Progress towards applications, reserved matters, discharge of conditions, etc.	No application has been submitted, with an application expected to be progressed following identification in Reg 19 local plan. – submission of the application anticipated by Winter 2026/27. High level review of utilities and transportation strategy has been undertaken, with a full design team appointed. The land-owner or a local housebuilder would be expected in be involved in construction of the dwellings. The agent has suggested that commencement would be expected by the end of 2027, with completions in 2029/30 and 2030/31.

Siddington: Land between disused canal and disused railway line, north of Park Way (ref: SD23)

Site Details	
Local plan allocation ref	SD23
Site name	Land between disused canal and disused railway line, north of Park Way
Total capacity (dwellings)	22
Total completions in plan period	22
Total completions in five years following adoption	0

Plan period up to adoption			Years following adoption*														
-2	-1	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	35/36	36/37	37/38	38/39	39/40	40/41	41/42	42/43
Annual completions																	
								11	11								

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	The site is within the ownership of Bathurst Estate
Developer interest	Bathurst Estate intend to work with a builder to deliver homes on the site.
Site assessment work	Design team appointed to undertaken site assessment work
Viability	No issues identified
Infrastructure provision	High level review of utilities. No significant infrastructure is expected.

Planning permission	N/A
Progress towards applications, reserved matters, discharge of conditions, etc.	The agents have indicated a potentially higher capacity on site. A design team for the site have been appointed for site assessment work. No significant infrastructure is expected. If the site is allocated, a full planning application would be expected to be submitted in 2027. The suggested access (in the Call for Sites) does not accord with the site template, with access to the site likely to need to be from an existing cul-de-sac rather than along an agricultural track. This, as well as the level of ecological buffer may result in delays in the planning process (as part of negotiations). Bathurst Estate have delivered residential schemes in Kemble and are involved in other sites around Cirencester. Whilst they have indicated delivery from 2029, given the uncertainty regarding the quantum of development, no builder currently involved and no application currently submitted, this considered overly optimistic. It is considered there is insufficient evidence to demonstrate the site is deliverable, although given the actors involved, it is considered the site will be developable at the earlier part of the 6-10 year period following adoption of the plan.

The South Cotswold Strategy Area

Andoversford: Land north-west of Templefields (ref: A2)

Site Details	
Local plan allocation ref	A2

				23	24												

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Owned by Quenington Properties Ltd. Site available.
Developer interest	Options agreement in place
Site assessment work	A full suite of technical documents has been prepared and submitted as part of application ref. 26/01327/FUL.
Viability	A viability report has been submitted with the planning application due to the costs of development, indicating the development could not viably provide the standard amount of affordable housing.

Infrastructure provision	Standard road, utilities etc. infrastructure required.
Planning permission	Application for 47 dwellings with full planning permission submitted 26/01327/FUL and pending consideration.
Progress towards applications, reserved matters, discharge of conditions, etc.	It has been advised that the Directors of Olivia Estates have a long and distinguished track record of delivering high quality developments, including in national landscape.

Coln St Aldwyns, Hatherop and Quenington: Glebe Farm Yard, Hatherop (ref: R670)

Site Details	
Local plan allocation ref	Glebe Farm Yard, Hatherop
Site name	R670
Total capacity (dwellings)	12
Total completions in plan period	12
Total completions in five years following adoption	12

Plan period up to adoption			Years following adoption*

						6	6										

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	The site is under one single ownership by the Ernest Cook Trust. Mintglebe Ltd is wholly owned subsidiary of the Ernest Cook Trust.
Developer interest	The intention is that Mintglebe Ltd will development the Site subject to planning and in-line with the Trust's Master planning principles.
Site assessment work	Initial ecology, landscape, arboriculture and heritage assessments are currently being undertaken.
Viability	No issues raised

Infrastructure provision	No key infrastructure requirements. Standard road, utilities, green infrastructure etc. expected.
Planning permission	N/A
Progress towards applications, reserved matters, discharge of conditions, etc.	Pre-application advice received. The applicant has commenced the process of preparing a detailed planning application for the site. There is an initial disagreement regarding the capacity on the site (12 or 15 dwellings). This would need to be resolved during the planning process. Pre-application advice with the Council has been engaged with. It would be anticipated that permission on the site would need to be subject to a legal agreement. Once the planning process is resolved the delivery on the site is expected to be relatively quick, given the link between the owner and site promoter. Given an application has not been submitted and uncertainty over numbers, it is considered that whilst the site is developable, there is insufficient information to confirm the development would be deliverable within 5 years of the intended adoption of the plan.

Fairford: Land south-east of Fairford (ref: F20A)

Site Details	
Local plan allocation ref	Land south-east of Fairford
Site name	F20A

										27	28						

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	The site is in single ownership. The land is available for development, with no known legal or ownership constraints that would prevent delivery.
Developer interest	In active and advanced discussions with a promoter for the site. No direct developer engaged.
Site assessment work	Preliminary site assessment and desktop review work has been undertaken across the principal environmental and technical considerations, including landscape, ecology, heritage, agricultural land quality, access and flood risk.
Viability	No viability issues have been identified at this stage.

Infrastructure provision	No infrastructure constraint has been identified at this stage by the landowners that is considered likely to prevent the site from being delivered. The development is expected to be served through connections to existing local highway, utility and service networks, together with proportionate on site and local improvements. These are likely to include the site access, on and off-site pedestrian and cycle connections, sustainable drainage, green infrastructure and any necessary utility upgrades.
Planning permission	N/A
Progress towards applications, reserved matters, discharge of conditions, etc.	Initial site assessment has been undertaken. Active discussions with promoter ongoing, with the indication of the agent of the expected delivery within five years of the adoption of the emerging Local Plan. Principle of an MoU for development of the land agreed. The site is therefore considered developable.

Fairford: Land west of Terminus Cottage and Station Cottage (ref: F39C / F52)

Site Details	
Local plan allocation ref	F39C / F52
Site name	Land west of Terminus Cottage and Station Cottage
Total capacity (dwellings)	30
Total completions in plan period	30
Total completions in five years following adoption	30

Plan period up to adoption	Years following adoption*

				15	15												

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	The site is subject to an options/promotion agreement with Rainier Developments Ltd. The site is therefore considered available.
Developer interest	Rainier Developments Ltd would intend to sell to a housebuilder once they secured planning permission.
Site assessment work	Significant progress has been made in terms of site assessment work, to inform the live planning application. Technical work undertaken includes: • Air Quality Assessment • Archaeology and Heritage Assessment • BNG Metric • Ecological Impact Assessment (includes relevant species surveys)

	• FRA and Drainage Strategy • Landscape and Visual Appraisal • Noise Impact Assessment • Preliminary Arboricultural Impact Assessment • Transport Assessment and Travel Plan • Utilities Assessment
Viability	No known issues.
Infrastructure provision	On site infrastructure requirements include new vehicular access and internal road infrastructure, SuDS, public open space, and pedestrian and cycle links. Offsite requirements include water network and sewage works upgrades.
Planning permission	Outline planning application 25/03880/OUT pending consideration. Issues raised during consultation process, suggesting a potential delay with the grant of permission..
Progress towards applications, reserved matters, discharge of conditions, etc.	Whilst there may be some delays with the planning application and need to sell the site on to a housebuilder, the agent has advised they advise they expect to deliver houses by 2027/28. This is considered optimistic, but nevertheless, the site is considered deliverable within 5 years of the anticipated adoption of the emerging Local Plan.

Fairford: Land at Totterdown Hill, Horcott (ref: F53A)

Site Details	
Local plan allocation ref	F53A
Site name	Land at Totterdown Hill, Horcott
Total capacity (dwellings)	150
Total completions in plan period	150
Total completions in five years following adoption	90

					30	30	30	30	30								

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	The site is within one ownership as is available for development.
Developer interest	A promotion agreement is in place with Ashflame Properties Limited. It intended that the site will be sold to a housebuilder upon grant of outline planning permission.
Site assessment work	Initial Heritage & Archaeology Assessment has been undertaken. A full suite of technical baseline work is intended to be undertaken over the coming months.
Viability	No known issues

Infrastructure provision	Usual infrastructure requirements anticipated (road, utilities, green space etc.)
Planning permission	It is anticipated that a planning application for outline planning permission will be submitted in Summer 2027.
Progress towards applications, reserved matters, discharge of conditions, etc.	Survey works being undertaken. The site is subject to a promotion agreement and is considered available for development. The promoter has also agreed to the principle of a MoU for the delivery of the site, with 90 homes within 5 years following the adoption of the emerging Local Plan.

Kempsford: Land to rear of the Knoll, Whelford Road (ref: R203A, R203B, R203C)

Site Details	
Local plan allocation ref	R203A, R203B, R203C
Site name	Land to rear of the Knoll, Whelford Road, Kempsford
Total capacity (dwellings)	Approximately 149
Total completions in plan period	149
Total completions in five years following adoption	149

Plan period up to adoption			Years following adoption*														
-2	-1	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	35/36	36/37	37/38	38/39	39/40	40/41	41/42	42/43
Annual completions																	
				40	40	40	29										

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Three owners
Developer interest	Agreement in place between all landowners and developer - Brookworth (South West) Limited. Brookworth Ltd are a housebuilder, intending to build out the development themselves.
Site assessment work	Preliminary Ecological Appraisal carried out June 2026, full surveys previously carried out as part of 23/01665/OUT. Other surveys to support application expected to start July 2026.
Viability	No issued raised

Infrastructure provision	Highways work carried out under 23/01665/OUT. Full transport assessments will be carried out in 2026/2027 prior to submission. Retail and community infrastructure required (as per the allocation). The development will be phased, with roads and other infrastructure in phase 1, with the rest of the site split into subsequent phases. The development template requires the provision of allotments and a convenience store.
Planning permission	23/01665/OUT – refused as contrary to housing strategy, lack of information on impact on a SAC and lack of legal agreement,
Progress towards applications, reserved matters, discharge of conditions, etc.	Pre-application engagement with CDC proposed for Q3/Q4 2026. Given the proximity to Fairford Airfield there will be discussions required with the MoU regarding the design on the overall site. The agent has suggested a capacity of closer to 190 homes on the site. This aim is not objectionable in principle, subject to suitable treatment of the site and its constraints, noting it exceeds the expected capacity. As there is a homebuilder with an option to buy the land is it considered that site could come forward relatively quickly within the plan period. They have committed to the delivery of the site from 2028/29. As such, the site is considered deliverable within 5 years following the adoption of the emerging Local Plan.

Lechlade: Land south of Butler's Court (ref: L19)

Site Details	
Local plan allocation ref	L19
Site name	Land south of Butler's Court
Total capacity (dwellings)	15
Total completions in plan period	15
Total completions in five years following adoption	15

Annual completions																	
													7	8			

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Within one ownership and available for development.
Developer interest	A site promotion agreement expired earlier this year. It would be intended to sell to a housebuilder for development.
Site assessment work	Undertaken in relation to refused application on the site.
Viability	No known issues
Infrastructure provision	Usual infrastructure requirements anticipated (road, utilities, green space etc.)

Planning permission	Planning Application 24/00845/FUL refused in June 2024 on multiple issues; however, planning permission granted at appeal on the site to the north (within the same ownership) which alters site context.
Progress towards applications, reserved matters, discharge of conditions, etc.	It is anticipated that they would submit a full application along with the reserved matters application for the site to the north. The site has had previous surveys undertaken. Given the link to the site to the north and intent to develop the site alongside the site to the north, it is considered that the site is deliverable within 5 years of the anticipated adoption of the emerging Local Plan.

Lechlade: Land south of Ferrers Park (ref: L33)

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Site has three landowners that are aware of the promotion and planning application at the site (ref. 25/04047/OUT).
Developer interest	There is a promotion agreement in place
Site assessment work	Site assessment work has been undertaken in preparation of 25/04047/OUT
Viability	No issues raised
Infrastructure provision	Sewerage and water network upgrades may be required. Standard road, utilities, green infrastructure etc. expected.

Planning permission	Planning application 25/04047/OUT currently pending considerations (outline planning permission for up to 150m houses). Any application recommended for permission would be expected to include pre-commencement conditions.
Progress towards applications, reserved matters, discharge of conditions, etc.	Works undertaken in submission of application Gallagher Developments work with a range of housebuilders to deliver new homes, with historic success of obtaining deliverable, technically robust and commercially sound planning consents. The timescale trajectory provided by the promoter starts in 2029/30. The promoter has agreed to the principle of an MoU. The site is therefore considered to be deliverable within 5 years of the anticipated adoption of the emerging Local Plan.

Poulton: Land north of London Road (ref: R607)

Site Details	
Local plan allocation ref	R607
Site name	Land north of London Road

Annual completions																	
			5	5													

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Site within one ownership with an agent employed on their behalf
Developer interest	The intention is to sell the site following grant of outline planning permission.
Site assessment work	The site assessment has been undertaken to accord with the intention to submit an application in July 2026.
Viability	No issues raised

Infrastructure provision	Standard road, utilities, green infrastructure etc. expected.
Planning permission	They intend to submit an outline planning application in July 2026.
Progress towards applications, reserved matters, discharge of conditions, etc.	The agent is undertaking surveys on the site following pre-application advice. They have confirmed their intention to submit a planning application in the year 2026/27, suggesting commencements on the site at the end of 2027. They have agreed to the principle of a MoU with the delivery dates included. Small site so swift build out anticipated. It is therefore considered that there is sufficient evidence to consider the site as deliverable within 5 years of the anticipated adoption of the emerging Local Plan.

Tetbury: Land adjacent to Blind Lane (ref: T31B)

Site Details	
Local plan allocation ref	T31B
Site name	Land adjacent to Blind Lane
Total capacity (dwellings)	44
Total completions in plan period	44
Total completions in five years following adoption	44

Plan period up to adoption			Years following adoption*

					22	22											

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	The site is in single ownership and is subject to an option agreement between the landowner and David Wilson Redrow Homes.
Developer interest	Redow Homes seeking to build out site
Site assessment work	Under review awaiting pre-application advice feedback
Viability	No known issues
Infrastructure provision	The agent has advised that there are no known infrastructure constraints.

	They are aiming to submit an application for planning permission on the wider site over the summer of 2026. The developer, Redrow South West, would build out the site themselves. They anticipate commencing development in 2027/28 with completions in 2028/29.
Planning permission	They are aiming to submit an application for planning permission on the wider site over the summer of 2026.
Progress towards applications, reserved matters, discharge of conditions, etc.	A pre-application enquiry has been submitted. Redrow South West are an established volume housebuilding who have a clear record of delivery nationwide. They have agreed to a memorandum of understanding for delivery of the smaller site, while noting their intent to apply for a larger site. As such, it is considered that there is sufficient evidence to consider the site as deliverable within 5 years of the anticipated adoption of the Local Plan.

Tetbury: Land north-west of Highfield Cottage (ref: T71A)

Site Details

													20	20			

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	The land is owned by charitable trust, who intend to submit an outline planning application, via a planning consultant - Morgan Elliot - and sell to a developer following the grant of this.
Developer interest	Council comments: Single site ownership likely to assist the development of the site
Site assessment work	The charity has advised that they have been contacted by developers/housebuilders expressing interest in the site.
Viability	No issues raised
Infrastructure provision	Key infrastructure is expected to be localised and delivered as part of the development, rather than requiring any strategic off-site works. Severn Trent Water have confirmed that foul flows from the

	proposed development could be accommodated within the local sewerage network.
Planning permission	Significant amounts undertaken in advance of the submission of an outline application. They have advised their intent to submit a planning application this year (2027).
Progress towards applications, reserved matters, discharge of conditions, etc.	The documentation and surveys for the submission of a planning application have been prepared. The site would be sold to a housebuilder, with some interest having been expressed by builders. While it is considered that the site may be delivered within 5 years, it is considered there is insufficient evidence to classify the site as deliverable.

Blockley: The Limes, Station Road (ref: BK14A)

Site Details	
Local plan allocation ref	BK14A
Site name	The Limes, Station Road, Blockley
Total capacity (dwellings)	8
Total completions in plan period	8
Total completions in five years following adoption	8

Plan period up to adoption			Years following adoption*														
-2	-1	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	35/36	36/37	37/38	38/39	39/40	40/41	41/42	42/43
Annual completions																	
						4	4										

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Land jointly owned and available for development
Developer interest	None specified (it is noted that Blockley is a desirable area to live, and as such it is considered likely that there would be significant developer interest in the site). They have also suggested that some would be self-build and some sold to a housebuilder.
Site assessment work	Several sets of site layouts done- drainage and flood done – tree survey booked, pending- Archaeology survey started – initial trenches done and more detailed survey quoted for
Viability	No issues raised beyond expense of some surveys - archaeology

Infrastructure provision	To be assessed.
Planning permission	N/A
Progress towards applications, reserved matters, discharge of conditions, etc.	Some survey work undertaken to date. The landowner has confirmed an intended timeline for the submission of a planning application and completions on the site. They have also agreed to the principle of signing an MoU to commit to these timescales. As such, the site is considered developable within years 6-10 of the anticipated adoption of the emerging Local Plan.

Bourton-on-the-Water: Land off Mallard Crescent (ref: B56)

Site Details	
Local plan allocation ref	B56
Site name	Land off Mallard Crescent
Total capacity (dwellings)	53
Total completions in plan period	53
Total completions in five years following adoption	53

Plan period up to adoption			Years following adoption*														
-2	-1	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	35/36	36/37	37/38	38/39	39/40	40/41	41/42	42/43
Annual completions																	
			15	24	14												

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Site within single ownership and promotion agreement in place (with Ashberry)
Developer interest	Ashberry with obtain planning permission and will then sell the site to a developer / housebuilder who will deliver the development.
Site assessment work	Full consultant and design team yet to be appointed. A Supporting Landscape Statement (SLS) and Heritage Impact Assessment (HIA) have been prepared to support the Call for Sites submission.
Viability	No issues raised

Infrastructure provision	Usual infrastructure requirements expected, along with links to a PRoW and circular route around the site.
Planning permission	N/A
Progress towards applications, reserved matters, discharge of conditions, etc.	Limited works undertaken to date on the site. However, given the experience of the site promoter it is considered they would be able to secure delivery on the site within 5 years following the anticipated adoption of the emerging Local Plan. They have agreed to the principle of a MoU agreeing when dwellings would be delivered on the site.

Chipping Campden: Land south of Station Road and east of Chandlers (ref: CC10A)

Site Details	
Local plan allocation ref	CC10A
Site name	Land south of Station Road and east of Chandlers
Total capacity (dwellings)	8
Total completions in plan period	8
Total completions in five years following adoption	0

Plan period up to adoption			Years following adoption*

													4	4			

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Site put forward on behalf of a housebuilder
Developer interest	Interest to develop by the housebuilder
Site assessment work	No specified
Viability	No issues raised
Infrastructure provision	Standard infrastructure requirements expected for this size of development

Planning permission	N/A
Progress towards applications, reserved matters, discharge of conditions, etc.	A pre-application enquiry was undertaken in 2021.

Chipping Campden: Land north-west of Aston Road (ref: CC66B)

Site Details	
Local plan allocation ref	CC66B
Site name	Land north-west of Aston Road
Total capacity (dwellings)	10
Total completions in plan period	10
Total completions in five years following adoption	10

Plan period up to adoption			Years following adoption*														
-2	-1	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

Annual completions																	
								5	5								

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Site is within one ownership and it is available for development.
Developer interest	Not advised
Site assessment work	Assessment works undertaken in relation to submitted planning application.
Viability	No issues raised
Infrastructure provision	Usual road, utilities, greenspace etc.

Planning permission	25/033349/FUL currently pending consideration.
Progress towards applications, reserved matters, discharge of conditions, etc.	Application pending consideration for a prolonged period. Application is for 5 houses rather than the number of houses considered suitable by the site template of 10. The agent has agreed to the principle of an MoU with the trajectory of the delivery on the site within 5 years of the anticipated adoption of the emerging Local Plan.

Chipping Campden: Land north-east of Aston Road (ref: CC68)

Site Details	
Local plan allocation ref	CC68
Site name	Land north-east of Aston Road, Chipping Campden
Total capacity (dwellings)	150
Total completions in plan period	150
Total completions in five years following adoption	0

Plan period up to adoption			Years following adoption*														
-2	-1	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	35/36	36/37	37/38	38/39	39/40	40/41	41/42	42/43
Annual completions																	
													40	40	40	30	

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Owned by Gloucestershire County Council
Developer interest	To be sold to a developer
Site assessment work	Work undertaken to date includes: Preliminary Ecological Survey complete and protected species surveys on-going Landscape and Visual Assessment Transport Assessment Air Quality Assessment Flood Risk Technical Note

Viability	No issues raised currently, but to be assess at point of planning application
Infrastructure provision	Road to school, and alternative car par, GP surgery, green infrastructure, play areas, utilities etc.
Planning permission	No current application. A screening opinion was undertaken.
Progress towards applications, reserved matters, discharge of conditions, etc.	Given the level of survey works that have been undertaken it is considered that some of the houses could be delivered within 5 years following the anticipated adoption of the emerging Local Plan. The agent has also advised that they would expect completions on the site from 2030/31.

Mickleton: Land east of former Meon Hill Nurseries (ref: MK2B / MK2C)

Site Details	
Local plan allocation ref	MK2B/MK2C
Site name	Land east of former Meon Hill Nurseries
Total capacity (dwellings)	40
Total completions in plan period	40
Total completions in five years following adoption	40

Plan period up to adoption			Years following adoption*														
-2	-1	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	35/36	36/37	37/38	38/39	39/40	40/41	41/42	42/43
Annual completions																	
			20	20													

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	The site is available with an options agreement in place
Developer interest	The promoter, Brookworth (South West) Limited, has an option on the site and would develop the site themselves.
Site assessment work	Site investigations as part of the previous withdrawn application.
Viability	No viability issues have been raised
Infrastructure provision	Standard infrastructure requirements anticipated.

Planning permission	Planning application 25/01621/OUT for 120 dwellings withdrawn.
Progress towards applications, reserved matters, discharge of conditions, etc.	The site has been subject to a withdrawn outline application and subsequent pre-application enquiry. Brookworth (South West) Limited have indicated a previous desire to deliver more housing on the site that the capacity indicated by the Council. Given the options agreement in place with a housebuilder, survey works undertaken to date, along with a principle agreement to agree an MoU with dwellings completed within 5 years of the anticipated adoption of the emerging Local Plan, the site is considered to be deliverable.

Mickleton: Land between Summerville Ltd. and Stratford Road (ref: MK7)

Site Details	
Local plan allocation ref	MK7
Site name	Land between Summerville Ltd. and Stratford Road
Total capacity (dwellings)	33
Total completions in plan period	33
Total completions in five years following adoption	0

Plan period up to adoption			Years following adoption*

Annual completions																	
													16	17			

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Site within two registries, but with a linked owner. The owner has confirmed an intention to sell the site.
Developer interest	The owner has advised there are discussions underway with potential developers.
Site assessment work	None indicated
Viability	None indicated
Infrastructure provision	No details provided.

Planning permission	N/A
Progress towards applications, reserved matters, discharge of conditions, etc.	N/A. As such, whilst the site is considered developable, it is not considered deliverable.

Mickleton: Land east of Stratford Road (ref: MK11A)

Site Details	
Local plan allocation ref	MK11A
Site name	Land east of Stratford Road
Total capacity (dwellings)	76
Total completions in plan period	76
Total completions in five years following adoption	0

Plan period up to adoption			Years following adoption*														
-2	-1	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	35/36	36/37	37/38	38/39	39/40	40/41	41/42	42/43
Annual completions																	
														25	26	25	

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Site in one ownership, Richard Porter's Charity. The charity has no development experience but have engaged chartered town planning consultancy 'Stansgate Planning Consultants Ltd'.
Developer interest	It would be intended to sell the site to a housebuilder (who may submit the outline planning application).
Site assessment work	Initial site appraisal has been carried out, but no technical assessments.
Viability	No issued raised
Infrastructure provision	Water and electricity supplies, as well as vehicular access will be required to be secured. Assess is required through site MK7.

Planning permission	No application or pre-applications currently pending. The site is tied to the delivery of the adjoining Mk7 site to provide vehicular assess.
Progress towards applications, reserved matters, discharge of conditions, etc.	Given the limited investigation works to date, requirement to sell the land to a housebuilder, as well as sort the access arrangements, it is considered that the site will not be deliverable. Nevertheless, in signing the MoU the landowner has shown clear intent for the delivery of the site. The site is therefore considered developable in the plan period.

Moreton-in-Marsh: Land west of Aldi (ref: M28B)

Site Details	
Local plan allocation ref	M28B
Site name	Land west of Aldi
Total capacity (dwellings)	20
Total completions in plan period	20
Total completions in five years following adoption	20

Plan period up to adoption			Years following adoption*														
-2	-1	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	35/36	36/37	37/38	38/39	39/40	40/41	41/42	42/43
Annual completions																	
					10	10											

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Site within two ownerships. The site has an options agreement in place with Aspects Building Services Ltd.
Developer interest	Aspects Building Services Ltd intend to build out the site.
Site assessment work	Site assessment works undertaken in preparation of current application
Viability	Agent has advised that affordable housing cannot be provided with the 10 houses currently proposed.
Infrastructure provision	Standard infrastructure requirements

Planning permission	25/02443/FUL – for 10 dwellings. Currently pending determination. Taken to committee in July 2026, and deferred. Concerns over number of dwellings, viability and access raised by members.
Progress towards applications, reserved matters, discharge of conditions, etc.	Aspects Building Services Ltd are an established company which have delivered homes on small to medium scale sites over the last 30 years. It is therefore expected that they have a realistic expectation of the timescale it will take for them to construct dwellings once works commence. While completions within 2027/28 are considered optimistic, the site is considered deliverable within 5 years.

Moreton-in-Marsh: Land west of Aldi (ref: M28B)

Site Details	
Local plan allocation ref	M74A
Site name	Land south of North Cotswold Hospital
Total capacity (dwellings)	44
Total completions in plan period	44
Total completions in five years following adoption	0

Annual completions																	
											10						

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Ownership currently with developer to the south but draft agreement to transfer the land to the Stow-on-the-Wold Community Land Trust to enable delivery of affordable homes all to be let at social rents
Developer interest	A Registered Provider would be expected to develop the site
Site assessment work	Ongoing in advance of an expected application in 2027.
Viability	No issues identified
Infrastructure provision	Roads etc. provided via the development to the south

Planning permission	N/A
Progress towards applications, reserved matters, discharge of conditions, etc.	Application for full planning permission expected in 2027.

Stow-on-the-Wold: Land adjoining Tall Trees, Oddington Road (ref: S55B)

Site Details	
Local plan allocation ref	S55B
Site name	Land adjoining Tall Trees, Oddington Road
Total capacity (dwellings)	8
Total completions in plan period	8
Total completions in five years following adoption	0

Plan period up to adoption	Years following adoption*																
-2	-1	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	35/36	36/37	37/38	38/39	39/40	40/41	41/42	42/43
Annual completions																	
								4	4								

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Ownership details not provided, but indicated that the site is controlled by a housebuilder
Developer interest	It is indicated that the site is controlled by a housebuilder
Site assessment work	On-going
Viability	No issues identified
Infrastructure provision	No major infrastructure anticipated

Planning permission	N/A
Progress towards applications, reserved matters, discharge of conditions, etc.	Pre-application advice currently engaged in, submitted by planning agent who works frequently in the district. The site is small in size and as such it is considered the build out would be relatively swift. Given involvement of a housebuilder, it is considered that the site is developable within years 6-10 of the emerging Local Plan period

Stow-on-the-Wold: The Hollies, Lower Swell Road (ref: S68)

Site Details	
Local plan allocation ref	S68
Site name	The Hollies, Lower Swell Road
Total capacity (dwellings)	35
Total completions in plan period	35
Total completions in five years following adoption	35

Plan period up to adoption			Years following adoption*														
-2	-1	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	35/36	36/37	37/38	38/39	39/40	40/41	41/42	42/43
Annual completions																	
			15	20													

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	The site is within one ownership and the site is available, with an agent acting on their behalf
Developer interest	Intent to build out themselves or sell to a housebuilder with full planning permission.
Site assessment work	Full planning application in preparation, detailed pre-planning application completed with comments from CDC
Viability	No issues raised
Infrastructure provision	Key infrastructure already in place. Anticipate new pedestrian link provided into the town and SUDS.

Planning permission	N/A
Progress towards applications, reserved matters, discharge of conditions, etc.	Anticipated to submit a full planning application within the next 6-8 weeks. Principle of an MoU including trajectory agreed. As such, it is considered that the site is deliverable within five years following the adoption of the emerging Local Plan.

Upper Rissington: Land west of Delphin Way (ref: UR1A)

Site Details	
Local plan allocation ref	UR1A (26/01045/FUL)
Site name	Land West of Delphin Way, Upper Rissington
Total capacity (dwellings)	26
Total completions in plan period	26
Total completions in five years following adoption	26

Plan period up to adoption		Years following adoption*															
-2	-1	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	35/36	36/37	37/38	38/39	39/40	40/41	41/42	42/43
Annual completions																	
		13	13														

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	The site is in single ownership of the masterdeveloper of the site, Vistry Cotswolds.
Developer interest	Owner/developer
Site assessment work	Undertaken in relation to current application 26/01045/FUL
Viability	No known issues
Infrastructure provision	No major infrastructure works planned. These were caried out pursuant to 08/03697/OUT.

Planning permission	Full planning application 26/01045/FUL pending consideration, although with outstanding matters. It will need to be determined at committee, be subject to a legal agreement and there are likely to be pre-commencement conditions should the application be permitted.
Progress towards applications, reserved matters, discharge of conditions, etc.	Vistry Cotswolds are part of the wider Vistry group. As proposed master developers of the site they have significant control over the timescales for delivery, which they have put forward as part of a MoU. Given the clear progression and intent, it is considered reasonable of the site to be considered deliverable, with completions anticipated in the year before the adoption of the emerging Local Plan.

Willersey: Land between Colin Lane and future Heritage Railway (ref: W4B)

Site Details	
Local plan allocation ref	W4B
Site name	Land between Colin Lane and future Heritage Railway
Total capacity (dwellings)	40
Total completions in plan period	40
Total completions in five years following adoption	40

Plan period up to adoption			Years following adoption*														
-2	-1	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
25/26	26/27	27/28	28/29	29/30	30/31	31/32	32/33	33/34	34/35	35/36	36/37	37/38	38/39	39/40	40/41	41/42	42/43

						20	20										

* It should be assumed that the plan will be adopted no earlier than one year after the date on which it is submitted for examination, and that Y1 starts on the 1 April following the date of adoption.

Ownership and availability	Site is being promoted on behalf of Newland Homes an SME housebuilder. It has been advised that the site currently comprises agricultural land, and the site should be able to come forward in a timely manner.
Developer interest	Newlands Homes are a housebuilder with an options agreement in place.
Site assessment work	Investigations undertaken
Viability	No issues identified
Infrastructure provision	Standard requirements

Planning permission	No current applications. The outline application on the site was refused due to conflict with the development strategy and lack of a S106 agreement. The first would be resolved by way of the proposed allocation, and it would be anticipated that the S106 application would be worked on during the course of any application submitted.
Progress towards applications, reserved matters, discharge of conditions, etc.	The agent has advised that they consider the site to be developable within a 5-10 year period, with the intent to submit a planning application in summer/autumn 2026. They have also confirmed the principle of agreement of the completion of an MoU for the delivery of the site. Given the active involvement of a housebuilder, and the small scale of the site, it is considered that completions are deliverable within 5 years of the anticipated adoption of the emerging Local Plan.

Strategic Site Allocations

Site 1: Cirencester - Steadings Southern Extension

Site Details	
Local plan allocation ref	C190
Site name	Steadings Southern Extension
Total capacity (dwellings)	1,364
Total completions in plan period	585

The Steadings / Chesterton Strategic Site: Delivery Evidence

COTSWOLD
District Council

This statement covers the expected delivery of The Steadings over the emerging Plan Period (1 April 2026 to 31 March 2043).

To demonstrate the deliverability and developability of housing (as per the NPPF definitions) on the Chesterton strategic site, Cirencester (The Steadings), the Council has engaged with the developer (Bathurst Development Ltd. (BDL), represented by Savills). The following statement is based on this engagement, but it has also been cross-checked with the Council's Development Management case officers responsible for planning applications and discharging conditions at The Steadings.

What is the current planning status of the site?

Planning permission was granted on 3 April 2019 for an "Outline application (with all matters except access reserved for subsequent consideration) for a mixed use development comprising demolition of existing buildings (as detailed on the submitted demolition plan) and the erection of up to 2,350 residential dwellings (including up to 100 units of student accommodation and 60 homes for the elderly), 9.1 hectares of employment land (B1, B2 and B8 uses), a primary school, a neighbourhood centre including A1, A2, A3, A4 and A5 uses as well as community facilities (including a health care facility D1), public open space, allotments, playing fields, pedestrian and cycle links (access points onto Tetbury Road, Somerford Road and Cranhams Lane) landscaping and associated supporting infrastructure to include vehicle access points from Tetbury Road, Spratsgate Lane, Wilkinson Road and Somerford Road" (ref: 16/00054/OUT).

The following reserved matters applications have subsequently been approved:

- Reserved matters permission for (Phase 1A) was granted on 29 November 2021 for "scale, layout, appearance and landscaping for the erection of 68 dwellings with associated open space and landscaping" (ref: 20/04343/REM). Permitted 29.11.2021.
- Approval of reserved matters relating to appearance, landscaping, layout and scale, pursuant to outline planning permission 16/00054/OUT, for earthworks remodelling and construction of SuDS infrastructure to form Primary Green Infrastructure Areas within Phase 2 at The Steadings (ref: 23/02253/REM). Permitted 21.12.2023.
- Approval of reserved matters relating to appearance, landscaping, layout and scale, pursuant to outline planning permission 16/00054/OUT, for those sections of Primary Enhanced Streets A and C that will serve Sub-Phases 2a, 2b and 2c (ref: 23/02252/REM). Permitted 06.12.2023.

- Application for approval of appearance, landscaping, scale and layout of pumping station and emergency storage tank (ref 23/03989/REM). Approved 19.07.2024.
- Application for approval of appearance, landscaping, scale and layout of pumping station and emergency storage tank (ref 23/03990/REM). Approved 19.07.2024.
- Reserved Matters pursuant to outline permission 16/00054/OUT relating to appearance, layout, landscaping and scale for the proposed earth works associated with the landscaping area and spine road and landscaping proposals associated with the public open space for Phase 2 D and E of the development and discharge of conditions 16, 18, 55, 56, 58, 60 and 61 (25/02185/REM). Permitted 26.11.2025.
- Reserved Matters pursuant to outline permission 16/00054/OUT relating to appearance, scale, landscaping and layout for the provision of the spine road to serve Phase 2 D and E of the wider development including construction of the road and provision of the landscape verges and footpath/cycleways and discharge of conditions 16, 18, 55, 56, 58, 60 and 61 (25/02186/REM). Permitted 30.01.2026.
- Reserved Matters pursuant to outline permission 16/00054/OUT relating to appearance, layout, landscaping and scale for the erection of 100 dwellings, landscaping and public open space for Phase 2 A of the development, and discharge of conditions 11, 16, 18, 48, 56 (25/02763/REM). Permitted 29.01.2026.
- Reserved Matters pursuant to outline permission 16/00054/OUT relating to appearance, landscaping, scale and layout of 2 no. substations for phases 2C and 2E (25/04016/REM). Permitted 13.02.2026.

The following reserved matters application is awaiting a decision:

- Reserved Matters pursuant to outline permission 16/00054/OUT relating to approval of scale, layout, appearance and landscaping for 129 dwellings and four ground floor community use spaces with associated roads, parking and landscaping for Phase 2D associated with outline planning permission 16/00054/OUT. Discharge of outline planning permission conditions 16 (SuDS Schemes for each phase/sub-phase), 17 (Conformity and Maintenance with/of SuDS), 18 (SuDS Maintenance and Management Plan), 48 (Electric vehicle charging infrastructure), 49 (Waste Minimisation and Soil Management), 51 (Phased Arboricultural Reports), 56 (Protection of BiodiversityCompliance wit), 58 (Ecological Construction Method Statement), 60 (Lighting Design Strategy), 61 (Landscape, Ecological and Arboricultural), 65 (Hours of operation), 67 (Hours of operation) and 68 (Noise). Discharge of S106 obligation 2.5 of Schedule 1 (26/01237/REM)

The following reserved matters application was refused by the Council and at Appeal:

- Application for the approval of appearance, landscaping, layout and scale of the employment area to the east of Spratsgate Lane (ref: 22/02749/REM). Refused 17.07.2024

Full planning permission was granted on 13.07.2023 on Phase 1a for the temporary change of use of an existing dwelling house (Class C3) to an office and meeting space for the Steadings Community Management Trust and local community (Class E and Class F.2) (ref: 23/01619/FUL).

The following planning conditions have been discharged for the outline planning permission:

- 20/01947/COMPLY - Compliance with conditions 6 (Phasing), 7 (Initial Enabling Works), 9 (Design Coding), 10 (Detailed Design Code Phases 1 & 1a), 13 (Waste water), 14 (Water Supply), 15 (SuDS Delivery Schedule), 16 (SuDS Schemes for each phase/sub-phase), 49 (Waste Minimisation and Soil Management), 64 (Broadband). Discharged 17.03.2021.
- 20/04593/COMPLY - Compliance with condition 69 (Scheduled Ancient Monument and Biodiversity Enhancement and Management Plan). Discharged 22.04.2021.
- 21/04448/COMPLY - Compliance with condition 58 (Ecological Construction Method Statement). Discharged 31.01.2022.
- 22/01125/COMPLY - Compliance with conditions 2 (Inspection Scheme) and 13 (Landscaping Scheme). Discharged 09.03.2023.
- 23/01488/COMPLY - Compliance with condition 58 (Ecological Construction Method Statement)
- 23/00458/COMPLY - Compliance with condition 44 (Construction Management Plan). Issued 26.01.2024.
- 24/00326/COMPLY - Compliance with conditions 58 (Ecological Construction Method Statement) and 61 (Landscape, Ecological and Arboricultural). Issued 27.02.2024.

The following conditions have been partly discharged:

- 21/00515/COMPLY - Part-compliance with conditions 44 (Construction Management Plan), 50 (Archaeological investigation), 58 (Ecological Construction Method Statement and Construction Environment Management Plans), 62 (Ecological report relating to off-site highways works) and 63 (Arboricultural report relating to off-site highways works). Issued 11.05.2021.
- 21/01030/COMPLY - Part-compliance with conditions 18 (SuDS maintenance), 44 (Construction Management Plan), 45 (Public transport infrastructure), 46 (Fire hydrants), 47 (Maintenance of streets), 48 (EV charging infrastructure), 49 (Waste

minimisation & soil management), 50 (Archaeological investigation), 51 (Arboricultural report), 55 (Contamination), 56 (Ecological mitigation and management), 58 (Ecological Construction Method Statement and Management Plans), and 61 (Landscape, Ecological and Arboricultural Management and Monitoring Plan). Issued 31.01.2022.

- 21/01950/COMPLY - Part-compliance with Condition 50 (Archaeological investigation). Issued 05.07.2021.
- 23/00809/COMPLY - Part-Compliance with condition 50 (Archaeological Investigation). Issued 04.07.2023.
- 22/01186/COMPLY - Part-compliance with Condition 10 (Detailed Design Code - Phase 2b). Issued 17.11.2022.
- 21/02318/COMPLY - Part-compliance with Condition 10 (Detailed Design Code - Phase 2a first section of Primary Enhanced Street East). Issued 13.07.2023.
- 23/02700/COMPLY – (Partial) Compliance with condition 58 (Ecological Construction Method Statement (ECMS) and Construction Environment Management Plans (CEMP)) and condition 61 (Landscape, Ecological and Arboricultural Management and Monitoring Plan (LEAMMP)) of permission 16/00054/OUT. Issued 21.12.2023
- 23/02701/COMPLY – (Partial) Compliance with condition 51 (Phased Aboricultural Reports), condition 55 (Contaminated Land), condition 58 (Ecological Construction Method Statement (ECMS) and Construction Environment Management Plans (CEMP)), and condition 61 (Landscape, Ecological and Arboricultural Management and Monitoring Plan (LEAMMP)) of permission 16/00054/OUT. Issued 21.12.2023
- 24/01826/COMPLY - Partial Compliance with conditions 46 (Fire Hydrants) and 47 (Maintenance of Streets) of permission 16/00054/OUT. Issued 02.10.2024
- 24/03693/COMPLY – (partial) Compliance with condition 10 (Detailed Design Code) for permission 16/00054/OUT. Issued 09.05.2025

The following planning conditions have been discharged for reserved matters applications

- 22/01808/COMPLY - Compliance with conditions 6 (Semi-solid boundary treatment), 8 (bicycle parking), 10 (External lighting), 16 (Roof materials), 17 (Walling finishes), 18 (Boundary treatments), 20 (Window and door colours), 21 (Submission of large-scale details) and 23 (Design details for heat pumps) re permission 20/04343/REM. Issued 13.10.2023
- 23/03497/COMPLY - Compliance with condition 3 (Post Occupancy Evaluation) of permission 20/04343/REM. Issued 09.10.2024
- 24/01243/COMPLY - Compliance with condition 6 (hard surfacing materials) of permission 23/02252/REM. Issued 13.02.2025

- 24/01632/COMPLY - Compliance with conditions 3 (Management Plan), 4 (earth structures), 5 (pavement and/or landscape construction) and 9 (external lighting) of approval 23/02253/REM. Issued 17.02.2025
- 24/01827/COMPLY - Compliance with condition 2 (Implementation of all hard and soft landscape works) attached to the approval of reserved matters relating to appearance, landscaping, layout and scale, pursuant to outline planning permission 16/00054/OUT, for those sections of Primary Enhanced Streets A and C that will serve Sub-Phases 2a, 2b and 2c at (23/02252/REM) Issued 13.02.2025
- 24/02078/COMPLY - Compliance with condition 2 (programme for landscape works) of permission 23/02253/REM. Issued 17.02.2025
- 25/01602/COMPLY - Compliance with condition 5 (Pre-occupation validation) of permission 20/04343/REM. Issued 16.07.2025

The following discharge of condition applications for reserved matters applications are pending consideration

- 24/01631/COMPLY - Compliance with conditions 4 (Management Plan for all planted areas), 5 (Tree root barriers), 7 (Planting areas) and 11 (Street lights) of approval 23/02252/REM
- 24/03049/COMPLY - Compliance with condition 2 (Inspection scheme) of permission 20/04343/REM. Reserved Matters (Phase 1A) pursuant to Outline permission 16/00054/OUT

What firm progress is being made towards the submission of a reserved matters application (e.g. a written agreement between the local planning authority and the site developer(s) which confirms the developers' delivery intentions and anticipated start and build-out rates)?

BDL has made significant progress towards submitting and being granted reserved matters for a phase of the development and provision of infrastructure on the main site, as well as discharging further planning conditions.

BDL has completed the initial phase of infrastructure required to open up the site, including the following:

- Junction improvements at Cherry Tree Lane.
- Junction improvements at Somerford Road and Chesterton Lane.
- New roundabout and realignment of the Spratsgate Lane/Somerford Lane junction to enable access to the eastern half of the Steadings.

- Localised footpath and cycleway upgrades.
- On-site utility works completed include the installation of electricity, water and drainage as well as diversions of existing pipes.
- An extension to Siddington School has been constructed.
- The eastern section of the spine road, landscaping and SuDS to allow access to Parcels 2A, 2B and 2C constructed.

Off-site highway work improvements on the Fire Station roundabout commenced in Summer 2024 and have now been completed so future phases of development are not held up.

Archaeological surveys have taken place on Parcels 2A – 2G, and relating to the Scheduled Ancient Monument.

Reserved matters applications for two foul water pumping stations to serve Phase 2 (i.e. Parcels 2A to 2F) and future Phases to the west have been approved.

Parcel 1A: This parcel has completed all 68 dwellings.

Parcels 2A, 2B and 2C: The housing parcels of this part of the development are under the control of Homes England. Having acquired these parcels from BDL in June 2021, Homes England has selected Keepmoat Homes to take forward Parcel 2A. A Reserved Matters application was granted in relation to Parcel 2A relating to appearance, layout, landscaping and scale for the erection of 100 dwellings, landscaping and public open space which was permitted on 29 January 2026. They expect to deliver these homes between 1 April 2027 and 31 March 2030.

Homes England has selected Crest Nicholson as their preferred developer for Parcels 2B and 2C. Pre-application meetings were held with Development Management Officers in June 2026 and the developers are expecting to submit a Reserved Matters Application for 168 homes in January 2027.

The three parcels will be delivered sequentially, with housing expected to be delivered on Parcels 2B and 2C from 1 April 2028 to 31 March 2033. Given the involvement of Homes England with a secured developer, and ongoing engagement with the Council's Development Management team, it is considered that there is clear evidence that the parcels will start to be delivered within a five year period.

Parcels 2D and 2E: BDL has entered into a contract with HarperCrewe for the development of Parcel 2D. A Reserved Matters Application was submitted in April 2026 for 129 homes and is due to be considered at Planning Committee in Summer 2026. Subject to securing consent the developer expects to start on site in Autumn 2026**.** Furthermore, BDL submitted, and had approved, the Detailed Design Code for these parcels in May 2025.

The Reserved Matters applications relating to the spine road and open space around these parcels to enable serviced plots to be delivered have also been submitted and approved (late 2025/early 2026). The housebuilders will progress Reserved Matters applications.

Parcels 2F and 2G: BDL is preparing the detailed Design Code for these parcels which is to be submitted by the end of July 2026. In parallel BDL is in negotiation with a developer for Parcel 2G to deliver a scheme of 90 homes.

The delivery of the individual parcels of development will be overlapped. For example, the four sub-phases in Phase 2 will overlap each other in 2029/30.

Is there a planning performance agreement (PPA) that sets out the timescale for approval of reserved matters applications and discharge of conditions?

There is a PPA is currently in place to help progress the development, with regular meetings between the District Council, BDL, Homes England and the County Councils as well as a higher level Steering Group meeting with the BDL Board Directors, the Chief Executive of the District Council and other key Council Officers.

Is there any further relevant information that has a bearing on the delivery of the site?

The delivery trajectory of the Chesterton strategic site was considered by the Inspector of the Cotswold District Local Plan. The relevant sections from the Inspector's report on the Local Plan examination, which includes the justification for his assumptions, are provided in Appendix 3b. The Inspector considered it reasonable that 78 dwellings would be built on Parcel 1A by April 2021 and that 120 dwellings could be included from the overall site within the five year housing land supply (5YHLS). He considered that an overall total of 1,800 dwellings would be completed on the site by 2031.

Since the Inspector's Report, there has been around a four-year delay to the delivery of the site. This is mainly due to the S106 agreement for the outline planning permission taking longer than expected to finalise; infrastructure provision taking longer to agree and install (note - this was undertaken at a time when supply shortages were an issue due to Brexit and Covid-19 lockdowns); it taking 15 months from the grant of the outline planning permission to submit the first discharge of conditions application; it taking longer than expected to agree the design of Parcel 1A and sign off planning conditions; and a delay to agreeing the Detailed Design Code for sub-phases 2A, 2B and 2C. Additionally, Covid-19 impacted Cotswold District Council's resources and the Council's ability to discharge planning condition applications, as staff had to be redeployed to assist with the Council's response to the pandemic. Furthermore, the Council received an increase of planning applications to determine, whilst at the same time having a churn of staff and difficulty recruiting within a highly competitive market for qualified planners.

BDL's delivery programme now includes 610 dwellings to be completed within the 5 year period following the anticipated adoption of the emerging Local Plan (1 April 2028 – 31 March 2033). This includes 82 dwellings from Parcel 2A, 168 dwellings from Parcels 2B/2C, 198 dwellings from Parcel 2D and 120 from Parcels 2F/2G, and 41 from the Western parcels. BDL consider this estimation to be realistic and capable of being delivered, especially given the significant progress with the on-site and off-site infrastructure and resources that are being proposed by the Council.

BDL's delivery programme includes an annual delivery rate in the 5YHLS from the anticipated adoption of the emerging Local Plan that peaks at 143 dwellings in 2029/30. This includes the delivery of both market and affordable housing on Parcel A (41 dwellings) Parcel 2B/2C (41 dwellings); Parcel 2D (41 dwellings); and Parcel 2F/G (20 dwellings). It is anticipated that Parcels 2A – 2G will be developed by separate housebuilders. Furthermore, Cirencester has strong housing demand[1]. This annual delivery rate is therefore capable of being delivered.

BDL have advised that a maximum dpa of 209. This is considered overly optimistic, with a realistic target of 166 (in line within Lichfield's 75 percentile for delivery on large scale sites of this size). This would be dependant on opening up a further sales point to the south of the site. Even with a reduced peak of delivery (i.e. 166dpa), the whole development could be complete in the emerging Plan Period.

The Local Plan Inspector concluded that various factors that The Steadings strategic site could deliver above the average rate achieved on such sites elsewhere in the

[1] https://www.zoopla.co.uk/discover/featured-homes/the-top-uk-towns-for-house-price-growth/

country. Cirencester has previously sustained an average annual build rate of around 150 dwellings for a five-year period. The trajectory also shows that the delivery rates will increase once all key infrastructure is in place.

Regarding the housing demand, a relatively small number of homes have been completed in Cirencester in recent years (4 in 2025/2026[2], 55 in 2024/25, 36 in 2023/24; 17 in 2022/23; 41 in 2021/22; 12 in 2020/21; 0 in 2019/20; and 62 in 2018/19). The number of completions in recent years has been largely determined by the availability of sites with planning permission. There is therefore likely to be a heightened level of latent demand in and around Cirencester.

What firm progress has been made with site assessment work?

All technical work has been undertaken and updated for Parcel 1A. Further technical work has been undertaken on the main site to enable marketing of further land and reserved matters applications to be submitted and approved.

Detailed technical work is progressing which, as mentioned above, includes archaeological work and any hedgerow removals to keep ahead of the housing delivery programme. Infrastructure delivery is also progressing to ensure it is in place prior to support each phase of housebuilding.

The incoming housebuilders will carry out any other necessary technical work required to support the reserved matters applications.

What clear relevant information is there to demonstrate that the site is viable?

A viability assessment was submitted in 2016 as part of the outline planning application to demonstrate the viability of the scheme.

HarperCrewe was appointed as the development partner for Parcel 1A in March 2020 and are bringing the parcel forward in line with the planning consent.

Parcels 2A, 2B and 2C are under the control of Homes England, who have selected Keepmoat Homes to bring forward Parcel 2A and Crest Nicholson as their preferred developer for Parcels 2B and 2C.

[2] This number includes 12 dwellings lost as part of a redevelopment scheme

Parcel 2D/2E has been marketed to a shortlist of partners. BDL has entered into a contract with HarperCrewe for the development of Parcel 2D. The sites are considered low-risk by the parcel developers, as the parcels benefit from outline consent and an approved Detailed Design Codes.

As with all schemes of this scale, the recent cost inflation and impact of world events have impacted costs and cash flow.

Are there any ownership constraints?

No. HarperCrewe has delivered Parcel 1A. Homes England own Parcels 2A, 2B and 2C. The remainder of the site is under the control of BDL as master developer.

What clear relevant information is there about infrastructure provision, such as successful participation in bids for large-scale infrastructure funding or other similar projects?

Thames Water completed work installing the new main sewer that links the site to the treatment works in South Cerney. This connects the new development and circa 850 existing properties in the Chesterton area to relieve pressure on the existing system.

Pre-commencement highway works have been completed at Cherry Tree Lane, Chesterton Lane/Somerford Road and the Spratsgate Lane roundabout. These works provide access into Parcel 1A and the eastern parcels of the main development area.

The condition for the detailed design code for the Eastern Spine Road from the new roundabout has been discharged and reserved matters consent granted. The Spine Road to serve Parcels 2A, B and C and the open space areas have been constructed. Reserved matters applications have been approved for two pumping stations to serve Phase 2 and the wider development.

Cotswold District Council comments

The four-year delay has had a knock on delay to the delivery of the subsequent phases of the development. However, work has not stood still with bringing the subsequent phases of development forward in the meantime. A significant amount of progress has been made and the situation is now far more advanced than that which the Local Plan Inspector considered. There is now clear evidence that 2,282 dwellings will be completed across the site between April 2026 and March 2043. This is in addition wo the 100 dwellings from Phase 1A.

Local Plan Inspector's Report Extract

COTSWOLD
District Council

The Planning Inspectorate

Report to Cotswold District Council

by William Fieldhouse BA (Hons) MA MRTPI

an Inspector appointed by the Secretary of State

Date: 5th June 2018

Planning and Compulsory Purchase Act 2004

(as amended)

Section 20

Report on the Examination of the Cotswold District Local Plan 2011-2031

The Plan was submitted for examination on 7 July 2017

The examination hearings were held between 10 October and 22 November 2017

File Ref: PINS/F1610/429/2

Is there a reasonable prospect of the Chesterton site delivering the number of dwellings assumed in the Plan by 2031?

