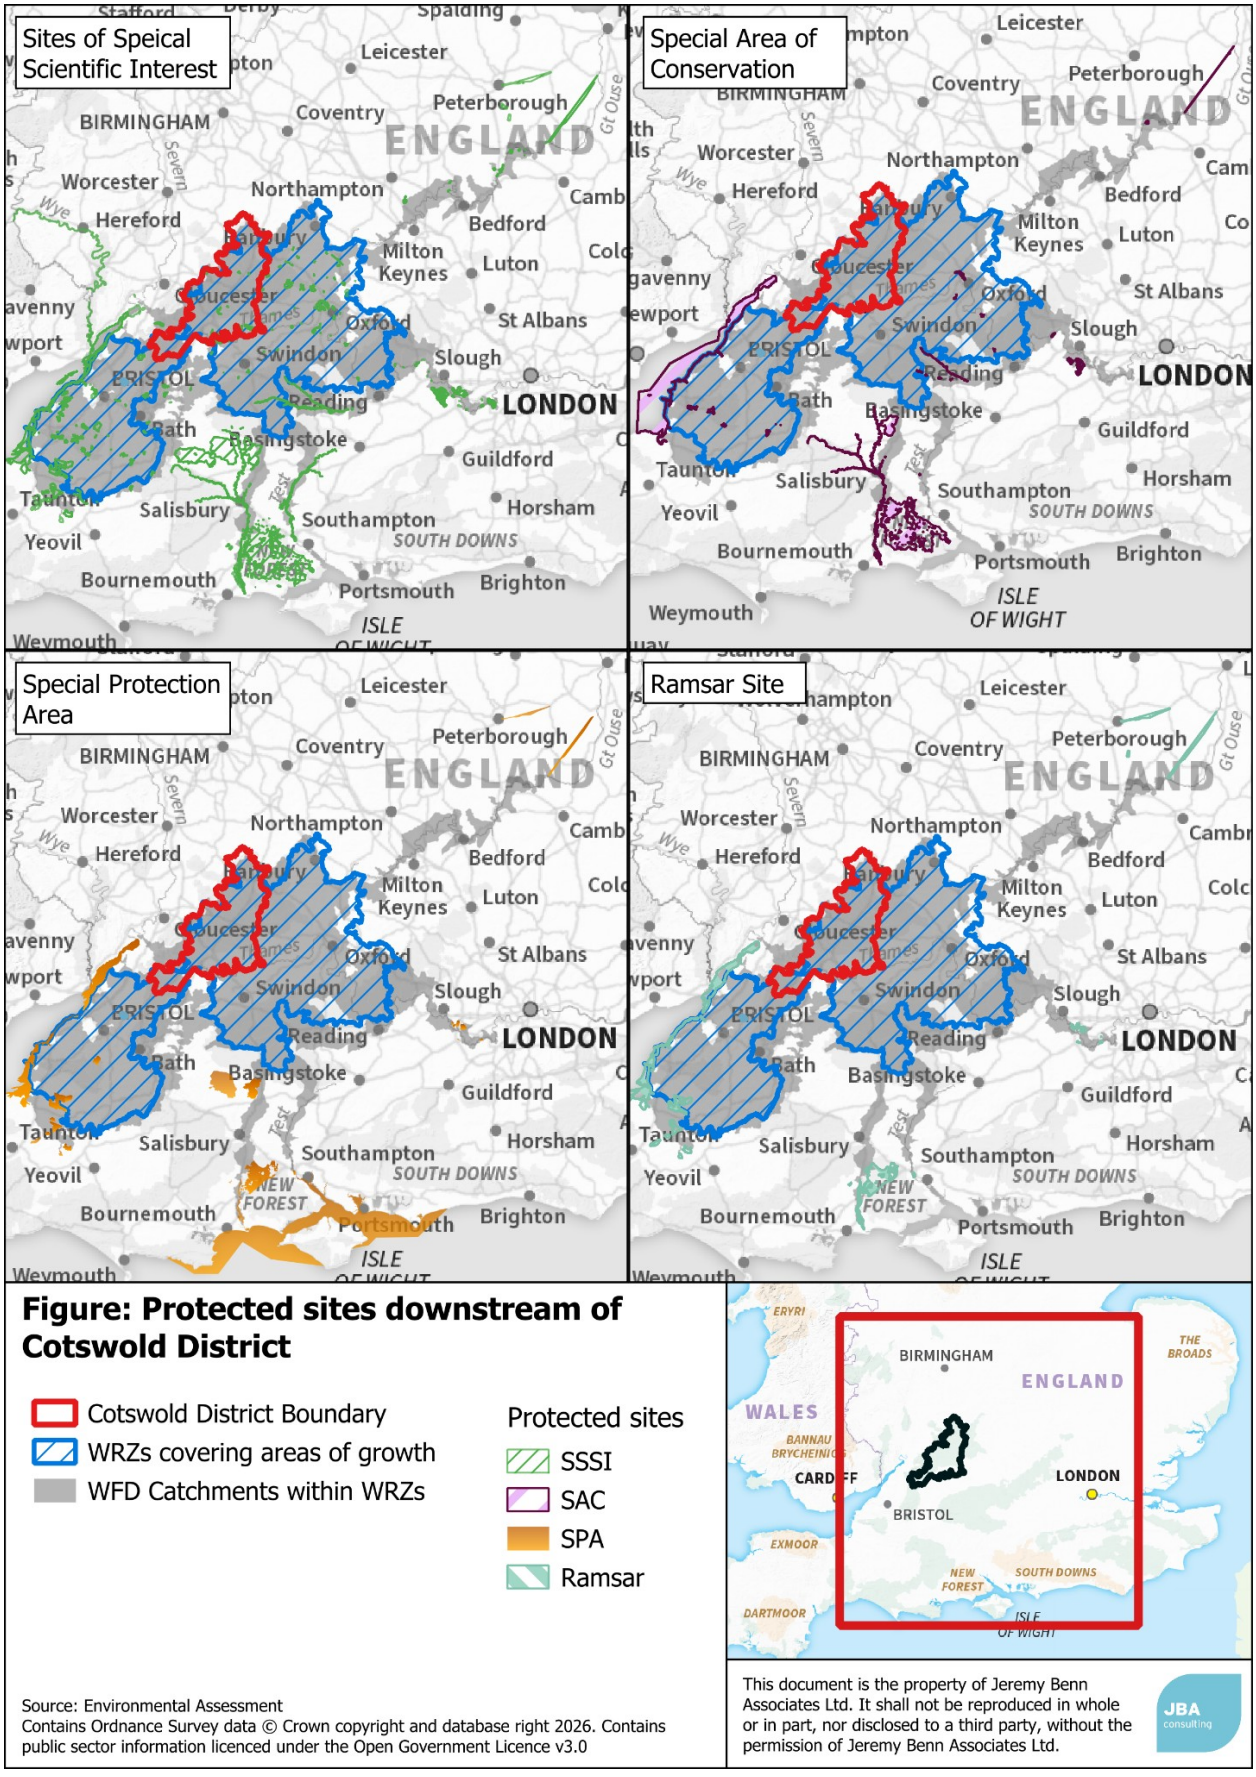

Figure 9.3 Designated sites downstream of Cotswold district

Figure 9.3 illustrates the extent of designated sites located downstream of surface waterbody catchments that fall within Cotswold district's WRZs. Due to the small size and limited visibility of some sites, the figure is not suitable for identifying each designated site individually.

Additionally, designated sites may span multiple surface water catchments. This overlap is reflected in the list provided in this section and in Appendix A.

9.2.3.2 Groundwater assessment

There are 161 GWDTEs within the WRZs serving Cotswold district that are in a groundwater body where flow, from groundwater abstraction, has been identified as a SWMI. WFD groundwater bodies and GWDTEs can be seen in Figure 9.4 and are listed in Appendix A.

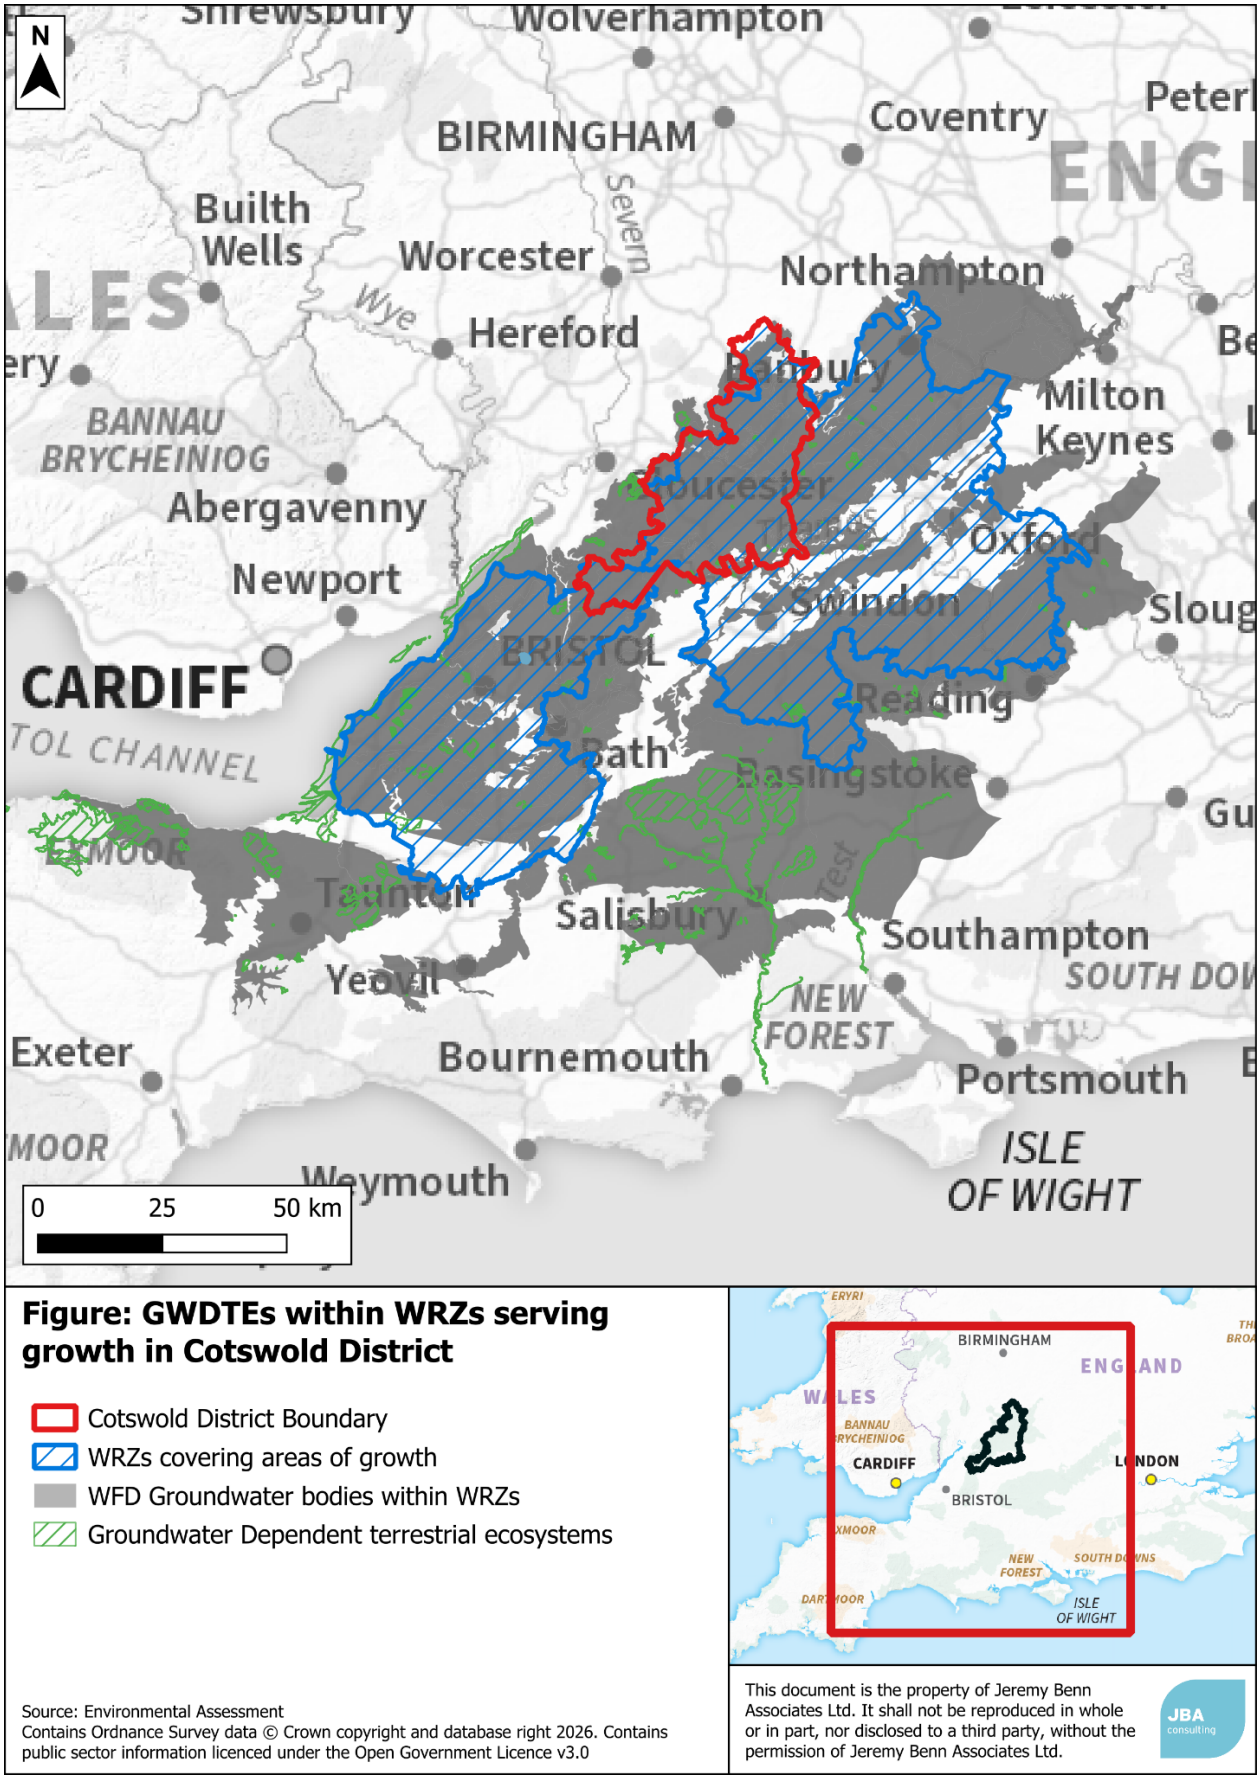

Figure 9.4 GWDTE sites within WRZ covering areas of growth in Cotswold District

9.3 Water quality impact

Water pollution is usually categorised as either diffuse or point source. Point source sources come from a single well-defined point, an example being the discharge from a WwTW.

Diffuse pollution is defined as 'unplanned and unlicensed pollution from farming, old mine workings, homes and roads. It includes urban and rural activity and arises from industry, commerce, agriculture and civil functions and the way we live our lives.'

The most likely sources of diffuse pollution from new developments include drainage from housing estates, runoff from roads, and discharges from commercial and industrial premises. The pollution risk posed by a site will depend on the sensitivity of the receiving environment, the pathway between the source of the runoff and the receiving waters, and the level of dilution available. After or during heavy rainfall, the first flush of water carrying accumulated dust and dirt is often highly polluting.

Whilst the threat posed by an individual site may be low, a number of sites together may pose a cumulative impact within the catchment.

Runoff from development sites should be managed by a suitably designed SuDS scheme. More information on SuDS can be found in Section 9.5.2.

9.3.1 Pathways

Pollutants can take a number of different pathways from their source to a 'receptor' – a habitat or species that can be impacted. This could be overland via surface water flow paths, via the river system, or via groundwater or a combination of all three. For the purpose of this study, it should be assumed at any protected site has the potential to be impacted by surface runoff from adjacent development sites. Linkages between development sites and protected sites will be explored further in Section 9.4.

9.3.2 Receptors

A receptor in this case is a habitat or species that is adversely impacted by a pollutant. Both the rivers and groundwater as well as being pathways, can also be considered to be receptors. Groundwater bodies are also given a status under the WFD which is reported in Section 4.2.2 for the groundwater bodies across Cotswold district.

A list of environmental designations is provided in Section 9.2.2, and protected sites within Cotswold district can be seen in Section 9.2.3.

9.4 Assessment of point source risk

9.4.1 Methodology

In order to identify which of the protected sites may be at risk, Flood Zone 2 from the Risk of Flooding from Rivers and the Sea mapping was used to define an area that was either beside a river or could be reasonable expected to receive surface water from a river during times of flood. Where a WwTW serving growth in the plan period was present in the catchment upstream of the protected site, this site was taken forward for further assessment.

Where there were no WwTW serving growth upstream, these protected sites were discounted as no deterioration would be predicted in a water quality model, and the impact would be expected to be minimal. However, in these cases the overall catchment water quality should be considered where for example they are designated for migratory fish species that may spend part of their lifecycle elsewhere in the catchment.

Whilst deterioration in water quality may not always lead to a significant impact at a protected site such as a SSSI, modelled deterioration can be used to highlight areas of risk for further analysis in the Habitats Regulations Assessment.

9.4.2 Results

The results of this assessment are presented in Appendix D. Results show there are no significant deteriorations adjacent to environmental sites that cannot be prevented by improvements in treatment to TAL with the exception of Cotswold Water Park SSSI downstream of Ampney St Peter.

As noted in 8.2.2, Ampney St Peter is in the upper catchment discharging to a waterbody with High WFD status for Ammonia. Current performance of the WwTW is at or exceeding the technically achievable limit so there is no theoretical room for further improvement at the WwTW, the TAL scenario does not predict an improvement in water quality and the percentage deterioration compared to the baseline remains 14%.

9.5 Groundwater protection

9.5.1 Overview

The EA is responsible for the protection of 'controlled waters' from pollution under the Water Resources Act 1991. These controlled waters include all watercourses and groundwater contained in underground strata.

The source protection zones are based on an estimate of the time it would take for a pollutant which enters the saturated zone of an aquifer to reach the source of abstraction or discharge point (Zone 1 = 50 days, Zone 2 = 400 days, Zone 3 is the total catchment area). The EA will use SPZs alongside other datasets such as the

Drinking Water Protected Areas (DrWPAs) and aquifer designations as a screening tool to show:

- Areas where the EA would object in principle to certain potentially polluting activities, or other activities that could damage groundwater.
- Areas where additional controls or restrictions on activities may be needed to protect water intended for human consumption.
- How it prioritises responses to incidents.

The EA have published a position paper outlining its approach to groundwater protection (assets.publishing.services.gov.uk) which includes direct discharges to groundwater, discharges of effluents to ground and surface water runoff. This is of relevance to this WCS where a development may manage surface water through SuDS.

9.5.2 Sewage and Trade Effluent

Discharges of treated sewage of 2m^3 per day or less to ground are called small sewage discharges (SSDs). The majority of SSDs do not require an EP if they comply with certain qualifying conditions. A permit will be required for all SSDs in Source Protection Zone 1 (SPZ1).

For treated sewage effluent discharges, the EA requires the use of shallow infiltration systems, which maximise the attenuation within the drainage blanket and the underlying unsaturated zone. Whilst some sewage effluent discharges may not pose a risk to groundwater quality individually, the cumulative risk of pollution from aggregations of discharges can be significant. Improvement or pre-operational conditions may be imposed before granting an EP. The EA will only agree to developments where the addition of new sewage effluent discharges to ground in an area of existing discharges is unlikely to lead to an unacceptable cumulative impact.

Generally, the EA will only agree to developments involving release of sewage effluent, trade effluent or other contaminated discharges to ground if it is satisfied that it is not reasonable to make a connection to the public foul sewer. The EA would normally expect to only permit new private discharges where the distance to connect to the nearest public sewer exceeds the number of dwellings multiplied by 30m. So, for example, a development of 100 dwellings would need to be more than 3km from a public sewer. The developer would have to provide evidence of why the proposed development cannot connect to the foul sewer in the planning application. This position will not normally apply to surface water run-off via SuDS and discharges from WwTW operated by sewerage undertakers with appropriate treatment and discharge controls.

Deep infiltration systems (such as boreholes and shafts) are not generally accepted by the EA for discharge of sewage effluent as they bypass soil layers and reduce the opportunity for attenuation of pollutants.

Discharges of surface water run-off to ground at sites affected by land contamination, or from sites for the storage of potential pollutants are likely to require an EP. This could include sites such as garage forecourts and coach and lorry parks. These sites would be subject to a risk assessment with acceptable effluent treatment provided.

9.5.3 Discharge of Clean Water

'Clean water' discharges such as runoff from roofs or from roads, may not require a permit. However, they are still a potential source of groundwater pollution if they are not appropriately designed and maintained.

- Where infiltration SuDS schemes are proposed to manage surface runoff they should:
- be suitably designed;
- meet government non-statutory technical standards for SuDS (gov.uk) – these should be used in conjunction with the NPPF and PPG; and
- use a SuDS management treatment train.

A hydrogeological risk assessment is required where infiltration SuDS is proposed for anything other than clean roof drainage in a SPZ1.

9.5.4 Source Protection Zones in Cotswold District

SPZs form a key part of the EA's approach to controlling the risk to groundwater supplies from potentially polluting activities and accidental releases of pollutants.

The EA's groundwater SPZs production manual (gov.uk), details position statements which provide information about the EA's approach to managing and protecting groundwater.

As shown in Figure 9.5, there are several SPZs intersecting the whole study area. Several proposed developments are located within SPZs.

There are eight SPZ Zone 1s within the study area, with the radiating zones 2 and 3 from these covering the majority of the centre and southwest of the area. Because these are mainly within the low-lying areas at the base of the river valleys, this hydrologically connects the upper elevations in the north to the south. These SPZs can be seen in Figure 4 9 below. In the event of an incident, widespread groundwater contamination is possible across the entire southern half of the study area; extra preventative precautions should be undertaken when considering developments in these areas.

Table 9.1 shows the potential allocations identified within SPZ with the corresponding EA advice.

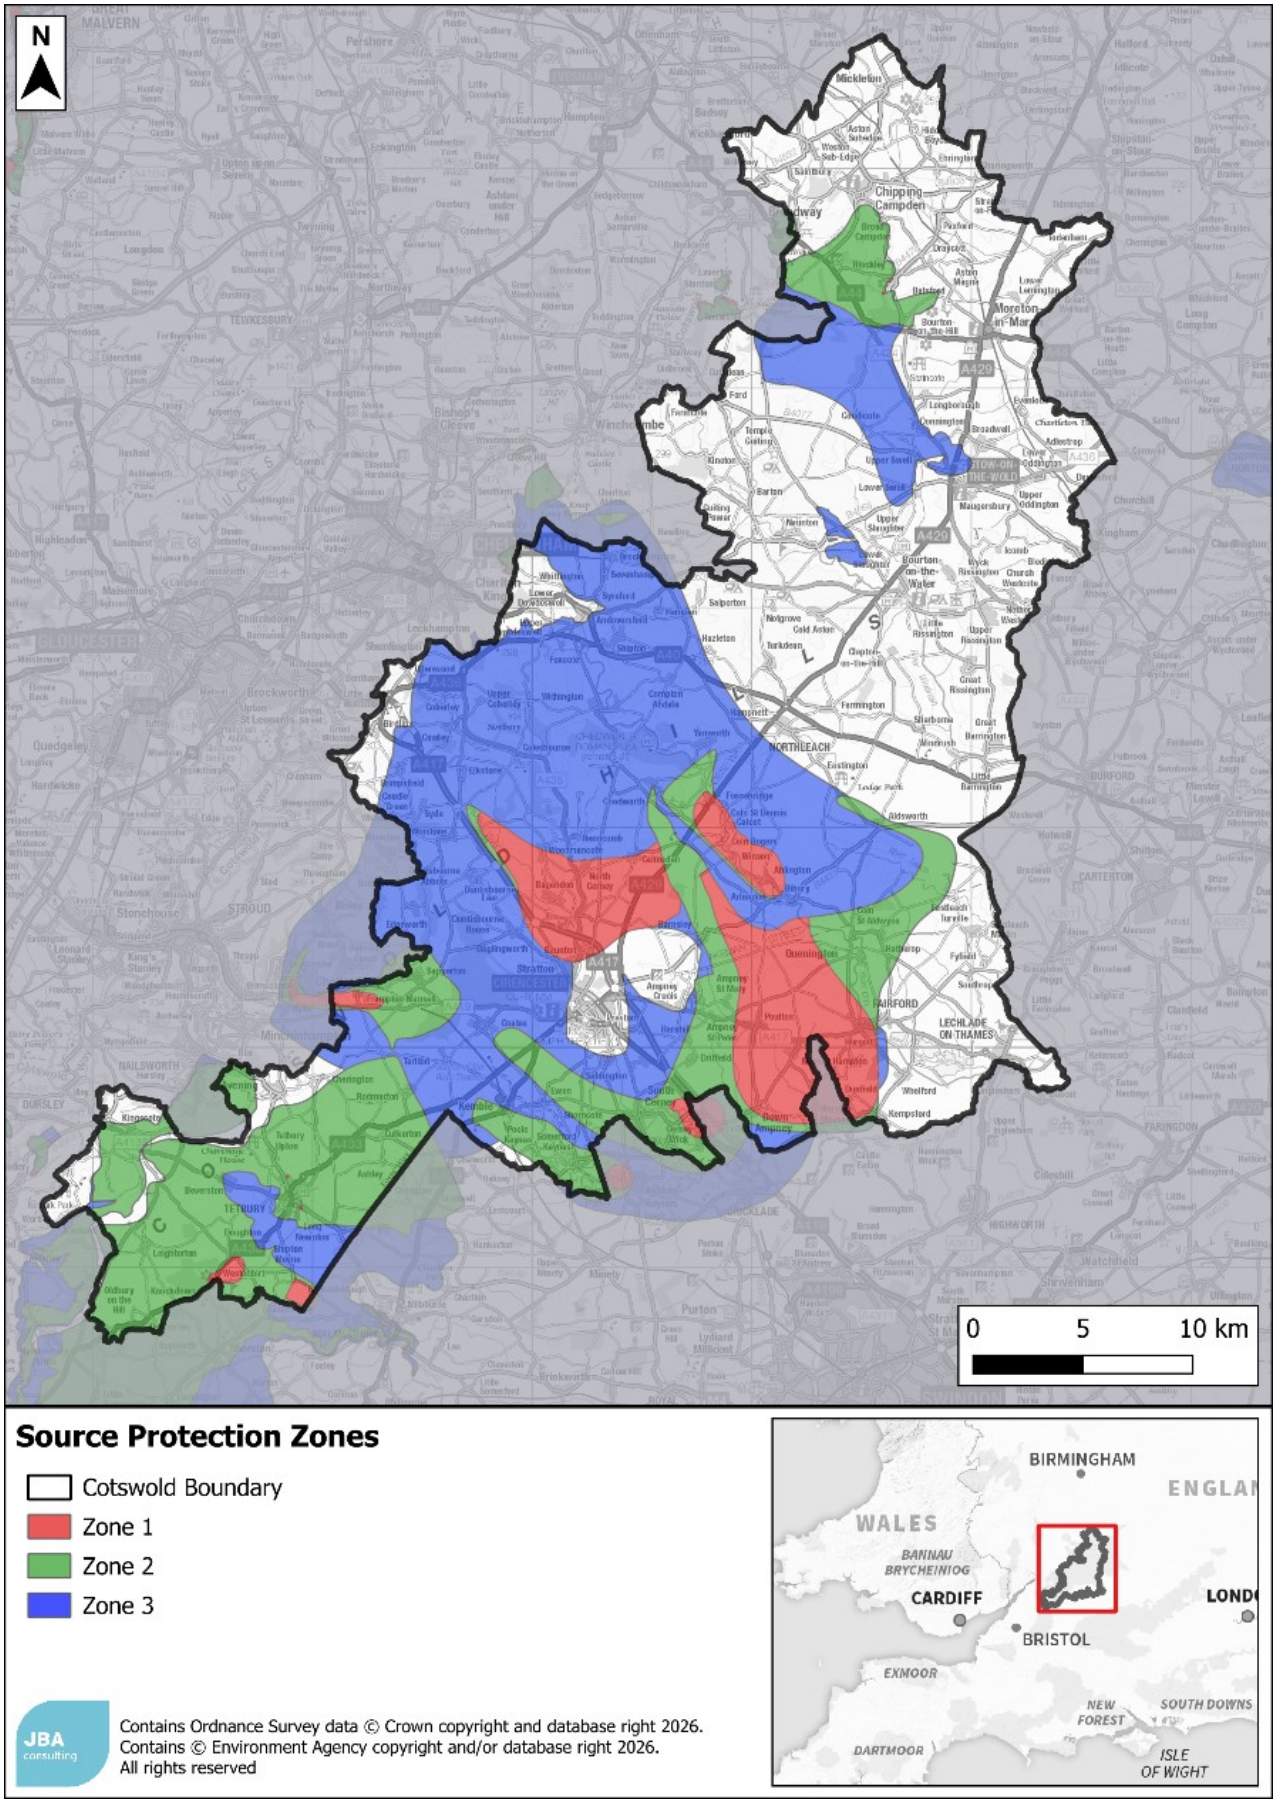

Figure 9.5 Source Protection Zones (SPZ) areas in Cotswold district

Table 9.1 Potential allocations within SPZs and EA guidance

Source Protection Zone	Sites	Management advice / EA position statement
Zone 1 – Inner Protection Zone	F53A R469 R607 New settlement to the south of Driffield Strategic extension to the north, east and south of Down Ampney	G2 – Inside SPZ1 all sewage effluent discharges to ground must have an environmental permit. G4 – Inside SPZ1 the EA will object to any new trade effluent, storm overflow from sewage system or other significantly contaminated discharges to ground where the risk of groundwater pollution is high and cannot be adequately mitigated. G12 – Discharge of clean roof water to ground is acceptable both within and outside SPZ1, provided all roof water down-pipes are sealed against pollutants entering the system from surface runoff, effluent disposal or other forms of discharge. The method of discharge must not create new pathways for pollutants to groundwater or mobilise contaminant already in the ground. No permit is required if these criteria are met. G13 – Where infiltration SuDS are proposed for anything other than clean roof drainage in a SPZ1, a hydrogeological risk assessment should be undertaken, to ensure that the system does not pose an unacceptable risk to the source of supply. SuDS schemes must be

Source Protection Zone	Sites	Management advice / EA position statement
		suitably designed.
Zone 2 – Outer Protection Zone	T31B T71A DA16A R670 R591 R592 Strategic extension to the south of The Steadings Strategic extension to the north-east of Fairford Strategic extension to the south-west of Kemble Strategic Site North of Ampney Crucis	A hydrogeological risk assessment is not a requirement for SuDS schemes, however they should still be "suitably designed", for instance following best practice guidance in the CIRIA SuDS Design Manual.
Zone 3 – Total Catchment	A2 C71 F20A SD15 Strategic extension to the south-west of Siddington	A hydrogeological risk assessment is not a requirement for SuDS schemes, however they should still be "suitably designed", for instance following best practice guidance in the CIRIA SuDS Design Manual.

9.6 Surface water drainage

9.6.1 Overview

From April 2015, Local Planning Authorities (LPA) were given the responsibility for ensuring that sustainable drainage is implemented on all major developments, including developments of 10 or more homes, or commercial developments creating 1,000m^2 of new floor space.

Previously SuDS guidance was developed by Defra to sit alongside the NPPF Planning Practice Guidance (PPG) and provide non-statutory standards as to the expected design and performance for SuDS.

As of July 2025, the Defra National standards for sustainable drainage systems (SuDS) (gov.uk) were brought in to comply with the principles of surface water drainage design.

The national standards contain two sets of standards. The first type (Standard 1) is known as the hierarchy standard and sets the criteria for the prioritisation of final surface water runoff destinations. The other standards (Standards 2-7) detail the

minimum design criteria that SuDS should satisfy alongside how they are to be appropriately built, maintained, and operated.

While remaining as a non-statutory specification, these now form a material consideration for LPAs when assessing planning applications. These standards aim to reflect and reinforce good practice and use of SuDS, reflecting the four pillars of SuDS design. All appropriate planning applications should demonstrate how the national standards have been met in the site design (Principle 10).

Standard 1: runoff destinations

Runoff from development shall be discharged to the following final destinations, to the maximum extent practicable, in accordance with the below hierarchy:

- Priority 1: collected for non-potable use (rainwater harvesting)
- Priority 2: infiltrated to ground
- Priority 3: discharged to an above ground surface water body
- Priority 4: discharged to a surface water sewer, or another piped surface water drainage system
- Priority 5: discharged to a combined sewer.

Non-potable use

There is potential for rainwater harvesting for non-potable uses to decrease the water demand from new developments and help improve water efficiency.

Rainwater harvesting shall be considered in all circumstances where any of the following apply:

- There is a demand for non-potable water and available contributing catchment area that will deliver safe and efficient water savings.
- Examples include industrial, commercial, horticultural, educational, public sector, residential and multiple-occupancy buildings.
- There is a need for landscape irrigation.
- The development is in an area identified as seriously water stressed.

Gloucestershire County Council is the LLFA for the study area and plays a key role in ensuring that the proposed drainage schemes for all new developments comply with technical standards and policies in relation to SuDS. Gloucestershire County Council's website contains advice relating to surface water drainage and expectations and design standards for SuDS in the area.

An updated version of the Construction Industry Research and Information Association (CIRIA) SuDS Manual was published in 2015. The guidance covers the planning, design, construction and maintenance of SuDS for effective implementation within both new and existing developments. The guidance is relevant for a range of roles with the level of technical detail increasing throughout the manual. The guidance does not include detailed information on planning requirements, SuDS approval and adoption processes and standards, as these vary

by region and should be checked early in the planning process. The manual itself can be found on the CIRIA website (ciria.org).

CIRIA also published 'Guidance on the Construction of SuDS' (C768) (ciria.org), which contains detailed guidance on all aspects of SuDS construction, with specific information on each SuDS component available online as a downloadable chapter, free to CIRIA members.

Severn Trent Water recommends four core SuDS solutions and supports the installation of them at developments: raingardens, bioswales, detention basins, and permeable paving. They also provide general SuDS guidance (stwater.co.uk) on their website.

9.6.2 Use of sustainable drainage systems in water quality management

SuDS allow the management of diffuse pollution generated by urban areas through the sequential treatment of surface water reducing the pollutants entering lakes and rivers, resulting in lower levels of water supply and wastewater treatment being required. This treatment of diffuse pollution at source can contribute to meeting WFD water quality targets, as well as national objectives for sustainable development.

This is usually facilitated via a SuDS Management Train of a number of components in series that provide a range of treatment processes delivering gradual improvement in water quality and providing an environmental buffer for accidental spills or unexpected high pollutant loadings from the site. Considerations for SuDS design for water quality are summarised in Table 9.2.

Table 9.2: Considerations for SuDS Design for water quality.

Action	Considerations
Manage surface water close to source	Where practicable, treatment systems should be designed to be close to source of runoff. It is easier to design effective treatment when the flow rate and pollutant loadings are relatively low. Treatment provided can be proportionate to pollutant loadings and sensitivity receptor. Accidental spills or other pollution events can be isolated more easily without affecting the downstream drainage system. Encourages ownership of pollution. Poor treatment performance or component damage/ failure can be dealt with more effectively without impacting on the whole site.

Action	Considerations
Treat surface water runoff on the surface	Where practicable, treatment systems should be designed to be on the surface Where sediments are exposed to UV light, photolysis and volatilisation processes can act to break down contaminants. If sediment is trapped in accessible parts of the SuDS, it can be removed more easily as part of maintenance. It enables use of evapotranspiration and some infiltration to the ground to reduce runoff volumes and associated total contamination loads (provided risk to groundwater is managed appropriately). It allows treatment to be delivered by vegetation. Sources of pollution can be easily identified. Accidental spills or misconnections are visible immediately and can be dealt with rapidly. Poor treatment performance can be easily identified during routine inspections, and remedial works can be planned efficiently.
Treat surface water runoff to remove a range of contaminants	SuDS design should consider the likely presence and significance of any contaminant that may pose a risk to the receiving environment. The SuDS component or combination of components selected should include treatment processes that, in combination, are likely to reduce this risk to acceptably low levels.
Minimise risk of sediment remobilisation	The SuDS design should consider and mitigate the risks of sediments (and other contaminants) being remobilised and washed into receiving surface waters during events greater than those which the component has been specifically designed for.
Minimise impacts from accidental spills	By using several components in series, SuDS can help ensure that accidental spills are trapped in/on upstream component surfaces, facilitating contamination management and removal. The selected SuDS components should deliver a robust treatment design that manages risks appropriately - considering the uncertainty and variability of pollution loadings, sensitivity of receptors and treatment processes.

Managing pollution close to its source can help keep pollutant levels and accumulation rates low, allowing natural processes to be more effective. Treatment

can often be delivered within the same components that are delivering water quantity design criteria, requiring no additional cost or land-take.

SuDS designs should control the 'first flush' of pollutants (usually mobilised by the first 5mm of rainfall) at source, to ensure contaminants are not released from the site. Best practise is that no runoff should be discharged from the site to receiving watercourses or sewers for the majority of small (e.g., less than 5mm) rainfall events.

Infiltration techniques are likely to require consultation with the EA. Early consideration of SuDS within master planning will typically allow a more effective scheme to be designed.

Further guidance on designing SuDS to reduce phosphorus (CIRIA, 2022a) and nitrogen (CIRIA, 2022b) in surface water runoff can be found in the relevant CIRIA guidance documents.

9.6.3 Benefits of sustainable drainage systems

Flood Risk

The Strategic Flood Risk Assessment contains recommendations for SuDS to manage surface water on development sites, with the primary aim of reducing flood risk.

SuDS are most effective at reducing flood risk for relatively high intensity, short and medium duration events, and are particularly important in mitigating potential increases in surface water flooding, sewer flooding and flooding from small and medium sized watercourses resulting from development.

Water Resources

A central principle of SuDS is the use of surface water as a resource. Traditionally, surface water drainage involved the rapid disposal of rainwater, by conveying it directly into a sewer or Water Recycling Centres.

SuDS techniques such as rainwater harvesting, allow rainwater to be collected and re-used as non-potable water supply within homes and gardens, reducing the demand on water resources and supply infrastructure.

Climate Resilience

Climate projections for the UK suggest that winters may become milder and wetter, and summers may become warmer, but with more frequent higher intensity rainfall events. This would be expected to increase the volume of runoff, and therefore the risk of flooding from surface water, and diffuse pollution, and reduce water availability.

SuDS offer a more adaptable way of draining surfaces, controlling the rate and volume of runoff leaving urban areas during high intensity rainfall, and reducing flood risk to downstream communities through storage and controlled release of rainwater from development sites.

Through allowing rainwater to soak into the ground, SuDS are effective at retaining soil moisture and groundwater levels, which allows the recharge of the watercourses and underlying aquifers. This is particularly important where water resource availability is limited, and likely to become increasingly scarce under future drier climates.

Biodiversity

The water within a SuDS component is an essential resource for the growth and development of plants and animals, and biodiversity benefits can be delivered even by very small, isolated schemes. The greatest value can be achieved where SuDS are planned as part of a wider green landscape, providing important habitat, and wildlife connectivity. With careful design, SuDS can provide shelter, food, foraging and breeding opportunities for a variety of species including plants, amphibians, invertebrates, birds, bats, and other animals.

Amenity

Designs using surface water management systems to help structure the urban landscape can enrich its aesthetic and recreational value, promoting health and well-being and supporting green infrastructure. Water managed on the surface rather than underground can help reduce summer temperatures, provide habitat for flora and fauna and act as a resource for local environmental education programmes and working groups and directly influence the sense of community in an area.

9.6.4 Suitable sustainable drainage system techniques

The hydraulic and geological characteristics of each property development site across Cotswold district should be assessed to identify the most appropriate forms of surface water management and any constraining factors to the utilisation of SuDS. These assessments are designed to inform the early-stage site planning process and should be followed up the site-specific detailed drainage assessments.

Appropriate SuDS techniques have been categorised into five main groups, as shown in Table 9.3, with further details provided on the Susdrain website (susdrain.org). Further site-specific investigation should be conducted to determine what SuDS techniques could be used on a particular development, informed by detailed ground investigations.

Table 9.3: Summary of SuDS Categories.

SuDS Type	Technique
Source Control	Green Roof, RwH, Pervious Pavements, Rain Gardens
Infiltration	Infiltration Trench, Infiltration Basin, Soakaway
Detention	Pond, Wetland, Subsurface Storage, Shallow Wetland, Extended Detention Wetland, Pocket Wetland, Submerged Gravel Wetland, Wetland Channel, Detention Basin
Filtration	Surface Sand filter, Sub-Surface Sand Filter, Perimeter Sand Filter, Bioretention, Filter Strip, Filter Trench
Conveyance	Dry Swale, Under-drained Swale, Wet Swale

9.6.5 Natural flood management

Natural Flood Management (NFM) is used to protect, restore, and re-naturalise the function of catchments and rivers to reduce flood risk. A wide range of techniques can be used that aim to reduce flooding by working with natural features and processes in order to store or slow down flood waters before they can damage flood risk receptors (e.g., people, property, infrastructure, etc.).

Techniques and measures, which could be applied in Cotswold district include:

- peatland and moorland restoration in upland catchments;
- offline storage areas;
- re-meandering streams;
- targeted woodland planting;
- reconnection and restoration of functional floodplains;
- restoration of rivers and removal of redundant structures;
- installation or retainment of large woody material in river channels;
- improvements in management of soil and land use; and
- creation of rural and urban SuDS.

In 2017, the EA published an online evidence base on working with natural processes to reduce flood risk 2024 (gov.uk) to support the implementation of NFM and with JBA produced maps showing locations with the potential for NFM measures[4]. These maps are intended to be used alongside the evidence directory to help practitioners think about the types of measure that may work in a catchment and the best places in which to locate them. There are limitations with the maps; however, it is a useful tool to help start dialogue with key partners.

4 Mapping the potential for working with natural process, Environment Agency and JBA (2017). Accessed online at: https://www.arcgis.com/home/item.html?id=7315f943998847e2b3797a85665f5438 on: 08/11/2024.

9.6.6 Multiple benefits of natural flood management

In addition to flood risk benefits, there are also significant benefits in other areas such as habitat provision, air quality, climate regulation and water quality.

Many NFM measures have the ability to reduce nutrient and sediment sources by reducing surface runoff flows from higher ground, reducing soil erosion, trapping sediment at the edge of agricultural land, or encouraging deposition of sediments behind natural dams upstream in watercourses.

Suitable techniques may include:

- leaky dams;
- woodland planting;
- buffer strips;
- runoff retention ponds; and
- land management techniques (soil aeration, cover crops etc.).

Case Study - Black Brook Slow the Flow

Four engineered log dams, see Figure 9.6, were installed on Black Brook at an estimated cost of £2,000, funded by Natural England and the EA to restore Stanley Bank SSSI. The scheme aimed to improve habitat and reduce the risk of flooding. However, the scheme also resulted in reduced levels of phosphate and nitrate in Black Brook, with phosphate concentrations falling by 3.6mg/l. By 2035, it is predicted that 792m^3 of sediment will be stored in three ponds retained by the dams.

Figure 9.6: Photograph of leaky dams at Black Brook.

Reproduced from Case Study 17. Black Brook Slow the Flow, St Helens, Norbury, Rogers and Brown, EA WwNP Evidence Base 2017. Photograph taken on 8 May 2015; courtesy of Matthew Catherall.

9.6.7 Integrated constructed wetlands

An integrated constructed wetland (ICW) is an artificial wetland created for the purpose of treating polluted water, whether this is municipal wastewater, grey water from residential properties, or agricultural runoff.

They are usually unlined, free surface flow wetlands, designed to contain and treat influents within emergent vegetated areas.

Defra carried out a systematic review of the effectiveness of various wetland types, including ICWs for mitigating agricultural pollution such as phosphate and nitrate. The overall conclusion was that all wetland types are very effective at reducing major nutrients and suspended sediments, with the exception of nitrite in ICWs. Nitrate is only reduced when passing through overland buffer strips and through constructed wetlands with vegetation, where the systematic review showed a mean reduction of 29% across the evidence included in the study. The mean reduction in Total Phosphorus across the evidence base was 78%. More information on this review can be accessed on the Natural Environment Research Council's open research archive (nora.nerc.ac.uk).

It needs to be noted that in some cases where phosphorus is especially high the effectiveness of removal may be less certain. Although the reduction in total phosphorus is beneficial, stakeholders need to ensure the excess nutrients are dealt with at source, such as storm overflows and at a policy level.

Other techniques to manage nutrients are possible such as catchment nutrient balancing, where excess nutrients are managed at a catchment level, as well as catchment permitting. These techniques are recommended where environmental capacity is restrictive to growth.
Severn Trent Water discusses plans for catchment nutrient balancing in their 2025-2030 Business Plan (stwater.co.uk).

Case Study - Frogshall ICW

The Upper River Mun in Norfolk was experiencing chronic pollution, and a loss in biodiversity in the river. Investigation found that nutrients from a WwTW upstream were contributing to this issue.

A pilot ICW was created consisting of three shallow ponds, filled with 18,000 emergent aquatic plants, and the outfall from the treatment works was diverted to pass through the wetland.

Early monitoring has shown that 90% of the phosphate is being removed by the wetland, and a large increase in biodiversity downstream observed.

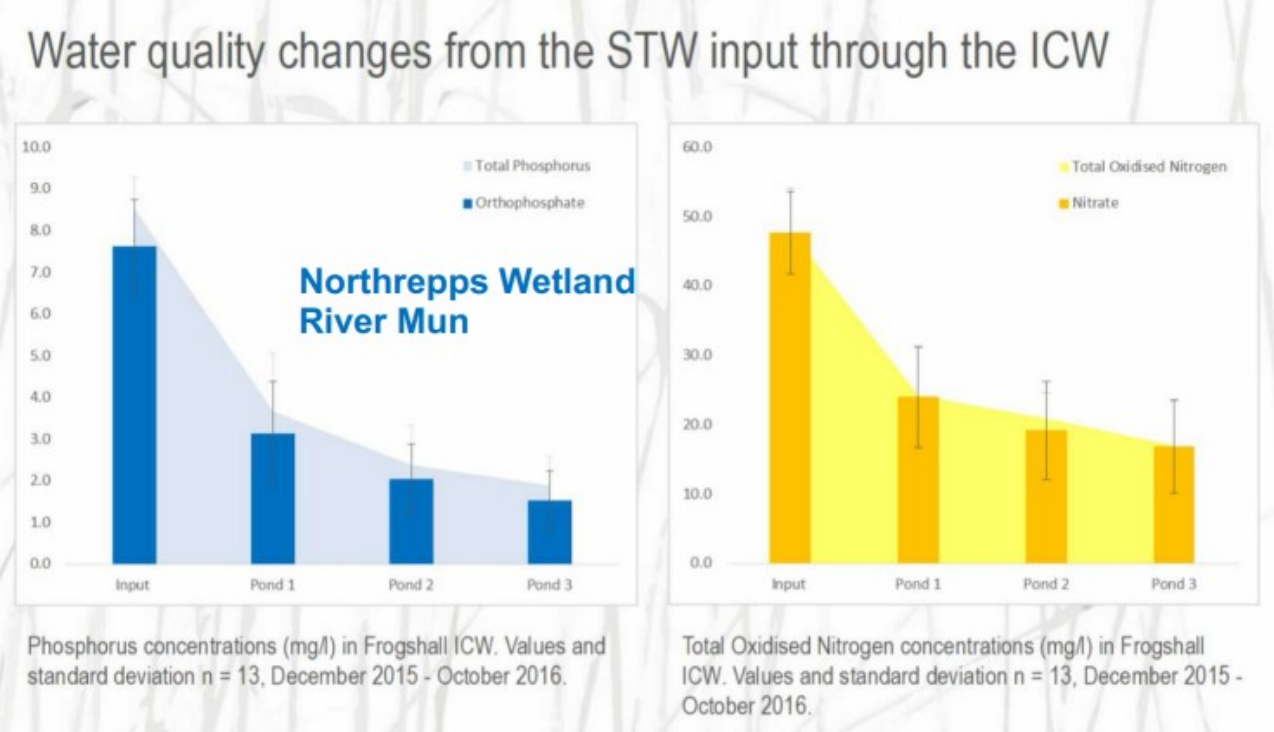

Figure 9.7: Graph of water quality changes

Reproduced from 'Stripping the Phosphate' (theriverstrust.org), a presentation by the Norfolk Rivers Trust (2018).