168. I consider now whether there is a reasonable prospect[69] that 2,350 dwellings will be completed on the site by 2031 and, if not, what a more realistic assumption would be. This requires consideration of (a) when development of the site is likely to start, and (b) once development is underway, how many dwellings are likely to be completed each year.

When is development of the Chesterton site likely to start?

169. Outline planning permission is dependent on the finalisation of a section 106 agreement containing numerous planning obligations which is unlikely to be before the end of 2018. In parallel with the preparation of those obligations, work can continue on preparing information to discharge any pre-reserved matters application conditions, and develop detailed proposals in consultation with the Council and key stakeholders.

170. It is likely that part of the eastern side of the site ("phase 1a") could be developed with access from Somerford Road without requiring any major off site infrastructure provision other then a new foul water sewer from the site to the Shorncote sewage treatment works that is likely to be in place by autumn 2018. There is evidence of interest from housebuilders, and it is possible that detailed planning permission could be in place in time for development of this area to start around the middle of 2019. Whilst there is no certainty that this timetable for phase 1a will be achieved, I am satisfied that there is a reasonable prospect that it could be.

171. The Plan assumes that development on the main part of the site could start early in 2020. Representatives for the site owner clarified during the examination that this represents a best case scenario[70]. Given the significant amount of work that still needs to be completed by numerous different bodies before development on the main part of the site gets underway, the inter-dependencies that exist between key events that need to occur, and the need for various approvals including of details required by planning conditions and for infrastructure projects, I consider it likely that there will be some slippage in the timetable. In order to ensure that the Plan is not based on unrealistic expectations about the timing of development on the strategic site, which is critical to meeting housing needs in the latter years of the plan period, it would be more appropriate to assume that development on the main part of the site will not start until 2021.

How many dwellings are likely to be built each year on the Chesterton site?

172. Once development on the main part of the site is properly underway, the Plan assumes that delivery rates would step up over the first three years then average 229 dwellings each year between 2023 and 2031[71]. The Council and site owner consider that this could be achieved by there being four separate outlets each on average delivering 40 market homes and 17 affordable homes per year. The owner suggests that specialist forms of residential accommodation could also be provided on the site, for example for students

[71] *Housing Land Supply Report* Appendix 3, CDC November 2017 [ED046].

and the elderly, and that discussions have taken place with the Royal Agricultural University and others regarding this.

173. There are no examples of large strategic sites having been delivered at such a rate for a sustained period in the district or elsewhere in the Gloucestershire housing market area in recent decades. The two recently completed Kingshill sites on the east of Cirencester did deliver a total of nearly 350 dwellings in 2011/12, but that was an exceptional one-year peak.

174. A number of strategic sites in Oxfordshire have delivered over 200 dwellings per year[72], and further evidence and analysis is available of strategic scale development elsewhere in the country over a number of years[73]. This shows an average delivery rate of 161 dwellings per year on the sites of over 2,000 dwellings that were analysed. Whilst the rates varied, only 4 of the sites had a delivery rate of over 200 dwellings per year. Output of open market homes from each sales outlet on large sites tends to be in the range of 30-35 dwellings per year[74].

175. The local housing market is strong, and when sites in the district receive planning permission they invariably get completed in a timely fashion[75]. Land prices are in the top 25% nationally, and the viability appraisal for the site factors in above-average build costs which is indicative that a high quality scheme would be delivered. None of the analysed sites of over 2,000 dwellings elsewhere in the country included as high a proportion of affordable homes than the 30% that has been shown to be viable on the Chesterton site. These factors suggest that a successful strategic site in the district could deliver above the average rate achieved on such sites elsewhere in the country.

176. However, although the local housing market is strong, it is of limited size. Whilst the number of completions in recent years has been largely determined by the availability of sites with planning permission, the average annual build rate in Cirencester over the last five years has been under 150 dwellings. So sustaining an average of around 230 per year for 9 years would represent a significant increase (over 50%) in market activity in the town. Whilst there are expressions of interest from 3 housebuilders, marketing of the site has not yet commenced and therefore there is no certainty that there would be such a high level of interest to ensure that 4 housebuilders would be willing to operate together consistently for a sustained period.

Conclusion on whether there is a reasonable prospect that the Chesterton site would deliver the number of dwellings assumed in the Plan by 2031

177. There is a high probability that the strategic site will be developed, and it is likely that a total of around 2,350 dwellings will be built by the time that it is completed. However, on balance, I do not consider there to be a reasonable prospect that all of those dwellings will be completed on the site by 2031. In summary, the main reasons for this are that it is unlikely that development on the main part of the site will start as early as hoped, or that four housebuilders would operate at all times over a 9 year period and each deliver

[72] *Chesterton Delivery Strategy Statement* paragraph 4.18 and Appendix 5 [ED014c].
[73] *Start to Finish: How Quickly do Large Scale Housing Sites Deliver?* (NLP, November 2016).
[74] Savills letter dated 25 August 2015 [ED014c Appendix 3].
[75] ED005 Q16.

an average of 40 market and 17 affordable homes every year during that period. There are also at present some uncertainties about the amount of specialist residential accommodation, such as for students or the elderly, that will be built on the site.

178. I consider that it is reasonable to assume that 78 dwellings would be built on phase 1a by April 2021, and that development on the main part of the site would start around that date with approximately 1,700 further dwellings being completed by 2031 giving an overall total of around 1,800. This would represent an average delivery rate slightly above that achieved on strategic sites elsewhere in the country. This is justified by the strength of the local housing market and the fact that a high quality scheme that includes infrastructure provision and 30% affordable housing has been assessed as viable. It allows for periods when there may be four housebuilders each delivering a total of 50-60 market and affordable homes per year, other times when there would be fewer operators and/or lower outputs, and the possibility of specialist accommodation being provided on parts of the site.

179. In total, therefore, it is reasonable to assume that around 1,800 dwellings would be built on the strategic site in the plan period, and that 120 of those would be completed by 1 April 2022. This latter figure is based on 78 dwellings be completed on phase 1a, and 42 on the main part of the site in 2021/2022. The Plan should be modified accordingly [**MM04** and **MM13**].

180. Sites in Cirencester with planning permission as at 1 April 2017 are likely to have been largely completed by 2022, and there are only a limited number of other small sites allocated in the town. This means that for most of the rest of the plan period the rate of housing growth in the town would be only slightly greater than that experienced in recent years. This reinforces my view that the delivery assumptions that I have set out are justified.

Conclusion on Housing Supply for the Plan Period

181. Based on the above, the housing land supply for the plan period 2011 to 2031 can be summarised as follows:

- Completions 1 April 2011 to 31 March 2017: 3,176 dwellings
- Sites with planning permission 1 April 2017: 2,870 dwellings
- Strategic site south of Chesterton: 1,800 dwellings
- Housing allocations: 577 dwellings
- Windfalls 2017 to 2031: 1,191 dwellings
- Total supply 2011 to 2031: 9,614 dwellings

182. This would represent a supply of housing land that should ensure that the identified requirement for 8,400 dwellings over the plan period could be met. Table 1 in the Plan, and reasoned justification for policy DS1, needs to be modified accordingly so that the Plan is justified and effective [**MM04**].

Appendix 3: Schedule of Actions Required to Overcome Common Constraints

1. Introduction

1.1 This report sets out Cotswold District Council's Housing and Economic Land Availability Assessment (HELAA). This assessment updates the Strategic Housing and Economic Land Availability Assessment (SHELAA) published in October 2021 and incorporates additional site submissions and/or amendments received through the recent Call for Sites exercises undertaken in 2023, 2024 and 2025, as well as through the Regulation 18 Local Plan Consultation held between November 2025 and January 2026.

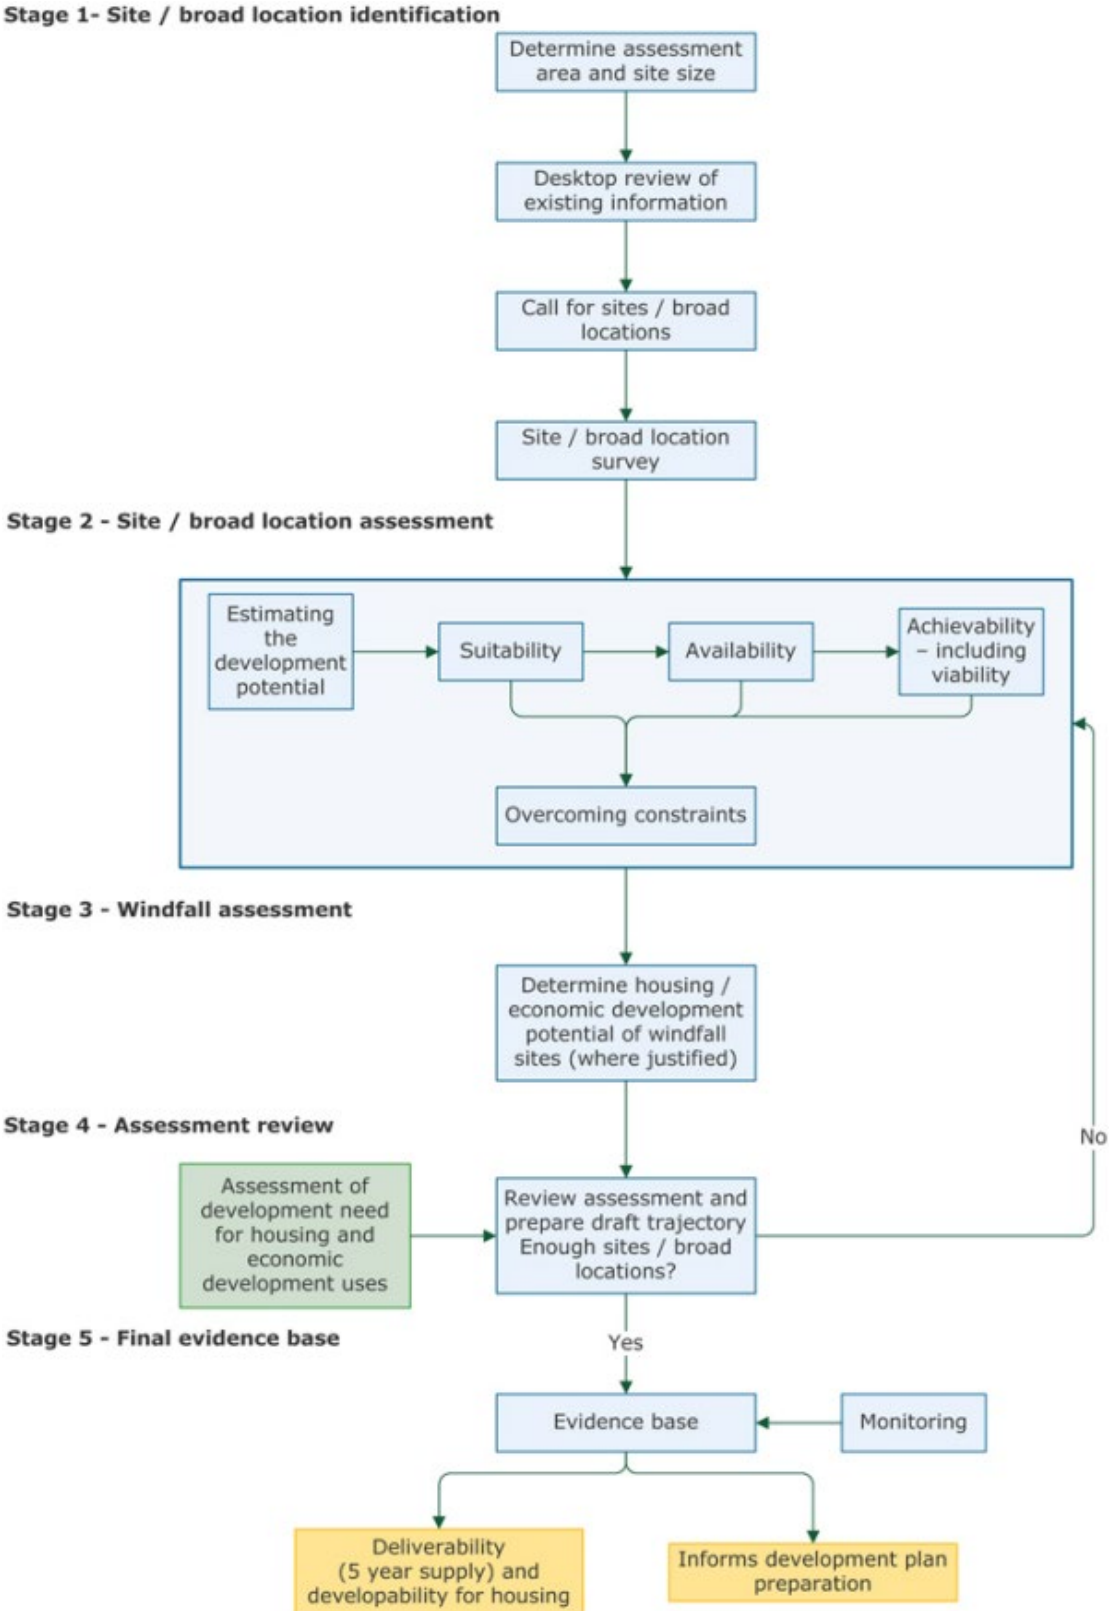
1.2 The HELAA identifies a future supply of land which is suitable, available and achievable for housing and economic development uses over the plan period. The assessment is an important part of the evidence base to inform plan-making and decision-taking and the identification of a five-year land supply of deliverable housing sites.

1.3 This HELAA should be read in conjunction with a series of complementary topic papers and evidence studies published alongside the Regulation 19 Cotswold District Local Plan (2026-42) (the Regulation 19 Local Plan). These include:

- Assessment of Broad Strategic Development Locations (November 2025)
- Housing Land Supply Topic Paper, including Housing Trajectory (July 2026)
- Housing Density and Optimising Housing Delivery Technical Paper (July 2026)
- Employment Land Review (July 2026)
- Infrastructure Delivery Plan (July 2026)
- Integrated Impact Assessment (July 2026)
- Site Selection Topic Paper (July 2026)

1.4 The HELAA does not in itself determine whether a site should be allocated for development. It is the role of the assessment to provide information on the range of sites which are available to meet the District's housing and economic development requirements, but it is for the Local Plan process to determine which of those sites are the most suitable to meet those requirements. The inclusion of a site in the HELAA also does not imply that the Council would grant planning permission for that site.

1.5 The remainder of this report explains the HELAA methodology and presents the findings of the assessment. The site assessments and maps are provided in **Appendix 1: Schedule of Discounted Sites** and **Appendix 2: Detailed Assessments and Settlement Maps**.



2. Methodology

2.1 This HELAA has been prepared in accordance with the National Planning Policy Framework (NPPF) (2024) and national Planning Practice Guidance (PPG) on Housing and Economic Land Availability Assessment (November 2025) (HELAA PPG)[1].

2.2 The PPG sets out the recommended methodology for the preparation of Housing and Economic Land Availability Assessments through a five-stage approach. Chapter 3 of this Report sets out the Council's assessment in accordance with each stage of the PPG Method Flowchart (**Figure 1**) and the outcomes of the assessment.

[1] Planning Practice Guidance on Housing and Economic Land Availability Assessment (MHCLG, 27 November 2025)

Figure 1: HELAA Method Flowchart (Planning Practice Guidance, Paragraph 005, Reference ID 3-005-20190722)

3. Stage 1: Identification of Sites and Broad Locations

Site / broad location identification

3.1 The first stage of the HELAA was to identify as many potential housing and economic development site opportunities in the District as possible, which is the plan-making area for the Cotswold Local Plan. The HELAA identifies and assesses all sites across the District consistently and does not apply the Local Plan's development strategy, which is considered further at the site selection stage.

3.2 In line with the guidance in the PPG, this HELAA has considered a wide range of site sources including:

- A review of all sites previously assessed in the SHELAA
- A review of existing housing and economic development allocations in the adopted Cotswold District Local Plan 2011-2031
- 'Call for Sites' exercises undertaken in 2008, 2013, 2016, 2019, 2020, 2023, 2024 and 2025
- Cotswold District Council's Brownfield Register
- Planning applications for housing and economic development
- Site submissions from representations to previous Local Plan consultations and to the recent Regulation 18 Local Plan consultation
- Register of surplus public sector land
- Engagement with strategic plans of other public sector bodies such as the County Council, Central Government, Natural England, Historic England, Environment Agency, National Health Service, Fire Services, utilities providers and statutory undertakers, as detailed in the Statement of Effective Cooperation (July 2026)
- Empty property register
- English House Condition Survey
- National Land Use Database
- Commercial property databases
- Valuation Office database, and
- Proactive site searches of sites and broad locations through Council Tax information, Ordnance Survey mapping, aerial photography and site surveys.

3.3 This includes a series of Call for Sites exercises undertaken at various points of plan-making. The most recent Call for Sites was conducted between November

2025 and January 2026 in parallel with the Regulation 18 Consultation on the Cotswold Local Plan. The Call for Sites was aimed at a wide range of audiences including individuals and organisations who were invited to put forward sites which they think may be suitable for development during the plan period. The Call for Sites form set out the information sought from respondents, which in line with the PPG, included site location, suggested potential type of development, scale of development and potential constraints to development. It also sought additional information on site ownership, landowner intentions, delivery and viability considerations, relevant planning history and adjacent land uses.

3.4 A total of **892** sites were identified through the initial site identification process. All sites were plotted on a Geographical Information System (GIS) so that all constraints could be easily identified in context.

Initial Site and Broad Location Survey

3.5 An initial site and broad location survey was undertaken to identify sites that, having regard to national policy and statutory designations, were clearly unsuitable for development and therefore did not warrant further detailed assessment at Stage 2.

3.6 Sites were discounted based on the following criteria:

Sites that are partially or wholly outside of the Plan Area

3.7 Paragraph 006 of HELAA PPG specifies that the area selected for assessment should be the plan-making area. Sites located entirely outside of the plan-making area were discounted from further assessment.

3.8 Sites that are partially within the plan-making area are further considered at Stage 2 where they have potential to deliver development capacity above the minimum HELAA site size threshold. The developable area of these sites has been adjusted to reflect their development capacity within the plan-making area.

Sites where development has been completed

3.9 Sites that have a planning permission that has been implemented and where development has been completed have been discounted from the HELAA as they have already been brought forward and cannot be considered for future allocation.

Sites that have been withdrawn from assessments

3.10 Some sites have been discounted from the HELAA as they have been withdrawn from assessment at the request of the landowners.

Sites below the minimum size threshold

3.11 Paragraph 009 of the HELAA PPG advises that plan-makers need to assess a range of different site sizes but it may be appropriate to consider all sites and broad locations capable of delivering 5 or more dwellings, or economic development on sites of 0.25 hectares (or 500 square metres of floorspace). This HELAA has applied the PPG-recommended site size threshold. No upper size threshold has been applied to the assessment to ensure that the HELAA has considered a range of different site sizes from small to large scale sites, including strategic housing and economic development.

Sites promoted for alternative uses outside of housing and economic development

3.12 Sites promoted for alternative uses outside of housing and economic development, such as allotments and sui generis uses, have been discounted from further assessment. However, these have been considered through the wider Local Plan evidence base where appropriate.

Sites with primary policy and designations constraints

3.13 Paragraph 014 of the HELAA PPG suggests that when taking into account national policy and designations, there may be some sites and broad locations which are clearly not suitable for development. A number of primary constraints (also known as 'showstopper' constraints) have been identified based on Footnote 7 of the NPPF.

3.14 Where a site or broad location wholly intersects with one or more primary constraints, the site is considered as unsuitable for development and has been discounted from further assessment. Where a site or broad location partially intersects with one or more primary constraints with the remaining developable area capable of delivering above the minimum HELAA site size threshold, the site has been taken forward for more detailed consideration with a reduced developable area at Stage 2.

3.15 The following designations were identified as primary constraints in the HELAA:

- Ramsar sites and proposed Ramsar sites
- Special Protection Areas and proposed Special Protection Areas (SPA)
- Special Areas of Conservation (SAC)
- Sites of Special Scientific Interest (SSSI)
- National Nature Reserves (NNR)
- Regionally Important Geological Sites (RIGS)
- Flood Zone 3, excluding areas protected by existing flood defences

- Ancient Woodlands
- Irreplaceable Habitats
- Scheduled Ancient Monuments
- Registered Battlefields
- Registered Parks and Gardens, and
- Local Green Spaces.

3.16 A number of constraints stated in Footnote 7 were not considered as 'showstoppers' in the HELAA as sites with these constraints may be suitable for future development subject to other technical work being undertaken and policy considerations of the Local Plan. These constraints are however considered through further suitability assessments as secondary constraints.

3.17 The relevant policy constraints include:

- **National Landscape**: Sites were not automatically discounted on the basis of being in the Cotswolds National Landscape. The impact of development on the National Landscape has been considered through the subsequent stages of the HELAA having regard to further landscape sensitivity assessments and the relevant national planning policy.
- **Conservation Areas**: Sites were not automatically discounted on the basis of being in a designated Conservation Area. The impact of development on the Conservation Area has been considered through the subsequent stages of the HELAA and would be subject to further heritage assessments.
- **Listed Buildings**: Sites were not automatically discounted on the basis of intersecting with the presence of Listed Buildings. The impact of development on Listed Buildings has been considered through the subsequent stages of the HELAA and would be subject to further heritage assessments.

Duplicate Sites

3.18 Duplicate sites were discounted to prevent double counting. The relevant assessment has been considered through the source site where applicable.

3.19 A total of **638** sites progressed to Stage 2 for detailed site and broad location assessment. **Appendix 1** presents a schedule of discounted sites.

4. Stage 2: Site and Broad Location Assessment

4.1 In line with the HELAA PPG, Stage 2 Site and Broad Location Assessment involves the following steps and considerations:

- Estimating the development potential
- Assessing the suitability of sites/broad locations for development
- Assessing the availability of sites/broad locations for development
- Assessing the achievability of sites/broad locations for development
- Considering constraints and actions that could be taken to overcome them
- Assessing the timescale and rate of development

Suitability Assessment

4.2 The suitability assessment considered whether each site is an appropriate location for development when considered against a range of environmental, physical, landscape and heritage constraints and the potential for mitigations in accordance with Paragraph 018 of the HELAA PPG.

4.3 A range of spatial data and the existing evidence base has been used to inform the analysis, including:

- GIS analysis of the percentage of intersection between site and identified primary and secondary constraints, based on available national or local policy data (where appropriate, distance from and count of the designations on or near the site have also been considered)
- Site information including Call for Sites submission and previous HELAA
- Specialist officer assessment and wider Local Plan Evidence Base studies including the Cotswold Landscape Sensitivity Assessment (July 2026)
- Desktop review of aerial photography, and
- Site visit, where appropriate.

The following designations and/or site characteristics were considered through the suitability assessment in addition to those identified as primary constraints in Paragraph 3.13:

- National Landscape: Sites assessed as having high or medium-high landscape sensitivity through the Cotswolds Landscape Sensitivity Assessment (July 2026) are considered unsuitable for housing and economic development, other than in exceptional circumstances and where it can be demonstrated that the development is in the public interest
- Special Landscape Areas
- Local Nature Reserves (LNR)
- Flood Risk, including land within Flood Zones 2 and 3 and areas susceptible to surface water or groundwater flooding
- Groundwater Source Protection Zones
- Access and physical constraints, including a high level assessment of whether suitable access could be achieved from the highway network and the presence of Public Rights of Way
- Conservation Areas
- Listed Buildings
- Agricultural Land Classification
- Natural Environment, including the presence of Tree Preservation Orders and other ecological features
- Safeguarding Zones
- Ground Conditions and Environmental Hazards

4.4 Sites are categorised as suitable, potentially suitable or unsuitable, accompanied by a high-level summary of key constraints present on site (including whole and partial intersection):

- **Suitable:** Site provides an appropriate location for development with no or minor constraints present.
- **Potentially suitable:** Site provides a potentially appropriate location for development subject to further technical investigation and mitigation of identified constraints.
- **Unsuitable:** Site is subject to one or more significant constraints which could not be reasonably mitigated to provide an appropriate location for development.

4.5 Where a site is partially constrained by environmental or physical factors, but a portion of the site is potentially developable, its site area is adjusted to reflect the developable area and the estimation of development capacity is applied to the reduced site area.

4.6 A small number of HELAA sites comprise extant allocations in the adopted 2011-31 Local Plan planning permissions for housing and economic development uses. These sites are reviewed to consider whether circumstances have changed which would alter their suitability and generally considered suitable for development in line with the PPG.

Availability Assessment

4.7 The availability of sites and broad locations was assessed having regard to:

- Land ownership, including whether the site may be in multiple ownership
- Development intention, including if the site is actively promoted for development, and
- Known legal or ownership issues

4.8 The availability assessment was informed by information received through recent Call for Sites, Regulation 18 Consultation, recent planning history and engagement with landowners.

4.9 As part of the Call for Sites process, promoters were asked to confirm whether they own the site or have the landowner's consent to promote it for development, and to provide an indication of when the site may become available for development. Legal and land ownership searches have not been conducted at this stage.

4.10 A site was considered available where, based on the best information available, there were no known ownership, legal or other impediments that would prevent it from coming forward for development within the plan period. In most cases, sites that are actively promoted in the last 5 years by a landowner or developer are generally assumed to be available in the foreseeable future.

4.11 Where there are potential availability issues, for example where multiple ownerships have not been demonstrably resolved or where recent confirmation of availability has not been received from the landowner or promoter, sites have been marked as potentially available. Further investigation, such as landowner engagement, is required to confirm whether these sites are available for development.

4.12 Sites were categorised as follows:

- **Available:** Site is actively promoted for development, such as supported by recent Call for Sites submissions or planning application, and has no known impediments to development.
- **Potentially Available:** Site is not subject to any known impediments to development based on the best information available, but would require further work, such as landowner engagement, to confirm its current availability. This includes sites where land ownership arrangements have not been demonstrably resolved, or where no recent confirmation has been received from the landowner or promoter regarding the site's availability for development.
- **Unavailable:** Site is confirmed as unavailable for development within the plan period by the landowner.

Achievability Assessment

4.13 Paragraph 020 of the HELAA PPG recommends the achievability assessment to consider whether there is a reasonable prospect that the type of development will be achieved on the site at a particular time, based on the economic viability of a site, and the capacity of the developer to complete and let or sell the development over a certain period.

4.14 The achievability assessment was informed by the findings of the Cotswold District Local Plan Viability Assessment (July 2026), which demonstrates that development is generally viable across the range of development typologies assessed. In line with this evidence, the HELAA focused on whether there are site-specific factors that may affect the viability or delivery of development.

4.15 In assessing achievability, regard was given to:

- The price point area within which the site is located
- The existing land use (such as greenfield or previously developed land) and associated benchmark land value
- The proposed or assessed land use, and
- The proposed scheme size, building typology and density.

4.16 The analysis was also complemented by site-specific considerations of abnormal costs and other factors affecting achievability, identified through Call for Sites submissions, specialist assessments and desktop review. Key factors considered included:

- Costs associated with treatment for contaminated sites or listed buildings
- Costs associated with brownfield, phased or complex sites
- Demolition of existing structures

- Flood prevention measures at waterside locations
- Remodelling land levels
- Relocating infrastructure such as substations or power lines, and
- Significant access improvements required.

4.17 Based on the assessment of the above factors, sites were classified under the following categories:

- **Achievable:** Site is of a viable development typology based on land use, price point area, site type and development density. There are no known factors that may impact its achievability.
- **Potentially Achievable:** Site is of a potentially viable development typology based on land use, price point area, site type and development density. It may be subject to physical, infrastructure or other factors that may impact its achievability.
- **Unachievable:** Site is not considered to be achievable due to viability or other factors. No sites were classified as unachievable in this assessment.

4.18 It is important to note that the viability work undertaken is based on the assessment of typologies that are broadly representative of the potential sites in the plan-making area and does not involve site specific assessments of viability or delivery.

Estimating Development Potential

4.19 Paragraph 025 of the HELAA PPG recommends that the estimated development potential of each site should be guided by existing or emerging plan policy, including locally determined policies on density.

4.20 For sites assessed as suitable, available and achievable (including those assessed as potentially suitable, potentially available and potentially achievable), an indicative development capacity was estimated using the following approach:

- Determine the Gross Developable Area: Reduce the gross developable area, where appropriate, to account for land affected by key constraints.
- Apply a net developable area assumption: For residential sites, a gross-to-net adjustment was applied to reflect the need for infrastructure, open space, landscaping, access and other non-developable uses.
- Apply density or plot ratio assumptions: Residential capacities were estimated using density assumptions derived from the Housing Density and Optimising Housing Delivery Technical Paper (July 2026). Employment capacities were estimated using plot ratios set out in the Cotswold Employment Land Review (July 2026).
- Refine Capacity Estimate: The resulting capacity estimates were reviewed and refined where there was reasonable justification to do so, taking account of planning history, site-specific technical evidence, promoter information or other relevant information regarding how a site could be developed.

4.21 For residential (including mixed use) development, Table 1 sets out how gross-to-net assumptions were applied based on the need for larger sites to accommodate a greater proportion of on-site infrastructure:

Table 1: Gross to net ratio area multiplier

Site size (Ha)	Discounted site area	Gross to net ratio area multiplier
0 - 0.4	0	100%
0.4 - 2	17%	83%
2+	37%	63%

4.22 Net residential capacities were then estimated using the density assumptions set out in the Housing Density and Optimising Housing Delivery Technical Paper (July 2026). Sites were assigned an appropriate density range based on their location and characteristics, with the midpoint of the recommended net density range used to calculate an indicative housing capacity.

Table 2: Density multiplier applied

Location	Recommended net density (dph)
Main town centres (infill and new district centres)	50+ / 60+
Primary streets and new local centres	40 – 50+ / 60+
Areas well related to settlements	30 – 40
Landscape edges / farmsteads / rural lanes / infill at non-principal settlements	20 – 35

4.23 Employment capacities were estimated using the plot ratio assumptions set out in the Cotswold Employment Land Review (July 2026). A plot ratio of 0.5 was applied to office development and 0.4 to industrial development. A blended ratio of 0.45 is applied where submissions do not indicate the proposed use class.

4.24 The capacities of some sites were further refined where there was reasonable justification to do so. This included information from previous planning application history, indicative masterplans demonstrating how a site could be laid out, site-specific technical evidence, promoter information or other relevant information.

4.25 The high-level capacity estimates identified through the HELAA are indicative. Development capacities may be refined further through the site allocation process, the preparation of detailed masterplans and supporting technical evidence, and the determination of planning applications.

Deliverability Assumptions

4.26 The HELAA PPG advises that an assessment should be made of the estimated build-out rates for sites and broad locations, together with an indicative trajectory of anticipated development based on the evidence available.

4.27 The assessment of deliverability was informed by the Council's housing trajectory and site delivery assumptions set out in the Housing Land Supply Topic Paper (July 2026) and the Housing Delivery Study (July 2026). This includes assumptions relating to lead-in times, build-out rates and the likely timing of development.

Overcoming Constraints

4.28 The HELAA PPG states that where constraints have been identified, the assessment will need to consider what action could be taken to overcome them. Examples of constraints include policies in the National Planning Policy Framework and the adopted or emerging development plan, which may affect the suitability of the site, and unresolved multiple ownerships, ransom strips tenancies or operational requirements of landowners, which may affect the availability of the site.

4.29 The suitability, availability and achievability assessments have taken account of the potential for identified constraints to be overcome or mitigated. **Appendix 3** provides a summary of the typical actions that may be required to overcome common constraints identified through the assessment. Further consideration of identified constraints and the actions required to address them are undertaken through the plan-making process and subsequent stages of site selection, detailed masterplanning and planning applications.

5. Stage 3: Windfall Assessment

5.1 The HELAA PPG states that a windfall allowance may be included within the anticipated housing supply where there is compelling evidence to support its inclusion, having regard to paragraph 70 of the National Planning Policy Framework. The PPG also confirms that broad locations identified for development in Years 6–15 may include a windfall allowance.

5.2 The Council's assessment of windfall development and the evidence supporting the use of a windfall allowance are set out in the Housing Land Supply Topic Paper (July 2026).

6. Stage 4: Assessment Review and Stage 5: Final Evidence Base

6.1 Following completion of the suitability, availability and achievability assessments, sites were reviewed and assigned one of three classifications reflecting their potential to come forward for development within the plan period:

- **Deliverable / Developable:** Sites considered suitable, available and achievable for development within the plan period.
- **Potentially Deliverable / Developable**: Sites that may have the potential to come forward for development within the plan period, subject to identified constraints being addressed.
- **Not Deliverable / Developable:** Sites that are not considered suitable, available or achievable for development within the plan period.

6.2 The classifications reflect the findings of the HELAA assessment and the extent to which sites are considered capable of being delivered, taking account of identified constraints and the likelihood that these can be overcome during the plan period.

6.3 The detailed site assessment findings are provided in **Appendix 2**. This includes the site assessment summary and maps showing the location of assessed sites and the outcome of the HELAA assessment.

6.4 The HELAA identifies a theoretical capacity of approximately 82,957 dwellings and 256,852 sqm of economic floorspace (excluding mixed use sites) across all assessed sites. This represents the total indicative capacity identified through the HELAA process and includes sites assessed as deliverable or developable (including potentially deliverable or developable).

6.5 The development capacity identified through the HELAA represents a high-level estimate of potential development opportunity and should not be interpreted as an indication that all identified sites will be allocated for development or delivered within the plan period. Inclusion within the HELAA does not imply that a site will be allocated in the Local Plan or that planning permission will be granted. Further assessment of sites will be undertaken through the plan-making process, as set out in the Site Selection Topic Paper, which will consider the sites in relation to the Local Plan Spatial Strategy and further detailed technical evidence.

Appendix 1: Schedule of Discounted Sites

HELAA Reference	Site Address	Settlement	Site Area (Ha)	Proposed Land Use	Assessment Outcome	Reason
A6	Adjacent The Old Station House, Station Road	Andoversford	0.06	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
B15A	Land south of The Manor Fields	Bourton-on-the-Water	1.29	Housing	Discounted	Wholly constrained by Designated Local Green Space
B15B	Land at The Manor Fields	Bourton-on-the-Water	2.05	Housing	Discounted	Wholly constrained by Scheduled Monument
B16	Land north of Lamberts Field	Bourton-on-the-Water	0.52	Housing	Discounted	Wholly constrained by Scheduled Monument
B23	Garage block near Rye Crescent	Bourton-on-the-Water	0.10	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
B24	Gardens near Rectory Lane	Bourton-on-the-Water	0.16	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
B29	Large gardens east of junction of Roman Way and Moor Lane	Bourton-on-the-Water	0.38	Housing	Discounted	Wholly constrained by Scheduled Monument
B51	Land at Clapton Row	Bourton-on-the-Water	0.10	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
BK12	Blockley allotments (northern part)	Blockley	1.46	Allotments on BK12	Discounted	The site is proposed for alternative land uses outside of housing and economic development and has therefore been discounted from further assessment.
BK16	Land east of Sheaf House Farm Buildings	Blockley	-	Housing	Discounted	Duplicate - site subsumed into BK7B
BK20	Land at Backends	Blockley	-	Housing	Discounted	Duplicate - site subsumed into BK24
C10	26 Ashcroft Road	Cirencester	0.08	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
C101A	Magistrates Court	Cirencester	0.10	Dependent on Town Centre Masterplan	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
C106D	Sheep Street Island SE parcel	Cirencester	0.02	N/A	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
C134	Vyners Close	Cirencester	0.75	Housing	Discounted	Planning permission for one dwelling (15/01951/FUL) and development complete
C135	Waterloo Car Park	Cirencester	0.67	Dependent on Town Centre Masterplan	Discounted	The site is proposed for alternative land uses outside of housing and economic development and has therefore been discounted from further assessment.
C141B	Land rear of Purley Road	Cirencester	0.17	Housing	Discounted	Wholly constrained by Flood Zone 3
C143	Playing Field, off Trinity Road	Cirencester	0.40	Housing	Discounted	Wholly constrained by Scheduled Monument
C145	Dingley Dell Car Park	Cirencester	0.51	Housing	Discounted	Wholly constrained by Scheduled Monument
C150	Abbey Car Park	Cirencester	0.29	Housing	Discounted	Wholly constrained by Scheduled Monument
C155	Garage, Purley Avenue	Cirencester	0.05	Housing	Discounted	Planning permission (17/04588/FUL) and development complete
C156	Jubilee Club, Ashcroft Road	Cirencester	0.10	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
C167	Land off Barn Way	Cirencester	0.08	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment

HELAA Reference	Site Address	Settlement	Site Area (Ha)	Proposed Land Use	Assessment Outcome	Reason
C176	Land to the rear of 28 Cheltenham Road, Stratton	Cirencester	0.04	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
C181	Royal Agricultural University	Cirencester	18.59	Uses directly related to the Royal Agricultural University	Discounted	The site is proposed for alternative land uses outside of housing and economic development and has therefore been discounted from further assessment.
C183	Land east of Stratton Mill	Cirencester	1.70	Community / Environmental	Discounted	The site is proposed for alternative land uses outside of housing and economic development and has therefore been discounted from further assessment.
C188	Land at Phoenix House, Bristol Road, GL7 1QG	Cirencester	1.04	Housing	Discounted	Wholly constrained by Scheduled Monument
C33	8 Thomas Street	Cirencester	0.11	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
C42	Land off Berry Hill Crescent, also known as "The Humpty Dumps"	Cirencester	4.71	Housing	Discounted	Wholly constrained by Designated Local Green Space
C57	Forum Car Park	Cirencester	0.54	Dependent on Town Centre Masterplan	Discounted	Wholly constrained by Scheduled Monument
C60	Garage Site, Apsley Road	Cirencester	0.09	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
C70B	Land adjacent Brewery Car Park (The Existing Bowls Club)	Cirencester	0.25	Housing	Discounted	Wholly constrained by Scheduled Monument
C82A	Paternoster School, Watermoor Road	Cirencester	0.43	Housing	Discounted	Wholly constrained by Scheduled Monument
C89	Land off Purley Road	Cirencester	1.18	Housing	Discounted	Wholly constrained by Scheduled Monument
C90	Land opposite 230 Stratton Heights	Cirencester	0.04	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
C93	Land to rear of Querns School	Cirencester	0.34	Housing	Discounted	Wholly constrained by Scheduled Monument
C98	Gardens to rear of 28A-36 London Road	Cirencester	0.23	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
CC1	Craftwork shops, situated off Sheep St with potential to convert buildings	Chipping Campden	0.11	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
CC33	Station Road Garage, Station Road	Chipping Campden	0.11	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
CC37	Wolds End Orchard, Back Ends	Chipping Campden	0.10	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
CC42	Royal Mail Delivery Office, Back End	Chipping Campden	0.06	N/A	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment
CC46A	Land adjacent to Top farmhouse and the west of Blind Lane	Chipping Campden	0.12	Housing	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment

HELAA Reference	Site Address	Settlement	Site Area (Ha)	Proposed Land Use	Assessment Outcome	Reason
CC46B	Land adjacent to Top farmhouse and the west of Blind Lane	Chipping Campden	0.06	Housing / Commercial	Discounted	Based on site size, characteristics and submitted information, the site is not considered capable of delivering 5 or more dwellings and falls below the minimum threshold for assessment

HELAA Reference	Site Address	Settlement	Site Area (Ha)	Site Type (Brownfield / Greenfield / Mix)	Proposed Land Use	Suitability	Site Commentary: Suitability	Availability	Site Commentary: Availability	Achievability	Site Commentary: Achievability	Overall Rating	Residential capacity (dwellings)	Employment capacity (sqm)
A1	Land adjacent Andoversford Sewage Treatment Works	Andoversford	0.36	Greenfield	Housing / employment	Unsuitable	Site is wholly within / contains: - Cotswolds National Landscape - Grade 3 Agricultural Land - Area susceptible to groundwater flooding - Superficial deposits flooding Site is partly within / contains: - Flood Zone 2 (45.42%) - Flood Zone 3 (23.48%) - Deciduous woodland (88%) The site is a in a sensitive location within the Cotswolds National Landscape adjacent to River Coln. The site is not adjacent to the existing settlement and would extend development beyond the A40. A large portion of the site is within Flood Zone 2 and Flood Zone 3 and would require significant flood mitigation. The site is located adjacent to a sewage treatment works. There is no existing access onto the site. Access would most likely need to be created from the access road to the sewage treatment	Potentially available	Site is submitted by the landowner through Call for Sites 2013. Availability has not been confirmed since	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Not Deliverable / Developable	0	

HELAA Reference	Site Address	Settlement	Site Area (Ha)	Site Type (Brownfield / Greenfield / Mix)	Proposed Land Use	Suitability	Site Commentary: Suitability	Availability	Site Commentary: Availability	Achievability	Site Commentary: Achievability	Overall Rating	Residential capacity (dwellings)	Employment capacity (sqm)
							works. Investigation may be required to determine whether the access is suitable for residential intensification. The site may include woodland at present which will require further ecological assessment. The site is unsuitable for development due to significant flood risk, unsustainable location and adjacency to sewage treatment works. The remaining developable area is not capable of delivering 5 or more dwellings.							
A2	Land north-west of Templefields	Andoversford	2.31	Greenfield	Housing	Suitable	Site is wholly within / contains: - Grade 3 Agricultural Land - Cotswolds National Landscape - Areas susceptible to groundwater flooding (Superficial Deposits Flooding) The site is adjacent to the settlement of Andoversford within the Cotswolds National Landscape. The Study of Land Surrounding Key Settlements (2026) finds the site to have 'Medium' landscape sensitivity. The site contains several trees protected under the	Available	Site is submitted by the landowner through recent Call for Sites (2025) and actively promoted for development	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Deliverable / Developable	52

R179	Land to south-east of Frampton Mansell	Frampton Mansell	15.37	Greenfield	Housing / community	Potentially suitable	Site is wholly within / contains: • Cotswolds National Landscape • Airfield Safeguard Area - Aston Down • Airfield Safeguard Area - Kemble • Areas Susceptible to Groundwater Flooding - Clearwater and Superficial Deposits Flooding Site is partially within / contains: • Grade 3 Agricultural Land (66.06%) The site comprises a greenfield agricultural field to the east of Frampton Mansell. It lies within a sensitive location in the Cotswolds National Landscape. The site is adjacent to the Frampnell Mansell Conservation Area and is within the setting of several Listed Buildings. Any heritage impacts would need to be mitigated. The site is currently accessed via agricultural lane, which is likely to require upgrading to accommodate residential development. Any improvements to access would need to be carefully considered in relation to a play space adjacent to the current access. There is little existing vegetation screening the site and the site is prevalent in views. The site is potentially suitable for development, subject to consideration of the significance of landscape impacts on the Cotswolds National Landscape and other identified constraints.	Potentially available	Site submitted in the 2013 Call for Sites. Availability has not been confirmed since	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Potentially Deliverable / Developable	422

R437	Site B, Land at Townend Farm	Didmarton	0.44	Greenfield	Housing	Unsuitable	Site is wholly within / contains: • Cotswolds National Landscape • Grade 3 Agricultural Land Site is partially within / contains: • Gas Pipeline Buffer - Wickwar / Swindon The site comprises greenfield associated with an existing farmhouse located adjacent to the settlement of Didmarton. It lies within a sensitive location in the Cotswolds National Landscape. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'Medium-High' landscape sensitivity. The site is currently accessed via agricultural lane, which is likely to require upgrading to accommodate residential development. Any improvements to access would need to be carefully considered in relation to a group Tree Preservation Order along the site boundary, as well as other Tree Preservation Orders within the site. The site is unsuitable due to landscape sensitivity.	Available	Site is submitted by the landowner through recent Call for Sites (2025) and actively promoted for development	Potentially achievable	Site is a viable residential typology constituting greenfield development in a high price point area. Factors that may impact achievability include costs associated with potential significant access improvements and demolition of existing structures. Overall developable area may be reduced subject to further utilities investigation.	Not Deliverable / Developable	0	
R439	Site D, Land rear of 47 The Street	Didmarton	0.29	Greenfield	Housing	Unsuitable	Site is wholly within / contains: • Cotswolds National Landscape • Grade 3 Agricultural Land The site comprises greenfield adjacent to the settlement of Didmarton, opposite to the Village Hall. It lies within a sensitive location in the Cotswolds National Landscape and adjacent to the Didmarton Conservation Area. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'Medium-High' landscape sensitivity. Access to site is via a residential lane which may require improvements to support further	Available	Site is submitted by the landowner through recent Call for Sites (2025) and actively promoted for development	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area. HELAA Reference	Site Address	Settlement	Site Area (Ha)	Site Type (Brownfield / Greenfield / Mix)	Proposed Land Use	Suitable	Site Commentary: suitability	Available	Site Commentary: availability	Achievable	Site Commentary: achievability	Rating	Residential capacity (dwellings)	Employment capacity (sqm)
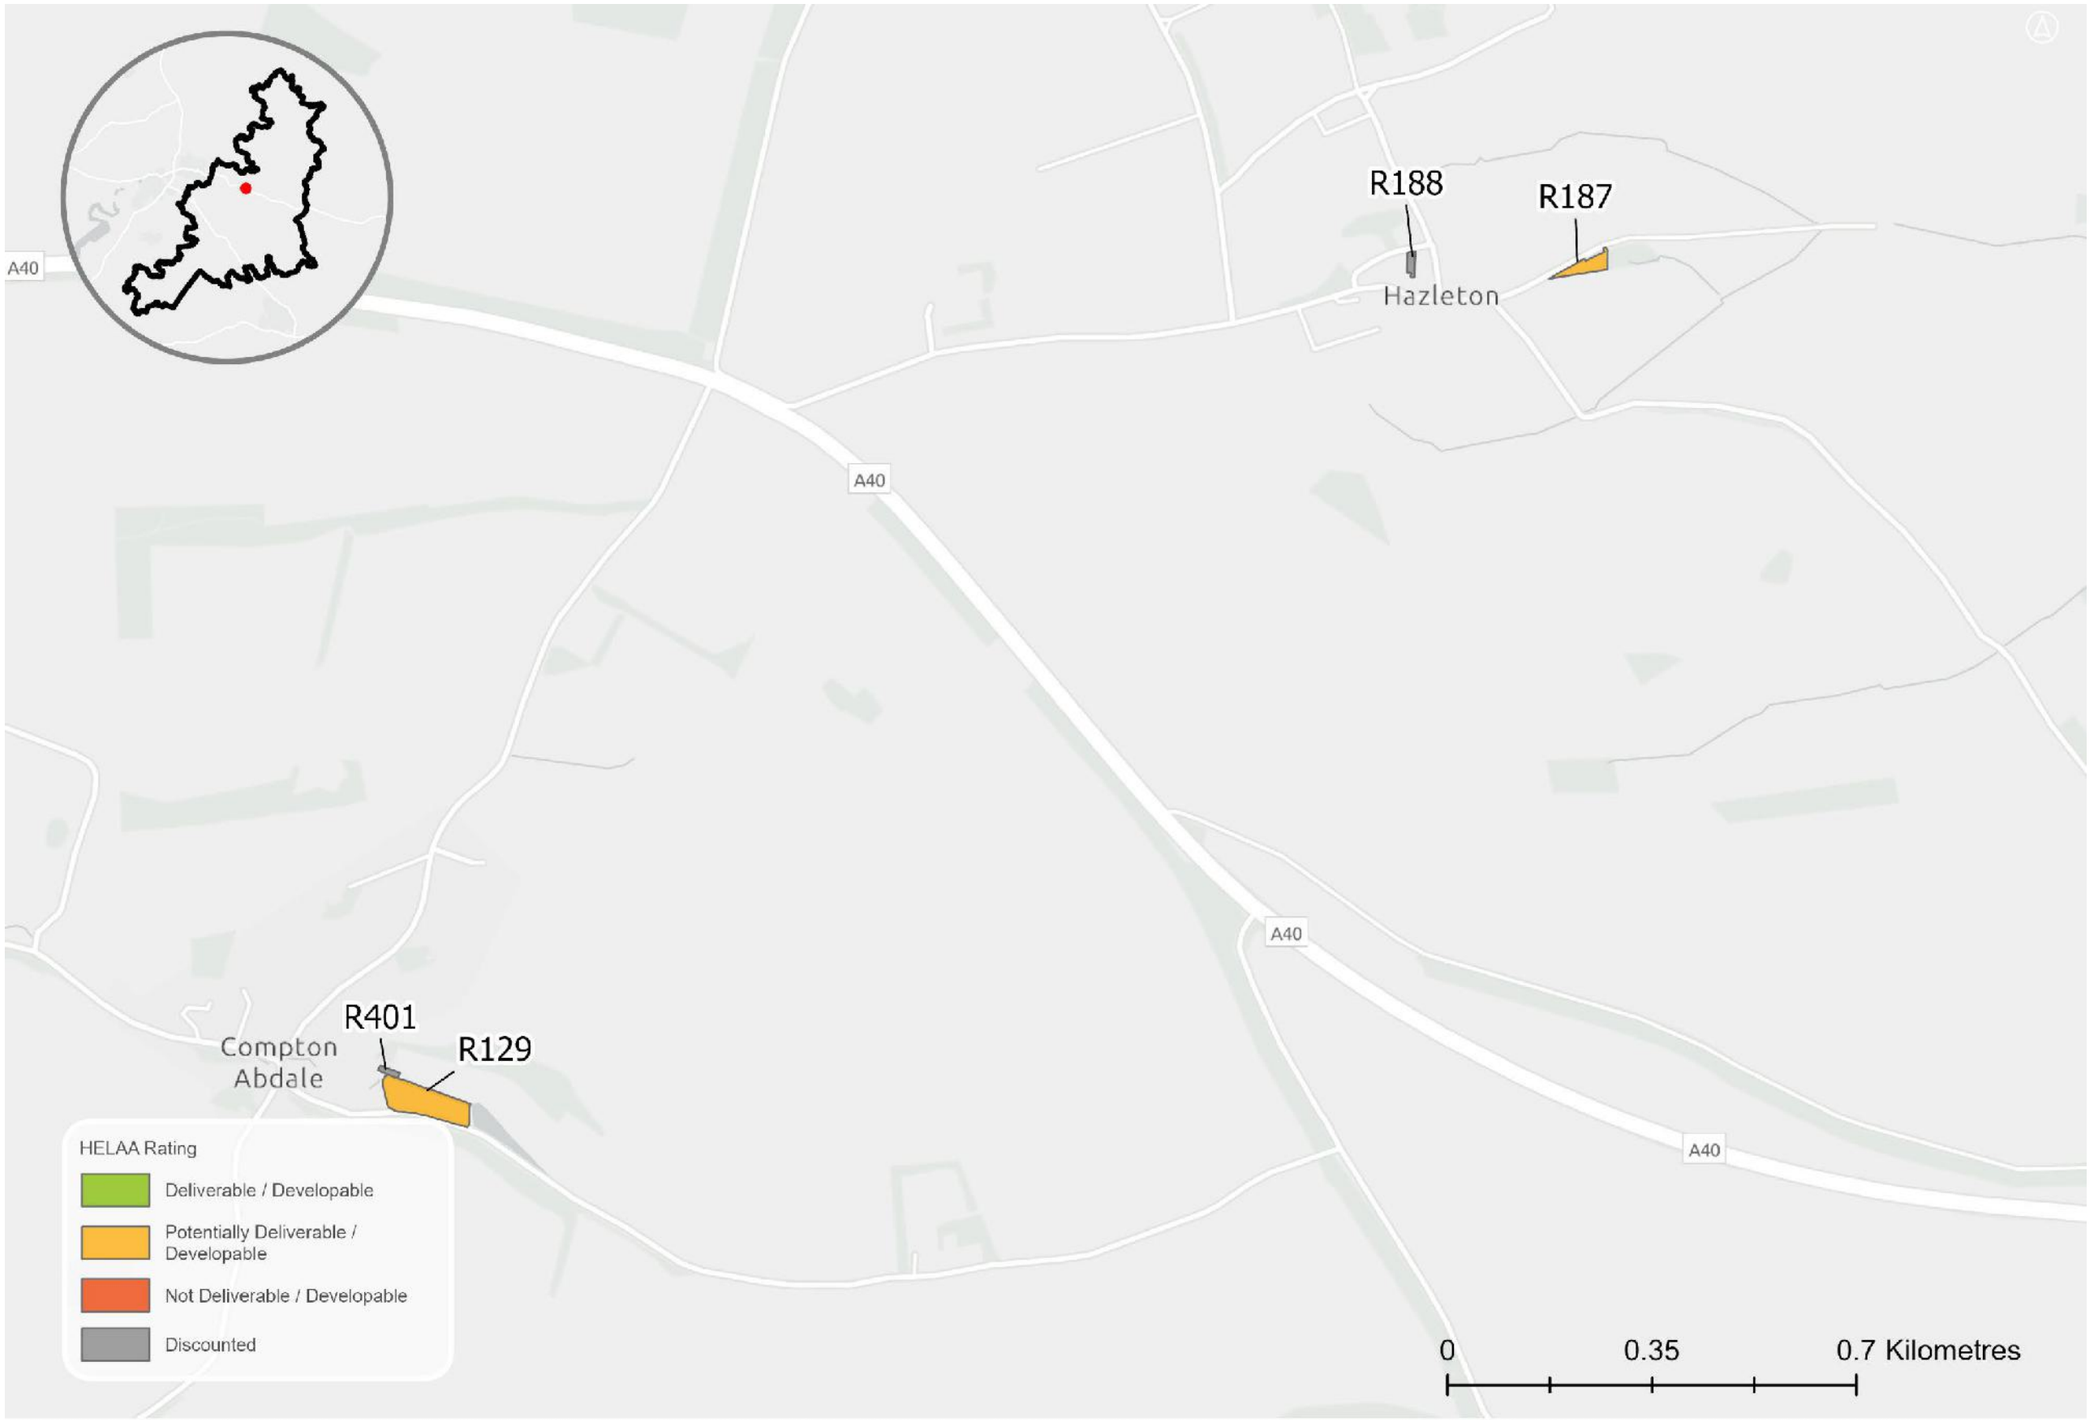
R627	Rear the Yews, Rectory Lane	Great Rissington	0.51	Greenfield	Housing	Potentially suitable	Site is wholly within / contains: • Cotswolds National Landscape • Grade 3 Agricultural Land • Airfield Safeguard Area - Little Rissington • Airfield Safeguard Area - Oxford Kidlington • Airfield Safeguard Area - Brize Norton • Areas Susceptible to Groundwater Flooding - Clearwater and Superficial Deposits Flooding The site comprises a greenfield agricultural field to the west of Great Rissington. It lies within a sensitive location in the Cotswolds National Landscape. The site is adjacent to the Great Rissington Conservation Area and is within the setting of several Listed Buildings. Any heritage impacts would need to be mitigated. There is a small existing pedestrian access off of Rectory Lane. Further investigation is required to determine whether creating a suitable access is feasible. Development of the site would match the existing development pattern to the north at Green's Close. The site is potentially suitable for development, subject to consideration of the significance of landscape impacts on the Cotswolds National Landscape and other identified constraints.	Available	Site is submitted by the landowner through recent Call for Sites (2025) and actively promoted for development	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Potentially Deliverable / Developable	15	



Guiting Power

One site was assessed in this settlement but it was not considered suitable to progress beyond the initial assessment stage. **Appendix 1** sets out all discounted sites.

HELAA Reference	Site Address	Settlement	Site Area (Ha)	Site Type (Brownfield / Greenfield / Mix)	Proposed Land Use	Suitable	Site Commentary: suitability	Available	Site Commentary: availability	Achievable	Site Commentary: achievability	Rating	Residential capacity (dwellings)	Employment capacity (sqm)
R229C	Large Field east of High Street	Longborough	8.23	Greenfield	Housing	Unsuitable	Site is wholly within / contains: • Cotswolds National Landscape • Grade 3 Agricultural Land • Airfield Safeguard Area - Little Rissington • Areas Susceptible to Groundwater Flooding - Clearwater and Superficial Deposits Flooding The site comprises greenfield to the southeast of Longborough. It lies within a sensitive location in the Cotswolds National Landscape. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'High' landscape sensitivity. The site is adjacent to the Longborough Conservation Area and is within the setting of many Listed Buildings. Any heritage impacts would need to be mitigated. The site is adjacent to a large area TPO. There is no existing access onto the site, and delivery of a suitable access is likely to require delivery through one of the sites to the north. The site is unsuitable for development due to high landscape sensitivity and lack of suitable access.	Available	Site is submitted by the landowner through recent Call for Sites (2025) and actively promoted for development	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Not Deliverable / Developable	0	

HELAA Reference	Site Address	Settlement	Site Area (Ha)	Site Type (Brownfield / Greenfield / Mix)	Proposed Land Use	Suitable	Site Commentary: suitability	Available	Site Commentary: availability	Achievable	Site Commentary: achievability	Rating	Residential capacity (dwellings)	Employment capacity (sqm)
R457	Field west of Old Rectory Gardens	Longborough	2.76	Greenfield	Housing	Unsuitable	Site is wholly within / contains: • Cotswolds National Landscape • Grade 3 Agricultural Land • Airfield Safeguard Area - Little Rissington • Areas Susceptible to Groundwater Flooding - Clearwater and Superficial Deposits Flooding The site comprises greenfield to the southwest of Longborough. It lies within a sensitive location in the Cotswolds National Landscape. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'Medium-High' landscape sensitivity. The topography rises from east to west, and the site is highly visible in the surrounding landscape and from the public right of way, which runs along the eastern boundary. The Conservation Area is also located opposite the eastern boundary and the site forms part of its rural setting. The access would be onto a single track rural road and would require cutting into the embankment and the removal of a large section of hedgerow in the location which is closest to the Conservation Area, which would have a highly harmful impact. The site is unsuitable for development due to high landscape sensitivity.	Available	Site is submitted by the landowner through recent Call for Sites (2025) and actively promoted for development	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Not Deliverable / Developable	0	

HELAA Reference	Site Address	Settlement	Site Area (Ha)	Site Type (Brownfield / Greenfield / Mix)	Proposed Land Use	Suitable	Site Commentary: suitability	Available	Site Commentary: availability	Achievable	Site Commentary: achievability	Rating	Residential capacity (dwellings)	Employment capacity (sqm)
R577	The Sitch, Moreton Road, GL56 0QJ	Longborough	4.54	Mix	Housing	Unsuitable	Site is wholly within / contains: • Cotswolds National Landscape • Grade 3 Agricultural Land • Airfield Safeguard Area - Little Rissington • Areas Susceptible to Groundwater Flooding - Clearwater and Superficial Deposits Flooding The majority of the site is designated as an Established Employment Site in the adopted Local Plan and is in active use as employment units (known as The Sitch). The Local Plan evidence base finds this site should continue to be protected for employment use and is unsuitable for redevelopment. The site is also located inside the Cotswolds National Landscape. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'Medium-Low' landscape sensitivity. Residential development to the south of The Sitch would break away from the settlement pattern into the National Landscape and would have a harmful impact. The site is unsuitable for development due to active employment use.	Available	Site is submitted by the landowner through recent Call for Sites (2025) and actively promoted for development	Potentially achievable	Site is a potentially viable residential typology constituting development of previously developed land in a high price point area.	Not Deliverable / Developable	0	

Mickleton

							The site is unsuitable due to flood risk.							
M12B	Land at Evenlode Road	Moreton-in-Marsh	3.07	Greenfield	Housing	Potentially suitable	Site is wholly within / contains: • Grade 2 Agricultural Land • Areas Susceptible to Groundwater Flooding - Superficial Deposits Flooding • Moreton-in-Marsh Surrounds Special Landscape Area The site comprises a greenfield site to the east of Moreton-in-Marsh. The site is in a sensitive location within the Moreton-in-Marsh Surrounds Special Landscape Area. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'Medium-Low' landscape sensitivity. A Public Right of Way runs through the site. The site is adjacent to a recently developed site to the west. There is no existing access onto the site, but access could likely be extended from the new development to the west. A sewage treatment work plant is located to the east of the site and may impact suitability of the eastern edge of the site for residential development. The site is potentially suitable for development, subject to consideration of the significance of landscape impacts on the Special Landscape Area, suitable access and consideration of other identified constraints.	Available	Site is submitted by the landowner through recent Call for Sites (2025) and actively promoted for development	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Potentially Deliverable / Developable	107

N1B	Land off Bassett Road	Northleach	2.72	Greenfield	Housing / employment	Unsuitable	Site is wholly within / contains: • Cotswolds National Landscape • Grade 3 Agricultural Land • Airfield Safeguard Area - Little Rissington • Areas Susceptible to Groundwater Flooding - Clearwater and Superficial Deposits Flooding Site is partly within / contains: • Local Green Space (47%) • Flood Zone 2 (1.28%) • Flood Zone 3 (19.05%) The site comprises greenfield to the east of Northleach. It lies within a sensitive location in the Cotswolds National Landscape. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'Medium-High' landscape sensitivity. Development of the site may result in loss of best and most versatile agricultural land. Part of the site is a designated Local Green Space and should be protected. A Public Right of Way runs through the site. The southern part of the site lies in Flood Zone 2 and Flood Zone 3 which may require some flood mitigation. There is no existing vehicular access onto the site. A suitable access could most likely be created from E End. Further transport assessment is required to ensure this is suitable. The site is unsuitable for development due to its Local Green Space designation and landscape sensitivity.	Available	Site is submitted by the landowner through recent Call for Sites (2025) and actively promoted for development	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Not Deliverable / Developable	0	

HELAA Reference	Site Address	Settlement	Site Area (Ha)	Site Type (Brownfield / Greenfield / Mix)	Proposed Land Use	Suitable	Site Commentary: suitability	Available	Site Commentary: availability	Achievable	Site Commentary: achievability	Rating	Residential capacity (dwellings)	Employment capacity (sqm)
N2	Land opposite Northleach C of E Primary School	Northleach	1.78	Greenfield	Housing	Unsuitable	Site is wholly within / contains: • Cotswolds National Landscape • Airfield Safeguard Area - Little Rissington • Areas Susceptible to Groundwater Flooding - Clearwater and Superficial Deposits Flooding Site is partly within / contains: • Grade 3 Agricultural Land (1.99%) • Flood Zone 2 (2.06%) • Flood Zone 3 (34.83%) The site comprises greenfield to the southwest of Northleach. It lies within a sensitive location in the Cotswolds National Landscape. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'High' landscape sensitivity. The site is adjacent to the Northleach Conservation Area and any heritage impacts would need to be mitigated. A Public Right of Way runs along the northern and eastern boundaries. The northern part of the site lies in Flood Zone 2 and Flood Zone 3 and significant flood risk mitigation is likely required. There is no existing vehicular access onto the site, and there may be issues creating this from Mill End due to a stone wall running along the length of the road. The site is unsuitable for development due to harmful impacts on National Landscape and Conservation Area.	Potentially available	Site is submitted by the landowner through Call for Sites 2019. Availability has not been confirmed since	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Not Deliverable / Developable	0	

HELAA Reference	Site Address	Settlement	Site Area (Ha)	Site Type (Brownfield / Greenfield / Mix)	Proposed Land Use	Suitable	Site Commentary: suitability	Available	Site Commentary: availability	Achievable	Site Commentary: achievability	Rating	Residential capacity (dwellings)	Employment capacity (sqm)
N12B	Land to rear of Shepherds Way & West End	Northleach	6.63	Greenfield	Housing	Unsuitable	Site is wholly within / contains: • Cotswolds National Landscape • Airfield Safeguard Area - Little Rissington • Areas Susceptible to Groundwater Flooding - Clearwater and Superficial Deposits Flooding Site is partially within / contains: • Grade 3 Agricultural Land The site comprises greenfield to the west of Northleach. It lies within a sensitive location in the Cotswolds National Landscape. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'High' landscape sensitivity. The site lies adjacent to the Northleach Conservation Area, and is within the setting of Listed Buildings, including a Grade I Listed Building. Any heritage impacts would need to be mitigated. A Public Right of Way runs through the site. Development of the site may result in loss of best and most versatile agricultural land. The site is on a hill sloping up to the southwest making it prominent in the setting of the Conservation Area. There is no existing vehicular access onto the site, though this could likely be created from W end. Further transport assessment is required to ensure this is suitable. The site is unsuitable for development due to high landscape sensitivity and likely harmful impacts on the National Landscape and Conservation Area.	Available	Site is submitted by the landowner through recent Call for Sites (2025) and actively promoted for development	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Not Deliverable / Developable	0

N13A	Land between A429 & West End	Northleach	2.98	Greenfield	Mixed use	Unsuitable	Site is wholly within / contains: • Cotswolds National Landscape • Grade 3 Agricultural Land • Airfield Safeguard Area - Little Rissington • Areas Susceptible to Groundwater Flooding - Clearwater and Superficial Deposits Flooding • Good quality semi improved grassland The site comprises greenfield to the north of Northleach. It lies within a sensitive location in the Cotswolds National Landscape. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'High' landscape sensitivity. Two Public Rights of Way run through the northeast of the site. Development of the site may result in loss of best and most versatile agricultural land. The site is on a hill sloping up to the north making it prominent in the setting of the Conservation Area and in approaches into Northleach from the A429. There is no existing vehicular access onto the site, though this could likely be extended from Hammond Drive. Further transport assessment is required to ensure this is suitable. The site has a majority overlap with a priority habitat (good quality semi improved grassland). Development of the site would be detrimental to this habitat. The site is unsuitable for development due to majority overlap with priority habitat, high landscape sensitivity and likely harmful impacts on the National Landscape and Conservation Area.	Available	Site is submitted by the landowner through recent Call for Sites (2025) and actively promoted for development	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Not Deliverable / Developable	0

N13C	Land adjoining the Old Coal Yard Industrial Site (Site A)	Northleach	0.68	Greenfield	Housing / employment	Unsuitable	Site is wholly within / contains: • Cotswolds National Landscape • Grade 3 Agricultural Land • Airfield Safeguard Area - Little Rissington • Areas Susceptible to Groundwater Flooding - Clearwater and Superficial Deposits Flooding • Good quality semi improved grassland Site is partly within / contains: • Flood Zone 2 (14.46%) • Conservation Area (71.84%) The site comprises greenfield to the west of Northleach. It lies within a sensitive location in the Cotswolds National Landscape and within the Northleach Conservation Area. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'Medium' landscape sensitivity. There is an area of Flood Zone 2 which may require some flood mitigation measures. An area TPO lies along the southern boundary of the site. Development of the site may result in loss of best and most versatile agricultural land. The site is on a gentle hill sloping up to the north making it prominent in the setting of the Conservation Area. There is a small existing agricultural access onto the site from W end. This is likely suitable for intensification subject to upgrades. Further transport assessment is required to ensure this is suitable. The site has a majority overlap with a priority habitat (good quality semi improved grassland). Development of the site would be detrimental to this habitat.	Available	Site is submitted by the landowner through recent Call for Sites (2025) and actively promoted for development	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Not Deliverable / Developable	0

N14B	Land adjoining East End & Nostle Road	Northleach	2.73	Greenfield	Housing	Potentially suitable	Site is wholly within / contains: • Cotswolds National Landscape • Grade 3 Agricultural Land • Airfield Safeguard Area - Little Rissington • Areas Susceptible to Groundwater Flooding - Clearwater and Superficial Deposits Flooding The site comprises greenfield to the east of Northleach. It lies within a sensitive location in the Cotswolds National Landscape. Development of the site may result in loss of best and most versatile agricultural land. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'Medium to Medium-High' landscape sensitivity. The site is on a gentle hill sloping up to the north and it has a low level of existing screening. There is a small existing agricultural access onto the site from E end. This is likely suitable for intensification subject to upgrades. Further transport assessment is required to ensure this is suitable. There is a pending application for 50 dwellings on site (ref: 26/00613/OUT). The site is potentially suitable for development, subject to consideration of impacts on the National Landscape and other identified constraints.	Available	Site is submitted by the landowner through recent Call for Sites (2025) and actively promoted for development	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Potentially Deliverable / Developable	35

N18	Land adjacent to Copse View	Northleach	0.80	Greenfield	Housing	Unsuitable	Site is wholly within / contains: • Cotswolds National Landscape • Grade 3 Agricultural Land • Airfield Safeguard Area - Little Rissington • Areas Susceptible to Groundwater Flooding - Superficial Deposits Flooding The site comprises greenfield to the west of Northleach on the other side of the A429 to the main settlement. It lies within a sensitive location in the Cotswolds National Landscape. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'High' landscape sensitivity. Development of the site may result in loss of best and most versatile agricultural land. The site is on a gentle hill sloping up to the south. There is a small existing agricultural access onto the site from the northeast. This is likely suitable for intensification subject to upgrades. Further transport assessment is required to ensure this is suitable. A previous application for up to 9 dwellings was refused (ref:16/04340/OUT) and an appeal was dismissed, mainly due to harmful impact on the National Landscape. The site is unsuitable for development due to landscape sensitivity and due to extension of development beyond the A429.	Potentially available	Site is submitted by the landowner through Call for Sites 2015. Availability has not been confirmed since	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Not Deliverable / Developable	0

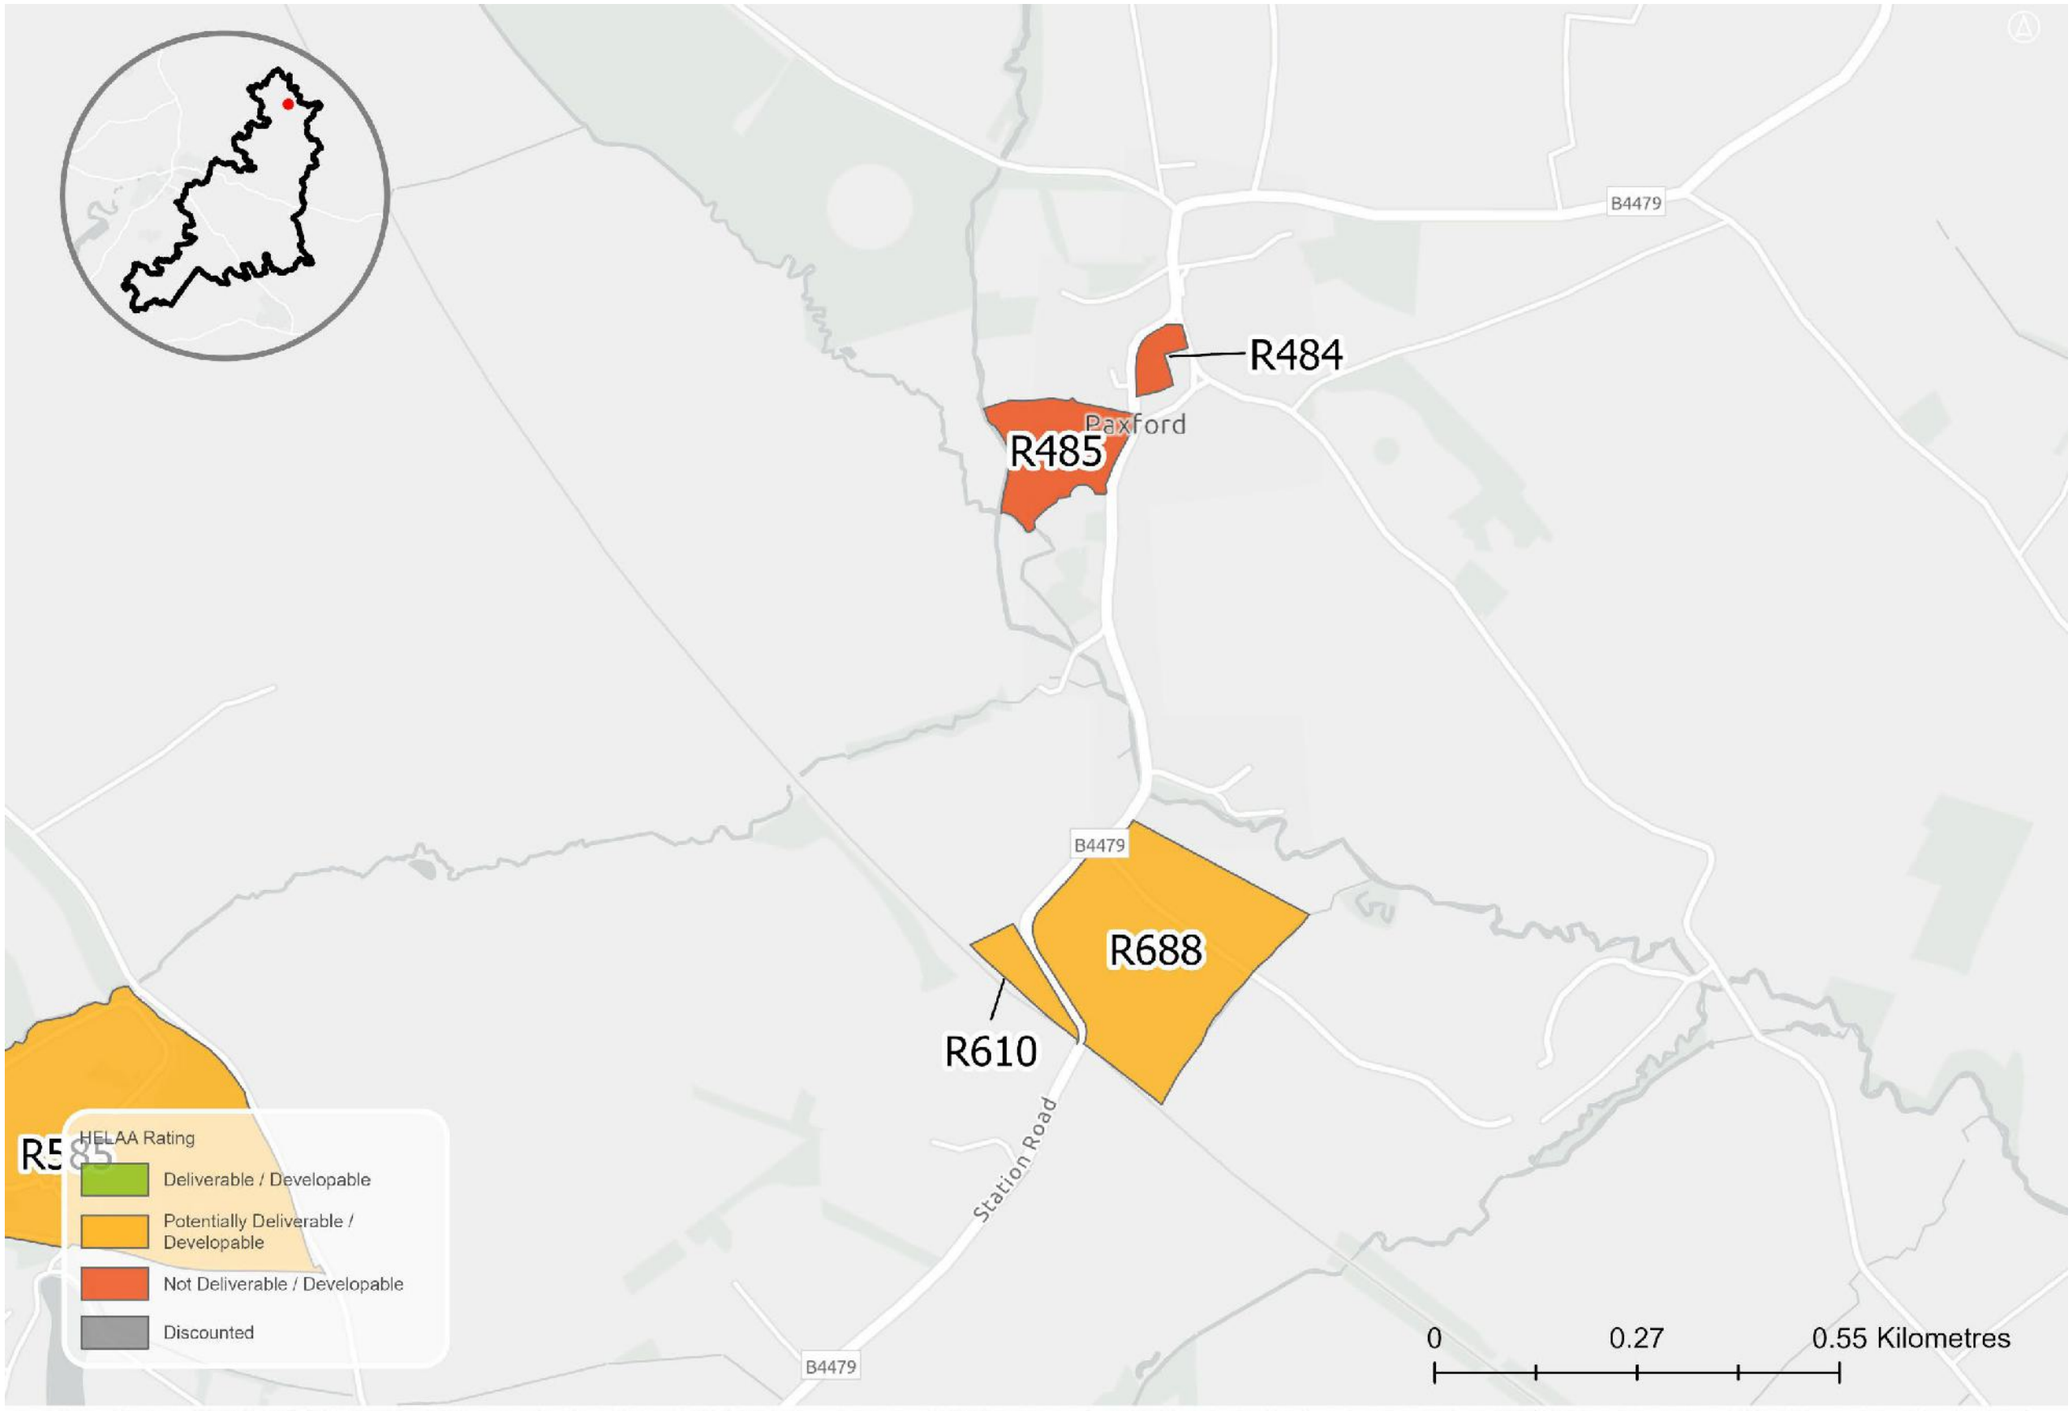
N21	East of Northleach	Northleach	5.07	Greenfield		Unsuitable	Site is wholly within / contains: • Cotswolds National Landscape • Grade 3 Agricultural Land • Airfield Safeguard Area - Little Rissington • Areas Susceptible to Groundwater Flooding - Clearwater and Superficial Deposits Flooding The site comprises greenfield to the east of Northleach. It lies within a sensitive location in the Cotswolds National Landscape. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'High' landscape sensitivity. Development of the site may result in loss of best and most versatile agricultural land. The site is on a gentle hill sloping up to the north and it has a low level of existing screening. There is no existing vehicular access onto the site, though this could potentially be created from E end. Further transport assessment is required to ensure this is suitable. Development of the site in isolation would result in isolated development separated from the main settlement. The site is unsuitable for development due to landscape sensitivity.	Unavailable	Site owned by the Farmington Trust and was submitted in its own right some time ago. Not included in the most recent Call for Sites submission of land available around Northleach.	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Not Deliverable / Developable	0	



HELAA Reference	Site Address	Settlement	Site Area (Ha)	Site Type (Brownfield / Greenfield / Mix)	Proposed Land Use	Suitable	Site Commentary: suitability	Available	Site Commentary: availability	Achievable	Site Commentary: achievability	Rating	Residential capacity (dwellings)	Employment capacity (sqm)
N23	Land to East of Farmington Road	Northleach	9.86	Greenfield	Housing / employment	Unsuitable	Site is wholly within / contains: • Cotswolds National Landscape • Grade 3 Agricultural Land • Airfield Safeguard Area - Little Rissington • Areas Susceptible to Groundwater Flooding - Clearwater and Superficial Deposits Flooding The site comprises greenfield to the north of Northleach. It lies within a sensitive location in the Cotswolds National Landscape. It is assessed in the Study of Land Surrounding Key Settlements (2026) to have 'High' landscape sensitivity. Development of the site may result in loss of best and most versatile agricultural land. A Public Right of Way runs through the northwest part of the site. The site is on a gentle hill above Northleach. There is no existing vehicular access onto the site. It is unlikely that a suitable access could be created from Farmington Road given its width. Further transport assessment is required to determine whether a suitable access could be created. The site is unsuitable for development due to landscape sensitivity and lack of potentially suitable access.	Available	Site is submitted by the landowner through recent Call for Sites (2025) and actively promoted for development	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Not Deliverable / Developable	0

HELAA Reference	Site Address	Settlement	Site Area (Ha)	Site Type (Brownfield / Greenfield / Mix)	Proposed Land Use	Suitable	Site Commentary: suitability	Available	Site Commentary: availability	Achievable	Site Commentary: achievability	Rating	Residential capacity (dwellings)	Employment capacity (sqm)
R547	Land to the west of Arlington Drive	Somerford Keynes	0.86	Greenfield	Housing	Unsuitable	Site is wholly within / contains: - Grade 2 Agricultural Land - Airfield Safeguard Area - Fairford - Airfield Safeguard Area - Kemble - Areas Susceptible to Groundwater Flooding - Superficial Deposits Flooding Site is partly within / contains: - Flood Zone 2 (15.98%) - Flood Zone 3 (18.37%) - No main habitat but additional habitats present (98%) - Coastal and floodplain grazing marsh (2%) The site is a greenfield site to the west of Somerford Keynes. Development of the site may result in loss of best and most versatile agricultural land. The site is within the setting of the Conservation Area, and any heritage impacts would need to be mitigated. The southern part of the site lies in Flood Zone 2 and Flood Zone 3 and would require some flood mitigation measures. There is no existing access onto the site from public highways, but this could potentially be created from the southeast or northeast. Further investigation is required to determine whether a suitable access can be developed. The site has a majority overlap with priority habitat. Developent of the site would be detrimental to this habitat. The site is unsuitable for development due to majority overlap with priority habitat.	Potentially available	Site is submitted through the Call for Sites 2019. Availability has not been confirmed since	Achievable	Site is a viable residential typology constituting greenfield development in a high price point area.	Not Deliverable / Developable	0

Appendix 3: Schedule of Actions Required to Overcome Common Constraints

Constraint	Actions required to overcome constraints
Flood Zone 2 or 3a	The site will be required to undergo the Sequential Test and the Exception Test in line with paragraphs 172 to 179 of the NPPF.
Source Protection Zone	Consult with the Environment Agency to ensure that the proposed development will not cause any contamination to groundwater.
Waste water treatment facility buffer zone	The developer will need to consult the local sewerage undertaker (e.g. Thames Water, Severn Trent or Wessex Water) to establish whether the proposed development is affected by the Odour Consultation Zone of the sewage treatment facility.
Noise or odour issue	An odour or noise impact assessment may be required, which will require further investigation and could require an Odour or Noise Impact Assessment.
Potential wastewater treatment infrastructure capacity issues	Developers may be required to demonstrate that there is adequate sewerage infrastructure capacity both on and off the site to serve the development and that it would not lead to problems for existing or new users. In some circumstances it may be necessary for developers to fund studies to ascertain whether the proposed development will lead to overloading of existing sewerage infrastructure. Developers are advised to consult their local sewerage undertaker from the outset of their development designs.
Filled quarry or landfill buffer zone or any potential contamination issues	A 'Phase 1 Study' (desktop study and site reconnaissance) should be submitted with a planning application. Depending on the findings of the Phase 1 Study, there may be a need for a more intrusive 'Phase 2 Study'.
Best and most versatile agricultural land: Land in grades 1, 2 and 3a of the Agricultural Land Classification.	NPPF paragraph 187 states that Planning policies should enhance the natural environment " . . . including the economic and other benefits of the best and most versatile agricultural land . . .". Footnote 65 states "where significant development of agricultural land is demonstrated to be necessary, areas of poorer quality land should be preferred to those of higher quality.". DEFRA provides information on land use classification. For some sites, detailed survey work

Constraint	Actions required to overcome constraints
	has been undertaken that marks out the exact areas of best and most versatile agricultural land. For sites in active or non-active agricultural use where a detailed survey of best and most versatile agricultural land has not been carried out, a ground survey will be required to establish whether the land is best and most versatile agricultural land.
Heritage assets and their setting including Scheduled Monuments, Listed Buildings, Registered Parks and Gardens, Registered Battlefields, Conservation Areas and non-designated heritage assets.	Liaise with Cotswold District Council Natural, Built and Historic Environment Team and Gloucestershire County Council Heritage Gateway to determine the evidence/assessment required to inform key design principles and ensure the conservation (protection and enhancement) of affected heritage assets and their setting. There may also be a requirement to liaise with Historic England. Within Scheduled Monuments there is a presumption that development that further damages archaeological deposits would not be appropriate.
Archaeology issues	Assessment and evaluation may be required prior to the determination of any planning application (where this has not already been carried out), to include an assessment of the impact of the development on the significance of any heritage assets and their settings. Contact Gloucestershire County Council for details of their Historic Environment Record.
Habitats Regulations Assessment Screening	In line with the precautionary approach applied by the Habitats Regulations Assessment Screening Report, several settlements have been identified where development could have an impact on European designated wildlife sites. Until significant effects can be ruled out, any development within the following settlements must undergo Habitats Regulations Assessment Screening: Andoversford; Blockley; Cirencester; Fairford; Kemble; Lechlade-on-Thames; Mickleton; Siddington; South Cerney; Tetbury; and Willersey.
Ecology issues	Ecological assessment required
Consultation Zone for an Airport	Consult the Civil Aviation Authority at the earliest stage of the planning application process.

Constraint	Actions required to overcome constraints
Consultation Area for the Minerals Local Plan, the Gloucestershire Waste Local Plan and the emerging Minerals and Waste Development Scheme	Consult the Gloucestershire County Council Minerals and Waste Policy Team at the earliest stage of the planning application process.

SUMMARY

Oxford Archaeology was commissioned by Cotswold District Council to undertake Heritage Impact Assessments (HIAs) for 17 potential site allocations identified through the emerging Cotswold Local Plan process. The results of the HIAs will inform the site selection process and will form part of the Local Plan evidence base.

The assessments identified a varied pattern of heritage sensitivity across the district. The principal issues relate to the contribution made by undeveloped land to the rural setting of historic settlements, conservation areas, listed buildings and scheduled monuments, together with the potential loss of archaeological remains and historic landscape character. Many of the allocations are located on settlement edges where agricultural land contributes to historic settlement form, settlement separation and the appreciation of heritage assets.

Of the 17 sites assessed, five were assigned a high heritage constraint rating, eleven a moderate heritage constraint rating, and one a lower heritage constraint rating. Constraint ratings reflect the significance of affected heritage assets, the contribution made by the site to that significance, the likely scale of impact and the potential for reducing impacts through design or archaeological investigation.

The HIAs also considered the potential for cumulative effects arising from multiple allocations. Cumulative effects were identified in several locations, most notably around Preston and Cirencester, where allocations C164A and R519/650 have the potential to affect the setting of Preston Conservation Area, the scheduled Roman town of Corinium and intervening rural landscapes. Additional cumulative effects were identified at Stow-on-the-Wold.

1 INTRODUCTION

1.1 Background

1.1.1 Oxford Archaeology was commissioned by Cotswold District Council to undertake Heritage Impact Assessments (HIAs) for proposed site allocations identified through the emerging Local Plan process.

1.1.2 Cotswold District contains a highly sensitive historic environment with a dense concentration of designated and non-designated heritage assets, including historic landscapes and archaeological remains. Many of the potential site allocations are situated on the edge of existing settlements or within landscapes that contribute strongly to heritage significance.

1.1.3 National Planning Policy Framework (NPPF) sets out a requirement for Local Plans to:

- Identify and assess the significance of heritage assets likely to be affected;
- Consider impacts on significance through changes to setting and from cumulative change, resulting from neighbouring proposals
- Set out a positive strategy for the conservation and enjoyment of the historic environment.

1.1.4 The purpose of the HIAs provided within this document is to identify heritage constraints and opportunities associated with each potential allocation site to inform decisions on whether the site is suitable for allocation within the emerging Local Plan.

1.1.5 The HIAs will form part of the evidence base for the Local Plan and will demonstrate that the plan has properly considered any heritage impacts arising from the allocations and taken appropriate steps to remove or reduce these impacts. Where appropriate the assessments will also highlight opportunities for the development to be informed by and draw positively on, the historic environment to shape the character of places and identify opportunities for new development to enhance or better reveal the significance of heritage assets and their settings.

1.2 Scope of Work

1.2.1 A total of 17 potential site allocations have been considered as part of this assessment. These sites include a combination of large scale allocation sites and smaller scale allocations set within, or on the periphery of existing settlements.

1.2.2 A summary of the original allocations as initially consulted upon is set out in Table 1.2 below.

Table 1.2: Summary of potential allocation sites

Reference	Name	Parish	Allocation Type	Number of Dwellings	Employment Area (ha)
R538B/C/D	Strategic site north of Ampney Crucis	Ampney Crucis	Residential	660	-

Reference	Name	Parish	Allocation Type	Number of Dwellings	Employment Area (ha)
B56	Land off Mallard Crescent	Bourton-on-the-Water	Residential	53	-
C190	Strategic extension to the south of The Steadings	Cirencester	Mixed use	1,540	2.1ha
C164A	Strategic extension to the east of Kingshill Lane	Cirencester	Mixed use	612	0.6ha
DA5-DA32	Strategic extension to the north, east and south of Down Ampney	Down Ampney	Residential	2,050	-
R644/657/658	New settlement to the south of Driffield	Driffield	Mixed use	2,565	13.5ha
F20A	Land south-east of Fairford	Fairford	Residential	109	-
F53A	Land at Totterdown Hill, Horcott	Fairford	Residential	150	-
K12	Land south-west of Kemble	Kemble	Mixed use	1,400	1.0ha
L19	Land south of Butler's Court	Lechlade	Residential	9	-
MK2B/C	Land north-east of Mickleton	Mickleton	Residential	40	-
M19C	Dunstall Farm, Fosseway	Moreton-in-Marsh	Residential	360	-
R519/650	Strategic extension to the south of Preston	Preston	Mixed use	1,085	6.7ha
R592	Land at Springfield Road	Quenington	Residential	31	-
SD17	Land east of Siddington Road and west of Bluebell Drive	Siddington	Residential	5	-
S55B	Remainder of site at Tall Trees, Oddington Road	Stow-on-the-Wold	Residential	15	-
S68	The Hollies	Stow-on-the-Wold	Residential	25	-

1.2.3 A site specific HIA has been prepared for each of the potential allocation sites (Appendix B).

2 POLICY AND GUIDANCE CONTEXT

2.1.1 This section provides a brief summary of the legislation, national planning policy and guidance used to inform this assessment.

2.2 Legislative context

Ancient Monuments and Archaeological Areas Act 1979

2.2.1 The Ancient Monuments and Archaeological Areas Act (1979) specifies that an archaeological site or historic building of national importance can be designated as a scheduled monument and registered with the Department of Culture, Media and Sport (DCMS). Under the terms of the act, any development that could affect the scheduled monument is subject to the granting of scheduled monument consent. Historic England provides advice to DCMS regarding individual applications for scheduled monument consent and also offers advice on the management of scheduled monuments.

Planning (Listed Buildings and Conservation Areas) Act 1990

2.2.2 The Planning (Listed Buildings and Conservation Areas) Act 1990 provides special controls in respect of listed buildings (buildings that are seen to be of special architectural or historic interest) and conservation areas (areas of special architectural or historic interest the character or appearance of which it is desirable to preserve or enhance).

2.2.3 Local authorities have a statutory duty under the provisions of sections 16, 66 (1) and 72 (1) of the Planning (Listed Buildings and Conservation Areas) Act 1990, when exercising any of their planning powers, to have 'special regard' to certain matters.

2.2.4 Section 66 (1) of the above act sets out the general duty of local planning authority in respect of exercising planning functions in respect of listed buildings:

'In considering whether to grant planning permission for development which affects a listed building or its setting, the local planning authority shall have special regard to the desirability of preserving the building or its setting or any feature of special architectural interest or historic interest which it possesses.'

2.2.5 When a local planning authority exercises planning functions in a conservation area, Section 72 (1) of the above act states:

'In the exercise, with respect to any buildings or other land in a conservation area, of any powers under any of the provisions mentioned in subsection (2), special attention shall be paid to the desirability of preserving or enhancing the character or appearance of that area.'

2.2.6 Section 74 of the 1990 act also specifically refers to the control of demolition in conservation areas.

Historic England Register of Parks and Gardens in England

2.2.7 The Register of Parks and Gardens of Special Historic Interest in England is maintained by Historic England (formerly English Heritage) and divides the site into three grades, similar to those used for listed buildings:

- Grade I: sites of exceptional interest;
- Grade II*: particularly important sites of more than special interest; and
- Grade II: sites of special interest warranting every effort to preserve them.

2.3 National Planning Policy

National Planning Policy Framework

2.3.1 The National Planning Policy Framework (NPPF) provides the overarching policy framework for assessing heritage impacts as part of the site allocation process. NPPF identifies protection and enhancement of the historic environment as a component of sustainable development (paragraph 8(c)), requires strategic policies to make sufficient provision for the conservation and enhancement of the historic environment (paragraph 20(d)), and requires Local Plan policies to be supported by relevant, proportionate and up-to-date evidence (paragraph 32).

2.3.2 NPPF also requires plans to be informed by sustainability appraisal and consideration of reasonable alternatives (paragraph 34), with these matters forming part of the test of whether a plan is justified and therefore sound (paragraph 36(b)).

2.3.3 Further relevant policies require development to respond positively to local character, history and landscape setting (paragraph 135(c)) and recognise the importance of preserving the setting and special character of historic towns (paragraph 143(d)).

2.3.4 Section 16 of the National Planning Policy Framework (NPPF) sets out the Government's approach to conserving heritage assets in a manner appropriate to their significance and provides the policy basis for assessing potential effects on designated and non-designated heritage assets.

2.3.5 Paragraph 203 states:

'Plans should set out a positive strategy for the conservation and enjoyment of the historic environment'

2.3.6 Paragraph 207 states:

'*In determining applications, local planning authorities should require an applicant to describe the significance of any heritage assets affected, including any contribution made by their setting. The level of detail should be proportionate to the assets' importance and no more than is sufficient to understand the potential impact of the proposal on their significance. As a minimum the relevant historic environment record should have been consulted and the heritage assets assessed using appropriate expertise where necessary. Where a site on which development is proposed includes, or has the potential to include, heritage assets with archaeological interest,*

local planning authorities should require developers to submit an appropriate desk-based assessment and, where necessary, a field evaluation.'

2.3.7 Paragraph 208 states:

'Local planning authorities should identify and assess the particular significance of any heritage asset that may be affected by a proposal (including by development affecting the setting of a heritage asset) taking account of the available evidence and any necessary expertise. They should take this into account when considering the impact of a proposal on a heritage asset, to avoid or minimise any conflict between the heritage asset's conservation and any aspect of the proposal.'

2.3.8 Paragraph 212 states:

'When considering the impact of a proposed development on the significance of a designated heritage asset, great weight should be given to the asset's conservation (and the more important the asset, the greater the weight should be). This is irrespective of whether any potential harm amounts to substantial harm, total loss or less than substantial harm to its significance.'

2.3.9 Paragraph 213 states:

'Any harm to, or loss of, the significance of a designated heritage asset (from its alteration or destruction, or from development within its setting), should require clear and convincing justification. Substantial harm to or loss of:

a) grade II listed buildings, or grade II registered parks or gardens, should be exceptional;

b) assets of the highest significance, notably scheduled monuments, protected wreck sites, registered battlefields, grade I and II listed buildings, grade I and II* registered parks and gardens, and World Heritage Sites, should be wholly exceptional*

(non-designated heritage assets of archaeological interest, which are demonstrably of equivalent significance to scheduled monuments, should be considered subject to the policies for designated heritage assets).'

2.3.10 Paragraph 214 states:

'Where a proposed development will lead to substantial harm to (or total loss of significance of) a designated heritage asset, local planning authorities should refuse consent, unless it can be demonstrated that the substantial harm or total loss is necessary to achieve substantial public benefits that outweigh that harm or loss, or all of the following apply:

a) the nature of the heritage asset prevents all reasonable uses of the site; and

b) no viable use of the heritage asset itself can be found in the medium term through appropriate marketing that will enable its conservation; and

c) conservation by grant-funding or some form of not for profit, charitable or public ownership is demonstrably not possible; and

d) the harm or loss is outweighed by the benefit of bringing the site back into use.'

2.3.11 Paragraph 215 states:

'Where a development proposal will lead to less than substantial harm to the significance of a designated heritage asset, this harm should be weighed against the public benefits of the proposal including, where appropriate, securing its optimum viable use.'

2.3.12 Paragraph 216 states:

'The effect of an application on the significance of a non-designated heritage asset should be taken into account in determining the application. In weighing applications that directly or indirectly affect non-designated heritage assets, a balanced judgement will be required having regard to the scale of any harm or loss and the significance of the heritage asset.'

2.3.13 Paragraph 218 states:

'Local planning authorities should require developers to record and advance understanding of the significance of any heritage assets to be lost (wholly or in part) in a manner proportionate to their importance and the impact, and to make this evidence (and any archive generated) publicly accessible

(Copies of evidence should be deposited with the relevant historic environment record, and any archives with a local museum or other public depository).

However, the ability to record evidence of our past should not be a factor in deciding whether such loss should be permitted.'

2.3.14 Paragraph 219 states:

'Local planning authorities should look for opportunities for new development within Conservation Areas and World Heritage Sites, and within the setting of heritage assets, to enhance or better reveal their significance.'

2.3.15 Paragraph 220 states:

'Not all elements of a Conservation Area or World Heritage Site will necessarily contribute to its significance. Loss of a building (or other element) which makes a positive contribution to the significance of the Conservation Area or World Heritage Site should be treated either as substantial harm under paragraph 214 or less than substantial harm under paragraph 215, as appropriate, taking into account the relative significance of the element affected and its contribution to the significance of the Conservation Area or World Heritage Site as a whole.'

2.4 Historic England Guidance

2.4.1 To ensure the assessment is comprehensive and carried out in line with best practice guidance the methodology has been prepared in accordance with key guidelines for assessing significance and managing change in historically sensitive places. Key guidelines include:

- Historic England's Good Practice Advice in Planning 1-3 (2015a, 2015b, 2017)
- Historic England's Advice Note 3 *The Historic Environment and Site Allocations in Local Plans* (2015c)
- Historic England's, *Conservation Principles* (2008)
- Historic England's Advice Note 12 *Statements of Heritage Significance* (2019)
- Planning Practice Guidance: Historic Environment – Published by Ministry of Housing, Communities & Local Government (updated 2019)

3 METHODOLOGY

3.1 Introduction

3.1.1 The methodology for the HIAs was developed in accordance with National Planning Policy Framework and Guidance (NPPF and PPG) and follows the staged approach outlined in:

- Historic England Advice Note 3 *The Historic Environment and Site Allocations in Local Plans*' (Historic England 2015)
- Historic England Good Practice in Planning Advice Note 1 (GPA 1) *The Historic Environment and Local Plans* (Historic England 2015).

3.1.2 The HIAs for the individual site allocations will focus on the identification and consideration of designated and non-designated heritage assets that may be affected by the proposed allocations, either directly or through changes to their setting. Consideration has also been given to historic landscape character, and relationships between heritage assets and their wider landscape context. The HIAs are not intended to replace application stage heritage statements or detailed archaeological desk-based assessments.

3.1.3 Archaeological considerations have been informed by a review of Gloucestershire Historic Environment Record data and comments provided by Gloucestershire County Archaeologist. Where known archaeological assets or areas of archaeological interest have been identified within an allocation site, these have been noted within the HIA and, where appropriate, recommendations have been made regarding the potential need for further archaeological assessment or investigation. The individual HIAs have not sought to provide a detailed assessment of archaeological potential or identify previously unrecorded archaeological remains through specialist techniques such as detailed aerial photographic analysis, LiDAR interpretation, geophysical survey or field investigation. Such matters would be addressed through site-specific assessment and investigation carried out as part of the planning application process.

3.2 Step 1: Identification of affected heritage assets and assessment of potential for previously unidentified archaeological remains

A desk-based review of the following sources was carried out to inform the HIAs:

- The National Heritage List for England for information on designated heritage assets

- The Gloucestershire Historic Environment Record (GHER) for non-designated heritage assets.
- Gloucestershire Historic Landscape Character Assessment (GHLCA).
- Relevant Conservation Area Appraisals. Management Plans and Neighbourhood Plan documents.
- Local list data as held by Cotswold District Council and Gloucestershire County Council.
- National and Local 'Heritage at Risk' data sets; and
- Historic Ordnance Survey (OS) maps as held by an online repository.
- Various online sources

3.2.1 These sources were collected for a 1km study area surrounding each of the proposed allocation sites.

3.2.2 This information was used to identify heritage assets within the site and its environs which could be affected by the proposed site allocation either directly or through changes to its setting, character or views.

Site Visits

3.2.3 Following the data collection stage of the project a rapid site visit was carried out to establish intervisibility between the site and heritage assets within the surrounding study area. This was carried out from public rights of way and publicly accessible areas. The visits were used to scope in/out heritage assets which may be affected by the allocation.

3.3 Step 2: Understand what contribution the site (in its current form) makes to the significance of identified heritage assets

3.3.1 The significance of known heritage assets which could be affected by the potential site allocations have been described in accordance with NPPF and Historic England Advice Note 12 *Statements of Heritage Significance: Analysing Significance in Heritage Assets* (Historic England 2019).

3.3.2 The significance of heritage assets is defined in terms of their value to this and future generations as a result of their heritage interests. Heritage interest is derived from both the heritage asset itself and its setting. In accordance with NPPF this interest may be archaeological, architectural, artistic, or historic.

3.3.3 For each asset scoped into the assessment the HIAs have described the heritage interests of the asset and the contribution that the site makes to these interests (or the ability to appreciate these interests) using the information collected in Step 1.

3.3.4 Once the heritage interests of the asset have been identified it will be allocated an overall heritage rating using the criteria outlined in the table below:

Significance	Criteria (Significance)
Very High	World Heritage Sites and the individual attributes that convey their outstanding Universal Value, or non-designated heritage assets of demonstrable international heritage interest
High	Scheduled monuments, listed buildings (Grade I, II*, II), conservation areas, registered parks and gardens (Grade I, II*, II), registered

	battlefields, protected wreck site, or non-designated heritage assets of demonstrable national importance due to their heritage interest.
Medium	Locally listed buildings, landscapes or non-designated heritage assets of demonstrable regional importance due to their heritage interest
Low	Non-designated heritage assets or landscapes of demonstrably limited heritage interest.
Negligible	Non-designated heritage asset of limited heritage interest.
Unknown	The significance of the heritage asset cannot be ascertained from available evidence.

3.3.5 The setting of the heritage assets was assessed in accordance with Historic England's *The Setting of Heritage Assets* (2nd edition).

3.3.6 Elements of a heritage asset's setting may make a positive or negative contribution to the significance of an asset, may affect the ability to appreciate that significance or may be neutral. The criteria used to grade the contribution that an area makes to the setting and significance of a heritage asset is outlined in the table below:

Contribution	Criteria (Contribution)
High Positive	The area/allocation makes an important contribution to one (or more) of the key heritage interests of the heritage assets and accordingly makes a strong positive contribution to its significance.
Low Positive	The area/allocation makes a limited contribution to one (or more) of the key heritage interests of the heritage asset and accordingly makes a positive contribution to its significance
Neutral	The area/allocation in its current form makes no contribution to the understanding or appreciation of the heritage interests of a heritage asset
Negative	The area/allocation detracts from the understanding or appreciation of the heritage interests of a heritage asset

3.4 Step 3: Impact Assessment

3.4.1 An impact assessment has been produced for each of the proposed allocations. This describes:

i. The potential impact of the proposed allocation on the character, condition and setting of known designated heritage assets
ii. The potential impact of the proposed allocation on known non-designated heritage assets.
iii. The potential impact of the proposed allocation upon the historic landscape character of the site and its environs; and

3.4.2 The impact assessment identifies direct and indirect (setting impacts) arising from the scale and location of the development, settlement edge expansion and changes to the historic landscape character as well as effects on views on the approach into settlement (where such views contribute to heritage significance). It also identifies any cumulative effects resulting effects from other allocations.

3.4.3 The scale of the impact upon identified assets has been described as either: no harm; less than substantial harm, potential for substantial harm, or potential enhancement of significance.

3.5 Step 4: Maximising enhancement and avoiding harm

3.5.1 In accordance with Step 4 of Historic England Advice Note 3 The Historic Environment and Site allocations in Local Plans (Historic England 2015) the final stage of the HIAs is the identification of measures that will maximise enhancement and minimise the harm resulting from the allocation of the site. A suite of recommendations have been made for each allocation to remove or reduce the level of harm identified.

3.5.2 These measures include identification of parts of the allocation that should not be developed or should be put to a particular use (i.e. green infrastructure); areas where buffers or landscape treatments could be used to minimise harm or protect the setting and /or significance of assets; areas where height, density or layout should be subject to design controls and key views and spatial relationships between heritage assets that should be retained.

3.5.3 Where possible opportunities for heritage enhancements, heritage-led placemaking or to better reveal the significance of heritage assets have also been identified.

3.6 Conclusions and suitability

3.6.1 Each HIA contains a conclusion and suitability section which summarises the key heritage sensitivities and the nature and scale of likely impacts.

3.6.2 In line with NPPF, the overall effect of the proposed allocation (or the degree of harm caused by the allocation) has been assessed with reference to the significance of known heritage assets and the potential impacts resulting from the allocation. Based upon this assessment each site has been allocated a heritage constraint rating based upon the criteria provided in the table below.