9.6.8 Agricultural management

The EA's RNAG database indicates that one of the reasons for some of the watercourses in the area are not meeting 'Good' WFD standards can be related to agriculture and rural land use. The cause of this includes pollution from fertilisers, manures, pesticides and soils washing into streams when it rains or percolating into the groundwater. Other pressures from agriculture include deepening, widening or re-routing of streams for land drainage, gravel removal and bankside erosion.

There is a big potential to improve water quality by interventions aimed at agricultural sources, especially considering the measures already taken by the water companies to reduce their contribution to phosphate load.

Potential schemes could include:

- buffer strips;
- cross slope tree planting;
- runoff retention basins;
- contour ploughing; and
- cover crops.

There is considerable overlap with NFM measures, and the challenges are also very similar. Exact impacts are difficult to measure, although modelling tools such as Farmscoper (adas.co.uk) exist to help with this. Once a scheme is implemented it

relies on the landowner to continue to maintain it in order to maintain the mitigation benefit.

Funding for agricultural interventions could come from Catchment Sensitive Farming or a Payment for Ecosystem Services approach.

Case Study - Wessex Water - EnTrade

Wessex Water catchment team used EnTrade to invite farmers to bid to grow cover crops over winter to reduce the nitrogen leaching into the watercourse.

This avoided the need to upgrade Dorchester WwTW to provide the same nitrogen removal capacity.

A trial auction was held in 2015, and two further auctions have since taken place attracting 557 bids from 63 farmers to save 153 tonnes of nitrogen.

Ruth Barden, Director of Environmental Strategy, Wessex Water, stated that "'Using EnTrade to create a market in measures to deliver reductions in nitrogen has delivered a 30% saving for Wessex Water compared to traditional catchment approaches."

9.6.9 Barriers

Whilst there are many benefits to implementing NFM and constructed wetlands, or modifying agricultural practises, the impact of these techniques is hard to quantify, and relies on ongoing maintenance to maintain that benefit. Where a potential scheme is not on a development site it will also require permission and support of the landowner. It may not be possible to influence this through planning policy.

9.7 Conclusions and recommendations

Cotswold district is supplied by four water companies—Bristol Water, Severn Trent Water, Thames Water and Wessex Water—across five Water Resource Zones (WRZs): Bristol Water (single zone), Forest and Stroud and Strategic Grid (Severn Trent Water), Swindon and Oxfordshire (SWOX; Thames Water), and Wessex Water Supply Area.

Within the WRZs serving growth over the Local Plan period and downstream of the district, there are 45 Sites of Special Scientific Interest (SSSIs) associated with waterbodies that are affected by surface water abstraction, identified as a significant water management issue, alongside 4 Ramsar sites, 11 Special Areas of Conservation (SACs) and 6 Special Protection Areas (SPAs). In addition, 290 groundwater-dependent terrestrial ecosystems (GWDTEs) are located within groundwater bodies where abstraction-related impacts on flows have also been identified as significant water management issues.

The water quality modelling results were used to identify the predicted deterioration in water quality in waterbodies adjacent to designated sites downstream of WwTWs serving growth during the Local Plan period. The results show there are no

significant deteriorations adjacent to environmental sites that cannot be prevented by improvements in treatment to TAL with the exception of the Cotswold Water Park SSSI downstream of Ampney St Peter WwTW.

As noted in the Water Quality chapter, Ampney St Peter is in the upper catchment discharging to a waterbody with High WFD status for Ammonia. Current performance of the WwTW is at or exceeding the technically achievable limit so there is no theoretical room for further improvement at the WwTW, the TAL scenario does not predict an improvement in water quality and the percentage deterioration compared to the baseline remains 14%. It remains at High WFD status.

SuDS are required on all development sites. Their design should consider both water quantity and water quality and site level investigations should be undertaken to define the most appropriate SuDS types for each specific development. Opportunities exist for these SuDS schemes to offer multiple benefits of flood risk reduction, amenity value and biodiversity.

CDC should be consulted at an early stage of development to ensure that SuDS are implemented and designed in response to site characteristics and policy factors. In the wider area, opportunities exist to implement NFM techniques to achieve multiple benefits of flood risk, water quality and habitat creation.

Recommendations for environmental constraints and opportunities are provided in Table 9.4.

Table 9.4: Recommendations for environmental constraints and opportunities.

at an early stage to maximise the benefits of the scheme. The design which should demonstrate all four areas of good SuDs design: quantity, quality, amenity, and biodiversity.		
Completed SuDs schemes should be accompanied by a maintenance schedule detailing maintenance boundaries, responsible parties and arrangements to ensure the SuDS are managed in perpetuity.	Developers	Ongoing
Work with developers to discourage connection of new developments into existing surface water and combined sewer networks. Prevent connections into the foul network, as this is a significant cause of sewer flooding.	CDC and developers	Ongoing
Opportunities for NFM that include schemes aimed at reducing/managing runoff should be considered to reduce nutrient and sediment pollution within CDC.	CDC, EA, Natural England	Ongoing

10 Conclusions and recommendations

10.1 Conclusions

Topic	Conclusion
Water resources	Water supply and wastewater services within the study area are provided by Bristol Water, Severn Trent, Thames Water and Wessex Water. Cotswold district is located across several water resource zones, but predominantly in Thames Water's SWOX WRZ. It is widely recognised that the climate is changing. In response, CDC declared a climate emergency in 2019. Climate change is predicted to increase pressure on water resources, increasing the potential for a supply-demand deficit in the future, and making environmental damage from over abstraction of water resources more likely. Furthermore, the delivery of water and wastewater services and the heating of water in the home require high energy inputs and therefore contribute directly to emissions of greenhouse gases. Water efficiency therefore reduces energy use and carbon emissions. It is important that new development does not result in an unsustainable increase in water abstraction. This can be done in a number of ways from reducing the water demand from new houses through to achieving water neutrality in a region by offsetting a new developments water demand by improving efficiency in existing buildings. The WINEP is a set of actions that the EA have requested all 20 water companies operating in England to complete in a particular AMP as part of their environmental commitments. A number of investigations are planned or underway to ensure that abstraction of water from both groundwater and rivers, is not leading to unsustainable reductions in flow. Development and population growth can increase abstraction, and so CDC have an opportunity to contribute to these actions indirectly by pursuing policies that promote water efficiency in new development. The National Water Resources Framework sets the objective to reduce the average per capita consumption in the UK to 110 l/p/d by 2050. This is now part of the Environmental Improvement Plan and water companies WRMPs. Within Defra's Plan for Water is the commitment to review Building Regulations and a target of 100 l/p/d in severely water stressed areas is suggested. The Future Homes Hub, who are supporting Defra to produce a roadmap to greater water efficiency propose a stages reduction in

Topic	Conclusion
	PCC, with a target of 100 l/p/d in water stressed areas in place from 2025, and a reduced target of 90 l/p/d in place by 2030 (depending on market conditions and customer acceptance). This study recommends that as a minimum the proposed new Building Regulations target of 100 l/p/d outlined in Defra's Plan for Water be adopted across the study area. This should be achieved using a fittings-based approach. The target would be subject to viability testing by the LPA. This should be supported by the requirement for non-household development to achieve three credits in the assessment category WAT01 of the Building Research Establishment Environmental Assessment Methodology (BREEAM) UK New Construction Standard.
Water supply infrastructure	TW provided a site-by-site assessment of potential allocations in their supply area. This identified 15 sites where further modelling by TW would definitely be required, and a further 20 where modelling may be required, in both cases, upgrades to the water supply network may be needed to accommodate development. Upgrades to the local supply network would be funded as part of the developer Infrastructure Charge. Early engagement between developers, CDC and the water companies is recommended to ensure upgrades are in place prior to occupation
Wastewater collection	Thames Water is the primary water and wastewater provider and the designated sewerage undertaker for the study area. Wessex Water, and Severn Trent Water also operate within small parts of the area. Development in areas where there is limited wastewater network capacity will increase pressure on the network, increasing the risk of a detrimental impact on customers, and increasing the likelihood of storm overflow operation. Early engagement with developers, Thames Water, Wessex Water and Severn Trent Water is required, and modelling of the network may be required at the planning application stage. Where network capacity constraints are identified, network reinforcement may be required which would be funded as part of the developer infrastructure charge. It may be necessary for development sites to be phased in line with the provision of any network upgrades. The drainage network includes 14 storm overflows that are likely to serve the study area. Storm overflow performance is generally poor with nine of these overflows currently exceeding the threshold for

Topic	Conclusion
	investigation. The poorest performing of these is at Avening WwTW, with a 3- year operation average of 128 spills per year. 2024 was a particularly bad year, in part because it was a wetter than average year. This was not the case in 2023 and 2025 when many of the storm overflows also operated well above the threshold. Further development in catchments where there are poorly performing overflows increase the risk of storm overflow operation due to increased sewage flows and surface runoff. There are opportunities through the planning system to ease pressure on the wastewater network by separating foul and storm flow in existing combined systems and not allowing new surface water connections. Surface water can also be better managed by retrofitting SuDS in existing residential areas, and in new development, ensuring SuDS are incorporated into designs at the master planning stage to maximise the potential benefits.

Topic	Conclusion
Wastewater treatment	There are 25 WwTWs that are within the Cotswold district or outside but serving a population within Cotswold district. Of these, twelve are expected to serve growth during the Local Plan period. Five WwTW are expected to have capacity for growth during the plan period and will not require further upgrades for capacity. Seven WwTWs are expected to exceed their permit limit during the Local Plan period, or be close to their permit limit by the end of the plan period. Where an increase in capacity may be required, sufficient time is needed for the water company to plan and deliver the upgrade scheme. This would typically be planned for delivery in the next AMP period. i.e., a need to upgrade a WwTW would be identified in DWMP28 for inclusion in the PR29 business plan and delivered between 2030 and 2035. There may therefore be a constraint to growth at WwTWs that are already at their permit limit and do not have upgrades planned within this AMP period. Beyond 2030, there should be sufficient time once the Local Plan is adopted for water companies to provide additional capacity where required. It is strongly advised that CDC discuss the phasing of potential allocations with TW, STW and WW early in the Local Plan period to allow infrastructure upgrades to be planned to provide capacity when it is required. The odour screening assessment identified eight potential allocations that are close enough to a WwTW that an odour impact assessment would be recommended. This would be funded by the developer.
Water quality	The EA's Reasons for Not Achieving Good (RNAG) dataset indicates that sewage treatment, the urban and transport sectors (urban development), as well as agriculture and rural land management, are the main reasons for watercourses not achieving good status in this area. Growth during the Local Plan period is predicted to cause a significant deterioration in water quality downstream of seven WwTWs (six have a greater than 10% deterioration in one or more determinands, and one has a deterioration in WFD class). With the exception of Ampney St Peter, Fairford and Moreton-In-Marsh WwTWs, all of these deteriorations can be prevented by upgrades to treatment processes. At Ampney St Peter, Fairford and Moreton-In-Marsh WwTWs, a greater than 10% deterioration is predicted for Ammonia and BOD

Topic	Conclusion
	which is not prevented in the modelling scenario where upgrades to WwTWs are applied. This is because these WwTWs are situated in an area where the current WFD classification for ammonia is "High" (i.e., the best water quality) and is operating either beyond or close to the technically achievable limit. Under these circumstances, a high percentage deterioration in water quality is expected, and as there is no theoretical room for further improvement at the WwTW, the TAL scenario does not predict an improvement in water quality and the percentage deterioration compared to the baseline remains high. No change in WFD classification is predicted, and High status is maintained for Ammonia and BOD. The WCS therefore does not consider this a constraint to growth. The water quality modelling indicates that growth alone will not prevent good ecological status being prevented in the future should improvements in upstream water quality be made. Where a WwTW is shared with a neighbouring authority, coordination of growth plans in collaboration with Thames Water, Severn Trent Water and Wessex Water provide is essential to ensure that infrastructure is in place prior to development to prevent a breach of the environmental permit.

Environmental opportunities and constraints	Cotswold district is supplied by four water companies—Bristol Water, Severn Trent Water, Thames Water and Wessex Water—across five Water Resource Zones (WRZs): Bristol Water (single zone), Forest and Stroud and Strategic Grid (Severn Trent Water), Swindon and Oxfordshire (SWOX; Thames Water), and Wessex Water Supply Area. Within the WRZs serving growth over the Local Plan period and downstream of the district, there are 45 Sites of Special Scientific Interest (SSSIs) associated with waterbodies that are affected by surface water abstraction, identified as a significant water management issue, alongside 4 Ramsar sites, 11 Special Areas of Conservation (SACs) and 6 Special Protection Areas (SPAs). In addition, 290 groundwater-dependent terrestrial ecosystems (GWDTEs) are located within groundwater bodies where abstraction-related impacts on flows have also been identified as significant water management issues. The water quality modelling results were used to identify the predicted deterioration in water quality in waterbodies adjacent to designated sites downstream of WwTWs serving growth during the Local Plan period. The results show there are no significant deteriorations adjacent to environmental sites that cannot be prevented by improvements in treatment to TAL with the exception of the Cotswold Water Park SSSI downstream of Ampney St Peter WwTW. As noted in the Water Quality chapter, Ampney St Peter is in the upper catchment discharging to a waterbody with High WFD status for Ammonia. 	exist to implement NFM techniques to achieve multiple benefits of flood risk, water quality and habitat creation.

10.2 Recommendations

Topic	Recommendation	Responsibility	Timeframe
Water resources	Continue to regularly review forecast and actual household growth across the supply region through WRMP Annual Update reports, and where significant change is predicted, engage with LPAs.	All water companies; Severn Trent, Thames Water and Wessex Water	Ongoing
Water resources	Provide yearly profiles of projected housing growth to water companies to inform the WRMP update.	All water companies and CDC	Ongoing
Water resources	The Council adopts a policy requiring a water efficiency target of 100 l/p/d in their joint Local Plan and allow for a reduction in this target to 90 l/p/d from 2030. This should be achieved using a fittings-based approach. This should be aligned with a robust enforcement approach to ensure that correct fixtures and fittings are being installed at site level.	CDC	In the CDC Local Plan
Water resources	Use planning policy to require new build non-residential development to achieve at least three credits in the Wat01 Measure for water in the BREEAM New Construction standard.	CDC	In the CDC Local Plan
Water resources	The concept of water neutrality or water positive development has the potential to provide a benefit in improving resilience to climate change and enabling all waterbodies to be brought up to 'Good' status. Explore further with the water companies and the EA how the Council's planning and climate change policies can encourage this	CDC, all water companies, and the EA	In the CDC Local Plan

Topic	Recommendation	Responsibility	Timeframe
	approach. This approach could have application in strategic sites and new settlements.		
Water resources	Continue to regularly review forecast and actual household growth across the supply region through WRMP Annual Update reports, and where significant change is predicted, engage with LPAs.	All water companies	Ongoing
Water supply infrastructure	Undertake network modelling to ensure adequate provision of water supply is feasible.	Thames Water and Bristol Water and CDC	Ahead of planning applications
Water supply infrastructure	CDC and developers should engage early with water companies to ensure supply infrastructure is in place prior to occupation.	Thames Water and Bristol Water and CDC developers	Ongoing
Water supply infrastructure	Developers should engage early with water companies to ensure that the capacity of distribution systems is adequate prior to development coming forward.	Thames Water and Bristol Water and CDC developers	Ongoing
Wastewater collection	Early engagement between CDC and water companies is required to ensure that where strategic infrastructure is required, it can be planned in by STW, TW or WW and will not lead to any increase in discharges from sewer overflows.	CDC, STW, TW, WW	Ongoing
Wastewater collection	Take into account wastewater infrastructure constraints in phasing development in partnership with the sewerage undertaker.	CDC, STW, TW, WW	Ongoing

Topic	Recommendation	Responsibility	Timeframe
Wastewater collection	Developers will be expected to work with the sewerage undertaker closely and early in the planning promotion process to develop an Outline Drainage Strategy for sites. The Outline Drainage strategy should demonstrate the wastewater assets required, their locations including points of connection to the public foul sewerage, whether the site drainage will be adopted by the water company and if any sewer requisitions will be required.	CDC, STW, TW, WW	Ongoing
Wastewater collection	Developers will be expected to demonstrate to the LLFA that surface water from a site will be disposed using a SuDS with connection to surface water sewers seen as the last option. New connections for surface water to foul sewers will be resisted by the LLFA.	CDC, LLFA, developers	Ongoing
Wastewater treatment	Early engagement with STW, TW and WW is required to ensure that provision of WwTW capacity is aligned with delivery of development.	CDC	Ongoing
Wastewater treatment	Continue to provide Annual Monitoring Reports to STW, TW and WW detailing projected housing growth.	CDC	Ongoing
Wastewater treatment	STW, TW and WW to assess growth demands as part of their wastewater asset planning activities and feedback to the Council if concerns arise.	STW, TW, WW	Ongoing
Wastewater treatment	Consider odour risk in the sites identified to be potentially at risk from nuisance odour.	CDC, Developers	Ongoing

Topic	Recommendation	Responsibility	Timeframe
Wastewater treatment	Carry out an odour assessment for site identified as being at risk of nuisance odour.	Developers	Ongoing
Water quality	Provide annual monitoring reports to Thames Water, Severn Trent Water and Wessex Water detailing projected housing growth in the Local Authority.	CDC	Ongoing
Water quality	Take into account the full volume of growth (from CDC and neighbouring authorities) within the catchment.	CDC, Thames Water, Severn Trent Water and Wessex Water	Ongoing
Environmental opportunities and constraints	Consider the environmental impact of development on protected sites downstream of receiving WwTW in the habitat's regulations assessment.	CDC	Local Plan preparation
Environmental opportunities and constraints	The Local Plan should include policies that require all development proposals with the potential to impact on areas with environmental designations to be considered in line with the relevant legislation and where stated, in consultation with Natural England (for national and international designations and priority habitats).	CDC	In the CDC Local Plan
Environmental opportunities and constraints	The Local Plan should include policies that require development sites to adopt SuDS to manage water quality of surface runoff.	CDC	In the CDC Local Plan
Environmental opportunities and constraints	In partnership, identify opportunities for incorporating SuDS into open spaces and green infrastructure, to deliver strategic flood risk management and meet WFD water quality targets.	CDC, Severn Trent Water, TW, WW, EA	Ongoing

Topic	Recommendation	Responsibility	Timeframe
Environmental opportunities and constraints	Developers should include the design of SuDS at an early stage to maximise the benefits of the scheme. The design should demonstrate all four areas of good SuDs design: quantity, quality, amenity, and biodiversity	Developers	Ongoing
Environmental opportunities and constraints	Completed SuDs schemes should be accompanied by a maintenance schedule detailing maintenance boundaries, responsible parties and arrangements to ensure the SuDS are managed in perpetuity.	Developers	Ongoing
Environmental opportunities and constraints	Work with developers to discourage connection of new developments into existing surface water and combined sewer networks. Prevent connections into the foul network, as this is a significant cause of sewer flooding.	CDC and developers	Ongoing
Environmental opportunities and constraints	Opportunities for NFM that include schemes aimed at reducing/managing runoff should be considered to reduce nutrient and sediment pollution within CDC.	CDC, EA, Natural England	Ongoing
Environmental opportunities and constraints	Consider the environmental impact of development on protected sites downstream of receiving WwTW in the habitat's regulations assessment.	CDC	Local Plan preparation

B WINEP

B.1 Driver Code

- **U_MON3** - Urban Waste Water treatment Regulations - Monitoring Emissions to Air, Land and Water (MCERTS) certified Flow Pass Forward (FPF) overflow operation monitoring at WwTW or last in line Sewage Pumping Station (SPS) overflows.
  - **U_MON3a** - MCERTS certification of an AMP7 U_MON3 driver output overflow operation monitor.
  - **U_MON 3b** - MCERTS certified overflow operation monitor.
- **U_MON4** - Urban Waste Water treatment Regulations - MCERTS certified FPF flow monitoring at WwTW or last in line SPS overflows.
  - **U_MON4a** - Move AMP7 U_MON4 driver output to 2-minute flow monitoring.
  - **U_MON4b** - Move AMP7 U_INV2 driver output to 2-minute flow monitoring.
  - **U_MON4c** - PR24 U_MON4 from U_INV2 investigation.
  - **U_MON4d** - MCERTS certified Flow passed forward flow monitor
  - **U_MON4e** - MCERTS certified Flow passed forward flow monitor including civils.
- **EnvAct_IMP4** - Improvements to reduce storm overflows spills so that they do not discharge above an average of ten rainfall events per year by 2050.
- **EnvAct_INV4** - Investigations to reduce storm overflow spills to protect the environment so that they have no local adverse ecological impact.
- **WFD_IMP** - Implementation of actions to improve water quality in terms of relevant WFDR status objectives.
  - The driver WFD_IMP should have a suffix letter applied to indicate what target the measure is aimed at achieving: the status objective standard. The following are to be used:
  - h – measure to meet High status for the element
  - g – measure to meet Good status for the element
  - m – measure to meet Moderate status for the element
  - p – measure to meet Poor status for the element.

- Potential changes to current water body objectives, as a result of PR24 planning, may be included in the 2027 river basin management plans.
- Where a water company is willing to do more for WFDR than is required then the work should be represented on the WINEP with two driver codes; one WFD_IMP driver code to reflect the statutory work and one 25 Year Environment Plan driver code (25YEP_IMP) to reflect the discretionary work. Please see the separate driver guidance on the 25 Year Environment Plan driver.
- If we know that a water company is going to implement an action, irrespective of our economic appraisal, then we should include that action in the programme of measures and build the expected outcome into the water body objective.

- **WFD_NDLS_Chem1 -** Measures related to load standstill requirements for chemicals (where Environmental Quality Standards (EQS) exceedance is predicted, but measures fail economic assessments associated with EQS).
- **WFD_NDLS_Chem2** - Measures related to load standstill requirements for chemicals (below EQS). These are set where a WwTW is discharging significant concentrations of a chemical, but the EQS is not threatened immediately downstream. Targets are set to ensure that current effluent quality does not deteriorate and to contribute to broader aims to cease and phase out emissions, discharges and losses of priority hazardous substances and prevent pollution swapping. This driver would be used where there is no risk that growth between 2015 and 2021 would cause an actual failure of the EQS.
- **WFD_IMP_CHEM** - To meet either good ecological status or good chemical status. Needed where an EQS is exceeded downstream of a WwTW discharge. Measures that fail economic tests will receive standstill limits under WFD_NDLS_CHEM1.
- **WFD_ND_WRFlow** - Action to protect/ensure no deterioration in status (surface water).
- **WFDGW_INV** - Groundwater good status improvement action relating to water resource or water quality.
- **EDWRMP_INV** - Investigations, options appraisals or feasibility studies for measures identified within the WRMP to meet regional planning requirements that do not fit with WFD driver requirements.

PART 1: INTRODUCTION

A Playing Pitch Strategy (PPS) has been commissioned by Cotswold District Council (CDC), to assess playing pitch and outdoor sport facility needs. This report provides the Strategy for Cotswold.

Building upon the preceding Assessment Report, this Strategy & Action Plan provides a clear, strategic framework for the maintenance and improvement of existing playing pitch and accompanying ancillary facilities up to 2031 (in line with the Local Plan review). It has been developed to provide:

- A vision for the future improvement and prioritisation of playing pitches and outdoor sports facilities.
- A number of aims to help deliver the recommendations and actions.
- A series of strategic recommendations which provide a strategic framework for the improvement, maintenance, development and, as appropriate, rationalisation of the playing pitch and outdoor sport facility stock.
- A series of sport by sport recommendations which provide a strategic framework for sport led improvements to provision.
- A prioritised area-by-area Action Plan to address key issues on a site-by-site basis.

The Strategy is delivered in accordance with Sport England's Playing Pitch Strategy (PPS) Guidance (for playing pitch sports) and Sport England's Assessing Needs and Opportunities Guide (for "non-pitch" sports). Sport England's PPS Guidance details a stepped approach, separated into five distinct sections:

- Stage A: Prepare and tailor the approach.
- Stage B: Gather information and views on the supply of and demand for provision.
- Stage C: Assess the supply and demand information and views.
- Stage D: Develop the Strategy.
- Stage E: Deliver the Strategy and keep it robust and up to date.

This report represents Stage D of the process, with stages A-C covered in the preceding Assessment Report and Stage E ongoing once the study is complete. The lifespan of a PPS is considered to be three years, although this can be increased if it updated.

A PPS delivers the evidence required to ensure that sufficient land is available to meet existing and projected future outdoor sport requirements. Its robust evidence base should inform and be implemented into planning policy and other relevant corporate strategies to enable local policies, planning and sport development criteria to work efficiently and effectively. It is capable of:

- Providing a clear framework for all playing pitch and outdoor sport providers, including the public, private and third sectors.
- Clearly addressing the needs of all identified sports within the area, highlighting particular local demand issues.
- Addressing issues of population growth and major growth/regeneration areas.
- Addressing issues of cross boundary facility provision.
- Addressing issues of accessibility, quality and management with regard to facility provision.
- Standing up to scrutiny at a public inquiry as a robust study.
- Supporting funding applications.
- Providing realistic aspirations which are implementable within the local authority's budgetary position and procurement regime.

The Strategy and Action Plan recommends several priority projects relating to sports provision which should be realised over the Local Plan period. It provides a framework for improvement and, although resources may not currently be in place to implement it, potential partners and possible sources of external funding.

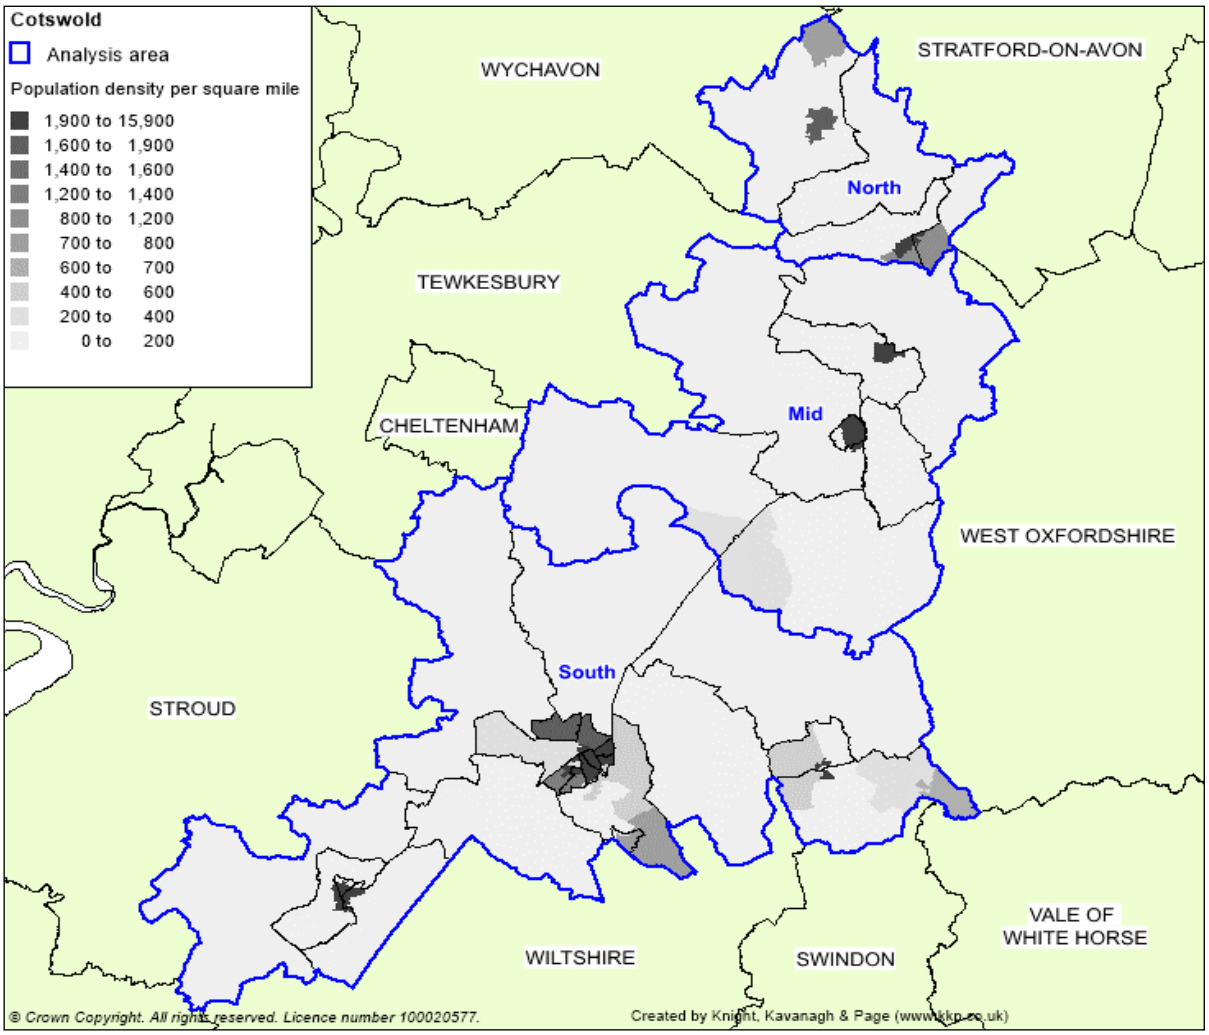
Partner organisations have a vested interest in ensuring that existing playing pitches, outdoor sports facilities and ancillary provision are protected and enhanced. As such, many of the objectives and actions within this document need to be delivered and implemented by a wide range of bodies such as National Governing Bodies of Sport (NGBs), sports organisations, education establishments and parish/town councils. In many instances, Cotswold District Council will not be the organisation which delivers these actions or recommendations as the PPS is not just for the Council to act upon. It applies to/for all the stakeholders and partners involved.

Scope

The following are the key pitch sports in the Cotswolds and as such are included within the scope of this report:

- Cricket
- Football
- Third generation artificial grass pitches (3G pitches)
- Rugby union
- Rugby league
- Hockey (artificial grass pitches)
- Polo

Study area



The study area comprises the whole of Cotswold District Council's administrative area which has been broken into smaller subsections known as analysis areas. The specific ward boundaries of these three analysis areas can be found in the preceding Assessment Report.

- North Area
- Mid Area
- South Area

Cross boundary issues have been explored to determine the level of imported and exported demand, recognising, for example, that people travel to and make use of strategic facilities irrespective of administrative boundaries.

The analysis areas and population density are shown in figure 1.1.

Figure 1.1: Analysis areas

Local context

The new Cotswold PPS will form part of the evidence base for the Local Plan (2011-2031). The main reasons for updating the Cotswold PPS are:

- To align with the other two Publica Authorities. Therefore, increasing alignment of studies which will provide the opportunity for long term efficiencies in terms of Officer resources, procurement and finance.
- To contribute to the partial update of the adopted Local Plan 2031.
- To inform the development and implementation of planning policy and infrastructure planning work.
- To provide a robust and up to date evidence base to assist the Council in determination of planning applications in the provision or loss of playing pitches.
- To provide justification and evidence base for developer contributions and external funding bids involving playing pitches, an up to date PPS would be a requirement of any investment from organisations such as the Football Foundation.
- To identify opportunities for improving access to playing pitches, whilst supporting the delivery ambitions contained in the Corporate Plan (supporting health and wellbeing and making the local plan green to the core), the Strategic Outcomes Planning Model (Leisure Strategy), sporting governing bodies' objectives and partial update to the Local Plan 2031

Cotswold Corporate Strategy (2020-2024)

The Cotswold Corporate Strategy recognises and embraces the challenges facing the district and states its aims and ambitions. It is underpinned by a set of action plans that describe in detail how we plan to deliver these ambitions. Of these, one of the key principles is to support the health and wellbeing of the district's residents. It sets out the following five aims to achieve this:

- Encourage resilient, well-connected and active communities that take responsibility for their own health and wellbeing goals.
- Promote both mental and physical health equally, to increase awareness of mental health issues and improve the community response to people in crisis.
- Promote healthy lifestyles, fun and self-care for all ages.
- Ensure our housing and built environments enable residents to live healthy lives.

National context

Paragraphs 98 of the NPPF states that Planning policies should be based on robust and up-to-date assessments of the need for open space, sport and recreation facilities (including quantitative or qualitative deficits or surpluses) and opportunities for new provision. Information gained from the assessments should be used to determine what open space, sport and recreational provision is needed, which plans should then seek to accommodate as relevant.

Paragraph 99 of the NPPF discusses assessments and the protection of "existing open space, sports and recreational buildings and land, including playing fields". Paragraphs 101 and 102 also promote the identification of important green spaces by local communities and the protection of these facilities. Such spaces may include playing fields.

An up-to-date PPS will form a key element of the Council's evidence base to support its emerging health and well-being policies and the Local Plan as a whole.

This may provide opportunities to develop new playing pitches or improve the quality of existing playing pitches in Cotswold in response to housing developments that create additional demand for pitches (as well as the accompanying ancillary offer). Any requirement would be calculated by using the Sport England Playing Pitch Calculator[1]. Where possible, this will be aligned to existing community sport clubs in Cotswold which already play an integral part in providing sport and physical activities to the local community.

Headline findings

Table 1.1 below highlights the quantitative headline findings identified for all main pitch sports included in the preceding Assessment Report. MES stands for match equivalent sessions and has been used as the comparable unit for natural grass pitches. Converting both the amount of play a site can accommodate (its carrying capacity) and how much play takes place there (its current use) into the same unit of demand enables a comparison to be undertaken.

The position on future demand is established through ONS projections (2031) and through a mixture of consultation feedback from community clubs in the district and information provided by the relevant national governing bodies of sport. Full details of this can be found in the preceding Assessment Report.

[1] Link to Sport England Sport Playing Pitch Calculator

Pitches have a limit of how much play they can accommodate over a certain period of time before their quality, and in turn their use, is adversely affected. As the main usage of pitches is for matches, it is appropriate for the comparable unit to be match equivalent sessions.

Based on how they tend to be played, this unit for football and rugby union pitches relates to a typical week within the season for each sport. For cricket pitches it is appropriate to look at the number of match equivalent sessions over the course of a season. How much play a cricket pitch can accommodate is primarily determined by the number and quality of wickets on a pitch. Only one match is generally played per pitch per day. However, play is rotated across the wickets to reduce wear and allow for repair. Each wicket is able to accommodate a certain amount of play per season as opposed to a week.

The Sport England PPS guidance does not advocate the conversion of MES to pitches as there is not always a case for providing pitches to meet the demand/shortfalls expressed. For example, improving the quality of pitches can also increase the capacity of existing pitches to accommodate such demand. For qualitative findings and site-specific findings, please see Part 4: Sport Specific Recommendations and Scenarios, and Part 6: Action Plan.

For artificial surfaces (AGPs/3G pitches), how much play can be accommodated is primarily determined by availability, rather than how much play it can accommodate before its quality is adversely affected as with natural grass pitches. Therefore, whole pitches are used as the comparable unit. Similarly, for the other non-pitch sports (i.e., tennis, netball bowls etc) where it is not as easy to determine carrying capacity, whole facilities are used as the comparable unit.

Table 1.1: Quantitative headline findings (pitch sports)

Sport	Analysis area	Pitch type	Current supply/ demand balance (match equivalent sessions)	Future supply/ demand balance (match equivalent sessions)
Football (grass pitches)	North	Adult	At capacity	At capacity
		Youth 11v11	Spare capacity of 1	Spare capacity of 0.5
		Youth 9v9	At capacity	At capacity
		Mini 7v7	At capacity	At capacity
		Mini 5v5	Spare capacity of 1	Spare capacity of 1
	Mid	Adult	At capacity	At capacity
		Youth 11v11	Spare capacity of 1	Spare capacity of 0.5
		Youth 9v9	Shortfall of 0.5	Shortfall of 0.5
		Mini 7v7	At capacity	At capacity
		Mini 5v5	At capacity	Shortfall of 1
	South	Adult	Shortfall of 1	Shortfall of 2
		Youth 11v11	Shortfall of 2.5	Shortfall of 5.5
		Youth 9v9	Spare capacity of 3.5	Spare capacity of 3
		Mini 7v7	Spare capacity of 2.5	Spare capacity of 2.5
		Mini 5v5	At capacity	Shortfall of 1
Football (3G pitches)[2]	North	Full size (Minimum dimensions 91 x 55m)	Shortfall of 0.5	Shortfall of 0.5
	Mid		Shortfall of 1	Shortfall of 1
	South		Shortfall of 1.25	Shortfall of 1.75
	North	Saturday	Spare capacity of 40	Spare capacity of 40

[2] Based on accommodating 38 teams on one full size pitch.

Sport	Analysis area	Pitch type	Current supply/ demand balance (match equivalent sessions)	Future supply/ demand balance (match equivalent sessions)
Cricket[3]		Sunday	Spare capacity of 40	Spare capacity of 40
		Midweek	Spare capacity of 88	Spare capacity of 88
	Mid	Saturday	Spare capacity of 48	Spare capacity of 48
		Sunday	Spare capacity of 60	Spare capacity of 60
		Midweek	Spare capacity of 114	Spare capacity of 114
	South	Saturday	Shortfall of 9	Shortfall of 9
		Sunday	Spare capacity of 27	Spare capacity of 27
		Midweek	Spare capacity of 75	Spare capacity of 75
Rugby union	North	Senior	At capacity	At capacity
	Mid		Shortfall of 3.25	Shortfall of 3.25
	South		Shortfall of 2.5	Shortfall of 2.5
Rugby league	Cotswold	Senior	No demand so no provision required	No demand so no provision required
Polo	Cotswold	-	Sufficient supply	Sufficient supply
Hockey (sand AGPs)	Cotswold	Full size (Minimum dimensions of 97.4 x 59m)	Sufficient supply	Sufficient supply, but a requirement for quality improvements.

Conclusions

From a quantitative perspective, the existing position for each sport is either that demand is being met or that there is a shortfall. Where shortfalls exist, these are currently small but are expected to be exacerbated in the future (based on increases in demand for each sport).

Where shortfalls do not currently exist, particularly for football, it is anticipated that over the Local Plan period that shortfalls will emerge, but at levels which are manageable and that can be theoretically be addressed through pitch improvements of existing provision, rather than the need for providing additional pitches.

Shortfalls are identified for 3G pitches, and these shortfalls cannot be addressed unless this type of pitch is approved and constructed within the District.

Hockey demand within Cotswold is currently adequately catered for. However, the existing pitches at both The Cotswold School and the Royal Agricultural University are due to fall out of use over the lifespan of the PPS and shall require surface replacements.

There are capacity deficiencies for rugby union which are expected to increase in the future. It is expected issues associated to this can be alleviated through quality improvements and the development of new provision expected to be established during the lifespan of the PPS.

Across all sports where demand is being met, this does not necessarily equate to a surplus of provision, with any spare capacity instead spare capacity is considered to be a solution to

[3]Future demand for cricket has been applied on a district wide level and cannot be allocated to the used catchments. It anticipates a growth of seven senior men's cricket teams putting additional pressure on the Saturday peak time period.

overcoming current or future shortfalls. There is a resultant need to protect all existing outdoor sport provision until all demand is met, or there is a requirement to replace provision in accordance with the National Planning Policy Framework (NPPF) and Sport England's Playing Fields Policy.

For the most part, the shortfalls identified can be met by better utilising current provision, such as through improving quality, re-configuration, installing additional sports lighting, improving ancillary facilities or enabling access to existing unused provision, such as at unavailable school sites. However, there is a shortfall of 3G pitches that can likely only be met through increased provision. With resources to improve the quality of grass pitches being limited, particularly at sites managed by parish and town councils, an increase in such provision could also help reduce grass pitch shortfalls through the transfer of play, which in turn can reduce overplay and aid pitch quality improvements.

PART 2: VISION

Vision

A vision has been set out to provide a clear focus with desired outcomes for the Playing Pitch Strategy.

> "To ensure that there are enough playing pitches and related facilities in Cotswold District of the right type, the right quality and in the right place to meet the needs" of the residents of the District now and in the future."

To achieve this vision the PPS will deliver the following objectives:

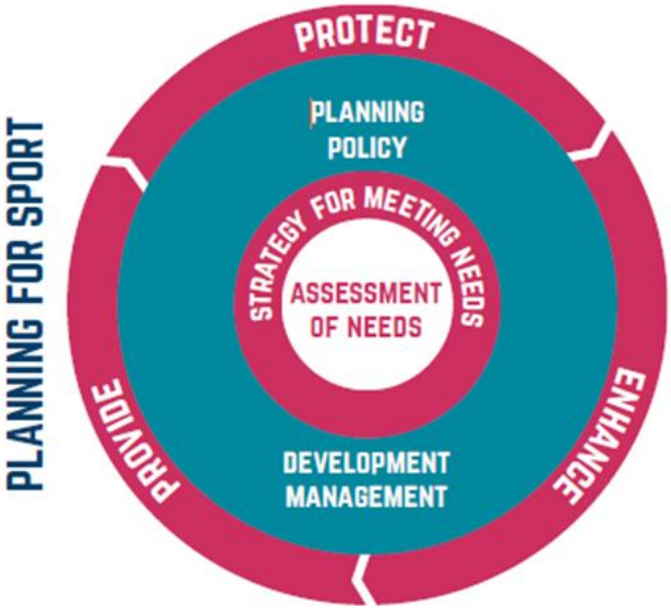
- Ensure that all valuable facilities are protected for the long-term benefit of sport.
- Promote a sustainable approach to the provision of playing pitches and management of sports clubs.
- Ensure that there are enough facilities in the right place to meet current and projected future demand.
- Ensure that all clubs have access to facilities of appropriate quality to meet current needs and longer-term aspirations.

PART 3: AIMS

The following overarching aims are based on the three Sport England objectives. It is recommended that they are adopted by the Council and partners to enable delivery of the overall PPS vision and Sport England planning objectives.

AIM 1

To **protect** the existing supply of outdoor sport facilities where it is needed to meet current and future needs.



AIM 2

To **enhance** outdoor sport facilities and ancillary facilities through improving quality and management of sites.

AIM 3

To **provide** new outdoor sport facilities where there is current or future demand to do so.

Figure 3.1: Sport England objectives

Source: Sport England, Planning for Sport Guidance (June 2019)

PART 4: SPORT SPECIFIC ISSUES SCENARIOS AND RECOMMENDATIONS

In this section, in order to help develop recommendations and actions for each sport, and to understand their potential impact, a number of relevant scenario questions are tested against the key issues identified in the preceding Assessment Report for each sport. This then informs sport specific recommendations.

Football – grass pitches

Assessment Report summary

Football – grass pitch summary

- The current supply of football provision is broadly sufficient in accommodating football demand on mini pitches and youth 9v9 pitches.
- Comparatively, adult and youth 11v11 pitches are showing a combined overplay of 2.5 MES.
- Future demand through team generation rates creates a shortfall of two match equivalent sessions per week.

Grass football pitch supply:

- The audit identifies a total of 116 grass football pitches across 55 sites. Of these, 90 are available, at some level, for community use across 37 sites. All unavailable pitches are located at education sites, the Duke of Gloucester Barracks and the Fire Service College Leisure Hub.

Grass football pitch quality:

- Of the 90 pitches which offer community use, 27 pitches are assessed as good quality, 38 as standard quality and 25 as poor quality. The identified good quality pitches are located at seven sites, those being Baunton Lane Playing Field, Cirencester Deer Park School, Corinium Stadium, Fairford Town FC, Horcott Road Playing Fields, Moreton Rangers FC and Royal Agricultural University.

Affiliated football demand:

- Through the audit and assessment, 157 teams from 35 clubs are identified as playing in Cotswold. This consists of 34 adult men's, one adult women's, 70 youth boys', three youth girls and 49 mini mixed teams.
- Future demand equates to the growth of two adult, nine youth boys' teams and two mini mixed teams based on team generation rates. Club growth ambitions of 17 teams have been discounted.
- The PPS Strategy & Action Plan will contain a housing growth scenario that will estimate the additional demand for football arising from housing development.

Supply vs demand analysis conclusions:

- There is broadly a sufficient supply of provision in Cotswold to accommodate demand on youth 9v9, mini 7v7 and mini 5v5 pitch types.
- There are existing shortfalls on adult and youth 11v11 pitches.
- Future demand exacerbates shortfalls on adult and youth 11v11 pitches and makes mini 5v5 pitches played at capacity, to give an overall picture of four MES of overplay for the District.
- There is spare capacity for youth 9v9 and mini 7v7 pitches both now and in the future.

Scenarios

Alleviating overplay/improving pitch quality

In total there are 10 pitches overplayed in Cotswold across nine sites, with overplay equating to 10.5 match equivalent sessions per week. Improving quality of these pitches (i.e., through increased maintenance or improved drainage) will increase capacity at the sites and consequently reduce both current and future shortfalls.

To illustrate the above, Table 4.1 highlights the current levels of overplay that would be alleviated if quality improved to good at each site. As a reminder, the capacity rating for each type and quality rating as detailed in the table below:

Adult pitches		Youth pitches		Mini pitches	
Pitch quality	**Matches per week**	**Pitch quality**	**Matches per week**	**Pitch quality**	**Matches per week**
Good	3	Good	4	Good	6
Standard	2	Standard	2	Standard	4
Poor	1	Poor	1	Poor	2

Table 4.1: Overplay if all pitches were good quality (match equivalent sessions)

Site ID	Site name	Analysis area	Current quality	Pitch type	No. of pitches	Capacity rating (MES)	Good quality rating (MES)
9	Blockley Sports & Social Club	North	Poor	Adult	1	0.5	1.5
11	Bourton Rovers Football & Social Club	Mid	Standard	Adult	1	0.5	0.5
12	Bourton Vale Cricket Club	Mid	Standard	Youth 11v11	1	0.5	1.5
13	Charlton Rovers AFC (Shipton Playing Fields)	Mid	Standard	Youth 9v9	1	1	1
36	Fairford RFC	South	Poor	Youth 11v11	1	0.5	2.5
48	Kingshill Sports Complex	South	Standard	Youth 11v11	2	2	2
62	Shipton Moyne Rec Ground	South	Standard	Adult	1	4.5	3.5
70	SWR Leisure	South	Poor	Youth 9v9	1	0.5	1.5
76	Upper Up Playing Fields	South	Standard	Adult	1	1	-

The impact of improving overplayed pitches to good quality is shown in the table above. In the main, overplay would be largely alleviated at all but one site; Shipton Moyne Recreation Ground which would still have 3.5 match equivalent sessions per week of overplay remaining. The overall impact of this equates to a reduction of overplay equating to 10.5 match equivalent sessions per week to 3.5.

Table 4.2: Impact of improving pitch quality on overall supply and demand

Pitch type	Demand (match equivalent sessions per week)			
	Current actual spare capacity	Current overplay	Current total	Potential position with improved pitches
Adult	**5.5**	**6.5**	**1**	**2.5**
Youth 11v11	**1.5**	**3**	**1.5**	**2.5**
Youth 9v9	**4.5**	**1.5**	**3.5**	**7.5**

Making these improvements would, on a districtwide level, theoretically alleviate all overplay. Remaining overplay at Shipton Moyne Recreation Ground would remain, but spare capacity at other sites across the District would balance out the overall position.

Local Football Facility Plan (LFFP)[4]

As improving the quality of all overplayed sites may not be feasible from an investment point of view, an alternative approach is to focus on improving specific strategic sites. To that end, the Local Football Facility Plan (LFFP) identifies nine sites for grass pitch improvements that are in need of investment and that are key to the development of football across Cotswold. This improvement is led by the County FA and FF with local clubs playing a role in the activation of projects.

The Cotswold LFFP (2018) identified two sites for pitch improvements. The impact on improving these is shown in Table 4.3 below. Pitches at the Corinium Stadium (associated with Cirencester Town Youth FC) are now good quality (having improved since the LFFP was established) and as such there is no theoretical improvement to capacity (albeit the user experience can still be improved and the durability of pitches during inclement weather can also be better withstood).

For Tetbury Memorial Ground improving the quality of pitches would create a total of eight match equivalent sessions of spare capacity.

Table 4.3: Impact of LFFP quality improvements

Site ID	Site name	Pitch type	No. of pitches	Quality	Current capacity rating	Good capacity rating
25	Corinium Stadium	Adult	2	Good	1	N/A
		9v9	2		8	N/A
		7v7	2		11.5	N/A
72	Tetbury Memorial Recreation Ground	Youth 11v11	1	Standard	0.5	2.5
		Youth 9v9	1		2	5
		Mini 5v5	1		3	5

As there is no peak time capacity available on any of the pitches at these two sites, there overall supply vs demand balance of the District would remain consistent with the current findings.

As the LFFP is a live document to be informed by an up-to-date PPS, it is recommended that the priority list is updated on the back of this study to account for changes in demand since the project was completed. To help guide this process, the table below comments on whether the PPS provides evidence to support the inclusion of the sites currently featured.

[4] Link to Cotswold LFFP

Table 4.4: Assessing LFFP priority list (grass pitch improvements)

Site ID	Site name	Comments	LFFP update recommendation
25	Corinium Stadium	Key for youth football.	**Retain for improvement**
72	Tetbury Memorial Recreation Ground	Key site that contains pitches which are standard quality. Site is in the process of delivering pitch improvements through Football Foundation funding.	**Retain for improvement**

In addition to the projects already within the LFFP, there is scope to add further projects based on the findings of the PPS to increase capacity of provision in the District as well as improving the user experience of pitches for resident clubs.

Most overplay in the District originates on single pitches; however, these are largely not single pitch sites and including these sites within any LFFP update will work to reduce pitch specific overplay but also benefit the surrounding pitches via capacity improvements. Suggested sites based on PPS findings are as follows:

- Charlton Rovers AFC (Shipton Playing Field)
- Fairford RFC
- Kingshill Sports Complex
- SWR Leisure

Fairford RFC and SWR Leisure are also key sites for rugby union and there may be overlapping opportunities to see improvements as part of a multi-sport funding offer.

Loss of tenure at education sites

Currently two education sites in the Cotswolds are accessed by community clubs where there is no tenure arrangement in place. Theoretically, these clubs could be asked to vacate at any time which would result in each requiring new provision to service existing levels of demand.

The football 22/23 affiliation data accounts for Forest Green Rovers Youth FC accessing Royal Agricultural University and Tetbury Town Youth access Sir William Romneys School. In the case of Royal Agricultural University, the site is now accessed by Stratton YFC which has a 15-year lease agreement in place, whilst Tetbury Town Youth FC uses Sir William Romneys for the equivalent amount of demand. The impact on removal of these two sites for community access are highlighted in the table below. Figures presented are in line with the 22/23 affiliation data.

Table 4.5: Assessing LFFP priority list (grass pitch improvements)

Pitch format	Actual spare capacity[5]	Demand (match equivalent sessions)		
		Overplay	Current total	Current total if education sites become unavailable
Adult	**5.5**	**6.5**	**1**	**1**
Youth 11v11	**1.5**	**3**	**1.5**	**4**
Youth 9v9	**4.5**	**1**	**3.5**	**1**
Mini 7v7	**2.5**	**-**	**2.5**	**-**
Mini 5v5	**1**	**-**	**1**	**-**

[5] In match equivalent sessions

Reconfiguring grass pitch layout

One potential means of reducing shortfalls for grass football pitches is re-configuring the use of existing football pitches which are unused to accommodate for formats with the highest need.

Shortfalls currently existing on adult and youth 11v11 pitch formats with no other format having a current or future shortfall. The sites identified below are sites which could be considered for reconfiguration, relative to goalposts and support being provided for site operators and sufficient demand generating the need to change provision formats.

Table 4.6: Potential grass pitch layouts

Site ID	Site name	Current grass pitch layout	Current supply and demand balance	Potential grass pitch layout	Potential supply and demand balance
36	Fairford RFC	Youth 11v11 x 1	0.5	Youth 11v11 x 2	0.5
		Youth 9v9 x 2	2	Youth 9v9 x 1	1
48	Kingshill Sports Complex	Youth 11v11 x 2	2	Youth 11v11 x 3	1
		Youth 9v9 x 3	4	Youth 9v9 x 2	2

In addition to these, unused sites with adult football pitches could also be considered for conversion to youth 11v11, particularly where changing rooms are not provided (as these sites typically cannot be utilised for competitive adult play).

Recommendations

- Protect the existing quantity of pitches (unless replacement provision meets Sport England requirements and is agreed upon and provided).
- Where pitches are overplayed and assessed as poor or standard quality, prioritise investment and review maintenance regimes to ensure it is of an appropriate standard to sustain use and improve quality.
- Utilise the Football Foundation's PitchPower app to assist in the improvement and ongoing maintenance of provision.
- Work to accommodate future demand at sites which are not operating at capacity.
- Seek to gain access to sites not currently available for community use, particularly where large quantities of pitches are provided, such as The Cotswold School.
- Improve ancillary facilities where there is a demand to do so and where it can benefit the wider footballing offer, such as Bourton Rovers FC and Tetbury Memorial Recreation Ground.
- Where appropriate, help to facilitate partnerships and/or lease arrangements with large, sustainable, development-minded clubs to manage their own sites, such as Tetbury Town FC at Tetbury Memorial Recreation Ground.
- Encourage clubs in the NLS to upgrade to LED sports lighting.
- Ensure that any large housing developments are provided for and assess the need for new pitch provision through master planning on an individual basis.
- Where a housing development is not of a size to justify on-site football provision, consider using contributions to improve existing sites within the locality.
- Protect existing quantity of pitches, including lapsed and disused provision, until all demand is being met (unless replacement provision meets Sport England requirements and is agreed upon and provided).
- Consider pitch re-configuration where capacity of one pitch type can be used to reduce shortfalls of another, and where it can better accommodate what demand is received.

Third Generation turf (3G) pitches

Assessment Report summary

3G summary[6]

Supply:

- There is one full size 3G pitch (106 x 72m) within Cotswold, located at Corinium Stadium. In addition to this there is one small sided (55 x 37m) domed 3G pitch, also located at Corinium Stadium. Both pitches are serviced by sports lights and open to community use.
- The full size 3G pitch at Corinium Stadium is on the FIFA register meaning it can accommodate competitive matches. The site is scheduled to lose its FIFA certification in June 2023.
- There are no World Rugby Compliant 3G pitches in Cotswold. The nearest of such provision is located at the Cheltenham RFC within Cheltenham.

Quality:

- The full-size pitch located at Corinium Stadium is of a standard quality as it is the same surface since its installation in 2017. Comparatively, the small size provision at Corinium Stadium is of a good quality having initially been installed in 2003, with replacement surfaces being installed in 2010 and May 2022.
- The ancillary provision provided at Corinium Stadium is all of a good quality and accessible to members of the public accessing outdoor provision. The site hosts two good quality changing rooms, four standard quality changing rooms, a large function room and an office space with a viewing point overlooking the stadia pitch.

Supply vs demand analysis:

- With 157 football teams currently affiliated to Cotswold, there is a need for four full size pitch equivalents (measuring minimum dimensions of 91 x 55m) to service current levels of demand. Future demand from ONS projections increases this requirement to 4.5 pitches.
- With one full size and one small sided pitch within Cotswold, there is the need for a further 3 full size pitches (measuring a minimum of 91 x 55m) to be provided (rounded up from a need of 2.75).
- When studying demand by analysis area, shortfalls are apparent in all three PPS analysis areas, with the South Analysis Area having the largest shortfall of 1.25 full size pitches (with one full size pitch measuring a minimum of 91 x 55m).
- Comparatively, the Mid Analysis Area shows both a current and future shortfall of one full size pitch, meaning the delivery of one project with a full size 3G pitch (measuring a minimum of 91 x 55m) would be able to accommodate both current and future levels of demand for one of the three analysis areas in the District. None of the three analysis areas are currently adequately catering for current or future demand, however, shortfalls in the North Analysis Area are minimal with it only supporting 16 teams currently accessing pitches.
- With both sites outlined in the LFFP for the installation of new small sided provision being located in the South Analysis Area, this would support but not resolve the existing shortfalls if delivered.

[6] A full size 3G pitch is one in which meets the minimum dimensions of 91 x 55m. A small sided pitch is one which falls under these dimensions.

Scenarios

Accommodating football training demand

In order to satisfy current football training demand (based on the FA's scenario of one full size 3G pitch equivalent being able to cater for 38 community football teams) there is a need for four full size equivalents 3G pitches to accommodate all training demand.

Note, a full size 3G pitch is considered by the FA to measure at least 91 x 55 metres. However, where possible, and where demand requires, pitches should be constructed to a size of 100 x 64 metres.

Table 4.7: Current demand for full size[7] 3G pitches by analysis area

Analysis area	Current number of teams	Full size 3G requirement[8]	Current number full size of 3G pitches	Current shortfall (full size)
Mid	30	1	0	1
North	16	0.5	0	0.5
South	111	2.5	1.25	1.25
Total	**157**	**4**	**1.25**	2.75

The broad need for four pitches is also consistent when analysed by analysis area with the South Analysis Area having the highest need for provision, with 1.25 full size pitches (with one full size pitch one full size measuring minimum dimensions of 91 x 55m).

When considering future demand (defined by ONS population casts to 2031) the shortfall in the South Analysis Area increases by 0.5 thus resulting in a full-size pitch shortfall of two pitches (each measuring minimum dimensions of 91 x 55m). There is no change to the need in the remaining analysis areas.

Cotswold Local Football Facility Plan

The Cotswold LFFP (2018[9]*)* identifies a need for two smaller size 9v9 format 3G pitches. These are at Fairford Town FC and Tetbury Memorial Ground to service the respective football clubs based at each site. Both sites are in the South Analysis Area.

As the LFFP is a live document to be informed by an up to date PPS, the priority project list should be revisited following this study and updated/amended based on the findings. As such, the aforementioned project list has been matched against the table below to see how it services against existing shortfalls.

Table 4.8: Impact of delivering current LFFP 3G pitch projects on PPS shortfalls

Analysis area	Potential full size 3G requirement	Current number of full size 3G pitches	Potential full size shortfall	No. of proposed full size 3G pitches	Remaining shortfall
Mid	1	0	1	-	1
North	0.5	0	0.5	-	0.5
South	2.5	1.25	1.25	1	0.25
Total	**4**	**1.25**	2.75	**1**	**1.75**

[7] A full size pitch is one with dimensions of a minimum of 91 x 55m.
[8] Rounded to the nearest 0.25 pitch
[9] Link to Cotswolds LFFP

Based on the existing portfolio of projects identified in the LFFP, if both projects were to be delivered there would remain a shortfall of 1.75 full size pitch equivalents in the District (with one full size pitch measuring a minimum of 91 x 55m).

Moving football mini match play demand to 3G pitches

To further the use of 3G pitches for matches, the FA is particularly keen to work with local authorities and providers within local authorities to understand the potential demand for full size (minimum 91 x 55m) sports lit 3G pitches to cater for different formats of match play.

The FA has an ambition to transfer 50% of mini play on to 3G pitches nationally. Thus, a programme of play has been created for Cotswold to determine how many full size 3G pitches (measuring a minimum of 91 x 55m) would be required to accommodate this, given that peak time for both mini 7v7 and mini 5v5 football is Sunday mornings.

Table 4.9: Moving all mini matches to 3G pitches

Time	AGP	Total games/teams
9.30am – 10.30am	4 x 5v5	4/8
10.30am – 11.30am	2 x 7v7	2/4
11.30am – 12.30pm	2 x 7v7	2/4
12.30pm – 1.30pm	2 x 7v7	2/4

Based on the above programming and separate start times for mini 5v5 and mini 7v7 matches, the overall need is for 3.5 full size 3G pitches (with each of the full size pitches measuring a minimum of 91 x 55m) to accommodate all current mini match play demand. This is calculated based on 25 teams playing 5v5 football and 24 teams playing 7v7 football at peak time.

If the current 3G pitch requirement of three additional full size pitches (each measuring 91 x 55m) for training within Cotswold were to be provided; it is feasible that all mini football requirements could be accommodated using the one existing and three additional 3G pitches.

The below looks at the number of full size (91 x 55m) pitches which would be required to accommodate 27 teams currently playing this format within Cotswold at peak time.

Table 4.10: Moving all 9v9 matches to 3G pitches

Time	AGP	Total games/teams
10am – Noon	1 x 9v9	1/2
Noon – 2pm	1 x 9v9	1/2
2pm – 4pm	1 x 9v9	1/2

Based on the above programming, there would be a need for 4.5 full size pitches (each measuring a minimum of 91 x 55m) to accommodate all youth 9v9 demand.

Based on the local landscape of football and its more traditional home vs away format, it is unlikely the above approach is viable and the development of 3G pitches provide more so to aid the need for recreational play and training requirements.

Forest Green Rovers – Eco Park Relocation

Forest Green Rovers FC is one of the highest level football clubs in the region. It has an integral link with the Cotswolds, with the Club using provision in the District for its junior academy teams as well for training requirements for its professional men's first team.

Its primary training base for its first team and senior academy teams is at the Coronium Stadium (home of Cirencester Town FC). Gloucestershire FA confirms the Club pays a premium rate for its access to the site. The Club has future plans[10] to develop its own provision which will adequately provide a training base outside of the Cotswolds in Stroud, which it considers to be its primary home location. Currently, its stadium for its men's first time is based in Nailsworth, Stroud.

A relocation of the Club would outside of the District for training purposes would therefore free up space on the only full size 3G pitch in the Cotswold district, at the Coronium Stadium. In relation to midweek evening use (17:00 – 21:00) Forest Green Rovers FC currently utilise 9.5 hours of full pitch use at the site. However, of this access 8.5 hours is on Mondays and Fridays which falls outside of the football peak usage model designed by the Football Association. One hour of use is therefore within the peak usage window on Wednesdays.

When considering this re-location against 3G requirements for the District and associated need for new provision (based on new availability likely to be present on the pitch). It can be determined that the relocation does not impact on existing need which has been identified. This is due to the impact of peak time need, typically between Tuesday, Wednesday, Thursday between 18:00 – 21:00 being broadly unaffected.

3G pitch development – Tetbury

The PPS Assessment Report identifies a need for 1.25 full size 3G pitches in the South Analysis Area of Cotswolds to meet existing demand for football. As a reminder, one full size pitch has minimum dimensions of 91 x 55m. The larger clubs within the Analysis Area are based in and around Tetbury and as such this location has been identified as the most appropriate for the development of a new full size pitch (with minimum dimensions of 91 x 55m).

Gloucestershire FA also highlights demand for 3G provision from Malmesbury area (Wiltshire Council) which would likely access provision in Tetbury to form a full usage programme of any provision which is developed.

SWR Leisure (Tetbury) aspires to develop a full sized 3G pitch (minimum dimensions of 91 x 55m) on its playing field. Likewise, the operators of the Tetbury Memorial Recreation Ground (Dolphins Trust) also have an aspiration for such a development to take place at Tetbury Memorial Recreational Ground.

Both Sport England and the Football Foundation has a preference to the SWR Leisure site as the development would not impact existing cricket or rugby union demand at the site (Tetbury Memorial Ground) and it would also allow for level of curricular usage of the facility throughout the school day. One of the key concerns of developing provision at Tetbury Memorial Ground is the prejudicial impact on cricket and the ability for matches to continue to be played.

[10] https://www.fgr.co.uk/eco-park

On the basis of the above, there is a sound evidence base to see the development of a full size 3G pitch (minimum 91 x 55m) to be developed in Tetbury and football partners and relevant stakeholders should come to a consensus on the most appropriate location relative to sporting outcomes.

World Rugby compliant 3G pitches

World Rugby produced the 'performance specification for artificial grass pitches for rugby', more commonly known as 'Regulation 22' that provides the necessary technical detail to produce pitch systems that are appropriate for rugby union.

The RFU generally support the development of 3G pitches which support rugby union where grass rugby pitches are over capacity and where a pitch would support the growth of the game at the host site and for the local rugby partnership, including local clubs and education establishments. In the case of Cotswold, there are no WR compliant 3G pitches within the District. The nearest example of this provision is situated at Cheltenham RFC.

Locally, capacity shortfalls are identified for rugby union pitches. These are however broadly minimal and not to the extent of which a need to modify existing provision (to install a rugby suitable shock pad) or to create new 3G pitches solely for the benefit of rugby union is warranted. These issues can be addressed via capital investment and maintenance improvements at club sites throughout the district. No clubs further identified this as an investment priority. On the basis of the above, there is no need for WR compliant 3G pitches to be provided in the District.

Recommendations

- Protect current stock of 3G pitches.
- Work with relevant partners to deliver additional 3G pitches in the district to cater for football training demand.
- Work with partners such as the FA, FF, Sport England and other NGBs as applicable to identify the most suitable locations to build new 3G pitches to alleviate known shortfalls, with SWR Leisure as a priority site.
- Ensure that any new 3G pitches have community use agreements in place.
- Ensure that all full size (with minimum dimension of 91 x 55) and larger smaller sized pitches remain on the FA register and are re-tested every three years to sustain certification.
- Ensure all current and future providers have in place a sinking fund to ensure long-term sustainability.
- Ensure that all new 3G pitches are constructed to meet FA recommended dimensions (minimum 91 x 55m) and quality performance standards.

Cricket pitches

Assessment report summary

Cricket – supply and demand summary

- The current broad position in Cotswold is actual spare capacity for peak time senior men's cricket, with all remaining formats also able to be accomodated.
- Actual spare capacity of 79 MES is present for Saturday demand, a figure that once future demand through Sport Englands Playing Pitch Calculator is considered, is removed and overplay of 5 MES is identified.
- Sunday and Midweek demand continues to display actual spare capacity once future demand is accounted for.
- The impact of club aspirations which be explored in the Strategy & Action Plan.
- Eight sites are overplayed, these are; Cirencester CC (both squares), Great Rissignton CC, King Goerge V Playing Field (Northleach), Meysey Hampton Playing Fields, Upper Up Playing Fields, Barnsley Beeches CC, Cowley CC and Chedworth CC. Total overplay equates to 65 MES.
- Despite overall spare capacity being present across the District, clubs such as Cirencester CC, Fairford CC, Chipping Campden CC, Moreton Marsh CC and Tetbury CC all have capacity issues specifically regarding peak time adult demand.

Cricket – supply summary

- In total, there are 36 active cricket sites in Cotswold consisting of grass squares.
- In total there are 39 grass wicket squares across 36 sites of which 34 squares are available for community use across 33 sites. The three non-community accessible sites are Rendcombe College, The Cotswold School and Westonbirt School and Leisure Centre.
- There are a seven standalone NTP's within Cotswold all of which are located at education sites and are not available for community use.
- Six clubs in Cotswold have freehold ownership of its sites, 12 have lease agreements in place and four rent its sites. The remaining clubs either have verbal agreements or are merely on good terms with the landowners.
- The audit of community available grass wicket cricket squares found six to be good quality, 19 to be standard quality and nine to be poor quality.
- Several clubs report issues relating to ancillary provision including clubs such as Ampney Crucis CC, Fairford CC and Williamstrip CC.
- Tetbury CC, Faiford CC, Cirencester CC, Bibury CC, Williamstrip CC and Ampney Crucis CC are all in the process of or have ambitions to enhance its ancillary provision offering.
- Nine clubs state the demand for additional training facilities at its home site, with developments including the installation of new fixed practice nets and NTP's.
- There are five disused squares (former grass pitch) within Cotswold, those being Stow-On-The-Wold CC, Guiting Power Village Hall, Kempsford CC, Windrush Valley Field and Avening and Cherington CC.

Cricket – demand summary

- There are 29 clubs in Cotswold which collectively provide 56 senior men's, seven senior women's, 43 junior boys teams and three junior girls team.
- Eight clubs within Cotswold currently offer the All-Stars program, whilst seven clubs deliver Dynamos sessions.
- Four clubs confirm delivering women's and girls' softball sessions which bring total participation figures of 50 participants.
- Future demand for cricket is identified through team generation rates using Sport England's Playing Pitch Calculator. This equates to the growth of seven senior men's teams, one senior women's team and five junior boys' teams by 2031.
- Club aspirations equate to the potential growth of four senior men's teams, two senior women's teams, six junior boys' teams and one junior girls' teams. A strategy exploring how future demand through club aspirations shall impact the supply and demand balance shall be explored in the accompanying strategy report.
- Ampney Crucis CC hosts the only example of imported demand within Cotswold whilst accommodating Swindon Nomads CC. The Club began accessing the site as of 2012, and share pitch allocation with Poulton CC. There are no identified instances of exported demand.

Scenarios

Addressing overplay

Although a regular, sufficient maintenance regime can sustain sites with minimal levels of overplay a reduction in play is recommended to ensure there is no detrimental effect on quality of cricket squares over time.

In Cotswold, overplay is identified at eight sites and across nine squares. The ECB recommends that poor quality squares do not have a carrying capacity due to being unfit for use. Regarding the squares below, six are poor quality. The impact of improving quality at all these sites, to good, where each wicket has a theoretical capacity of five is considered in the table below.

Table 4.11: Overplay if all overplayed squares were good quality

Site ID	Site name	No. of squares	Square quality	No. of wickets	Current overplay (matches per season)	Potential position (matches per season)
17	Cirencester CC	2	Good	10	20	20
			Standard	6	20	14
41	Great Rissington CC	1	Good	10	5	5
46	King George V Playing Field (Northleach)	1	Poor	5	3	17
53	Meysey Hampton Playing Field	1	Poor	7	6	22
76	Upper Up Playing Fields	1	Poor	5	4	16
92	Barnsley Beeches CC	1	Poor	10	3	37
95	Cowley CC	1	Poor	6	1	23
99	Chedworth CC	1	Poor	5	3	17

As seen in the table above, only the squares provided at Cirencester CC (two squares) and Great Rissington CC would continue to be overplayed if the quality were to be improved to good.

Poor-quality squares across Cotswold are only showing small amounts of overplay, that would be removed if quality was only improved to standard. As this is a more achievable recommendation to clubs it should certainly be prioritised.

Cricket squares can be accompanied by non-turf pitches (NTPs), made of a synthetic material that allows users to play on a usable wicket all year round whilst not contributing towards playing demand on natural turf wickets (grass wickets). By the nature of its design, an NTP is able to accommodate significantly more demand than a natural cricket wicket, meaning it can contribute towards addressing overplay issues on grass cricket squares.

Great Rissington CC is not serviced by an NTP and could theoretically benefit from such provision as a way of reducing identified overplay.

The ECB highlights that non-turf pitches which follow its TS6 guidance[11] on performance standards are suitable for high level, senior play and are considered able to take 60 matches per season, although this may include training sessions via the use of mobile nets.

Cirencester CC has an on-site NTP which is suitable for younger aged junior cricket. Higher utilisation of this may provide a capacity benefit but other options could be considered as highlighted below.

Hybrid wickets

Although not readily available within grassroots cricket, there may be potential in the future to address overplay through the installation of hybrid wicket/s on competitive senior squares. The ECB has been working with SIS Pitches on the installation of hybrid cricket wickets at county cricket clubs (2019) and more recently recreational squares such as Perry Hall Park in Birmingham (2021) and Didsbury Cricket Club in Manchester (2022). Due to already good standing provision at Cirencester Cricket Club, and Great Rissington Cricket, there is scope to potentially explore the opportunity to install hybrid wickets in the future.

A hybrid wicket combines natural turf grass with less the 5% of uniquely engineered, soft polyethylene yarn, which has already been used to improve golf tees, tennis courts and pitch surrounds. These wickets are to offer a greater capacity in addition to reducing time on repair works with a faster recovery time. Reports found that hybrid wickets improve surface stability, reduced wear, reduced bowler foot holes and significantly extended hours of playing time.

Ideally, once these become more readily available for community cricket clubs and have gone through the required testing, they could act as a way to increase levels of playing capacity on overplayed squares. This would be particularly beneficial for those sites which are limited on space and cannot create additional wickets due to restrictions things such as boundary length or ball strike.

Although it is difficult at this stage to understand what impact hybrid wickets could have on each site's capacity, it is suggested that it could potentially alleviate all the overplay on all three squares in the District. This assumes that more senior demand can take place on the hybrid wickets allowing for the outer senior wickets to be used/converted for junior demand.

Accommodating future demand

Population growth over the Local Plan period to 2031 is expected to see the population of the district rise from 90,264 to 104,399. The Sport England PPC anticipates this will lead to the creation of seven senior men's teams, one senior women's team and five junior boys' teams.

This future demand cannot be attributed to any one analysis area or club but is important to understand how this can be accommodated across the District. The preceding Assessment Report shows that for men's Sunday cricket, senior women's and all formats of junior cricket there is sufficient capacity (notwithstanding specific club overplay issues).

For senior men's cricket on Saturdays, however, there are shortfalls identified if all future demand is realised equating to five match equivalent sessions. In the main, this is modest and will largely be unfelt at club level but dependent on where demand aligns itself to (i.e. club specific and analysis area specific) they may well be instances of pressure at certain clubs which have high levels of existing demand (i.e. Cirencester CC).

[11] Link to ECB website TS6 guidance

Where increases in demand are causing capacity issues for Saturday cricket, the PPS Assessment identifies that the sites listed below can accommodate for an increase in demand within the peak period and if ground sharing agreements can be fostered then demand could be accommodated for at these sites on Saturday afternoons (based on 2022 season data):

- Andoversford Sports and Social Club
- Bibury Cricket Club
- Blockley Sports & Social Club
- Ebrington Cricket Club
- Lechlade Cricket Club
- Longborough & Sezincote Cricket Club
- Mickleton Sports Club
- North Cerney CC
- Slaughters CC
- Stowell Park CC

That being said, it is not always realistic for clubs to access other club sites as secondary venues due either increases in demand changing the availability of provision, clubs wishing to protect the quality of provision for their existing teams, or not wanting to permit access altogether. On this basis, it is important to note the role disused provision can play in accommodating demand for cricket in the future.

Disused sites

There are five disused cricket squares in Cotswold located at the following sites:

- Stow-On-the-Wold CC (Queen Elizabeth II Field)
- Guiting Power Village Hall
- Kempsford CC
- Windrush Valley Field
- Avening and Cherington CC

Of these sites, provision at Stow-On-the-Wold CC and Avening and Cherington are most akin for cricket usage having had the most recent use and thus requiring the least amount of investment to bring back into use.

The remaining three sites are most likely to need higher levels of capital to get back into a sufficient position for use (albeit this would need to be fully determined via an agronomy report undertake by a turf specialist).

As there are future shortfalls identified for cricket in the District, where possible, a minimum of one of these sites should be retained for the benefit of cricket. Site nearest to prominent clubs exhibiting high levels of demand are likely the best and could, in theory, serve as secondary home venues if suitable partnerships and access arrangements can be made.

Tetbury CC Loss of Flicx pitch

Consultation with Gloucester Cricket Foundation confirms that the use of a Flicx pitch12 at Tetbury Memorial Recreation Ground (Tetbury CC) is something that clubs within its league do not approve of. This has resulted in the league requesting that it identifies another pitch to play on. It uses currently uses the provision to enable two senior games to take place concurrently on the site.

[12] Link to Flicx website

As identified in the accompanying Assessment Report, this temporary form of artificial pitch is rolled onto the senior rugby union pitch at the site which is used predominately by Tetbury RFC. However, Tetbury Rugby Club has purchased a 12 acre site; Pike Field, in the north of Tetbury and plans to relocate to this site in 2025.

Dependent on how demand is satisfied at the new rugby union site, the existing rugby union pitch at Tetbury Memorial Recreation Ground may be able to be repurposed to accommodate a new cricket square (natural turf) or NTP. If this is to take place, the RFU should confirm this is a decision which will not impact on rugby union.

An alternate solution, if the rugby union pitch is to be retained, could be to reinstate the grass wicket squares provided at Avening and Cherington CC. The site is disused, however, of all the disused squares within the District it remains in a fairly good condition and is located just four miles from Tetbury Memorial Recreation Ground. As such, this could offer an alternative venue for the Club. Whilst being in a better condition than the remaining disused squares, the site would likely require some investment to be brought back into use for Tetbury CC.

Recommendations

- Protect existing quantity of cricket squares.
- Retain a supply of disused sites to serve as a strategic reserve for future demand.
- Improve quality at sites assessed as standard and ensure quality is sustained at sites assessed as good through partnership working with Gloucester County Cricket Board.
- Address overplay via quality improvements, NTP installation and consideration of hybrid wickets in the future.
- Look to address the issues regarding the Flicx pitch at Tetbury Memorial Recreation Ground, with the development of a new cricket square (in replacement of the existing rugby union pitch in 2025) or via reinstating the square at Avening and Cherington CC as two possible solutions.
- Pursue improved security of tenure for clubs without ownership or a long-term lease arrangement in place, particularly those engaging in lease renewals.
- Improve the changing and ancillary facilities where there is a need to do so, with priorities placed at Cirencester CC, Fairford CC, Tetbury CC, Bibury CC, Williamstrip CC and Ampney Crucis CC through support from Poulton CC
- Consider options to increase and improve stock of suitable practice facilities, as nine clubs raise this as an issue at their sites.
- Continue to support ECB initiatives such as All Stars and Dynamos and ensure unaffiliated demand and recreational cricket is provided for.
- Ensure that any residential development considers potential increases in demand for the sport and that new provision or contributions are properly sought through utilisation of the Sport England Playing Pitch Calculator.
- Ensure that the applicant of any development adjacent to existing cricket grounds undertakes an appropriate ball-strike assessment to determine need for potential ball strike mitigation requirements.
- Look to enable community use access to the grass wicket square at Westonbirt College in line with the sites community use stipulation in the planning application for its full sized AGP.

Rugby union - grass pitches

Assessment Report summary

Rugby union summary

- There is insufficient level of senior rugby union provision in Cotswold to accommodate current and future demand. Current shortfalls equate to 5.75 match equivalent sessions per week and future demand increases this to 6.75 match equivalent sessions per week.

Pitch supply:

- There is a total of 36 rugby union pitches in the Cotswolds across 11 sites. This consists of 27 senior pitches and nine mini (mixed aged grade) pitches. Of these, 21 pitches, located at education sites, are unavailable for community use.
- There are no WR compliant 3G pitches located within Cotswold, the nearest available provision is in either Cheltenham or Wiltshire.
- Tetbury RFC is working to develop new provision consisting of three pitches and accompanying ancillary provision at a new site (Pike Field) in Tetbury. It is expected this will be available for use from 2025.

Pitch quality:

- In terms of quality, of community use pitches, there are five good quality, one standard quality and four poor quality pitches which are available for community use. There are also five poor quality mixed age grade pitches which are also available for community use.
- From a community club perspective, poor quality pitch provision is an issue for Fairford and Tetbury rugby clubs.

Ancillary provision quality:

- Of the four clubs in the District, good quality provision is available to Cirencester and Stow-on-the-Wold rugby clubs. Poor quality provision is available to Tetbury and Fairford rugby clubs.
- Fairford RFC has aspirational plans to improve its ancillary offer through a partnership with Fairford CC.
- Tetbury RFC has planning permission to provide new ancillary provision, which is expected to be of a good quality at its new site at Pike Field.

Demand:

- There are four rugby union clubs in Cotswold which in total generate demand equating to 51 teams. As a breakdown, this consists of seven senior men's, three boy's colts, 11 junior boys, one junior girl and 24 mixed age grade teams.
- Future demand from team generation rates equates to one junior boys' team and two mini (mixed age grade) team.
- From an aspirational growth perspective, community clubs have highlighted growth equating to two senior men's teams, one senior women's team, two junior boys' teams and two junior girls' teams.

Supply and demand analysis:

- There is an overall insufficient supply of provision to cater for both current and future demand. Current shortfalls equate to 5.75 match equivalent sessions per week and future demand increases this to 6.75 match equivalent sessions per week.

Scenarios

Improving pitch maintenance and drainage

Maintenance and drainage solutions are an integral method in improving pitch quality at rugby union sites, ensuring that pitches can accommodate demand throughout the season. Locally, there are several sites which are identified as being overplayed and the following scenario explores what impact improving both the level of maintenance and installation of drainage solutions would have on the capacity of provision.

The table below illustrates the RFU pitch quality scoring methodology which ascertains the capacity of pitches based on the scoring criteria.

Table 4.12: Pitch capacity (matches per week) based on quality assessments

		Maintenance		
		Poor (M0)	Adequate (M1)	Good (M2)
Drainage	Natural Inadequate (D0)	0.5	1.5	2
	Natural Adequate or Pipe Drained (D1)	1.5	2	3
	Pipe Drained (D2)	1.75	2.5	3.25
	Pipe and Slit Drained (D3)	2	3	3.5

The table below looks at what capacity benefits would be ascertained through improvement of both maintenance and drainage solutions in one increment on the above technical criteria. It further looks at the benefit of maximum improvements to both drainage and maintenance to explore maximum benefits.

Table 4.13: Improving maintenance on all sites/senior pitches by one increment (based on RFU technical criteria)

Site ID	Site name	Number of senior pitches	Current technical score	Quality*	Sports lighting?	Match equivalent sessions (per week)	Pitch Capacity (sessions per week)	Capacity rating	Improved technical score	Improved quality score	Improved capacity rating
23	Cirencester RFC	2	M2/D1	Good	No	4.5	6	1.5	N/A	N/A	N/A
		1	M1/D1	Standard		1.75	2	0.25	M2/D1	Good	1.25
36	Fairford RFC	1	M0/D1	Poor	No	1	1.5	0.5	M1/D1	Standard	1
105	Leafield Road (Fairford RFC)	1	M0/D0	Poor	No	1	0.5	0.5	M1/D0	Standard	0.5
68	Stow-on-the-Wold RFC	2	M2/D1	Good	Yes	9.25	6	3.25	N/A	N/A	N/A
		1	M2/D1	Good	No	2	3	1	N/A	N/A	N/A
72	Tetbury Memorial Ground	1	M0/D1	Poor	No	2.5	1.5	1	M1/D1	Standard	0.5
70	SWR Leisure (Tetbury RFC)	1	M0/D0	Poor	No	2	0.5	1.5	M1/D0	Standard	0.5

Improving the maintenance of senior pitches at all sites accessed by community clubs would have a theoretical capacity benefit for several clubs. For Cirencester RFC (two pitches) and Stow-on-the-Wold RFC, pitch maintenance is already at an M2 threshold and therefore there is no real opportunity to increase capacity through an increased/improved maintenance offer (based on the RFU capacity criteria). This is because it is considered that both clubs already undertake a good level of technical maintenance to their pitches.

For the remaining sites (including one pitch at Cirencester RFC) there will be a capacity benefit to pitch improvements via maintenance. Overplay at Leafield Road (Fairford RFC) would be alleviated and overplay at both Tetbury Memorial Ground and SWR Leisure (Tetbury RFCs secondary site) would both reduce to 0.5 match equivalent sessions per week each.

Table 4.14: Improving drainage on all sites/senior pitches by one increment (based on RFU technical criteria)

Site ID	Site name	Number of senior pitches	Current technical score	Quality*	Sports lighting?	Match equivalent sessions (per week)	Pitch Capacity (sessions per week)	Capacity rating	Improved technical score	Improved quality score	Improved capacity rating
23	Cirencester RFC	2	M2/D1	Good	No	4.5	6	1.5	M2/D2	N/A	1.75
		1	M1/D1	Standard		1.75	2	0.25	M1/D2	N/A	0.75
36	Fairford RFC	1	M0/D1	**Poor**	No	1	1.5	0.5	M0/D2	N/A	0.75
105	Leafield Road (Fairford RFC)	1	M0/D0	Poor	No	1	0.5	0.5	M0/D2	N/A	0.25
68	Stow-on-the-Wold RFC	2	M2/D1	Good	Yes	9.25	6	3.25	M2/D2	N/A	2.75
		1	M2/D1	Good	No	2	3	1	M2/D2	N/A	1.25
72	Tetbury Memorial Ground	1	M0/D1	Poor	No	2.5	1.5	1	M0/D2	N/A	0.75
70	SWR Leisure (Tetbury RFC)	1	M0/D0	Poor	No	2	0.5	1.5	M0/D1	N/A	1.25

A similar approach to improving maintenance has been undertaken here for drainage installation (through improvement to pitches by one increment on the RFU technical criteria). In this case, for both Cirencester RFC and Stow-on-the-Wold RFC, capacity benefits would be seen with additional spare capacity generated at Cirencester RFC and an overall reduction of overplay across two pitches at Stow-on-the-Wold RFC by 0.5 match equivalent sessions.

For the remaining sites, each would see a slight reduction in overplay, but this would remain higher than when compared to the maintenance improvement position. This shows that maintenance improvements should take priority over capital drainage solutions at sites associated with Fairford RFC and Tetbury RFC.

Table 4.15: Improving both maintenance and drainage to M2/D3 at all sites/senior pitches (based on RFU technical criteria)

Site ID	Site name	Number of senior pitches	Current technical score	Quality*	Sports lit?	Match equivalent sessions (per week)	Pitch Capacity (sessions per week)	Capacity rating	Improved technical score	Improved quality score	Improved capacity rating
23	Cirencester RFC	2	M2/D1	Good	No	4.5	6	1.5	M2/D3	N/A	2.5
		1	M1/D1	Standard		1.75	2	0.25	M2/D3	Good	1.75
36	Fairford RFC	1	M0/D1	**Poor**	No	1	1.5	0.5	M2/D3	Good	2.5
105	Leafield Road (Fairford RFC)	1	M0/D0	Poor	No	1	0.5	0.5	M2/D3	Good	2.5
68	Stow-on-the-Wold RFC	2	M2/D1	Good	Yes	9.25	6	3.25	M2/D3	N/A	2.25
		1	M2/D1	Good	No	2	3	1	M2/D3	N/A	1.5
72	Tetbury Memorial Ground	1	M0/D1	Poor	No	2.5	1.5	1	M2/D3	Good	1
70	SWR Leisure (Tetbury RFC)	1	M0/D0	Poor	No	2	0.5	1.5	M2/D3	Good	1.5

This table illustrates the position if all senior pitches in the District which are accessed by community clubs were improved to an M2/D3 threshold. This is the highest threshold a pitch can score based on the RFU technical criteria. In all cases, overplay would be removed and a moderate amount of spare capacity generated on all sites, aside from the overplayed pitches at Stow-on-the-Wold RFC which would see overplay reduced.

Stow-on-the-Wold RFC

For Stow-on-the-Wold RFC, the impact of capital drainage solutions will not overcome its overplay issues. As such, other opportunities need to be considered, however, the shortfalls are not substantial enough to warrant the development of a dedicated 3G pitch (or likewise a shock pad to be installed on any forthcoming development of such provision).

On this basis, where, and if, opportunities present themselves in the future for land acquisition on an adjacent field to provide new senior pitches (or likewise, generic playing field with sports lighting for training purposes) then this should be explored further as an option to relieve capacity shortfalls. The RFU confirm the Club is working towards installing a fourth pitch in the adjacent field to its site.

Improving sports lighting at Cirencester RFC

Consultation with Cirencester RFC confirms it has an ambition to increase the number of sports lit pitches at its site. The RFU confirm the Club has been in receipt of Section 106 funding to install sports lights on one of its senior pitches.

All training demand at the site currently takes place on a dedicated sports lit training area which is not of a sufficient size to accommodate continued demand for all its competitive teams which train midweek during autumn and winter months and as such require this sports lighting. As all pitches have a level of spare capacity there is scope to provide this on existing marked pitches without exacerbating or causing shortfalls to appear. On this basis, any proposal to develop sports lighting on the site should be supported.

Table 4.16: Current space capacity at Cirencester RFC

Site ID	Site name	Current number of senior pitches	Current technical score	Quality*	Sports lit?	Match equivalent sessions per week	Capacity rating
23	Cirencester RFC	2	M2/D1	Good	No	4.5	1.5
		1	M1/D1	Standard		1.75	0.25

Alleviating overplay at club specific sites

Leafield Road (Fairford RFC)

Leafield Road is a satellite site accessed by Fairford RFC for its mini (mixed age grade) and singular junior team. It is overplayed by 0.5 match sessions per week. As evidenced in Table 4.13, this overplay can be alleviated through pitch maintenance improvements on the site (from M0 to M1).

Stow on the Wold RFC

Stow on the Wold RFC has a cumulative site overplay of 3.25 match equivalent sessions per week. Capital drainage solutions or maintenance improvements are not sufficient to alleviate this (as evidenced in Table 4.13 and 4.14). As such, other opportunities need to be considered.

The shortfall of 3.25 match equivalent sessions is not considered by the RFU be sufficient to warrant the need for a WR22 compliant 3G pitch to be provided. On this basis, where, and if, opportunities present themselves in the future, land acquisition near or adjacent to the site to provide a new pitch (or floodlit training area) provided at an M2/D2 standard would fully alleviate shortfalls. The RFU confirm the Club is working towards installing a fourth pitch in the adjacent field to its site.

Tetbury Memorial Ground (Tetbury RFC)

Tetbury Memorial Ground has a shortfall of one match equivalent session per week. This can be alleviated through a combination of maintenance and drainage solutions as identified in Table 4.15.

It is however noted that Tetbury RFC will be relocating from its site to Pike Field in 2025. This is a new development which will provide two senior pitches and a junior pitch. Dependent on the quality provision is provided to, it is likely this will resolve capacity shortfalls identified. This will need to be monitored as part of Stage E.

SWR Leisure (Tetbury RFC)

SWR Leisure is a satellite site accessed by Tetbury RFC to accommodate its mini (mixed age grade) teams. Shortfalls on the site equate to 1.5 match sessions per week. This can be alleviated via maintenance and drainage solutions as identified in Table 4.15. The development of Pike Field may also provide a role in reducing this overplay. This will need to be monitored as part of Stage E.

Recommendations

- Protect the existing quantity of rugby union pitches including those used for curricular and extra-curricular demand.
- Work to undertake targeted pitch improvements at sites associated with Fairford RFC and Cirencester RFC to alleviate shortfalls at these sites.
- Support clubs in taking part in the GMA pitch advisory service to explore technical requirements to improve pitch quality to address overplay.
- Explore land acquisition and potential to develop new pitch provision close to Stow-on-the-Wold RFC to alleviate overplay associated with the Club.
- Support Cirencester RFC in its aspirations to provide additional sports lighting.
- Work with clubs to improve their ancillary offer where this a need to do so.
- Ensure that any residential development considers potential increases in demand for the sport and that new provision or contributions are properly sought through utilisation of the Sport England Playing Pitch Calculator.

Hockey pitches (sand/water-based AGPs)

Assessment Report summary

Hockey summary

- **There is sufficient supply of hockey suitable pitches in Cotswold from a programming perspective to accommodate current levels of peak time demand.**
- **Future demand of one senior ladies team and two junior teams can be accommodated on current provision from a programming perspective.**
- **With both AGP's provided at the Royal Agricultural University and The Cotswold School nearing end of life, there is the need to provide pitch replacements at both sites in order to accommodate existing and future hockey demand.**

Pitch supply:

- There are five full size hockey suitable AGPs in Cotswold located across as many sites. Four of these pitches are open to community use with the AGP at Rendcombe College being the only provision with no formal community use agreement in place.
- Westonbirt School is scheduled to have an AGP and accompanying clubhouse with two changing rooms installed, with a proposed deadline of completion being 2023. The school state it does not know if the site shall be accompanied by sports lights or if a community use agreement shall be reached, however, it was acceptant to the idea if an arrangement that fits around curricular demand can be decided.

Pitch quality:

- The full-size pitch at Rendcombe College resembles the only good quality playing provision within the District, with the AGP receiving a carpet replacement in 2019. Provision found at Cirencester Deer Park School and Everyone Active Chipping Campden are both of a standard quality, with the former being five years of age and the latter seven years old.
- The AGPs provided at the Royal Agricultural University and The Cotswold School are both of a poor quality and in need of replacement surfaces before reaching condemnation. The Cotswold School does not have a sinking fund in place for its provision, whilst details regarding the Royal Agricultural University are unknown.

Affiliated demand:

- There are four hockey clubs within Cotswold, those being Cirencester HC, Chipping Campden HC, Blockley Ladies HC and Bourton and Sherbourne HC.
- Cirencester HC hosts five senior mens teams, four ladies teams and six junior teams. Chipping Campden HC has one ladies team, Blockley Ladies HC provide two ladies teams and a junior team, whilst Bourton and Sherbourne HC accommodate two senior ladies teams, one senior mens team and a junior team.
- Cirencester HC access both Deer Park School and Royal Agricultural University for home fixtures. Chipping Campden HC and Blockley Ladies HC both access Everyone Active Chipping Campden School, whilst Bourton and Sherbourne HC play at The Cotswold School.
- Future demand from Cirencester HC is to gain a fifth senior ladies team as of the 2022/23 season, whilst Blockley Ladies HC hope to gain a junior boys and a junior girls team. Future demand from Cirencester HC can be accommodated for from a programming perspective at Royal Agricultural University, however, given the age of provision the site should not be outlined for increasing in usage.

Supply and demand analysis conclusions:

- Based on current levels of demand, there is a sufficient supply of provision to accommodate existing demand, however, if necessary, pitch replacements are not undertaken at Royal Agricultural University and The Cotswold School, both pitches shall reach a point of condemnation during the lifespan of the PPS.
- Future demand can be accommodated with existing provision if replacement surfaces are provided at the Royal Agricultural University and The Cotswold School.

Scenarios

Meeting demand for hockey suitable AGPs

The PPS Guidance suggests that a pitch with sports lighting can accommodate four match equivalent sessions on a Saturday. With teams playing on a home and away format, this equates to one AGP being able to cater for eight 'home' teams (one team requires 0.5 match equivalent sessions per week on its 'home' AGP).

The table below outlines the position for hockey usage across all the hockey suitable sites across the District. In the main, all pitches are operating at capacity. The only pitch to be considered as having spare capacity is at Everyone Active Chipping Camden School. The pitch at Rendcombe College is unavailable to the community and as such has not been allocated any capacity for use. Lastly, the pitches at Royal Agricultural College and the Cotswold School have had their capacities reduced due to the poor quality surfaces not being recommended to accommodate for an increase in demand.

Table 4.17: Hockey usage and spare capacity

Site ID	Site name	Site user	Current use in peak period (MES)	Spare capacity?
18	Cirencester Deer Park School	Cirencester HC	4 MES	No
34	Everyone Active Chipping Camden School	Chipping Campden HC Blockley Ladies HC	2 MES	Yes
59	Rendcombe College	-	0 MES	No
60	Royal Agricultural University	Cirencester HC	3 MES	No
75	The Cotswold School	Bourton and Sherbourne HC	3 MES	No

Table 4.18: Quality of existing hockey suitable artificial grass pitches

Site ID	Site name	Surface type	User	Quality rating	Built/ resurfaced
18	Cirencester Deer Park School	Sand dressed	Cirencester HC	Standard	2003 / 2017
34	Everyone Active Chipping Camden School	Sand dressed	Chipping Campden HC -Blockley Ladies HC	Standard	2015
59	Rendcombe College	Sand dressed	-	Good	2010 / 2019
60	Royal Agricultural University	Sand filled	Cirencester HC	Poor	2003
75	The Cotswold School	Sand filled	Bourton and Sherbourne HC	Poor	2005

Based on the above, it can be determined that the quantity of provision for the District is sufficient, however, the quality of provision servicing clubs insufficient at two sites (those being the Royal Agricultural College and The Cotswold School).