Heritage Constraint Rating	Criteria
High	The allocation site contains known historic environment constraints that are of high or very high heritage significance. The presence of such assets would prevent a considerable proportion or all of the site from being developed.
Moderate	The site contains historic environment constraints that are of medium or low significance. The site is suitable for development subject to recommended mitigation or design controls.
Lower	The allocation site contains heritage assets of negligible significance. Or

	The allocation contains no heritage constraints

4 SUMMARY OF FINDINGS

4.1.1 A total of 17 potential allocation sites were assessed. Individual HIAs have been produced for each allocation and are provided in Appendix B. The results of the HIAs are summarised below.

Table 4.1: Summary of HIAs

Site	Name	Principal Sensitivities	Potential Impact	Recommendations to reduce harm and maximise enhancement	Heritage Constraint Rating
R538B/C/D (no longer proposed for allocation)	Strategic site north of Ampney Crucis	Ampney Crucis and Ampney St Mary Conservation Areas; listed buildings at Hilcote End and Dudley Farm; archaeology and historic landscape character.	Potential erosion of rural setting, settlement form and separation, with loss of archaeological remains and historic landscape character.	Reduce development scale and avoid the most sensitive eastern/south-eastern areas; retain green buffers, corridors, boundary planting and PROWs; use lower-density, locally responsive design; undertake archaeological evaluation and agree mitigation, with interpretation where appropriate.	High
B56	Land off Mallard Crescent	Archaeological remains	Loss of potential archaeological remains, areas of ridge and furrow and historic landscape character.	Undertake archaeological evaluation and agree mitigation, with interpretation where appropriate.	Lower
C190	Strategic extension to the south of The Steadings	Scheduled settlement south-east of Chesterton Farm; listed buildings at the Royal Agricultural	Potential truncation of the scheduled monument and associated remains, with adverse effects	Retain the Scheduled Monument as open space with appropriate landscape buffers; avoid sensitive site edges and focus development in less sensitive central areas; retain historic routes,	High

R644/657/658	New settlement to the south of Driffield	Driffield Conservation Area; listed buildings at Fosse Farm; archaeology and historic landscape character.	Loss of rural setting, archaeological remains and historic landscape character.	Retain undeveloped buffers and existing boundaries around sensitive heritage assets; preserve rights of way within green corridors and maintain key views; retain existing vegetation and woodland screening; maintain areas of open land around heritage assets; undertake archaeological assessment, evaluation and agreed mitigation prior to development.	Moderate
F20A	Land south-east of Fairford	Fairford Conservation Area; adjacent listed buildings Moor Farmhouse and Morgan Hall; and archaeology.	Loss of rural character, views and setting of the conservation area and nearby listed buildings, with loss of archaeological remains and historic landscape character.	Retain the western part of the site as open space; focus low-density development within the less sensitive eastern area; retain existing boundary planting and key views; use locally responsive vernacular design and materials; limit building heights; and undertake archaeological evaluation with agreed mitigation prior to development.	High

Site	Name	Principal Sensitivities	Potential Impact	Recommendations to reduce harm and maximise enhancement	Heritage Constraint Rating
F53A	Land at Totterdown Hill, Horcott	Listed buildings in Horcott comprising Bailiffs Cottage, Horcott House and Horcott Farmhouse; and archaeology.	Loss of rural setting of listed buildings, increased settlement coalescence with RAF Fairford, and loss of archaeological remains and historic landscape character.	Retain the north-eastern part of the site as green space; set development back from the northern boundary; retain existing hedgerows, trees and field boundary alignments; restrict building heights and use locally responsive vernacular design; and undertake archaeological survey, evaluation and agreed mitigation prior to development.	Moderate
K12	Land south-west of Kemble	Kemble Conservation Area; listed buildings including Church of All Saints, Kemble House and Home Farm; archaeology and historic landscape character.	Loss of rural setting of the conservation area and listed buildings, with loss of archaeological remains and historic landscape character.	Retain and enhance boundary vegetation; provide an undeveloped north-eastern buffer covering the area recommended for conservation area inclusion and key views; and undertake archaeological assessment, evaluation and agreed mitigation prior to development.	Moderate
L19	Land south of Butler's Court	Lechlade-on-Thames Conservation Area; listed buildings at Butler's Court and Green Farm; scheduled multi-period settlement; and archaeology.	Loss of rural setting, historic approach views and wider setting of Butler's Court. Loss of archaeological remains and historic landscape character.	Retain a grassland buffer along the A417; utilise a loose, spacious settlement pattern in the layout; retain and enhance existing hedgerows and boundary planting; use locally responsive vernacular design, materials and building heights; and implement any required archaeological mitigation and recording.	Moderate

Site	Name	Principal Sensitivities	Potential Impact	Recommendations to reduce harm and maximise enhancement	Heritage Constraint Rating
MK2B/C	Land north-east of Mickleton	Scheduled Meon Hill; and archaeology.	Introduction of development into views from scheduled monument; loss of views of scheduled monument from within site; and loss of archaeological remains and historic landscape character.	Undertake targeted archaeological evaluation with agreed mitigation prior to development; retain and enhance existing boundary vegetation; preserve open green space alongside the existing trackway; retain views of Meon Hill from public rights of way; and use locally responsive vernacular design and materials.	Moderate
M19C	Dunstall Farm, Fosseway	Listed Church of St David and Batsford Park; archaeology and historic landscape character.	Limited change to view from Batsford Park; loss of view from PROW looking towards the Church of St David; loss of archaeological remains and historic landscape character.	Undertake targeted archaeological evaluation with agreed mitigation; retain and enhance boundary vegetation; and retain long-distance views of the Church of St David from historic public rights of way.	Moderate
R519/650	Strategic extension to the south of Preston	Preston Conservation Area; listed buildings within Preston Conservation Area; scheduled Roman town of Corinium; listed buildings at Siddington House and	Loss of rural setting and settlement separation. Loss of archaeological remains, potentially associated with Corinium, and historic landscape character.	Retain green space buffer along the north-western edge of the site; focus development within the less sensitive central and southern areas; reduce development density towards site edges; retain and enhance existing planting, hedgerows, field boundaries, parish boundaries and historic routes; preserve	Moderate

5 STRATEGIC OVERVIEW

5.1 Strategic Heritage Context

5.1.1 The HIAs for the proposed site allocations demonstrate that the proposed allocations interact with the historic environment in a range of ways. While some sites have limited heritage sensitivities, others have the potential to affect designated and non-designated heritage assets through changes to setting, direct impacts on archaeological remains, or alteration of historic landscape character.

5.1.2 The main issue to arise from the HIAs is that the undeveloped agricultural land surrounding many of the settlements in the district plays a role in preserving historic settlement form, and allows settlements to be appreciated as distinct rural communities. Many of the impacts identified within the HIAs, would arise from the loss of connection between the settlements and/or their rural setting and settlement coalescence. Where appropriate, policy wording, should seek to ensure that this connection is preserved within any new development.

5.1.3 Allocations with a 'high' heritage constraint level have the potential to cause harm to the setting of designated heritage assets (e.g. conservation areas, listed buildings, registered parks and gardens or scheduled monuments) and/or could result in direct impact upon these assets as is the case in C190. While allocations with 'moderate' heritage constraints level may also affect the setting of designated heritage assets, this effect is likely to be lesser and could be reduced or removed through appropriate mitigation measures. Allocations with 'lower' heritage constraint levels, such as B56, are unlikely to significantly change the setting of designated heritage assets but may require further archaeological evaluation and recording.

5.1.4 The scale of the allocation alone does not determine its heritage constraint level. Some larger allocations have been allocated a 'moderate' heritage constraint, where design mitigation could help to manage impacts (i.e. DA5-DA32, R644/657/658, K12, C164A, R519/650), while some smaller allocations are considered to have a 'high' heritage constraint because of their relationship with nearby heritage assets (F20A, R592, S55B).

5.2 Recurring Heritage Sensitivities

5.2.1 The HIAs have identified a number of recurring heritage sensitivities, resulting from loss of rural land. This is most apparent where proposed allocations contribute to the setting of historic settlements, conservation areas, listed buildings or scheduled monuments. This occurs mostly on settlement edges where new development can affect, views on the approach into settlements, historic plan form, and in areas where the relationship between built form and historically associated agricultural land remains legible.

5.2.2 A second recurring issue is the effect of larger allocations on historic landscape character. Large sites such as DA5–DA32, C164A, C190, R644/657/658, K12, R519/650, R538 and M19C have the potential to result in

loss of historic field boundaries and enclosure patterns and ridge and furrow earthworks and would result in the introduction of large areas of development into formerly agricultural landscapes. This would result in the loss of low/locally significant historic landscape character types. Across these sites, the HIAs emphasise the importance of, where possible, retaining undeveloped margins, existing field boundaries, green corridors, historic routes and using lower-density or locally responsive design at sensitive edges.

5.2.3 Archaeological sensitivity is present across many of the allocations, although it varies in degree. C190 is the most archaeologically sensitive site, containing a scheduled monument, while other allocations have the potential to contain assets which would contribute to the setting of nearby scheduled monuments (C164A, R519/650, L19). Common recommendations for managing archaeological sensitivity are preserving nationally significant remains such as scheduled monuments in situ and protecting significant settings or views using open space and buffers.

5.2.4 Other allocations such as DA5-DA32 are known to contain non-designated archaeological remains and/or have the potential to contain previously unidentified remains. The majority of the allocations will require early archaeological assessment and targeted evaluation, to be submitted alongside any planning application for the site. This information will be used to develop an appropriate archaeological mitigation strategy.

5.3 Cumulative Effects

5.3.1 The clearest cumulative effects arise around Preston and the southern edge of Cirencester. C164A and R519/650 would affect Preston Conservation Area and its rural setting from different directions, while also introducing change close to the scheduled Roman town of Corinium and nearby listed buildings. Individually, each allocation would affect settlement separation, rural setting and historic landscape character; together, they increase the risk of perceived coalescence between Preston and Cirencester. Green infrastructure, retained routes, boundary planting and green space buffers should be secured through allocation-specific policy wording.

5.3.2 A smaller-scale cumulative issue is evident at Stow-on-the-Wold, where S55B and S68 would both contribute to incremental change on the rural edge of Stow-on-the-Wold and Maugersbury Conservation Area. The principal concern is piecemeal erosion of settlement-edge character. Consistent requirements for setbacks, open buffers, retention of stone walls and planting, and locally responsive design would help manage these effects.

5.4 Issues Potentially Relevant at Examination

5.4.1 The principal issue likely to be relevant at Examination is whether the proposed mitigation measures are sufficient to reduce the heritage impacts of the allocations to an acceptable level. The Section 4 table demonstrates that ratings are based not only on development scale but on the significance of affected heritage assets, the contribution made by the site to that significance, the likely extent of harm, and the realistic scope for mitigation. Examination is therefore likely to focus on whether the identified design,

layout, landscape and archaeological measures are capable of avoiding or sufficiently reducing harm in practice, particularly for those allocations assessed as having a high heritage impact.

5.4.2 The approach taken to Ampney Crucis is likely to be relevant in this regard. As a result of the HIA findings, Ampney Crucis (R538B/C/D) is no longer proposed for allocation. This demonstrates that heritage considerations have directly informed the site selection process.

5.4.3 The high-rated allocations are likely to require the closest scrutiny. C190 raises particular issues because of the scheduled settlement south-east of Chesterton Farm and the need to avoid direct and indirect harm, which could be reduced through open-space retention, buffers and archaeological mitigation. At Quenington (R592), Fairford (F20A), and Stow (S55B) the close relationships between these allocations and the adjacent conservation areas and nearby listed buildings, raises questions as to whether the proposed mitigation measures would be sufficient to avoid substantial harm. While proposed landscape and design measures could reduce impacts, Examination may consider whether these effects can be fully mitigated.

5.4.4 The allocations around Preston and Cirencester (C164A and R519/650) while individually assessed as having a 'moderate' heritage constraint rating may present an issue as a result of their scale and their combined impact upon the Preston Conservation Area, historic settlement pattern and the rural setting of listed buildings. While mitigation for each site is proposed through landscape structure, retained open space, buffers and design controls, Examination may consider whether the cumulative impacts of both allocations on the setting of the conservation area can be satisfactorily mitigated.

5.4.5 A smaller cumulative issue arises at Stow-on-the-Wold, where S55B and S68 would contribute to incremental change on the rural edge of Stow-on-the-Wold and Maugersbury Conservation Area.

5.5 Conclusion

5.5.1 This report summarises the findings of 17 HIAs prepared for potential site allocations within the emerging Cotswold Local Plan. The sites assessed comprise a combination of large strategic residential and mixed-use allocations at Ampney Crucis, Cirencester, Down Ampney, Driffield, Kemble and Preston, together with a number of smaller residential allocations located on the edge of existing settlements including Bourton-on-the-Water, Fairford, Horcott, Lechlade, Mickleton, Moreton-in-Marsh, Quenington, Siddington and Stow-on-the-Wold.

5.5.2 The assessments demonstrate that heritage sensitivities are not evenly distributed across the proposed allocations. Key sensitivities across the allocations relate to the contribution made by undeveloped agricultural land to the setting of conservation areas, listed buildings and scheduled monuments; the preservation of historic settlement form and settlement separation; the retention of historic landscape character; and the presence of known or potential archaeological remains.

5.5.3 Of the 17 sites assessed, five allocations were assigned a high heritage constraint rating (R538B/C/D, C190, F20A, S55B and R592), eleven allocations were assigned a moderate heritage constraint rating, and one allocation (B56) was assigned a lower heritage constraint rating. Heritage constraint ratings are influenced by the significance of affected heritage assets, the contribution made by the site to that significance, the likely scale of impact and the potential for mitigation, rather than by development scale alone.

5.5.4 The assessments also identify cumulative effects arising from multiple allocations. Cumulative effects occur around Preston and the southern edge of Cirencester, where allocations C164A and R519/650 have the potential to affect Preston Conservation Area, the setting of the scheduled Roman town of Corinium, settlement separation and rural landscape character. Smaller-scale cumulative effects have been identified at Stow-on-the-Wold, where allocations S55B and S68 would contribute to incremental change along the settlement edge.

5.5.5 A number of the assessments identify opportunities for heritage-informed place-shaping. Across many of the allocations, recommendations have been made to draw upon the historic character of settlements through the use of locally distinctive layouts, building forms, materials and landscape features, helping new development respond positively to its historic context. The assessments also emphasise the retention of historic routes, field boundaries, vegetation and key views where these contribute to local character and sense of place. In some instances, additional opportunities have been identified, including the incorporation of archaeological interpretation within new development and, at C190, the retention of the scheduled monument within open space, helping to secure its long-term conservation as part of the wider development framework.

Oxford Archaeology Ltd is a
Private Limited Company, No: 1618597
and a Registered Charity, No: 285627

Site Reference	B56
Settlement	Bourton-on-the-Water
Location	Land off Mallard Crescent
Proposed allocation use	Residential development
Number of dwellings	53

Brief description of site:

The site is situated towards the north-eastern extent of the village of Bourton-on-the-Water, to the north-west of Moor Lane, and north-east and south-east of modern residential development on Heron Close, Kingfisher Road and Mallard Crescent (Fig. S60.1). The site encompasses an area of rough pasture of approximately 1.84ha, at an elevation of approximately 236m aOD.

The site is not crossed by public rights of way, and not highly visible from publicly accessible areas. It comprises a parcel of land, which appears to be pastoral, recently used by horses, and there are caravans and sheds at the south-eastern extent, and a shed at the south-west. Mature trees and hedgerows surround the site, giving it an enclosed character, though modern residences populate the areas to the south-west and north-west within a wider industrial area. The site is divided in two by a west-south-west/east-north-east orientated electric fence.

Topographically, the site is relatively level. Views from the site across the wider landscape are restricted by mature vegetation bounding the site, though modern housing is visible to the north-west.

Significance of designated heritage assets in the site:

There are no designated heritage assets in the site.

Significance of designated heritage assets in the environs of the site which could be affected by the allocation of the site:

Within a 1km radius of the site are two scheduled monuments, 88 listed buildings and one conservation area (Fig. S56.2). All are considered of **high significance**. The majority of the listed buildings are located within Bourton-on-the-Water Conservation Area (CONARA/139) designed to conserve and enhance the older parts of the village. The nearest designated heritage asset to the site is Salmonsbury Camp, a scheduled Iron Age fortified enclosure, approximately 130m to the south-east (1017340). This extends to the south side of Moor Lane, which is lined on both sides by mature trees. This, combined with residential developments to the south-west of the site, and the mature trees and hedgerows bounding the site itself, means that no designated

heritage assets are visible from the site and thus there is minimal likelihood that the allocation of the site would impact these.

Significance of non-designated heritage assets in the site:

There are no known non-designated heritage assets mapped within the site (Figs. S56.4, S56.5 and S56.6), though the edges of a large swathe of late medieval or post medieval ridge and furrow are mapped at the south-western and north-eastern extents of the site (Fig. S56.5). Owing to their evidential value, assets attesting to late medieval or post-medieval activity, particularly relating to agriculture, would be considered of **low significance**.

Significance of non-designated heritage assets in the environs of the site:

The HER records a total of 132 non-designated heritage assets within a 1km radius of the site (Figs. S56.4, S56.5 and S56.6), as well as, and sometimes including, features identified from previous archaeological investigations (Fig. S56.7), and/or from the National Mapping Programme (Fig. S56.8).

In the immediate vicinity of the site, these include, as well as the scheduled Iron Age fortified enclosure to the south-west of the site (1017340/ 342/ 34769) where Bronze Age activity has also been encountered (40038), and which was also used in the Roman period (2204), evidence for Mesolithic activity (49107), a Middle Bronze Age cemetery (43031) and prehistoric features (52390) identified during archaeological investigations ahead of the residential development to the north-west of the site (Fig. S56.7). Known prehistoric and Roman activity is also known from the wider area (Fig. S56.4).

Medieval activity is also known from the immediate vicinity, evidencing agricultural arable land use (513434; Fig. S56.5), also identified by the National Mapping Programme (Fig. S56.8). Geophysical survey to the north and west of the site revealed three undated archaeological anomalies (43032, 43033, and 43034; Fig. S56.6), and an undated field system has been identified to the east of the site, west of Moor Farm (40009; Fig. S56.6).

Owing to their evidential value, assets dating from the prehistoric to medieval periods are generally considered to be of **medium significance**, while any deposits/materials dating to post-medieval activity, particularly agricultural and quarrying, would be of comparatively **low significance**. Where HER records include designated heritage assets such as listed buildings, registered parks and gardens, or scheduled monuments, they are considered to be of **high significance**.

A number of non-designated heritage assets with upstanding remains within a 1km radius of the site have been identified within the Bourton-on-the-Water Conservation Area Statement, including buildings of special character, buildings under article 4(2) direction and important hedgerows (Fig. S56.3). None of these have the potential to be affected by the allocation of the site, due to topography, mature boundaries, and neighbouring built landscape. This is also applicable to areas identified as having landscape value, important/notable viewpoints, and important approaches (Fig. S56.3). These would all be considered of **medium/low significance**.

Historic landscape character of the site (and significance):

The site lies entirely within the Cotswolds National Landscape (CNL), designated as an Area of Natural Beauty (AONB) in 1966, in recognition of its rich, diverse and high-quality landscape. It is the third largest protected landscape in England, after the Lake District National Park and the Yorkshire Dales National Park. This encompasses a wide variety of landscapes, each displaying distinctive patterns of landform, vegetation and landscape elements, as mapped by Landscape Characterisation assessments. The Cotswolds AONB Partnership includes the site within 'Character Area 17: Pastoral Lowland Vale' (Cotswolds AONB Partnership 2016). Key characteristics of this landscape type have been identified as:

- extensive pastoral vale defined by the farmed slopes, with flat or gently undulating landform fringed by distinctive shallow slopes;
- generally human-scale intimate landscape, but with intermittent open expansive character and expansive views in some areas;
- extensive drifty deposits mask underlying solid geology;
- productive and verdant landscape;
- network hedgerows of varying height and quality with intermittent hedgerow trees and occasional stone walls;
- areas of wetland meadow and limited areas of species rich grassland bordering river channels;
- limited woodland cover including ancient woodland; and
- sparse settlement pattern.

The Gloucestershire Historic Landscape Characterisation (HLC; Gloucestershire County Council 2013) includes the site within the mapped extent of A2m (Fig. S56.9). A2 is defined as 'less irregular enclosure partly reflecting former unenclosed cultivation patterns'. This type is interpreted as enclosure of former un-enclosed cultivation. Although this may have been undertaken by local arrangement and exchange, the internal cohesion of the morphology of this type would suggest that enclosure was undertaken in a less piecemeal way. In

some areas, the enclosure may be medieval or early post-medieval in date, and therefore may be amongst the earliest surviving boundaries within the landscape. Despite the potential early origins, later medieval and post medieval historic landscape character is common in the wider area, and so is considered to be of **low significance**.

Contribution of the site to the significance and setting of known heritage assets:

The site comprises an enclosed area of rough pasture, the only views from which are of the modern residential development to the north-west. Historically it would have formed part of the wider agricultural landscape north-east of Bourton-on-the-Water, north of Moor Lane. The wider area, with the closure of the railway line to the north-west, has been developed as part of an industrial park, with more recent residential development to the immediate north-west and south-west of the site, eroding the agricultural rural character. In its present form, the site provides a **neutral contribution** (i.e. the site provides no contribution to an understanding or appreciation of the heritage interests of known heritage assets), even to the scheduled monument of Salmonsbury Camp (1017340), with which it shares no visual or associative link.

Impact assessment:

The site has been identified as providing at best a neutral contribution to the significance of known designated heritage assets, largely due to surrounding development and mature vegetation, and thus the level of impact of a development within the site is anticipated to result in **no harm**.

Although no known archaeological features are mapped within the site, investigations in adjacent areas, combined with the high number of known heritage assets in the wider area, particularly of the prehistoric and Roman periods, suggests that the potential for sub-surface archaeological remains could be high. Development within the site would have a **permanent negative impact** on any surviving archaeological remains resulting in **substantial harm** to these heritage assets. Without appropriate investigation and mitigation measures, any development that disturbs archaeological heritage assets is unlikely to satisfy relevant national and local planning policy objectives.

The development of the allocation would change the historic landscape character of the site from less irregular enclosure to modern residential development, reducing the extent of this overall historic landscape type and further eroding the post-medieval rural character of the landscape to the north-east of Bourton-on-the-Water. Given the small size and scale of the site, its

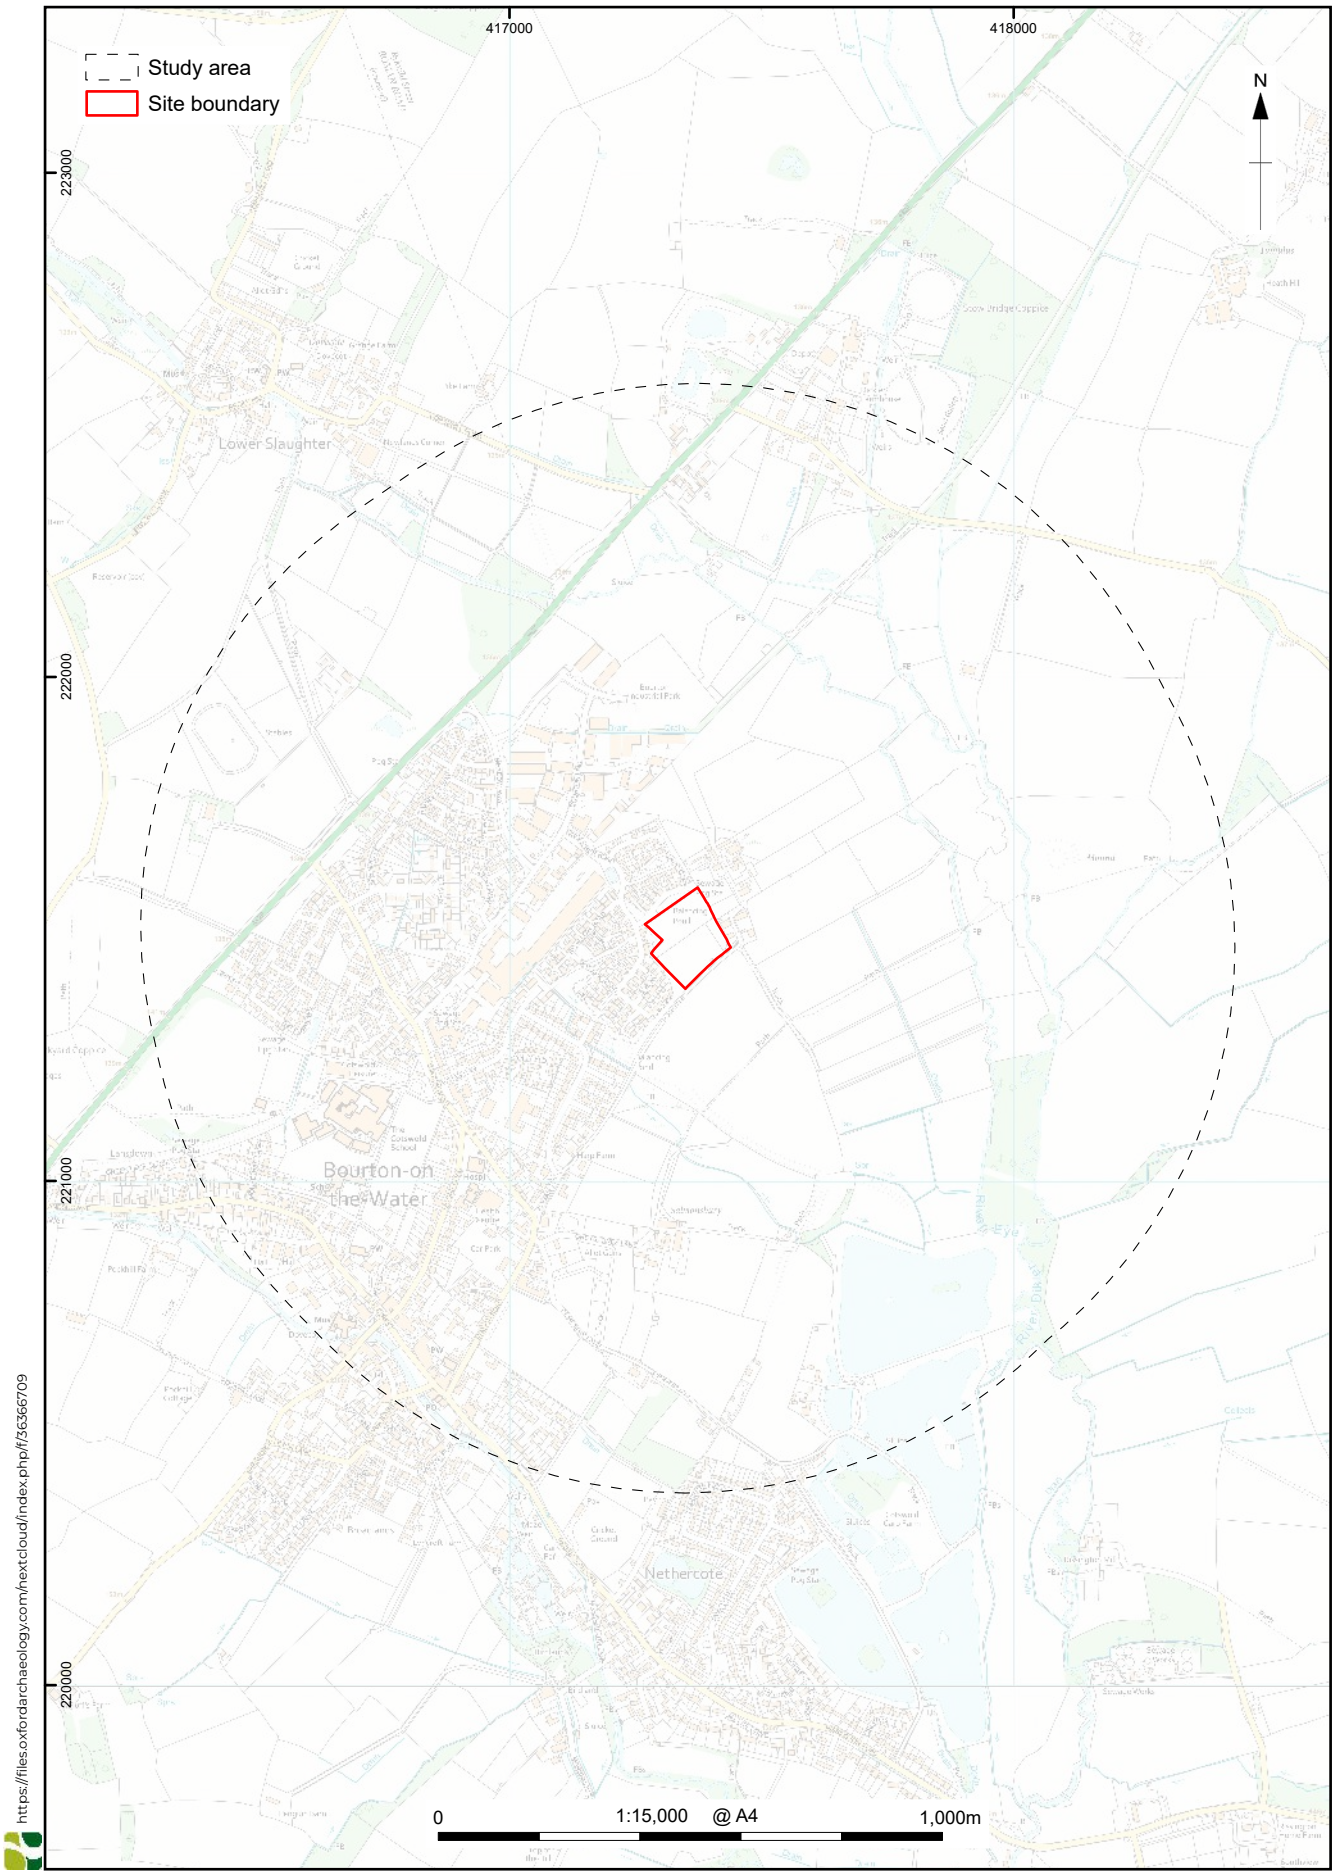
enclosed nature, and its location at the edge of recently developed industrial and residential plots, this would have a slight negative impact upon a low significance historic landscape character within this area, resulting in an anticipated maximum level of harm of **less than substantial**.

Cumulative impacts deriving from the allocation of the site:

No cumulative impacts are anticipated, as there are no known interacting heritage effects arising from this allocation in combination with other schemes or allocations that would give rise to additional harm beyond the impacts identified for the site itself.

Recommendations for minimising harm and maximising enhancement:

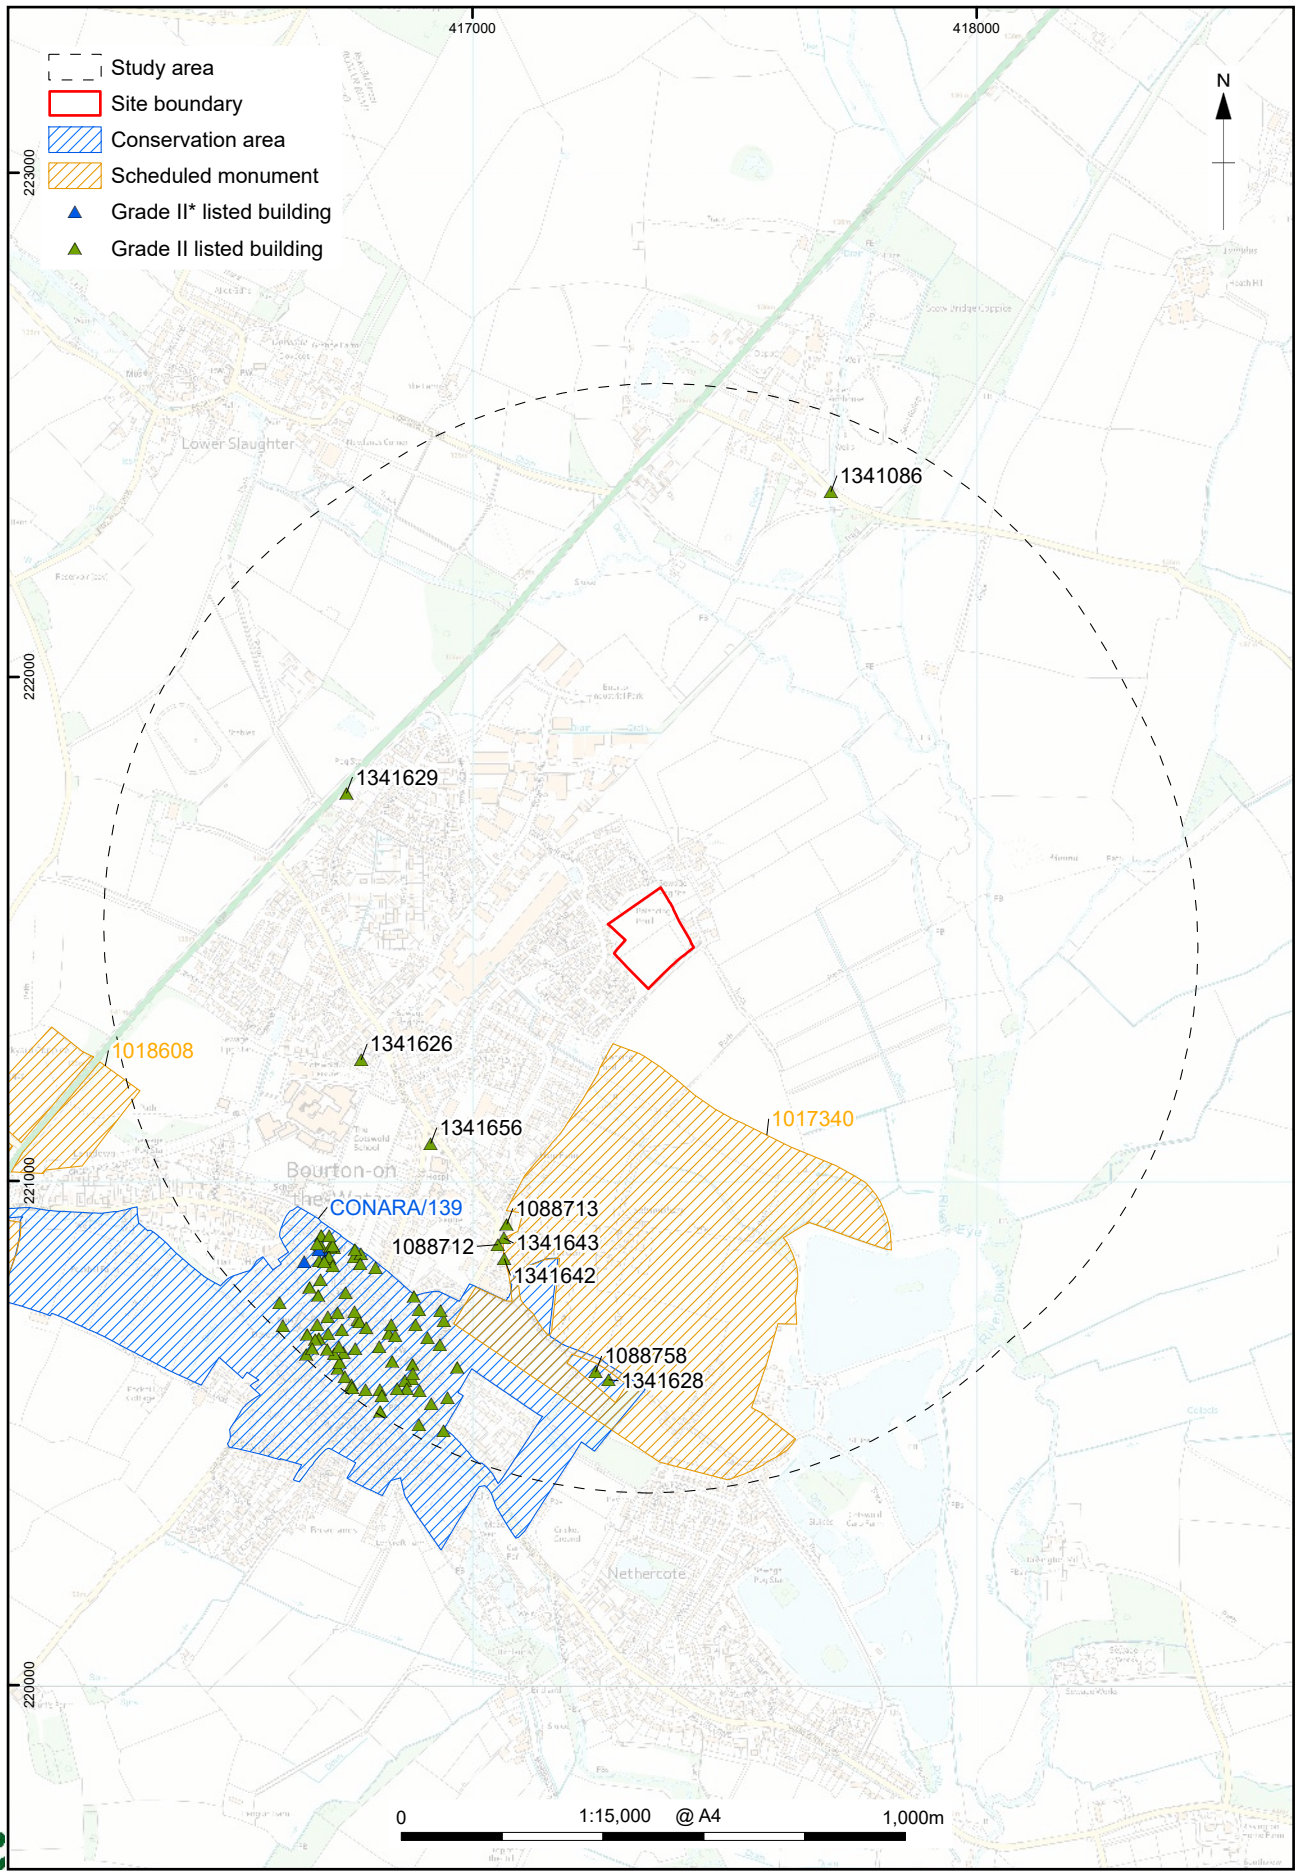
Given the archaeological potential of the site, it is likely that geophysical survey and/or a programme of targeted archaeological evaluation trenching will be required. This would help to identify and understand the extent and character of any surviving archaeological assets and would inform a strategy to mitigate the impact of any subsequent development upon them. Development should only occur after appropriate archaeological investigation has taken place, the full extent of impact is understood, and a strategy of mitigation is agreed with the Gloucestershire Planning Archaeologist.



It is considered that the allocation of this site would result in no harm to the significance of known heritage assets in the wider area, with a maximum of less than substantial harm to historic landscape character. Given the small size of the site, and the low levels of anticipated harm, there are minimal opportunities to minimise such harm. No opportunities for heritage enhancement are readily identifiable.

Conclusions and suitability:

It has been assessed that the progression of this site as a site allocation, through to final development, could result in a level of harm, equivalent to no harm to the heritage significance of upstanding heritage assets, and a maximum anticipated level of less than substantial harm to historic landscape character.



Heritage constraints rating: Lower

The site is considered to have a final heritage sensitivity score of **Lower** (i.e. contains no heritage constraints). This does not consider below ground impacts to sub-surface archaeological remains, which would require full consideration if the site is progressed.

Gloucestershire County Council (2013) Gloucestershire Historic Landscape Characterisation (HLC) including the Cotswolds and the Wye Valley Areas of Outstanding Natural Beauty [data-set]. York: Archaeology Data Service [distributor] https://doi.org/10.5284/1020235

Figure B56.9: Historic landscape characterisation of the study area

Site Reference	C164A
Town	Cirencester
Site Name	Strategic extension to the east of Kingshill Lane
Related policies	-
Proposed allocation use	Mixed use: residential development and employment area
Number of dwellings	612
Employment area	0.6ha

Brief description of site:

The site covers an area of *c*. 41.9ha between the A429 and A417, *c*. 300m from the eastern edge of Cirencester and *c*. 720m from its historic core. It is located on the western edge of the parish of Preston, *c*. 240m to the north of its eponymous village, and in the Cotswolds District of Gloucestershire (Fig. C164A.1).

The site comprises at least part of six agricultural fields that at the time the site was visited were not in cultivation and showed indications of being used for recreation (dog walking). It also incorporates corridors of woodland towards the north of the site, along the western boundary and along part of the eastern boundary. The site is bounded by roads to the north, east and west (London Road, the A417 and Kingshill Lane respectively), but by agricultural land to the south. Beyond, further agricultural land and small settlements lie to the north, east and south, while the modern edge of Cirencester lies to the west with schools and recreational facilities. Mature hedgerows form most of the boundaries within the site, with occasional ditches and post-and-wire fences also present alongside hedges in the centre of the site. The hedgerows were often over 2m high and included occasional mature trees. Evidence of modern disturbance associated with overhead lines was observed in the northern and eastern parts of the site, as well as along its southern boundary.

Topographically, Cirencester lies on the low-lying floodplain of the River Churn, with the river *c*. 140m to the south-west of the site. This lies within a shallow bowl that is surrounded by the Cotswold Hills to the north and west, while flatter land of the Upper Thames Valley lies to the south. The site sits within an undulating landscape, with the site itself rising gently from *c*. 112m aOD in the south to *c*. 117m aOD in the east and *c*. 123m aOD in the north. The River Churn lies *c*. 660m to the south-west of the site, and drains cross the centre.

Significance of designated heritage assets in the site:

There are no designated heritage assets within the site.

Significance of designated heritage assets in the environs of the site which could be affected by the allocation of the site:

A number of designated heritage assets have been identified across the study area, comprising two conservation areas, two scheduled monuments and 24 listed buildings (Fig. C164A.2).

Conservation areas and their associated listed buildings

The Preston conservation area (CONARA/067) is situated *c.* 240m to the south of the site and covers the historical elements of the village. Preston is a small historic Cotswold village of loose linear form aligned on a single road. The historic settlement is centred on All Saints Church and made up of a collection of historic farmhouses and cottages. Despite some post 1950s infill development, the settlement retains its historic linear layout and open grain. The conservation area contains a number of listed buildings constructed from traditional local limestone which contribute to the classic Cotswold identity of the settlement. A defining feature of the village is the open countryside that surrounds it and is visible in gaps between the buildings which offer views out to the surrounding countryside and maintain a strong visual link between the settlement and its rural setting. No conservation appraisal has yet been produced for Preston. Analysis would suggest that the village principally derives its significance from its intrinsic character and appearance, as well as the architectural and historic interest of its layout, linear development along the main road, historic spaces, buildings and boundary treatments. Within the conservation area, the village of Preston includes nine listed buildings, including one of Grade II* status and eight of Grade II status, all of which form part of, and contribute to, its significance. These include the Grade II* Church of All Saints (1089268) as well as the Grade II listed:

- 1089227 - Group of five monuments in line to south of south porch in churchyard of Church of All Saints
- 1089228 - Letterbox Cottage and Pear Tree Cottage
- 1089229 - 90 And 91, Preston Village
- 1089230 - Village Farm Cottage Village Farm House
- 1153591 - Church Farmhouse
- 1153596 - Group of three monuments to south of west tower in churchyard of Church of All Saints
- 1341394 - Preston Place
- 1341395 - The Old Farmhouse

These listed buildings form part of the conservation area and contribute to its significance. The church (1089268) relates to historic settlement dating from

the 13th and 14th centuries, although it was restored during the 19th century, and is also associated with the 18th- and 19th-century tombs (1089227 and 1153596) and the 19th-century former vicarage (1341394). Beyond these, the farmhouses (1089230, 1153591 and 1341395) indicate the prominence of rural and agricultural buildings in the village and the surrounding area. The other listed buildings (1089228 and 1089229) relate to post-medieval settlement in the area. Due to their architectural, historic and group interest, the conservation area and associated listed buildings are considered to be of **high significance**. The site is separated from the conservation area by a band of agricultural land which sits outside of the allocation. The field boundaries in this area provide vegetation that screens much of the site in views from the conservation area. However, the topography of the area means that the northern and western edges of the conservation area share intervisibility with the western and southern parts of the site, while the south-east of the site is visible from the western entrance to the conservation area. Views from the site looking towards the conservation area take in the tower of All Saints Church (1089268) and Church Farm in the western part of the conservation area. The agricultural buildings surrounding the farmhouse (1153591) at Church Farm screen it in views from the site. There are also some glimpsed views of the Grade II listed No. 90 and 91, Preston Village (1089229) in the eastern part of the village, from within the site.

The Cirencester South conservation area (CONARA/144) is located *c.* 730m to the west of the site and covers the southern extent of the historical town, representing its 18th century and later expansion southwards, almost filling the entire area of low-lying and boggy common land and waste ground that had been defined by the walls and ramparts of the Roman town (*Corinium*). The conservation area incorporates three Grade II* and 29 Grade II listed buildings that contribute to its character and significance. Although there have been alterations and additions to many of the listed buildings, these retain and form part of their historical character within the conservation area. Within the study area, these listed buildings comprise five buildings of Grade II status that form part of its post-medieval development and links to the surrounding landscape, including the River Churn to the south-west of the site:

- 1205389 - Rose Cottage
- 1280751 - 10, City Bank Road
- 1280970 - The Old Mill House
- 1298663 - Cotswold Club and attached railings
- 1298699 - 12, City Bank Road

The conservation area appraisal identifies that its significance lies in its context of mostly 19th and 20th century development on relatively flat land with a mixture of residential, community and industrial uses. This includes the informal grid pattern of its layout, the form and character of the buildings, open spaces and mature trees that form a green backdrop enclosing and compartmentalising the area. Views within the Cirencester South conservation area are concentrated within its area but also include longer range views to its north-west. None of these incorporate views of the site. A number of issues face the conservation area as a result of demolition and redevelopment, including inadequate enclosure and the loss of boundary features; poorly maintained buildings; poorly proportioned and sited 20th century commercial buildings; visual clutter; and inadequate interpretation of the area's archaeology, architecture and history. Due to its architectural and historic interest, as well as the group value of the listed and historic buildings in this area, the conservation area and its associated listed buildings are considered to be of **high significance**. The presence of modern built development to the east of the conservation area (and west of the site), separates the conservation area from the rural landscape that would have facilitated an understanding of its development within its original context. In addition to this, the tall hedgerow on the western boundary of the site restricts intervisibility with the conservation area from the site's internal area. As such, the conservation area (and its listed buildings) is unlikely to be affected by the proposed allocation and have been scoped out from further assessment.

Scheduled monuments

To the west of the site, the scheduled monument of *Corinium* Roman town (1003426) lies *c.* 790m from the site at its closest point. The scheduled monument relates to some of the above- and below-ground remains associated with the Roman town that developed here from the 1st century AD and became the capital of the Cotswold region and second-largest town in Britain. While remains of the Roman town (400) were defined by its walls, associated remains, including cemeteries, extend to the north-east along the Fosse Way Roman road (6491), with further settlement, enclosures, a field system and finds (4773 and 4774) extending towards the south-western corner of the site. Remains within the area of the scheduled monument include those of the town (forum, basilica and residential districts), its walls and the amphitheatre. Due to its archaeological and historic interests, which relate to its ability to provide information about the Roman settlement, the scheduled monument is considered to be of **high significance**. The scheduled monument is separated from the site by modern development.

The scheduled monument of Tar Barrows (1003418) lies *c.* 820m to the north-west of the site, on the south-west facing slope of higher ground to the north-east of Cirencester. This monument relates to two areas of earthwork and the buried remains of prehistoric or Roman round barrows, with the southern area also including the buried remains of a Roman or earlier funerary and ritual site, including the possible presence of a temple or shrine that would have served the local population at *Corinium*. Surface scatters of 5th-9th century AD pottery have also been recovered from the area. Due to their archaeological and historical interest, the rarity of these features, their identified survival as both earthworks and as buried remains visible through geophysical survey, and their group value with other Roman monuments to the west, these remains are regarded as being of **high significance**. Post-medieval quarrying has resulted in some damage to both the earthworks and the area of buried remains. Despite the topography of the area, the scheduled monument is separated from the site by the intervening modern development and is unlikely to be affected by development within the proposed allocation and has been scoped out from further assessment.

Listed buildings

In addition to the listed buildings that lie within the conservation areas, a further 10 Grade II listed buildings are located within the study area, with these principally including associations with scattered isolated farmsteads and settlement within the wider agricultural landscape surrounding the site.

To the north-east of the site, these comprise the early 18th century Norcote House (1089267) as well as the late 18th/ early 19th century farmhouse (1089266) and barns (1089265 and 1304246) at Norcote. Due to their high levels of architectural and historic interest, these are considered to be of **high significance**. The current planting along the field boundaries and the intervening roads, as well as the intervening distance, means that there is some separation between these buildings and the site, and that there is no intervisibility between them.

The historic farmstead at Forty Farm lies *c.* 540m to the south-west of the site. The farmstead contains the 17th century Forty Farmhouse (1341396) and its associated barn (1089231). Originally, this farmstead would have been one of the discrete isolated farmsteads that characterised settlement in this part of the study area. Due to the architectural and historic interest of these buildings and their group value with one another, these buildings are considered to be of **high significance**. During the 20th century, the area to the immediate north of these buildings contained further agricultural buildings. The complex to the immediate north of these buildings saw minor adjustments during the 21st

century, and outline planning permission has now been granted for residential development further to the north. The intervening copse of trees (to the north-east of the buildings) prevent views from these listed buildings looking towards the site.

Further to the south, is the Grade II listed Preston Mill (1089264), which lies *c.* 820m from the site. The list entry relates to a 17th/ early 18th century millhouse and late 18th/ early 19th century mill. The mill sits over and was related to the mill waters of the River Churn. Due to its architectural and historic interest, this asset is considered to be of **high significance**. The listed building is separated from the site by the A419 (Cirencester Road) and existing development on the western edge of Preston. As such, it is unlikely to be affected by development within the proposed allocation and has been scoped out from further assessment.

A further Grade II listed building, Golden Farm Public House (1298727) lies *c.* 860m to the west of the site. This building is of late 17th century/ early 18th century date and comprises a building associated with the historic farmstead of Golden Farm. Due to its architectural and historic interest, this asset is considered to be of **high significance**. The intervening modern development separates this building from the agricultural land of the proposed allocation, and as such, it is unlikely to be affected by development within the site and has been scoped out from further assessment.

To the north of the site, Stow Lodge (1187419) comprises an early 19th century lodge that sat on the eastern edge of the woodland of Hare Bushes, with views historically focused to the east (away from the site). Woodland continues in the area to the south, which in addition to the A429, provides separation between this building and the site. To the south-west of Stow Lodge, is an 18th century milestone (1187417). The milestone relates to the 18th century turnpike road that continued the use of the line of the Fosse Way. Due to their architectural and historic interest, these assets are considered to be of **high significance**. They are separated from the site by distance, the A429, and existing planting and development. These assets are unlikely to be affected by development within the proposed allocation and have been scoped out from further assessment.

Significance of non-designated heritage assets in the site:

Several non-designated heritage assets have been recorded within or immediately adjacent to the site (Figs C164A.3-6):

- An area of possible Mesolithic settlement (12642) has been identified through fieldwalking in the north of the site. Geophysical survey and trial

trench evaluation within this area identified linear features and possible pits of Mesolithic, Neolithic, Bronze Age and Roman date, as well as Bronze Age flint, with further prehistoric finds and segmented ditches immediately to the east of the site. A further flint scatter (32901) is also located in the north of the site. Remains associated with these are considered to be of **low to medium significance** due to their archaeological and historical interest.

- The route of a Roman road (5963) may have extended along the alignment of Kingshill Lane on the western edge of the site. As a result of its archaeological and historic interest, as well as its connections to the wider Roman road network, remains associated with the road are considered to be of **medium significance**.
- The medieval or post-medieval agricultural landscape is also reflected through the presence of ridge and furrow cultivation (51241 and 51243) that has been identified through aerial photographs across the north-west and south-east of the site and extending into the surrounding landscape. Most of this has been plough levelled. Due to the fact that they form part of the wider pattern of historic agriculture within the area, these are considered to be of **low to medium significance**. By the post-medieval period, this agricultural landscape also included drainage ditches (33307) that extend into the south of the site. These are considered to be of **low significance** due to their historic interest.
- The alignment of the 18th century turnpike between Cirencester and Lechlade (3358) is preserved within the route of the A417 London Road which passes along northern edge of the site, and the former route of the 19th century Midland and South-Western Junction Railway (4944) passes through the northern part of the site. These are considered to be of **low significance** as a result of their historic interest.

Significance of non-designated heritage assets in the environs of the site:

The GHER records a further 182 non-designated heritage assets within the 1km study area (Figs C164A.3-6), dating from the Mesolithic period onwards. These include remains associated with a Bronze Age funerary landscape; prehistoric settlement and enclosures; the Roman town of *Corinium*; further Roman settlement, field systems, enclosures and cemeteries; and the routes of Akeman Street, Ermin Street and the Fosse Way Roman roads, whose alignments have continued to be used as routeways. They also include early and later medieval settlement; post-medieval settlement, quarrying, turnpikes and railways; further medieval and later agriculture; historical farmsteads; and a Civil War grave.