As it stands, the pitch at Rendcombe College serves no role in servicing demand but if suitable relationships could be forged with the school, it could theoretically act as a strategic reserve site or alternatively a home site for one of the clubs accessing poor quality provision.

Likewise, as highlighted in the preceding assessment report, Westonbirt School has plans to build a new full size hockey suitable pitch in 2023 and is not opposed to allowing community bookings for an appropriate club. This could further be an option is the usability of existing sites comes to a position in which a club may need to relocate.

Conclusion

There is a sufficient quality of pitches in the District to accommodate current hockey demand. However, quality improvements are needed at existing sites to sustain current home venues for Cirencester HC and Bourton and Sherbourne HC.

Future opportunities to access provision at Rendcombe College and Westonbirt College may also present opportunities as strategic reserve sites if suitable relationships can be forged between clubs and providers. This may require England Hockey or the Active Partnership to support relationship management. In the case of Westonbirt College, the Gen 2 pitch development planning application has a community use agreement stipulation outlined.

Converting sand-based AGPs to 3G

Since the introduction of 3G pitches and given their popularity for football, providers have seen this as a way of replacing their tired sand-based carpet and generating money from hiring out a 3G pitch to football clubs and commercial football providers. This has come at the expense of hockey, with players now travelling further distances to gain access to a suitable pitch and many teams being displaced from their preferred geographical area.

Due to its impact on hockey, it is appropriate to ensure that sufficient sand-based AGPs are retained for the playing development of the sport. To that end, a change of surface should require a planning application and, as part of that, the applicants should have to show that there is sufficient provision available for hockey in the locality. Opportunities to incorporate this into planning policy should therefore be explored, and advice from Sport England and EH should also be sought prior to any planning application being submitted.

It should also be noted that, if a surface is changed, it could require the existing sports lighting to be changed and, in some instances, noise attenuation measures may need to be put in place.

The 3G surface is limited in the range of sport that can be played or taught on it. Those proposing a conversion should take advice from the appropriate sports' governing bodies or refer to Sport England guidance 'Selecting the Right Artificial Grass Surface[13].

Recommendations

- Protect all sand based AGPs for continue hockey use.
- Improve quality of the AGP at the Royal Agricultural College and The Cotswold School.
- Ensure all hockey suitable AGPs have a sinking fund in place for their eventual refurbishment.
- Work to secure community access to provision which is planned for development in the future through a secure community use agreement.
- Ensure that any residential development considers potential increases in demand for the sport and that new provision or contributions are properly sought through utilisation of the Sport England Playing Pitch Calculator.

[13] Link to Sport England Guidance for outdoor surfaces

Polo

Assessment Report summary

Polo - summary

- There is a total of 25 polo pitches across five sites in Cotswold.
- There are four polo clubs identified within Cotswold, all of which, are located within the South Analysis Area.
- All provision provided across Cotswold is of a good quality.
- There is an adequate amount of polo pitches to meet the needs of both current and future demand.

Recommendations

- Protect the existing supply of provision as to ensure current and future demand for polo can be accommodated within the District.
- Sustain current quality of provision on existing pitches.

PART 5: STRATEGIC RECOMMENDATIONS

The strategic recommendations for the Strategy have been developed via the combination of information gathered during consultation, site visits and analysis which culminated in the production of an assessment report, as well as key drivers identified for the Strategy. They reflect overarching and common areas to be addressed, which apply across playing pitch and outdoor sport facilities and may not be specific to just one sport.

AIM 1

To **protect** the existing supply of outdoor sport facilities and ancillary facilities where it is needed for meeting current and future needs.

Recommendations:

a. Ensure, through the use of the PPS, that outdoor sport facilities are protected through the implementation of local planning policy.

b. Secure tenure and access to sites for high quality, development minded clubs, through a range of solutions and partnership agreements.

c. Maximise community use of education facilities where needed.

Recommendation (a) – Ensure, through the use of the PPS, that outdoor sport facilities are protected through the implementation of local planning policy.

The PPS shows that all existing playing field and outdoor sport sites cannot be deemed surplus to requirements because of shortfalls now and in the future. As such, all provision requires protection or replacement until all identified shortfalls have been overcome. This includes lapsed, disused (including any which may not have been identified in this document) underused and poor quality sites as there is a requirement for such provision to help meet and alleviate the identified shortfalls.

When shortfalls are evident, provision can only be permanently lost when the current picture changes to the extent that the site in question is no longer needed as a result of no shortfalls existing, or unless replacement provision is provided and agreed upon by all stakeholders. NPPF paragraph 99 states that existing open space, sports and recreational buildings and land, including playing fields, should not be built on unless:

- An assessment has been undertaken which has clearly shown the open space, buildings or land to be surplus to requirements; or
- The loss resulting from the proposed development would be replaced by equivalent or better provision in terms of quantity and quality in a suitable location; or
- The development is for alternative sports and recreational provision, the needs for which clearly outweigh the loss.

The PPS should be used to help inform development management decisions that affect existing or new playing pitch provision and accompanying ancillary facilities. All applications are assessed by the Local Planning Authority on a case-by-case basis taking into account site specific factors. In addition, Sport England is a statutory consultee on planning applications that affect or prejudice the use of playing field used within the last five years. They will use the PPS to help assess the planning application against its Playing Fields Policy.

Policy Exception E1:

'A carefully quantified and documented assessment of current and future needs has demonstrated to the satisfaction of Sport England that there is an excess of playing field provision in the catchment, and the site has no special significance to the interests of sport'.

Where the PPS cannot demonstrate that the site, or part of a site, is clearly surplus to requirements then replacement of the site, or part of a site, will be required to comply with the remaining Sport England policy exceptions.

Policy Exception E2

'The proposed development is for ancillary facilities supporting the principal use of the site as a playing field and does not affect the quantity and quality of playing pitches or otherwise adversely affect their use'.

Policy Exception E3

'The proposed development affects only land incapable of forming part of a playing pitch and does not:

- Reduce the size of any playing pitch;
- Result in the inability to use any playing pitch (including the maintenance of adequate safety margins and run-off areas);
- Reduce the sporting capacity of the playing field to accommodate playing pitches or the capability to rotate or reposition playing pitches to maintain quality;
- Result in the loss of other sporting provision or ancillary facilities on the site;
- Prejudice the use of any remaining areas of playing field on the site'.

Policy Exception E4:

'The playing field or fields to be lost as a result of the proposed development would be replaced, prior to the commencement of development, by a new playing field site or sites:

- of equivalent or better quality and
- of equivalent or greater quantity;
- in a suitable location and;
- subject to equivalent or better management arrangements.

Policy Exception E5

'The proposed development is for an indoor or outdoor facility for sport, the provision of which would be of sufficient benefit to the development of sport as to outweigh the detriment caused by the loss, or prejudice of use, of the area of playing field'.

Disused sites should also be protected from development or replaced in accordance with Sport England's policy exceptions as they currently provide a solution to reducing identified shortfalls. Any disused playing fields are included within this Action Plan together with a recommendation in relation to bringing the site back into use or to mitigate the loss on a replacement site to address the shortfalls identified.

It may be appropriate to consider rationalisation of certain low value playing pitch sites (i.e. one/two pitch sites with no changing provision) to generate investment and focus resources towards creating bigger and better quality venues (hub sites). Such sites could then be re-purposed to meet other recreational needs or, if appropriate and agreed could be developed for other uses. It is vital, however, that there is no net loss of facilities and that replacement provision is in place and available for use prior to existing provision being lost.

Recommendation (b) – Secure tenure and access to sites through a range of solutions and partnership agreements.

Unlike some authorities nationally, there is not too much an overreliance for on the education sector to provide for most of the demand for playing pitch & outdoor sport facilities. However, where this is the case, particularly for the likes of hockey, it is imperative that future opportunities to secure tenue for clubs is explored and progressed where possible.

The following schools provide community use to clubs. These clubs and the sport are detailed in the table below.

Table 5.1: Known use of education sites

School	Club	Sport
Royal Agricultural School	Forest Green Rovers Youth FC Cirencester HC	Football Hockey
Sir William Romney	Tetbury FC Juniors Tetbury RFC	Football Rugby Union
The Cotswold School	Bourton and Sherbourne HC	Hockey
Cirencester Deer Park School	Cirencester HC	Hockey

Not having fully formalised usage presents a risk for those clubs using these sites as community use could technically be terminated at any time.

For unsecure sites, NGBs, Sport England and other appropriate bodies such as England Hockey can often help to negotiate and engage with providers where the local authority may not have direct influence. This is particularly the case at sites that have received funding from these bodies or are going to receive funding in the future as community access can be a condition of any agreement.

In the context of the Comprehensive Spending Review[14] which announced significant public spending cuts, it is increasingly important for the Council to work with voluntary sector organisations to enable them to take greater levels of ownership and support the wider development and maintenance of facilities. To facilitate this, where practical, the Council should support and enable clubs to generate sufficient funds, providing this is to the benefit of sport.

The Council (including parish and town councils) and private landlords (as relevant) should further explore opportunities where security of tenure could be granted via lease agreements (minimum 25 years as recommended by Sport England and NGBs) so that clubs are in a position to apply for external funding. This is particularly the case at poor quality sites, possibly with inadequate or no ancillary facilities, so that quality can be improved and sites developed.

Local sports clubs should be supported by partners including the Council (where relevant), parish and town councils and NGBs to achieve sustainability across a range of areas including management, membership, funding, facilities, volunteers and partnership work.

[14] Link to Government website

For example, club development should be support and clubs should be encouraged to develop evidence of business and sports development plans to generate income via their facilities.

All clubs could be encouraged to look at different management models such as registering as Community Amateur Sports Clubs (CASC)[15]. They should also be encouraged to work with partners locally, such as volunteer support agencies or local businesses.

Each club interested in leasing a council site (including those from parish and town councils) should be required to meet service and/or strategic recommendations. An additional set of criteria should also be considered, which takes into account club quality, aligned to its long-term development objectives and sustainability, as seen in the table below.

Table 5.2: Recommended criteria for lease of sport sites to clubs/organisations

Club	Site
Clubs should have NGB accreditation award. Clubs commit to meeting demonstrable local demand and show pro-active commitment to developing school-club links. Clubs are sustainable, both in a financial sense and via their internal management structures in relation to recruitment and retention policy for both players and volunteers. Ideally, clubs should have already identified (and received an agreement in principle) any match funding required for initial capital investment identified. Clubs have processes in place to ensure capacity to maintain sites to the existing, or better, standards.	Sites should be those identified as 'Local Sites' (recommendation d) for new clubs (i.e. not those with a district-wide significance) but that offer development potential. For established clubs which have proven success in terms of self-management 'Key Centres' are also appropriate. Sites should acquire capital investment to improve or be leased with the intention that investment can be sourced to contribute towards improvement of the site.

The Council (and likewise, Parish and Town Councils) could establish core outcomes to derive from clubs taking on a lease arrangement to ensure that the most appropriate are assigned sites. Outcomes may, for example, include:

- Increasing participation.
- Supporting the development of coaches and volunteers.
- Commitment to quality standards.
- Improvements (where required) to facilities, or at minimum retaining existing standards.

In addition, clubs should be made fully aware of the associated responsibilities/liabilities when considering leases of multi-use public playing fields. It is important in these instances that the site, to some degree, remains available for other purposes or for other users.

For clubs with lease arrangements already in place, these should be reviewed when fewer than 25 years remain to improve security of tenure and aid the attraction of funding; clubs with fewer than 25 years remaining on a lease agreement are unlikely to be eligible for external funding.

[15] http://www.cascinfo.co.uk/cascbenefits

Recommendation (c) - Maximise community use of education facilities where needed

To maximise community use of education facilities more coherent, structured relationship with schools is recommended. The ability to access good facilities within the local community is vital to any sports organisation, yet many clubs struggle to find good quality places to play and train.

A large number of sporting facilities are located on education sites and making these available to sports clubs can offer significant benefits to both the schools and local clubs, as well helping to reduce identified shortfalls. It is, however, common for school provision not to be fully maximised for community use, even on established community use sites.

Although there are a growing number of academies over which the Council has little or no control, it is still important to understand the significance of such sites and attempt to work with the schools where there are opportunities for community use. In addition, relevant NGBs have a role to play in supporting the Council to deliver upon this recommendation and communicating with schools where necessary to address shortfalls in provision.

Where new schools are provided in major new residential developments, they should be designed to facilitate community access, with opportunities for meeting the community's outdoor sports needs explored at the outset to maximise the potential for facility provision to be made within the developments, if appropriate. An example of this is ensuring the provision of youth 11v11 and/or youth 9v9 grass football pitches, given current shortfalls and their suitability for the playing format of students, or multi-use provision such as sports lit courts that can accommodate both tennis and netball activity.

As detailed earlier, NGBs, the Active Partnership and Sport England can often help to negotiate and engage with schools where the local authority may have limited direct influence. This is particularly the case at sites that have received funding from the relevant bodies or are going to receive funding in the future as community access can be a condition of the funding agreement.

AIM 2

To **enhance** outdoor sports facilities and ancillary facilities through improving quality and management of sites.

Recommendations:

d. Maintain quality and seek improvements where necessary.

e. Adopt a tiered approach (hierarchy of provision) to the management and improvement of sites.

f. Work in partnership with stakeholders to secure funding.

g. Secure developer contributions.

Recommendation (d) – Improve quality

There are several ways in which it is possible to increase pitch quality and these are explored below.

Ground Management Association (GMA) Pitch Advisory Service

With quality of grass pitches becoming one of the biggest influences on participation, the Pitch Advisory Service (PAS, formerly the Grounds and Natural Turf Improvement Programme) was launched in 2014 and is funded by the GMA and its partners; the Football Foundation, Sport England, FA, ECB, RFU and RFL.

Its aim is to raise the standards of sports surfaces as well as the understanding of sports turf management practices among grassroots clubs across England and Wales. The PAS provides an enhanced network of support and expertise available to those maintaining natural turf pitches, particularly at a local level.

The service can be utilised by grassroots clubs, organisations and local authorities with the simple aim of improving the quality of grass pitches. The key principles behind the service are to provide members of the programme with advice/practical solutions via a report which will also identify the key enhanced maintenance works required along with machinery requirements.

Pitch providers are encouraged to complete a self-assessment of pitches using the Football Foundation PitchPower app. In August 2022, PitchPower was re-launched, with enhanced capability to support use beyond football pitches and is now accessible for the assessment of natural turf pitches for cricket, rugby league and rugby union.

In relation to cricket specifically, maintaining high pitch quality is the most important aspect of the sport. If the wicket is poor, it can affect the quality of the game and, in some instances, become dangerous. The ECB recommends full technical assessments of wickets and pitches available through a Performance Quality Standard (PQS) assessment. The Performance Quality Standard Assessment assesses a cricket square to ascertain whether it meets the standards that are benchmarked by the Ground Management Association.

Football Foundation PitchPower Assessment

The Premier League, The FA and the Football Foundation are increasing efforts to improve the quality of grass pitches in England with the launch of the PitchPower app. Launched in 2020 alongside the Football Foundation Pitch Preparation Fund, The app is a new digital self-assessment tool to allow reports and recommendations to be made more quickly and easily once submitted for review by GMA regional pitch advisors.

The tool across mobile app and desktop is open to access by all providers, for example clubs, schools and local authorities. Following a PitchPower Assessment Report, organisations can work towards the recommended dedicated maintenance regime identified to improve the quality of their pitches.

In addition to non-technical assessments, a second assessment was undertaken for grass football pitches in April 2021 at 16 local authority managed/publicly accessible sites using the Football Foundation PitchPower app. Consequently, technical recommendations have been established through the PPS process for the local authority to act upon in delivering any improvement, whilst this exists at some club managed sites already.

Football Foundation Grass Pitch Maintenance Fund (GPMF)

Eligible clubs and organisations can also utilise the report as an evidence base to acquire potential funding streams, for example, to obtain the required maintenance equipment. If a PitchPower assessment categorises pitches as 'poor' or 'basic' they are then eligible to apply for funding through the Football Foundation through the Grass Pitch Maintenance Fund[16], a fund offering six-year tapered grants to help clubs enhance or sustain the quality of their grass pitches. The fund is a key part of the Football Foundation's Grass Pitch Improvement Programme - an ambition to deliver 20,000 good quality grass pitches by 2030. Clubs with good or standard quality pitches can also apply for a lower level of funding to improve and sustain quality.

All applicants must have the required security of tenure and have received a PitchPower Pitch Assessment Report, with the fund currently open to football clubs, leagues, and charities. Local authorities are not currently eligible applicants, however, clubs, leagues and charitable organisations using local authority sites can apply provided they have security of tenure.

The Council is not presently eligible to access the GPMF as an applicant, however, can undertake technical assessment of pitches using the PitchPower app. Opportunities to access the fund to support presently Council managed sites include establishment of a service level agreement with a resident club for maintenance responsibilities, or transfer of long-term management to the club/organisation through leasehold or CAT, both enabling the club/organisation to apply to the fund.

Furthermore, the Football Foundation also launched a new Groundskeeping Community online platform in 2019 which provides a resource of expert advice for grounds staff, enabling them to connect with peers, discover new tips and tricks and share advice on best industry practice. Users can seek guidance from the GMA regional pitch advisors, who are available to answer questions and update members on changes to industry standards.

[16] Link to grass pitch maintenance fund

Addressing overplay

In order to improve the overall quality of the outdoor facility stock; it is necessary to ensure that provision is not overplayed beyond recommended carrying capacity. This is determined by assessing quality (via a non-technical site assessment) and allocating a match limit to each (daily for hockey, weekly for football and rugby union and seasonal for cricket).

The FA, RFU, RFL, ECB and EH all recommend a number of matches that pitches should take based on quality, as seen in the table below. For other grass pitch sports, no guidelines are set by the NGBs although it can be assumed that a similar trend should be followed.

Table 5.3: Capacity of pitches

Sport	Pitch type	No. of matches		
		Good quality	Standard quality	Poor quality
Football	Adult pitches	3 per week	2 per week	1 per week
	Youth pitches	4 per week	2 per week	1 per week
	Mini pitches	6 per week	4 per week	2 per week
Rugby union	Natural Inadequate (D0)	2 per week	1.5 per week	0.5 per week
	Natural Adequate (D1)	3 per week	2 per week	1.5 per week
	Pipe Drained (D2)	3.25 per week	2.5 per week	1.75 per week
	Pipe and Slit Drained (D3)	3.5 per week	3 per week	2 per week
Cricket	One grass wicket One synthetic wicket	5 per season 60 per season	4 per season	0 per season
Hockey	Full size AGP	4 per day	4 per day	4 per day
Polo	Pitches	N/A	N/A	N/A

It is imperative to engage with clubs to ensure that sites are not played beyond their capacity. Where overplay is identified, play should be encouraged, to transfer to alternative venues that are not operating at capacity. Alternatively quality, should be improved to increase capacity to appropriate levels. Where play is transferred, this may include transferring play to 3G pitches or to sites not currently available for community use but which may be in the future.

For cricket, an increase in the usage of NTPs (or hybrid wickets when suitable) is key to alleviating overplay as this allows for the transfer of junior demand from grass wickets. It also does not require any additional playing pitch space as NTPs can be installed adjacent to existing squares.

For rugby union, most overplay can be resolved through improvements to pitch maintenance or via capital drainage solutions. Only Stow-on-the-Wold RFC has a need options outside of enhancing existing provision.

As mentioned earlier, there are also sites that are poor quality that are not overplayed. These should not be overlooked as often poor quality sites have less demand than others but demand could increase if the quality were improved. It does, however, work both ways as potential improvements may make sites more attractive and therefore more popular, which in the long run can lead again to them becoming poor quality pitches if not properly maintained.

Improving changing provision

There is a need to address changing provision at some sites in the District, these are generally centred at either club or parish/town council managed sites.

Sites which predominantly accommodate adult and/or older junior age group sports should be prioritised for improvements, whilst there is a trend for younger junior age groups (particularly for football) not to require use of changing provision, with suitable male and female toilet provision for players and spectators considered to be of greater importance.

The following sites are identified locally as ones where improvements are needed:

- Baunton Lane Playing FIeld
- Fairford RFC
- Ampney Crucis Cricket Club
- Horcott Road Playing Fields
- Barnsley Beeches Cricket Club
- Maurice Thornton Playing Fields
- Chedworth Cricket Club
- Mickleton Sports Club
- Cockrup Farm (Williamstrip CC)
- Naunton Recreation Ground
- Cowley Cricket Club
- North Cerney Cricket Club
- Duntisbourne Abbots Cricket Club
- Tarbarrow Cricket Club
- Everyone Active Chipping Camden
- Tetbury Town FC / Tetbury RFC
- Fairford Cricket Club
- Willersey Recreation Ground

In addition to the above, Cirencester CC has a purpose and vision strategy of enhancing its site, of which improving its existing clubhouse by 2025 is one of the main goals. This should be supported as by relevant partners to ensure it can continue to be one of the leading cricket clubs in the region.

Further to the above, King George's (Stow on the Wold), Sherbourne Playing Fields, Hatherop Playing Fields and Chipping Campden Recreation Ground each site has been excluded from Table 2.6 as they do not have any form of ancillary provision. In the case of Chipping Campden Recreation Ground, football users are not granted access to the Baden Powell Centre which is located on site.

Recommendation (e) – Adopt a tiered approach (hierarchy of provision) to the management and improvement of sites

To allow for facility developments to be programmed on a phased basis the Council should adopt a tiered approach to the management and improvement of outdoor sport sites and associated facilities. Please refer to Part 6: Action Plan for the proposed hierarchy.

Recommendation (f) – Work in partnership with stakeholders to secure funding

Partners should ensure that appropriate funding secured for improved sports provision is directed to areas of need, underpinned by a robust strategy for improvement in outdoor sport provision and accompanying ancillary facilities.

To address community need a coordinated approach to strategic investment is required. In delivering this recommendation, the Council should maintain a regular dialogue with local partners through the PPS Steering Group.

Although some investment in new provision will not be made by the Council directly, it is important that the Steering Group directs and leads a co-ordinated approach to facility development whether made at/by education sites, NGBs, sports clubs and the commercial sector. This is to ensure that the extent to which it addresses community need is optimised and duplication is avoided.

One of sport's key contributions is its positive impact on public health. It is therefore important to lever in investment from other sectors such as, for example, health and wellbeing. Sport and physical activity can have a profound effect on peoples' lives, and plays a crucial role in improving community cohesion, educational attainment and self-confidence.

Recommendation (g) – Secure developer contributions

It is important that this strategy informs policies and supplementary planning documents by setting out the approach to securing sport and recreational facilities through new housing development contributions.

For playing pitches, it is recommended the Council use Sport England's Playing Pitch Calculator as a tool for helping to determine the additional demand for pitches and to estimate the likely developer contribution required linking to sites within the locality. This should form part of the Council working with Sport England to develop a process and guidance for obtaining developer contributions.

The calculator uses the current number of teams by sports pitch type contained within the Assessment Report and calculates the percentage within each age group that play that sport. That percentage is then applied to the population growth. The additional teams likely to be generated are then converted into match equivalent sessions and associated pitch requirements in the peak period, with the associated costs (both for providing the pitch/facility and for its life cycle) then given. The calculator splits the requirement into peak time demand for natural turf pitches, training demand for artificial grass pitches, and the number of new changing rooms required.

The PPS should be used to help determine the likely impact of a new development on demand and the capacity of existing sites in the area, and whether there is a need for improvements to increase capacity of existing provision or if new provision is required. Where a development is located within access of existing high-quality provision, this does not necessarily mean that there is no need for further provision or improvement to existing provision, as additional demand arising from the development is likely to result in increased usage (which can result in overplay or quality deterioration).

Where it is determined that new provision is required to accompany a development, priority should be placed on providing facilities that contribute towards alleviating existing shortfalls within the locality. To determine what supply of provision is provided, it is imperative that the PPS findings are taken into consideration and that for particularly large developments consultation takes place with the relevant NGBs and Sport England. This is due to the importance of ensuring that the stock of facilities provided is correct to avoid provision becoming unsustainable and unused. The preference is for multi-pitch and potentially multi-sport sites to be developed, supported by a clubhouse and adequate parking facilities which consider the potential for future AGP development. This is because single-pitch facilities are more likely to become under-used (or unused), unviable and unsustainable.

It is recognised that consultation cannot take place with NGBs for every development due to resource restrictions.

Instead, it is recommended that such discussions take place within PPS Steering Group meetings, which should take place regularly following adoption of the study as part of the ongoing monitoring and evaluation process. It is recommended that these take place every 6-12 months and inform the annual review/update (see Part 8 for further information).

The guidance should form the basis for negotiation with developers to secure contributions to include provision and/or enhancement of appropriate provision and subsequent maintenance. S106 contributions could also be used to improve the condition and of the pitches in order to increase pitch capacity to accommodate more matches.

Sport England recommends that a number of objectives should be implemented to enable the above to be delivered:

- Planning consent should include appropriate conditions and/or be subject to specific planning obligations. Where developer contributions are applicable, a S106 agreement or equivalent must be completed that should specify, when applied, the amount that will be linked to Sport England's Building Cost Information Service from the date of the permission and timing of the contribution/s to be made.
- Contributions should also be secured towards the first ten years of maintenance on new pitches (lifecycle costs), the cost of which is indicated by the Sport England Playing Pitch Calculator. NGBs and Sport England can provide further and up to date information on the associated costs.
- External funding should be sought/secured to achieve maximum benefit from the investment into appropriate facility enhancement, alongside other open space provision, and its subsequent maintenance.
- Where new provision is provided, appropriate changing rooms and associated car parking should be located on site.
- All new or improved outdoor sports facilities on school sites should be subject to community use agreements.

AIM 3
To **provide** new outdoor sport facilities where there is current or future demand to do so.

Recommendations:

h. Rectify quantitative shortfalls through the current stock.

i. Identify opportunities to add to the overall stock to accommodate both current and future demand.

Recommendation (h) - Rectify quantitative shortfalls through the current stock

The Council and its partners should work to rectify identified inadequacies and meet identified shortfalls as outlined in the preceding Assessment Report and the sport-by-sport specific recommendations (Part 4) as well as the following Action Plan (Part 6).

It is important that the current levels of provision are protected, maintained and enhanced to secure provision both for now and in the future. Maximising use of existing provision through a combination of the following will help to reduce shortfalls and accommodate future demand:

- Improving quality in order to improve the capacity to accommodate more demand.
- Transferring demand from overplayed sites to sites with spare capacity.
- The re-designation of facilities e.g. converting an unused pitch (or pitch type) for one sport to instead cater for another sport (or another pitch type).
- Securing community use at school sites including those currently unavailable.
- Working with commercial and private providers to increase usage.

Unmet demand, changes in sport participation and trends, and proposed housing growth should be recognised and factored into future facility planning. Assuming an increase in participation and housing growth occurs, it will impact on the future need for certain types of sports facilities. Sports development work also approximates unmet demand which cannot currently be quantified (i.e. it is not being suppressed by a lack of facilities) but is likely to occur. The following table highlights the main development trends in each sport and their likely impact on facilities. However, it is important to note that these may be subject to change.

Furthermore, retaining some spare capacity allows some pitches to be rested to protect overall pitch quality in the long-term. Therefore, whilst in some instances it may be appropriate to redesignate a senior pitch where there is low demand identified a holistic approach should be taken to re-designation for the reasons cited. The site-by-site action planning will seek to provide further clarification on where re-designation is suitable.

The PPS identifies priority sites that should be focused upon, including those that are presently overplayed and/or poor quality, or unused sites that are particularly large. It also advises how issues can be overcome.

Recommendation (i) - Identify opportunities to add to the overall stock to accommodate both current and future demand

The Steering Group should use and regularly update the Action Plan within this Strategy. The Action Plan lists recommendations for each site, focused upon both qualitative and quantitative improvements, which if delivered will lessen the need for new provision.

Linked to the above and as evidenced in Part 4, although there are identified shortfalls of match equivalent sessions, most current and future demand is currently being met and most shortfalls can be addressed via quality improvements and/or improved access to sites that are presently used minimally or that are currently unavailable. Adding to the current stock, particularly in the short term, is therefore not recommended as a priority, except for 3G pitches and the shortfall for which cannot be reduced without new stock.

However, the one exception to the above is at Stow-on-the-Wold RFC where there the club would benefit from land acquisition for the development of one additional senior rugby union pitch (or dedicated sports lit training area to the equivalent size of a senior pitch).

Notwithstanding the above, large scale housing developments and the establishment of new schools may also necessitate the need for new provision. Where new schools are developed, there is an opportunity to combine the building of the school to the development of a new multi-sport site that will be of a benefit to the school as well as the wider community.

For housing developments, as outlined in Recommendation (g), Sport England's Playing Pitch Calculator can be used as a guide to inform requirements. See Part 7 for further information.

PART 6: ACTION PLAN

The site-by-site action plan seeks to address key issues identified in the preceding Assessment Report. It provides recommendations based on current levels of usage, quality and future demand, as well as the potential of each site for enhancement. It is organised by analysis area and includes information pertaining to the sub sections below.

Site hierarchy

The Council should make it a high priority to work with NGBs and other partners to comprise a priority list of actions based on local priorities, NGB priorities and available funding. As stated in Recommendation (e), to allow for facility developments to be programmed within a phased approach, the Council should adopt a tiered approach to the management and improvement of playing pitch sites and associated facilities.

The identification of sites is based on their strategic importance in a District-wide context i.e., they accommodate the majority of demand, or the recommended action has the greatest impact on addressing shortfalls identified either on a sport-by-sport basis or across the Council area as a whole.

Table 6.1: Tiered site criteria

Criteria	Hub sites	Key centres	Local sites
Site location	Strategically located in the district. Priority sites for NGBs.	Strategically located within the analysis area.	Services the local community.
Site layout	Accommodates three or more grass pitches, generally including provision of an AGP (or with the potential).	Accommodates two or more grass pitches.	Accommodates one or two pitches.
Type of sport	Multi-sport provision. Could also operate as a central venue.	Single or multi-sport provision.	Generally single sport provision but may cater for two.
Management	Management control allows for wide community use, i.e., through the local authority, a leisure operator or a school with a community use agreement.	Management control generally allows for wide community use but may include sites that are owned or leased by clubs/other organisations.	Management control can be via the local authority, schools, clubs and other providers such as town or parish councils
Maintenance regime	Maintenance regime aligns or could align with NGB guidelines.	Maintenance regime aligns or could align with NGB guidelines.	Standard maintenance regime or an in-house maintenance contract.
Ancillary facilities	Good quality ancillary facilities on site (or potential), with sufficient changing rooms and car parking to serve the number of pitches; may include wider social/function facilities.	Good quality ancillary facility on site (or potential), with sufficient changing rooms and car parking to serve the number of pitches.	Limited or no changing room access on site.

Hub sites are of district wide importance where users are willing to travel to access the range and high quality of facilities offered and are likely to be multi-sport.

These have been identified on the basis of the impact that the site will have on addressing the issues identified in the assessment.

Key centres are more community focused, although some are still likely to service a wider analysis area (or slightly wider); however, there may be more of a focus on a specific sport i.e., a dedicated site.

It is considered that some financial investment may be necessary to improve the facilities at both hub sites and key sites. This could be to improve the provision, create additional provision (e.g., a 3G pitch) or to enhance the ancillary facilities in terms of access, flexibility (i.e., single-sex changing if necessary) and quality as well as ensuring that they meet the rules and regulations of local competitions.

Local sites refer to those sites offering minimal provision or that are of minimal value to the wider community. Primarily they are sites with one pitch/facility or a low number of pitches/facilities that service just one or two sports (e.g., bowling green sites).

For local sites, consideration should be given, on a site-by-site basis, to the feasibility of a club taking on a long-term lease (if not already present), in order that external funding can be sought. Such sites will require some level of investment, either to the outdoor sport facilities or ancillary facilities and is it anticipated that one of the conditions of offering a hire/lease is that the Club would be in a position to source external funding to improve/extend the provision.

Other sites considered in this tier may be primary school sites or secondary school sites that are not widely used by the community or that do not offer community availability.

Partners

The column indicating partners in the Action Plans below refers to the main organisations that the Council (or the relevant provider) would look to work with to support delivery of the actions.

Given the extent of potential actions, it is reasonable to assume that partners will not necessarily be able to support all the actions identified but where the action is a priority and resource is available the partner will endeavour to assist.

As all sites sit within the local authority area, the Council is considered to be a partner for each identified action (as the column indicates partners for the Council) and is therefore not included. However, it is acknowledged that it will take on more of a leading role for some specific sites and some specific actions (e.g., at council venues).

Priority

Although hub sites are mostly likely to have a **high** level actions, as they have wide importance, high priority sites have been identified on the basis of the impact that the site will have on addressing the key issues identified in the assessment. Therefore, some key centres and local sites are also identified as having a high priority level. It is these projects/sites which should generally, if possible, be addressed within the short term (1-2 years).

The majority of key centres have **medium** priority actions. These have analysis area importance and are identified on the basis of the impact that they will have on addressing the issues identified in the assessment, although not to the same extent as high priority actions.

The **low** priority actions tend to be for single pitch or single sport sites and often club or education sites with local specific importance but that may also contribute to addressing the issues identified in the assessment for specific users. Whilst low priority, there may be opportunities to action some of the recommendations made against such sites relatively quickly e.g., through S106 funding.

Costs

The strategic actions have also been ranked as low, medium, or high based on cost. The brackets are:

- (L) -Low - less than £50k
- (M) -Medium - £50k-£250k
- (H) -High £250k and above

These are based on Sport England's estimated facility costs which can be found at:
Link to Facility cost guidance Sport England

Timescales

The Action Plan has been created to be delivered over a ten-year period and the information within the Assessment Report, Strategy and Action Plan will require updating as developments occur. The indicative timescales relate to delivery times and are not priority based:

- (S) -Short (1-2 years)
- (M) - Medium (3-5 years)
- (L) - Long (6+ years)

Aim

Each action seeks to meet at least one of the three Sport England aims of the Strategy; **Enhance, Provide, Protect.**

MID ANALYSIS AREA

Summary pitch sports (Mid Area)

Sport	Analysis area	Current demand		Future demand (2031)[17]
		Pitch type	Current capacity total in MES[1]	Future capacity total in MES
Football (grass pitches)	Mid	Adult	At capacity	At capacity
		Youth 11v11	Spare capacity of 1	Spare capacity of 0.5
		Youth 9v9	Shortfall of 0.5	Shortfall of 0.5
		Mini 7v7	At capacity	At capacity
		Mini 5v5	At capacity	At capacity
	Cotswold	Adult	Shortfall of 1	Shortfall of 2
		Youth 11v11	Shortfall of 1.5	Shortfall of 5.5
		Youth 9v9	Spare capacity of 3.5	Spare capacity of 3
		Mini 7v7	Spare capacity of 2.5	Spare capacity of 2.5
		Mini 5v5	Spare capacity of 1	At capacity
Football (Full size 3G pitches measuring minimum dimension of 91 x 55m)	Mid	Full size, sports lit	Shortfall of 1	Shortfall of 1
	Cotswold	Full size, sports lit	Shortfall of 2.75	Shortfall of 3.25
Cricket	Mid	Saturday	Spare capacity of 48	Spare capacity of 48
		Sunday	Spare capacity of 60	Spare capacity of 60
		Midweek	Spare capacity of 114	Spare capacity of 114
	Cotswold	Saturday	Spare capacity of 79	Shortfall of 5
		Sunday	Spare capacity of 127	Spare capacity of 115
		Midweek	Spare capacity of 277	Spare capacity of 247
Rugby union	Mid	Senior	Shortfall of 3.25	Shortfall of 3.25
	Cotswold	Senior	Shortfall of 5.75	Shortfall of 6.75
Hockey (Sand based AGP measuring a minimum of 97.4 x 55m)	Cotswold	Full size, sports lit	Sufficient supply if quality improvements are undertaken.	Sufficient supply if quality improvements are undertaken.
Polo	Cotswold	Pitches	Sufficient supply	Sufficient supply

[17] Future demand (2031) is determined via ONS forecasts and club aspirations identified in PPS Assessment Report (2022).
[1] MES – match equivalent sessions per week (per season for cricket).

Site ID	Site	Sport	Management	Current status	Recommended actions	Partners	Site hierarchy tier	Priority	Timescales [18]	Cost[19]	Aim
3	Andoversford Sports and Social Club	Football	Sports Club	One standard quality adult pitch which is use by Andoversford FC. The pitch has actual spare capacity of 0.5 MES.	Sustain quality to accommodate for existing demand.	Sports Club GFA, FF	Local	L	L	L	Protect
		Cricket		One standard quality cricket square with a standard quality outfield. Site has actual spare capacity for additional Saturday, Sunday, and midweek play.	Sustain quality of the square and consider options to maximise available spare capacity.	Sports Club ECB GCB		L	L	L	
10	Bourton on the Water Primary Academy	Football	School	Two poor quality mini 5v5 pitches which are not available for community use.	Protect for curricular use.	School GFA, FF	Local	L	L	L	Protect
11	Bourton Rovers Football & Social Club	Football	Sports Club	One standard quality adult pitch used by both Bourton Rovers FC and Bourton Rovers YFC. Site is overplayed by 0.5 MES. Adult pitch is overmarked to accommodate youth demand. It has ambitions to modernise the interior of its function room, install a new patio, extending its garage for additional storage and to install a ten metre ball striking net between the football pitch and cricket provision. Club received a £7.500 grant from Bourton Parish Council to fund its garage extension but requires an additional £5,000 for the enhancement.	Improve pitch quality through enhanced maintenance regime to alleviate overplay. Work with the Club towards its ancillary facility upgrades, such as a ball striking net, additional storage, modernising its function room and installing a patio.	Sports Club GFA FF	Local	M	M-H	M	Protect Enhance Provide
12	Bourton Vale Cricket Club	Football	Sports Club	One youth 11v11 pitch, one youth 9v9 pitch and one mini 7v7 pitch all of standard quality and used by Bourton Rovers YFC. Overplay of 0.5 MES is present on youth 11v11 pitch which is overmarked by a 5v5 pitch. Site hosts Bourton and Sherbourne HC for its post-match teas.	Improve pitch quality to alleviate known overplay. Ensure the relationship between the cricket club and hockey club is sustained to allow for a social outlet to be maintained for the hockey club.	Sports Club GFA FF	Locak	L	L	L	Protect Enhance
		Cricket		One good quality cricket square with a good quality outfield. Site has actual spare capacity for additional midweek play. Football pitches are marked on outfield of the cricket pitch. Ancillary provision supporting the site is good quality.	Sustain current maintenance regime as to preserve quality.	Sports Club ECB GCB		L	L	L	
13	Charlton Rovers AFC (Shipton Playing Fields)	Football	Sports Club	One adult pitch, one youth 11v11 pitch, one youth 9v9 pitch and one mini 7v7 pitch all of standard quality and used by Charlton Rovers YFC. Actual spare capacity of 1 MES is present on youth 11v11 pitch. However, youth 9v9 pitch is overplayed by 1 MES. Good quality clubhouse opened in 2022.	Work to improve the quality of pitches on site to enable a higher capacity of use.	Sports Club GFA FF	Local	M	L	L	Protect Enhance
41	Great Rissington Cricket Club	Cricket	Sports Club	One good quality cricket square with a good quality outfield. Site is overplayed by five sessions per season.	Sustain current maintenance regime as to preserve quality. Consider development of NTP or hybrid wicket	Sports Club ECB GCB	Local	L	L	L	Protect Provide

[18] (S) -Short (1-2 years); (M) - Medium (3-5 years); (L) - Long (6+ years)
[19] (L) -Low - less than £50k; (M) -Medium - £50k-£250k; (H) -High £250k and above

Site ID	Site	Sport	Management	Current status	Recommended actions	Partners	Site hierarchy tier	Priority	Timescales [18]	Cost[19]	Aim
					provision to enable a higher site capacity.						
46	King George V Playing Field (Northleach)	Football	Parish Council	One standard quality youth 11v11 pitch and one standard quality youth 9v9 pitch used by Northleach JFC. The site has actual spare capacity of one MES.	Maintain existing maintenance offer on the site accommodate existing levels of demand.	Parish Council GFA FF	Local	L	L	L	Protect Enhance
		Cricket		One poor quality cricket square with a good quality outfield. Site is overplayed by three sessions per season. Minety and Northleach CC state that Cricklade CC (Wiltshire) has a set of old roll on covers it is willing to gift to the Club if it can transport the equipment to the site.	Improve wicket quality through enhanced maintenance regime to alleviate overplay. Work with Cricklade CC to transport its old covers to the site, as to improve square quality.	Parish Council ECB GCB		M	S	L	
47	King Georges Field (Stow on the Wold)	Football	Town Council	One poor quality youth 9v9 pitch which is currently unused. Actual spare capacity is discounted due to poor quality.	Consider opportunities to utilise provision, including reconfiguration to alternate pitch formats to accommodate local demand.	Town Council GFA FF	Local	L	L	L	Protect Enhance
51	Longborough & Sezincote Cricket Club	Cricket	Private	One standard quality cricket square with a standard quality outfield. Site has actual spare capacity for additional Saturday, Sunday, and midweek play.	Utilise actual spare capacity for Saturday, Sunday and midweek play.	Private ECB GCB	Local	L	L	L	Protect Enhance
58	Naunton Recreation Ground	Cricket	Parish Council	One standard quality cricket square with a standard quality outfield. Site has no spare capacity.	Sustain quality of square and explore future options to improve the quality to enable a higher capacity to be generated.	Parish Council ECB, GCB	Local	L	L	L	Protect Enhance
61	Sherborne Playing Fields	Football	Council	One poor quality adult pitch with is used by Sherbourne Harriers FC.	Improve pitch quality through enhanced maintenance regime.	Council GFA FF	Local	L	L	L	Protect Enhance
67	Stow-On-the-Wold CC	Cricket	Council	Disused site that formerly provided a cricket square. Site now acts as a public park under the name of Queen Elizabeth II Field.	Consider the site as a strategic reserve site for cricket. The site will likely need modest investment (to be determined through an agronomy specialist) to reinstate of demand is established.	Council ECB GCB	Local	M	M	M	Protect Enhance Provide
68	Stow-on-the-Wold RFC	Rugby Union	Sports Club	Three good quality (M2/D1) senior grass pitches of which two are provided with sports lighting. The Club has ambitions of gaining a plot of land next to its site for the installation of a fourth pitch as to its junior and future demand. It also hopes to develop additional changing facilities for women's and girls' demand as well as a gym.	Support the club's aspiration to acquire adjacent land to increase its supply of senior pitches. Its existing provision cannot generate sufficient capacity to accommodate existing levels of demand for the site. Other options such as additional sports lighting for training areas should also be supported.	Sports Club RFU	Local	M-H	M-L	M-H	Protect Provide
69	Stow-on-the-Wold Primary School	Football	School	One poor quality mini 7v7 pitch which is unavailable for community use.	Protect for curricular use.	School GFA, FF	Local	L	L	L	Protect
75	The Cotswold School	Football	School	One poor quality adult pitch and two poor quality mini 5v5 pitches which are unavailable for community use. Bourton Rovers FC formerly accessed the sites pitches, however following Covid the provision is no longer community accessible.	Explore options to reinstate community use of grass pitches for the benefit of Bourton Rovers FC as to alleviate the clubs overplay at its home site. If reinstated, explore options to improve pitch quality to enable a higher capacity for use.	School GFA FF	Key Centre	M	S-M	L	Protect

Site ID	Site	Sport	Management	Current status	Recommended actions	Partners	Site hierarchy tier	Priority	Timescales [18]	Cost[19]	Aim
		Rugby Union		Three poor quality (M0/D0) senior pitches which are not open to community use.	Retain for curricular use.	School RFU		L	L	L	
		Cricket		One non community accessible square.	Retain for curricular use.	School ECB, GCB		L	L	L	
		AGP		One poor quality full sized, sports lit, sand filled AGP that was installed in 2005 and is available for community use. Site is accessed by Bourton and Sherbourne HC which do not have any form of tenure. The School confirm not having a sinking fund in place, with a bid to Sport England scheduled to be sent with the hope of securing funding for a replacement pitch.	Protect existing provision and work with relevant partners to secure sufficient funding for a carpet replacement.	School SE EH		H	S	H	
79	Withington Playing Field	Cricket	Parish Council	One poor quality cricket square with a standard quality outfield. The square sits on a slope and has weeds and dandelions growing on the square itself. Site is unused.	Consider using the un-used site as a second venue for larger clubs in the local area.	Council ECB GCB	Local	L	L	L	Protect
91	Aldestop CC	Cricket	Sports Club	One standard quality cricket square with a good quality outfield. Site has actual spare capacity for additional Sunday, and midweek play.	Sustain quality for current levels of use.	Sports Club ECB GCB	Local	L	L	L	Protect
97	Slaughters CC	Cricket	Sports Club	One standard quality cricket square with a good quality outfield. Site has actual spare capacity for additional Saturday, Sunday, and midweek play.	Sustain quality for current levels of use.	Sports Club ECB GCB	Local	L	L	L	Protect

Site ID	Site	Sport	Management	Current status	Recommended actions	Partners	Site hierarchy tier	Priority	Timescales [24]	Cost[25]	Aim
				The Club has a 25 year lease signed in 2009 with The Bathurst Estate and it is looking to extend this to enable it to secure grant funding opportunities. The Club raise frustrations with the quality of its main square with the West of England Division 2 league representatives deducting points due to its quality. The Club is considering a partially knitted (hybrid) wicket as to enhance its quality, as well as extending its boundary on the South side. The Club has a vision strategy of improving its existing clubhouse by 2025 which it estimates shall cost £200,000. It is looking to install a glass front wall, a new roof, re-tile its front patio and re-wire its electrics. It also hopes to develop a small second pavilion for its second square. The Club wishes to re-surface its existing fixed lane practice facility, as well as installing additional lanes to the site in an undetermined location.	Work with the Club and provide support where necessary/required to enable it to access grant funding and secure a longer term lease arrangement on suitable terms as to enable its aspirations for the site. Support its aspiration to develop its clubhouse as part of a multi-sport offer with hockey to allow it to be a focal point for cricket within the District. Work with the Club to explore the means of fulfilling the club's ambitions to develop its ancillary provision and training facility offerings. Given the clubs high performing first team, number of junior members attending ECB All Stars and Dynamos sessions and overall large demand identified, this should be seen as a priority for the area.						
18	Cirencester Deer Park School	Rugby Union	School	Two poor quality (M0/D0) senior pitches. Pitches are at capacity with curricular demand.	Improve pitch quality through enhance maintenance regime to better serve curricular demand.	School RFU	Key Centre	L	L	L	Protect Enhance
		Football		Two good quality adult pitches which are available for community use but not currently being used. Actual spare capacity on the site is discounted due to unsecure tenure.	Sustain current maintenance regime as to preserve quality.	School GFA FF		L	L	L	
		AGP		One standard quality full size, sports lit AGP that was installed in 2003, resurfaced in 2017 and is open to community use. The site is accessed by Cirencester HC for training and fixtures.	Protect existing provision. Look to replace the existing surface as to enhance quality and prevent the pitch from becoming disused.	School EH		H	M	H	
19	Cirencester Kingshill School	Football	School	Two standard quality adult pitches and two standard quality youth 9v9 pitches which are available for community use but currently unused.	Improve pitch quality from standard to good quality through enhanced maintenance regime.	School GFA FF	Key Centre	L	L	L	Protect Enhance
		Rugby Union		Two poor quality (M0/D0) senior pitches with no community use. Pitches are at capacity with curricular demand.	Improve pitch quality through enhanced maintenance regime to better serve curricular demand.	School RFU		L	L	L	
		Cricket		Site has one standalone NTP that is not open to community use.	Protect for curricular use.	School ECB, GCB		L	L	L	
20	Cirencester Park Polo Club	Polo	Sports Club	Eight good quality polo pitches which are available for community use. The Club states it struggles with junior members despite the neighbouring Cotswold Polo Academy (OKL Polo and Equestrians).	Sustain current maintenance regime to preserve quality. Look to form a partnership with a school as to increase junior membership rates.	Sports Club HPA	Local	L	L	L	Protect