These indicate that the site lies within a landscape that is known for both its prehistoric and Roman activity, with historical scattered isolated farmsteads and settlement and wide areas of medieval and post-medieval agricultural practices, across the area. Owing to their archaeological interest, assets dating from the prehistoric to later medieval periods are generally considered to be of **low to medium significance**, while any deposits/ materials dating to the post-medieval agricultural use of the study area are of comparatively **low significance**. Where the GHER refers to designated heritage assets such as listed buildings, scheduled monuments these remains are considered to be of **high significance**.

Historic landscape character of the site (and significance):

The Preston Neighbourhood Plan identifies that most of the parish consists of undulating arable fields that are typical of the Cotswold landscape, with hedges and walls forming their boundaries and that incorporates copses that break-up the skyline. The arable nature of the land is recognised as helping to maintain the rural feel of the parish, something that is noticeable on the site with the area being quiet other than road noise and the occasional aircraft. The geographic separation created by the break in built development between Cirencester and Preston was also identified as something that needs to be retained as it helps to maintain the village's separation from Cirencester. The Landscape Character Assessment (LCA) associated with this identified that this landscape included uniformity in the defining features such as rectilinear woodland copses and hedgerows along field boundaries, and that while there is a historic road network across the area, the modern roads split the landscape into smaller parcels that can be experienced, with the site forming most of the area experienced alongside the Preston conservation area (CONARA/067).

The Historic Landscape Characterisation (HLC) for Gloucestershire, the Cotswolds Area of Outstanding Natural Beauty (AONB) and Wye Valley AONB describes the historic landscape character of the site as 'Less regular organised enclosure partly reflecting former unenclosed cultivation patterns (A4p; Fig. C164A.7). The 'p' suffix indicates that parliamentary enclosure was undertaken within the parish. This covered all of the site and extended across much of the eastern part of the study area, with further enclosed land (A2, A3, A3x and A4) comprising much of the surrounding area. This landscape extends to the east and partly reflects the former unenclosed cultivation pattern. This enclosure pattern includes boundaries of a later date (18th century or later) that now form a defining characteristic of the landscape, with the land remaining extensively ploughed since it was enclosed. Within the site, the agricultural character continues and includes evidence associated with the traces of earlier

cultivation through the evidence of ridge and furrow cultivation identified within the GHER (51241 and 51243). While to the south and east of the site, this landscape includes settlement with medieval or earlier origins (G2) and whose extents had been defined by the 19th century (G3), the modern extent of Cirencester (G4) has extended into the former agricultural land and sits only *c.* 350m to the west of the site, separated only by a single field now forming part of school grounds and used for recreation.

Within these, settlement at Preston to the south of the site includes elements of medieval or earlier origin (G2), with the extent of the historic core defined by the 19th century (G3), while surviving early woodland (C1?) forms the landscape associated with Stow Lodge (1187419) to the north, and the designed ornamental landscapes (F1) associated with Norcote House (1089267) lies to the north-east. Overall, the historic landscape character type within the site is considered to be of **low significance**.

Contribution of the site to the significance and setting of known heritage assets:

The surrounding agricultural landscape, of which the site is a part, forms the setting of the village of Preston and its conservation area (CONARA/067), helping its historic rural context to be understood. The landscape character assessment for the village highlights the importance of the connection between the settlement and surrounding agricultural landscape which is preserved by the open green space visible between gaps in the houses within the development. Additionally, the undeveloped rural landscape surrounding the village plays a role in preserving its historic linear form and retaining the settlement's separation from Cirencester. The site forms part of the agricultural land to the north of Preston but is separated from the village by a band of agricultural land. It comprises an open rural landscape that extends across raised ground, which is visible in views on the approach into the conservation area, with intermittent visibility between houses and through planting from within the conservation area. Historically the site would have been within the parish of Preston and would have been farmed by its inhabitants. The site is considered to make a **high positive contribution** to the setting of the conservation area, contributing to understanding of the village as a small agricultural community that was distinctly separate from Cirencester.

The site is also considered to contribute towards the setting of the listed buildings within the conservation area. The immediate setting of All Saints Church (1089268) includes the historic churchyard plot, as well as the monuments within the churchyard (1089227 and 1153596), which is defined by its wall and the surrounding settlement. The site forms part of the wider setting

of the church and the church tower is prominent in views looking across the site. A footpath extends north from the churchyard into the fields that separate the village from the site and connects to a farm track that extends into the southern part of the site. Views of the church from this footpath allow the church and surrounding settlement to be appreciated within their historic rural setting. While the site is not visible alongside the church in views from the footpath to the south of the site, it contributes to the more general rural and agricultural context while experiencing these views and make a **low positive contribution** to the setting of the church and conservation area. Views of the church and conservation area from elsewhere within the site are restricted by planting and therefore other parts of the site make a lesser contribution to this aspect of the setting of these assets.

The approach to, and principal façade of, Church Farmhouse (1153591) is orientated to the south (away from the site), and its immediate setting is principally defined by its farmstead plot, which was developed during the 20th and 21st centuries making the farmhouse less appreciable as a former farm building. The site forms part of the historic agricultural landscape which would historically have surrounded the farm. This landscape (of which the site forms part) makes a **low positive contribution** to the setting of Church Farmhouse although the scale of this contribution is reduced by the limited intervisibility between the farmhouse and the site.

The visibility of the church tower and 90 and 91, Preston Village (1089229) reinforces this rural association. Numbers 90 and 91 are partially visible in views from the site; views which look across the agricultural land that separates the site from the allocation and allows the buildings to be appreciated as part of a small rural village. This makes a **low positive** contribution to the setting of these assets.

While intervisibility with the other buildings within the conservation area (1089228, 1089230, 1341394 and 1341395) is more restricted due to the presence of trees and other buildings, its agricultural nature of the site contributes to their rural setting, especially of the farmhouse (1341395), helping them to be appreciated as part of a small rural village. As such, the site makes a **low positive** contribution to their setting.

The site forms part of the rural agricultural landscape that separates the discrete farmstead and settlement at Norcote from Cirencester to the west and Preston to the south. The planting and orientation of boundaries shown on historical maps suggest that the principal view from Norcote House (1089267) was to the south, and historically this view may have incorporated the eastern part of the site. However, the presence of high hedges in the area, as well as

the modern A417, blocks views of the site from Norcote within the modern landscape. The site and surrounding agricultural landscape cumulatively make a **low positive** contribution to the setting of the isolated settlement at Norcote, including its Grade II listed buildings (1089265, 1089266, 1089267 and 1304246) by preserving its rural character and separation from the surrounding settlements.

The site forms part of the wider agricultural landscape surrounding the historic farmstead at Forty Farm as historic farmland within the parish of Preston. There is currently no intervisibility between the site and the listed buildings associated with Forty Farm (1089231 and 1341396) and there is currently surviving agricultural land to the north, east and west of the farm (outside of the site) which allows these assets to be appreciated as a former farm building set within agricultural land. While the agricultural land within the site would have formed part of the wider agricultural landscape surrounding the site, there is currently no intervisibility between the farm buildings and this landscape. Due to the lack of intervisibility and distance between the site and the assets at Forty Farm the site is considered to make a **neutral contribution** to their setting.

The proposed allocation is separated from the scheduled remains of the Roman town of *Corinium* (1003426) by the intervening distance, modern development and planting and there is no intervisibility between these areas. However, as the GHER records evidence of Roman activity, including further settlement and field systems, connecting these two areas, the site is considered to have the potential to contain archaeological remains which may provide insight into the relationship between the town and its hinterland. This connection is reinforced by the Roman road adjacent to the site boundary which connects to three Roman roads that head into Cirencester. Any Roman remains found within the site could make a **low positive** contribution to the setting of the scheduled monument (1003426).

The Cirencester South conservation area (CONARA/144) and its associated listed buildings, as well as the scheduled monument of Tar Barrows (1003418), and the other listed buildings (1003418, 1187417, 1187419, 1298727) within the study area, do not share historic or visual connections with the site. The significance of these designated heritage assets derives from their architectural and historic interests and relationship with one another rather than from any visual, spatial or historical relationship with the site. As such, the site makes a **neutral** contribution to their setting.

Impact assessment:

Having identified the surrounding designated heritage assets and assessed the site and its context, this assessment concludes that the site makes a high positive contribution to the setting of Preston conservation area (CONARA/067) and a low positive contribution to the setting of listed buildings associated with the settlements at Preston and Norcote. The site contributes to the setting of these assets primarily by contributing to their distinct identities as separate rural communities. The site also has the potential to contain archaeological remains that could contribute to the setting of the scheduled Roman town (1003426).

The site forms part of the rural landscape to the north of Preston conservation area (CONARA/067). This incorporates the Grade II* listed building of the parish church (1089268) as well as the Grade II listed buildings (1089227, 1089228, 1089229, 1089230, 1153591, 1153596, 1341394 and 1341395) associated with the historic development of the village and its agricultural setting. Due to the scale and extent of the proposed allocation, and the intervisibility between the north of the conservation area and some of these listed buildings (1089268 and 1089229) within the site, it would be difficult for development not to impact the setting of these designated heritage assets. Although development within the site would extend the built edge of Cirencester further to the east, and erode some of the separation between Cirencester and Preston, agricultural land to the south of the site would retain some of this separation. As a result, development within the proposed allocation has the potential for **less than substantial harm** to the setting and significance of the conservation area and its associated listed buildings. However, the scale and extent of the proposed allocation would bring a large change to the historic character of the area to the north of the village. Although this impact could not be fully removed, the scale of the impact could be reduced through consideration of the historic landscape and settlement pattern within the layout, as well as the use of green space and the associated use of sensitive design within the built development.

The site forms part of the wider rural landscape outside the Roman town of *Corinium* (1003426), with the Roman road network providing connections between it and the town. As such, the site has the potential to contain extramural activity associated with the Roman town. Development within the site would remove any such remains, and without appropriate investigation and recording, this could result in **less than substantial harm** to the setting of the scheduled monument.

The site forms part of the rural landscape that allows the discrete isolated farmstead and settlement at Norcote, and its listed buildings (1089265,

1089266, 1089267 and 1304246), to be appreciated. Although development within the site would reduce this separation, its area is constrained by the modern road (A419) that already provides a constraint to the appreciation of the area, as identified in the LCA, and agricultural land would remain in the intervening area (outside the site). As a result, development within the site would have the potential to cause **less than substantial harm** to the setting of the discrete settlement at Norcote.

Although the site forms part of the agricultural landscape around the Grade II listed buildings at Forty Farm (1089231 and 1341396), redevelopment that has taken place in the area to the north, as well as the screening afforded by the intervening planting, separates them from the site. The rural setting of the farm would also be protected by the agricultural land which separates the site from Forty Farm (outside the site). Due to this separation and absence of intervisibility, development within the site would result in **no harm** to the setting of these Grade II listed buildings.

Development of the site would have **no harm** to the Cirencester South conservation area (CONARA/144) and its associated listed buildings (1205389, 1280751, 1280970, 1298663 and 1298699) as there are no direct historical associations between them and the site, modern development provides separation, and the surrounding rural landscape incorporates trees and hedges that preclude intervisibility. For similar reasons, the development of the proposed allocation would have **no harm** to the scheduled monument associated with Tar Barrows (1003418) or the other listed buildings within the study area (1003418, 1187417, 1187419 and 1298727).

Previous archaeological investigations within the site have been limited to a site assessment (EGC258) in the centre of the site and a geophysical survey and trial trench evaluation (EGC257) in the north. As well as the evidence that these produced finds and features associated with the Mesolithic, Neolithic, Bronze Age activity of the area (12642 and 32901), known remains also relate to medieval and later agricultural practices (33307, 51241 and 51243) are known in the north-west and south-east of the site, and the route of a Midland and South-Western Junction Railway (4944) across the north, as well as Roman (5963) and turnpike (3358) roads adjacent to the site. Given the extent of ground disturbance likely to arise, development within the site will almost certainly impact upon surviving below-ground archaeological assets through the truncation, removal and loss of archaeological legibility of the remains, as they will probably sit just below the subsoil and cut into the natural deposits. This has the potential for **substantial harm** to the archaeological resource, both within the site and the wider study area, and would be permanent. Without

appropriate mitigation measures, any development that disturbs the archaeological heritage assets is unlikely to satisfy relevant national and local planning policy objectives.

The HLC of the site comprises part of the enclosed fields of a much wider agricultural landscape. The site is currently enclosed land that is not under cultivation but may be in a fallow year. The hedgerows within and surrounding the site form part of the character of the landscape and screen parts of the site from the wider landscape and the buildings within. The site covers most of Area 4a identified in the LCA for the Preston Neighbourhood Plan. This identified that the rural landscape permeates into the village from the north, with intervisibility incorporating views south from public footpaths and views north (between vegetation) from the village. With the site comprising agricultural land that contributes to this character, development within the potential allocation has the potential to cause **less than substantial harm** to the low significance HLC type of the area and would lead to a change in the historic landscape character. Given the scale and extent of the proposed allocation, this harm would not be able to be fully mitigated against, but the scale of the impact could be reduced through the use of strategic green space and sensitive layout and design considerations.

Cumulative impacts deriving from the allocation of the site:

Due to the presence of a second large-scale proposed allocation to the south of Preston (R519/650), there is the potential for a cumulative impact on the separated and linear settlement character of the Preston conservation area (CONARA/067). Despite the proximity of both potential allocations to the conservation area, as well as the potential loss of rural land to both its north and south, due to the continued presence of some rural land between the conservation area and the two proposed allocations (outside the sites), as well as the trees and hedges in the intervening area, this cumulative impact has the potential for **less than substantial harm** to the significance of the conservation area.

Recommendations for minimising harm and maximising enhancement:

The proposed allocation extends to within 250m of the Preston conservation area and sits within the setting of Grade II* and Grade II listed buildings. It forms part of the agricultural landscape which permeates into the Preston conservation area and contributes positively to the rural character of these assets. It also helps to preserve the separation between areas of discrete and linear settlements and farmsteads that make up the historic settlement pattern

to the south and south-east of Cirencester. Development is therefore likely to cause heritage harm, which cannot be fully avoided given the scale of the allocation. However, the following measures should be used to reduce harm and maximise opportunities for enhancement.

Due to its proximity to the Preston conservation area to the south, as well as multiple listed buildings at Norcote to the north-east, the southern and north-eastern parts of the site are the most sensitive. An existing area of green land remains in the intervening area (outside the site), that would retain some separation between the site and Preston. A gradual reduction in density of buildings should be incorporated on the southern limit of the development, as well as along the eastern and northern site edges, in order to soften the transition between built development and the surrounding countryside in views from these directions. This should incorporate larger plots, open space and a softer settlement edge. This would help to maintain the rural setting of Preston and preserve some of the separation between settlements. Planting along London Road and the A417 to the north and north-east of the site should also be maintained and enhanced in order to maintain the planting that currently prevents views of the site from the listed buildings at Norcote. Building heights should also be restricted, especially in the north-east of the site in order to prevent development from becoming visible from Norcote.

The existing planting along the site boundaries should be retained in order to maintain screening between heritage assets further afield.

To reduce the impact of the allocation, development should respond to the differing sensitivities across the site with lower density development, landscape planting and field boundaries used to create a softer transition at the southern, eastern and northern edges. Where possible, areas of green infrastructure and planting, incorporating the retention of field boundaries, should be used to break up development and landscape buffers should be used to soften the edges of development. The alignment of development could reflect that of the Roman road to the west or the historic field boundaries in order to retain a historic connection. Building styles should reflect those of Preston and the surrounding farmsteads and pockets of settlement. Building heights should be restricted to respect the dominance of trees in the surrounding skyline and help preserve the rural character of views of the surrounding landscape and to preserve views from surrounding heritage assets. The use of local vernacular building designs and materials, including stone walls may help to retain some of the rural character. Where employment space is to be developed, its design, layout and materials should be agricultural in appearance and respect the local

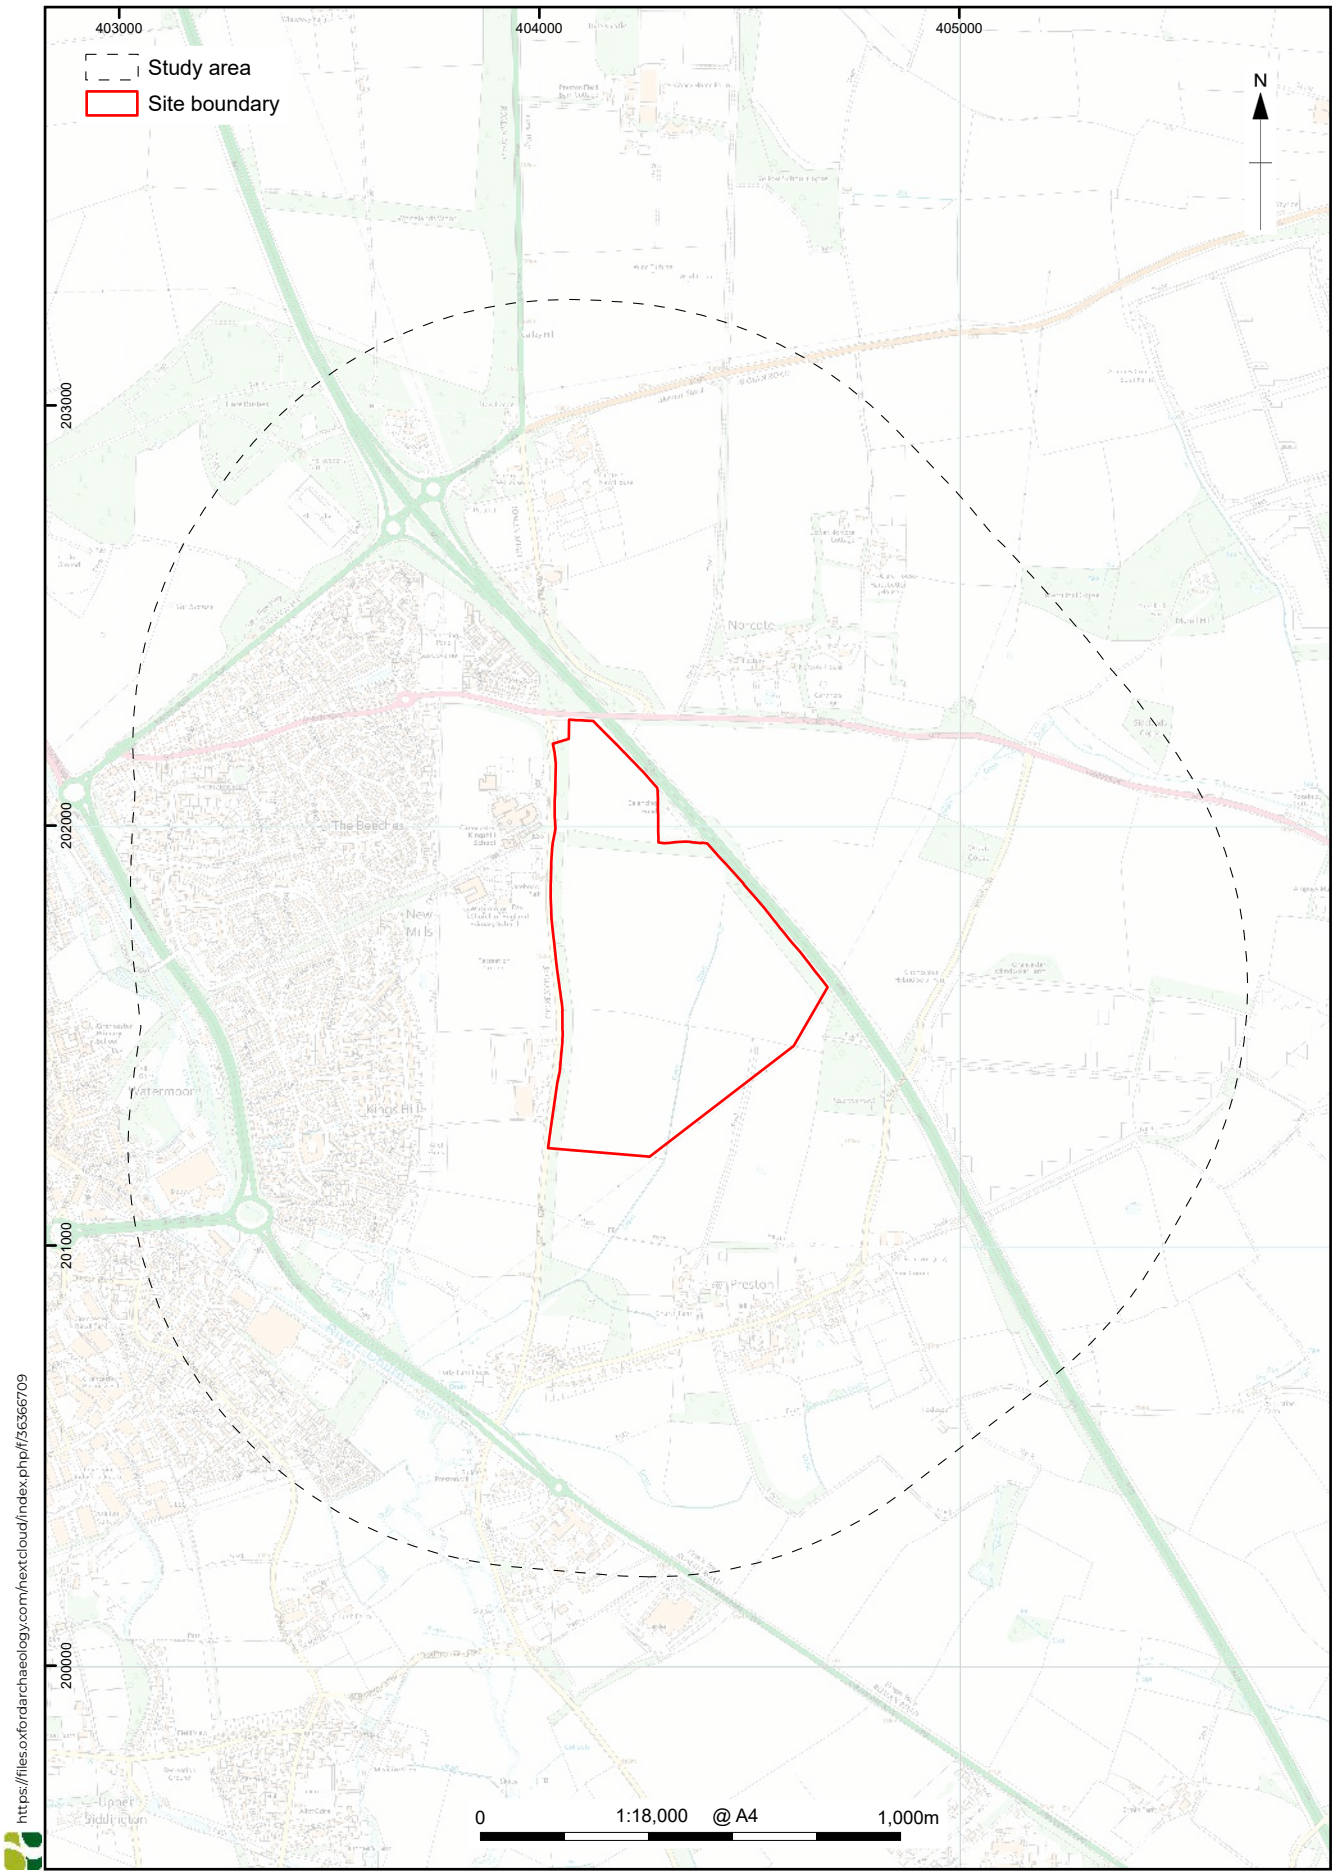
vernacular. Where edges of built development are visible, native trees and hedges should be planted in order to soften their edges.

The Cotswold Design Code and a sensitively designed masterplan and development template should be used to ensure that development is built to a high standard, and that green infrastructure and suitable landscape provision is made across the site.

A heritage impact assessment (Orion 2026) has been carried out for the site. Considering the archaeological potential of the site and previous archaeological investigation within its area having been limited to geophysical survey and trial trench evaluation (EGC257) in the north of the site, it is recommended that a programme of geophysical survey and archaeological evaluation trenching is carried out across areas that have not yet seen investigation. This should be undertaken pre-determination of any planning application. This would help to understand the extent and character of the surviving archaeological assets and would inform a strategy to mitigate the impact of any subsequent development upon them. Development should only occur after appropriate archaeological investigation has taken place, the full extent of impact is understood, and a strategy of mitigation is agreed with the Gloucestershire Planning Archaeologist.

Conclusions and suitability:

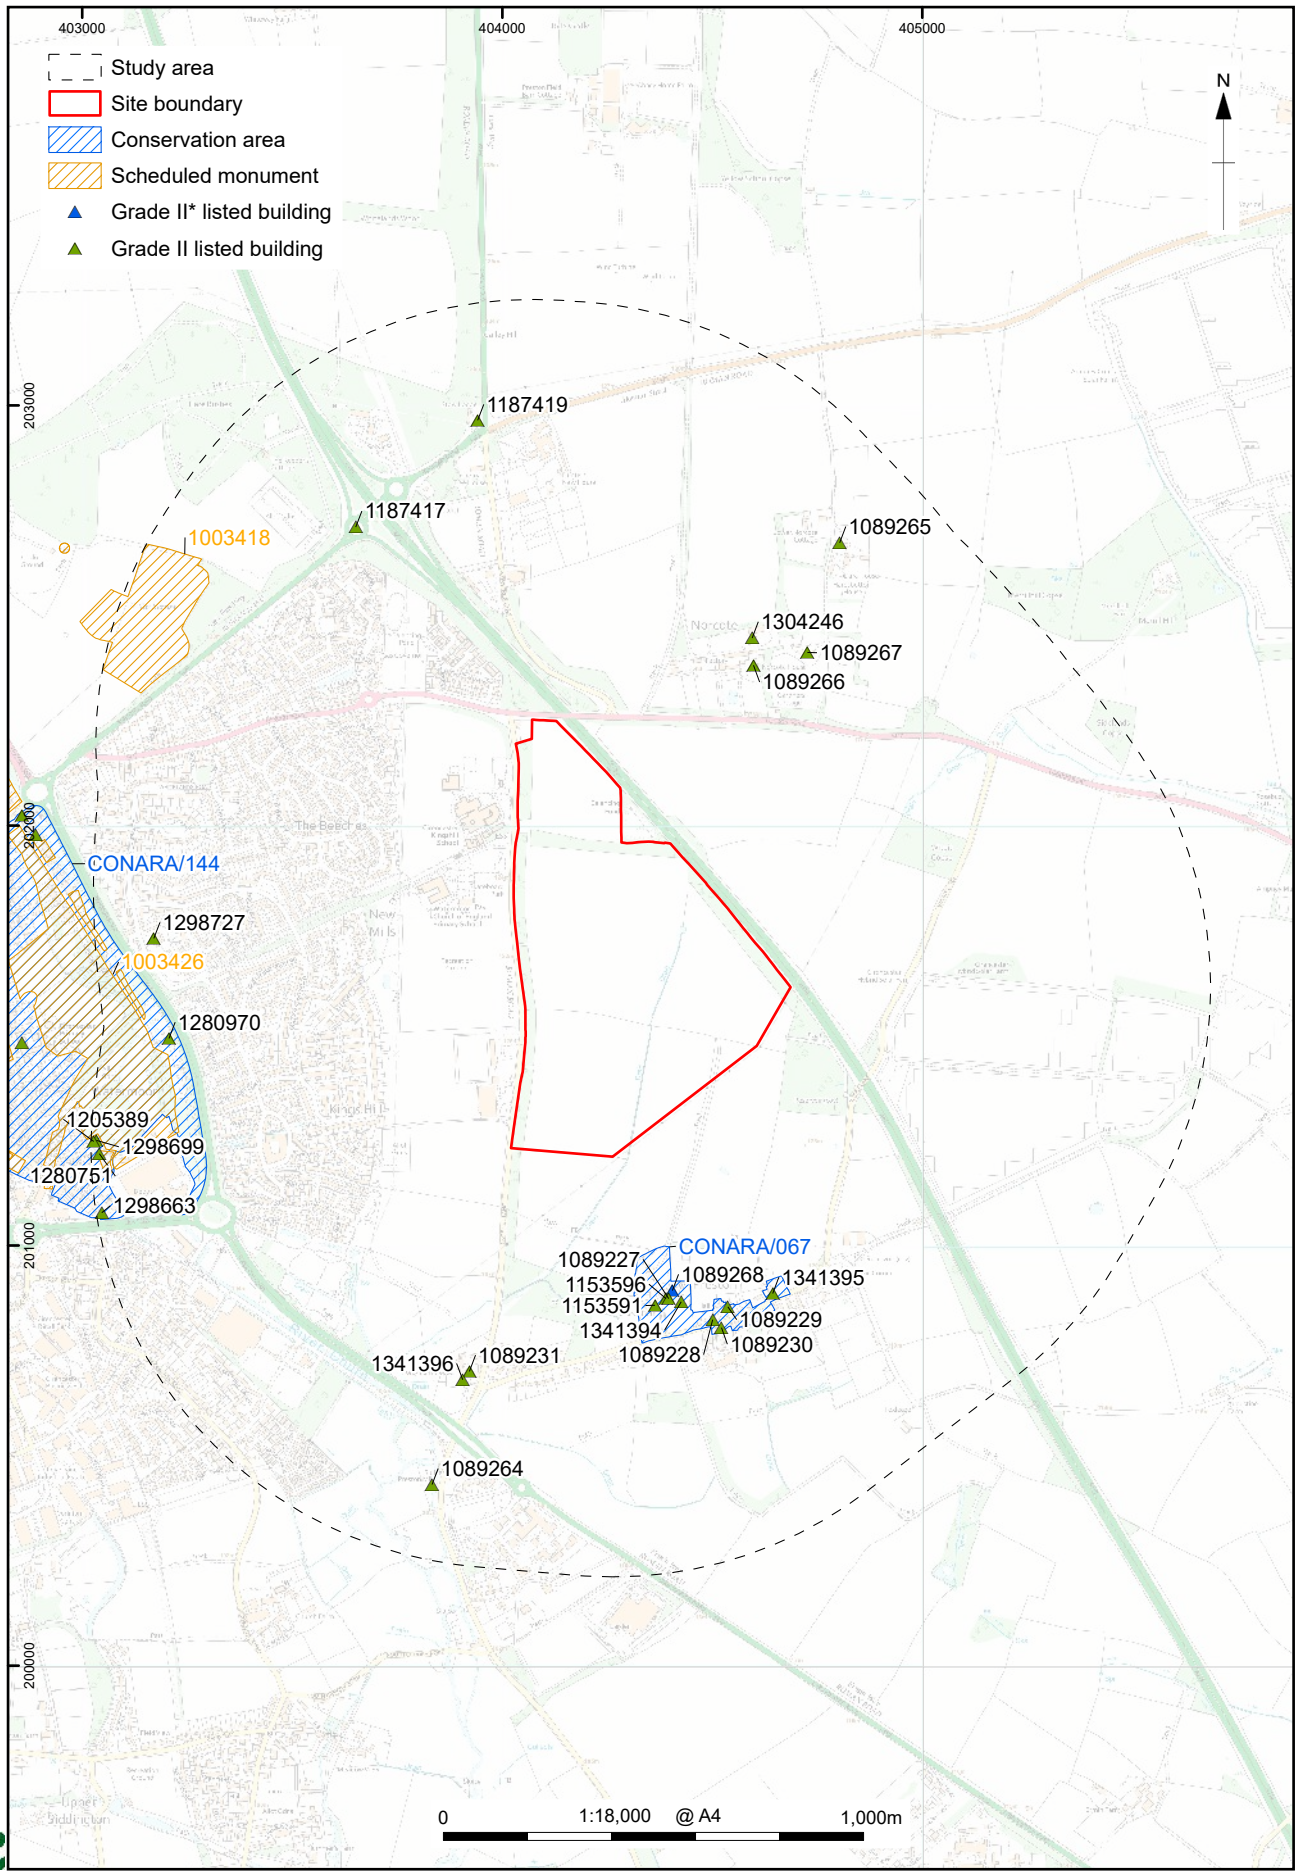
This assessment has identified that development within this potential allocation could result in **less than substantial harm** to the significance of a conservation area, scheduled monument, listed buildings and the historic settlement pattern of the area and without appropriate mitigation it could also result in **substantial harm** to archaeological remains within the site. Although it would not be possible to prevent development of the scale and extent proposed for this allocation from causing some level of harm, it may be possible to reduce the scale of its impact through appropriate design mitigation, including the use of sensitive, considerate design in the final development proposals.



There is also the potential for cumulative harm to be caused by development within this proposed allocation in conjunction with one to the south of Preston.

Heritage Constraint Rating: Moderate

The site is considered to have an overall heritage constraint rating of Moderate (i.e. the site contains historic environment constraints but is suitable for development subject to recommended mitigation or design controls). The south and north-east of the site are the most sensitive to development. A reduction in potential harm could be achieved through design mitigation measures and a



programme of archaeological investigation but would not entirely prevent it due to the proposed scale of the allocation.

It is considered that the proposed allocation is suitable for development subject to design and layout controls. Development should respond to the differing sensitivities across the site, with lower density development, landscape planting and the retention of existing field boundaries used to soften the transition between the allocation and the surrounding countryside, particularly towards Preston and along the southern edge of the site. This would help to reduce visual impacts and help to preserve the rural character of the area. However, given the scale and extent of the proposed allocation, it would not be possible to fully mitigate this harm.

Gloucestershire County Council (2013) Gloucestershire Historic Landscape Characterisation (HLC) including the Cotswolds and the Wye Valley Areas of Outstanding Natural Beauty [data-set]. York: Archaeology Data Service [distributor] https://doi.org/10.5284/1020235

Figure C164A.7: Historic landscape characterisation of the study area

Site reference	C190
Settlement	Cirencester
Site name	Strategic extension to the south of The Steadings
Related policies	-
Proposed allocation use	Mixed use: residential development and employment area
Number of dwellings	1,540
Employment area	2.1ha

Brief description of site:

The site covers an irregularly shaped area of *c*. 116.6ha that lies *c*. 500m to the south-west of the edge of Cirencester, *c*. 1.2km from its historic core, and in the Cotswolds District of Gloucestershire (Fig. C190.1).

The site comprises 14 fields of agricultural land that are separated by a network of hedgerow boundaries and are currently under arable cultivation, other than two fields in the centre of the site (corresponding to the area of a scheduled monument) that are currently grazed, and the eastern field which is overgrown grass/meadow. The site extends to the A433, A429 and Spratsgate Lane, with hedgerows and woodland corridors forming its boundaries and further agricultural land and areas of woodland beyond. Tall hedgerows are present along most of the northern edge of the site, as well as along parts of its southern edge, the railway embankment to the south and south-east, and within the site. Drystone walls also form part of the northern and southern boundaries. The southern boundary of the site also partially follows the route of the former Cirencester Branchline, while a minor road and trackways cross the proposed allocation and are included within its area. The landscape around the site includes both arable fields and pasture.

Topographically, the site forms part of a gently undulating landscape that drops down to the Trent and Severn Canal to the east and south, but rises gently to the north. Within the site, this encompasses a low point of *c*. 111m aOD in the south, which rises to *c*. 118m aOD in the east, *c*. 120m aOD in the south-west and *c*. 128m aOD in the north-west.

Significance of designated heritage assets in the site:

A single designated heritage asset lies within, and extends to the north of, the site. This comprises the scheduled 'Settlement south-east of Chesterton Farm' (1003444; Fig. C190.2).The scheduled monument is on the heritage at risk register due to ongoing damage from arable ploughing. The register states that

it has as a medium vulnerability and that its condition is improving, presumably because it has been taken out of cultivation.

The scheduled area relates to the area of a Roman farmstead that may have had earlier (Iron Age) origins. It incorporates multiple multi-phase settlement enclosures, structures and field boundaries as well as a possible trackway. While the main enclosure was used throughout the life of the settlement, there were multiple phases of activity both within and around it. Finds recovered from the area suggest that there may have been a mosaic. The scheduled area has seen episodic ploughing since the medieval period. Originally identified through cropmarks, this has been subject to geophysical surveys (EGC4415 and EGC9099), with the off-site portion to the north also subject to limited archaeological trial trenching (EGC5796 and EGC5779) that corresponded with the geophysical survey. Within the site, the cropmarks and geophysical survey indicate that the remains relate to two distinct areas of settlement located on either side of a shallow valley (at *c.* 111m AOD), with the southern of these extending to the south of the scheduled area and the site. To the north (and outside the site), the identified remains represent an area of 'ladder' settlement.

Due to its archaeological and historic values, relating to its ability to yield information regarding Roman extra-mural settlement and agricultural activity, the scheduled monument is considered to be of **high significance**. However, there are no above-ground features surviving, limiting the ability to perceive or appreciate the value of the remains. The geophysical survey results suggest that remains associated with the scheduled monument extend to the north and south of the site, although there is potential for unidentified associated remains to extend to the east and west, within the site.

Significance of designated heritage assets in the environs of the site which could be affected by the allocation of the site:

The scheduled 'Settlement south-east of Chesterton Farm' (Fig. C190.2 1003444) extends beyond the site boundary to the north. In addition, one registered park and garden and 16 listed buildings (Fig. C190.2) have been recorded within the study area.

Registered park and garden

The Grade I registered park and garden of Cirencester Park (1000432), although mostly outside the study area extends, at its closest point along its southern edge, to *c.* 820m to the north of the site. This comprises an extensive area of wooded park, first planted between 1714 and 1775, and also includes areas of parkland, pleasure grounds and a lake. The planting was begun by Allen, first Earl Bathurst, with the help of Alexander Pope, and was influenced

by Earl Bathurst's association with Stephen Switzer, and the lake forms one of the earliest irregular pieces of water in the history of English gardening. The park is associated with eight Grade II* and 11 Grade II listed buildings that include the park mansion, temples, an ice house and monuments/ piers that are concentrated although spread across its area are concentrated towards its eastern end, to the north of the site. The main approaches to the park lie to the east (north of the site), although there are minor entrances along its southern edge that include lodges. A 1.5-2m high drystone wall extends around most of the park, except for a short length of hedge. Avenues, or Rides, extend between viewpoints and divide the park, with the central axis extending east to west and several Rides extending into the wider landscape.

Due to the historic, architectural and artistic (aesthetic), interests associated with its layout design and development and its historical links to prominent figures, as well as its archaeological interest (potential to contain archaeological remains) Cirencester Park is considered to be of **high significance**. Due to its visual and physical separation from the site along with screening provided by the intervening vegetation, including mature hedgerows and trees, the setting of the registered park and garden is unlikely to be affected by the proposed allocation.

Listed buildings

Although the 16 Grade II listed buildings that lie within the study area generally lie towards the edge of Cirencester, to the north and east of the site, they also include buildings to the south.

The closest of these buildings comprise the 18th-19th-century farm complex (farmhouse, outbuilding, wall, barn and cattle stalls; 1187401 and 1298718) associated with Chesterton Farm which lie *c.* 180-200m to the north of the site. Due to their individual architectural and historic interest and their group value as a historic farm complex, these buildings are considered to be of **high significance**. These buildings are separated from the site by a single field, with the site mostly screened in views looking out from the farm by the hedgerow along the northern boundary of the site. There are occasional return views of the farm from the agricultural land within the central part of the site (the scheduled monument).

Also within the fields to the north of the site is the Grade II listed building of The Cranhams (1187449). This relates to a three-storey 19th-century house. Due to its architectural and historic interest, this is considered to be of **high significance**. The building is partially surrounded by trees, but shares

intervisibility with the grassland in the centre (the scheduled area) across a paddock to its south.

To the north-west of the site, and on the opposite side of the A433, is the Royal Agricultural College (1187418) and its 19th-century chapel (1298726). The college dates to 1846, with the college building, which incorporates a five-storey tower with views across the college grounds and into the wider landscape, linked to a 17th-century farmhouse and barn. The chapel was built shortly after the college for its students to prevent them monopolising pews in Cirencester Parish Church. Due to the architectural and historic interest of the buildings and their group value as part of the historic college complex, these assets are considered to be of **high significance**. The siting of the chapel, to the north of the college building, means that this does not share intervisibility with the site. However, although there is some separation of the college building from the site created by the intervening mature planting, the height of the tower means that this shares intervisibility with, and is prominent in views from, the western half of the site, as well as being visible above the trees from its eastern end and southern edge.

In addition to these, the 18th-century Farm Buildings at Smerrill Farm (1089279), *c*. 690m to the south of the site, comprises a complex of two adjoining barns and stable that has also previously been in use as a museum of farm implements and practices. Due to its architectural and historic interest, this is considered to be of **high significance**. Due to the topography of the area, as well as the intervening woodland, these buildings do not share intervisibility with the site.

A dispersed settlement, focused around Furzen Leaze Farm lies to the south of the site. The closest listed buildings from this settlement to the site are a pair of cottages that have been converted into a single cottage (1153845) *c*. 720m to the south of the site. To the east of these are the refronted mid/late 18th-century farmhouse (1089247) and late 18th/early 19th century barn and stable (1340984) associated with Furzen Leaze Farm. Due to their architectural, and historic interest and group value as a dispersed rural settlement these buildings are considered to be considered to be of **high significance**. Although the topography of the area means that these buildings sit higher than the site and would overlook it, the mature trees and hedges in their immediate environs screen them from sharing intervisibility with the site.

Another dispersed rural settlement characterised by buildings on both sides of the Thames and Severn Canal at Upper Siddington is located between *c*. 520m and 710m to the east of the site. To the north of the canal, and closer to the site, these comprise the well preserved mid/late 19th-century estate farmhouse

(1090075) associated with Barton Farm which sits adjacent to a mid-19th-century schoolhouse (1153896). An 18th century road bridge (1090036) spans the canal, with the late 17th century Upper Siddington House (1340989) to the south of the canal. Due to their architectural and historic interest and group value, these are considered to be of **high significance**. These buildings are separated from the site by the surrounding mature planting, and the bridge lies along a route that does not connect directly with the site.

Also to the east of the site is the mid 19th-century Grade II listed building of The Old Rectory (1379927) which lies *c*. 540m from the site and is now a house. Due to its architectural and historic interest, this is considered to be of **high significance**. This is surrounded by mature planting, and where views out from this looks towards the site, they are interrupted by the presence of modern housing with further trees beyond. As such, this is unlikely to be affected by development within the site.

Further afield, and within Cirencester, the 20th-century Former Oakley Hall School Memorial Chapel (1407024), *c*. 940m to the north of the site, was built as a war memorial for pupils at Oakley Hall School who had died during World War I and later during World War Two. Reportedly, this was the first place of worship to be begun and completed after World War I. Due to its architectural and historic interests, as well as its intactness and association with the school, who's building and grounds have been converted into housing, this is considered to be of **high significance**. Due to the intervening mature planting and buildings, as well as its significance away from the site, this is unlikely to be affected by the proposed allocation.

In addition to the buildings, these Grade II listed monuments include a mid-18th-century milestone (1187416) that sits adjacent to the A433 and marks the distances to Cirencester, Tetbury and Bath. Due to its historical interest this is considered to be of **high significance**. However, this does not share intervisibility with the site due to the surrounding planting, and it is directly associated with the turnpike road (48829), now A433. As such, it does not share a connection with the site, and as such is unlikely to be affected by development within the site.

Significance of non-designated heritage assets in the site:

Non-designated heritage assets (Figs C190.3-6) have been recorded within the site, including:

- The site of a possible Bronze Age barrow (2367) which lies on the parish boundary between Cirencester to the north and Kemble and Ewen to the south. This has not been investigated, but if remains survive, they are

likely to be of **medium significance** as they indicate part of a broader funerary landscape with further potentially associated remains identified outside the site.

- In addition to the scheduled area of settlement (1003444, 330) in the centre of the site, an area of Late Iron Age and Roman settlement (33210) has also been identified in the west of the site through cropmarks. It comprises areas of ditched enclosures, boundaries and pits, while surface finds of Roman pottery and tile have also been made from the area. These have not been investigated, and if remains survive, they are likely to be of **medium to high significance** due to their potential association with the designated remains to the east.
- The later medieval agricultural use of the area is also represented, with blocks of ridge and furrow cultivation (51375) evident in the east of the site and extending to its north-east. These relate to the open field system of the medieval deserted settlement of Upper Siddington (2117). Although these were formerly visible as earthworks on aerial photographs, they have since been plough-razed. If remains are present, they are likely to be of **low to medium significance** as they form part of the historical use and character of the area, including links to deserted settlement to the north-east of the site.

Significance of non-designated heritage assets in the environs of the site:

The GHER records a further 122 non-designated heritage assets within the 1km study area (Figs C190.3-6), including the presence of further remains associated with a Bronze Age funerary landscape, Iron Age and Romano-British settlement and enclosures, the route of the Fosse Way Roman road (later used for the post-medieval turnpike road) adjacent to the western boundary of the site, early and later medieval settlement, post-medieval settlement, turnpikes and railways, as well as further medieval and later ridge and furrow cultivation, historical farmsteads, post-medieval quarrying and industrial activity, and World War Two pillboxes.

These remains indicate that the site forms part of a well-utilised landscape incorporating settlement and associated activity from the Iron Age onwards, creating a general area of high archaeological potential, with the majority of these assets supplementing, and adding context to, those assets outlined above. Owing to their archaeological interest, assets dating from the prehistoric to later medieval periods are generally considered to be of **low to medium significance**, while any deposits/ materials dating to the post-medieval agricultural use of the study area are of comparatively **low significance**.

Where GHER records refer to designated heritage assets such as the scheduled monument, they are considered to be of **high significance**.

Historic landscape character of the site (and significance):

The Gloucestershire, Cotswolds Area of Outstanding Natural Beauty and Wye Valley Area of Outstanding Natural Beauty Historic Landscape Character Assessment (GHLC) describes the historic landscape character of the site as 'regular organised enclosure ignoring former unenclosed cultivation patterns' (A3; Fig. C190.7). This covers all of the site, with no parliamentary enclosure where the site was within Cirencester Parish (A3x). In the east, this overlay the area of ridge and furrow cultivation (37128) related to the later medieval open field system, while the loss of the earlier unenclosed system continued to the south-west and west. Boundaries associated with these fields are likely to be of a relatively late date (18th century or later), but form a defining characteristic of their landscape. In addition to the enclosed land of the site, and the hedges along field boundaries, areas of woodland have historically been adjacent to the site, including Swallow Copse, Chesterton Plantation and Ewen Copse to the south.

Where the agricultural landscape continues to the south and east of the site, the fields became enclosed through Parliamentary enclosure and at least partially reflect the earlier unenclosed field patterns to the south and east (A4p). Beyond these fields to the north are areas where the character of the Cirencester Park registered park and garden (1000432) has been lost through either its conversion into arable enclosures (F2) or where it has been used as a World War II military hospital (I1F). Further loss of the historic landscape is reflected in the extension of settlement beyond the limits as identified during the 19th century (G4).

The site covers land within three parishes: Cirencester in the centre, Siddington in the east, and Kemble and Ewen in the west. As such, parish boundaries cross the site, with the northern site boundary also partially following a parish boundary. Where hedgerows follow these boundaries, they are considered important.

The areas of enclosure within the site are representative of the rural landscape used for agriculture as it saw organised enclosure from the 18th century. This regular enclosure is considered to be of **low significance**.

Contribution of the site to the significance and setting of known heritage assets:

The site currently comprises agricultural land (arable and grazing) that incorporates three-quarters of the area of the scheduled monument (1003444). There are no upstanding (above-ground) features associated with the scheduled monument within the site or its surrounds. However, the alignment of the Roman Road, The Fosse Way is preserved in the modern road alignment to the north-west of the site. The current agricultural landscape within the site is post-medieval and modern and the field patterns do not fossilise or respect the earlier Roman landscape (fields are on a much larger scale than those identified through cropmarks and geophysical survey and do not share alignments with known features).

Cropmarks and geophysical survey indicate that archaeological remains survive within the site. Where the shallow valley extends across the area of the scheduled monument, it helps in the understanding of the separation between the areas of settlement. Due to the buried nature of the remains, their significance primarily relates to their archaeological interest. The scheduled part of the site contains archaeological remains of high significance. Outside this, the site makes a **low positive** contribution to the setting of the scheduled monument as the rural character of the site allows the scheduled monument to be appreciated as a rural settlement within a rural context. The presence of the Fosse Way, as a relic of the Roman landscape on the western boundary of the site, extends this connection across the site with its alignment visible as the hedge lining the A433.

The site forms part of the historical agricultural landscape in which the Royal Agricultural College was established. The college grounds replaced Port Farm, with the principal college building (1187418) incorporating the former farmhouse and barn to its rear. At the front, the college building's tower is prominent in views north from the west of the site, as well as above the treeline in views north-west across the site from the southern edge and in the east. To the rear of the college building, is a second Grade II listed building associated with the college, comprising the chapel (1298726) that was built for the use of the students. Additional, non-designated, buildings have subsequently been built to the north-west of these.

The historic grounds of the college (not including the site) form its immediate setting and are bounded by the A433 to the south and south-east, the A419 to the north and north-east, and a field boundary to the west. The site forms agricultural ground to the lies to the south-west of the college grounds and is separated from the college grounds by the A433.

The agricultural character of the site is visible in views approaching the college along the A433. These views take in the tower and the intervening farmland. In

general, the agricultural nature of the site makes a low positive contribution to the setting of the college, contributing to its rural character. Views of the tower looking which incorporate site and the surrounding agricultural landscape allow the college building to be appreciated within its rural setting. The agricultural landscape surrounding the Royal Agricultural College (1187418), which includes the site, makes a **low positive** contribution to the setting of the college allowing it to be appreciated as a former farm building that has continued to have agricultural associations.

The significance of the chapel is derived from its association to the college and its students. It is physically and visually separated from the site by the buildings of the college. The proposed allocation is therefore considered to make a **neutral** contribution to the significance of the chapel.

The site lies to the south of the two Grade II listed buildings at Chesterton Farm (1187401 and 1298718). The main approach to the buildings at Chesterton Farm historically lay to the east and potentially incorporated the track along the northern edge of the site. The significance of the buildings primarily relates to their built form and relationship with each other that allows them to be understood as part of a historic farmstead. This relationship allows the development and function of the historic farmstead to be understood. Given the proximity of the farm to the site and due to the presence of Chesterton Plantation on the opposite side of the site, it is likely that at least part of the site was historic agricultural land associated with Chesterton Farm. Views linking the agricultural landscape within the site to the farm reinforce this connection and allow the listed farm buildings to be appreciated within its original rural setting. As such, agricultural land immediately to the south of the listed buildings (which shares a visual connection with the farm buildings) makes a **high positive** contribution to the setting of the site, while the land that does not share intervisibility makes a **low positive** contribution as part of the wider rural setting of Chesterton Farm.

In contrast, the buildings associated with the other historic farms within the environs of the site – Smerrill Farm (1089279), Furzen Leaze Farm (1089247 and 1340984) and Barton Farm (1090075) – are separated from the site by the intervening distance and planting. The significance of the buildings primarily relates to their built form and relationship with their associated farms, which allows their development and function to be understood. As such, the continued agricultural use of the land, as well as the survival of the field boundaries from the time these farms were established, facilitates the continued understanding of these historical buildings within their original context. As such, the site makes a **low positive** contribution to their setting, and thereby their significance.

The site comprises agricultural (arable and grazing) land to the south of The Cranhams (1187449). The significance of this building primarily relates to its built form and its association with the garden and paddock in its immediate vicinity. Although the listed building is surrounded by mature planting, there is intervisibility with the site in the grazed fields towards the east. The paddock in the intervening area is also overlooked by the house, with the present field layout corresponding to that seen when the house was built. Although the fields do not historically relate to the house, they form part of its outlook. As such, the land within the site makes a **low positive** contribution to the setting and significance of the listed building.

The registered park and garden (1000432) as well as the other listed buildings within the study area (1090036, 1153845, 1153896, 1187416, 1340989, 1379927 and 1407024), do not share historic or visual connections with the site. The significance of these designated heritage assets derives from their aesthetic, architectural, historic, cultural and group interests rather than any from any visual, spatial or historical relationship with the site. As such, the site makes a **neutral** contribution to their setting.

Impact assessment:

Having identified the surrounding designated heritage assets and assessed the site and its context, this assessment concludes that the centre of the site (the area of the scheduled monument) makes a **high positive** contribution to the significance of the scheduled monument of Settlement south-east of Chesterton Farm (1003444) and the Grade II listed buildings at Chesterton Farm (1187401 and 1298718), with other parts of the site making a **low positive** contribution to these heritage assets. The site also makes a **low positive** contribution to the significance of a further six Grade II listed buildings in the environs of the site.

Development within the potential allocation would have the potential to cause both direct and indirect impacts on the scheduled monument (1003444) in the east of the site. Any ground disturbance within its area may cause truncation, removal or loss of archaeological legibility of the remains within its area, and these may sit just below the subsoil and cut into the natural deposits. The geophysical survey and cropmark evidence suggest that remains directly associated with the identified settlement areas lie within the site. As such, development has the potential for **substantial harm** to the archaeological resource, both within the site and the wider study area, and would be permanent. Ground works or development within the scheduled area is unlikely to be acceptable and would require Scheduled Monument Consent. Without appropriate mitigation measures, any development that disturbs the

archaeological heritage assets is unlikely to satisfy relevant national and local planning policy objectives.

In addition to this, development to the east and west of the scheduled area would be likely to have an indirect impact on its setting. It would be likely to introduce built forms into views in these directions, where the rural aspect contributes to the rural setting of the settlements. Built form within these areas would result in the loss of the rural setting in these directions, although land to the south, and some to the north (outside the site) would remain rural in aspect. Built development in both directions, especially considering modern development being undertaken at The Steadings in the area to the north, would be especially harmful as this would create a more enclosed feel to the setting. Due to the scale of the proposed allocation, development (depending on its design and layout) within the site would have the potential to cause **less than substantial harm** to the setting of the scheduled monument and its connection with the wider rural landscape, including the visual presence of the route of the Fosse Way provided by the hedge along the A433.

The western part of the site forms part of the rural landscape visible in approaches to the grounds of the Royal Agricultural College and the main approach to its buildings. The tower of the principal college building also shares intervisibility with the site, including in views looking north-west across the western half of the site, along its southern edge and in the east. These views take in the rural and agricultural landscape, with the tower clearly visible in the background, and allow the building to be appreciated within its rural context. Development within the site would result in the loss of some of the agricultural land in the wider landscape that formed the original setting of college building (and earlier farm). As such development within the proposed allocation would have the potential for **less than substantial harm** to the setting of the college building (1187418) through the erosion of the wider agricultural landscape surrounding the college, particularly on the approach along the A433. However, this could be reduced through appropriate design mitigation.

Development within the site would result in a loss of agricultural land potentially associated with buildings at Chesterton Farm (1187401 and 1298718) and the introduction of housing (and employment space) into views south from the area of the farm. Development within this potential allocation would erode the wider rural setting of the farm. The agricultural land within the site, including the surviving presence of post-medieval boundaries, makes a high positive contribution to the listed buildings and farmstead area (especially with the possible connection of land within the site to the farm), allowing them to be appreciated within their original rural context. Development immediately to the

south of the farm, on the scale of the proposed allocation, would have the potential for **substantial harm** to the setting of the listed buildings. Beyond the area intervisibility, and given the sale of the proposed allocation, development would have the potential for **less than substantial harm** due to the erosion of the wider agricultural landscape surrounding the farm. This could be adequately prevented through the preservation of the land to the south of the farm as green space to preserve the rural setting.

Development within the site would also result in a loss of agricultural land that formed the original setting of listed buildings associated with other historic farms (1089247, 1089279, 1090075 and 1340984) within the environs of the site. Due to the absence of intervisibility between these and the site, the agricultural land within the site, including the surviving presence of post-medieval boundaries, makes a low positive contribution to the listed buildings and farmstead areas, allowing them to be appreciated within their original rural context. Development on the scale of the proposed allocation would reduce this rural context. However, as agricultural land would still form part of their surroundings, and this would not reduce the visibly associated land, this is perceived to have the potential for **less than substantial harm** to the setting of these listed buildings.

The site also forms agricultural land that forms part of the rural setting seen from the listed building of The Cranhams (1187449). The grazed part of the site can be seen in views across paddocks that form the setting of this building and makes a low positive contribution to its significance. Development within this part of the site would result in the loss of this part of the rural aspect and the introduction of built development in views in this direction. However, agricultural land would still be present in the surrounding area (outside the site). As a result, development in this part of the site would cause **less than substantial** harm to the setting of the listed building.

Development of the site would have **no harm** on the Cirencester Park registered park and garden (1000432) as there are no direct historical associations between it and the site, and the surrounding rural landscape incorporates trees and hedges that preclude intervisibility. For similar reasons, the development of the proposed allocation would have **no harm** on the other listed buildings of the area (1090036, 1153845, 1153896, 1187416, 1340989, 1379927 and 1407024).

Archaeological investigations within the site have been limited to a geophysical survey (EGC9099) that revealed the extent of the scheduled remains within the site, and a geophysical survey and watching brief (EGC8080 and EGC8567) associated with a foul water pipeline in the east of the site where evidence was

limited to three furrows. However, non-designated heritage assets, including low to high significance remains associated with a Bronze Age funerary landscape, Iron Age and Roman settlement and medieval and post-medieval agricultural activity, are known within its area. Given the extent of ground disturbance likely to arise, development within the site will almost certainly impact upon surviving below-ground archaeological assets through the truncation, removal and loss of archaeological legibility of the remains, as they will probably sit just below the subsoil and cut into the natural deposits. This has the potential for **substantial harm** to the archaeological resource, both within the site and the wider study area, and would be permanent. Without appropriate mitigation measures, any development that disturbs the archaeological heritage assets is unlikely to satisfy relevant national and local planning policy objectives.

The historic landscape characterisation of the site is made up of post-medieval enclosure which contains evidence of levelled ridge and furrow that predates the enclosures. The trees and hedges that form both the boundaries of the site and lie within it, allow the post-medieval enclosure pattern to be understood. Development within the site would result in the loss of this enclosure pattern and would result in **less than substantial harm** to this low significance historic landscape character type in this area due to its surviving presence in the wider area.

Cumulative impacts deriving from the allocation of the site:

No additional cumulative impacts are anticipated from other potential allocations considered at this stage. Although development within this site could cause less than substantial harm to the Grade II listed farmhouse at Barton Farm (1090075), which also lies within the study area for potential allocation SD17 to the east, SD17 is not expected to affect the farmhouse. Other large-scale allocations near Cirencester (C164A and R519/650) are located east of the town and are separated from this site by existing development, planting and intervening rural land outside the allocations. Similarly, the large-scale proposed allocation at Kemble (K12) is separated from this site by distance, built development and intervening rural land. These allocations also do not share heritage assets that could be harmed in combination with this site. As such, there are no known interacting heritage effects that would give rise to additional harm beyond the impacts identified for this site itself.

While the HIAs only consider cumulative effects arising from the proposed allocations, it is noted that the ongoing development of The Steadings to the immediate north of the site, when combined with the allocation, would have cumulative effects on the scheduled monument of Settlement south-east of

Chesterton Farm (1003444) within the site and to its north, as well as the listed buildings at Chesterton Farm (1187401 and 1298718) and The Cranhams (1187449) which lie in the area to the north of the site, within the area of The Steadings. Development of both sites would also lead to a reduction in the rural landscape visible from the Royal Agricultural College (1187418), as well as other farmsteads (1089279, 1089247, 1340984, 1090075) in the area. In addition to these, there would be a cumulative effect on the historic landscape character of the area, with both developments potentially extending the built edge of Cirencester up to 1500m to the south-east and leading to reduced separation to the dispersed farmsteads and settlement in this direction.

Recommendations for minimising harm and maximising enhancement:

The proposed allocation includes part of a scheduled monument on the Heritage at Risk Register and lies within the setting of several Grade II listed buildings. The site contributes to the rural character and separation of nearby historic farmsteads and to the preservation and understanding of Roman settlement remains. Development is therefore likely to cause heritage harm, which cannot be fully avoided given the scale of the allocation. However, the following measures should be used to reduce harm and maximise opportunities for enhancement.

Built development within the area of the scheduled monument should be avoided, with this area retained as green space**.** Any works or change of use within the scheduled area would require Scheduled Monument Consent. While the Heritage at Risk register noted that arable ploughing was still an issue in 2025, at the time of the site visit it was an area of long grass/ meadow. If the scheduled area has not already been removed from ploughing, it should be. The alignment of the Fosse Way could be incorporated into the layout of any development, maintaining links between the road and scheduled area. Interpretation boards should also be established (subject to Scheduled Monument Consent) that provide links to the wider Roman landscape, such as the Fosse Way, and that provide a better appreciation of the scheduled monument.

Appropriate landscape buffers should be provided around the scheduled monument, particularly to the west and east, to help preserve its rural context and reduce the effects of development at The Steadings to the north.

Built development should be avoided in the far east of the site where it would erode the rural setting of the scheduled monument; this area could form part of

the strategic green infrastructure. Built development should also be avoided along the western edge of the site where it could erode the rural feel of the approach to the Royal Agricultural College.

Development should be concentrated within the less sensitive central parts of the site, with large, visually continuous areas of built form to be avoided. Substantial green infrastructure, retained field boundaries and landscape planting should be used to break up development, maintain separation and reduce the perception of a continuous urban extension.

Given the presence of surrounding mature planting, and the expected continuation of grazing within the area of the scheduled monument, it may be possible to prevent new development within the site from becoming visible in views looking south from the historic Chesterton Farm area towards the site.

Existing boundary planting, important hedgerows and parish boundary alignments should be retained and used as structuring features within the layout.

Building heights, layouts, materials and detailing that are used should respond to the rural character of the area, nearby farmsteads and existing hedged boundaries.

The survival of areas of historical farmsteads within the area, such as Chesterton Farm to the north, Siddington Field Farm in the east (if developed) and North Furzen Leaze Farm on the southern edge of the site, provides an opportunity for the siting of areas of employment space. The design of any employment areas should reflect the scale, form and materials of local agricultural buildings, with native trees and hedgerows used to soften visible edges.

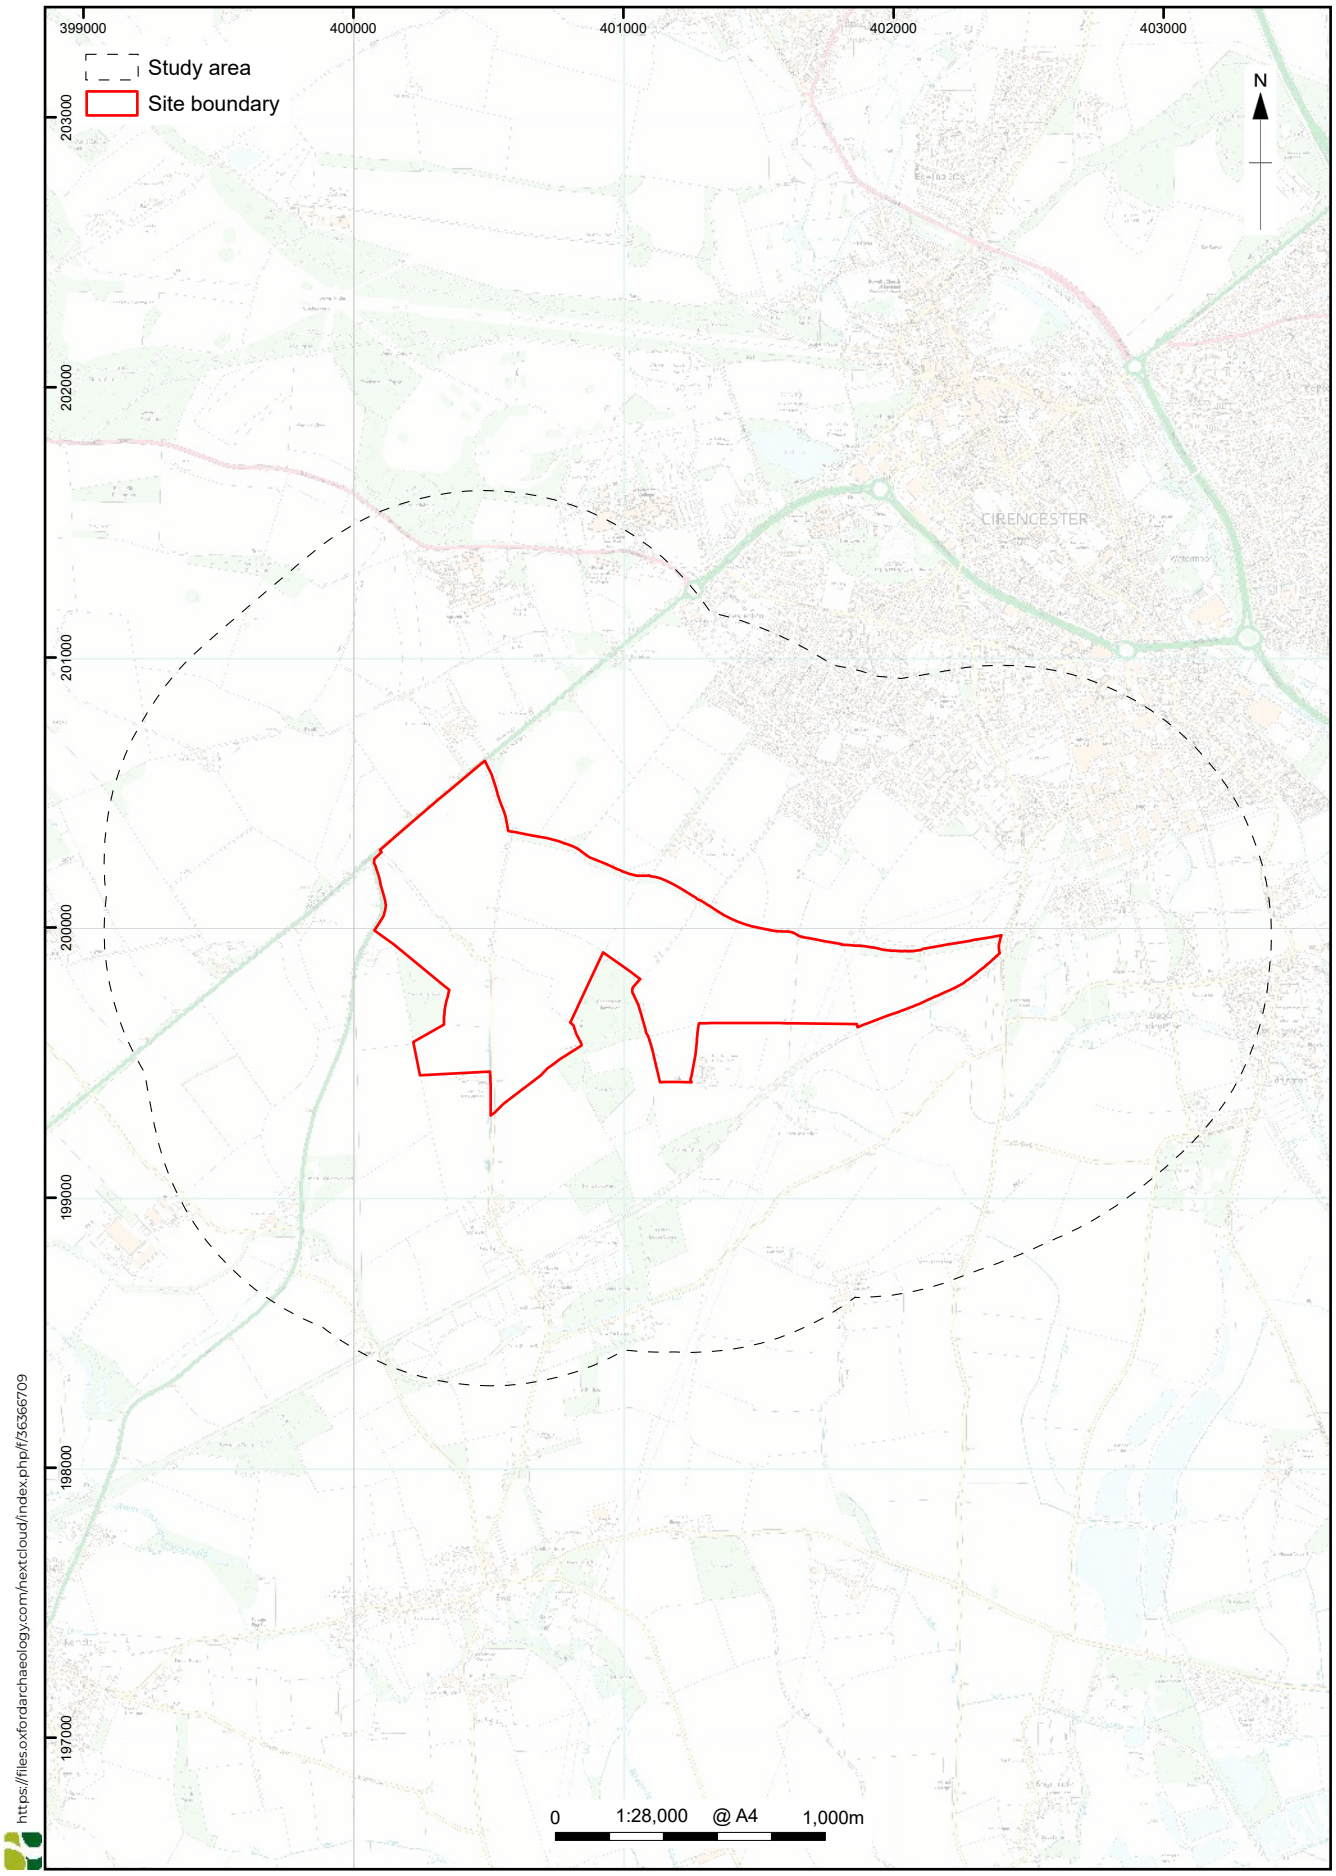
Historic access routes and footpath alignments should be retained as green corridors where possible, with potential to incorporate a heritage trail and interpretation around the scheduled monument and surrounding landscape.

In order to reduce harm to the historic landscape and settlement character if the area, large, visually continuous or monolithic areas of built form should be avoided where possible. Areas of substantial green infrastructure should be used to break up development and maintain a sense of separation through the retention of field boundaries, as well as the use of landscape buffers and planting to soften edges.

Considering the archaeological potential of the site, a heritage impact assessment (EDP 2026) has been undertaken for the site and limited archaeological investigations have been undertaken within its area, with these

limited to geophysical survey and a watching brief. Land to the immediate north of the site has seen archaeological evaluation and some areas of mitigation take place. It is recommended that a programme of geophysical survey and archaeological evaluation trenching should be undertaken across areas of the site that have not been investigated pre-determination of any planning application. This would help to tie the remains within the site into the results of those undertaken to the north, and help understand the extent and character of the surviving archaeological assets and would inform a strategy to mitigate the impact of any subsequent development upon them, including any further areas that have the potential for preservation *in situ*. Development should only occur after appropriate archaeological investigation has taken place, the full extent of impact is understood, and a strategy of mitigation is agreed with the Gloucestershire Planning Archaeologist.

Conclusions and suitability:

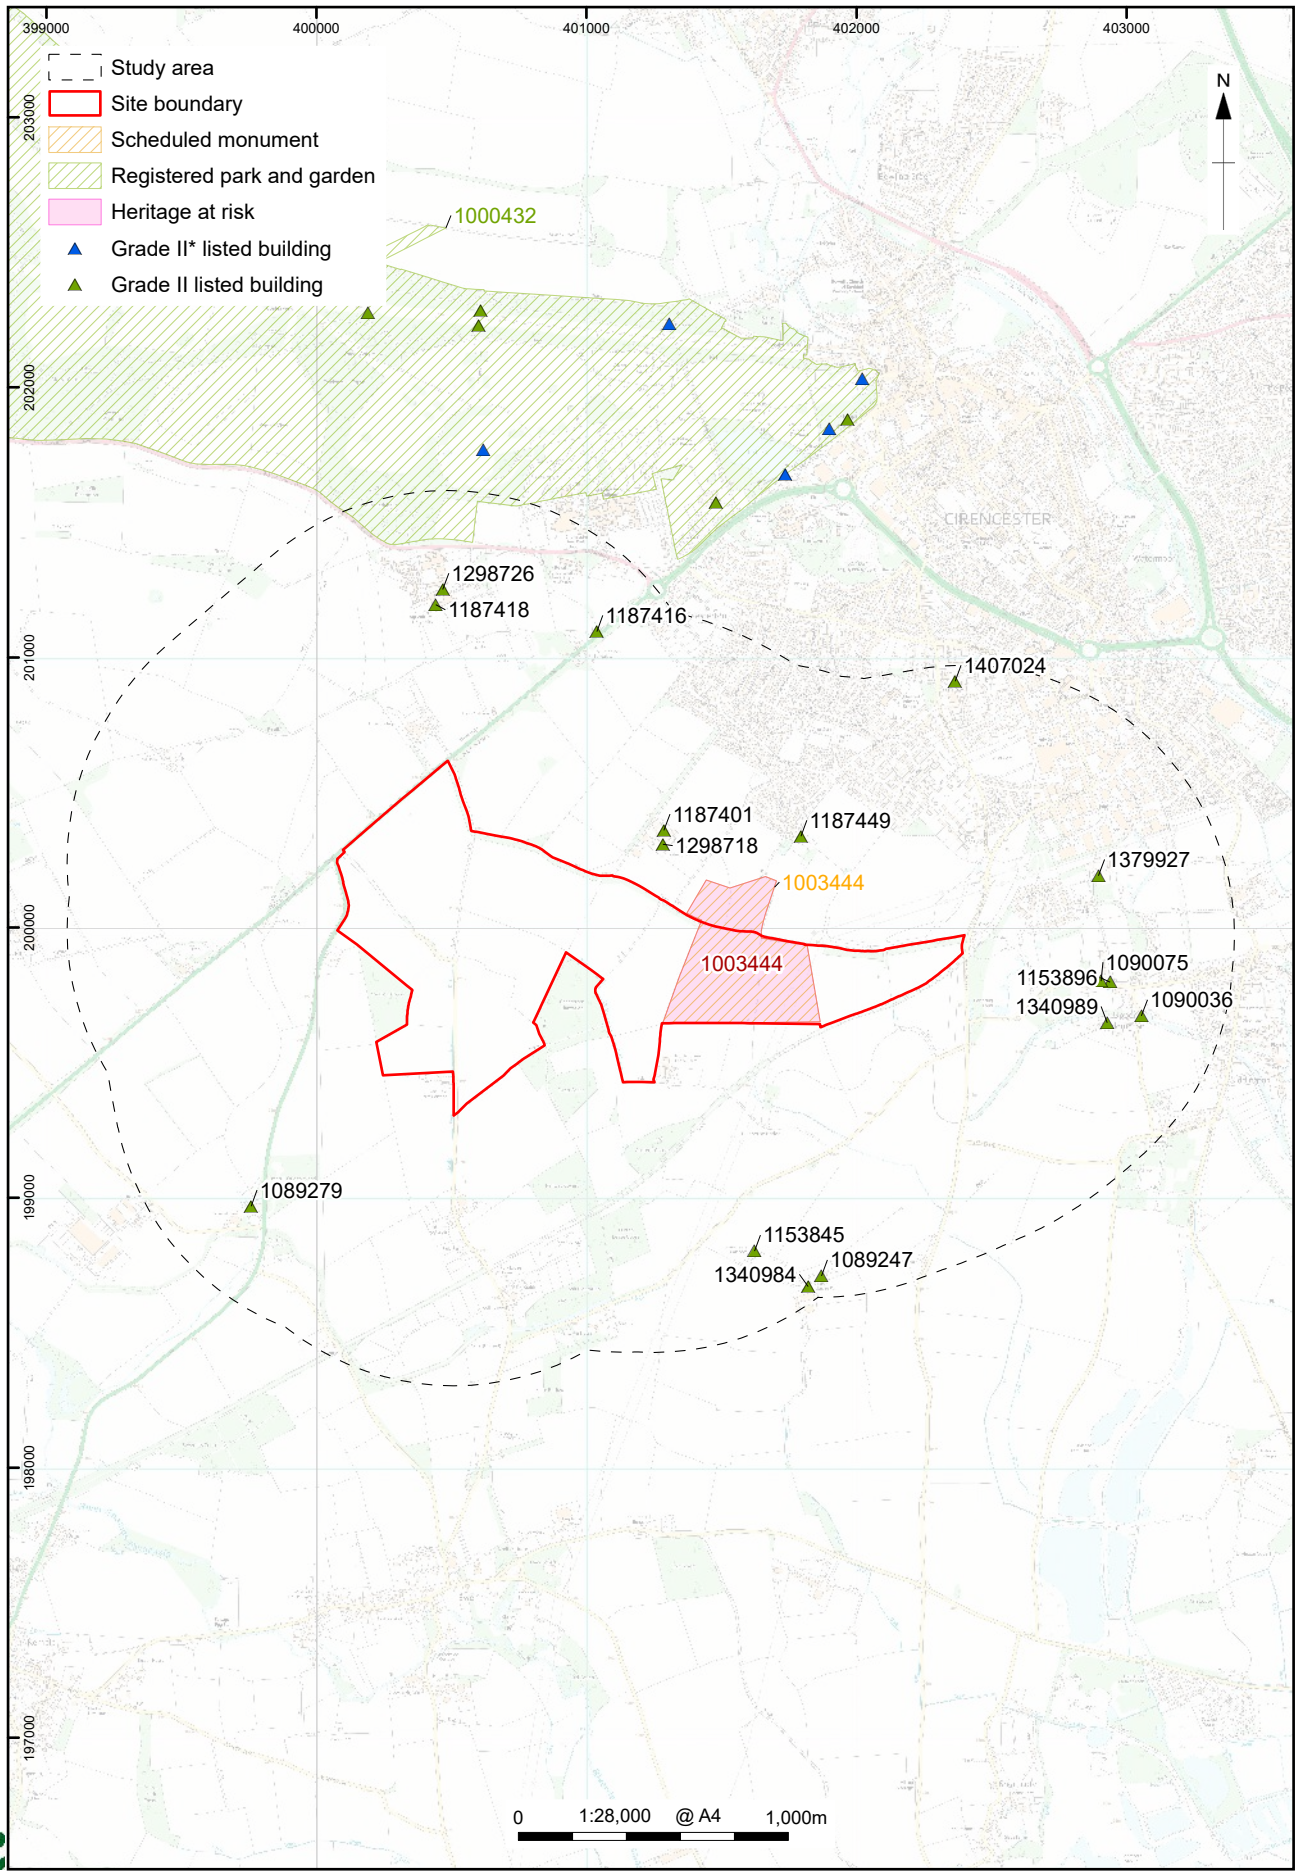


This assessment has identified that development within this potential allocation could result in **substantial harm** to a scheduled monument and listed buildings that share intervisibility with the site, as well as archaeological remains within the site. It could also cause **less than substantial harm** to the heritage significance of listed buildings in the surrounding area and the historic settlement pattern of the area. Although it would not be possible to prevent development of the scale and extent proposed for this allocation from causing this harm, it may be possible to reduce its impact through appropriate design mitigation. This would include avoiding built development in the east of the site and along its western edge, as well as the use of sensitive, considerate design in the final development proposals.

Heritage Constraint Rating: High

The site is considered to have an overall heritage constraint rating of High (i.e. the site contains historic environment constraints that would prevent part or all of the site from being developed). Development should be avoided in the east of the site and along its western edge in order to avoid impacts on the scheduled monument and surrounding listed buildings. A reduction in potential harm could be achieved through design mitigation measures and a programme of archaeological investigation, but would not entirely prevent it due to the proposed scale of the allocation.

Heritage constraints are likely to influence the scale of development that could be accommodated within this allocation, and there are parts of the site which may not be appropriate for development on heritage grounds. Subject to



appropriate design and layout controls, parts of the site may be capable of accommodating development.

Site Reference	DA5-DA32
Town	Down Ampney
Site Name	Strategic extension to the north, east and south of Down Ampney
Proposed allocation use	Residential development
Number of dwellings	2,050

Brief description of site:

The site covers an area of *c.* 133ha to the north-west, north, north-east, east and south-east of the village of Down Ampney, *c.* 8.5km south-east of the historic core of Cirencester. It encompasses agricultural fields, predominantly arable, in the immediate vicinity of the village (Fig. DA5-DA32.1).

The site predominantly comprises large arable fields, though some are meadow, and the small area to the immediate east of the village is pasture. The site is truncated by roads to the neighbouring villages of Poulton to the north, Meysey Hampton to the north-east, and Marton Meysey to the east. Where field boundaries are present within the site, these are hedgerows dotted with mature trees; hedgerows with mature trees also line the roads. Small blocks of woodland are present within the eastern part of the site, adjacent to roads.

The site sits within the Ampney Brook catchment and comprises a relatively level, flat landscape, with minor undulations and a slight rise northward, to the north of the village, with elevations of between approximately 85 and 90m aOD. The site lies within the designated boundary of Cotswold Water Park, although the closest lake within the water park is approximately 1.4km to the west of the site at the nearest point.

Significance of designated heritage assets in the site:

There are no designated heritage assets within the site.

Significance of designated heritage assets in the environs of the site which could be affected by the allocation of the site:

A number of designated heritage assets have been identified within a 1km radius of the site, the majority being listed buildings, largely concentrated either within Down Ampney village or Down Ampney Conservation Area approximately 580m south-west of the present village centre, which is centred around the manor house and church (Fig. DA5-DA32.2). There are also two scheduled monuments within a 1km radius.

The furthest scheduled monument from the site is, Settlement at Bean Hay Copse (1003446), a probable prehistoric and/or Roman period settlement

identified from cropmarks visible on aerial photographs. Its significance is largely archaeological, based on its potential to retain well-preserved waterlogged deposits due to its location on an historic flood plain on the gravel beds of the Upper Thames. The scheduled monument is considered to be of **high significance**.

The second scheduled monument is much closer to the site, within the present village itself, and is the Village Cross (1015133). Wayside crosses are one of several types of Christian cross erected during the medieval period, most between the 9th and 15th centuries, and over 350 are known nationally, largely concentrated in the south-west of England. They contribute significantly to an understanding of medieval religious customs and sculptural traditions and to knowledge of medieval routeways and settlement patterns. Most wayside crosses which survive as earth-fast monuments, except those which are extremely damaged and removed from their original locations, are scheduled. The Down Ampney wayside cross, despite the shaft and head being later 19th century additions, survives well with many original 14th century elements intact. The structure itself is Grade II listed (1089939). The cross is situated within a small triangular green at the western extent of the village centre on the approach from the main road to the village from the A419 to the west. It is approximately 55m east of the western part of the site. The cross is considered to be of **high significance**.

In addition to the Village Cross, the other nine listed buildings within Down Ampney Village are all Grade II listed. As the present village essentially originated as a roadside agricultural settlement, it is not surprising that they are located along the main winding south-west/north-east road through it. The earliest of these buildings are 17th and 18th century cottages, located towards the north-eastern extent of the village (1304885 and 1152162), the remainder being of early-mid 19th century date, comprising three pairs of semi-detached estate cottages dotted through the village (1152171, 1089938 and 1152159), two larger, detached dwellings (1089937 and 1089936), one a former farmhouse, the former vicarage (1089934) and the primary school (1089935). Later infill structures have largely respected the original building line and are set back from the road. More modern development has occurred beyond this linear strip, to the north, and rear of the roadside buildings at Chestnut Court and Suffolk Place, and, currently under construction, at Overlord Way, within the eastern part of the village. This modern development, along with existing property boundaries and mature vegetation, and the intrinsic nature of the immediate setting of these listed buildings within their own grounds, significantly restrict intervisibility between these heritage assets and the site. Despite this, the three Grade II listed cottages at the eastern extent of the

village, Pear Tree Cottage (1152162), Cottage immediately south of Pear Tree Cottage (1089937) and Hampton Cottage (1304885), less surrounded by adjacent properties, have the potential to be affected by the site's allocation. These listed buildings within Down Ampney are considered to be of **high significance**.

Down Ampney Conservation Area (CONARA/118) incorporates the early settlement, centred around the manor house and church. No appraisal has yet been produced, but its significance is based on its historical and architectural interest, incorporating the earliest and most impressive buildings at Down Ampney, the church, first consecrated in 1265 (1089941) and the late 15th century manor house (1341033), replacing a predecessor dating to the 1300s, both Grade I listed, as well as on archaeological interest in relation to the location of the earlier village and associated sub-surface potential. The conservation area boundary extends eastwards to include Sycamore Walk, an avenue lined with sycamore trees which extends through 19th century managed parkland to the main manor gates, and is aligned broadly parallel to a concrete-surfaced lane, likely associated with the World War II airfield, which meets Oak Road to the east. Ampney Brook runs to the west of the conservation area. There are nine listed buildings within Down Ampney Conservation Area. The previously mentioned Grade I listed Church of All Saints (1089941) and Down Ampney House (1341033) with an additional seven Grade II listed buildings. These, with the exception of Home Farm (1304888), are associated with the two Grade I listed heritage assets and comprise gatepiers at Down Ampney House (1089940) and five sets of funerary monuments within the churchyard (1304899, 1152207, 1152212, 1089942 and 1341034). The conservation area and associated listed buildings are considered to be of **high significance**.

There are an additional two Grade II listed buildings at Castle Hill Farm (1304915 and 1341032), *c.* 690m east of the site. These are considered to be of **high significance**.

Distance, intervening topography, and mature vegetation suggests that there is a low possibility of intervisibility or other meaningful connection between the site and designated heritage assets beyond a 1km radius.

Significance of non-designated heritage assets in the site:

Several non-designated heritage assets have been recorded within the site (Figs. DA5-DA32.4-5), comprising:

- the site of a probable Bronze Age round barrow seen as cropmarks on aerial photographs (26806) identified within the north-western part of the site. This is not visible at surface level, so must have been plough

levelled. Sub surface remains of a former round barrow would likely be considered of at least **medium significance**;

- an Iron Age and Romano-British period settlement to the north-east of the village within the site (3055). Elements of this have also been mapped as part of Historic England's National Mapping Programme (Fig. DA5-DA32. 7). Sub surface remains of a former prehistoric and/or Roman settlement would likely be considered of at least **medium significance**;
- three areas of former gravel extraction pits, also identified from cropmarks on aerial photographs, and interpreted as of late medieval or later origin, all located within the northern half of the site (26859, 26733 and 26734). These have also been mapped as part of Historic England's National Mapping Programme (Fig. DA5-DA32. 7). These are considered of **low significance**;
- an area within the northern part of the site, which also encompasses the possible Bronze Age round barrow site, incorporates a complex of enclosures of uncertain origin (3025). A second area of undated enclosures has been identified towards the western extent of the site (3136) with a possible trackway and field boundary further west still (26801). These have also been mapped as part of Historic England's National Mapping Programme (Fig. DA5-DA32. 7). If these are proved to be evidence of former settlement activity of the medieval period or earlier, they would be considered of **medium significance**. If they evidence agricultural or extractive activity of the later medieval or later periods, they are more likely to be of **low significance**; and
- within the southern part of the site, a possible ditch and drainage ditch of unknown date identified from cropmarks from aerial photographs (26732). In addition, to the immediate east, a possible former building (3023), and, within its mapped extent, and perhaps associated with it, six blast shelters associated with Down Ampney World War II airfield, with a further four blast shelters to the north of the village, also within the site (52514). The south-eastern extent of the site has been identified as lying within the mapped extent of the former airfield itself (21116). If any of these undated features are proved to be evidence of former settlement activity of the medieval period or earlier, they may be considered of **medium significance**. If they evidence agricultural, or extraction activity of the later medieval or later periods, they are more likely to be of **low significance**. Any sub-surface remains of the World War II airfield, or contemporary, associated features, would also likely be considered of **low significance**.

Significance of non-designated heritage assets in the environs of the site:

As well as identifying three heritage assets to the south of the site, two beyond a 1km radius, and the third of which is included also in the HER dataset as a non-designated heritage asset (rectangular enclosure/ 2415) and which is discussed below, the neighbourhood plan identifies a landscape area and nine key views, with the potential to be affected by the allocation of the site (Fig. DA5-DA32.3). These key views relate to one of the defining characteristics of Down Ampney as a traditional Cotswold settlement in open countryside, where the households have easy access to footpaths. Four of these views, from within the western part of the village facing south-south-east and south-west will not be affected by the site's allocation. The others, the westernmost and the four easternmost, may be affected. The significance of these views does not appear to be based on their heritage (architectural, historic, archaeological or artistic) interests, so do not require further consideration in this assessment.

A further 61 non-designated heritage assets are mapped within a 1km radius of the site (Figs. DA5-DA32.4-5). These are similar in character and period to those evidenced within the site itself. They include twelve heritage assets evidencing probable prehistoric or Roman activity, comprising enclosures, settlements and field systems, several of which are also mapped by the National Mapping Project (Fig. DA5-DA32.7). A possible round barrow and a Roman coffin, and some findspots of the prehistoric period are also known within a 1km radius. Most are located to the east, south or west of the site (Fig. DA5-DA32.4). Several former gravel pits, typical of the Cotswold Water Park area, are also known from the wider area, and field boundaries and enclosures further demonstrate the continued importance of agriculture to the economy in the medieval and post medieval periods (Figs. DA5-DA32.4-5).

During World War II, Down Ampney airfield was established to the south of the village, and included blast shelters and military buildings, as well as the airfield itself, some elements if which extend to within the site boundary itself (Fig. DA5-DA32.5). There are also 27 undated heritage assets within a wider 1km radius of the site, including enclosures, trackways, boundaries etc (Fig. DA5-DA32.4).

Owing to their archaeological interest, assets dating from the prehistoric to later medieval periods are generally considered to be of **low to medium significance**, while any deposits/ materials dating to post-medieval agricultural use are of comparatively **low significance**. Where HER records include designated heritage assets such as listed buildings, or scheduled monuments, they are considered to be of **high significance**.

Historic landscape character of the site (and significance):

The site lies within the designated boundary of Cotswold Water Park. Cotswold Water Park was established in 1967, in recognition of the growing significance and opportunities presented by the many lakes created through the restoration of extensive areas of former gravel working within the Upper Thames Valley. The Cotswold Water Park landscape character assessment maps the site within Character Area Type 3: River Basin Clay Vale, and more specifically, Area 3B: Down Ampney and Meysey Clay Vale Lowland (LDA Design 2009). This comprises a low lying, predominantly flat floodplain landscape, dominated by arable agricultural fields, generally large in size. Hedgerows tend to be medium in height adjacent to roads, and low, well maintained and regularly trimmed when forming divisions between fields. Numerous copses are located in the vicinity of the village of Down Ampney, including Horseground Covert, Poplar Wood, Gally Leaze Copse, The Grove and Bean Hay Copse and all are associated with estate farmland. Coniferous linear copses prevail around the perimeter of the disused airfield, whilst elsewhere copses tend to be predominantly deciduous and more irregular in shape. Generally, this part of Cotswold Water Park has experienced much less gravel extraction, and the landscape character is more influenced by agricultural intensification than restoration to lakes.

According to the Gloucestershire Historic Landscape Characterisation (HLC; Gloucestershire County Council 2007) land within the site comprises several character area types. At the far south-western extent, the land is defined as type D3R, the rest of the western part being within type A3. The central northern section is within type A4P, and the remainder, the eastern and south-eastern elements, within character area type A3M (Fig. DA5-DA32.8).

Character type A relates to former unenclosed cultivation, now enclosed. A3 more specifically, is defined as regular organised enclosure ignoring former unenclosed cultivation patterns, and 'm' denotes rich, wet grassland. A4 is less regular organised enclosure partly reflecting former unenclosed cultivation patterns, and 'p' denotes the presence of parliamentary enclosure. These both originate from non-parliamentary large-scale organised enclosure during the 18th and 19th centuries. Character type D3 is defined as floated water meadow system. This character type, too, is of post medieval origin, probably dating from the 17th to 19th century.

These landscape character types are considered to be of **low significance**, as post medieval enclosure is a common character area within Gloucestershire.

Contribution of the site to the significance and setting of known heritage assets:

The distance of the site from the scheduled prehistoric and/or Roman settlement at Bean Hay Copse (1003446), as well as resulting lack of intervisibility and other known relationships, results in the site in its present form providing a **neutral contribution** to its significance, which derives predominantly from sub-surface archaeological potential and survivability.

The other scheduled monument with the potential to be affected by the allocation of the site, is the Village Cross, which is also Grade II listed, (1015133/1089939). Historic England's National Heritage List Entry states that the cross is thought to occupy its original, medieval location, although the triangular green in which it is presently situated post-dates the Tithe Map of 1843. The Tithe map also shows cottages to the west of the cross's location in 1843, showing that the built form of the village once extended westwards from its present limits, and west of the site's south-western boundary. The historic estate was modernised in the mid to late 19th century, which, in the vicinity of the cross, resulted in a realigned and straightened local stream (with some segments were culverted), creation of the triangular village green which surround the cross, and the loss of the buildings to the west of the village. From this date onwards the green and village cross marked the entrance to the village from the west. In addition, in 1878 the cross was restored, with the provision of a new cross shaft and head. The setting of the restored cross has changed little since the mid-late 19th century, when many of the listed buildings in the village date to.

The Village Cross's significance derives from its structural, historic and architectural components, rarity, and setting as a waymarker at the on the edge of the village (though the village itself is thought to have been relocated from its location at the church and manor house to the south following the Black Death). Despite more modern alterations in this part of the village, in the form of new dwellings to the immediate east, and a gas cabinet and Thames Water site to the west, the cross remains a key feature on entry to the village and is readily recognisable on the approach into the village from the agricultural hinterland. Views on the western approach into the village take in the agricultural land in the south-western part of the site, the triangular green and Village Cross, with the village beyond. These views allow the rural character of the approach, and the 19th century entrance to the village created as part of estate improvements, to be understood, as well as the function of the cross as a waymarker for the village. As a result, the visible agricultural landscape within

the site on the approach to the cross and village can be seen to make a **low positive** contribution to the setting of the cross.

The linear roadside village of Down Ampney contains nine additional Grade II listed buildings. Their significance derives primarily from their architectural and historic interest, although their rural setting also contributes to their significance by helping them to be understood as part of a historic estate village and agricultural landscape. The site currently makes up to a **low positive** contribution to the setting of these buildings by maintaining this agricultural context. This contribution is limited in places where existing buildings and vegetation reduce intervisibility between the site and the heritage assets.

Hampton Cottage (1304885) a late 17th century cottage, Pear Tree Cottage (1152162) an early 18th century cottage, and the 19th century cottage to the south of Pear Tree Cottage (1089937) are Grade II listed buildings situated at the eastern extent of the village. These buildings are less screened from the surrounding landscape than the other listed buildings within the village. While the rural setting of these assets has been eroded by modern residential development at Broadleaze, to the north-west, Overlord Way to the east and The Croft, at Rooktree Farm Court, to the east of these heritage assets, the site in its present form provides a swathe of agricultural land to the north, east and south, retaining elements of their rural setting, less screened than the remainder of the village. As a result, the site can be seen to make a **low positive** contribution to the setting of these three Grade II listed buildings.

The site forms part of the rural landscape to the north of Down Ampney Conservation Area (CONARA/118), which is situated, at its closest point, *c.* 255m to the south. The conservation area is centred on the manor house (1341033) and church (1089941) which are associated with the medieval village, before it was relocated to its present location. An additional seven Grade II listed buildings or structures are situated within the conservation area. Distance, intervening topography, woodland blocks at Scrubs Copse and to the south of the easternmost part of the site, modern dwellings to the south of the village core and mature vegetation alongside the road between the conservation area and Down Ampney, mean that there is no intervisibility between the conservation area, and its listed buildings, and the site. This is applicable, even to the spire of the Grade I listed All Saint's Church (1089941) which is well screened by mature trees within the landscape. Thus, the site provides a **neutral** contribution to the significance of the conservation area and six of the seven listed buildings within it. However, the site does have associations with the manor house, Down Ampney House (1341033), as it forms part of its historic agricultural estates. The current field layout largely

respects that shown on historic Ordnance Survey maps, and the tithe map, except the south-western extent. As a result, the site provides a **low positive** contribution to setting of the house, historically part of its functioning agricultural estate.

For the two Grade II listed buildings at Castle Hill Farm, located to the east of the site, distance, intervening topography, mature vegetation and modern farm buildings result in very limited intervisibility with the allocation. Although there are some distant views of the farm from the site, these are dominated by modern agricultural sheds, with the historic buildings visible only as glimpsed rooflines beyond. As these views do not make a meaningful contribution to the appreciation of the farm's significance, the site is considered to make a **neutral** contribution to the setting and significance of these heritage assets.

Impact assessment:

The site has been identified as providing a maximum of a low positive contribution to known designated heritage assets, in terms of its contribution to the setting of heritage assets of high significance, specifically the scheduled and Grade II listed Village Cross (1015133/1089939), the three Grade II listed cottages towards the eastern extent of the village (1304885, 1152162 and 1089937), and the Grade I listed Down Ampney House (1341033). This is due to its current character as undeveloped agricultural land associated with the estate. The introduction of modern built form will have an adverse impact on the setting of these heritage assets. Detailed designs of any proposed development are unknown but have the potential to result in an impact level of harm equivalent to **less than substantial**, through considered design, due to the erosion/removal of the rural setting of these heritage assets.

The allocation includes a possible Bronze Age round barrow in the north-western part of the site, within a wider area of enclosures, which although untested, have been postulated as of probable prehistoric or Roman origin. There are further areas of undated enclosures within the eastern part of the site and an Iron Age and Romano-British settlement within the north-eastern part of the site. Additional undated features are mapped within the southern part of the site, as is part of the World War II airfield and associated blast shelters. Historic gravel extraction pits also lie within the site. Development within the site would have a permanent negative impact on any surviving archaeological remains, resulting in **substantial** harm. Without appropriate investigation and mitigation measures, any development that disturbs archaeological heritage assets is unlikely to satisfy relevant national and local planning policy objectives.

The development of the allocation would change the historic landscape character of the site from post medieval enclosure to modern residential development, reducing the extent of these historic landscape types and eroding the post-medieval rural character of the landscape around Down Ampney. Given the size and scale of the site, this would have a negative impact on historic landscape character of the wider area, but as its significance is low, this would result in an overall level of **less than substantial harm**.

Cumulative impacts deriving from the allocation of the site:

No cumulative impacts are anticipated, as there are no known interacting heritage effects arising from this allocation in combination with other schemes or allocations that would give rise to additional harm beyond the impacts identified for the site itself.

Recommendations for minimising harm and maximising enhancement:

The allocation of the site has been identified as having the potential to result in a less than substantial level of harm in relation to setting impacts to a scheduled monument/Grade II listed Village Cross, three Grade II listed cottages and the Grade I listed Down Ampney House. Some level of harm is unavoidable, given the proximity of the site to these heritage assets, and the size and scale of the allocation, but mitigation measures could be implemented to aim to reduce such harm.

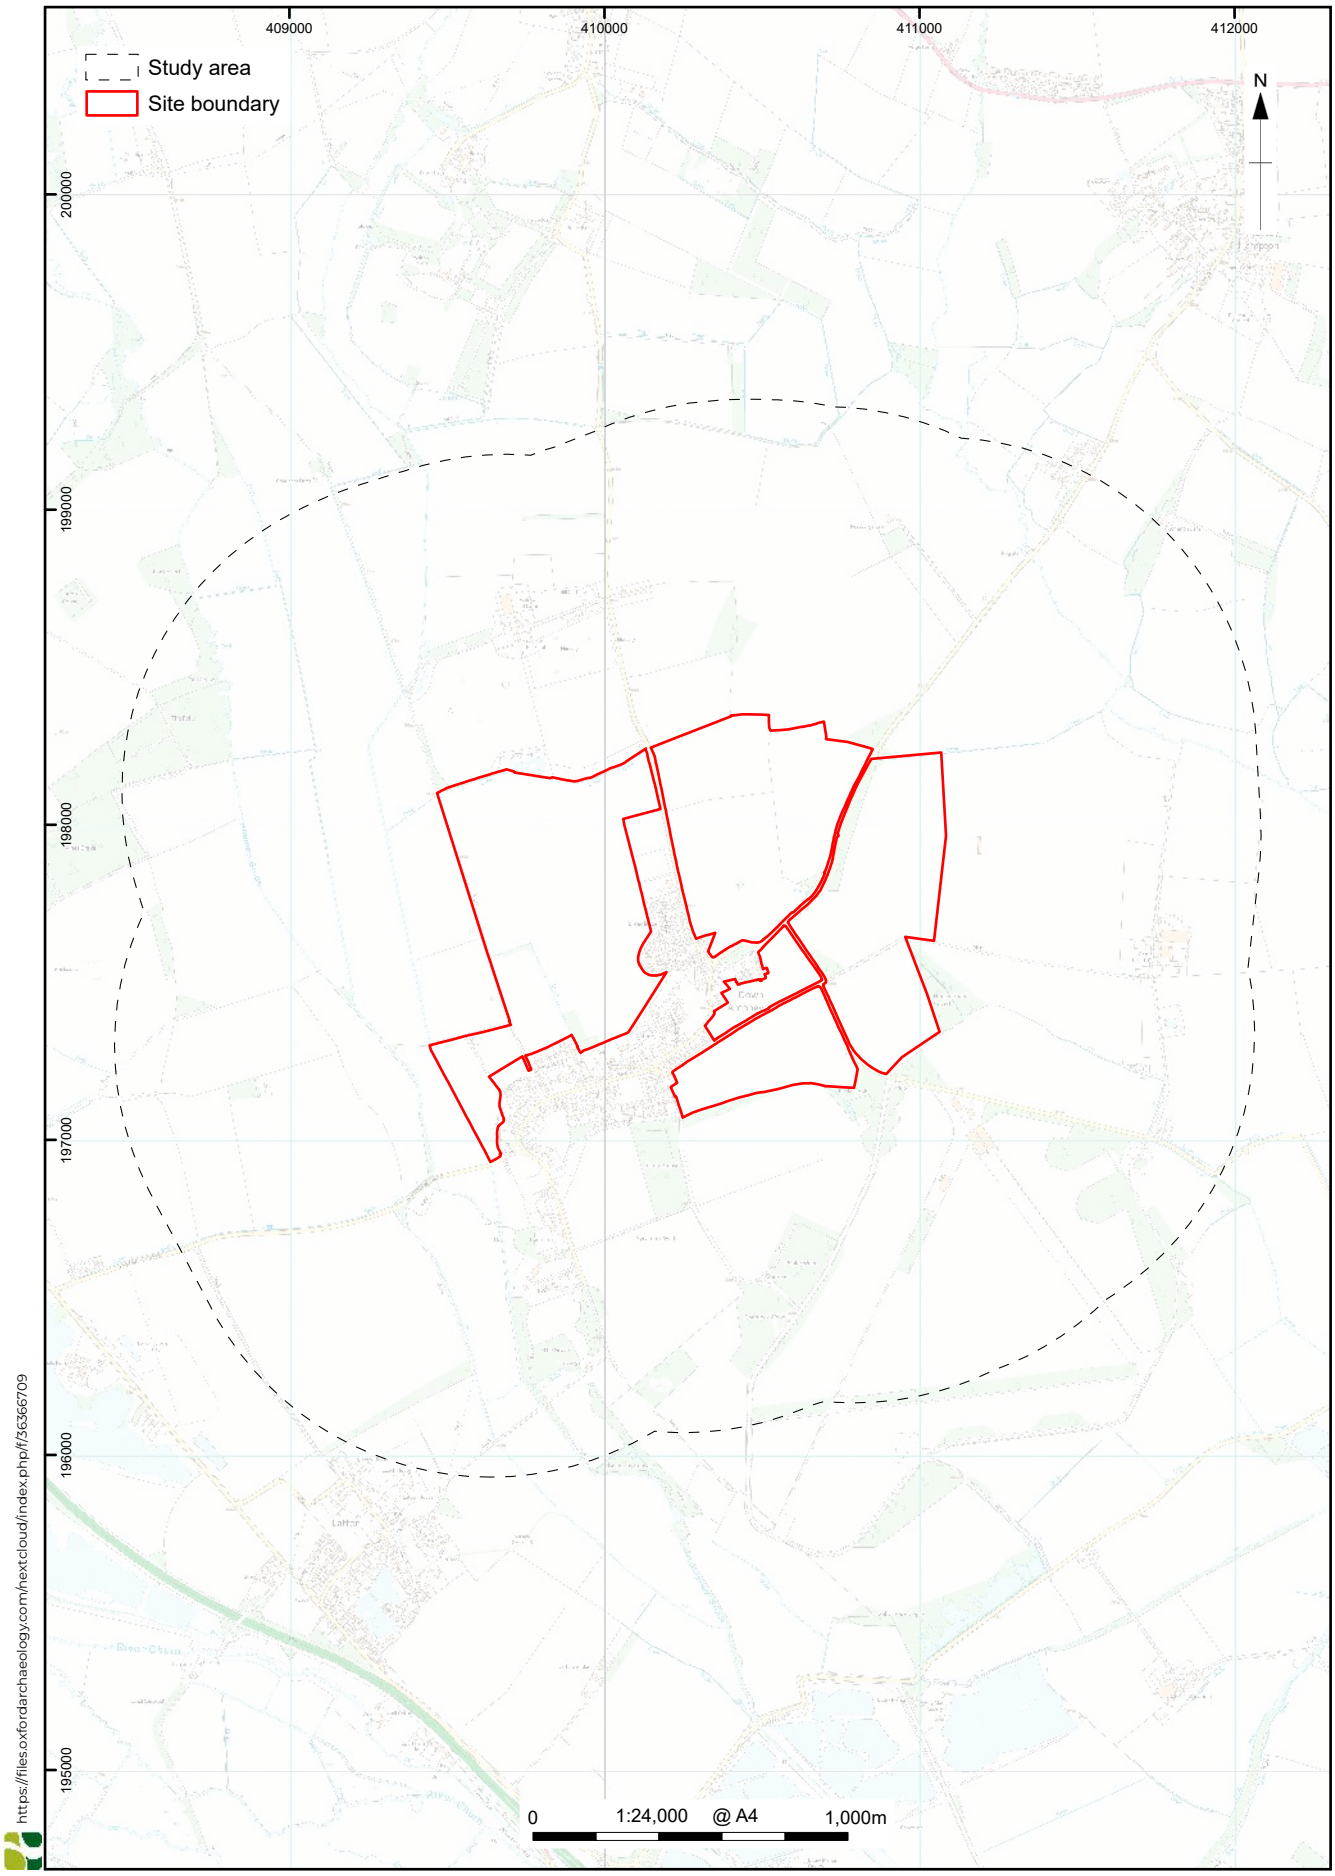
For the Village Cross, consideration could be given to leaving an undeveloped margin of land at the southern extent of the western extent of the site, north of Down Ampney Road, with the retention of extant boundaries. This would retain the agricultural, rural character on the approach to the village from the west, meaning that the cross would retain its present role, marking the western extent of the settlement.