Site ID	Site	Sport	Management	Current status	Recommended actions	Partners	Site hierarchy tier	Priority	Timescales [24]	Cost[25]	Aim
				It does not have a partnership with a school but would be willing to do so as to increase membership rates.							
21	Cirencester Park Polo Club (Jackbarrow)	Polo	Sports Club	One polo good quality pitch which is unavailable for community use.	Sustain current maintenance regime to preserve quality.	Sports Club HPA	Local	L	L	L	Protect
22	Cirencester Primary School	Football	School	Four poor quality mini 7v7 pitches that are unavailable for community use.	Retain for curricular use.	School GFA, FF	Local	L	L	L	Protect Enhance
23	Cirencester RFC	Rugby Union	Sports Club	Two good quality (M2/D1) senior pitches and one standard quality (M1/D1) senior pitch. Spare capacity across all pitches equating to 1.75 MES. None of the clubs' pitches are sports lit, with the site hosting a dedicated sports lit training area. The ancillary offer servicing the site is good quality with investment being driven into the site in 2022. The Club is hoping to install sports lights on one of its senior pitches in 2025, as well as raising the height of the sports lights on the dedicated sports lit training area.	Sustain current levels of provision as continue accommodating the current levels of demand on the site. The sports lit training area currently services most training demand, but further sports lighting of one senior pitch would also provide benefit to the rotation of training and abilities to host late night rugby matches.	Sports Club RFU	Local	M	L	L	Protect Enhance
25	Corinium Stadium	Football	Sports Club	Two adult pitches, two youth 9v9 pitches and two mini 7v7 pitches all good quality. Site is showing a combined actual spare capacity of 3.5 MES.	Sustain current maintenance regime to preserve pitch quality.	Sports Club GFA FF	Key Centre	L	L	L	Protect Enhance Provide
		3G		One standard quality FIFA approved, full size, sports lit 3G that was installed in 2017. Stadia pitch. Sports lighting needs replacing to a more energy efficient offer. Turnstiles also in need of replacement for the stadia site.	Work with the Club to upgrade its outdated turnstiles and look to enhance the clubs' sports lights as to reduce energy costs. Sustain quality of 3G pitch and ensure sufficient capital is in place to resurface the pitch when required.	Sports Club GFA FF		M	M	M	
				One good quality small sided, (55m x 37m) domed sports lit 3G that was installed in 2003 and resurfaced in March 2023. Pitch is open to community use and used to capacity. Pitch has been accounted for as 0.25 of a full sized pitch in the total current supply given its smaller scale and programming which includes a midweek league running twice a week.	Protect existing provision.						
26	Didmarton Playing Fields	Football	Council	One standard quality adult pitch with standard ancillary provision. Pitch is currently unused and has actual spare capacity of one MES.	Sustain quality and maximise use.	Council GFA FF	Local	L	L	L	Protect Enhance
		Cricket		One poor quality cricket square with a poor-quality outfield. Site has no actual spare capacity for additional Saturday, Sunday, and midweek play.	Improve pitch quality through enhanced maintenance regime to accommodate more demand.	Council ECB GCB		L	L	L	
27	Down Ampney Football	Football	Council	One poor quality adult pitch used by Down Ampney FC. Spare capacity is discounted due to poor quality.	Sustain quality and maximise use.	Council GFA, FF	Local	L	L	L	Protect Enhance

28	Duke of Gloucester Barracks	Football	M.O.D	One poor quality adult pitch which is unavailable for community use.	Retain for military use.	M.O.D GFA, FF	Local	L	L	L	Protect Enhance
32	Edgeworth Polo Club	Polo	Sports Club	Seven good quality polo pitches which are available for community use.	Sustain current maintenance regime to preserve quality.	Sports Club HPA	Local	L	L	L	Protect
33	England's Sports Ground	Football	Trust	One standard quality adult pitch which is used by Poulton FC. The site has actual spare capacity of 0.5 MES.	Sustain quality for existing use.	Trust GFA, FF	Key Centre	L	L	L	Protect Enhance
		Cricket		One good quality square with a good quality outfield that is accessed by Poulton CC which is currently trying to renew a longer-term agreement than its current rolling 12-month lease. Site has actual spare capacity for additional Sunday, and midweek play.	Sustain current maintenance regime to preserve quality.	Trust ECB GCB		L	L	L	
35	Fairford Cricket Club	Cricket	Trust	One standard quality cricket square with a good quality outfield. Site has no spare capacity. The Club is trying to negotiate a 25- or 50-year lease for the site, with its current lease expiring in 2025. The site has a poor-quality ancillary provision, with the Club hoping to develop a brand-new clubhouse given its small social space and poor changing rooms. The Club states having £70,000 in retained profits but estimates the total cost being much higher.	Improve pitch quality through enhanced maintenance regime. Work with the Club in its efforts to extend its existing lease. Following this support the Club in its work towards developing a new clubhouse.	Trust ECB GCB	Local	H	M	H	Protect Enhance Provide
36	Fairford RFC	Football	Council	One poor quality youth 11v11 pitch and two poor quality youth 9v9 pitches used by Fairford YFC. Youth 11v11 is overplayed by 0.5 MES.	Improve pitch quality through enhanced maintenance regime to alleviate overplay.	Council GFA FF	Key Centre	L	L	L	Protect Enhance
		Rugby Union		One poor quality (M0/D1) senior pitch used by Fairford RFC. Site has spare capacity of 0.5 MES. The site is set to be asset transferred from Gloucestershire CC to Fairford Town Council, which in return are expected to provide a long-term lease to Fairford RFC. The Club use a converted metal container with a basic shower offering as its changing rooms and Fairford CC for social activity. Both Fairford RFC and YFC confirm ambitions to develop a brand new ancillary provision at the site.	Improve pitch quality through enhanced maintenance regime. Work with the rugby and football clubs to enhance the existing ancillary provision offering.	Council RFU		M	M	H	
37	Fairford Town FC	Football	Sports Club	One good quality adult pitch and two standard quality adult pitches used by Fairford Town FC. The site has actual spare capacity of two MES. The Club highlights the need for a borehole to improve its irrigation offer in warmer months. It also stresses the need for additional changing facilities and parking to avoid using the grass near the pitch.	Where needed, support the Club through its need for an improved irrigation offer. Likewise, it should also be supported with developments relating to its ancillary provision and potential need for a small sided 3G pitch.	Sports Club GFA FF	Key Centre	M	M-L	M	Protect Enhance Provide

Improve pitch quality through enhanced maintenance regime to alleviate overplay on the site and to generate an additional small amount of spare capacity.	Council RFU	Local	L	L	L	Protect Enhance

Page 6599

PART 7: HOUSING GROWTH SCENARIOS

The PPS provides an estimate of demand for pitch sports based on population forecasts and club consultation to 2031 (in line with the Cotswold Local Plan). This future demand is translated into teams likely to be generated, rather than actual pitch provision required. The Sport England Playing Pitch Calculator adds to this, updating the likely demand generated for pitch sports based on housing increases and converts the demand into match equivalent sessions and the number of pitches required. This is achieved via team generation rates in the Assessment Report to determine how many new teams would be generated from an increase in population derived from housing growth and gives the associated costs of supplying the increased pitch provision.

In accordance with National Planning Policy Guidance, contributions should not be sought from developments of 10 units or less, and which have a maximum combined gross floor space of no more than 1,000 square metres (gross internal area). However, where over this threshold, it is recommended that the Council utilise the Playing Pitch Calculator.

Experience shows that housing sites with 600 dwellings or more are likely to generate demand for new provision to be created. For such large scale developments, consideration should be given to providing multi-pitch sites with suitable ancillary provision, including appropriate clubhouse/changing facilities and car parking. Single pitch sites which have been provided traditionally by developers are not considered to provide long term sustainable provision for the relevant sports.

Where demand does not warrant new pitch provision, the Action Plan in this document should be consulted to determine whether the additional demand can be accommodated via existing provision (in which case no further action is required). If this is not the case, contributions should be sought to enhance existing provision in the locality to accommodate the increased demand. This can be through, for example, improving quality, or providing new or improved ancillary provision. Consultation with appropriate NGBs should also be used to assist in the selection of suitable sites and suitable enhancements.

The scenarios below are provided as a guide to show the potential additional demand for pitch sports that could be generated from housing growth in Cotswold, thus showing how the calculator works and what it provides. The demand is shown in match equivalent sessions per week for most sports, except for cricket, where match equivalent sessions are by season. Training demand is expressed in either hours or match equivalent sessions. Where expressed in hours, it is expected that demand will be to either a 3G pitch (to accommodate football demand) or an AGP (to accommodate hockey demand). Where expressed in match equivalent sessions, it is expected training will take place on sports lit grass pitches (rugby).

Two example scenarios are explored below to give an indicative position on what growth may equate to for developments of similar size. The Council is still working on its specific growth requirements as part of its Local Plan Review and as such will refine numbers utilised in this scenario, for its own purposes, in the future.

- **Scenario One** – 100 dwelling development
- **Scenario Two** – 500 dwelling development

For reference, the indicative figures assume that population growth will average 2.4[26] per dwelling.

[26] The occupancy rate of 2.4 is in line with figures used in the 2021 Census.

Scenario One – 100 dwellings

The estimated additional population derived from housing growth from 100 dwellings with an occupancy rate of 2.4 per household is 2,400 people. This population increase equates to 0.08 match equivalent sessions of demand per week for grass pitch sports, 0.01 match equivalent sessions on a hockey suitable AGP and 1.05 match equivalent sessions of demand per season for cricket. Training demand equates to 0.17 hours of use per week for football on 3G pitches and 0.03 hours on a hockey suitable AGP.

Table 7.1: Likely demand for grass pitch sports generated from 100 dwellings

Pitch sport	Estimated demand by sport for 100 dwellings	
	Match demand per week[27]	Training demand[28]
Adult football	0.02	0.17 hours
Youth football	0.04	
Mini soccer	0.03	
Rugby union	0.02	0.02 match equivalent sessions
Rugby league	0.00	0.00 match equivalent sessions
Adult hockey	0.01	0.02 hours
Junior & mixed hockey	0.00	0.01 hours
Cricket	1.05	-

The table below translates estimated demand into new pitch provision with associated capital and lifestyle costs.

Table 7.2: Estimated demand and costs for new pitch provision

Pitch type	Estimated demand and costs for new pitches				Changing rooms	
	Number of pitches to meet demand	Capital cost[29]	Lifecycle Cost (per annum)[30]		Number	Capital cost
Adult football	0.02	£2,018	£426		0.04	£7,255
Youth football	0.04	£3,411	£716		0.05	£9,558
Mini soccer	0.03	£806	£169		0.00	£0
Rugby union	0.02	£2,660	£569		0.03	£6,276
Rugby league	0.00	£0	£0		0.00	£0
Cricket	0.02	£8,091	£1,634		0.05	£9,256
Sand based AGPs	0.00	£2,216	£69		0.00	£973
3G	0.00	£4,878	£174		0.01	£1,713
Total	**0.13**	**£24,081**	**£3,757**		**0.18**	**£35,031**

Overall, an additional 0.13 pitches would be required to meet additional demand arising from a 100 dwelling development. This consist of 0.13 grass pitches and a residual amount of access to artificial pitches, albeit not enough to warrant a figure within the above table. This would require an expected capital cost of £24,081 and a lifecycle cost per annum of £3,757.

[27] As per the PPS Guidance, demand for cricket is considered in terms of match equivalent sessions per season rather than per week.
[28] Hours equate to access to a full size sports lit 3G pitch or hockey suitable AGP
[29] Sport England Facilities Costs Third Quarter 2022 – Facility cost guidance | Sport England
[30] Lifecycle costs are based on the % of the total project cost per annum as set out in Sport England's Life Cycle Costs Natural Turf Pitches and Artificial Surfaces documents (2012)

To facilitate the increased provision, 0.18 changing rooms would need to be provided at a capital cost of £35,031.

As none of these figures represent full pitch or changing room developments, contributions to improve existing facilities within the vicinity of the development should be sought.

Scenario Two – 500 dwellings

The estimated additional population derived from housing growth from 500 dwellings with an occupancy rate of 2.4 per household is 1,200 people. This population increase equates to 0.41 match equivalent sessions of demand per week for grass pitch sports, 0.06 match equivalent sessions on a hockey suitable AGP and 5.27 match equivalent sessions of demand per season for cricket. Training demand equates to 0.83 hours of use per week for football on 3G pitches and 0.17 hours on a hockey suitable AGP.

Table 7.3: Likely demand for grass pitch sports generated from 500 dwellings

Pitch sport	Estimated demand by sport for 500 dwellings	
	Match demand per week[31]	Training demand[32]
Adult football	0.09	0.83 hours
Youth football	0.19	
Mini soccer	0.13	
Rugby union	0.08	0.10
Rugby league	0.00	0.00
Adult hockey	0.04	0.12
Junior & mixed hockey	0.02	0.05
Cricket	5.27	-

The table below translates estimated demand into new pitch provision with associated capital and lifestyle costs.

Table 7.4: Estimated demand and costs for new pitch provision

Pitch type	Estimated demand and costs for new pitches				Changing rooms	
	Number of pitches to meet demand	Capital cost[33]	Lifecycle Cost (per annum)[34]		Number	Capital cost
Adult football	0.09	£10,097	£2,130		0.18	£36,300
Youth football	0.19	£17,031	£3,577		0.24	£47,679
Mini soccer	0.13	£4,038	£848		0.00	£0
Rugby union	0.08	£13,291	£2,844		0.16	£31,358
Rugby league	0.00	£0	£0		0.00	£0
Cricket	0.12	£40,467	£8,174		0.24	£46,291
Sand based AGPs	0.01	£11,086	£344		0.02	£4,866
3G	0.02	£24,393	£868		0.04	£8,566
Total	**0.65**	**£120,403**	**£18,785**		**0.89**	**£175,061**

[31] As per the PPS Guidance, demand for cricket is considered in terms of match equivalent sessions per season rather than per week.
[32] Hours equate to access to a full size sports lit 3G pitch or hockey suitable AGP
[33] Sport England Facilities Costs Third Quarter 2022 – Facility cost guidance | Sport England
[34] Lifecycle costs are based on the % of the total project cost per annum as set out in Sport England's Life Cycle Costs Natural Turf Pitches and Artificial Surfaces documents (2012)

Overall, an additional 0.65 pitches would be required to meet additional demand arising from a 100-dwelling development. This consist of 0.61 grass pitches and 0.03 artificial grass pitches.

This would require an expected capital cost of £120,403 and a lifecycle cost per annum of £18,785. To facilitate the increased provision, 0.89 changing rooms would need to be provided at a capital cost of £175,061.

As none of these figures represent full pitch or changing room developments, contributions to improve existing facilities within the vicinity of the development should be sought.

Conclusion

For the example scenarios above, the tables show, that through housing growth relating to the developments, some demand will be generated for football, rugby union, hockey and cricket. However, the level of demand generated for each sport, will not require new provision to be provided. As such any new housing developments should look to support existing playing pitches within the District.

As the demand generated from the housing growth does not equate to a whole pitch for any of the sports, contributions for these size of developments would be better focused on improving existing sites in the locality to increase capacity to an appropriate level. The PPS and in particular the Action Plan, as well as future consultation with NGBs, should be used to inform this (e.g., to select suitable sites).

To provide the greatest impact, contributions from housing developments could be pooled together to improve key sites. The action plan identifies high priority sites which would likely provide the most benefit from investment. Key sites which would benefit from capacity and ancillary improvements are provided below, by analysis area.

PART 8: DELIVER THE STRATEGY AND KEEP IT ROBUST AND UP TO DATE

The section below is a generalised approach on how to deliver a PPS whilst also keeping it robust and up to date. However, a more tailored approach should also be considered and designed for the Cotswolds based on the requirements and priorities of the Steering Group.

Delivery

The PPS seeks to provide guidance for maintenance/management decisions and investment made across the Cotswolds. By addressing the issues identified in the Assessment Report and using the strategic framework presented in this Strategy, the current and future sporting and recreational needs of the District can be satisfied. The Strategy identifies where there is a deficiency in provision and recommends how best to resolve this in the future.

It is important that this document is used in a practical manner, is used to engage with partners and encourages partnerships to be developed, to ensure that outdoor sports facilities are regarded as a vital aspect of community life and which contribute to the achievement of Council priorities.

The creation of this document should be regarded as part of the planning process. The success of this Strategy and the benefits that are gained are dependent upon regular engagement between all partners involved and the adoption of a strategic approach. Each member of the steering group should take the lead to ensure the PPS is used and applied appropriately within their area of work and influence.

To help ensure the PPS is well used, it should be regarded as the key document within the study area guiding the improvement and protection of playing pitch and outdoor sport provision. It needs to be the document people regularly turn to for information on the how the current demand is met and what actions are needed to improve the situation and meet future demand. For this to be achieved, the Steering Group needs to have a clear understanding of how the PPS can be applied and therefore delivered.

The process of completing the PPS will hopefully have already resulted in a number of benefits that will help with its application and delivery. These may include enhanced partnership working across different agendas and organisations, pooling of resources along with strengthening relationships and understanding between different stakeholders and between members of the steering group and the sporting community. The drivers behind the PPS and the work to develop the recommendations and action plan will have also highlighted, and helped the steering group to understand, the key areas to which it can be applied and how it can be delivered.

Monitoring and updating

It is important that there is regular monitoring and review against the actions identified in the Strategy. This monitoring should continue be led by the local authority and supported by all members of, and reported back to, the Steering Group. Understanding and learning lessons from how the PPS has been applied should also form a key component of monitoring its delivery. It is possible that in the interim between reviews the Steering Group could also operate as a ‘virtual’ group; prepared to comment on suggestions and updates electronically when relevant.

It is agreed that the Council (potentially via consultants e.g., KKP) is responsible for keeping the database and background supply and demand information up to date in order that area-by-area action plans can be updated. This should be carried out in consultation with the NGBs, particularly around affiliation time when information is updated.

As a guide, if no review and subsequent update has been carried out within three years of the PPS being signed off by the steering group, then Sport England and the NGBs would consider it and the information on which it is based to be out of date. The nature of the supply and in particular the demand for provision is likely to change year-on-year, meaning that without any form of review and update it would be difficult to make the case that the supply and demand information and assessment work is sufficiently robust.

An annual review should not be regarded as a particularly resource intensive task. However, it should highlight:

- How the delivery of the recommendations and action plan has progressed and any changes required to the priority afforded to each action (e.g., the priority of some may increase following the delivery of others).
- How the PPS has been applied and the lessons learnt.
- Any changes to particularly important sites and/or clubs in the area (e.g., the most used or high quality sites for a particular sport) and other supply and demand information, what this may mean for the overall assessment work and the key findings and issues.
- Any development of a specific sport or particular format of a sport.
- Any new or emerging issues and opportunities.

Alongside regular steering group meetings a good way to keep the strategy up to date and maintain relationships is to hold sport specific meetings with the NGBs and other relevant parties. These meetings look to update the key supply and demand information, if necessary amend the assessment work, track progress with implementing the recommendations and action plan and highlight any new issues and opportunities.

These meetings could be timed to fit with the annual affiliation process undertaken by the NGBs which would help to capture any changes in the number and nature of sports clubs in the area. Other information that is already collected on a regular basis such as pitch booking records for local authority and other sites could be fed into these meetings.

The NGBs are also able to indicate any further performance quality assessments that have been undertaken within the study area.

Checklists

In order for this Strategy to be signed off by the steering group, a Stage D Checklist: Develop the Strategy, is signed off.

Stage D Checklist: Develop the Strategy	Tick ✓ Yes	Tick ✓ Requires Attention
Step 7: Develop the recommendations and action plan 1. Have a number of study area specific scenarios been looked at to help explore key issues and findings along with possible recommendations and actions?	✓	
2. Have any recommendations and actions regarding AGP provision taken into account the guidance in the 'Selecting the Right Artificial Surface' document and any NGB specific information?	✓	
3. Do the recommendations reflect the drivers, vision and objectives of the work?	✓	
4. Are the recommendations precise enough to enable the development of clear individual area, sport and site specific actions to help achieve them?	✓	
5. Have all relevant parties been engaged with the development of, and are signed up to the delivery of, the recommendations and actions?	✓	
6. Are the recommendations and actions clearly presented?	✓	
7. Has particular attention been paid to the situation at priority sites and those which are being significantly overplayed?	✓	
8. Have area, sport and site specific solutions been proposed to protect, enhance, and provide playing pitch provision to meet the current and future demand?	✓	
9. Has guidance on the future of any sites highlighted as being at risk been provided?	✓	
10. Do the recommendations and actions seek to make the best use of existing pitches?	✓	
11. Has the detriment and benefit of proposals to relocate provision been presented?	✓	
12. Has the level and type of any new playing pitch provision required been presented?	✓	
13. Has the importance of providing appropriate and fit for purpose ancillary facilities been highlighted in order to maximise the potential benefit to sport of any pitches?	✓	
14. Have the recommendations sought to ensure an adequate amount of spare capacity in the provision of accessible pitches with secured community use?	✓	
15. Does the PPS provide a steer as to the future of any spare capacity and any provision that may be genuinely surplus to requirements (paragraphs D12 to D15)?	✓	
16. Does the action plan cover the points listed in paragraph D17?	✓	
17. Does the action plan provide the most appropriate actions to improve provision in the study area rather than just those which the local authority can deliver?	✓	
18. Does the action plan represent an infrastructure plan for playing pitches with deliverable area, sport and site specific actions and projects?	✓	
Step 8: Write and Adopt the Strategy 1. Does the PPS document provide the reader with a clear understanding of the areas listed in paragraph D20?	✓	

2.	Is it clear from the PPS document why the recommendations and actions have been included, how they are to be delivered and what they will achieve?	✓	
3.	Does the PPS document indicate how it should be used and applied in different areas and circumstances along with the benefits of doing so?	✓	
4.	Has the PPS document been subject to appropriate consultation?	✓	
5.	Do all members of the steering group and other relevant parties endorse the PPS and recognise its lead role in guiding the improvement of pitches in the study area?	✓	
6.	Has the PPS document been formally adopted by the local authority and is its status recognised across all relevant departments?	✓	

To help ensure the PPS is delivered and is kept robust and up to date, the steering group can refer to the new methodology Stage E Checklist: Deliver the strategy and keep it robust and up to date:

Stage E: Deliver the strategy and keep it robust and up to date	Tick ✓	
	Yes	Requires Attention
Step 9: Apply & deliver the strategy		
1. Are steering group members clear on how the PPS can be applied across a range of relevant areas?		
2. Is each member of the steering group committed to taking the lead to help ensure the PPS is used and applied appropriately within their area of work and influence?		
3. Has a process been put in place to ensure regular monitoring of how the recommendations and action plan are being delivered and the PPS is being applied?		
Step 10: Keep the strategy robust & up to date		
1. Has a process been put in place to ensure the PPS is kept robust and up to date?		
2. Does the process involve an annual update of the PPS?		
3. Is the steering group to be maintained and is it clear of its on-going role?		
4. Is regular liaison with the NGBs and other parties planned?		
5. Has all the supply and demand information been collated and presented in a format (i.e. single document that can be filtered accordingly) that will help people to review it and highlight any changes?		
6. Have any changes made to the Active Places Power data been fed back to Sport England?		

For more information, see:
https://www.sportengland.org/how-we-can-help/facilities-and-planning/planning-for-sport

APPENDIX ONE: SPORTING CONTEXT

The following section outlines a series of national, regional and local policies pertaining to the study and which will have an important influence on the Strategy.

National context

The provision of high quality and accessible community outdoor sports facilities at a local level is a key requirement for achieving the targets set out by the Government and Sport England. It is vital that this strategy is cognisant of and works towards these targets in addition to local priorities and plans.

Department of Media Culture and Sport Sporting Future: A New Strategy for an Active Nation (2015)

The Government published its strategy for sport in December 2015. This strategy confirms the recognition and understanding that sport makes a positive difference through broader means and that it will help the sector to deliver five simple but fundamental outcomes: physical health, mental health, individual development, social and community development and economic development. In order to measure its success in producing outputs which accord with these aims it has also adopted a series of 23 performance indicators under nine key headings, as follows:

- More people taking part in sport and physical activity.
- More people volunteering in sport.
- More people experiencing live sport.
- Maximising international sporting success.
- Maximising domestic sporting success.
- A more productive sport sector.
- A more financially and organisationally sustainable sport sector.
- A more responsible sport sector.

Sport England: Uniting the Movement 2021

Sport and physical activity has a big role to play in improving the physical and mental health of the nation, supporting the economy, reconnecting communities and rebuilding a stronger society for all. From this notion, Sport England has recently released its new strategy, Uniting the Movement, its 10-year vision to transform lives and communities through sport and physical activity.

It seeks to tackle the inequalities long seen in sport and physical activity. Providing opportunities to people and communities that have traditionally been left behind, and helping to remove the barriers to activity, has never been more important.

There are three key objectives to the Strategy:

- Advocating for movement, sport and physical activity.
- Joining forces on five big issues
- Creating the catalyst for change

In particular, the five big issues are identified where the greatest potential is seen for preventing and tackling inequalities in sport and physical activity. Each one is a building block that, on its own, would make a difference, but together, could change things profoundly:

Recover and reinvent: Recovering from the biggest crisis in a generation and reinventing as a vibrant, relevant and sustainable network of organisations providing sport and physical activity opportunities that meet the needs of different people.

Connecting communities: Focusing on sport and physical activity's ability to make better places to live and bring people together.

Positive experiences for children and young people: Unrelenting focus on positive experiences for all children and young people as the foundations for a long and healthy life.

Connecting with health and wellbeing: Strengthening the connections between sport, physical activity, health and wellbeing, so more people can feel the benefits of, and advocate for, an active life.

Active environments: Creating and protecting the places and spaces that make it easier for people to be active.

The specific impact of the Strategy will be captured through programmes funded, interventions made, and partnerships forged. For each specific area of action, a set of key performance indicators will be developed. This hybrid approach will help evidence the overall progress being made by all those involved in supporting sport and physical activity.

National Planning Policy Framework (2021)

The National Planning Policy Framework (NPPF) sets out planning policies for England. It details how these changes are expected to be applied to the planning system. It also provides a framework for local people and their councils to produce distinct local and neighbourhood plans, reflecting the needs and priorities of local communities.

The NPPF states the purpose of the planning system is to contribute to the achievement of sustainable development. It identifies that the planning system needs to focus on three themes of sustainable development: economic, social and environmental. A presumption in favour of sustainable development is a key aspect for any plan-making and decision-taking processes. In relation to plan-making the NPPF sets out that Local Plans should meet objectively assessed needs.

The 'promoting healthy communities' theme identifies that planning policies should be based on robust and up-to-date assessments of the needs for open space, sports and recreation facilities and opportunities for new provision. Specific needs and quantitative or qualitative deficiencies or surpluses in local areas should also be identified. This information should be used to inform what provision is required in an area.

As a prerequisite the NPPF states existing open space, sports and recreation buildings and land, including playing fields, should not be built on unless:

- An assessment has been undertaken, which has clearly shown that the open space, buildings or land is surplus to requirements.
- The loss resulting from the proposed development would be replaced by equivalent or better provision in terms of quantity and quality in a suitable location.
- The development is for alternative sports and recreational provision, the needs for which clearly outweigh the loss.

In order for planning policies to be 'sound' local authorities are required to carry out a robust assessment of need for open space, sport and recreation facilities.

The FA National Football Facilities Strategy (2018-28)

The Football Association's (FA) National Football Facilities Strategy (NFFS) provides a strategic framework that sets out key priorities and targets for the national game (i.e., football) over a ten-year period.

The Strategy sets out shared aims and objectives it aims to deliver on in conjunction with The Premier League, Sport England and the Government, to be delivered with support of the Football Foundation.

These stakeholders have clearly identified the aspirations for football to contribute directly to nationally important social and health priorities. Alongside this, the strategy is clear that traditional, affiliated football remains an important priority and a core component of the game, whilst recognising and supporting the more informal environments used for the community and recreational game.

Its vision is: *"Within 10 years we aim to deliver great football facilities, wherever they are needed"*

£1.3 billion has been spent by football and Government since 2000 to enhance existing football facilities and build new ones. However, more is needed if football and Government's shared objectives for participation, individual well-being and community cohesion are to be achieved. Nationally, direct investment will be increased – initially to £69 million per annum from football and Government (a 15% increase on recent years).

The NFFS investment priorities can be broadly grouped into six areas, recognising the need to grow the game, support existing players and better understand the different football environments:

- **Improve 20,000 Natural Turf pitches,** with a focus on addressing drop off due to a poor playing experience;
- **Deliver 1,000 3G AGP 'equivalents'** (mix of full size and small sided provision, including MUGAs - small sided facilities are likely to have a key role in smaller / rural communities and encouraging multi-sport offers), enhancing the quality of playing experience and supporting a sustainable approach to grass roots provision;
- **Deliver 1,000 changing pavilions/clubhouses,** linked to multi-pitch or hub sites, supporting growth (particularly in women and girls football), sustainability and providing a facility infrastructure to underpin investment in coaching, officials and football development;
  Support access to flexible indoor spaces, including equipment and court markings, to support growth in futsal, walking football and to support the education and skills outcomes, exploiting opportunities for football to positively impact on personal and social outcomes for young people in particular;
- **Refurbish existing stock to maintain current provision,** recognising the need to address historic under-investment and issues with refurbishment of existing facilities;
- **Support testing of technology and innovation,** building on customer insight to deliver hubs for innovation, testing and development of the game.

Local Football Facility Plans

To support in delivery of both the current and superseding FA National Game Strategy (NGS), the FA commissioned a nationwide consultancy project. A Local Football Facility Plan (LFFP) has now been produced for every local authority across England. Each plan is unique to its area as well as being diverse in its representation.

The LFFP is strategically aligned to the National Football Facilities Strategy (NFFS); a 10-year plan to change the landscape of football facilities in England. The NFFS represents a major funding commitment from the national funding partners (The FA, Premier League, DCMS, Football Foundation) to inform and direct an estimated one billion pounds of investment into football facilities over the next ten years.

Each LFFP will build upon PPS findings (where present and current) regarding the formal and affiliated game, to also include strategic priorities for investment across small sided football (recreational and informal including indoors). The LFFP will also incorporate consultation with groups outside of formal football, as well as underrepresented communities. This could include those which may be key partners with regards to football for behavioural change and groups which may be key drivers of FA NGS priorities around participation in the likes of women and girls' football, disability football and futsal.

LFFPs will identify key projects to be delivered and act as an investment portfolio for projects that require funding. As such, around 90% of all national football investment through the funding partners will be identified via LFFPs.

It is important to recognise that a LFFP is an investment portfolio of priority projects for potential investment - it is not a detailed supply and demand analysis of all pitch provision in a local area. Consequently, it cannot be used in place of a PPS and is not an accepted evidence base for site change of use or disposal. A LFFP will, however, build on available/existing local evidence and strategic plans and may adopt relevant actions from a PPS and/or complement these with additional investment priorities.

The FA: Survive .Revive. Thrive (2020-2024)

The FA launched its new National Game Strategy in January 2021 which aims to 'unite the game and inspire the nation'. It will do this in two ways, by 'changing the game to maximise its impact' and by 'serving the game to deliver football for all'.

To achieve this, the strategy will focus on six Game Changer objectives, to change the fabric of the game and tackle long-term issues, to make the largest possible impact in the years ahead:

- Win a major tournament
- Service > two million through a transformed media platform
- Ensure equal opportunities for every girl
- Delivery of 5,000 quality pitches
- A game free of discrimination
- Maximise the appeal and revenue of the FA cups and BFAWSL

These are underpinned by eight Serve objectives, ensuring maintenance of brilliant business-as-usual services to support the growing and evolving needs of the game:

- Trusted, progressive regulation and administration
- Safe and inclusive football pathways and environment
- Personalised and connected learning experiences
- Maximum investment into the game
- Diverse, high-performing workforce and inclusive culture
- World class venues and events
- Technology enabled and insight driven

England and Wales Cricket Board (ECB) Inspiring Generations (2019-2024)

"Inspiring Generations" is the new ECB participation strategy which was announced in January 2019. It builds on the strong foundations laid by Cricket Unleashed and supports the growth of cricket in England and Wales between 2020 and 2024. At the heart of this strategy is a single unifying purpose, which gets to the core of what the game can do for society both on and off the field to ensure that cricket is in an even stronger position that it is in 2019.

Inspire Generations has six key priorities and activities including transforming women's and girls' cricket to increase the representation of women in every level of cricket by:

- Growing the base through participation and facilities investment.
- Growing the base through participation and facilities investment.
- Launching centres of excellence and a new elite domestic structure.
- Investing in girls' county age group cricket.
- Delivering a girls' secondary school programme.

The Rugby Football Union Strategic Plan 2021 onwards

The RFU has released its new strategic vision for rugby in England. The strategy is based on four main elements which are; Protect, Engage, Grow and Win. It covers all elements of rugby union ranging from elite rugby to grassroots, although the general relevancy to the PPS is centred around growing the game.

The RFU exists to promote and develop rugby union in England and ensure the long-term sustainability of clubs by growing player numbers and retaining them across all age groups. Responding to wider marker influences, work will continue on developing new ways to take part in all forms of the game, without comprising the sports traditions. This will ensure a lasting legacy from elite success by attracting new players and encouraging current male and female adult players to play.

England Hockey Strategy

England Hockey's Facilities Strategy can be found here.
http:/www.englandhockey.co.uk/page.asp?section=2075&sectionTitle=Facilities+Strategy

Vision: For every hockey club in England to have appropriate and sustainable facilities that provide excellent experiences for players.

Mission: More, Better, Happier Players with access to appropriate and sustainable facilities

The 3 main objectives of the facilities strategy are:

1. **PROTECT: To conserve the existing hockey provision**

   - There are currently over 800 pitches that are used by hockey clubs (club, school, universities) across the country. It is important to retain the current provision where appropriate to ensure that hockey is maintained across the country.

2. **IMPROVE: To improve the existing facilities stock (physically and administratively)**

   - The current facilities stock is ageing and there needs to be strategic investment into refurbishing the pitches and ancillary facilities. England Hockey works to provide more support for clubs to obtain better agreements with facilities providers & education around owning an asset.

3. **DEVELOP: To strategically build new hockey facilities where there is an identified need and ability to deliver and maintain. This might include consolidating hockey provision in a local area where appropriate.**

England Hockey has identified key areas across the country where there is a lack of suitable hockey provision and there is a need for additional pitches, suitable for hockey. There is an identified demand for multi pitches in the right places to consolidate hockey and allow clubs to have all of their provision catered for at one site.
The intention is to:

- Be progressive.
- Offer opportunities to participate at national and international level.
- Work to raise the profile of the sport in support of recruitment and retention.
- Lead the sport.
- Support clubs and county associations.

APPENDIX TWO: FUNDING PLAN

In order to deliver much of the Action Plan it is recognised that external partner funding will need to be sought. Below is a list of current funding bodies and relevant website links; further detail is not available at this stage as the funding streams are regularly changing.

Awarding body	Website link
The National Lottery Community Fund	http://www.tnlcommunityfund.org.uk/
Sport England	https://www.sportengland.org/funding/
Football Foundation	https://footballfoundation.org.uk/what-we-do
Premier League	Premier League LED Floodlight Fund | Premier League Stadium Fund
Rugby Football Union	RFU (englandrugby.com)
The England and Wales Cricket Trust	https://www.ecb.co.uk/news/73112/club-funding
National Hockey Foundation	http://www.thenationalhockeyfoundation.com/

Funder's requirements

Below is a list of funding requirements that can typically be expected to be provided as part of a funding bid, some of which will fall directly out of the Playing Pitch Strategy:

- Identify need (i.e., why the Project is needed) and how the Project will address it.
- Articulate what difference the Project will make.
- Identify benefits, value for money and/or added value.
- Provide baseline information (i.e., the current situation).
- Articulate how the Project is consistent with local, regional and national policy.
- Financial need and project cost.
- Funding profile (i.e., Who's providing what? Unit and overall costs).
- Technical information and requirements (e.g., planning permission).
- Targets, outputs and/or outcomes (i.e., the situation after the Project/what the Project will achieve)
- Evidence of support from partners and stakeholders.
- Background/essential documentation (e.g., community use agreement).
- Assessment of risk.

Indicative costs

The indicative costs of implementing key elements of the Action Plan can be found on the Sport England website: https://www.sportengland.org/guidance-and-support/facilities-and-planning/design-and-cost-guidance/facility-cost-guidance

The costs are for the development of community sports facilities and are based on providing good quality sports facility based on the last quarter. The Facilities Costs are updated on the Sport England website every quarter.

These rounded costs are based on schemes most recently funded through the Lottery (and therefore based on economies of scale), updated to reflect current forecast price indices provided by the Building Cost Information Service (BCIS), prepared by Technical Team Lead of Sport England.

Draft document for Council governance process July and August 2026

Facilities Planning Model Assessment of Sports Hall Provision for Cotswold District Council

Bespoke Report

8 May 2026

This document has been produced by ORH on behalf of Sport England for Cotswold District Council on 8 May 2026. This document can be reproduced by Cotswold District Council, subject to it being used accurately and not in a misleading context. When the document is reproduced in whole or in part within another publication or service, the full title, date, and accreditation to Sport England must be included.

ORH is the trading name of Operational Research in Health Limited, a company registered in England with company number 2676859.

Disclaimer

EXECUTIVE SUMMARY

Introduction

0.1 Cotswold District Council (also referred to as Cotswold or the District) is reviewing its current provision of sports halls and assessing the future demand and level of provision required to 2043.

0.2 This report has been prepared based on an assessment using the Sport England Facilities Planning Model (FPM) spatial modelling tool. The FPM study is a quantitative, accessibility and spatial assessment of the supply, demand and access to sports halls.

0.3 The FPM modelling runs are to provide the following:

- Run 1 – baseline assessment of provision in 2025
- Run 2 – forward assessment of demand for sports halls and its distribution, based on the projected changes in population between 2025 and 2043

0.4 The main report sets out the full set of findings under each of the seven assessment headings.

0.5 The next section of the report provides the headline strategic overview, and the key findings and interventions arising from the FPM study on supply, demand and accessibility.

Headline Strategic Overview

0.6 The headline strategic overview is that the weekly peak period demand for sports halls can be met by the available supply in both 2025 and 2043.

0.7 There is an increase in demand to 2043 but no change in the very large proportion of demand met. Cotswold's demand is significantly below the available supply in the weekly peak period in both years.

0.8 The increase in demand and its distribution to 2043 means that Cirencester Leisure Centre is estimated to be uncomfortably busy (more than 80% utilised) in the weekly peak period in 2043. This is for the following reasons:

- Demand is highest in Cirencester in both years.
- The largest housing growth sites are in the Cirencester area.
- The centre opened in 2006 and, therefore, is highly attractive to residents.
- In 2025, 29% of the imported demand to Cotswold is from Stroud and 28% in 2043. Demand is high in the centre of Stroud and to the border with Cotswold. The A419 provides access for some Stroud residents to the sports hall sites in Cirencester.

0.9 All the other sports halls in Cotswold are estimated to be under-utilised in 2025 and 2043.

0.10 The educational sector provides almost all the sports hall sites in the District. There is a high commitment to community use and this needs to be protected. However, because educational sites are not available during weekday daytimes, these sports halls do not meet the needs of the economically inactive, retired, stay at home carers and home workers who would access the facilities at these times.

Key Findings

0.11 The key findings that underpin the headline strategic overview are as follows:

1. The total supply in Cotswold in 2025 and 2043 is the equivalent of 64.4 badminton courts, of which 43.4 courts are available for community use in the weekly peak period. The unavailable supply equates to 33% of the total supply
2. In 2025 and 2043 the ten educational sports halls provide 80% of the available capacity. The public leisure centre provides 14%, and Fire Service College Leisure Club provides 6%.
3. Cotswold's population is projected to increase by 15% between 2024 and 2043, resulting in an 8% increase in demand for sports halls. The smaller increase in demand compared with population growth is because of the ageing of the population in Cotswold between 2025 and 2043. There will be fewer residents in the age bands with the highest sports hall participation (0-15 year olds and 16-24 year olds) in 2043 than in 2025. Cotswold has a larger proportion of residents over 65 years old than the national average.
4. Cotswold's demand is the equivalent of 41% of the District's available supply in 2025, increasing to 44% in 2043.
5. It is estimated that 4% of journeys by Cotswold residents to sports halls are made by public transport or bicycle in 2025 and 2043. This is less than the regional proportion of 6% and the national proportion of 9% in both years.
6. In 2025 and 2043, 96% of Cotswold's demand is met. The number of visits met in the weekly peak period increases from 6,227 in 2025 to 6,714 in 2043 because of the increase in demand in the District.
7. Most of Cotswold's satisfied demand is met within the District, at 75% in 2025 and 78% in 2043. In terms of visits, 4,661 are retained in the weekly peak period in 2025, and 5,212 in 2043.
8. In both 2025 and 2043 unmet demand is 0.9 courts, accounting for 4% of demand. In both years all the unmet demand is too far from a facility.
9. The estimated used capacity of Cotswold's sports halls is 40% in the weekly peak period in 2025, and 44% in 2043. However, Cirencester Leisure Centre is estimated to be 79% utilised at peak times in 2025, and 92% in 2043.

Interventions and Next Steps

0.12 Cotswold has sufficient provision of sports halls to meet demand in 2025 and 2043. The increase in demand can be accommodated by the current supply. There are sports halls in all the main settlements.

0.13 The strategic interventions are:

- Increasing usage at educational sports halls in Cirencester to provide a better overall balance between supply and demand
- Protecting the educational supply for community use
- Modernisation of the stock

0.14 Demand for sports halls is highest in Cirencester in both years. The largest housing growth sites are located around Cirencester. Cirencester Leisure Centre has the largest sports hall in the District and the only six-court hall. As the only public leisure centre in Cotswold, it is the most attractive site in the District to residents. The centre is available for the maximum 46.0 hours in the weekly peak period; therefore, there is no scope to increase capacity and reduce the proportion of used capacity to a comfortable level.

0.15 The intervention is to try and increase access at the educational sites in Cirencester by improving the availability of the sports halls to better meet demand in the area. It is suggested that Cotswold District Council investigates increasing community use at one or two of these sites.

0.16 There are four educational sports hall sites in Cirencester. In terms of the FPM findings, the most beneficial sites at which to increase access are:

- Cirencester College
    - Most recent sports hall to open in 2015
    - Four-court hall with dimensions suitable for club development
    - Located in west Cirencester
    - Currently only available for 5.0 hours in the weekly peak period
- Cirencester Kingshill School
    - Opened in 2000
    - Four-court hall and activity hall
    - Only site in east Cirencester
    - School actively promotes community use but currently only available for 17.5 hours in the weekly peak period

0.17 Community Use Agreement (CUA) provides the framework to protect the current supply and any new or replacement educational sports halls. If not already in place, a CUA should be negotiated and agreed.

0.18 Sport England will advise on the requirements as part of the planning process for any new or replacement sports hall. Once a CUA has been put in place, it is essential that the Council monitors its actual delivery.

0.19 Sport England's website provides a free resource, Use our School, to support educational sites opening up their facilities or increasing access for community use.

0.20 Six sports hall sites opened before 2000, and two educational sites have been modernised. Four sites opened between 2000 and 2010, and none have been refurbished. Cirencester Leisure Centre is 19 years old in 2025 and 37 years old in 2043.

0.21 The scale of the projected increase in demand will increase the usage of the sports halls and their maintenance costs. To maintain the attractiveness and meet demand within the District, Cirencester Leisure Centre will require modernisation. Furthermore, the Council may wish to consider investing in further modernisation of the educational stock in return for continuing committed community use.

0.22 These interventions and suggested next steps are based on the FPM findings and should be considered as a key part of the all-round evidence base for the provision of sports halls and the Council's strategy. Combining the FPM assessment with the wider review of provision will lead to well considered options on the best ways to meet the projected demand for sports halls up to 2043 and beyond.

1 INTRODUCTION

1.1 Cotswold District Council (also referred to as Cotswold or the District) is reviewing its current provision of sports halls and assessing the future provision required to 2043.

1.2 This report has been prepared based on an assessment using the Sport England Facilities Planning Model (FPM) spatial modelling tool. The FPM study is a quantitative, accessibility and spatial assessment of the supply, demand and access to sports halls.

1.3 The strategic drivers for Cotswold District Council are to understand:

- How the existing supply of sports halls meets demand in 2025 and 2043
- The impact that population change and residential development have in changing the demand for sports halls and its distribution up to 2043

1.4 The outputs from the FPM assessment will inform:

- Cotswold District Council's strategic planning review of sports halls provision and future strategy
- An evidence base that contributes to the development of planning policy for the provision of indoor sports facilities

1.5 The sequence of work is based on assessments known as runs, and these are set out in the Executive Summary.

The Study Area

1.6 The assessments include the sports halls and population in Cotswold District Council and the neighbouring local authority areas, which comprise study area (see Map **1.1**).

1.7 A customer's choice of sports hall does not respect local authority boundaries. There may be management and possibly pricing incentives for customers to use sports facilities in their local authority area. Other factors that influence the choice of sports hall include:

- How close the venue is to where residents live or work
- Other facilities at the same site, such as a gym or studio
- Programming of the hall with activities that appeal to residents and are available at times that fit with the lifestyle of residents
- Age and condition of the facility and inherently its attractiveness

1.8 Increasingly, the quality of sports halls and their offer are of more importance to residents in their choice of venues. New facilities will have a significant draw because of the enhanced quality of the venues.

1.9 In determining the position across Cotswold, it is important to take full account of the sports halls and population in neighbouring local authority areas. The most attractive facility for some Cotswold residents may be outside the District (known as exported demand). For

residents of neighbouring local authorities, their most attractive sports hall may be inside Cotswold (known as imported demand).

1.10 To take account of these factors, a study area is established that places Cotswold District Council at its centre and includes the neighbouring local authority areas.

Map 1.1: Study Area for Cotswold Sports Halls Assessment

Report Structure, Content and Sequence

1.11 The findings for the Cotswold assessment are set out in a series of tables for both runs. This allows a 'read across' to see the specific impact of changes between Runs 1 and 2 and builds up the picture of change.

1.12 The headings for each table are:

- Supply
- Demand
- Accessibility
- Satisfied Demand
- Unmet Demand
- Used Capacity
- Local Share

1.13 The terms listed above are defined beneath the tables.

1.14 To support the findings, this report also includes maps that show sports hall locations, demand, deprivation, driving and walking coverage, public transport access, exported satisfied demand, unmet demand, imported used capacity and local share.

1.15 Where valid, the findings for neighbouring local authorities are set out. A commentary is provided on these comparable findings. For example, some local authorities like to know how their findings on proportion of met demand compare with those of neighbouring local authorities.

1.16 The key findings in each of the sections are numbered and highlighted in bold typeface.

1.17 The facilities excluded from the study, with explanations, are listed in Appendix 1. Details of the sports halls in the neighbouring local authority areas included in the assessment are set out in Appendix 2. The FPM and its parameters are described in Appendix 3.