For the three Grade II listed cottages in the east of the village, recent changes in the vicinity, including the modern residential development of Broadleaze to the north-west, Overlord Way to the east and The Croft, at Rooktree Farm Court, to the east, as well as tall vegetation forming property and field boundaries, have reduced intervisibility between these and the site. This is particularly applicable to those elements of the site to the south of these buildings. Development in these parcels of land will have minimal impact. However, the large field to the north of the listed buildings is partially visible, if only from the entrance gates to Pear Tree Cottage (1152162), and retains an open rural character setting. Similar to the western extent of the site, consideration could be given to setting any newly built form back from the road

to Meysey Hampton, as well as the retention of existing boundary vegetation and provision of any new access further north, from the road to Poulton. This would leave an undeveloped margin of land at the eastern extent of the village and retain an element of the present rural setting to the listed building. For the Grade I listed Down Ampney House (1341033) minimising harm through design is more difficult, due to no intervisibility, the identified harm being from loss of associated estate land, rather than noticeable changes to the physical setting of the structure itself. Consideration could be given to the preservation of field boundaries, where possible within any undeveloped areas of land, to help preserve elements of the layout of the former agricultural landscape within the allocation. This would also reduce harm, to some extent, to the anticipated level of less than substantial harm to historic landscape character, by helping to preserve the legibility of the present landscape. However, given the size and scale of the area to be affected, some impact to historic landscape character is unavoidable.

Given the known archaeological potential of the site, especially of the prehistoric and Roman periods evidenced within the site itself by the possible Bronze Age round barrow and Iron Age and Romano-British settlement, and further enclosures interpreted from cropmark features from aerial photographs, it is likely that a dedicated archaeological desk-based assessment that considers the archaeological potential of the site, and assesses the results of previous archaeological investigations in the area will be applicable. This would involve the examination of primary sources (historic maps and documents, aerial photographs, previous archaeological investigation reports and LiDAR) and a detailed walkover survey, all of which are beyond the scope of this present assessment. This could then be followed, as required, by geophysical survey and/or a programme of targeted archaeological evaluation trenching. This would help to understand the extent and character of surviving archaeological assets and inform a strategy to mitigate the impact of any subsequent development upon them. The results of any evaluation should inform design proposals for the allocation, particularly where archaeological remains of high or national significance are encountered and may require preservation in situ. Development should only occur after appropriate archaeological investigation has taken place, the full extent of impact is understood, and a strategy of mitigation is agreed with the Gloucestershire Planning Archaeologist.

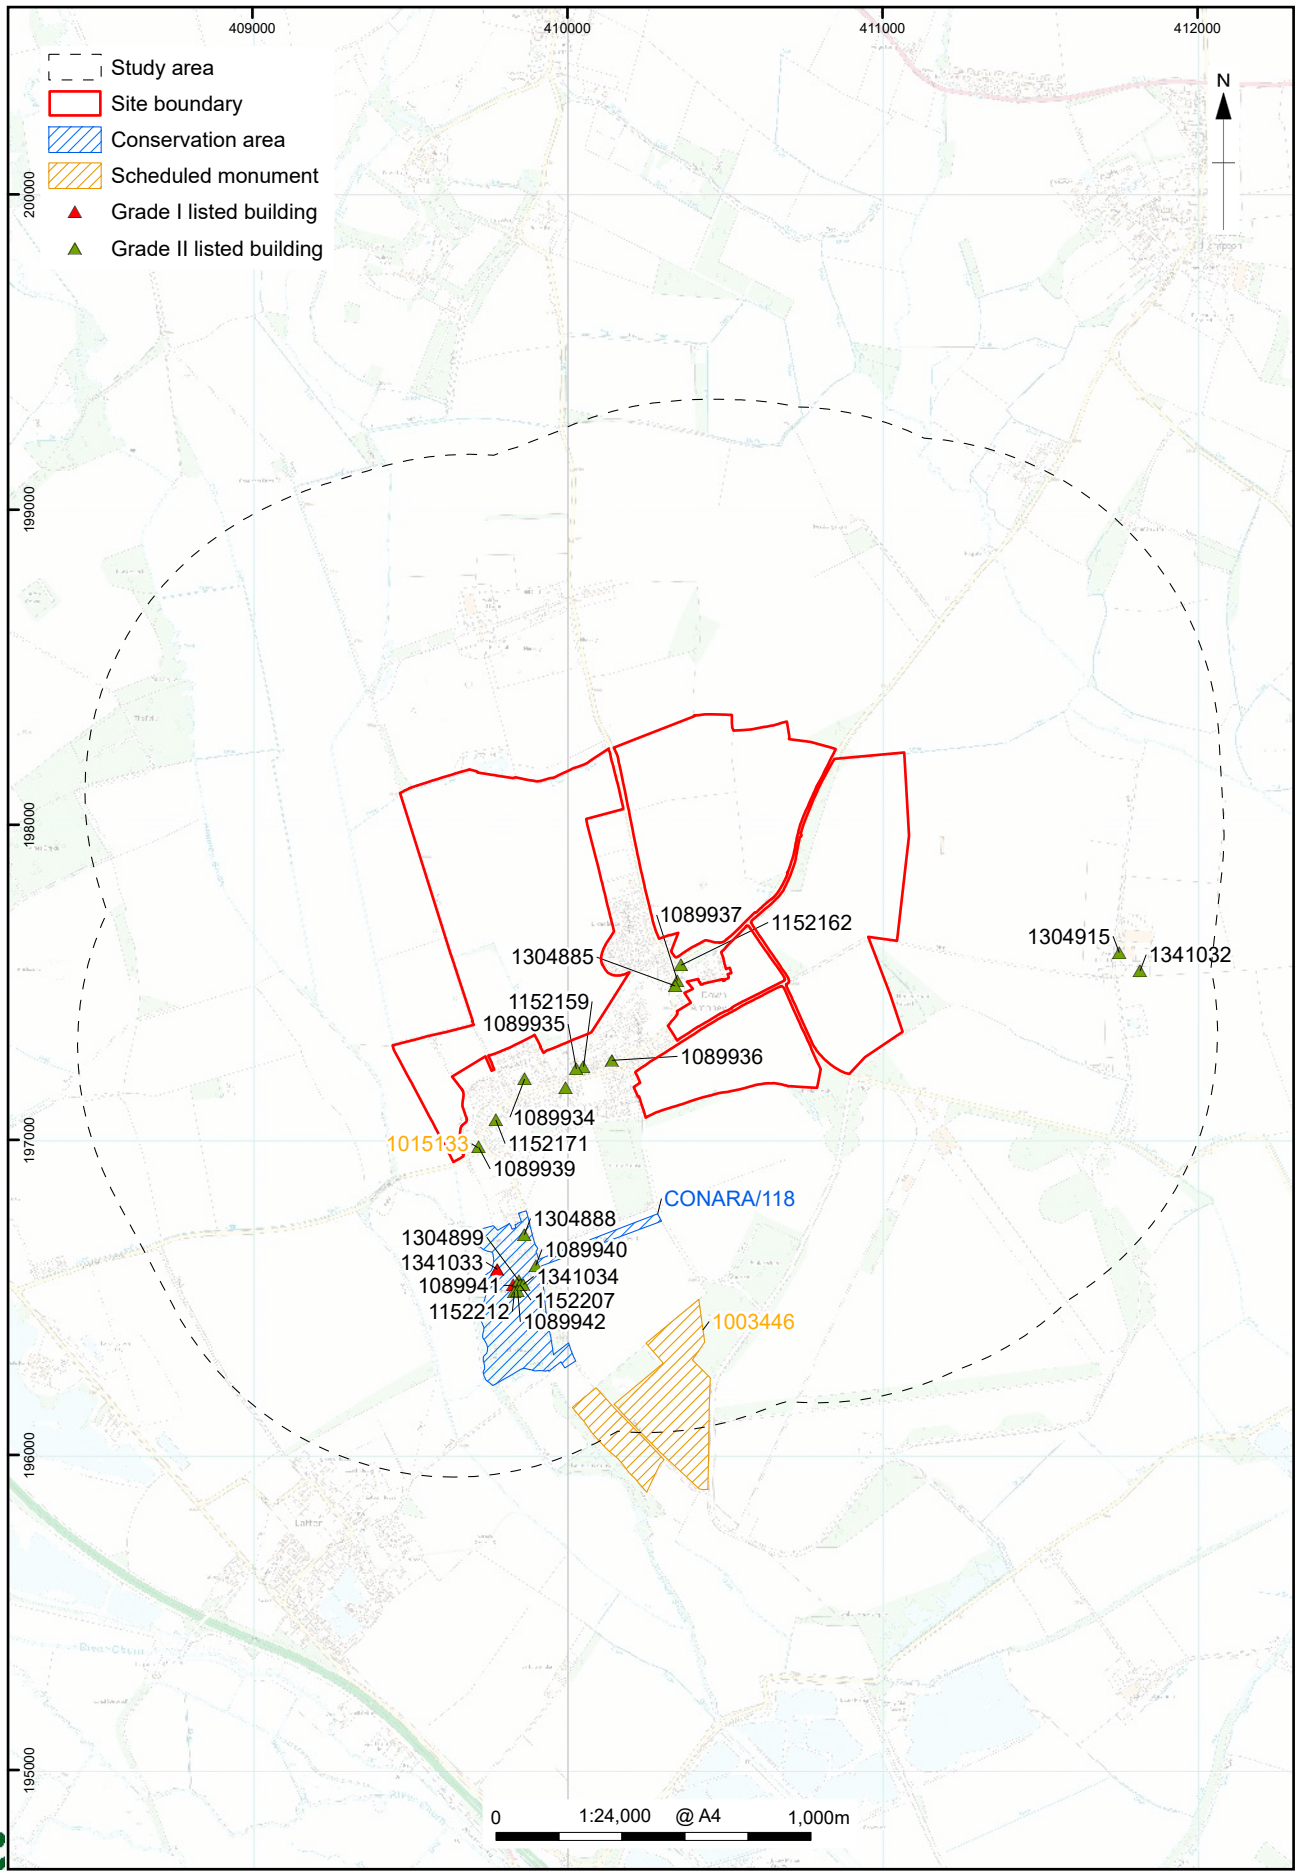
No opportunities for heritage enhancement are readily identifiable.



Conclusions and suitability:

It has been assessed that the progression of this site as a site allocation, through to final development, could result in a level of harm equivalent to less

than substantial harm to the heritage significance of a scheduled monument/Grade II listed Village Cross, three Grade II listed cottages, the Grade I listed Down Ampney House and historic landscape character. However, sensitive, considerate design of the final development proposals has the potential to reduce this.



Heritage Constraint Rating: Moderate

The site is considered to have a final heritage sensitivity score of **Moderate** (i.e. suitable for development subject to recommended mitigation or design controls).

Site Ref	F20A
Town	Fairford
Site Name	Land south-east of Fairford
Related policies	
Proposed allocation use	Residential development
Number of dwellings	109

Brief description of site:

The site is located immediately to the south-east of Fairford and covers c.5.75 hectares of agricultural land historically associated with Beaumoor Farm, which lies 50m to the west (Fig. F20A.1). The southern boundary of the site is not defined by any existing landscape features and passes through two agricultural fields. The remaining site boundaries follow existing field boundaries and are defined by hedgerows, with tracks and footpaths running along the northern and eastern boundaries of the site.

Fairford is situated within a broad, shallow valley associated with the River Coln. Land levels in the environs of the village generally rise in a north-westerly direction away from the river. The site itself lies on the south-eastern edge of Fairford on low-lying ground, ranging from approximately 85m AOD in the north-west to 82m AOD in the south-east, indicating a gentle fall towards the river. The settlement at East End and Morgan Hall Gardens, located to the west and north of the site respectively, occupies slightly higher ground, while the landscape to the east and south comprises lower-lying land associated with the floodplain of the Coln and the artificial lake to the east. Although the immediate environs of the site are characterised by low-relief topography, there are localised areas of higher ground in the wider landscape, notably at Horcott Hill to the south.

Significance of designated heritage assets in the site:

There are no designated heritage assets within the site.

Significance of designated heritage assets in the environs of the site which could be affected by the allocation of the site:

Fairford Conservation Area lies immediately to the north and c.100m to the west of the site. There is no formal conservation area appraisal; however, its development and character are outlined in the Fairford Character and Design

Assessment (2022)[1], which forms part of the evidence base for the Fairford Neighbourhood Plan. The conservation area derives its significance primarily from its historic and architectural interest, reflecting its development as a medieval and post-medieval market town. Its historic interest is expressed through its layout, including the High Street, historic routeways and market area, as well as its relationship with the River Coln and the surrounding agricultural hinterland. Its architectural interest derives from the consistent use of locally quarried limestone, vernacular forms and materials, and a concentration of 15th- to 19th-century buildings, including the Grade I listed Church of St Mary (1089998), four Grade II* listed buildings (1090001, 1305142, 1089954 and 1341028) and 100 Grade II listed buildings. The conservation area also has archaeological interest, with potential for buried remains associated with medieval and post-medieval settlement, historic plots and routeways.

The site adjoins the south-eastern part of the conservation area, known as East End (Fig. F20A.2). This area developed as a small rural hamlet on the edge of Fairford and contains a range of 16th- to 18th-century historic buildings, including the 18th-century Moor Farm, originally Beaumoor Farm, which contains the Grade II listed Moor Farmhouse (1305211); the 18th-century Grade II listed East End House (1089996); and the 16th-century Grade II listed Morgan Hall (1089970) and its associated park. Other notable features highlighted in this area include the track passing along the northern boundary of the site, Fieldway, which may have originated as a prehistoric trackway and later connected the settlement to its surrounding fields (Fig. F20A.3).

The 1971 Policy Statement for the conservation area defines Fairford as a unique market town with open country penetrating to the centre. The permeable settlement edge, with corridors of green space and rural land that break up the line of development, is therefore also considered to contribute to the character of this part of the conservation area.

The conservation area has a high level of architectural and historic interest and accordingly is considered to be of **high significance**.

The majority of the listed buildings within the study area are separated from the site by surrounding development and are unlikely to be affected by the proposed allocation. Moor Farmhouse (1305211) and Morgan Hall (1089970)

[1] Evidence base: Fairford Character and Design Assessment, March 2020, revised September 2022: https://www.cotswold.gov.uk/planning-and-building/planning-policy/neighbourhood-planning/fairford-neighbourhood-plan/

have been scoped into this assessment due to their proximity and historic relationship with the site.

The Grade II listed Moor Farmhouse (1305211) lies 115m to the west of the site. Moor Farmhouse originated in the early to mid-18th century as the farmhouse for Beaumoor Farm. It was later enlarged in the late 18th or early 19th century in response to evolving domestic and agricultural needs. The farmhouse is constructed in coursed rubble stone with a stone slate roof, in keeping with the local vernacular tradition, and it retains a number of key features such as gabled dormers, stone stacks and casement windows. Despite later alterations, including a 20th-century porch and extensions, the building preserves evidence of its original symmetrical plan and subsequent development, including its integration with an attached cottage range. The farmhouse has a high level of historic and architectural interest, derived from its surviving plan form, use of traditional materials and construction techniques, and incremental adaptation throughout the 18th and 19th centuries. The low-lying landscape to the south-east of the farmhouse, between the town and the river, including the site, was historically known as Beau Moor and appears to have been farmland associated with the farmhouse. As a result, it is considered to be of **high significance**.

The Grade II listed Morgan Hall lies c.180m to the north of the site. Morgan Hall originated in the late 16th century, when it was known as Bakers. It was later refaced and enlarged in the 18th century and, by at least the 19th century, was known as Fairford Lodge. The house has an E-shaped plan form and comprises two storeys plus an attic. It is constructed of local rubble stone, later rendered with roughcast finishes. Its significance arises primarily from the architectural and historic interest inherent in its built form, surviving historic fabric and architectural detailing. Its architectural interest arises from its phased development, rubble stone construction, stone slate roofs and mixture of casement and sash windows, which illustrate local vernacular traditions. The 18th-century alterations illustrate evolving architectural trends in the Georgian period. It has historic interest as a high-status dwelling that was reputed to have been a Cromwellian stronghold during the Civil War.

The hall is surrounded by gardens, which are separated from an area of parkland by a ha-ha. The gardens are shown on maps dating back to at least 1834 and included a walled garden. The garden wall and ha-ha fall within the curtilage of the listed building and contribute to its historic and architectural interest. Overall, Morgan Hall is considered to be of **high significance**.

Significance of non-designated heritage assets in the site:

Several non-designated heritage assets have been recorded within or immediately adjacent to the site:

- Fieldway (Fig. F20A.3), an early trackway shown on inclosure maps, may have prehistoric origins. The hedgerows on either side of the path are identified as a non-designated heritage asset in the evidence base for the neighbourhood plan. The trackway is considered to be of **medium significance** as a result of its archaeological and historic interest.
- Cropmark remains of a prehistoric or Roman settlement have been identified within the site (Figs. F20A.5 and F20A.8). These remains are indicative of surviving below-ground archaeological features and are considered to be of **medium significance** as a result of their archaeological interest.
- A disused segment of the East Gloucestershire and Witney Railway lies to the north-east of the site (Fig. F20A.6). The railway line is no longer extant, but its alignment is preserved by existing development and planting. It is considered to have **low significance** as a result of its historic interest.

Significance of non-designated heritage assets in the environs of the site:

The GHER records a further 73 non-designated heritage assets within the 1km study area (Figs. F20A.5-6). Owing to their archaeological interest, assets dating from the prehistoric to later medieval periods are generally considered to be of **local/low** or **medium significance**, while any deposits/materials dating to the post-medieval agricultural use of the study area are of comparatively **local/low significance**. Where GHER records refer to designated heritage assets such as listed buildings, registered parks and gardens, and scheduled monuments, they are considered to be of **high significance**.

Historic landscape character of the site (and significance):

The site forms part of the proposed River Coln Valued Landscape, which is defined in the Fairford Neighbourhood Plan. This area covers the site and the landscape to the south, which extends to the River Coln. The River Coln Valued Landscape aims to safeguard and enhance the riparian landscape to the south of Fairford and safeguard its ecological and wildlife value. While this is not a heritage designation, the description for the area notes that it contains a possible prehistoric or Roman settlement and that the fields within the site, Home Ground and Morgans Ground, contribute towards the rural setting of nearby listed buildings and Fieldway, which is an ancient trackway.

The Historic Landscape Characterisation (HLC) for Gloucestershire, The Cotswolds Area of Outstanding Natural Beauty (AONB) and the Wye Valley AONB describes the refined historic landscape character of the site as Type A3 x 'regular organised enclosure ignoring former open-cultivation patterns' (Fig. F20A.9). This type of enclosure is characterised by the organised enclosure of areas of former un-enclosed cultivation during the post-medieval period. The 'x' suffix indicates that the enclosure was not a result of parliamentary enclosure. This type of enclosure is considered to be of **local/low heritage significance**.

This area of regular organised enclosure lies to the west of an area of existing development (G4), which is made up of 18th-century farm buildings and later modern infill development. The landscape to the north (F1 - surviving post-medieval designed ornamental landscape) and south (D3r - floated watermeadow system), together with the surviving 18th-century farm buildings to the east, preserve the post-medieval rural character of East End and the landscape to the east of Fairford. Further to the north, this character has been eroded by modern development.

Contribution of the site to the significance and setting of known heritage assets:

The site comprises agricultural land located to the east and south of the Fairford Conservation Area. The adjacent part of the conservation area is characterised by the remains of a small agricultural hamlet, East End, which historically sat on the edge of the town.

The 1971 Policy Statement for the conservation area defines Fairford as a unique market town with open country penetrating to the centre. The Design and Character Assessment for the Neighbourhood Plan also notes the importance of the indented settlement edges and green spaces that permeate into the settlement. The agricultural land within the site contributes to the setting of the conservation area, by preserving the historic settlement edge and contributing to a corridor of green space that leads into the settlement between Morgan Hall and Moor Farm.

Views looking across the site towards the conservation area from the agricultural landscape to the south and east are dominated by trees, vegetation and fields, with partial views of buildings on the edge of the conservation area, including Moor Farmhouse. These views allow the conservation area to be appreciated within its original rural setting from the surrounding footpaths and former water meadows.

Overall, the site is considered to make a **high positive contribution** to the setting of the conservation area by allowing it to be appreciated as a rural settlement set within surrounding fields and watermeadows. The undeveloped character of the site helps to preserve the indented settlement edge in this area and contributes to a corridor of green space leading into the settlement from the east.

The rural character of the site is also considered to make a **low positive contribution** to the wider setting of the Grade II listed Morgan Hall. While there is no direct visibility between the listed building and the site due to planting along the southern edge of the park, the open and rural character of the site allows the origins of the listed building as a country house situated on the edge of Fairford to be better understood. To the north and east, this rural context has been eroded by modern development, and development within the site could result in the loss of this context.

As historic agricultural land associated with the Grade II listed Moor Farmhouse, the site is considered to make a **low positive contribution** to the setting of this listed building, allowing it to be appreciated as a former farm building set within surrounding farmland. This contribution is enhanced by partial views looking across the site from public rights of way, which take in the farmhouse and surrounding farmland.

The site and surviving agricultural land adjacent to the track make a high positive contribution to the setting of Fieldway, a non-designated ancient trackway shown on inclosure maps connecting the settlement to its surrounding fields. The agricultural character of the site allows the historic context and original function of the track to be better understood.

Impact assessment:

Having identified the surrounding designated heritage assets and assessed the site and its context, this assessment concludes that the site makes a **high positive contribution** to the setting and significance of the Fairford Conservation Area and a **low positive contribution** to the setting of two of the Grade II listed buildings in the environs of the site.

There are no designated heritage assets within the site. The allocation of the site would therefore not result in any direct impacts upon designated heritage assets. However, the site sits on the edge of the historic settlement of Fairford, within the rural setting of the Fairford Conservation Area and the Grade II listed buildings Moor Farmhouse and Morgan Hall.

Development within the site would expand the settlement beyond its current footprint and erode the corridor of green space that leads into Fairford between Morgan Hall and Moor Farm. Green space permeating into the settlement from the surrounding landscape is highlighted as a key characteristic of Fairford, and development would erode the green corridor leading into the settlement from the east, which would have a negative impact on this aspect of the conservation area's setting. Additionally, there are views from surrounding public rights of way looking across the site towards the conservation area, which allow the conservation area to be appreciated within its original rural context. These views preserve the connection between the settlement and the surrounding agricultural land and water meadows. Inappropriate development could result in the loss of these views and reduce the appreciation of this aspect of the conservation area's setting. Development of the allocation is likely to result in a level of impact of **less than substantial harm** upon the setting of the conservation area, with the potential for **substantial harm** should development proposals fail to respond to the setting and character of the neighbouring conservation area.

The rural open character of the site also positively contributes to the setting of the Grade II listed Morgan Hall. This listed building developed as a country house set within gardens and a surrounding park on the edge of Fairford. Modern development surrounding the park has already eroded the rural setting of the Hall to the north and east, leaving the agricultural land to the south, of which the site forms part, as the last remaining area of agricultural land surrounding the park. Development within this area would further reduce the rural character of the landscape surrounding the park, making its origins as a country house less appreciable. As there is no direct visibility between Morgan Hall and the site, the loss of the surrounding agricultural land would be considered to result in **less than substantial harm** to the setting of Morgan Hall.

The site forms part of the historic agricultural land associated with the Grade II listed Moor Farmhouse. While the farmhouse is no longer in agricultural use, its position on the edge of the settlement, overlooking the surrounding agricultural land, and the views looking back over the site towards the farmhouse from public rights of way allow it to be appreciated as a former farm building. Inappropriate development within the site would erode the rural character of the farmhouse in these views and could further separate the farmhouse from its historic rural context. As the landscape to the south-east, outside of the site, would still be retained, development within the site would likely result in **less than substantial harm** to the setting of this listed building.

The introduction of residential development into the site would also have a negative impact on the setting of the non-designated asset Fieldway, an ancient trackway which connected the settlement to its surrounding fields. The introduction of development and the loss of agricultural land from the site would make the original function of this feature less appreciable. The setting of this asset has already been eroded by the 19th-century railway line interrupting its original alignment and by areas of development to the north. The loss of agricultural land to the south would further erode the setting of this feature, resulting in **less than substantial harm** to this asset.

The development of the allocation would change the historic landscape character of the site from Type A3 x 'regular organised enclosure ignoring former open-cultivation patterns' to modern residential development, reducing the extent of this historic landscape type and eroding this post-medieval rural character of the landscape on the eastern edge of Fairford. This would have a negative impact upon local/low significance historic landscape character within this area resulting in **less than substantial harm**.

The allocation is situated within an area of cropmarks identified from aerial photographs, which are suggestive of a late prehistoric or Romano-British settlement. Development within the site would have a **permanent negative impact** on any surviving archaeological remains within the area resulting in **substantial harm** to these assets. Without appropriate investigation and mitigation measures, any development that disturbs archaeological heritage assets is unlikely to satisfy relevant national and local planning policy objectives.

Cumulative impacts deriving from the allocation of the site:

No cumulative impacts are anticipated, as there are no known interacting heritage effects arising from this allocation in combination with other schemes or allocations that would give rise to additional harm beyond the impacts identified for the site itself.

Recommendations for minimising harm and maximising enhancement:

The allocation site is situated on the edge of the conservation area, in close proximity to the Grade II listed Morgan Hall and Moor Farmhouse. Its open and rural character contributes positively to the rural character of these assets and it forms part of a green corridor which connects the settlement at Fairford to its surrounding agricultural landscape. As a result, development within the site is likely to result in **less than substantial harm** to the setting of the surrounding listed buildings, and **substantial harm** to the archaeological

assets within the site. Impacts on the setting of the conservation area are likely to result in **less than substantial harm** to its setting, however this could rise to **substantial harm** if development proposals fail to respond appropriately to the character of this area.

Given that its contribution to the setting of these assets lies predominantly in its open and undeveloped character, it is unlikely that this harm could be completely prevented. However, design measures could reduce the impact of the allocation. The western part of the allocation is the most sensitive, due to its proximity to the conservation area and nearby listed buildings. Preserving the western part of the site as open, undeveloped land would help to maintain the agricultural character of this area and preserve some views looking north-west across the site towards the conservation area and Moor Farmhouse from the adjacent water meadows and surrounding public rights of way to the south. It would also preserve part of the arable landscape alongside Fieldway and Morgan Hall park. The existing planting along the site boundaries, particularly alongside Fieldway where it currently screens the site from the trackway and the parkland associated with Morgan Hall, should be retained.

To reduce the impacts of the allocation, new development should be located in the less sensitive eastern part of the site and should be low density, comprising mainly detached or semi-detached buildings that mirror the character of the settlement to the west. Building heights should be restricted to respect the low-level town skyline and help preserve views between the town and the surrounding landscape. The use of local vernacular materials and building designs, including limiting building heights and using stone walls along plot boundaries, may also help to retain some of the rural character and integrate built development into the conservation area.

Considering the archaeological potential of the site, and the absence of previous archaeological investigation within its area, it is recommended that an archaeological desk-based assessment and programme of archaeological evaluation trenching is undertaken across the site prior to determination of any planning application. This would help to understand the extent and character of the surviving archaeological assets and inform a strategy to mitigate the impact of any subsequent development upon them. Development should only occur after appropriate archaeological investigation has taken place, the full extent of the impact is understood, and a mitigation strategy has been agreed with the Gloucestershire Planning Archaeologist.

Conclusions and suitability:

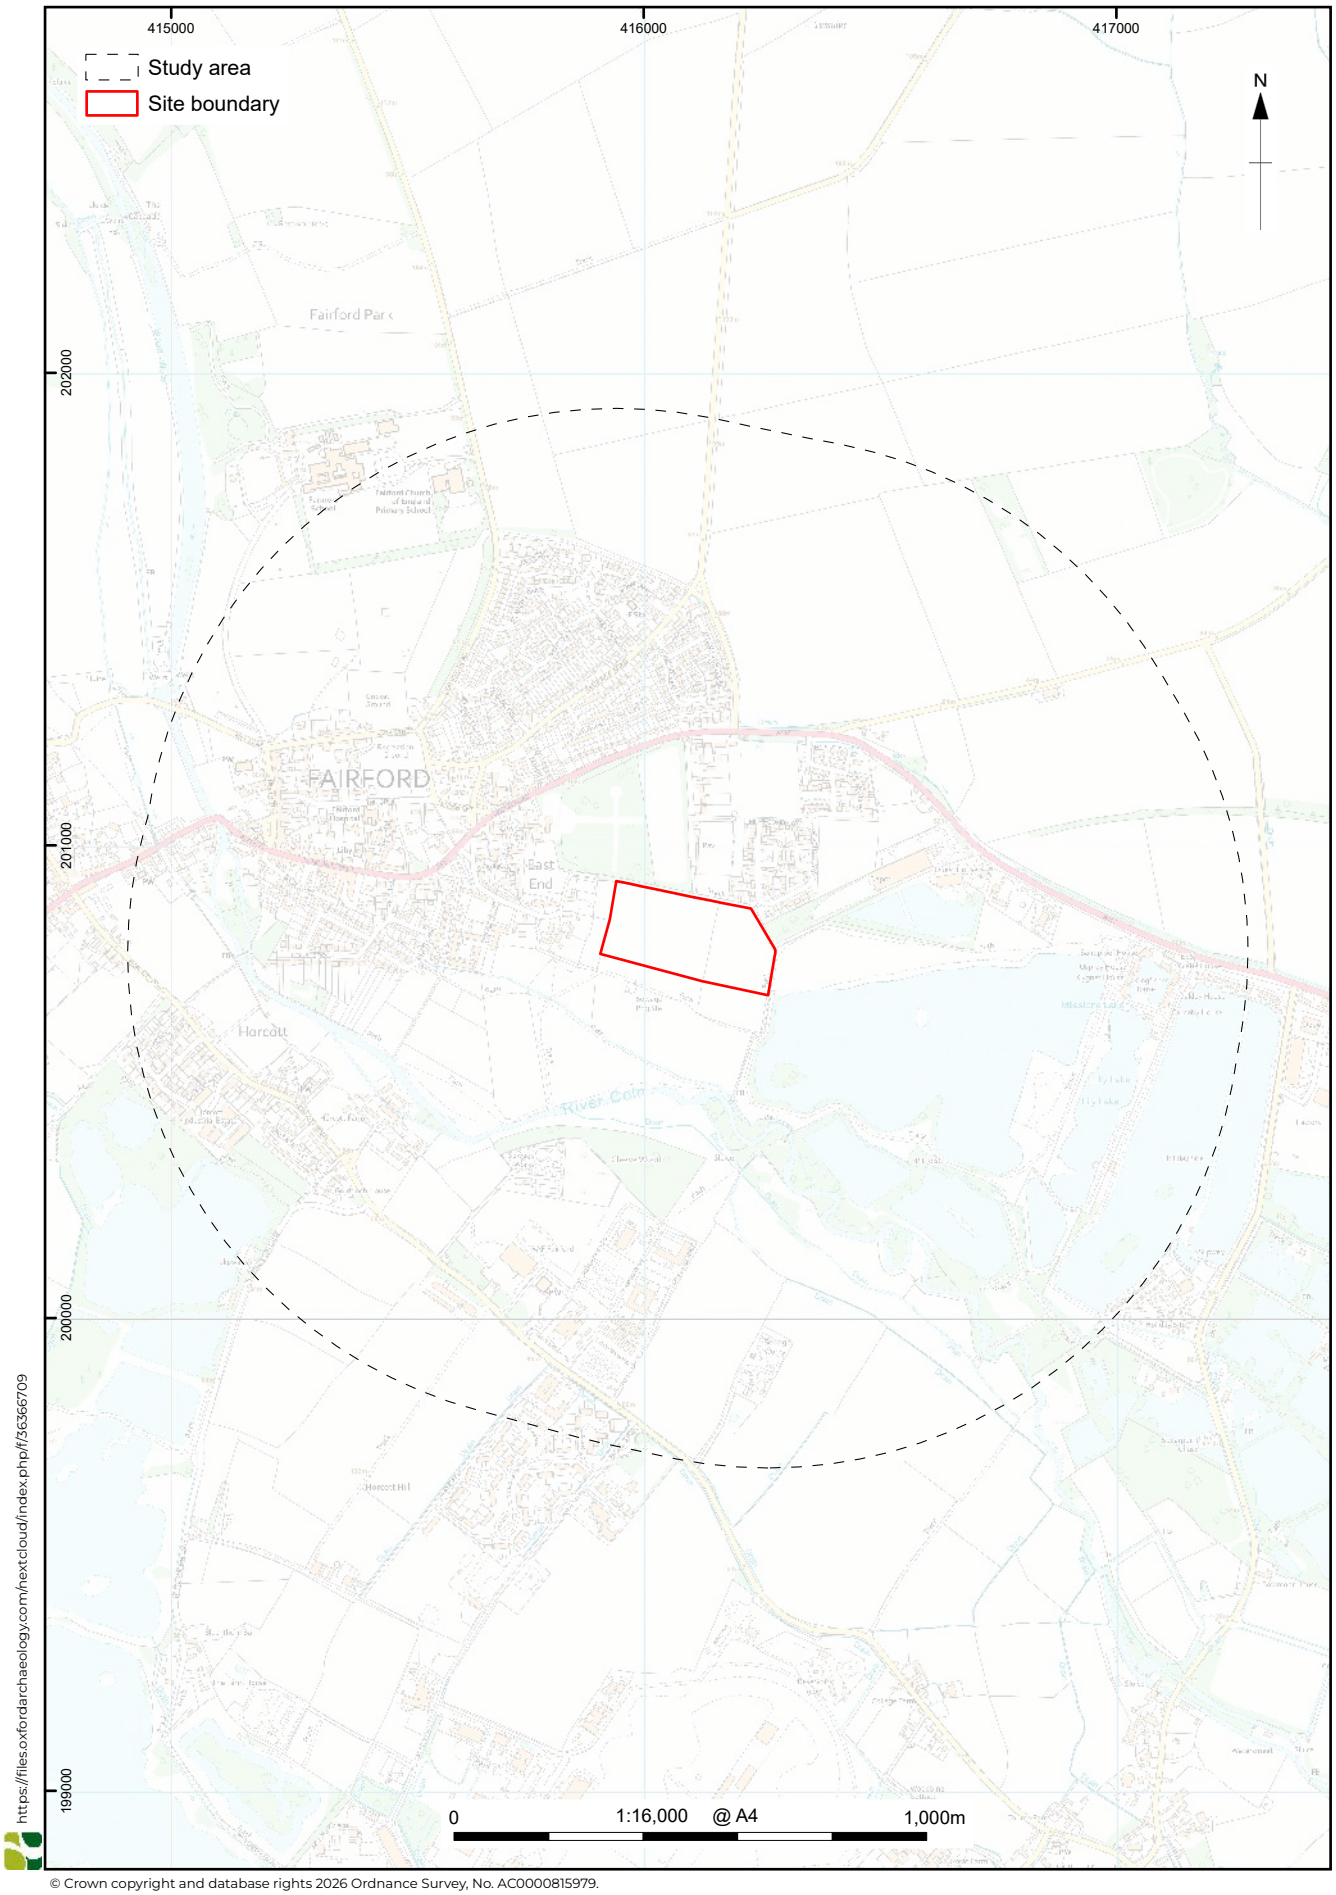
The site makes a high positive contribution to the setting of the Fairford Conservation Area and a low positive contribution to the setting of the Grade II listed Moor Farmhouse (1305211) and Morgan Hall (1089970). It also makes a high positive contribution to the setting of the non-designated heritage asset known as Fieldway. This contribution largely derives from the open and rural character of the site, which allows the historic settlement edge, nearby listed buildings and Fieldway to be better understood within their rural context.

Due to the site's location immediately adjacent to the south-eastern edge of the Fairford Conservation Area, and its proximity to Moor Farmhouse, Morgan Hall and Fieldway, development within the site has the potential to cause **less than substantial harm** to the setting of these listed buildings and the conservation area, this could rise to **substantial harm** to the setting of the conservation area if final designs for the development are inappropriate. This harm would arise principally from the erosion of the rural and undeveloped character of the land, the partial loss of the green corridor that penetrates into the settlement from the east, and the weakening of the historic relationship between East End and the surrounding agricultural landscape.

These impacts are likely to be experienced through the introduction of development into views across the site towards the conservation area and Moor Farmhouse from the surrounding public rights of way and water meadows, and the further separation of Morgan Hall and Moor Farmhouse from elements of their historic rural surroundings. Development would also reduce the connection between Fieldway and the surrounding fields.

The changes resulting from development within the allocation would alter the historic landscape character of the site from regular organised post-medieval enclosure to modern residential development. This would adversely affect the surviving post-medieval agricultural character of the landscape on the eastern edge of Fairford.

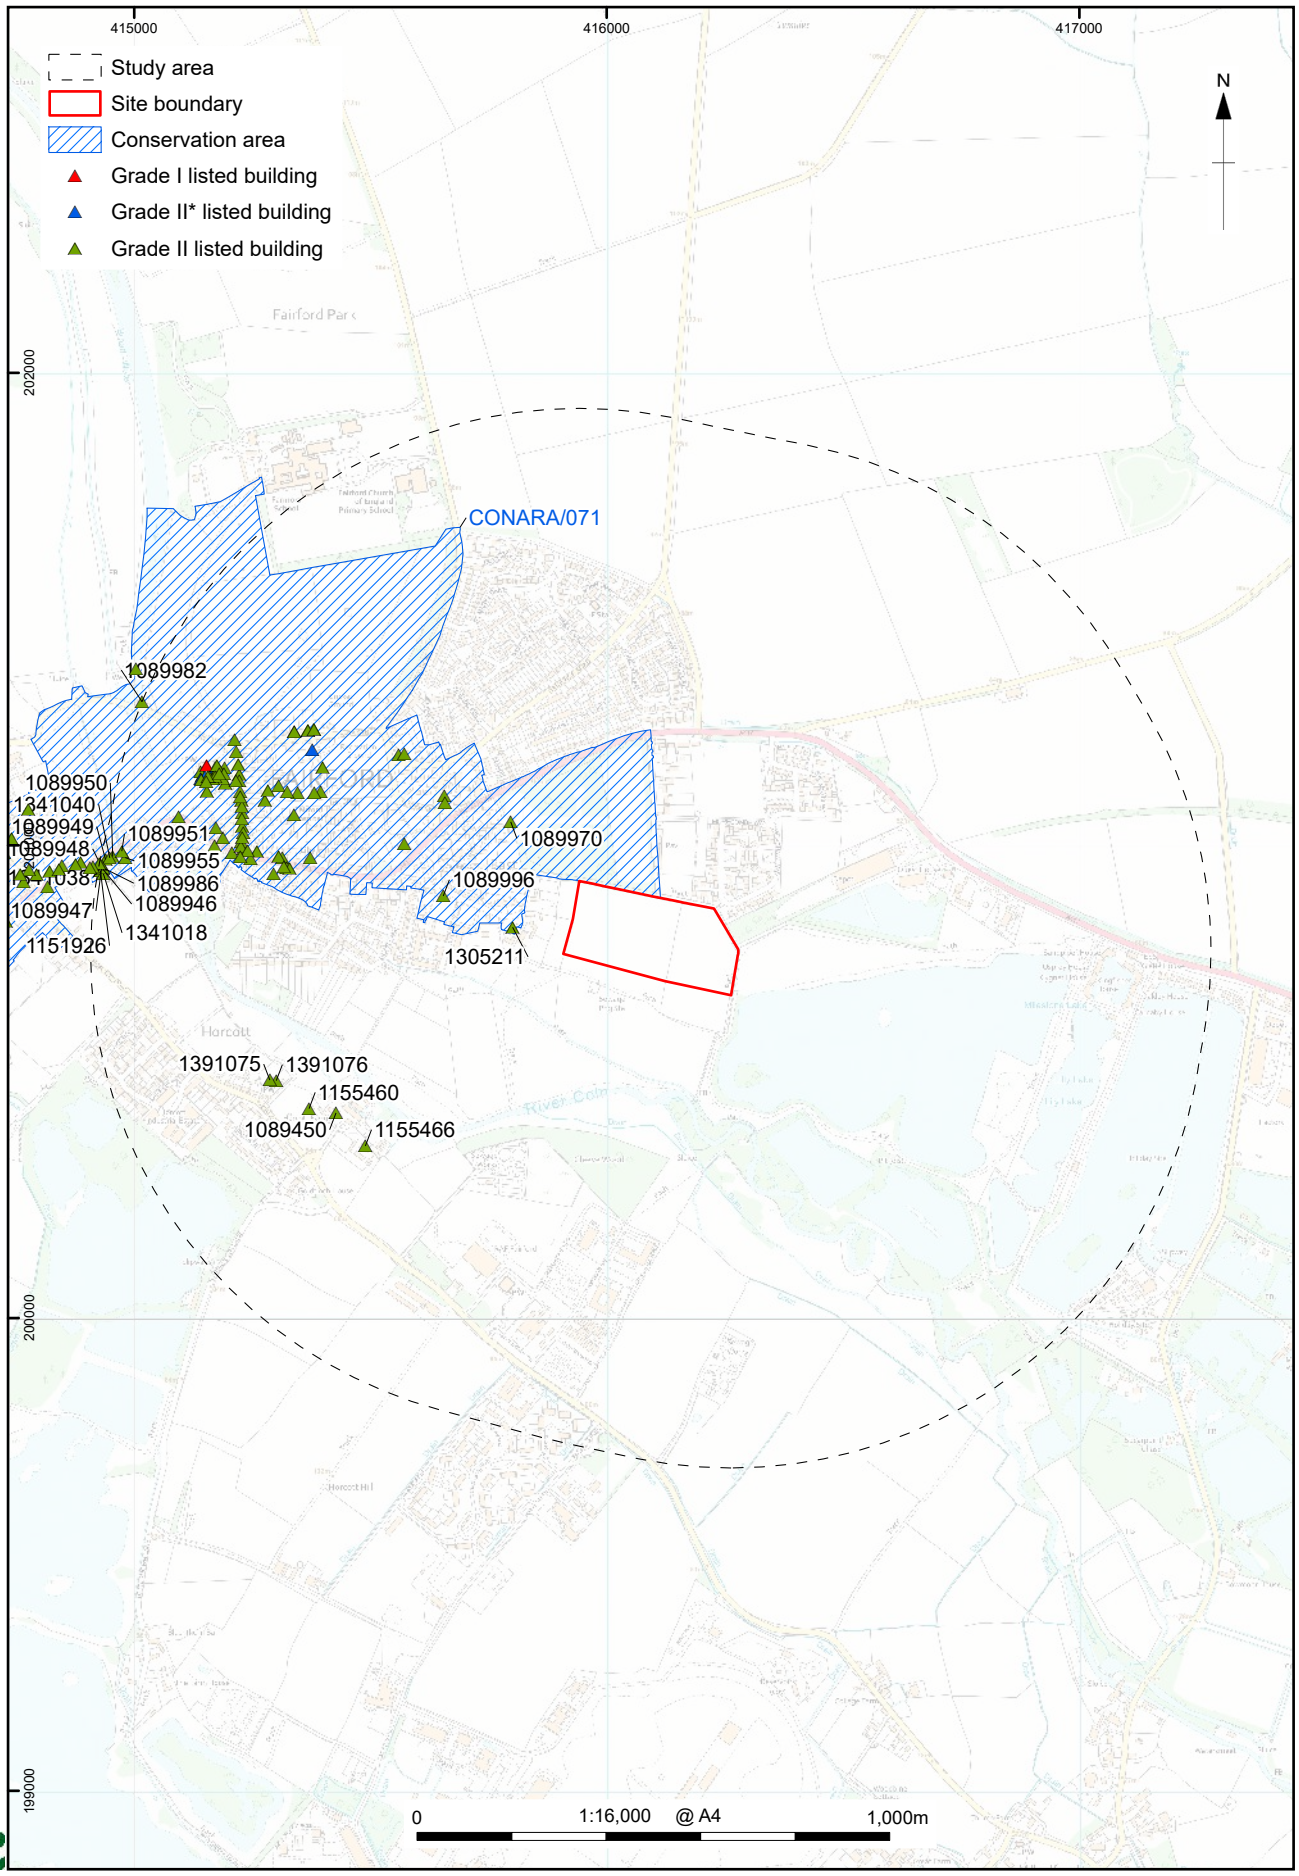
With cropmark evidence indicating the presence of a probable late prehistoric or Romano-British settlement within the site, development also has the potential to permanently truncate or remove archaeological remains and result in the loss of their legibility.



The site is considered to be sensitive to development, although careful design and layout mitigation could reduce the identified harm. Built development should be avoided in the most sensitive western part of the site, where the land makes its clearest contribution to the setting of the conservation area, Moor Farmhouse, Morgan Hall and Fieldway. This area should be retained as open green space to preserve the rural character of the historic settlement edge,

maintain views towards the conservation area and Moor Farmhouse, and provide a meaningful undeveloped buffer alongside Fieldway and Morgan Hall. Any development should be focused in the less sensitive parts of the site, be low density, and have restricted building heights that reflect the character and scale of buildings in the adjacent part of the conservation area. Building materials and boundary treatments should also reflect the local vernacular.

An archaeological desk-based assessment and programme of archaeological evaluation, including trial trenching, is likely to be required to support any planning application for the site. This would be used to establish the extent, character and significance of surviving archaeological remains before development proceeds.



Heritage Constraint Rating: High

The site is considered to have an overall heritage constraint rating of **High** (i.e. The site contains historic environment constraints that would prevent part or the site from being developed). The recommended design controls would restrict development within the western part of the allocation.

Gloucestershire County Council (2013) Gloucestershire Historic Landscape Characterisation (HLC) including the Cotswolds and the Wye Valley Areas of Outstanding Natural Beauty [data-set]. York: Archaeology Data Service [distributor] https://doi.org/10.5284/1020235

Figure F20A.9: Historic landscape characterisation of the study area

Site Ref	F53A
Town	Fairford
Site Name	Land at Totterdown Hill, Horcott
Related policies	
Proposed allocation use	Residential development
Number of dwellings	150

Brief description of site:

The site is located on the south-eastern edge of Horcott, 500m to the south of Fairford, and covers c.12.8 hectares of agricultural land. It is currently divided into three arable fields, with Horcott Road forming the northern site boundary, Totterdown Lane forming the western site boundary, and hedgerows defining the southern and eastern site boundaries (Fig.F53A.1).

Horcott lies within a broad, shallow valley associated with the River Coln. The hamlet occupies low-lying, relatively flat land that falls gently to the north in the direction of the river. The market town of Fairford is situated to the north of Horcott on the opposite bank of the river. The two settlements are separated by a stretch of river meadows and agricultural land. To the south-east of Horcott, the land rises in the direction of Horcott Hill, which at its peak reaches 104m aOD. The land level within the site rises from approximately 84–86m aOD along Totterdown Lane to between 92m and 100m aOD along the eastern site boundary, with the highest ground located in the north-eastern corner.

Significance of designated heritage assets in the site:

There are no designated heritage assets within the site.

Significance of designated heritage assets in the environs of the site which could be affected by the allocation of the site:

Bailiffs Cottage at Horcott Farm (1155466) is the closest listed building to the site, lying 166m to the north (Fig. F53A.2). The cottage dates from the late 17th century and probably originated as the farmhouse for Horcott Farm. It is listed at Grade II due to its high level of historic and architectural interest. Its architectural interest is derived from its traditional Cotswold materials, including random coursed rubble stone walls and a slate roof; its vernacular design; and its surviving architectural features including an external stone chimney stack, stone stack end and stone mullioned windows with square hoodmoulds. Its historic interest is derived from its association with the agricultural development of Horcott Farm and the associated agricultural landscape. It provides evidence of the organisation and operation of the working farmstead from the late 17th century. It is considered to be of **high significance.**

Horcott Farmhouse (1089450), located c.190m to the north of the site, is also part of the Horcott Farm complex (Fig. F53A.2). The farmhouse was built in the 18th century, with some 19th-century alteration, probably as a replacement for Bailiffs Cottage (1155466). It is Grade II listed due to its high level of historic and architectural interest. Its architectural interest is derived from its use of traditional Cotswold materials, including coursed rubble stone and a slate roof, its surviving vernacular design and features including stone stacks and stone mullioned windows with hoodmoulds and Gothic tracery. Its historic interest is derived from its association with the development of Horcott Farm and the associated agricultural landscape. The farmhouse provides evidence for the organisation and operation of the working farmstead in the 18th and 19th centuries. It is considered to be of **high significance.**

Horcott House (1155460) is located c.200m to the north-west of the site, adjacent to Horcott Farm (Fig. F53A.2). The house was constructed in the late 18th or early 19th century. It is designated as a Grade II listed building as a result of its high level of architectural and historic interest. Its architectural interest arises from its vernacular design and distinctive detailing, which includes traditional rubble stone construction, slate stone roofing, dressed stone chimney stacks, coped gables with finials, and Gothic-style mullioned windows. Its historic interest arises from its association with the development of Horcott as a rural settlement. It is considered to be of **high significance.**

The Roman Catholic Church of St Thomas of Canterbury (1391075) and the Presbytery of the Church of St Thomas of Canterbury (1391076) are located 245m to the north-west of the site (Fig. F53A.2). The church was built in 1845, with the presbytery constructed in 1865 by Benjamin Bucknall. The buildings are listed at Grade II due to their high level of historic and architectural interest.

The significance of the church lies in its architectural interest as a well-presented Early English Gothic Revival church, with traditional coursed limestone construction, lancet windows, buttresses, a bellcote, gabled porch and simple single-cell plan form, as well as the survival of significant interior features. Its historic interest derives from its association with the 19th-century Roman Catholic community in Fairford and Horcott. Its relationship to the attached presbytery adds to this interest as part of the church complex. It is considered to be of **high significance.**

The attached presbytery has architectural interest derived from its High Victorian Gothic design and well-preserved internal features. Its historic interest stems from its functional and historic relationship with the adjacent church.

Together, the two buildings illustrate the organisation and function of the 19th-century church complex. It is considered to be of **high significance.**

Fairford Conservation Area lies c 650m to the north of the site. There is no formal conservation area appraisal; however, its development and character are outlined in the Fairford Character and Design Assessment (2022), which forms part of the evidence base for the Fairford Neighbourhood Plan (Fig. F53A.2). The conservation area derives its significance primarily from its historic and architectural interest, reflecting its development as a medieval and post-medieval market town. Its historic interest is expressed through its layout, including the High Street, historic routeways and market area, as well as its relationship with the River Coln and the surrounding agricultural hinterland. Its architectural interest derives from the consistent use of locally quarried limestone, vernacular forms and materials, and a concentration of 15th- to 19th-century buildings, including the Grade I listed Church of St Mary (1089998), four Grade II* listed buildings (1090001, 1305142, 1089954 and 1341028) and 100 Grade II listed buildings. The conservation area also has archaeological interest, with potential for buried remains associated with medieval and post-medieval settlement, historic plots and routeways.

The 1971 Policy Statement for the conservation area defines Fairford as a unique market town with open country penetrating to the centre. The permeable settlement edge, with corridors of green space and rural land that break up the line of development, is therefore also considered to contribute to the character of this part of the conservation area.

The conservation area has a high level of architectural and historic interest and accordingly is considered to be of **high significance**. The conservation area and listed buildings contained within it are separated from the site by existing modern development, agricultural land and meadows associated with Horcott Farm.