1.18 All maps for the study are provided in a separate document as layered PDFs.

2 SPORTS HALL SUPPLY

Cotswold has an extensive supply of sports halls. There are ten four-court halls, of which seven have dimensions suitable for club development.

Cirencester Leisure Centre is a six-court hall, and is the largest the District. It has the largest capacity of any site in Cotswold.

The educational sector is the major provider, having ten of the 12 sites. There is a high commitment to community use, with seven educational sites available for between 22.0 and 44.0 hours in the weekly peak period.

The educational supply needs to be protected for community use.

The stock in Cotswold is ageing. Six sports hall sites opened before 2000, of which two have been modernised. Four sites opened between 2000 and 2010, and none have been refurbished.

Table 2.1: Supply of Sports Halls in Cotswold by Run

Supply	Run 1	Run 2
Cotswold	2025	2043
Number of sports halls	17	17
Number of sports hall sites	12	12
Supply in badminton court equivalents	64.4	64.4
Supply in courts scaled with hours available in peak period	43.4	43.4
Unavailable supply in the weekly peak period	33%	33%
Supply in visits per week in peak period	15,968	15,968
Average age of all sites	26	44
Average age of public leisure centres	19	37

Definition of supply – This is the supply or capacity of the sports halls available for community and club use in the weekly peak period. Supply is expressed in the number of visits that a sports hall can accommodate in the weekly peak period and in the number of badminton courts.

Weekly peak period – This is when most visits take place and when users have most flexibility to visit. The peak period for sports halls is one hour on weekday mornings, five hours on weekday evenings and eight hours on weekend days. This gives a total of 46 hours per week. The modelling and recommendations are based on the ability of the public to access facilities during this weekly peak period.

2.1 In 2025 and 2043, 17 sports halls are modelled across 12 sites.

2.2 The facilities excluded from the study are listed in Appendix 1.

Table 2.2: Details of Sports Halls in Cotswold included in the Runs

Site	Provider	Facility Type	Dimensions (m)	Area (sqm)	Peak Hours	Total Hours	Capacity (visits)	Year Built	Year Refurb
Cirencester Leisure Centre	Public	6-court	34 x 27	918	46	100.5	2,208	2006

Westonbirt School and Leisure Centre	Educational (in-house)	4-court	34.5 x 20	690	44	92	1,408	2005	
Fire Service College Leisure Club	Other (sport club)	4-court	34.5 x 20	690	30	79	960	1977	

* SWR Leisure (Sir William Romney's Leisure Ltd) was the former operator of a leisure centre in Tetbury. The company ceased operating and closed the facility in July 2019. The leisure centre has since re-opened for community use and is operated in-house by Sir William Romney's School.

2.3 Key finding 1 is that the total supply in Cotswold in both 2025 and 2043 is the equivalent of 64.4 badminton courts, of which 43.4 courts are available for community use in the weekly peak period. The unavailable supply equates to 33% of the total supply.

Providers

2.4 Cirencester Leisure Centre is a public leisure centre. Public leisure centres are available for use to all residents, and provide recreational pay-and-play as well as organised team and individual sports activities.

2.5 There are ten sports hall sites provided by the educational sector. Eight are managed in-house and, therefore, are responsible for promoting community use. Promotion may be passive, whereby the school responds to booking requests, or dynamic, with the school working alongside sports clubs to encourage community use.

2.6 Two sports hall sites were modelled as being operated by external providers:

- Cotswold Leisure Chipping Campden is a dual-use site with a school. The centre is operated by Freedom Leisure on behalf of Cotswold District Council.
- SWR Leisure (Sir William Romney's Leisure Ltd) was the former operator of a leisure centre in Tetbury, located at Sir William Romney's School. The company ceased trading and closed the facility in July 2019. The centre has re-opened and is now operated in-house by Sir William Romney's School.

2.7 Given that nearly all the sports hall stock is provided by the educational sector, this may restrict residents who require access during weekday daytimes, for example, stay-at-home parents, home workers, and the unemployed or retired. This places greater reliance on the more limited public leisure centre stock for these residents.

2.8 There is one other provider; Fire Service College Leisure Club. The centre is operated by Capita, primarily serving College staff and trainees. It is available for local sports clubs, community groups and commercial users to hire.

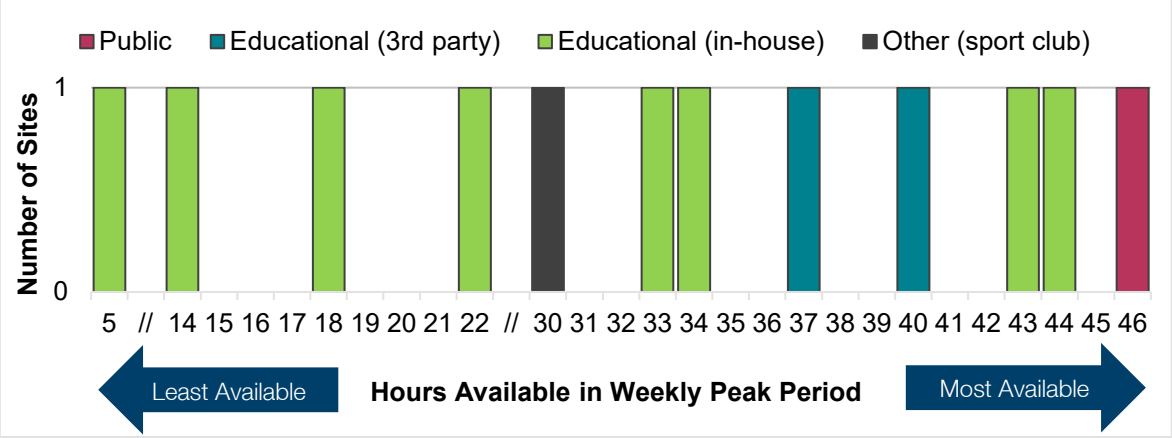
Scale

2.9 The largest sports hall is Cirencester Leisure Centre, which has a six-court hall. Six-court halls can accommodate multiple sports activities at same time. The second largest site is The Cotswold School, which has a five-court hall with unusual dimensions of 40.6m x 21.35m, and an activity hall.

2.10 There are ten four-court halls, of which:

- Seven have dimensions of 34.5m x 20m. This is the size that Sport England and the National Governing Bodies for hall sports recommend for a four-court hall. These dimensions can cater for all hall sports at the community level of participation and also meet the requirements for hall sports club development.
- The dimensions of the other three halls are slightly smaller at 35m x 19m, 34m x 18m, and 32m x 18m. These sizes of sports hall, while meeting the requirements for most

indoor hall sports at the community level of participation, have less space between and behind individual courts. This may prohibit use of these sports halls if they do not meet the requirements for competition play.



2.11 There are five sites which have a main hall and an activity hall. An activity hall is a flexible space for multiple sports that is smaller than the equivalent of three badminton courts, and may or may not have line markings. Four of the activity halls have dimensions of 18m x 10m, and one has dimensions of 18m x 17m.

2.12 Where a sports hall site has a main hall and an activity hall, the activities for the two halls are programmed together. The main hall can accommodate big/high space activities such as basketball and badminton, which have low participant numbers at-one-time. The activity hall can accommodate smaller space activities such as martial arts, which have higher participant numbers.

2.13 The at-one-time capacity of a main hall with marked courts is eight people per badminton court (the equivalent area of a badminton court is 144 sqm). For an activity hall, this increases to 15 people per court. Therefore, an activity hall has almost double the capacity of a main hall with the same dimensions.

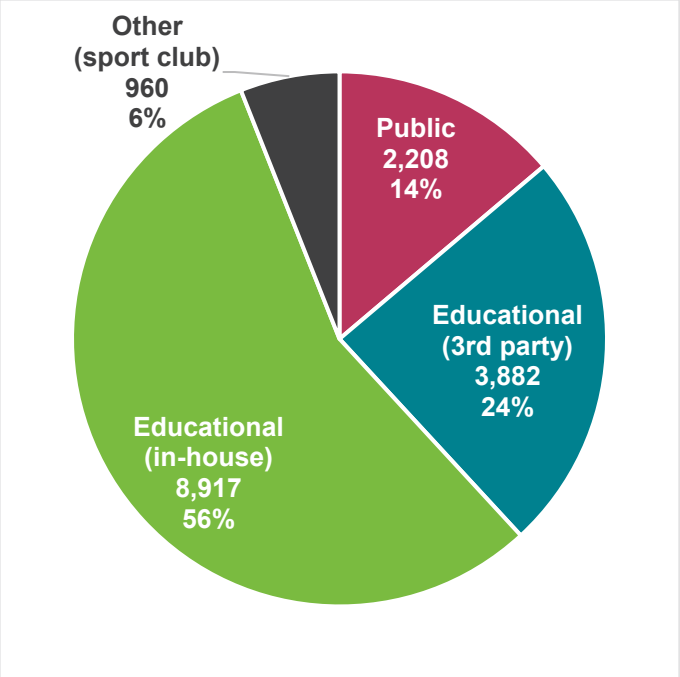
Availability

Chart 2.1: Availability of Cotswold Sports Halls by Provider

2.14 Cirencester Leisure Centre is available for the maximum 46.0 hours in the weekly peak period, with no scope to increase availability and capacity at peak times.

2.15 There is a high commitment to community use at six of the educational sites, with availability of between 32.5 hours and 44.0 hours in the weekly peak period. Availability is best in the weekly peak period at Westonbirt School and Leisure Centre at 44.0 hours, and Royal Agricultural University at 43.0 hours.

2.16 This is very good availability, as it is unusual for educational sports halls managed in-house to be available for more than 41.0 hours in the weekly peak period because they are not available for community use during weekday daytimes.



2.17 Sport England has produced a resource to support schools in opening their facilities for community use in non-school hours. The resource covers how to get started, who can help, operating models, legal and governance, finance, marketing, operating safely and safeguarding, and can be found here: https://www.sportengland.org/funding-and-campaigns/use-our-school.

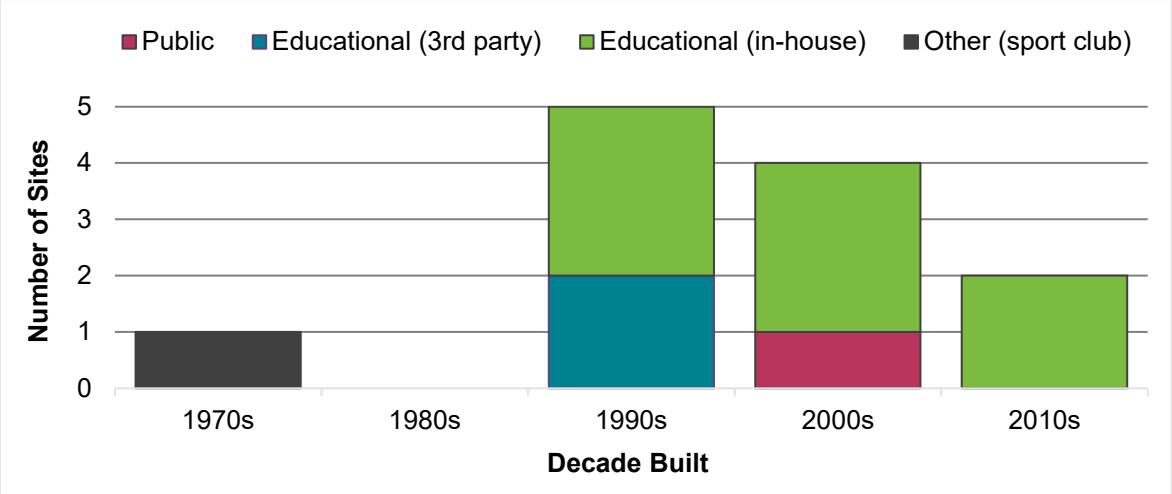
2.18 The resource can be used to support discussions with schools to open their sites for community use, either for the first time or to extend the available hours.

2.19 Fire Service College Leisure Club is available to hirers for up to 30.0 hours in the weekly peak period.

Capacity

Chart 2.2: Proportion of Available Hall Space by Provider in 2025 and 2043

2.20 **Key finding 2** is that the ten educational sports halls provide 80% of the available capacity in both 2025 and 2043. The public leisure centre provides 14%, and Fire Service College Leisure Club 6%, of the remaining capacity.



2.21 Cirencester Leisure Centre has the largest capacity in Cotswold and can accommodate a total of 2,208 visits in the weekly peak period.

2.22 Cotswold Leisure Chipping Campden has the second largest capacity, and the largest capacity of the educational sites, at 2,005 visits in the weekly peak period.

2.23 Cirencester College has the smallest capacity at 160 visits in the weekly peak period. This site also has the lowest availability at 5.0 hours in the weekly peak period.

Age

Chart 2.3: Decade Built of Sports Halls in Cotswold by Provider

2.24 The average age of all the sports hall sites is 26 years in 2025, and 44 years in 2043. Cirencester Leisure Centre is 19 years old in 2025, and 37 years old in 2043.

2.25 The oldest sports hall is Fire Service College Leisure Club, which opened in 1977 and is unmodernised. The most recent sports hall to open is Cirencester College in 2015.

2.26 Six sports hall sites opened before 2000, and two of these have been modernised. Four sites opened between 2000 and 2010, and none have been refurbished.

2.27 There is an increasing need for modernisation of the sports halls.

2.28 Modernisation is defined as one or more of the following:

- Upgrade of the sports hall floor to a sprung timber floor
- Upgrade of the lighting in the sports hall
- Modernisation of the changing accommodation

Sports Hall Locations

2.29 Nine of the sports hall sites are located in the southern half of the District (see Map 2.1). There are four sports hall sites in Cirencester.

2.30 There are several sports hall sites in Cheltenham and Swindon that are located close to the border with Cotswold.

3 DEMAND FOR SPORTS HALLS

Demand for sports halls in Cotswold increases by 8% to 2043, which is the equivalent of 1.7 courts.

Demand is highest in Cirencester, followed by Tetbury, Fairford, Moreton-in-Marsh and Stow-on-the-Wold.

Demand increases in all local authorities in the study area to 2043. The largest increase is in South Gloucestershire at 11.8 courts, representing a 15% increase from 2025.

Table 3.1: Demand for Sports Halls in Cotswold by Run

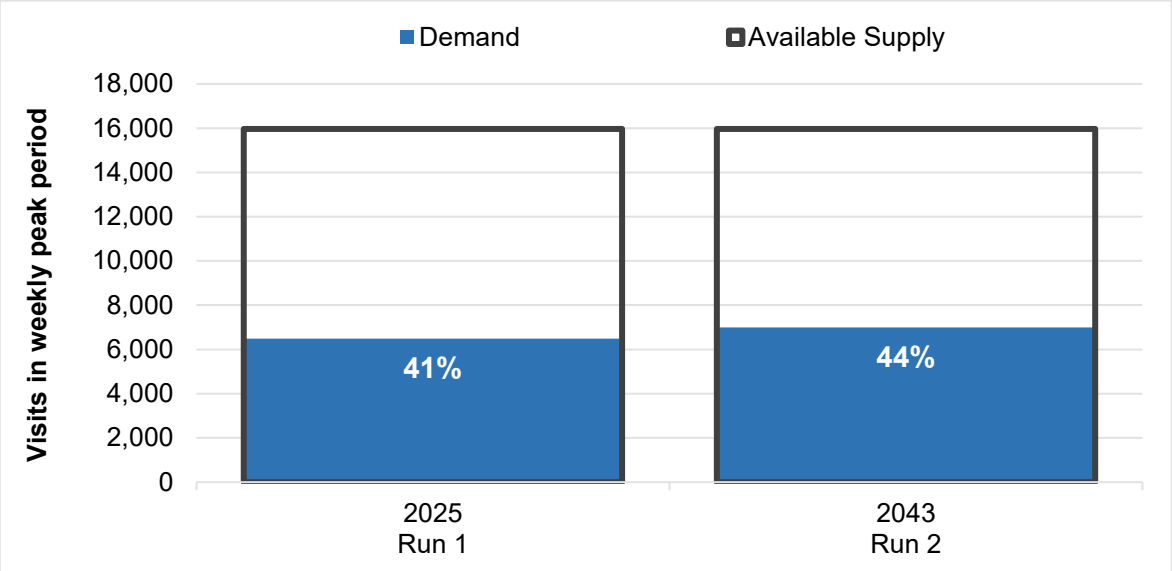
Demand	Run 1	Run 2
Cotswold	2025	2043
Population	94,598	108,344
Visits demanded in weekly peak period	6,484	6,992
Demand in courts with comfort factor included	22.0	23.8
% of demand in the 10% most deprived LSOAs nationally	0%	0%

Definition of total demand – This represents the total demand for sports halls by gender and for six age bands from 0 to 79 and is calculated as the percentage of each age band/gender that participates. This is added to the frequency of participation in each age band/gender to arrive at a total demand figure, which is expressed in visits in the weekly peak period and number of badminton courts. The FPM parameters for the percentage of participation and frequency of participation, for gender and for different age bands, are calculated from Sport England's Active Lives survey up to November 2023 and are set out in Appendix 3.

3.1 Demand is calculated from the resident population. Cotswold District Council provided its population forecast for 2043. The geographical distribution of the population in the FPM for 2043 includes housing growth sites, the details of which were provided by the Council that were known at the time of modelling. There are extensive housing growth sites to the south of Cirencester (see Map 3.1).

3.2 The latest development trajectory for Cotswold to 2043 has more dwellings than modelled and there are changes to the locations of the sites. However, the geographical distribution is similar to what was modelled and the differences per area are smaller when converted into demand. The total population forecast for Cotswold remains the same from the Office for National Statistics 2022-based subnational projection. Therefore, the changes in housing growth will not have a significant impact on the overall findings of this report.

3.3 **Key finding 3** is that Cotswold's population is projected to increase by 15% between 2024 and 2043, resulting in an 8% increase in demand for sports halls. The smaller increase in demand compared with population growth is because of the ageing of the population in



Cotswold between 2025 and 2043. There will be fewer residents in the age bands with the highest sports hall participation (0-15 year olds and 16-24 year olds) in 2043 than in 2025. Cotswold has a larger proportion of residents over 65 years old than the national average.

3.4 The rate and frequency of sports hall participation is assumed to be unchanged between the two years (for participation rates and frequency, see Appendix 3: Sports Halls Parameters).

3.5 Of Cotswold's population (source: ONS Census 2021):

- Residents aged 65 and over represent 28% of the total population compared to the national average of 20%
- Disabled residents account for 16% compared to the national average of 17%
- Working from home residents are 39% compared to the national average of 32%

Chart 3.1: Demand as a Proportion of Available Supply in Cotswold by Run

3.6 Key finding 4 is that Cotswold's demand is the equivalent of 41% of its available supply in 2025, increasing to 44% in 2043.

Demand in the Study Area

3.7 Demand is projected to increase in all neighbouring local authorities. Cotswold has the third smallest increase in demand in courts to 2043.

3.8 The largest increase in demand in courts is in South Gloucestershire at 11.8 courts, representing a 15% increase in demand. Cheltenham has the smallest increase at 0.3 courts, and is a 1% increase.

Table 3.2: Demand for Sports Halls by Area and Run

Demand in Court Equivalents Considering a 'Comfort' Factor	Run 1	Run 2	Change 2025 to 2043	
Area	2025	2043	Courts	% Change
Cotswold	**22.0**	**23.8**	**1.7**	**8%**
Cheltenham	30.2	30.5	0.3	1%
South Gloucestershire	77.6	89.5	11.8	15%
Stratford-on-Avon	34.4	40.9	6.5	19%
Stroud	30.3	33.6	3.2	11%
Swindon	61.0	61.4	0.4	1%
Tewkesbury	24.8	28.5	3.7	15%
Vale of White Horse	37.0	42.2	5.2	14%
West Oxfordshire	29.1	31.7	2.6	9%
Wiltshire	126.8	130.5	3.7	3%
Wychavon	33.0	37.0	4.0	12%

Geographical Distribution of Demand

2025

3.9 Demand is highest in Cirencester, followed by Tetbury, Fairford, Moreton-in-Marsh and Stow-on-the Wold (see Map 3.2).

3.10 Demand in each of the main settlements is as follows:

- Cirencester town and surrounding area – 4.8 courts across 16 square kilometres (there are five sports hall sites in this area, including Cirencester Leisure Centre)
- Tetbury – 1.5 courts across five square kilometres (SWR Leisure is located in this area)
- Moreton-in-Marsh – 1.0 courts across three square kilometres (Fire Service College Leisure Club is located east of this area)
- Fairford – 0.8 courts across five square kilometres (Farmor's Sports Centre is located in this area)
- Stow-on-the-Wold – 0.8 courts across five square kilometres (The Cotswold School is located in this area)
- Chipping Campden – 0.5 courts across five square kilometres (Cotswold Leisure Chipping Campden is located in this area)

3.11 Outside of these areas demand is less than 0.5 courts per square kilometre (dark blue and purple squares).

2043

3.12 In 2043 demand across Cotswold increases by 1.7 courts, with a comfort factor included.

3.13 Demand in the Cirencester area increases to 5.8 courts across 19 square kilometres (see Map 3.3).

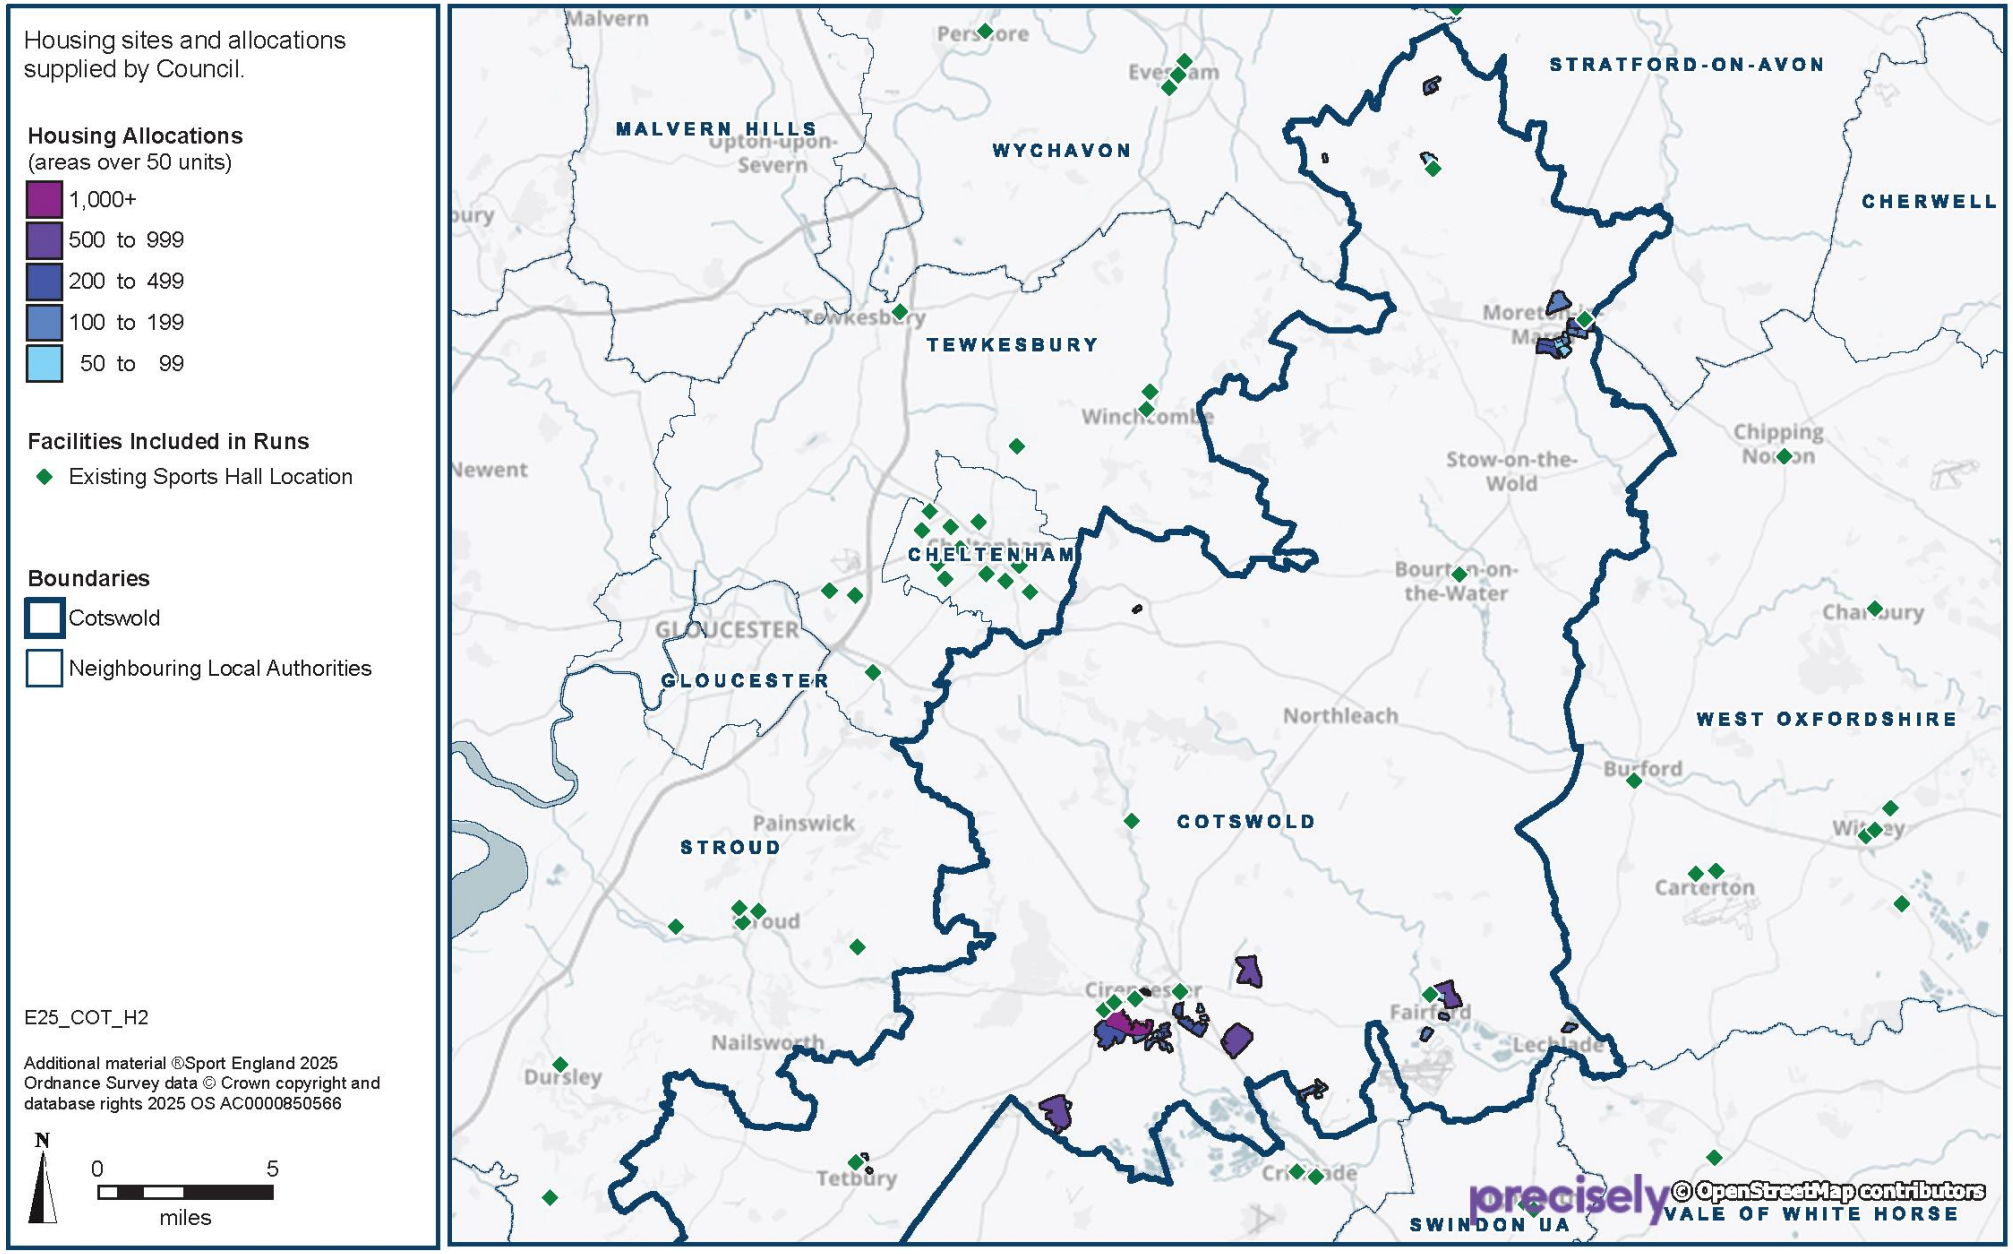
3.14 The changes in demand in other areas are as follows:

- Tetbury – decreases by 0.3 courts to1.2 courts across five square kilometres
- Moreton-in-Marsh – increases by 0.6 courts to 1.6 courts across six square kilometres
- Fairford – increases by 0.1 courts to 1.1 courts across six square kilometres
- Stow-on-the-Wold – unchanged at 0.8 courts across five square kilometres

3.15 Demand in Chipping Campden decreases by 0.2 courts to 0.3 courts.

3.16 Outside of these areas demand remains at between 0.1 and 0.2 courts.

Deprivation



3.17 None of Cotswold's demand is in the 10% most-deprived lower super output areas (LSOAs) nationally in 2025 or 2043.

3.18 The area of greatest deprivation in Cotswold is in the 40% most-deprived LSOAs in south Cirencester (dark orange area in Map 3.4).

3.19 The Index of Multiple Deprivation (IMD) score is used in the FPM to limit whether people will use commercial facilities (see Appendix 3 for definition of IMD). A weighting factor is incorporated to reflect the cost element often associated with commercial facilities. The assumption is that the higher the IMD score (less affluence), the less likely the population of the LSOA would choose to go to a commercial facility.

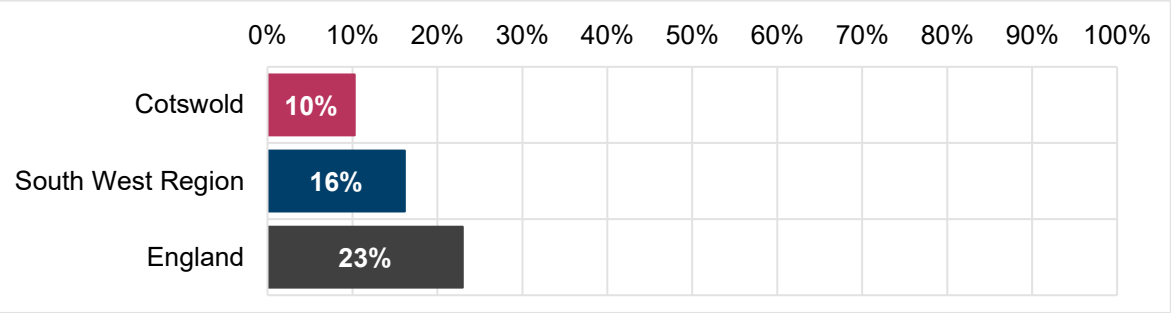
4 ACCESSIBILITY

A third of Cotswold's residents are within a 20-minute walk of a sports hall.

All the sports hall sites are within a five-minute walk of an existing bus stop.



In both 2025 and 2043, all residents of Cotswold are within a 20-minute drive of at least one sports hall. Access is better in the southern half of the District where residents in some areas can drive to more than 20 sports hall sites within 20 minutes.

Table 4.1: Travel Mode of Cotswold Demand to Sports Halls by Run

Accessibility	Run 1	Run 2
Cotswold	2025	2043
% of total residents within a 20-minute walk of a sports hall	33%	33%
% of demand satisfied when travelled:		
on foot	7%	7%
by public transport or bicycle	4%	4%
by car	89%	89%

Definition of accessibility – The FPM uses a distance decay function where the further a user is from a facility, the less likely they will travel. A description of the distance decay function is set out in Appendix 3. On average, a 20-minute travel time accounts for approximately 90% of visits to a sports hall.

Chart 4.1: Proportion of Residents Without Access to a Car

4.1 In Cotswold, 10% of residents do not have access to a car. This is lower than both the regional average of 16% and the national average of 23%.

Walking Access

4.2 In 2025 and 2043, 33% of Cotswold's residents are within a 20-minute walk of a sports hall.

4.3 Residents in the main settlements are mostly within a 20-minute walk of one sports hall (see Map 4.1).

4.4 However, not all residents in these areas will walk to a sports hall and some will travel further. It is estimated that 7% of journeys by Cotswold residents to sports halls are made on foot in 2025 and 2043.

Public Transport Access

4.5 All the sports hall sites are within a five-minute walk of an existing bus stop (pink areas in Map 4.2). However, the bus service is very limited, for example, in Southrop there is one return bus a day. This is the level of service in many villages.

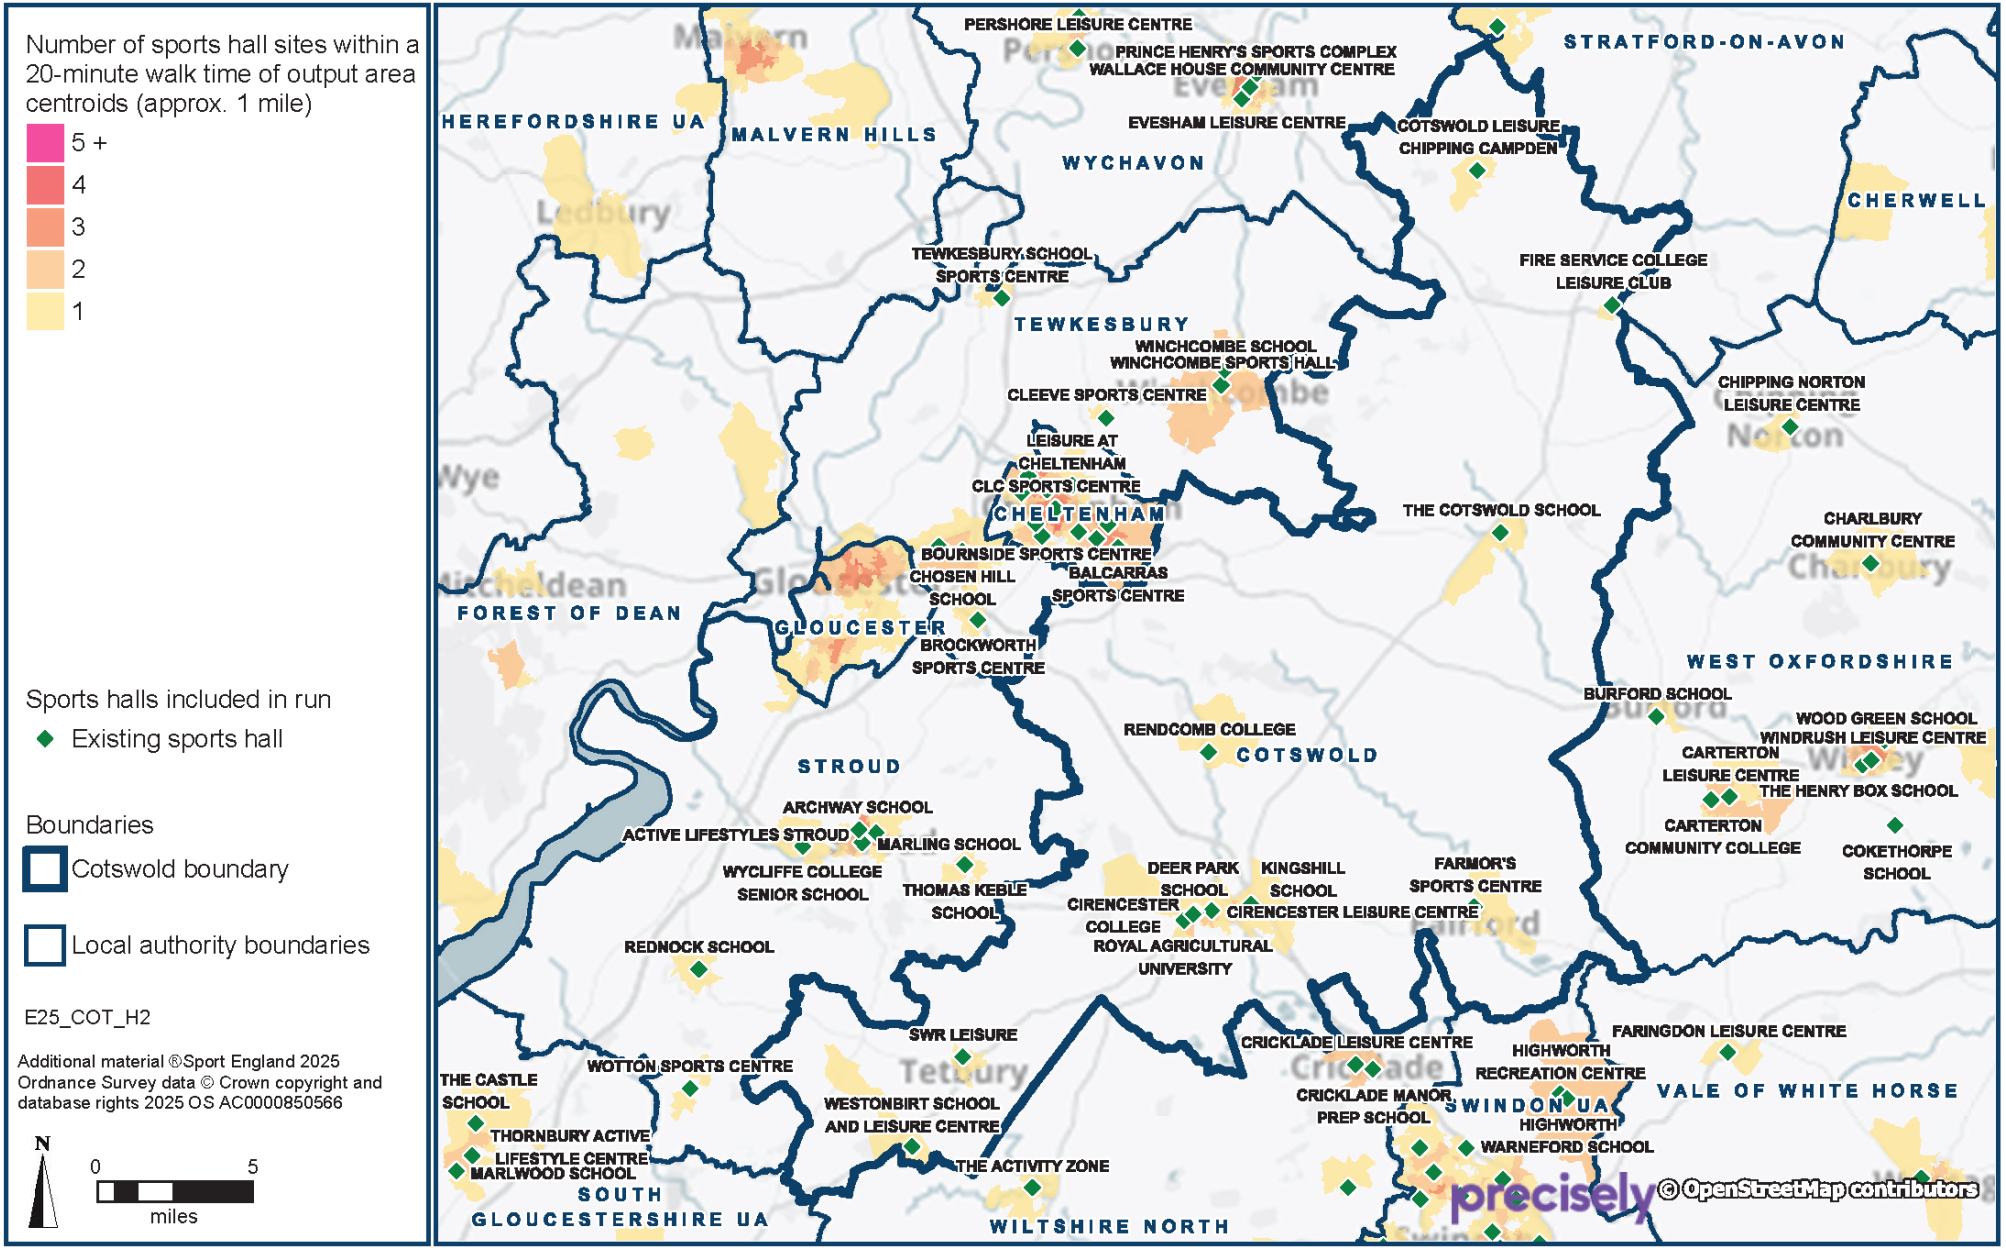
4.6 None of the sports hall sites are within a 15-minute walk of a railway station (purple areas).

4.7 It should be noted that, while most Cotswold residents can access an existing public transport stop, it may not mean they can get to a sports hall within 20 minutes from home via a combination of walking and public transport.

4.8 Key finding 5 is that it is estimated that 4% of journeys by Cotswold residents to sports halls are made by public transport or bicycle in 2025 and 2043. This is less than the regional proportion of 6% and the national proportion of 9% in both years.

Driving Access

4.9 In both 2025 and 2043, all residents of Cotswold are within a 20-minute drive of at least one sports hall (light green areas in Map 4.3).



4.10 Access is better in the southern half of the District where residents in most areas can drive to between five and 14 sites within 20 minutes (medium green and light blue areas).

4.11 There are 11 sports hall sites in the small land area of Cheltenham, and three in Tewkesbury, which are close to the border with Cotswold. This high level of provision contributes to residents in two small areas bordering these local authorities being able to access more than 20 sports hall sites within a 20-minute drive (purple areas).

4.12 It is estimated that 89% of journeys by Cotswold residents to sports halls are made by car in 2025 and 2043.

SPORT ENGLAND

Map 4.3: Driving Access to Sports Halls in 2025 (Run 1) and 2043 (Run 2)

5 SATISFIED DEMAND FOR SPORTS HALLS

Nearly all of Cotswold's demand is satisfied in 2025 and 2043, and most is met within the District.

Around a quarter of the Cotswold's satisfied demand is met at sports halls in neighbouring local authority areas.

In 2025 the largest amount of exported demand goes to West Oxfordshire, and in 2043 to Swindon. The difference in the number of visits between the two local authorities is small.

Table 5.1: Satisfied Demand for Sports Halls in Cotswold by Run

Satisfied Demand	Run 1	Run 2
Cotswold	2025	2043
Number of visits which are met per week in peak period	6,227	6,714
% of total demand satisfied	96%	96%
Number of visits retained per week in peak period	4,661	5,212
Demand retained as a % of satisfied demand	75%	78%
Number of visits exported per week in peak period	1,566	1,502
Demand exported as a % of satisfied demand	25%	22%

Definition of satisfied demand – This represents the proportion of total demand that is met by the capacity at the sports halls from Cotswold residents who live within the travel time of a sports hall. This includes sports halls located both within and outside Cotswold.

5.1 **Key finding 6** is that 96% of Cotswold's demand is met in 2025 and 2043. The number of visits met in the weekly peak period increases from 6,227 in 2025 to 6,714 in 2043 because of the increase in demand in the District.

5.2 Cotswold's proportion of met demand is above the regional average of 95% in both years, and the national average of 95% in 2025 and 94% in 2043.

5.3 The proportion of met demand in Cotswold is the same as in Stratford-on-Avon, Stroud, and Wiltshire and Wychavon in both years. Met demand is highest in Cheltenham at 98% in both years.

5.4 Details of the sports halls in the neighbouring local authority areas are listed in Appendix 2.

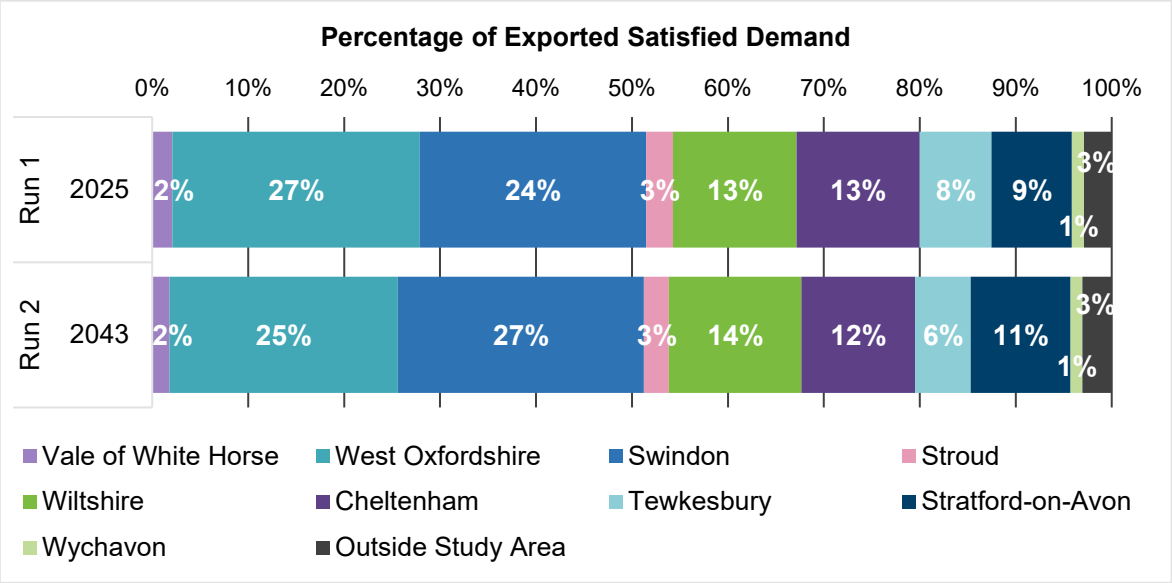
Table 5.2: Proportion of Demand Met by Area and Run

Proportion of Demand Met	Run 1	Run 2
Area	2025	2043
Cotswold	**96%**	**96%**
Cheltenham	98%	98%
South Gloucestershire	97%	97%
Stratford-on-Avon	96%	96%
Stroud	96%	96%
Swindon	97%	96%
Tewkesbury	97%	97%
Vale of White Horse	97%	97%
West Oxfordshire	97%	97%
Wiltshire	96%	96%
Wychavon	96%	96%
South West Region	**95%**	**95%**
England	**95%**	**94%**

Retained Demand

Definition of retained demand – A subset of the satisfied demand findings shows how much of Cotswold residents' demand for sports halls is met at sports halls located within the District. This assessment is based on the travel time from Cotswold's sports halls and residents in the District participating at these halls.

5.5 **Key finding 7** is that most of Cotswold's satisfied demand is met within the District at 75% in 2025 and 78% in 2043. In terms of visits, 4,661 are retained in the weekly peak period in 2025, and 5,212 visits in 2043.



Exported Demand

Definition of exported demand – The residue of satisfied demand, after retained demand, is exported demand. This is based on Cotswold residents who live within the travel time of a sports hall located outside Cotswold and use that hall.

5.6 Of Cotswold's satisfied demand, around a quarter is met at sports halls in neighbouring local authority areas, at 25% in 2025 and 22% in 2043.

5.7 In terms of visits, the District exports 1,566 visits in the weekly peak period in 2025, decreasing slightly to 1,502 visits in 2043.

Chart 5.1: Percentage of Exported Satisfied Demand by Destination and Run

5.8 In 2025 the largest proportion of Cotswold's exported demand goes to West Oxfordshire, accounting for 27% and 402 visits in the weekly peak period (see Map 5.1).

5.9 There are four sports hall sites in West Oxfordshire quite close to the border with Cotswold, including two public leisure centres. Carterton Leisure Centre is a four-court hall suitable for club development, and opened in 2020. Chipping Norton Leisure Centre is a four-court hall, and opened in 2002. Both are attractive sites in terms of their age and availability.

5.10 The second largest amount of exported demand goes to Swindon at 24%. In terms of visits, 368 are exported and met in Swindon. Highworth Recreation Centre in Swindon is accessible to some Cotswold residents. The centre has a four-court hall and a large activity hall. The centre opened in 1988, was refurbished in 2004, and has extensive availability.

5.11 Demand exported from Cotswold and met in neighbouring local authorities in the weekly peak period decreases from 1,566 visits in 2025 to 1,502 visits in 2043.

5.12 There is little change in the number of visits exported to each local authority (see Map 5.2). Demand exported to Swindon increases by 16 visits in the weekly peak period to 384 visits, and accounts for 27% of Cotswold's exported demand. In Cotswold there is a demand increase in Fairford (on the Swindon border) because of housing growth, and there is no change in supply.

5.13 Demand exported to West Oxfordshire decreases by 46 visits in the weekly peak period to 356 visits, accounting for 25% of Cotswold's exported demand.

6 UNMET DEMAND FOR SPORTS HALLS

Unmet demand in Cotswold is very low, at less than one court in both 2025 and 2043.

All the unmet demand is too far from a facility.

Unmet demand is distributed in very low values per square kilometre across Cotswold, the highest value being 0.1 courts.

Table 6.1: Unmet Demand for Sports Halls in Cotswold by Run

Unmet Demand	Run 1	Run 2
Cotswold	2025	2043
Number of visits unmet per week in peak period	257	278
Unmet demand as a % of total demand	4%	4%
Equivalent in courts with comfort factor	0.9	0.9
% of unmet demand due to:		
Facility too far away:	100%	100%
Without access to a car	85%	87%
With access to a car	15%	13%
Lack of facility capacity:	0%	0%
Without access to a car	0%	0%
With access to a car	0%	0%

Definition of unmet demand – This has two parts; demand for sports halls that cannot be met because either:

1. There is too much demand for any particular sports hall within its travel time area and there is a lack of capacity.
2. The demand is located too far from any sports hall that it can use (taking into account deprivation) or reach (taking into account car access) and is then classified as unmet demand.

6.1 Unmet demand in Cotswold is low and there is little change between 2025 and 2043. In 2025 unmet demand is 257 visits in the weekly peak period, and in 2043 is 278 visits.

6.2 **Key finding 8** is that in 2025 and 2043 unmet demand is 0.9 courts, accounting for 4% of demand in both years. In both years all the unmet demand is too far from a facility.

6.3 Residents who are too far from a facility account for all unmet demand in both years.

6.4 There is no unmet demand due to lack of sports hall capacity.

6.5 Unmet demand too far from a sports hall will always exist because it is not possible to achieve complete spatial coverage whereby all areas of a local authority are within walking distance of a sports hall that is not commercial and not everyone will want, or is able, to drive the full distance.

Location of Unmet Demand

2025

6.6 As unmet demand is less than one court across Cotswold, there is no area with high unmet demand. The largest cluster of unmet demand, at less than 0.1 courts per square kilometre, is in Cirencester (purple squares in Map 6.1).

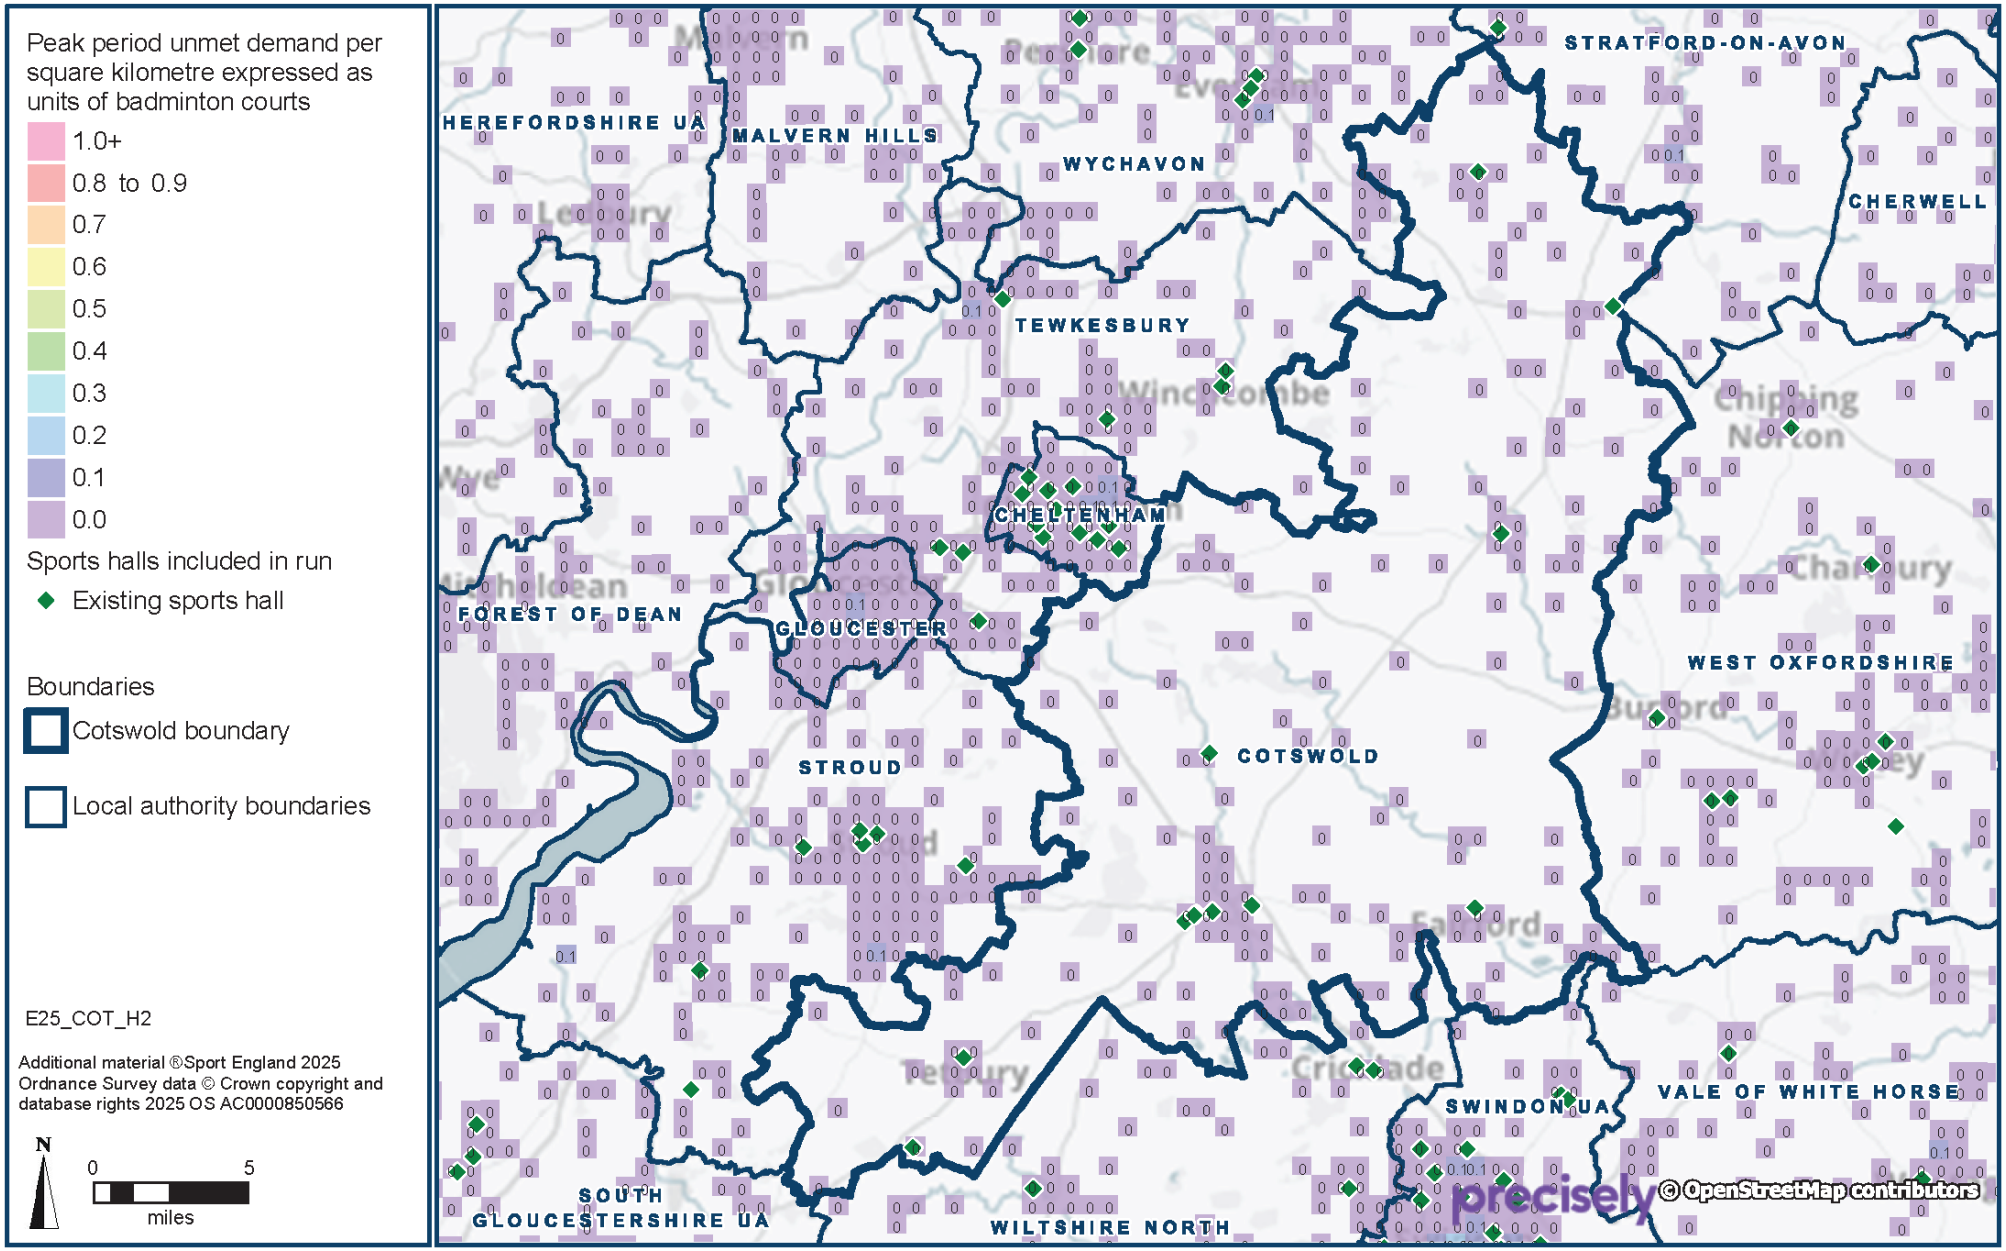
6.7 Clusters of unmet demand of less than 0.1 courts are next highest in Fairford and Tetbury.

2043

6.8 In 2043 unmet demand is unchanged and remains at less than 0.1 courts per square kilometre across Cotswold (see Map 6.2).

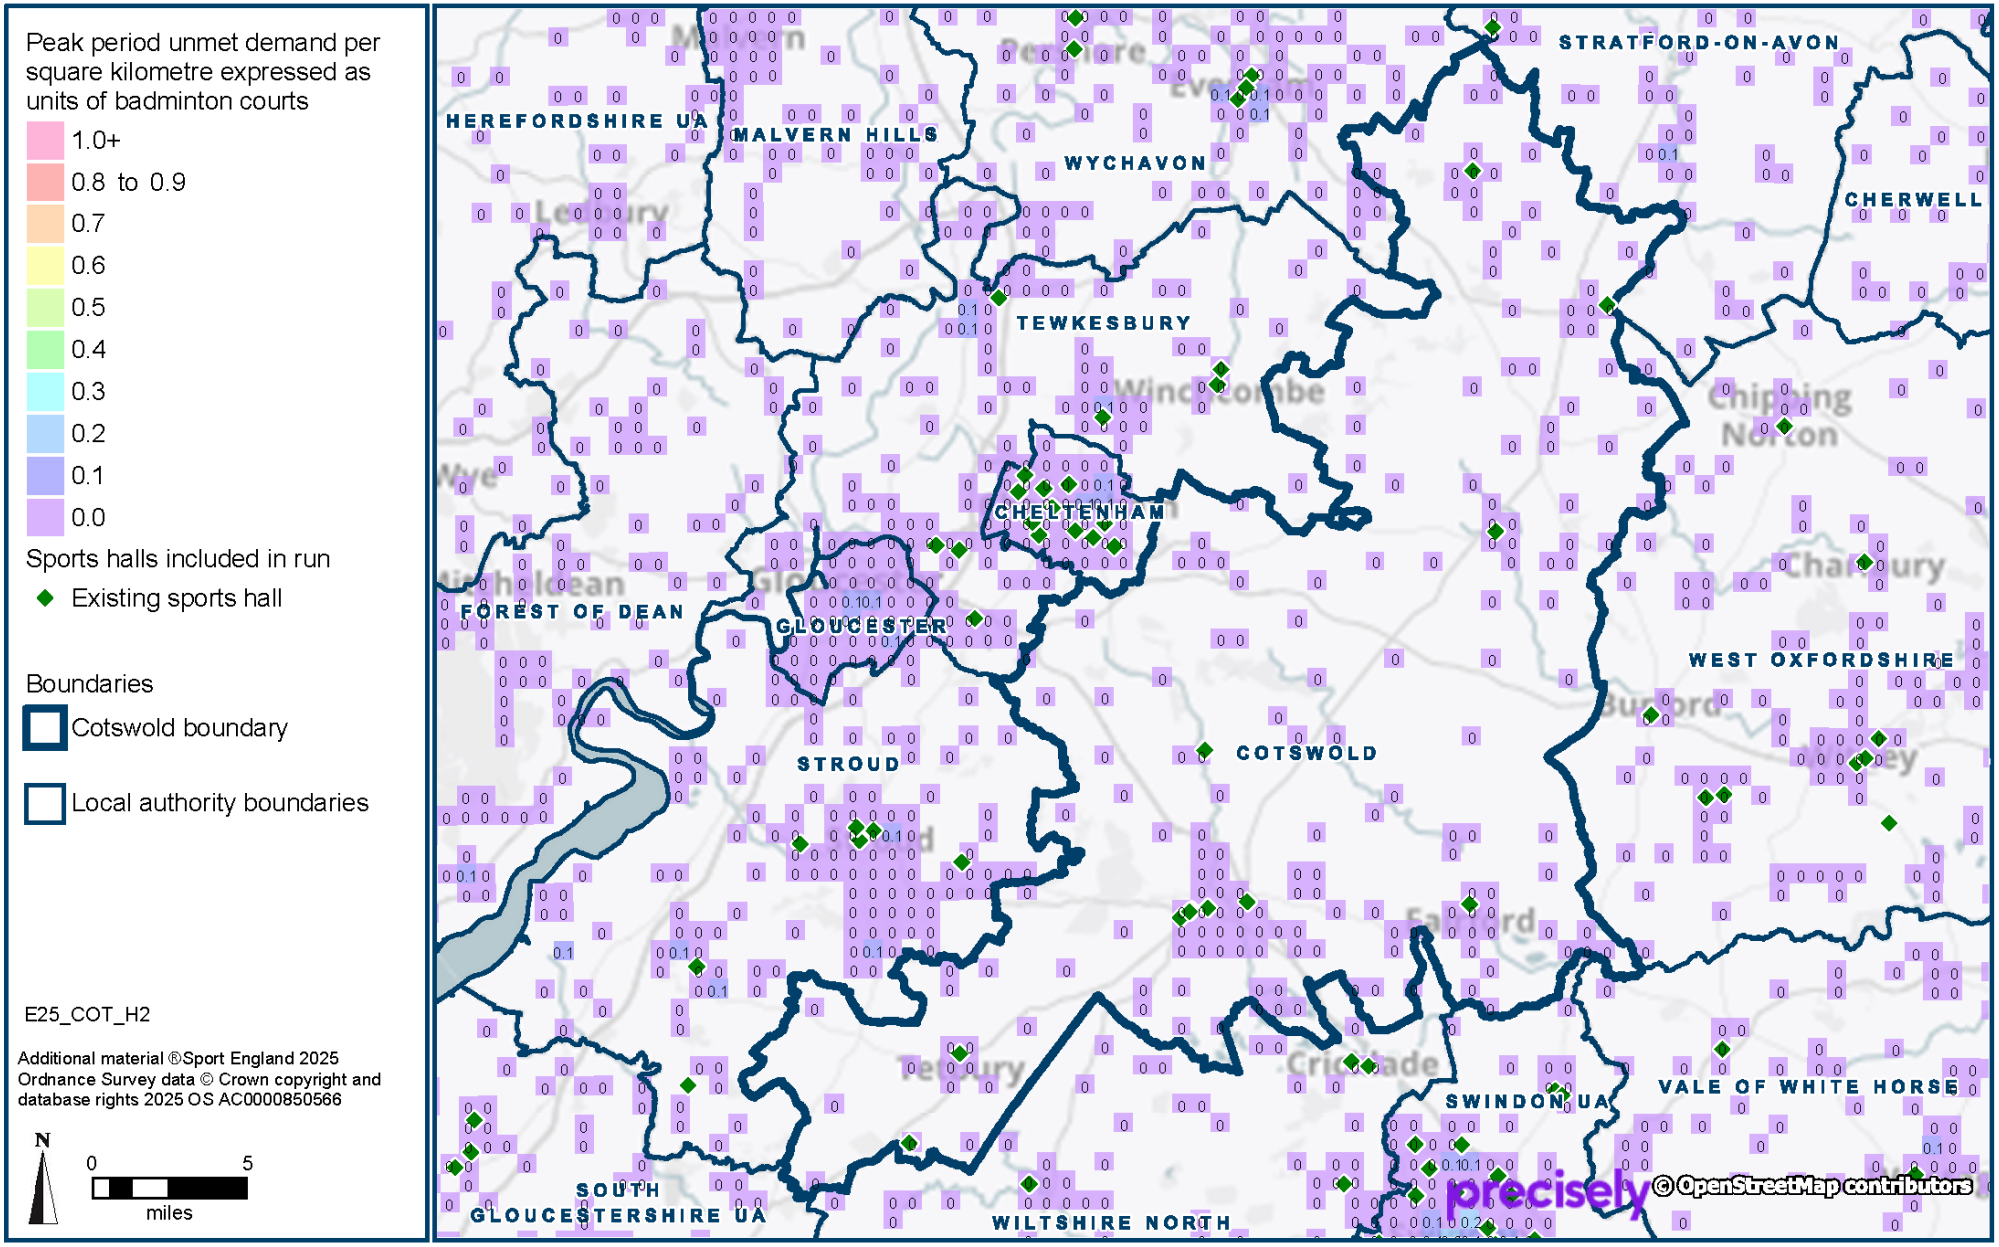
6.9 The largest cluster of unmet demand remains in Cirencester and over a larger area due to the housing growth sites. Unmet demand is also more extensive in Fairford.

Meeting Unmet Demand



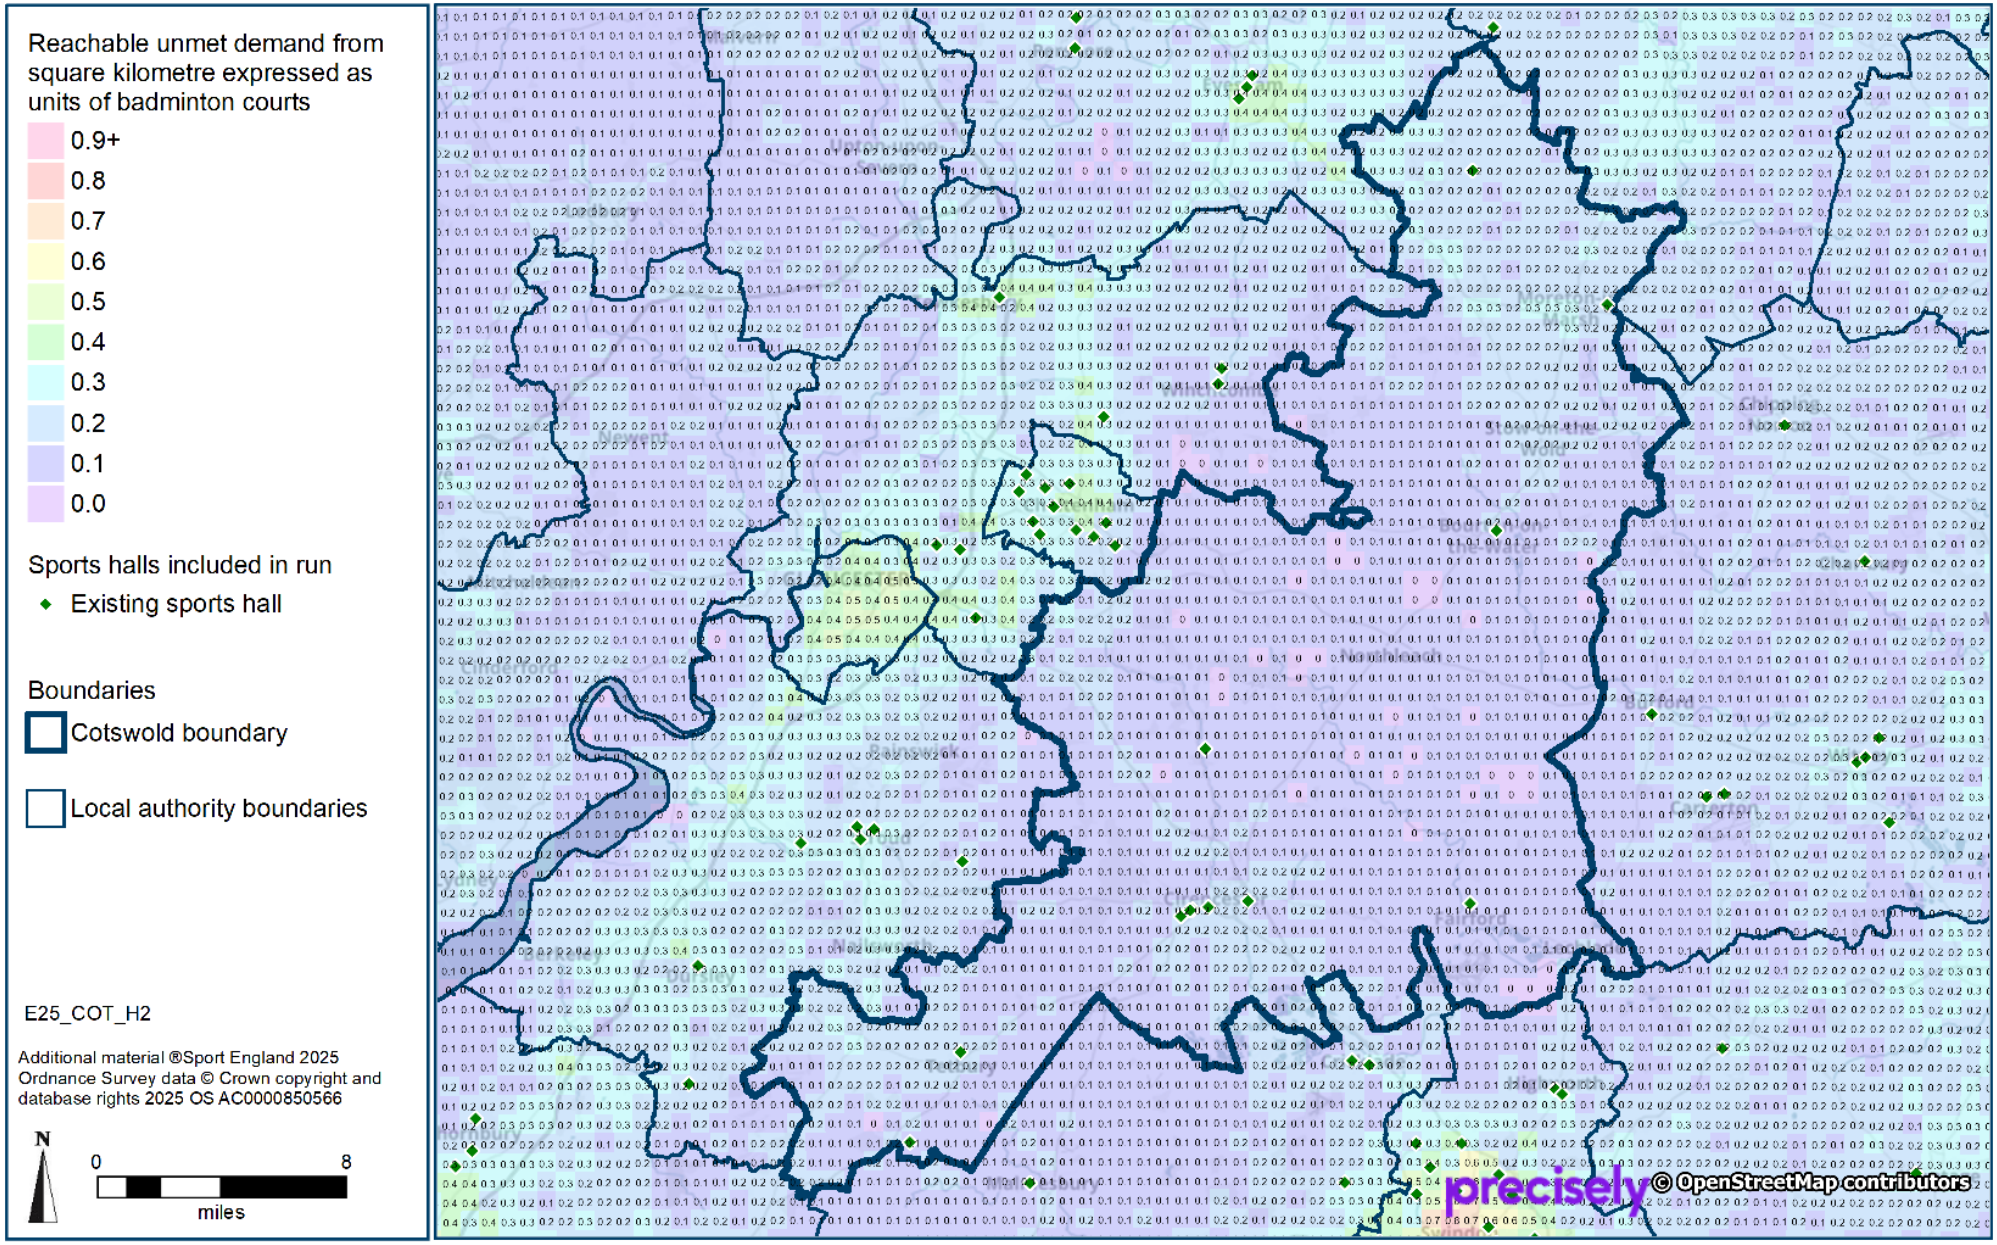
> **Definition of reachable unmet demand** – Analysis of the spread of unmet demand shows the level of unmet demand that would be met by a potential new facility in any given location. This 'reachable unmet demand' is calculated for each one-kilometre grid square and figures are shown in the map.

6.10 In 2043 the locations in Cotswold where the most unmet demand can be met are in Kingscote (southwest Cotswold), Moreton-in-Marsh, Bourton-on-the Hill and Saintbury (north Cotswold) at 0.3 courts (light blue squares in Map 6.3). This is an insufficient amount to consider providing a new sports hall to meet unmet demand and improve accessibility for residents.



For context, the minimum number of reachable courts required to justify a new sports hall would be three.

SPORT ENGLAND



Map 6.1: Unmet Demand for Sports Halls in 2025 (Run 1)

Map 6.3: Reachable Unmet Demand for Sports Halls in 2043 (Run 2)

7 USED CAPACITY OF FACILITIES

Overall utilisation of the sports halls in Cotswold in 2025 is 40% at peak times, and in 2043 is 44%.

Cirencester Leisure Centre is estimated to be 79% utilised in 2025, increasing to 92% in 2043.

Imported demand accounts for just over a quarter of the used capacity of Cotswold's sports halls in both years.

Most of the imported demand is divided almost equally between Stratford-on-Avon, Wiltshire and Stroud.

Cotswold imports more visits than it exports in both 2025 and 2043.

Table 7.1: Used Capacity of Sports Halls in Cotswold by Run

Used Capacity	Run 1	Run 2
Cotswold	2025	2043
Number of visits used of capacity in weekly peak period	6,352	7,076
% of overall capacity of halls used	40%	44%

Definition of used capacity – This is a measure of usage at sports halls and estimates how well used or how full facilities are. The FPM is designed to include a 'comfort factor', beyond which the venues are too full. When the venues are too full, the time taken to change the sports hall programme and equipment starts to impinge on the activity time itself and the changing and circulation areas become congested. In the model, Sport England assumes that usage above 80% of capacity is busy and that the sports hall is operating at an uncomfortable level.

7.1 The number of visits met at Cotswold's sports halls in the weekly peak period increases from 6,352 visits in 2025 to 7,076 visits in 2043, due to the increase in demand to 2043.

7.2 **Key finding 9** is that the estimated used capacity of Cotswold's sports halls is 40% in the weekly peak period in 2025, and 44% in 2043. However, Cirencester Leisure Centre is estimated to be 79% utilised at peak times in 2025, and is uncomfortably busy (more than 80% utilised) at 92% utilisation in 2043.

7.3 The overall small proportion of used capacity is because Cotswold's demand is less than half of the District's available supply in both years.

Table 7.2: Weekly Peak Period Used Capacity of Cotswold Sports Halls by Run

Used Capacity	2025 (Run 1)		2043 (Run 2)		Provider	Peak Hours	Year Built	Year Refurb
Individual Sites	Proportion	Visits Met	Proportion	Visits Met				
Cirencester Leisure Centre	79%	1,746	92%	2,031	Public	46	2006	
Cotswold Leisure Chipping Campden	57%	1,139	56%	1,128	Educational (3rd party)	39.5	1996	
SWR Leisure	45%	852	38%	718	Educational (3rd party)	37	1993	2013

Fire Service College Leisure Club	39%	376	61%	583	Other (sport club)	30	1977	

Site Utilisation Factors

7.4 The estimated used capacity should be reviewed with the facility operator. There are several reasons for the variation in estimated used capacity by site. Often it is difficult to identify which of these reasons apply because several could be interacting simultaneously, but variation is generally caused by any of the following factors.

Type of site operator (public/educational)

- Public leisure centres have a 'draw effect' for the following reasons:
  - They have the greatest accessibility for both sports club and public use because they are available for daytime use, which is not possible at educational venues during term time
  - Public operators actively promote hall sports and physical activity participation, with a programme of use that reflects the activities customers wish to participate in and when they wish to participate
- Access to educational sports halls for community use will be determined by the policy of each educational provider and affects the hours available for community use:
  - Some schools and colleges actively promote community use, while others let their sports halls to sports clubs or community groups on a termly basis, or for shorter periods
  - At some venues there is little differentiation between educational and wider community use, with community access based on a membership system (classed as commercial)

Age of the hall and its 'attractiveness'

- To assess their comparative attractiveness to customers, all sports halls in the model are weighted to reflect their age, whether they have been modernised, and how actively managed they are (educational sites managed in-house have a lower weighting).
- The effect of refurbishment at a site decreases as the site gets older, and it becomes less attractive than a site built in the same year as the refurbishment.
- The quality and range of the offer are considered by customers. These features are of increasing importance to customers and affect participation levels. Desirable features include a modern sports hall with a sprung timber floor, good-quality lighting, modern changing rooms, and other facilities on site such as a studio and/or a gym. Residents may travel further to use a sports hall with this all-round offer rather than participate at the sports hall closest to where they live.

Location of demand and competition from other sites

- Where sports halls are located close together, the demand for these sites is shared between the venues, and this contributes to the level of used capacity at each.
- Conversely, where a sports hall is remotely located, it benefits from having no competition for the local demand.

Capacity

- When reviewing the estimated used capacity, it is important to consider the capacity of the site and not just the proportion in isolation. Centres with the same or similar proportions of used capacity can accommodate very different levels of demand.
- The hours when a site is available for community use affects its capacity at peak times.

Imported demand

- If residents in neighbouring local authority areas participate at a site in Cotswold, their usage becomes part of the used capacity of Cotswold's sports halls.

7.5 Cirencester Leisure Centre meets the most visits in Cotswold in 2025 and 2043 for the following reasons:

- Only six-court hall in the District with the largest capacity
- Has the 'draw effect' of being a public leisure centre
- Attractive to residents in both years having opened in 2006
- Located in the area of highest demand in both years and close to the largest housing growth sites in Cirencester

7.6 Cirencester Leisure Centre is available for the maximum 46.0 hours in the weekly peak period; therefore, there is no scope to increase availability and capacity at peak times and reduce the proportion of used capacity.

Imported Demand

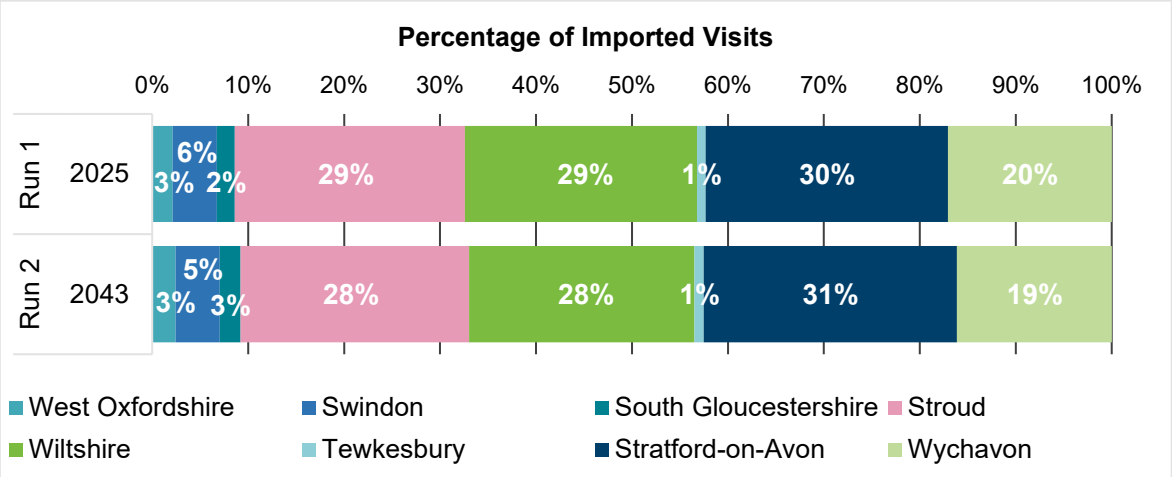

Table 7.3: Imported Demand for Sports Halls in Cotswold by Run

Imported Demand	Run 1	Run 2
Cotswold	2025	2043
Number of visits imported in weekly peak period	1,690	1,865
Visits imported as a % of used capacity	27%	26%
Difference between visits imported and exported	124	362

7.7 Imported demand to Cotswold's sports halls increases from 1,690 visits in the weekly peak period in 2025 to 1,865 visits in 2043. This equates to 27% of the used capacity of Cotswold's sports halls at peak times in 2025, and 26% in 2043. The proportion of imported used capacity is lower in 2043 because the number of retained visits has risen more in 2043.

7.8 Cotswold is a net importer of visits, importing 124 more visits in the weekly peak period than it exports in 2025, and 362 more visits in 2043.

Chart 7.1: Proportion of Imported Visits by Origin and Run

7.9 In 2025 the largest amount of imported demand is from Stratford-on-Avon at 424 visits in the weekly peak period (see Map 7.1). This accounts for 30% of Cotswold's imported demand. While demand is quite low in the area of Stratford-on-Avon that borders Cotswold, there are no sports hall sites in that area. Cotswold Leisure Chipping Campden and Fire Service College Leisure Club are both accessible to Stratford-on-Avon residents.

7.10 The second largest proportions of imported demand are 29% from:

- Wiltshire – 406 visits in the weekly peak period. Some of Wiltshire's demand can access the four sports hall sites in Cirencester.
- Stroud – 402 visits in the weekly peak period. Demand is high in the centre of Stroud and to the border with Cotswold. The A419 provides access for some Stroud residents to the sports hall sites in Cirencester.

7.11 In 2043 most of Cotswold's imported demand is from the same three local authorities (see Map 7.2):

- Stratford-on-Avon increases to 488 visits in the weekly peak period, which equates to 31% of Cotswold's imported demand.
- Wiltshire increases to 435 visits in the weekly peak period, which equates to 28% of Cotswold's imported demand.
- Stroud increases slightly to 441 visits in the weekly peak period, which equates to 28% of Cotswold's imported demand.

8 LOCAL SHARE OF FACILITIES

In 2025 Cotswold has the best provision of sports hall space per head of population in the study area, with provision being above the regional and national averages.

In 2043 Cheltenham has the highest provision and Cotswold the second highest. The District's provision remains considerably higher than the regional and national averages.

Table 8.1: Local Share of Sports Halls in Cotswold by Run

Local Share	Run 1	Run 2
Cotswold	2025	2043
Local share of sports halls relative to demand in local area: <1 = poorer, >1 = better	1.26	0.76

Definition of local share – This helps show which areas have a better or worse share of facility provision. It considers the size, availability and quality of facilities, and travel modes. Local share is useful for looking at 'equity' of provision. Local share is the available capacity that people want to visit in an area (considering deprivation), divided by the demand for that capacity in the area. Local share decreases as facilities age.

8.1 Local share shows how the access and share of sports halls differs across the local authority area, as follows:

- A value of 1 means that there is sufficient suitable supply reachable by the demand
- A value of less than 1 indicates a shortage of suitable supply that can be reached by the demand
- A value greater than 1 indicates a surplus of suitable supply that can be reached by the demand

8.2 Overall, local share identifies the areas of the local authority where the share of sports halls is better and worse. The intervention is to try and increase access for residents in the areas with the poorest access to sports halls.

8.3 In 2025 local share in Cotswold is 1.26, meaning that there is sufficient suitable provision that demand can access based on the age, used capacity and operation of the sports halls. Demand is lower in 2025 than in 2043.

8.4 In 2043 local share is 0.76, meaning that there is insufficient suitable provision that demand can access. Demand has increased, there is no change in capacity, and the sports halls have aged and become less attractive to residents.

Geographical Distribution of Local Share

2025

8.5 In 2025 local share varies across Cotswold, and is best in Rendcomb at 2.9 to 4.0 (purple squares in Map 8.1). Demand is very low in this area and residents can access Rendcomb College (a four-court hall with high availability and very low utilisation at peak times).

8.6 Local share in Tetbury is 1.7 to 1.8 (dark blue and purple squares). Residents can access SWR Leisure and Westonbirt School and Leisure Centre. Both centres have a four-court hall, and SWR Leisure also has an activity hall. Demand in Tetbury is quite high but is low in the surrounding area.

8.7 Local share is poorest in Moreton-in-Marsh at 0.8 (light green squares). Fire Service College Leisure Club is accessible to residents; however, it is the oldest sports hall in the District, having opened in 1977, and is unmodernised which makes it less attractive to residents.

2043

8.8 In 2043 local share remains best in Rendcomb but is lower at 2.1 to 3.1 (purple squares in Map 8.2). Demand is unchanged but there is no increase in capacity, and Rendcomb College sports hall has aged and become less attractive to residents. Local share in Tetbury is 1.0 (dark green squares).

8.9 Local share in Cirencester is 0.7 to 0.9 (yellow and light green squares). While Cirencester has the highest supply of sports halls with four sites, it also has the greatest demand. Demand increases to 2043 because the largest housing growth sites are to the south of the town.

8.10 Local share remains poorest in Moreton-in-Marsh at 0.4 (orange squares). Demand increases slightly and there is no improvement in supply or change in capacity.

Comparative Measure of Provision

8.11 A comparative measure of sports hall provision is the number of badminton court equivalents per 10,000 population.

8.12 In 2025 Cotswold's provision is 6.8 courts per 10,000 population. This is considerably above the regional average of 4.2 court per 10,000 population and the national average of 3.8 courts.

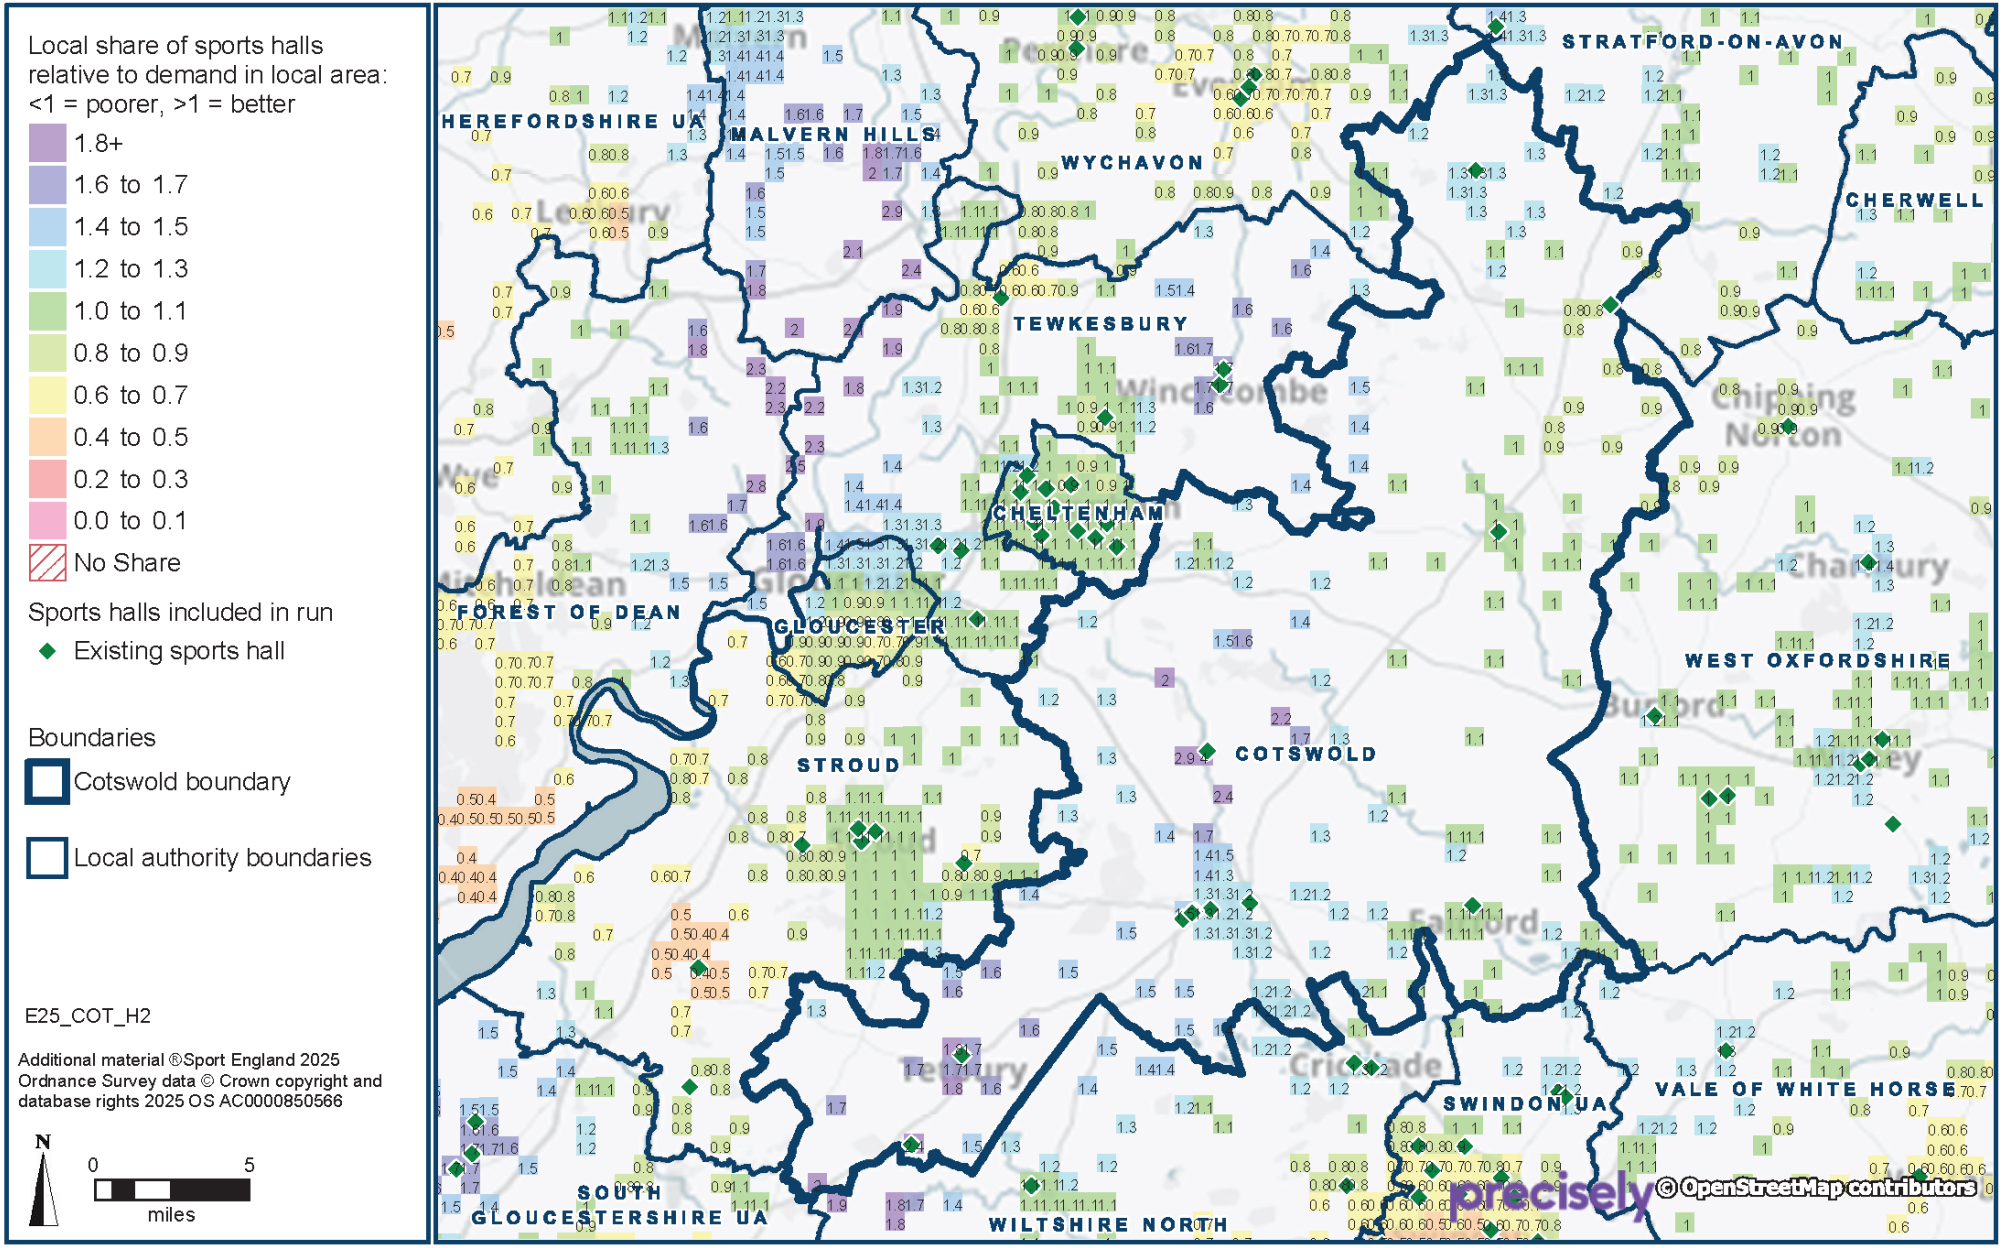
8.13 Cotswold has the best provision in the study area. Provision is only slightly lower in Cheltenham at 6.4 courts per 10,000 population. Wychavon has the poorest provision at 2.7 courts per 10,000 population.

8.14 In 2043 Cotswold's provision is 5.9 courts per 10,000 population, because the population has increased and the supply is unchanged.

8.15 Cotswold has comparatively better provision than the regional average, which decreases to 3.8 courts per 10,000 population, and the national average, which remains at 3.6 courts.

8.16 Provision in the study area is now best in Cheltenham at 6.0 courts per 10,000 population. Cotswold has the second best provision.

Table 8.2: Badminton Court Equivalents per 10,000 Population by Area and Run



Courts per 10,000 Population	Run 1	Run 2
Area	2025	2043
Cotswold	**6.8**	**5.9**
Cheltenham	6.4	6.0
South Gloucestershire	3.3	2.8
Stratford-on-Avon	3.2	2.6
Stroud	3.1	2.7
Swindon	3.8	3.6
Tewkesbury	3.7	3.1
Vale of White Horse	4.9	4.1
West Oxfordshire	4.7	4.1
Wiltshire	4.2	3.9
Wychavon	2.7	2.3
South West Region	**4.2**	**3.8**
England	**3.9**	**3.6**

8.17 **The findings on badminton courts per 10,000 population are set out because some local authorities like to compare their quantitative provision with that elsewhere; however, this does not set a standard of provision and should not be used as such.**

8.18 The supply and demand assessment for sports halls in Cotswold is based on the findings from the previous six headings analysed in this report.

APPENDIX 1: FACILITIES EXCLUDED

The audit excludes facilities that are deemed to be either for private use, too small, closed or there is a lack of information, particularly relating to hours of use. The following facilities were deemed to fall under one or more of these categories and therefore excluded from the modelling:

Site	Facility Type	Reason for Exclusion
Fairford RFC	Activity	Private use
Hatherop Castle School	Main	Private use
Lechlade Memorial Hall and Pavilion	Activity x 2	Principal hall too small
National Star College	Activity	Principal hall too small
Paternoster School	Activity	Private use
Stow-On-The-Wold Primary School	Activity	Principal hall too small
The Chedworth Village Hall	Activity	Principal hall too small
Upper Rissington Village Hall and Playing Fields	Activity	Principal hall too small
Westwoods Centre	Activity	Principal hall too small

APPENDIX 2: FACILITIES IN NEIGHBOURING LOCAL AUTHORITY AREAS INCLUDED IN THE ASSESSMENT

Site	Provider	Facility Type	Dimensions (m)	Area (sqm)	Year Built	Year Refurb
Cheltenham						
All Saints Academy (Cheltenham)	Educational (in-house)	4-court	34.5 x 20	690	2011

APPENDIX 3: MODEL DESCRIPTION, INCLUSION CRITERIA AND MODEL PARAMETERS

Included within this Appendix are the following:

- Model Description
- Facility Inclusion Criteria
- Model Parameters

Model Description

1 Background

1.1 The Facilities Planning Model (FPM) is a computer-based supply/demand model, which has been developed by Edinburgh University in conjunction with sportscotland and Sport England since the 1980s.

1.2 The model is a tool for helping to assess the strategic provision of community sports facilities in an area. It is currently applicable for use in assessing the provision of the following facilities that Sport England holds substantial demand data for:

- sports halls
- swimming pools
- indoor bowls centres
- artificial grass pitches (AGPs)

2 Use of FPM

2.1 The FPM is one of Sport England's principal tools and has been developed as a means for:

- Assessing the requirements for different types of community sports facilities on a local, regional and national scale.
- Helping local authorities to determine an adequate level of sports facility provision to meet their local needs.
- Helping to identify strategic gaps in the provision of sports facilities.
- Comparing alternative options for planned provision, taking account of changes in demand and supply. This includes testing the impact of opening, relocating and closing facilities, and the likely impact of population changes on the need for sports facilities.

2.2 The FPM has been used in the assessment of Lottery funding bids for community facilities and as a principal planning tool to assist local authorities in planning for the provision of community sports facilities.

3 How the Model Works

3.1 In its simplest form, the model seeks to assess whether the capacity of existing facilities for a particular sport is capable of meeting local demand for that sport, considering how far people are prepared to travel to such a facility.

3.2 In order to do this, the model compares the capacity of facilities (supply) within an area against the demand for that facility from the local population, similar to other social gravity models.

3.3 To do this, the FPM converts both demand (in terms of people) and supply (facilities) into a single comparable unit. This unit is 'visits in the weekly peak period'. Once converted, demand and supply can be compared.

3.4 The FPM uses a set of parameters to define how facilities are used and by whom. These parameters are primarily derived from a combination of data, including actual user surveys from a range of sites across the country in areas of good supply, together with participation survey data. These surveys provide core information on the profile of users such as their age and gender, how often they visit, the distance travelled, duration of stay, as well as information on the facilities themselves such as programming, peak times of use and capacity of facilities.

3.5 This survey information is combined with other data sources to provide a set of model parameters for each facility type. The original core user data for halls and pools comes from the National Halls and Pools survey undertaken in 1996. This data previously formed the basis for the National Benchmarking Service. For AGPs, the core data used comes from the user survey of AGPs carried out in 2005/06 jointly with sportscotland.

3.6 User survey data from the National Benchmarking Service and other appropriate sources are used to update the model's parameters on a regular basis. The parameters are set out at the end of the document, and the main data sources analysed are:

- Active Lives:
    - For the adult survey, this data is collected by an online survey or paper questionnaire on behalf of Sport England. Each annual sample includes approximately 175,000 people and covers the full age/gender range. Detailed questions are asked about over 200 separate sport categories in terms of participation and frequency.
    - For the children and young people survey, this data is collected through schools, with up to three mixed ability classes in up to three randomly chosen year groups completing an online survey.
- National Benchmarking Service (now ceased):
    - This was a centre-based survey whose primary purpose was to enable centres to benchmark themselves against other centres. Sample interviews were conducted on site. The number of people surveyed varied by year depending on how many centres took part. Approximately 10,000 swimmers and 3,500 sports hall users were surveyed per year. This data was used for journey

times, establishing proportions of particular activities in different hall types, the duration of activities and the time of activity (peak period).

- Moving Communities Customer Experience Survey:
    - Annual online survey distributed by participating local authorities and operators via email. Email invites are sent to any member or customer on their database who has attended their leisure centre in the last 3 months. The results inform the travel mode that residents use to access facilities.
- Scottish Health:
    - Annual survey of approximately 6,600 people (just under 5,000 adults). This data is primarily used to assess participation, frequency and activity duration.

3.7 Other data is used where available. For example, the following data sources are among those that have been used to cross-check results:

- Children's Participation in Culture and Sport, Scottish Government, 2008
- Young People's Participation in Sport, Sports Council for Wales, 2009
- Health and Social Care Information Centre, Lifestyle Statistics, 2012
- Young People and Sport, Sport England, 2002
- Data from Angus Council, 2013/14
- National Pools and Halls Survey, 1996
    - This survey was used to obtain capacities per sports hall for differing sport types for programming data.

4 Calculating Demand

4.1 Demand is calculated by applying the user information from the parameters, as referred to above, to the population[1]. This produces the number of visits for that facility that will be demanded by the population.

4.2 Depending on the age and gender composition of the population, this will affect the number of visits an area will generate. In order to reflect the different population profiles of the country, the FPM calculates demand based on the smallest census groupings. These are output areas (OAs)[2].

4.3 The use of OAs in the calculation of demand ensures that the FPM is able to reflect and portray differences in demand in areas at the most sensitive level based on available census

[1] For example, it is estimated that 7.72% of 16-24 year old males will demand to use an AGP 1.67 times a week. This calculation is done separately for the 12 age/gender groupings.

[2] Census OAs are the smallest grouping of census population data and provide the population information on which the FPM's demand parameters are applied. A demand figure can then be calculated for each OA based on the population profile. There are over 178,600 OAs in England. An OA has a target value of 125 households per OA.

information. Each OA used is given a demand value in visits in the weekly peak period by the FPM.

5 Calculating Supply Capacity

5.1 A facility's capacity varies depending on the following factors:

- Its size (area of pool or hall, number of pitches or rinks)
- How many hours the facility is available for use by the community in the weekly peak period
- How many visits can be accommodated by the facility at any one time (pools = 1 user/6 sqm, main halls/barns = 8 users/court, activity halls/studios = 15 users/court, AGPs = 28 users/pitch, indoor bowls = 6 users/rink)

5.2 The FPM calculates the maximum number of visits that a facility can accommodate, which gives it a theoretical capacity in visits in the weekly peak period.

5.3 Based on travel time information (see Travel Time section) taken from the user surveys, the FPM then calculates how much demand would be met by the facility, having regard to its capacity and how much demand can travel to the facility. The FPM includes an important feature of spatial interaction. This feature takes account of the location and capacity of all the facilities, having regard to their access and the size of demand, and assesses whether the facilities are in the right place to meet the demand.

5.4 It is important to note that the FPM does not simply add up the total demand within an area and compare that to the total supply within the same area. This approach would not take account of the spatial aspect of supply against demand in a particular area. For example, if an area has a total demand for five facilities and there are currently six facilities within the area, it would be too simplistic to conclude that there is an over-supply of one facility as this approach would not take account of whether the five facilities are in the correct location for local people to use them within that area. It may be that all the facilities are in one part of the local authority area, leaving other areas under-provided. An assessment of this kind would not reflect the true picture of provision. The FPM is able to assess supply and demand within an area based on the needs of the population within that area.

5.5 In making calculations as to supply and demand, visits made to sports facilities are not artificially restricted or calculated by reference to administrative boundaries, such as local authority areas. Users are generally expected to use their closest facility. The FPM reflects this through analysing the location of demand against the location of facilities, allowing for cross-boundary movement of visits. For example, if a facility is on the boundary of a local authority, users will generally be expected to come from the population living close to the facility, but who may be in a neighbouring authority.

6 Calculating the Capacity of Sports Halls – Badminton Court Equivalents

6.1 The capacity of sports halls is calculated in the same way as described above, with each sports hall site having a capacity in visits in the weekly peak period. In order for this capacity to be meaningful, these visits are converted into the equivalent of main hall badminton

courts. This 'court' figure is often mistakenly read as being the same as the number of 'marked courts' at the sports halls in the Active Places data, but it is not the same. There will usually be a difference between this figure and the number of 'marked courts' in Active Places.

6.2 The reason for this is that the badminton court equivalents are of all the main and activity halls' capacities; this is calculated based on hall size (area) and whether it is a main hall or an activity hall. This gives a more accurate reflection of the overall capacity of the halls than simply using the 'marked courts' figure, for two reasons:

- In calculating the capacity of halls, the model uses a different at-one-time parameter for main halls and for activity halls. Activity halls have a greater at-one-time capacity than main halls. Marked courts can sometimes not properly reflect the size of the actual main hall. For example, a hall may be marked out with four courts, when it has space for three courts. As the model uses the 'courts' as a unit of size, it is important that the hall's capacity is included as a 'three-court unit' rather than a 'four-court unit'.
- It is often difficult to visualise how much hall space there is when expressed as visits in the weekly peak period. To make things more meaningful, this capacity is converted back into badminton court equivalents and is noted in the output tables as hall space in courts.

7 Facility Attractiveness – for Halls and Pools Only

7.1 Not all facilities are the same, and users will find certain facilities more attractive to use than others. The model attempts to reflect this by introducing an attractiveness weighting factor, which affects the way visits are distributed between facilities. Attractiveness, however, is very subjective. Currently weightings are only used for sports hall and swimming pool modelling.

7.2 Attractiveness weightings are based on the following:

- Age and refurbishment weighting (pools and halls): The older a facility is, the less attractive it will be to users. It is recognised that this is a general assumption and that there may be examples where older facilities are more attractive than newly built ones due to excellent local management, programming and sports development. Additionally, the date of any significant refurbishment is also included within the weighting factor; however, here attractiveness is set lower than a new build of the same year. It is assumed that a refurbishment that is older than 20 years will have a minimal impact on the facility's attractiveness. The information on year built/refurbished is taken from Active Places. A graduated curve is used to allocate the attractiveness weighting by year. This curve levels off at 70 years old with a 20% weighting. The refurbishment weighting is slightly lower than the new built year equivalent.
- Management and ownership weighting (halls only): Due to the large number of halls being provided by the education sector, an assumption is made that these halls will generally not provide as balanced a programme as halls run by local authorities, trusts, etc, with school halls more likely to be used by teams and groups through block booking. A less balanced programme is assumed to be less attractive to a general

pay-and-play user than a standard local authority leisure centre sports hall with a wider range of activities on offer.

7.3 To reflect this, two weighting curves are used:

- High weighted curve – includes non-education management (third party) and a more balanced programme, therefore more attractive
- Lower weighted curve – includes educational halls managed in-house, therefore less attractive

7.4 Commercial facilities (halls and pools): While there are relatively few sports halls provided by the commercial sector, an additional weighting factor is incorporated within the model to reflect the cost element often associated with commercial facilities. For each population OA, the Indices of Multiple Deprivation (IMD) score is used to limit whether people will use commercial facilities. The assumption is that the higher the IMD score (less affluence), the less likely the population of the OA would choose to go to a commercial facility.

7.5 The English Indices of Deprivation 2019, produced by the Ministry of Housing, Communities and Local Government, measure relative levels of deprivation in 32,844 lower super output areas in England. IMD is an overall relative measure of deprivation constructed by combining seven domains of deprivation according to their relative weights.

8 Used Capacity

8.1 Used capacity refers to how much of a facility's theoretical capacity is being used. At first this can appear to be unrealistically low, with local authority figures being in the 50-60% region. Without any further explanation, it would appear that facilities are half empty. The key point is not to see a facility's theoretical maximum capacity (100%) as being an optimum position. In practice this would mean that a facility would need to be completely full every hour it was open during the peak period. This would be both unrealistic from an operational perspective and undesirable from a user's perspective, as the facility would be completely full.

8.2 For example, a 25m four-lane pool has a theoretical capacity of 2,260 visits per week during a 52.5-hour peak period. Usage of a pool will vary throughout the evening, with some sessions being busier than others through programming, such as an aqua aerobics session between 19:00 and 20:00 and lane swimming between 20:00 and 21:00 (see table below). Other sessions will be quieter, such as between 21:00 and 22:00. This pattern of use would mean a total of 143 swims taking place. However, the pool's maximum theoretical capacity is 264 visits throughout the evening. In this instance the pool's used capacity for the evening would be 54%.

Visits per hour	16:00-17:00	17:00-18:00	18:00-19:00	19:00-20:00	20:00-21:00	21:00-22:00	Total visits for the evening
Theoretical maximum capacity	44	44	44	44	44	44	264
Actual usage	8	30	35	50	15	5	143
% of capacity used	18%	68%	80%	114%	34%	11%	54%

9 Comfort Factor – Halls and Pools

9.1 If the facilities were full to their theoretical capacity, there would simply not be the space to undertake the activity comfortably. In addition, there is a need to take account of a range of activities taking place which have different numbers of users; for example, aqua aerobics will have significantly more participants than lane swimming sessions. Additionally, there may be times and sessions that, while being within the peak period, are less busy and so will have fewer users.

9.2 To account for these factors the notion of a 'comfort factor' is applied within the model. For swimming pools, 70%, and for sports halls, 80%, of their theoretical capacity is considered as indicating where a facility starts to become uncomfortably busy. This should be seen only as a guide to help flag when facilities are becoming busier, rather than as a 'hard threshold'.

9.3 The comfort factor is also used to increase the capacity needed to comfortably meet unmet demand. If this comfort factor is not applied, then any facilities provided will be operating at their maximum theoretical capacity, which is not desirable as previously noted.

9.4 The comfort factor is not applied to AGPs due to the fact they are predominantly used by teams that have a set number of players, therefore, the notion of having a 'less busy' pitch is not applicable.

10 Travel Times

10.1 The model includes three different modes of travel:

- driving
- walking and wheeling
- public transport and cycling

10.2 Car access is also considered. In areas where there is less access to a car, the model reduces the number of visits made by car and increases those made on foot for shorter journeys and public transport for longer journeys.

10.3 Overall, surveys have shown that most visits to swimming pools, sports halls and AGPs are made by driving, with a significant minority of visits to facilities being made on foot.

Facility	Driving	Walking	Public Transport	Cycling
Swimming Pool	74%	18%	4%	4%
Sports Hall	76%	19%	2%	3%
AGP Combined AGP Football AGP Hockey	79% 74% 97%	18% 22% 2%	3% 4% 1%	unknown

10.4 The model includes a distance decay function where the further a user is from a facility, the less likely they will travel. Set out below is the survey data with the percentage of visits made

within each of the travel times. This shows that almost 90% of all visits, both by car and on foot, are made within 20 minutes. Hence, 20 minutes is often used as a rule of thumb for the coverage for sports halls and swimming pools.

Minutes	Swimming Pools		Sport Halls	
	Drive	Walk	Drive	Walk
0-10	56%	53%	54%	55%
11-20	35%	34%	36%	32%
21-30	7%	10%	7%	10%
31-45	2%	2%	2%	3%

10.5 For AGPs, there is a similar pattern to halls and pools, with hockey users observed as travelling slightly further (89% travel up to 30 minutes). Therefore, a 20-minute travel time can also be used for combined and football, and 30 minutes for hockey.

Minutes	AGP Combined		AGP Football		AGP Hockey	
	Drive	Walk	Drive	Walk	Drive	Walk
0-10	28%	38%	30%	32%	21%	60%
10-20	57%	48%	61%	50%	42%	40%
20-40	14%	12%	9%	15%	31%	0%

NOTE: These are approximate figures and should only be used as a guide

10.6 Ordnance Survey's Multi-Modal Network with average speed data is used to calculate the off-peak drive times between facilities and the population, observing any one-way and turn restrictions that apply. These travel times have been validated against national survey work, and therefore are based on the actual travel patterns of users.

10.7 The network is also used to calculate walk times along paths and roads, excluding motorways and trunk roads. A standard walking speed of 3 mph is used for all journeys.

10.8 Due to the complexity of public transport timetables, public transport travel times in the model are assumed to be twice as long as driving times.

10.9 A cycling speed of 12 mph is used for roads and shared use cycleways, which is approximately half the average speed of driving in urban areas. A speed of 7.5 mph is used for tracks and off-road travel.

Facility Inclusion Criteria

Sports Halls

The following inclusion criteria were used for this analysis.

- Include all operational sports halls available for community use, ie, pay-and-play, membership, sports club/community association.
- Exclude all halls not available for community use, ie, private use.
- Exclude all halls where the main hall is less than 3 courts in size.
- Include all 'planned', 'under construction', and 'temporarily closed' facilities only where all data is available for inclusion.
- Where opening times are missing, availability is included based on similar facility types.
- Where the year built is missing, assume date 1975[3].

Facilities over the border in Wales and Scotland included, as supplied by sportscotland and Sport Wales.

[3] Choosing a date in the mid-1970s ensures that the facility is included, while not overestimating its impact within the run.

Model Parameters

Sports Halls Parameters

At-one-time Capacity

32 users per 4-court hall
15 users per 144 square meters of activity hall

Coverage Maps

Car: 20 minutes
Walking: 1.6 km
Public transport: 20 minutes at about half the speed of a car

NOTE: Travel times are indicative, within the context of a distance decay function of the model

EXECUTIVE SUMMARY

Introduction

0.1 Cotswold District Council (also referred to as Cotswold, or the District) is reviewing its current provision of swimming pools and assessing future demand and level of provision required to 2043.

0.2 This report has been prepared based on an assessment using the Sport England Facilities Planning Model (FPM) spatial modelling tool. The FPM study is a quantitative, accessibility and spatial assessment of the supply, demand and access to swimming pools.

0.3 The FPM modelling runs are to provide the following:

- Run 1 – baseline assessment of provision in 2025
- Run 2 – forward assessment of demand for swimming pools and its distribution, based on the projected changes in population between 2025 and 2043

0.4 The main report sets out the full set of findings under each of the seven assessment headings.

0.5 The next section of the report provides the headline strategic overview, and the key findings and interventions arising from the FPM study on supply, demand and accessibility.

Headline Strategic Overview

0.6 The headline strategic finding is that the current supply of swimming pools meets Cotswold's demand in the weekly peak period for swimming pools in 2025 and 2043, and there is no need to increase provision to meet demand. Satisfied demand is very high, with most being met within the District. Unmet demand is very low, and there is almost no unmet demand due to lack of capacity.

0.7 Based on population change and provision of 4,000 new housing units, there is a 10% increase in demand for swimming pools between 2025 and 2043. The District-wide level of swimming pool utilisation increases from 62% in the weekly peak period in 2025 to 66% in 2043. The increase in demand can be met by the current accessible supply in the weekly peak period. However, Cirencester Leisure Centre is estimated to be uncomfortably busy (more than 70% utilised) in 2025 and fully utilised at peak times in 2043. This is for the following reasons:

- Demand is highest in Cirencester in both years.
- The largest housing growth sites are in the Cirencester area.
- It is the most recent site to open and, therefore, highly attractive to residents.
- In both years, the largest amount of imported demand to Cotswold is from Stroud, accounting for 39% of Cotswold's imported demand in 2025 and 41% in 2043. While The Pulse Dursley in south Stroud is relatively new and attractive, provision in Stroud is poor compared to demand.

Key Findings

0.8 The key findings that underpin the headline strategic overview are as follows:

1. Cirencester Leisure Centre, Bourton Leisure Centre and Westonbirt School and Leisure Centre are all available for the maximum 52.5 hours in the weekly peak period. Therefore, there is no scope to increase availability and capacity at peak times at these sites.
2. Cirencester Leisure Centre provides 34% of the available capacity in both 2025 and 2043. The four educational sites provide 53% of the available capacity and Fire Service College Sports Club provides 13%.
3. Cotswold's population is projected to increase by 15% between 2025 and 2043, resulting in a 10% increase in demand for swimming pools. The smaller increase in demand compared with the population growth is because of the ageing of the population in Cotswold between 2025 and 2043. There will be fewer residents in the age bands with the highest swimming participation (0-15 year olds and 25-39 year olds) in 2043 than in 2025. Cotswold has a larger proportion of residents over 65 years old than the national average.
4. Cotswold's demand is the equivalent of 57% of its available supply in 2025, increasing to 63% in 2043.
5. It is estimated that 4% of journeys by Cotswold residents to swimming pools are made by public transport or bicycle in 2025 and 2043. This is less than the regional proportion of 6% and the national proportion, which decreases from 10% in 2025 to 9% in 2043.
6. In 2025, 95% of Cotswold's demand is met; and 94% in 2043. However, the number of visits met in the weekly peak period increases from 5,761 in 2025 to 6,316 in 2043 due to the increase in demand in the District.
7. In 2025 and 2043, 71% of Cotswold's satisfied demand is met within the District. In terms of visits, 4,091 are retained in the weekly peak period in 2025, increasing to 4,473 in 2043.
8. Unmet demand in Cotswold is 52 sqm of water in 2025, and 62 sqm in 2043. Unmet demand that is too far from a facility is 98% in 2025, and 93% in 2043. Lack of capacity accounts for 1 sqm of water in 2025, and 4 sqm of water in 2043.
9. In 2043 the location in Cotswold where the most unmet demand can be met is Kingscote at 34 sqm of water. This is insufficient unmet demand to consider providing a new swimming pool.

Interventions and Next Steps

0.9 The assessment has identified that there is sufficient provision to meet demand in 2025 and 2043. Therefore, the strategic intervention focuses on managing Cirencester Leisure Centre to better meet demand so as to improve the balance between supply and demand. However, the scope for this is very limited.

0.10 Cirencester Leisure Centre is the only public leisure centre in Cotswold District Council and is located in the area of highest demand. It is the most recent site to open, and has the joint largest main pool and the only teaching pool in the District. For all these reasons, it is the most attractive site to residents.

0.11 Both pools at Cirencester Leisure Centre are available for the maximum peak period hours. Therefore, there is no scope to increase availability and capacity at peak times to reduce the proportion of used capacity.

0.12 Given the distance between Bourton Leisure Centre and Cirencester Leisure Centre, there appears to be limited scope to manage the programme of use for both sites collaboratively. The purpose here would be to increase utilisation at Bourton Leisure Centre and reduce it at Cirencester Leisure Centre.

0.13 However, Bourton Leisure Centre is the nearest pool site to Cirencester and is managed by the same operator. It has estimated utilisation of 43% in the weekly peak period in 2025, and 39% in 2043. It is recommended that any potential for collaborative management of the sites with a shared programme of use is investigated by Cotswold District Council.

0.14 The increasing level of utilisation at Cirencester Leisure Centre will impact on the condition of the site. In 2043 the centre will be 37 years old and in need of refurbishment. Adherence to the pools equipment and plant maintenance schedule is important in contributing to the site's containing attractiveness. This is also applicable to the other older sites that have not been refurbished, notably, the two educational sites that are older than Cirencester Leisure Centre. If a pool site suffers equipment failure, it may get moth balled possibly leading to long term closure.

0.15 Cotswold District Council should consider applying this assessment of need to develop planning policy to secure developer contributions towards the refurbishment of Cirencester Leisure Centre.

0.16 These interventions and suggested next steps are based on the FPM findings and should be considered as a key part of the all-round evidence base currently being developed to inform Cotswold District Council's strategic planning of swimming pools. Combining the FPM assessment with the wider review of provision will lead to well considered options on the best ways to meet the projected demand for swimming pools up to 2043 and beyond.

1 INTRODUCTION

1.1 Cotswold District Council (also referred to as Cotswold or the District) is reviewing its current provision of swimming pools and assessing the future provision required to 2043.

1.2 This report has been prepared based on an assessment using the Sport England Facilities Planning Model (FPM) spatial modelling tool. The FPM study is a quantitative, accessibility and spatial assessment of the supply, demand and access to swimming pools.

1.3 The key drivers for the work are to understand the impact of the following:

- How well the supply of swimming pools meets demand in 2025 and 2043
- The impact that population change and residential development have in changing the demand for swimming pools and its distribution up to 2043

1.4 The outputs from the FPM assessment will:

- Inform Cotswold's District Council's strategic planning review of swimming pool provision and future strategy
- Provide an assessment of need that contributes to the evidence base for the development of planning policy on the provision of indoor sports facilities
- Provide an assessment of need that contributes to the inward investment strategy for the provision of swimming pools

1.5 The sequence of work is based on assessments known as runs, and these are set out in the Executive Summary.

The Study Area

1.6 The assessments include the swimming pools and population in Cotswold and the neighbouring local authority areas, which comprise the study area (see Map 1.1).

1.7 A customer's choice of swimming pool does not respect local authority boundaries. There may be management and possibly pricing incentives for customers to use sports facilities in their local authority area. Other factors that influence the choice of swimming pool include:

- How close the venue is to where residents live or work
- Other facilities at the same site, such as a gym or studio
- Programming of the pool with swimming activities that appeal to residents and are available at times that fit with the lifestyle of residents
- Age and condition of the facility and inherently its attractiveness

1.8 Increasingly, the quality of swimming pools and their offer are of more importance to residents in their choice of venues. New facilities will have a significant draw because of the enhanced quality of the venues.

1.9 In determining the position across Cotswold, it is important to take full account of the swimming pools and population in neighbouring local authority areas. The most attractive facility for some Cotswold residents may be outside the District (known as exported demand). For residents of neighbouring local authorities, their most attractive swimming pool may be inside Cotswold (known as imported demand).

1.10 To take account of these factors, a study area is established that places Cotswold at its centre and includes the neighbouring local authority areas.

Map 1.1: Study Area for Cotswold Swimming Pools Assessment

Report Structure, Content and Sequence

1.11 The findings for the Cotswold assessment are set out in a series of tables for both runs. This allows a 'read across' to see the specific impact of changes between Runs 1 and 2 and builds up the picture of change.

1.12 The headings for each table are:

- Supply
- Demand
- Accessibility
- Satisfied Demand
- Unmet Demand
- Used Capacity
- Local Share

1.13 The terms listed above are defined beneath the tables.

1.14 To support the findings, this report also includes maps that show swimming pool locations, demand, deprivation, driving and walking coverage, public transport access, exported satisfied demand, unmet demand, imported used capacity and local share.

1.15 Where valid, the findings for neighbouring local authorities are set out. A commentary is provided on these comparable findings. For example, some local authorities like to know how their findings on proportion of met demand compare with those of neighbouring local authorities.

1.16 The key findings in each of the sections are numbered and highlighted in bold typeface.

1.17 The facilities excluded from the study, with explanations, are listed in Appendix 1. Details of the swimming pools in the neighbouring local authority areas for the assessment are set out in Appendix 2. The FPM and its parameters are described in Appendix 3.

1.18 All maps for the study are provided in a separate document as layered PDFs.

2 SWIMMING POOL SUPPLY

There are seven swimming pools across six sites in Cotswold. There is one teaching pool at Cirencester Leisure Centre.

Two sites have a six-lane pool and can accommodate more than one activity at a time. Four sites have a four-lane pool and can accommodate all activities, but most likely only one at a time.

The educational sector is the dominant provider, having 53% of the available capacity in both 2025 and 2043.

Four swimming pool sites opened between 2000 and 2006. Cirencester Leisure Centre is the most recent site to open. Three swimming pool sites have been refurbished.

Table 2.1: Supply of Swimming Pools in Cotswold by Run

Supply	Run 1	Run 2
Cotswold	2025	2043
Number of pools	7	7
Number of pool sites	6	6
Total water space in sqm	1,563	1,563
Available sqm of water in weekly peak period	1,213	1,213
Unavailable supply in the weekly peak period	22%	22%
Supply in visits per week in peak period	10,611	10,611
Average age of all of sites	28	46
Average age of public leisure centres	19	37

Definition of supply – This is the supply or capacity of the swimming pools available for community and swimming club use in the weekly peak period. Supply is expressed in the number of visits that a pool can accommodate in the weekly peak period and in square metres of water.

Weekly peak period – This is when most visits take place and when users have most flexibility to visit. The peak period for swimming pools is one hour on weekday mornings, one hour on weekday lunchtimes, five and a half hours on weekday evenings, and seven and a half hours on weekend days. This gives a total of 52.5 hours per week. The modelling and recommendations are based on the ability of the public to access facilities during this weekly peak period.

2.1 In 2025 and 2043 there are seven swimming pools across six sites in Cotswold.

2.2 The facilities excluded from the study are listed in Appendix 1.

Table 2.2: Details of Swimming Pools in Cotswold included in the Runs

Site	Provider	Type	Dimensions (m)	Area (sqm)	Year Built	Year Refurb	Peak Period Hours	Available Hours	Capacity (visits)
Cirencester Leisure Centre	Public	6-lane Teaching	25 x 13 13 x 7	325 91	2006		52.5 52.5	100.5 100.5	3,640
Bourton Leisure Centre	Educational (3rd party)	4-lane	25 x 9	225	2003		52.5	97.5	1,969
Cotswold Leisure Chipping Campden	Educational (3rd party)	4-lane	18 x 9	162	1996	2003	38.5	46.5	1,040
National Star College	Educational (in-house)	6-lane	25 x 13	325	2000	2008	15	28	813
Westonbirt School and Leisure Centre	Educational (in-house)	4-lane	25 x 8.4	210	2005		52.5	93	1,838
Fire Service College Leisure Club	Other (sport club)	4-lane	25 x 9	225	1977	2004	35	70	1,313

Providers

2.3 In Cotswold there is one public leisure centre, which is available to all residents and provides all the following swimming activities:

- Learn to swim
- Casual recreational swimming
- Lane and fitness swimming activities
- Swimming development through clubs

2.4 There are four educational swimming pool sites:

- Bourton Leisure Centre and Cotswold Leisure Chipping Campden have dual-use with schools, and are operated by Freedom Leisure on behalf of Cotswold District Council.
- National Star College and Westonbirt School and Leisure Centre are operated in-house.

2.5 National Star College is a specialist college for pupils with disability. Community use provides a learn to swim programme for babies and children, focusing on fun, water confidence, and skill-building. The College also provides a programme for disabled children and their families, featuring tailored lessons, recreational sessions, and focusing on a supportive setting for physical and social development.

2.6 Westonbirt School and Leisure Centre operates a learn to swim programme for children and adults. It also caters for private tuition and operates a lifeguard award scheme to teach water safety.

2.7 Given that nearly all the swimming pool stock is provided by the educational sector, this may restrict residents who require access during weekday daytimes; for example, stay-at-home parents, home workers, and the unemployed or retired. This places greater reliance on the more limited public leisure centre stock for these residents.

2.8 There is one other provider; Fire Service College Leisure Club. The centre is operated by Capita, primarily serving College staff and trainees. It is available for local community groups and commercial users to hire for recreational swimming.

Scale

2.9 Cirencester Leisure Centre is the largest site in Cotswold and the only site with two pools (a 25m x 13m six-lane pool and a 13m x 7m teaching pool). The site can provide all swimming activities, and the main pool is suitable for club development.

2.10 Bourton Leisure Centre and Cotswold Leisure Chipping Campden are single pool sites. Bourton Leisure Centre is the larger of the two sites with a 25m x 9m four-lane pool. Cotswold Leisure Chipping Campden has an 18m x 9m four-lane pool, which is the smallest main pool in the District. Both sites can only provide one swimming activity at a time.

2.11 National Star College has a 25m x 13m six-lane pool, the same size as the main pool at Cirencester Leisure Centre.

2.12 Westonbirt School and Leisure Centre has a 25m x 8.4m four-lane pool. It is the second smallest pool in the District, but is suitable for its main activity of learn to swim.

2.13 Fire Service College Leisure Club has a 25m x 9m four-lane pool, which is a suitable size for its programme of use.

Availability

2.14 Key finding 1 is that Cirencester Leisure Centre, Bourton Leisure Centre and Westonbirt School and Leisure Centre are available for the maximum 52.5 hours in the weekly peak period. Therefore, there is no scope to increase availability and capacity at peak times at these sites.

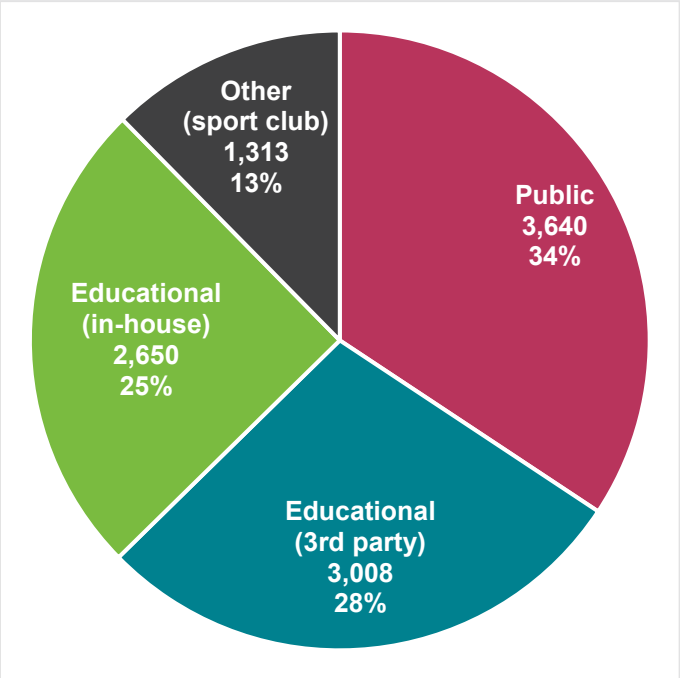
2.15 Educational pools are unlikely to be available for the maximum hours because the weekly peak period includes hours that fall during school time and when after school clubs are running. While Bourton Leisure Centre is an educational site, it is also a dual-use site and caters for community use in addition to educational use.

2.16 Westonbirt School and Leisure Centre availability is unusually high for an educational site, but it does have a very extensive learn to swim programme and employs seven instructors.

2.17 Availability in the weekly peak period at the other educational sites is:

- Cotswold Leisure Chipping Campden – 38.5 hours
- National Star College – 15.0 hours

2.18 National Star College has the least availability of the swimming pool sites. However, it has a specialist programme of use, and the hours available probably reflect its needs.



2.19 Sport England has produced a resource to support schools in opening their facilities for community use in non-school hours. The resource covers how to get started, who can help, operating models, legal and governance, finance, marketing, operating safely and safeguarding, and can be found here: https://www.sportengland.org/funding-and-campaigns/use-our-school.

2.20 This resource can be used to support discussions with schools to open their sites for community use, either for the first time or to extend the hours available to the local community.

2.21 Fire Service College Leisure Club is available to its membership and hirers for 35.0 hours in the weekly peak period. There is scope to increase availability at peak times.

Capacity

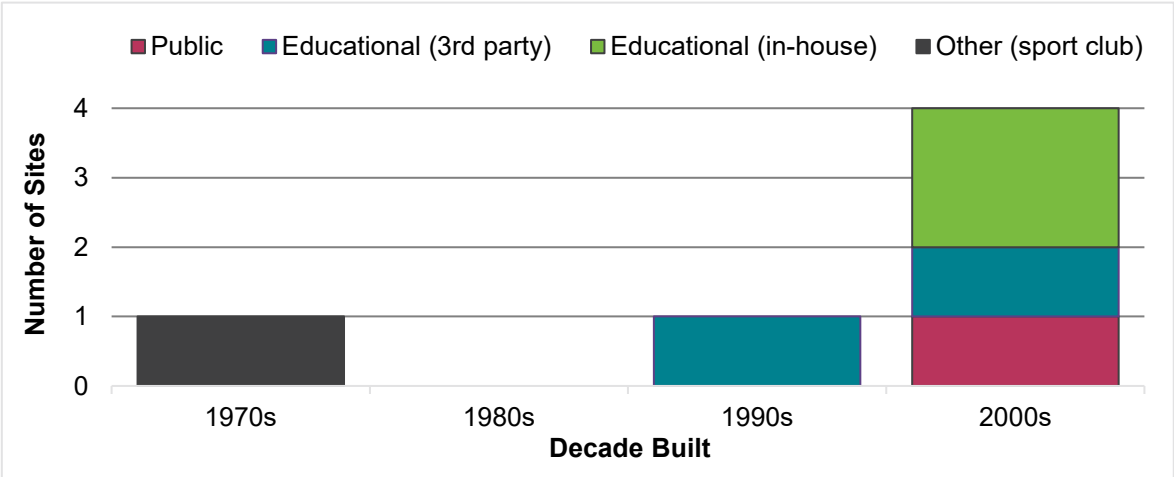


Chart 2.1: Proportion of Available Water Space by Provider in 2025 and 2043

2.22 Key finding 2 is that Cirencester Leisure Centre provides 34% of the available capacity in both 2025 and 2043. The four educational sites provide 53% of the available capacity, and Fire Service College Sports Club provides 13%.

Age

Chart 2.2 Decade Built of Pools in Cotswold by Provider

2.23 The average of all the swimming pool sites is 28 years in 2025, and 46 years in 2043. Cirencester Leisure Centre is 19 years old in 2025, and 37 years old in 2043.

2.24 The oldest swimming pool is Fire Service College Leisure Club, which opened in 1977 and was refurbished in 2004.

2.25 Cirencester Leisure Centre is the most recent site to open in 2006 and, therefore, the most attractive to residents.

2.26 The oldest unmodernised swimming pool is Bourton Leisure Centre, which opened in 2003.

2.27 The most recent site to have been modernised is National Star College in 2008.

Swimming Pool Locations

2.28 Cirencester Leisure Centre is located in the largest settlement in Cotswold (see Map 2.1). Cotswold Leisure Chipping Campden is located in the northeast of the District close to the border with Stratford-on-Avon and Wychavon. Bourton Leisure Centre is in the east of the District.

2.29 Three swimming pool sites are located very close to the border with neighbouring local authorities:

- Westonbirt School and Leisure Centre is in the southwest bordering North Wiltshire
- National Star College in the west bordering South Gloucestershire
- Fire Service College Leisure Club in the northeast bordering Stratford-on-Avon

3 DEMAND FOR SWIMMING POOLS

Cotswold's population and demand for swimming pool provision both increase between 2025 and 2043, by 15% and 10% respectively.

Demand in Cotswold is less than its available supply in both years.

Demand is greatest in Cirencester in both years.

Cotswold has the third smallest increase in demand in sqm of water, but the smallest population in the study area.

Table 3.1: Demand for Swimming Pools in Cotswold by Run

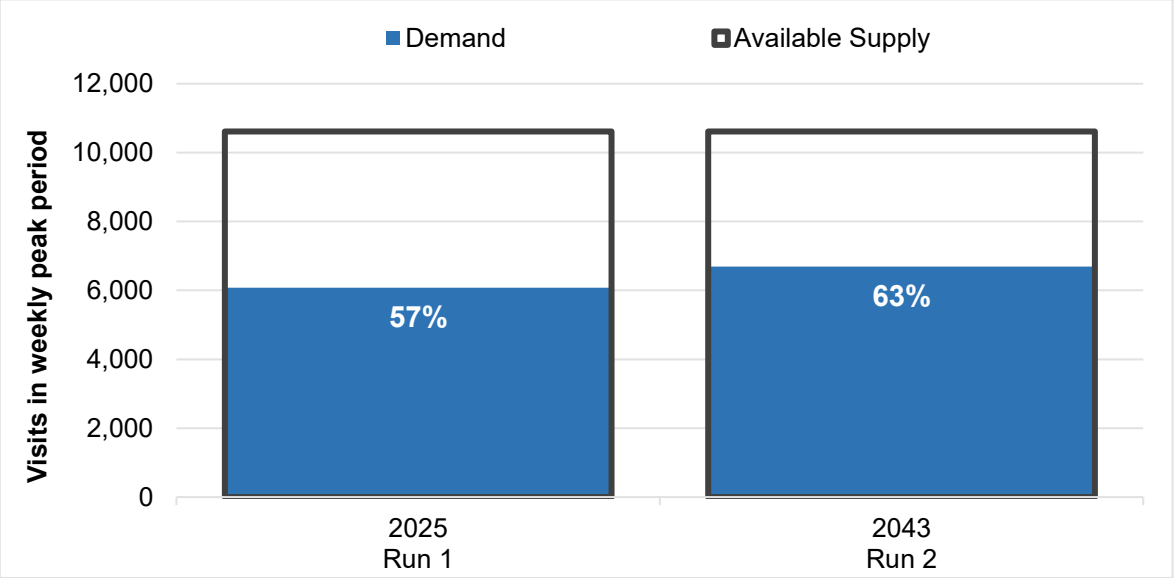
Demand	Run 1	Run 2
Cotswold	2025	2043
Resident population	94,598	108,344
Visits demanded in weekly peak period	6,079	6,695
Demand in sqm of water with comfort factor included	1,000	1,101
% of demand in the 10% most deprived LSOAs nationally	0%	0%

Definition of total demand – This represents the total demand for swimming by gender and for six age bands from 0 to 80+ and is calculated as the percentage of each age band/gender that participates. This is added to the frequency of participation in each age band/gender to arrive at a total demand figure, which is expressed in visits in the weekly peak period and square metres of water. The FPM parameters for the percentage of participation and frequency of participation, for gender and for different age bands, are calculated from Sport England's Active Lives survey up to November 2023 and are set out in Appendix 3.

3.1 Demand is calculated from the resident population. The geographical distribution of the population in the FPM for 2043 includes housing growth sites, the details of which were provided by Cotswold District Council that were known at the time of modelling. There are extensive housing growth sites to the south of Cirencester (see Map 3.1).

3.2 The latest development trajectory for Cotswold to 2043 has more dwellings than modelled and there are changes to the locations of the sites. However, the geographical distribution is similar to what was modelled and the differences per area are smaller when converted into demand. The total population forecast for Cotswold remains the same from the Office for National Statistics 2022-based subnational projection. Therefore, the changes in housing growth will not have a significant impact on the overall findings of this report.

3.3 **Key finding 3** is that Cotswold's population is projected to increase by 15% between 2025 and 2043, resulting in a 10% increase in demand for swimming pools. The smaller increase in demand compared with the population growth is because of the ageing of the population in Cotswold between 2025 and 2043. There will be fewer residents in the age bands with



the highest swimming participation (0-15 year olds and 25-39 year olds) in 2043 than in 2025. Cotswold has a larger proportion of residents over 65 years old than the national average.

3.4 The rate and frequency of swimming participation is assumed to be unchanged between the two years (for participation rates and frequency, see Appendix 3: Swimming Pools Parameters).

3.5 Of Cotswold's population (source: ONS Census 2021):

- Residents aged 65 and over represent 28% of the total population compared to the national average of 20%
- Disabled residents account for 16% compared to the national average of 17%
- Working from home residents are 39% compared to the national average of 32%

Chart 3.1: Demand as a Proportion of Available Supply in Cotswold by Run

3.6 Key finding 4 is that Cotswold's demand is the equivalent of 57% of its available supply in 2025, increasing to 63% in 2043.

Demand in the Study Area

3.7 Demand is projected to increase in all of Cotswold's neighbouring local authorities.

3.8 Demand in Cotswold increases by 101 sqm of water. This is the third smallest increase in demand in sqm of water, but Cotswold has the smallest population in the study area.

3.9 The largest increase in demand in water space is in South Gloucestershire at 539 sqm of water, equating to a 16% increase. Demand increases in Stratford-on-Avon by 324 sqm of water, which is the highest percentage increase in the study area at 21%.

3.10 The smallest increase is in Cheltenham at 26 sqm of water, which is a 2% increase

Table 3.2: Demand for Swimming Pools by Area and Run

Demand in sqm of water considering a 'comfort factor'	Run 1	Run 2	Difference 2025 to 2043	
Area	2025	2043	Sqm of Water	% change
Cotswold	**1,000**	**1,101**	**101**	**10%**

Geographical Distribution of Demand

2025

3.11 Demand is highest in Cirencester, followed by Tetbury, Fairford and Bourton (see Map 3.2).

3.12 The greatest densities of demand per square kilometre are in Cirencester at 31 sqm of water (light blue square) and east of Cirencester Leisure Centre at 27 sqm of water (medium blue square).

3.13 Demand per square kilometre in other locations is highest in the following areas:

- Moreton-in-Marsh – 21 sqm of water (medium blue square)
- Tetbury – 18 sqm of water (dark blue square)
- Northleach – 15 sqm of water (dark blue square)
- Rissington – 14 sqm of water (dark blue square)

3.14 The largest clusters of demand are as follows:

- Cirencester – 175 sqm of water across 18 square kilometres (Cirencester Leisure Centre is located in this area)
- Tetbury – 53 sqm of water across five square kilometres
- Moreton-in-Marsh – 39 sqm of water across three square kilometres (Fire Service College Leisure Club is located east of this area)
- Bourton-on-the-Water – 34 sqm of water across six square kilometres (Bourton Leisure Centre is located in this area)

- Fairford – 32 sqm of water across five square kilometres
- South Cerney – 27 sqm of water across five square kilometres
- Lechlade – 22 sqm of water across four square kilometres
- Rissington – 19 sqm of water across three square kilometres
- Mickleton – 18 sqm of water across three square kilometres
- Chipping Camden – 17 sqm of water across six square kilometres (Cotswold Leisure Chipping Campden is located in this area)

3.15 Outside of these areas demand is less than 14 sqm of water per square kilometre (dark blue and purple squares).

2043

3.16 In 2043 demand in Cirencester increases to 222 sqm of water across a larger area of 23 square kilometres (see Map 3.3).

3.17 The changes in demand in other areas are as follows:

- Tetbury – decreases to 48 sqm of water across five square kilometres
- Moreton-in-Marsh – increases to 46 sqm of water across three square kilometres
- Fairford – increases to 46 sqm of water across a larger area of nine square kilometres
- Bourton-on-the-Water – decreases to 32 sqm of water across six square kilometres