To the west of the site, on the far side of Horcott Lakes, there is a cluster of four Grade II listed buildings associated with Burdocks (1089980), a 20th-century country house built by Sir E. Guy Dawber (Fig. F53A.2). The associated listed buildings, including a lodge (1089981), pavilion (1305022), and gate piers and quadrant entrance wall to Burdocks (1305024), sit within the former grounds of the country house. These structures have architectural interest inherent in their individual built form and surviving architectural details. Their historic interest is derived from their ability to illustrate the development and layout of the early 20th-century estate and the formal setting of Burdocks. These listed buildings are considered to be of **high significance.**

To the south of Burdocks, and c.710m to the west of the site, there is a scheduled hengiform barrow with an associated ring ditch (1014394) (Fig. F53A.2). This monument provides a rare surviving example of a prehistoric burial ground within the Upper Thames Valley. The significance of the monument is derived from its archaeological interest, its potential to preserve archaeological evidence relating to Bronze Age burial practices and ceremonial activities, and its extant earthworks, which preserve its historic form within the modern landscape. These interests are enhanced by the relationship between the barrow and the contemporary ring ditch. Overall, this asset is considered to be of **high significance.**

Significance of non-designated heritage assets in the site:

The site is situated on the northern edge of Fairford Airfield (20964) as recorded by the GLHER (Fig. F53A.11). The airfield was constructed in 1943 and officially opened in 1944 to serve as a base for wartime bombing operations. The historic runways were situated away from the site within the modern airfield to the south. Housing, and administrative support facilities for the airfield are situated to the north-east of the site on the far side of Horcott Road. The site itself has the same field layout as shown on early Ordnance Survey maps that predate the airfield. The historic airfield is considered to be of **low/local significance**.

No other non-designated heritage assets have been recorded within the site. However, the GLHER does identify cropmarks of a prehistoric settlement (52012) immediately to the east of the site (Fig. F53A.8) and a scheduled hengiform barrow and ring ditch to the west (1014394) (Fig. F53A.2). These remains highlighting the potential for associated remains to be present within the site.

Significance of non-designated heritage assets in the environs of the site:

The GLHER records 107 non-designated heritage assets within the 1km study area (Figs. F53A.8 – F53A.11). Owing to their archaeological interest, assets dating from the prehistoric to later medieval periods are generally considered to be of **local/low** or **medium significance**, while any deposits/materials dating to the post-medieval agricultural use of the study area are of comparatively **local/low significance**. Where GLHER records refer to designated heritage assets such as listed buildings, registered parks and gardens, or scheduled monuments, they are considered to be of **high significance**.

Thirty-three non-designated heritage assets were identified within the evidence base for the Fairford Neighbourhood Plan (Fig. 53A.3). These assets are considered to be of **low/local or medium significance.**

Historic landscape character of the site (and significance):

The Historic Landscape Characterisation (HLC) for Gloucestershire, the Cotswolds Area of Outstanding Natural Beauty (AONB) and the Wye Valley AONB describes the historic landscape character of the site as Type A2 'Less irregular enclosure partly reflecting former unenclosed cultivation patterns' (Fig. 53A.5). This enclosure type is characterised by small fields with boundaries that may preserve elements of former open field divisions and is associated with the medieval or post-medieval enclosure of open land. Due to its more irregular form, this type of enclosure may have been undertaken by local arrangement. It is considered to be of **low/local heritage significance**.

The land to the east of the site is characterised as B3A 'Regular organised enclosure formed of unenclosed pasture'. This type of enclosure is likely to be the result of either parliamentary enclosure of open pasture or another form of organised 18th- or 19th-century enclosure. It is considered to be of **low/local heritage significance**.

To the west, the landscape is characterised as Types H1 and H2, which refer to disused and active industrial sites respectively. This area was subject to gravel extraction and is now in use as Horcott Lakes. This landscape type is considered to be of **negligible heritage significance.**

Contribution of the site to the significance and setting of known heritage assets:

The site comprises agricultural land situated to the south and south-east of the historic hamlet of Horcott. The hamlet was first documented in the 12th century at a minor crossing point of the River Coln known as Cutlers Ford, when it was associated with a mill likely located in close proximity to the mill race north of Horcott Farm. Horcott continued in use as a small agricultural settlement that expanded in the post-war period. The Grade II listed buildings located to the north and north-west of the site, including Bailiffs Cottage at Horcott Farm (1155466), Horcott Farmhouse (1089450), Horcott House (1155460), the Roman Catholic Church of St Thomas of Canterbury (1391075) and the Presbytery of the Church of St Thomas of Canterbury (1391076), are surviving elements of the post-medieval rural settlement.

The listed buildings are separated from the site by agricultural land to the north of Horcott Road and some modern development to the south of the road and

north-west of the site. The site is currently visually screened from Horcott House (1155460) and the listed buildings at Horcott Farm (1155466, 1089450) by tree and hedgerow planting alongside Horcott Road and along the northern boundary of the site. Without this planting, due to the topography of the site, there would likely be views of the agricultural land within the northern part of the site from these assets, particularly the higher ground in the north-eastern corner. The agricultural land within the site forms part of the post-medieval agricultural land associated with Horcott Farm and the historic agricultural hamlet of Horcott. The surviving post-medieval field boundaries and agricultural character of the site make a **low positive contribution** to the listed buildings at Horcott House and Horcott Farm, allowing them to be appreciated within their original rural setting. The site, particularly where it borders Horcott Road, along with the fields to the north and east, helps to preserve the separation between the historic hamlet and the later development associated with RAF Fairford (Horcott Hill). This separation helps preserve the understanding and appreciation of these listed buildings as part of a small agricultural settlement.

The site is separated from the Roman Catholic Church of St Thomas of Canterbury (1391075) and its associated presbytery (1391076) by modern development to the south of Horcott Road. There is no intervisibility between these assets and the site, and the setting of these assets is unlikely to be altered by the allocation of the site. The site is considered to make a **neutral contribution** to the setting of these assets.

The site is located over 500m to the south of the Fairford Conservation Area and is separated from it by river meadows and agricultural land, as well as the existing development at Horcott Farm and RAF Fairford. There does not appear to be any intervisibility between the site and the conservation area and the setting of the conservation area is unlikely to be significantly altered by the allocation. The site therefore makes a **neutral contribution** to the setting of this asset and the listed buildings contained within it.

During the early 20th century, when Burdocks (1089980) and its associated listed buildings were constructed, the site would have formed part of the agricultural landscape to the east of the house. The agricultural landscape surrounding the house and its ground allows it to be understood and appreciated as an early 20th century country house. Since the construction of the house, the site has been physically and visually separated from these listed buildings by Horcott Lakes and the preceding extraction activity. Due to this separation, the site no longer appreciably contributes to this aspect of the listed buildings' setting, and the allocation of the site is unlikely to affect the setting

of these assets. Accordingly, the site is considered to make a **neutral contribution** to the setting of these listed buildings.

Horcott Lakes similarly separate the scheduled 'Hengiform barrow and associated ring ditch south of Burdocks' (1014394) from the site, and there is currently no intervisibility between these two areas. There are also no known archaeological assets associated with the scheduled monument recorded within the site. Based on current information, the site makes a **neutral** contribution to the setting of this asset.

Impact assessment:

Having identified the surrounding designated heritage assets and assessed the site and its context, this assessment concludes that the site makes a **low positive contribution** to the setting and significance of the Grade II listed Bailiffs Cottage at Horcott Farm (1155466), Horcott House (1155460) and Horcott Farmhouse (1089450). This contribution derives from the site's role in preserving part of the assets' historic rural setting and maintaining their separation from nearby development associated with RAF Fairford. This rural setting and sense of separation allow the assets to be understood as part of a historic agricultural settlement. Development within the site, particularly along the northern boundary and in the north-east corner, would reduce the rural character of this setting and weaken the separation between the listed buildings and adjacent development. This would result in **less than substantial harm** to the setting of these assets.

The allocation of the site is unlikely to change the setting of the Fairford Conservation Area or any of the other listed buildings identified within the study area. It would therefore result in **no harm** to the setting of these assets.

The development of the allocation would change the historic landscape character of the site from 'A2: Less irregular enclosure partly reflecting former unenclosed cultivation patterns' to modern residential development, reducing the extent of this historic landscape type and eroding the post-medieval rural character of the landscape on the eastern edge of Horcott. This would have a negative impact upon locally significant historic landscape character within this area, resulting in **less than substantial harm**.

The site is currently undeveloped agricultural land situated between cropmarks indicative of a prehistoric settlement to the east and a scheduled hengiform barrow and associated ring ditch to the west. Archaeological information in the surrounding area has identified concentrations of prehistoric and Roman remains within the surrounding landscape. The site is thus considered to have the potential to contain similar remains. Development within the site would

have a **permanent negative impact** on any surviving archaeological remains within the site, resulting in **substantial harm** to any assets that may be present. Without appropriate investigation and mitigation measures, any development that disturbs archaeological heritage assets is unlikely to satisfy relevant national and local planning policy objectives.

Cumulative impacts deriving from the allocation of the site:

No cumulative impacts are anticipated, as there are no known interacting heritage effects arising from this allocation in combination with other schemes or allocations that would give rise to additional harm beyond the impacts identified for the site itself.

Recommendations for minimising harm and maximising enhancement:

The allocation of the site has the potential to result in **less than substantial harm** to the setting of the Grade II listed buildings Bailiffs Cottage at Horcott Farm (1155466), Horcott Farmhouse (1089450) and Horcott House (1155460), by reducing their rural setting and making them less appreciable as part of a distinct agricultural settlement. It is likely that this harm could be reduced through good design, by preserving the more sensitive north-eastern part of the site as green space, setting development well back from the northern site boundary and, where possible, by maintaining the existing hedgerow and treeline along Horcott Road within the development.

Building heights should be restricted to respect the low-level town skyline, and the development should utilise local vernacular materials and building designs to help preserve the rural character of the area. This is particularly important along the northern edge of the development, where new housing, depending on its location, could become visible in views looking out from and towards the listed buildings.

The allocation of the site would result in **less than substantial harm** to the historic landscape of the area by replacing an area of low/locally significant enclosure with modern residential housing. Preservation of existing field boundaries within the site's green infrastructure provision, or where this is not possible preservation of their alignment within the layout of the proposed development, would help preserve the legibility of this field system within the new development and could offset some of this harm.

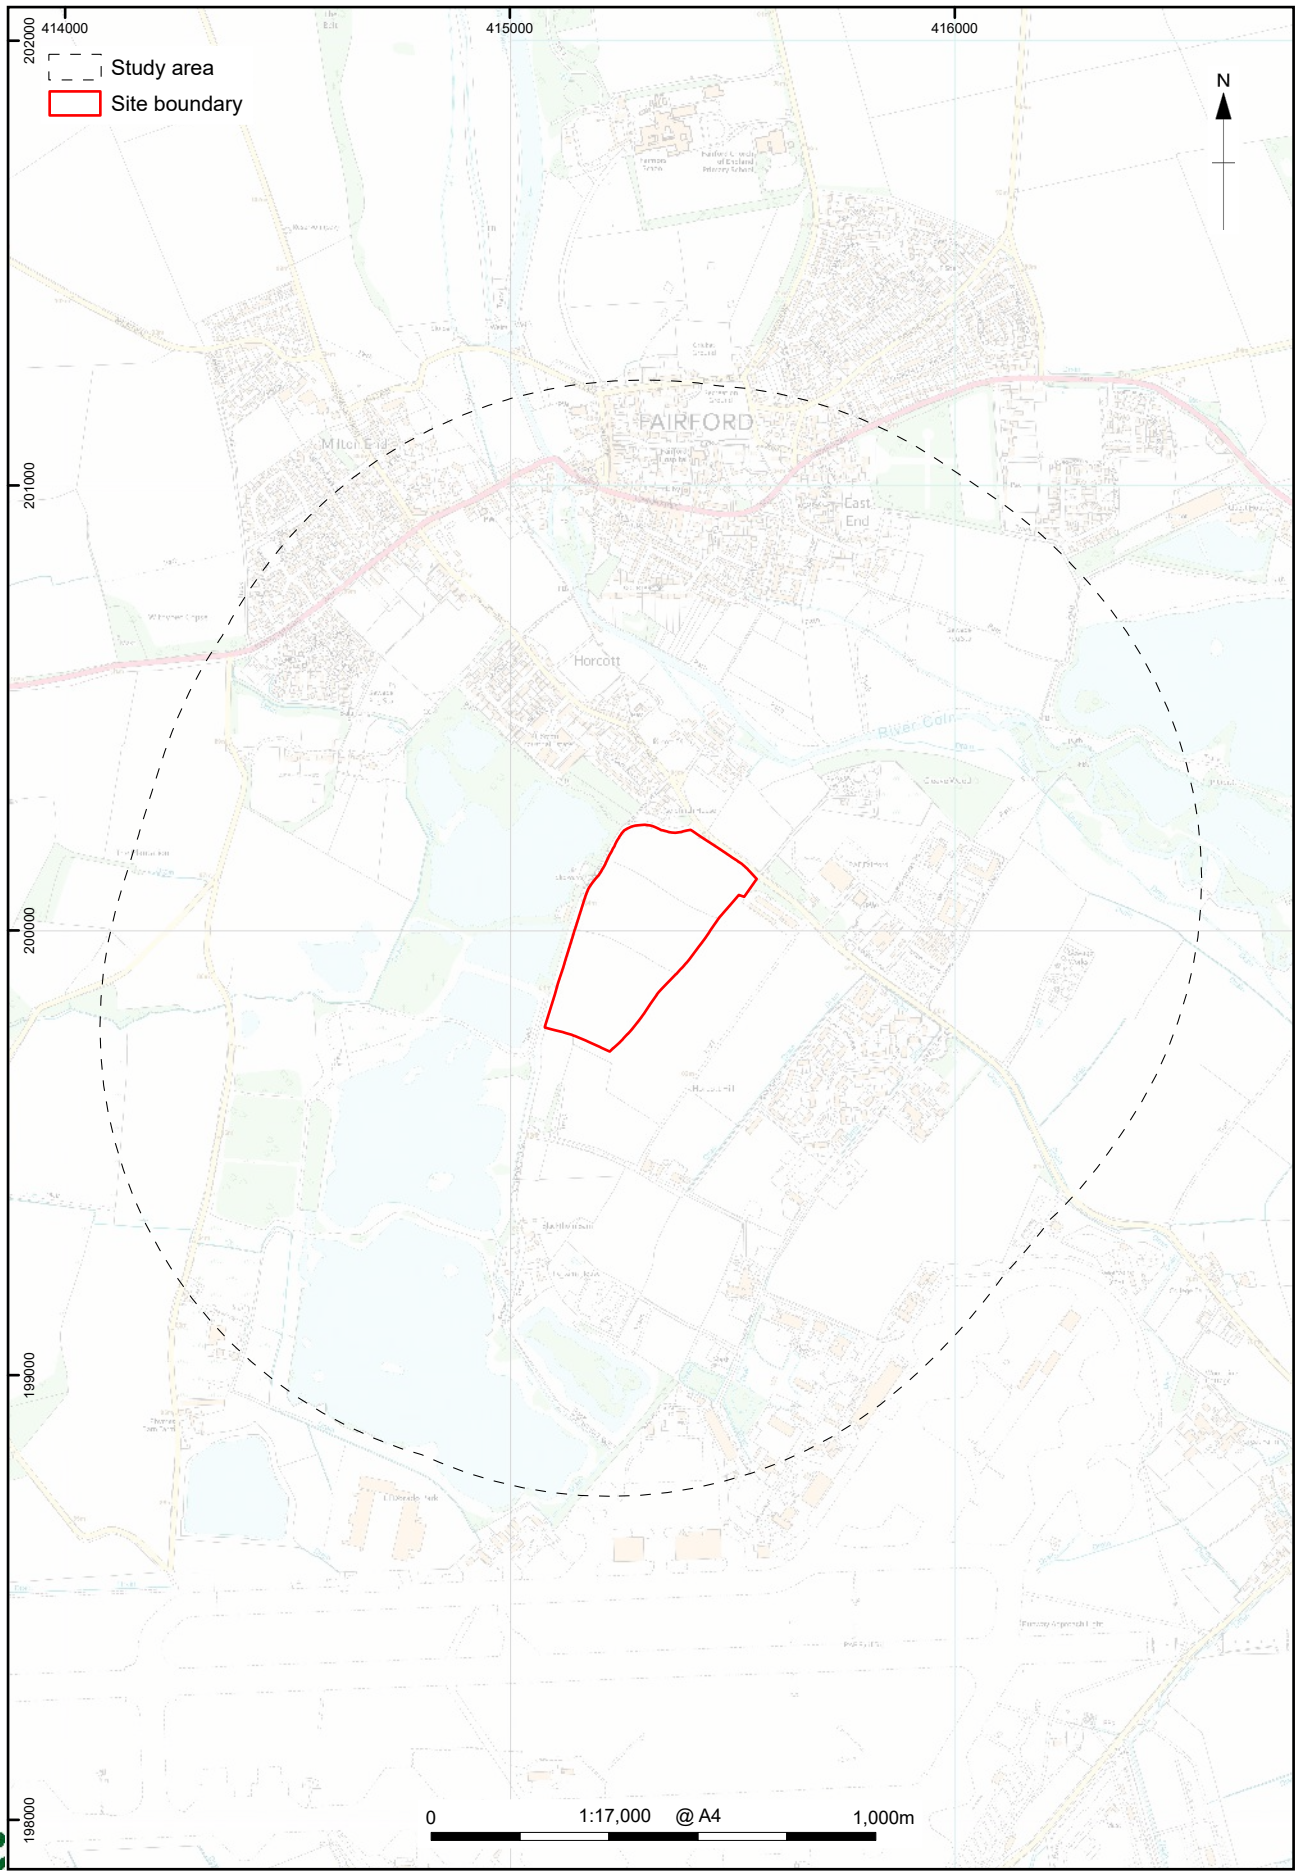
Considering the archaeological potential of the site, and the absence of previous archaeological investigation within its area, it is recommended that a programme of geophysical survey and archaeological evaluation trenching is

undertaken across the site prior to determination of any planning application. This would help to understand the extent and character of the surviving archaeological assets and inform a strategy to mitigate the impact of any subsequent development upon them. Development should only occur after appropriate archaeological investigation has taken place, the full extent of the impact is understood, and a mitigation strategy has been agreed with the Gloucestershire Planning Archaeologist.

Conclusions and suitability:

The site makes a **low positive contribution** to the setting and significance of the Grade II listed Bailiffs Cottage at Horcott Farm (1155466), Horcott House (1155460) and Horcott Farmhouse (1089450), principally through its rural character, surviving post-medieval field boundaries and role in maintaining separation between the historic hamlet and later development associated with RAF Fairford.

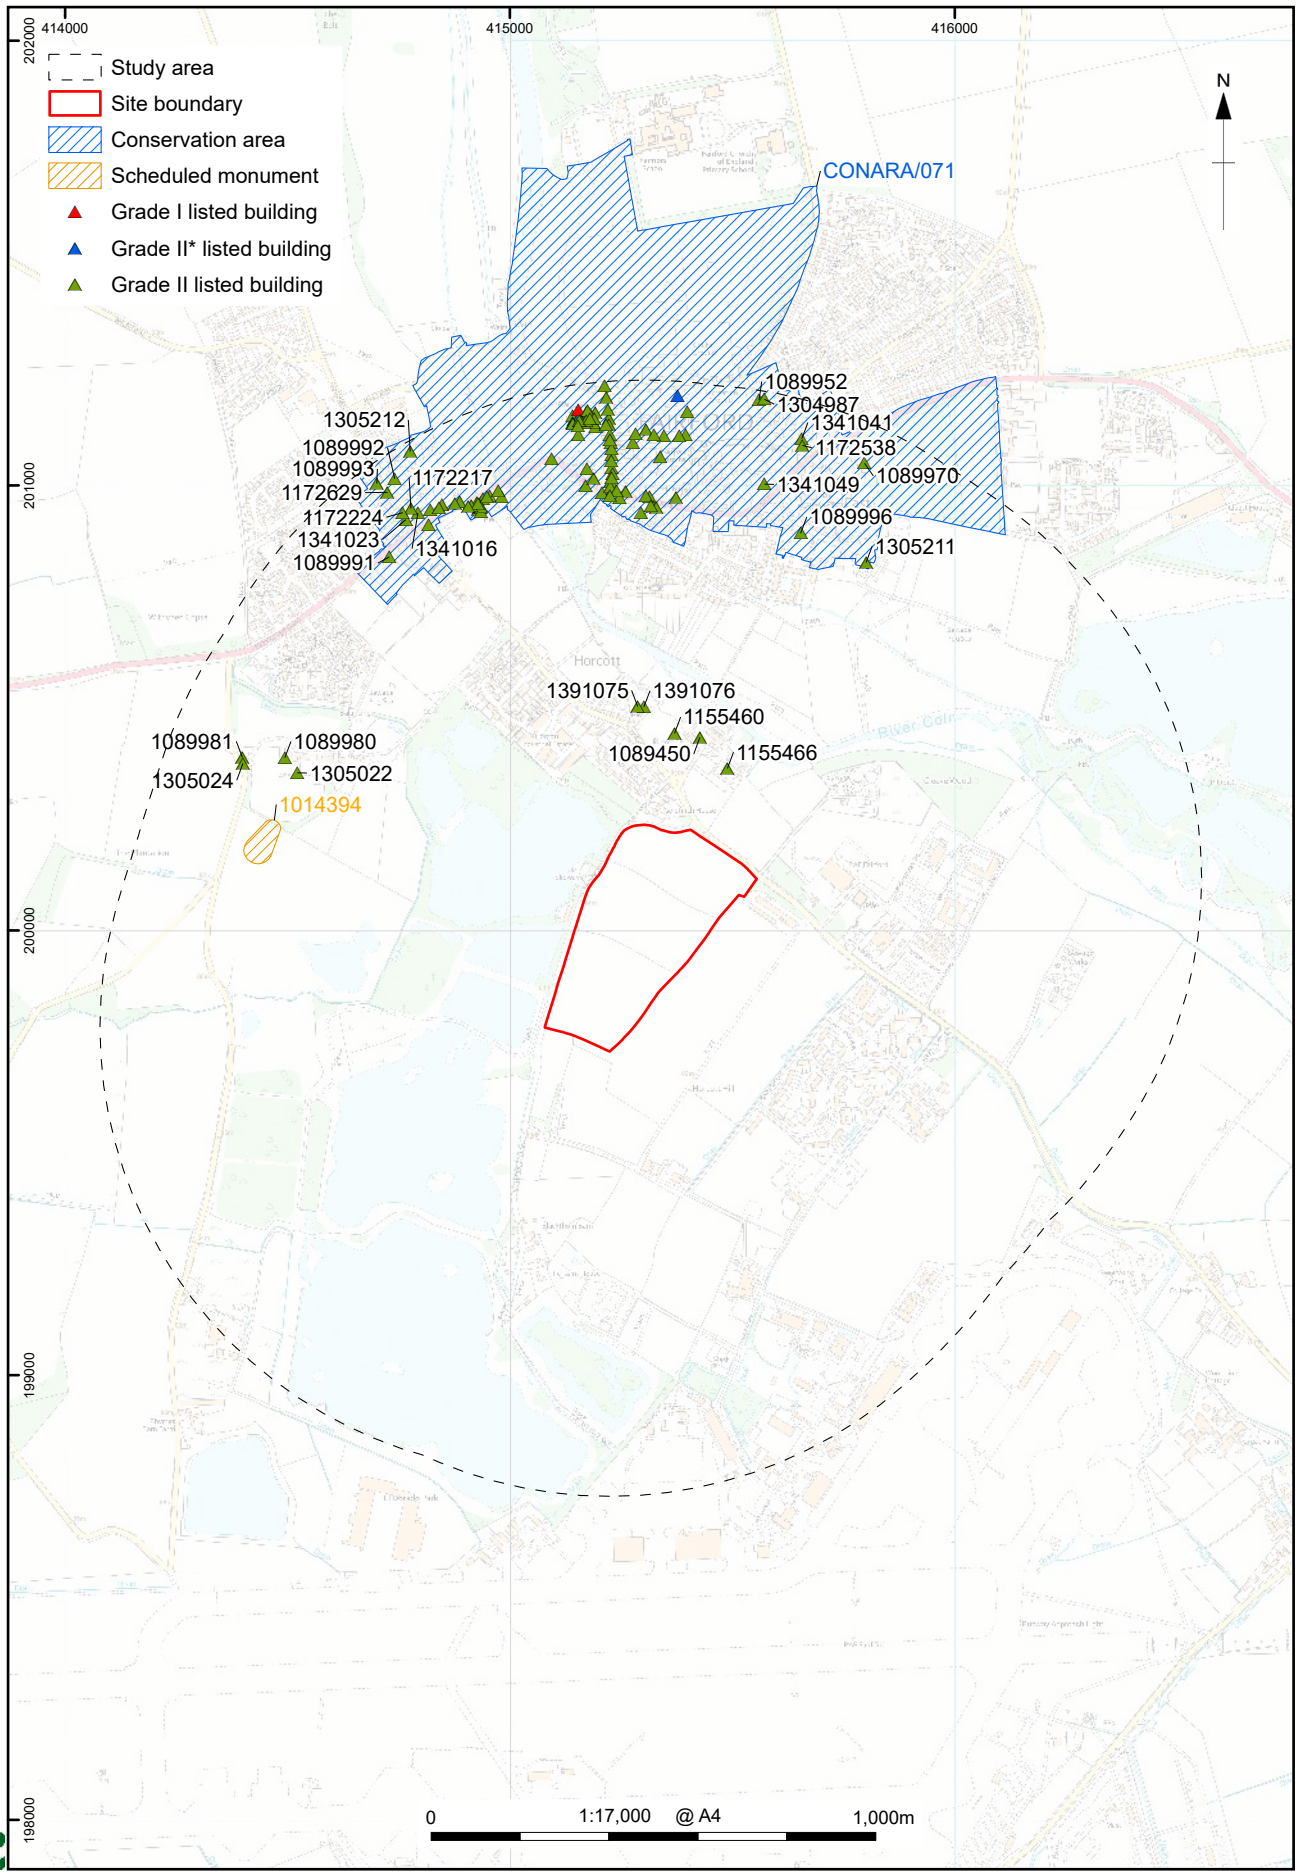
Residential development would therefore have the potential to cause **less than substantial harm** to these listed buildings by eroding the rural character of their wider setting and weakening the distinction between the historic agricultural settlement and more recent development. The north and north-eastern part of the site is the most sensitive area in this regard. The allocation would be unlikely to appreciably alter the setting of the Fairford Conservation Area, the Roman Catholic Church of St Thomas of Canterbury and its presbytery, the listed buildings associated with Burdocks, or the scheduled hengiform barrow south of Burdocks.



Development would result in **less than substantial harm** to the historic landscape of the area by replacing an area of low/locally significant post-medieval enclosure with modern residential development.

The site is considered sensitive to development, but the identified harm could be reduced through a careful layout that avoids or limits development in the north-eastern part of the site, retains and strengthens boundary planting along Horcott Road, preserves existing field boundaries where feasible, limits building heights, and uses low-density development, appropriate materials and building designs that are in keeping with the local vernacular.

Considering the archaeological potential of the site, it is recommended that an archaeological desk-based assessment and programme of archaeological evaluation, including geophysical survey and trial trenching should be undertaken to establish the extent, character and significance of any surviving archaeological remains and to inform an appropriate mitigation strategy in consultation with the Gloucestershire Planning Archaeologist.



Heritage Constraint Rating: Moderate

The site contains historic environment constraints relating to the setting of nearby Grade II listed buildings, the survival and legibility of locally significant historic landscape character, and the potential presence of archaeological remains. The site could potentially be developed, subject to the recommended mitigation, design controls and archaeological investigation.

Figure F53A.11: Historic landscape characterisation of the study area

Site Reference	K12
Settlement	Kemble
Location	Land south-west of Kemble
Proposed allocation use	Mixed use
Number of dwellings	1,400
Employment (ha)	1.0

Brief description of site:

The site is situated to the south-west of Kemble, south of the A429 and west of the Great Western Railway line, with Kemble Tunnel to the immediate east of the north-eastern extent of the site (Fig. K12.1). It comprises an area of *c.* 65 hectares, the western parcels predominantly used for crop cultivation with two areas of plantation towards the western extent and the eastern parcels used as horse paddocks. Two residences, Clover Barn and Little Stalls are located within the site boundary, the latter accessed immediately from Old Vicarage Lane which takes an approximate north-east/south-west alignment across the south-eastern part of the site; Clover Barn accessed from a separate access track extending west from this. The site lies at an elevation of approximately 120m aOD.

The site comprises a broadly square parcel of land, indented at its south-western corner, bounded to the north by the A429, the east by the Great Western Railway line, the south by hedgerow field boundaries and an access track to Rendall's Barn, and the west by Kemble Solar Farm an associated access track, and hedgerow field boundaries to adjacent fields. A single public right of way, now an access track known as Old Vicarage Road, allows access across the south-eastern part of the site. Either side of this track, which is higher than the surrounding land by a maximum of 1.6m, the land is divided by electric fencing into paddocks for horses associated with the stables to the east of the site, and this extends as far south as the dwelling of Little Stalls. The remainder of the site is arable land, with two areas of plantation towards the western extent of the site, Highstubs Plantation to the north, and Beanfield Plantation to the south. Within the site, boundaries, except for electric fencing for horse paddocks, are formed by hawthorn-dominant hedgerows up to 2m in height.

Significance of designated heritage assets in the site:

There are no designated heritage assets within the site.

Significance of designated heritage assets in the environs of the site which could be affected by the allocation of the site:

There are twenty listed buildings within a 1km radius of the site, all but two of which are situated within conservation areas (Fig. K12.2). The two which are not are both associated with an outlying farm, Clayfurlong; its Grade II listed mid-19th century farmhouse (1153295) and an 18th and 19th century barn (1341381), located either side of the A429, at a distance of approximately 745m north-east of the site. These would remain unaffected by the allocation of the site.

To the north of the site, at a minimum distance of 260m away, is Kemble Station Conservation Area (CONARA 113). Within this are three Grade II listed railway-related structures (1089288, 1304289 and 1429827; Fig. K12.2). These are separated from the site by the A429, and mature trees, particularly on its northern side and including a small, wooded area to the east of the junction with Station Road, prevent intervisibility. As a result, none of these heritage asses would be affected by the allocation of the site.

The remaining fifteen listed buildings are within Kemble Conservation Area (CONARA 099) and all are Grade II listed, except the Grade II* parish church (Fig. K12.2). They include 18th and 19th century agricultural-related buildings; five barns or former barns (1304288, 1341382, 1089248, 1153426 and 1153316) and a farmhouse (1089286), and cottages, the earliest being a possible late 16th century cottage with medieval origins (1153406), the remainder of 18th and 19th century origin (1341366, 1089249 and 1089280). At a grander scale, Kemble House (1089287) and its associated former coachhouse and lodge or garden house (1444307) are also within the conservation area, as is the Grade II* listed Anglican Church of All Saints (1089285), with tomb monument within its grounds (1304326) and First World War Memorial to the north-west (1429156). At its closest, the conservation area is approximately 40m to the east of the site. Kemble is a typical Cotswold agricultural settlement, evolving incrementally to adapt to altered agricultural use of the surrounding landscape. The majority of the buildings are of oolitic limestone construction, with limestone slate roofs, and the land boundaries are typically drystone walls also of limestone. Kemble differs from other Cotswold agricultural villages in that its surrounding landscape is relatively flat, resulting in the potential for wider views into and out of the historic core of the village. Mature trees and well-established hedgerows, within private gardens and populating ownership boundaries, provide an enclosed character which limits these views. As such, only the uppermost part of the tower and spire of the Grade II* listed Anglican Church of All Saints (1089285), and perhaps the

partial rooftop of the historic core of Home Farm behind the more modern stable and shed structures (1304288 and 1089286), are discernible against and through the mature trees, from within the far eastern part of the site. In winter months, elements of Kemble House (1089287) may also be visible. This is most evident from the public right of way, Old Vicarage Lane, which has also been identified as one of only two key viewpoints on the approach to the village in the conservation area appraisal. This cites the spire of All Saints Church as a key focal point. All Saints Church (1089285) is predominantly of Early English style, the earliest elements of which date to the 13th century. The spire rises to approximately 120 feet, although it was damaged by lightning in 1823 and was rebuilt as a result.

From this key viewpoint within the site, the landscape associated with Kemble House (1089287) is also referenced in the conservation area appraisal (Fig. K12.2). Kemble House (1089287) is situated approximately 15m to the south of All Saints Church (1089285); it was very common for the manor house and church to be closely sited in early medieval settlements, representing the concentration of power with the Lord of the Manor and the Church. In addition, another important element of this view is the line of the Great Western Railway, deliberately designed to be visually unobtrusive by the creation of Kemble Tunnel and gradient of the railway line into it. This was negotiated by Richard Gordon (1786-1864), owner of Kemble House (1089287), the historic seat of the Manor of Kemble following his marriage to the heir, and aimed to reduce the impact on his parkland estate. The negotiations also resulted in the requirement for the planting of shrubs and trees along the route of the line, as well as their subsequent maintenance. The presence of Kemble House, therefore, in views from this part of the site, can be seen as significant due to this historic association. Kemble's conservation area appraisal includes the recommendation for additional land to be considered for inclusion within the boundary, based on the pressure for development at the edge of the settlement. This includes two areas, the first being the former parkland of Kemble House, which includes land to the south-east of the village, east of Church Lane; this land is also included in the Kemble and Ewen Neighbourhood Plan as a non-designated heritage asset which should be considered in accordance with local policies and NPPF if it has the potential to be impacted by development (KE9/6; Fig. K12.3). The second area of land identified for consideration within the conservation area appraisal is to the west of the village, and includes Home Farm, land at Top Farm, recently redeveloped as a modern residential area, and land east of the railway lane, but also incorporating the north-eastern extent of the site itself. This land is also included in the Kemble and Ewen Neighbourhood Plan in the same way as the

historic parkland associated with Kemble House (KE9/7; Fig. K12.3). The justification for it to be considered for inclusion within the conservation area is largely based on:

- the association of the land with the Kemble House Estate, and 19th century owner, Richard Gordon, and the associated negotiation with the Cheltenham and Great Western Union Railway that his land should not be transected at ground level;
- the resulting designed traversal of the railway across the land incorporating tunnelling (the Kemble Tunnel) and planting to screen the impacts of the infrastructure visually, maintaining the rural setting of the village, including All Saints Church and Kemble House and its parkland estate;
- the identified viewpoint within this area, allowing a view of All Saints Church (1089285) from a public right of way, as well as partial and/or seasonal glimpses of Kemble House (1089287), and perhaps the roofs of the historic core of Home Farm behind modern stable and shed structures (1304288 and 1089286); and
- the erosion of the setting of the conservation area on the west side of the village, seen by the redevelopment at Top Farm, to the north-east of the site.

Kemble Conservation Area, All Saints Church, Kemble House and the historic core of Home Farm, all with the potential to be affected by the allocation of the site, are also all considered to be of **high significance**.

Significance of non-designated heritage assets in the site:

Two known non-designated heritage assets are mapped within the site itself (Fig. K12.4). One is a probable Iron Age to Roman rectilinear enclosure, identified from cropmarks (3061) to the east of Beanfield Plantation, within the south-western part of the site. A metal detector rally undertaken in 2025 across the southernmost three fields within the site, as well as a field beyond it, recovered a large number of Roman coins, a brooch, Iron Age coins and buckles, likely associated with this enclosure site. Roman-period settlement activity and cremations were encountered in the adjacent area to the east ahead of development (39957), and Roman burials were recovered to the north-east (13870). In addition Roman activity, as well as a ring ditch and other prehistoric features were revealed at the Solar Farm site to the immediate south-west of the site (25973). The second known heritage asset within the site is an area of medieval or post medieval ridge and furrow, identified from earthworks shown on aerial photographs taken in 1952 (53659), and also clearly shown on LiDAR imagery. No traces of either of these non-designated

heritage assets were noted in the June 2026 site visit to support this assessment. Any surviving sub-surface remains of the prehistoric and/or Roman period would likely be of **medium significance**, and that those relating to agricultural activity, of the late medieval or post medieval period, of **low significance**, based on evidential value.

Significance of non-designated heritage assets in the environs of the site:

The HER records an additional 39 non-designated heritage assets beyond the site boundary but within a 1km radius of the site (Figs. K12.4 and K12.5), some of which are known also from previous archaeological investigations (Fig. K12.6) and/or the National Mapping Programme (Fig. K12.7). As well as the prehistoric and Roman features from adjacent sites, cited above, additional evidence for prehistoric and Romano-British period activity has been identified in the wider area, largely to the north-east and south-west of the site, further demonstrating the potential for the survival of similar remains within the site itself. In addition, three early medieval cemeteries and a settlement, as well as an architectural fragment of the period, indicate the importance of the area in the early medieval period, and a possible later medieval settlement site has been identified to the south, at Kemble Wick. Discounting medieval and post medieval upstanding buildings, the vast majority of known activity within a 1km radius of the site relates to agricultural landuse. This takes the form of ridge and furrow, plough headlands, boundary features and trackways, as well as quarry sites, a lime kiln and railway infrastructure. Owing to their evidential value, assets dating from the prehistoric to early medieval periods are generally considered to be of **medium significance**, while any deposits/materials relating to agricultural activity of the later medieval period and any deposits/materials dating to the post-medieval activity, particularly agricultural and quarrying, would be of comparatively **low significance**. Where HER records include designated heritage assets such as listed buildings, registered parks and gardens, or scheduled monuments, they are considered to be of **high significance**.

Indirect, setting impacts to non-designated heritage assets with no upstanding remains are not currently a consideration in the planning process. Four non-designated heritage assets with upstanding remains within a 1km radius of the site have been identified within the conservation area appraisal as being of particular interest and/or the Kemble and Ewen Neighbourhood Plan as requiring specific consideration if they have the potential to be affected by future development (Fig. K12.3). These comprise:

- Kemble School (KE9/1), located approximately 430m to the east of the site;
- Kemble Village Hall (KE9/2), located approximately 409m to the east of the site;
- the former Primitive Methodist Chapel (48933; KE9/3), a corrugated iron structure erected in 1900, located approximately 672m to the east of the site; and
- the water pump and stone surround on Kemble village green (KE9/4), approximately 295m east of the site.

These would all be considered of **medium/low significance**. None of these are visible, or appreciable, from the site, and thus have no potential to be affected by the allocation of the site.

Historic landscape character of the site (and significance):

The site lies outside the Cotswolds National Landscape (CNL), designated as an Area of Natural Beauty (AONB), and lies approximately 1.1km to the south-east of it, at its nearest point.

The Gloucestershire Historic Landscape Characterisation (HLC; Gloucestershire County Council 2013) includes the site within the mapped extent of A2 'less irregular enclosure partly reflecting former unenclosed cultivation patterns' (Fig. K12.4). The Gloucestershire Landscape Character Assessment of 2006 (LDA Design 2006) includes the site within the Dip Slope Lowland character type, specifically TV 3A Kemble Dip Slope. This states that the character area retains a largely rural character, and beyond the largest settlement of Kemble, there is a pattern of scattered farmsteads and detached dwellings. Kemble contains both old stone dwellings and modern infill development, with the older historic core designated as a Conservation Area. Within the southern part of Kemble, stone buildings surround a village green and include the village church with its prominent spire that forms a local landmark. Kemble is located on the main line railway with a station at the north western edge of the village providing direct links to London. This has resulted in recent residential development within the village, reflecting its growing role as a commuter settlement. Key characteristics of the Kemble Dip Slope character type are defined as:

- broad area of gently sloping, undulating lowland with a predominantly south easterly fall;
- lowland landform gently dissected by infrequent small streams flowing towards the River Thames and its principal tributaries, and often inconspicuous within the landscape;

- well-managed productive landscape with a general predominance of medium to large scale arable fields and smaller scale improved pastures;
- seasonal variations in colour and texture associated with mixed arable farming;
- boundaries comprise a network of hedgerows of varying quality, together with stone walls and post and wire fencing;
- occasional woodland copses and shelterbelts, mainly geometric in form; and
- settlement pattern of intermittent linear and nucleated villages, hamlets and isolated farmsteads.

Historic landscape character types with post medieval period origins are well represented in the wider landscape, and so it is considered to be of **low significance**.

Contribution of the site to the significance and setting of known heritage assets:

The site comprises predominantly agricultural arable land in large fields interspersed by two small areas of plantation, the eastern extent parcelled into horse paddocks, and includes two small residences, and a north-east/south-west aligned access track, also public right of way, leading to these residences, ultimately leading to a third residence to the south-west of the site. To the north is the A429, to the east, a railway line, and to the south-west a Solar Farm. Agricultural land surrounds the remainder of the site.

The south-western extent of Kemble Conservation Area is approximately 40m to the east of the site, and this contains several listed buildings with some intervisibility with the site, the Grade II* listed Church of All Saints and the Grade II listed Kemble House a little to the south, as well as the Grade II listed farmhouse and barn associated with Home Farm. The specific characteristics defined by the conservation area relate to the special architectural and historic character of its built form. As such, no elements of the site itself contribute to this. However, the north-eastern part of the site in particular has been identified as retaining specific qualities important in the setting of the conservation area, through its association with the Kemble Estate and the design-implications of the Great Western Railway through the land to the immediate east of the site, and the historic public right of way/access track within the south-eastern part of the site and the key view of the village, conservation area, and four cited listed buildings from it. As such, it has been identified as a key landscape in the setting of the village, and been recommended for consideration for inclusion within the conservation area itself. Modern residential development to the east, at Top Farm, providing around fifty

new homes, has eroded this significance to some degree, and views are limited by mature vegetation. Thus, the site's contribution to the significance of Kemble Conservation Area is assessed to be **low positive** (i.e. the site provides some/a limited contribution to an understanding or appreciation of the heritage interests of the conservation area and a positive contribution to its significance). This is also applicable to the four identified listed buildings.

There are no shared historic or visual relationships between the site and other identified upstanding heritage assets, and thus it provides a **neutral** contribution to their heritage significance. The site's present contribution to landscape value has been reduced by residential development to the east, and a Solar Farm to the south-west, but its rural, agricultural character, easily comparable to historic nineteenth century Ordnance Survey mapping, results in its **low positive** contribution to landscape significance.

Impact assessment:

The site has been identified as providing a maximum of a low positive contribution to known designated heritage assets, in terms of its current character as agricultural land to the south-west of Kemble Conservation Area and its role in the setting of it, and four listed buildings, both visually and associatively. This is further evidenced by the recommendation that the north-eastern part of the site be considered for inclusion within the conservation area, though this has not been enacted. At a minimum, this is likely to result in an impact level of **less than substantial**.

The allocation includes an area of cropmarks identified from aerial photographs, interpreted as probable Iron Age to Roman enclosures, further corroborated by the discovery of Iron Age and Roman period metal finds across a wider area within the site during a metal detector rally. A small area of ridge and furrow has also been mapped at the eastern extent of the site, representing medieval, or post medieval, agricultural activity. Development within the site would have a **permanent negative impact** on any surviving archaeological remains resulting in **substantial harm** to these heritage assets. Without appropriate investigation and mitigation measures, any development that disturbs archaeological heritage assets is unlikely to satisfy relevant national and local planning policy objectives.

The development of the allocation would change the historic landscape character of the site from irregular enclosure to modern residential development, reducing the extent of these historic landscape types and eroding the post-medieval rural character of the landscape to the west of Kemble. Given the size and scale of the site, this would have a negative impact upon a large

area of land, but, given the significance of the historic landscape character is low, this would result in an overall level of **less than substantial harm**.

Cumulative impacts deriving from the allocation of the site:

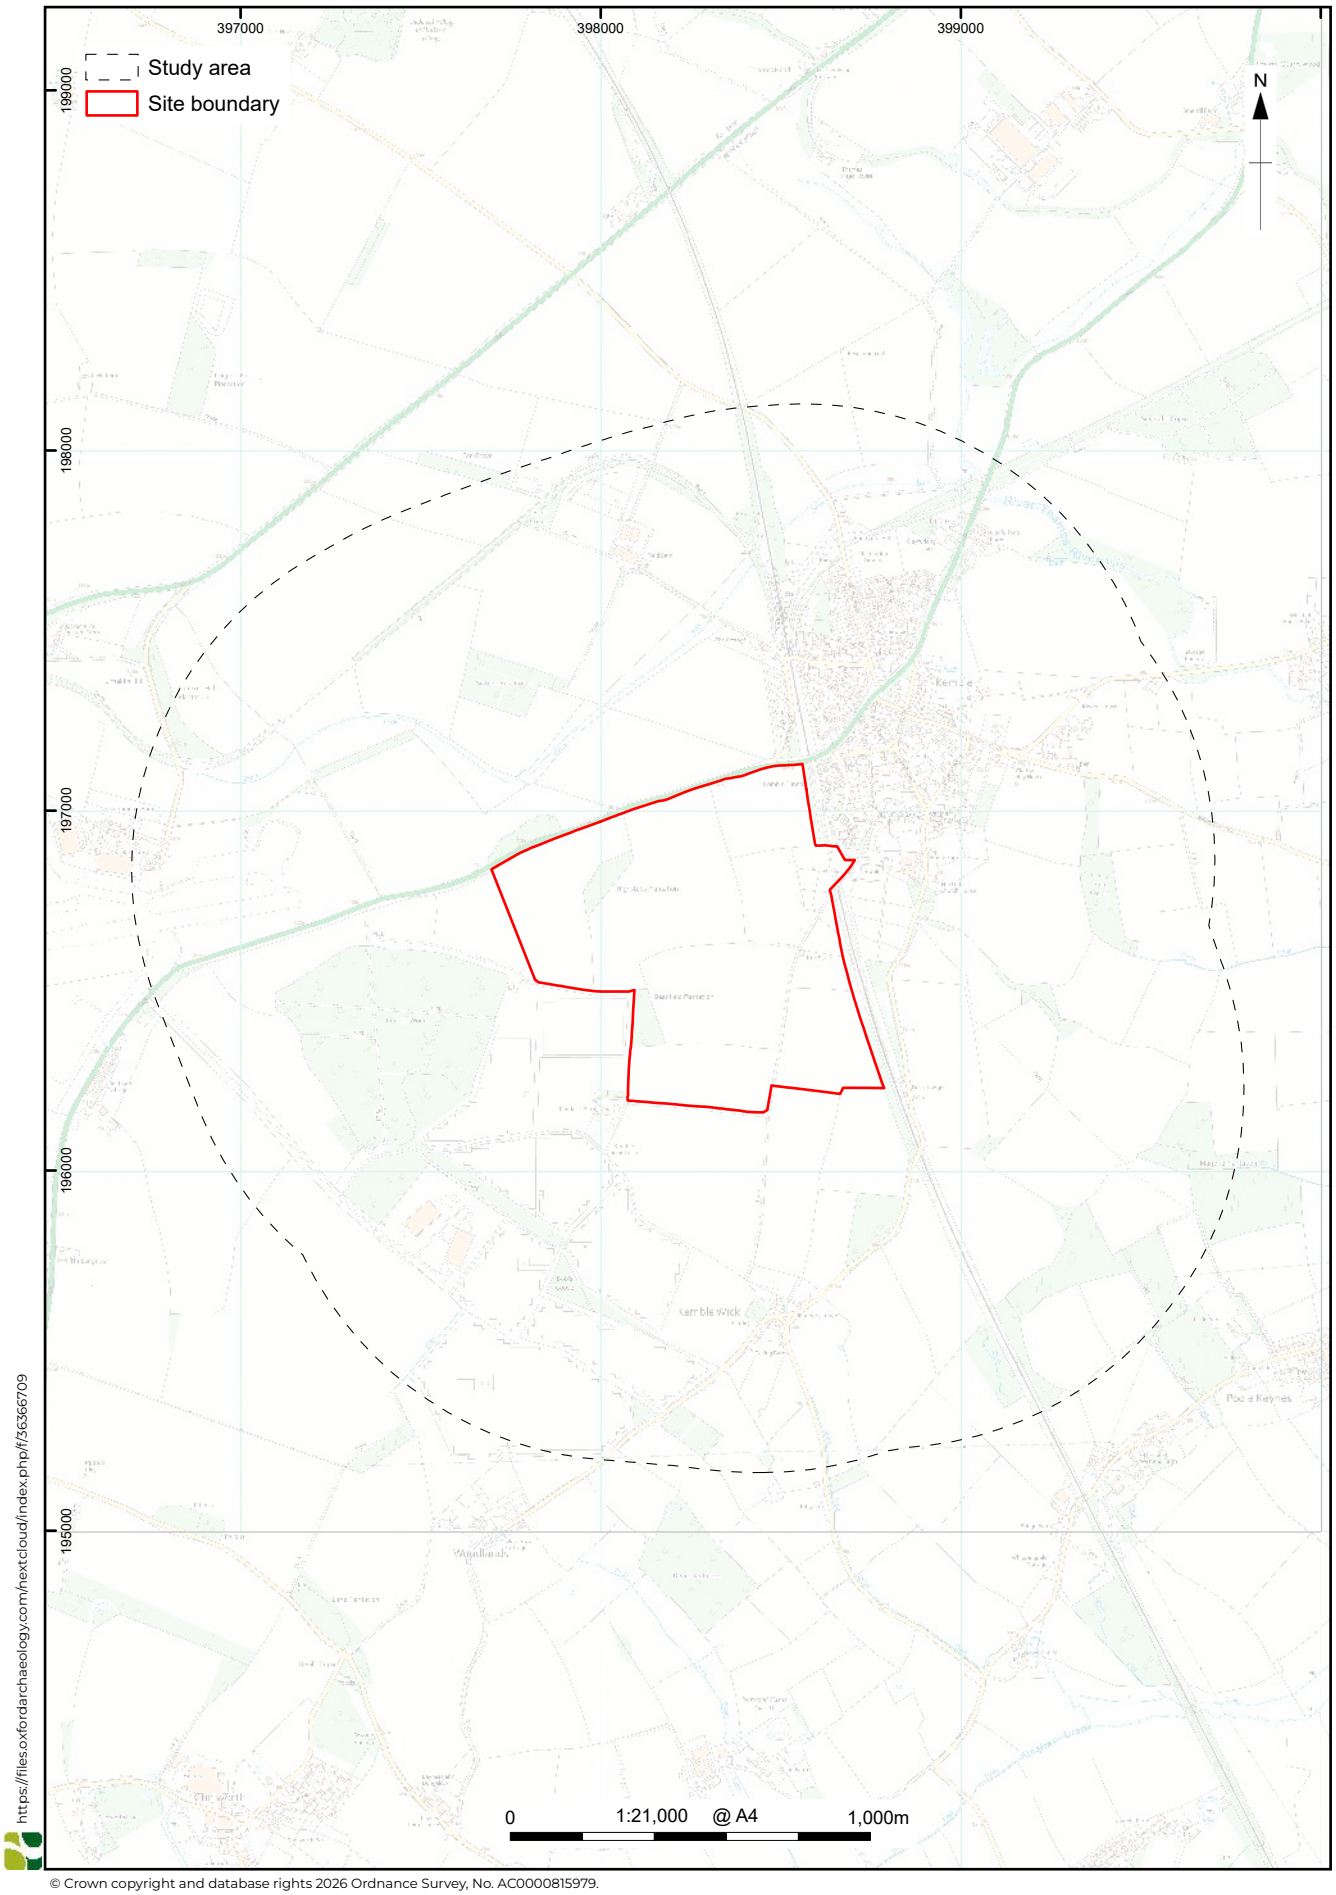
No cumulative impacts are anticipated, as there are no known interacting heritage effects arising from this allocation in combination with other schemes or allocations that would give rise to additional harm beyond the impacts identified for the site itself.

Recommendations for minimising harm and maximising enhancement:

It is likely that a dedicated archaeological desk-based assessment that considers the archaeological potential of the site, and assesses the results of previous archaeological investigations in the area will be applicable for the site. This would involve the examination of primary sources (historic maps and documents, aerial photographs, previous archaeological investigation reports and LiDAR) and a detailed walkover survey, all of which are beyond the scope of this present assessment. This could then be followed, as required, by geophysical survey and/or a programme of targeted archaeological evaluation trenching, as has occurred for adjacent sites. It could be that, given the known archaeological potential of the site, from the cropmark evidence for Iron Age/Romano-British settlement, supported by metal detectorist finds, and the known ridge and furrow, the site can be immediately progressed to geophysical survey and trial trench evaluation, negating the requirement for an archaeological desk-based assessment. Either approach would help to understand the extent and character of surviving archaeological assets and would inform a strategy to mitigate the impact of any subsequent development upon them. Development should only occur after appropriate archaeological investigation has taken place, the full extent of impact is understood, and a strategy of mitigation is agreed with the Gloucestershire Planning Archaeologist.

Due to the topography of the site and the proposed scale of the development, it would be difficult to prevent the allocation from having an impact upon the setting of Kemble Conservation Area and the listed buildings of All Saints Church, Kemble House, and the barn and farmhouse of Home Farm. This impact could equate to less than substantial harm, reduced, to a degree, through the retention and enhancement of existing boundary vegetation, and by incorporating less built-form into the north-eastern extent of the site, to retain a more open, green buffer space between the conservation area and the new development. This would aim to retain an understanding and appreciation of the rural setting of the village, preserved by deliberate railway infrastructure

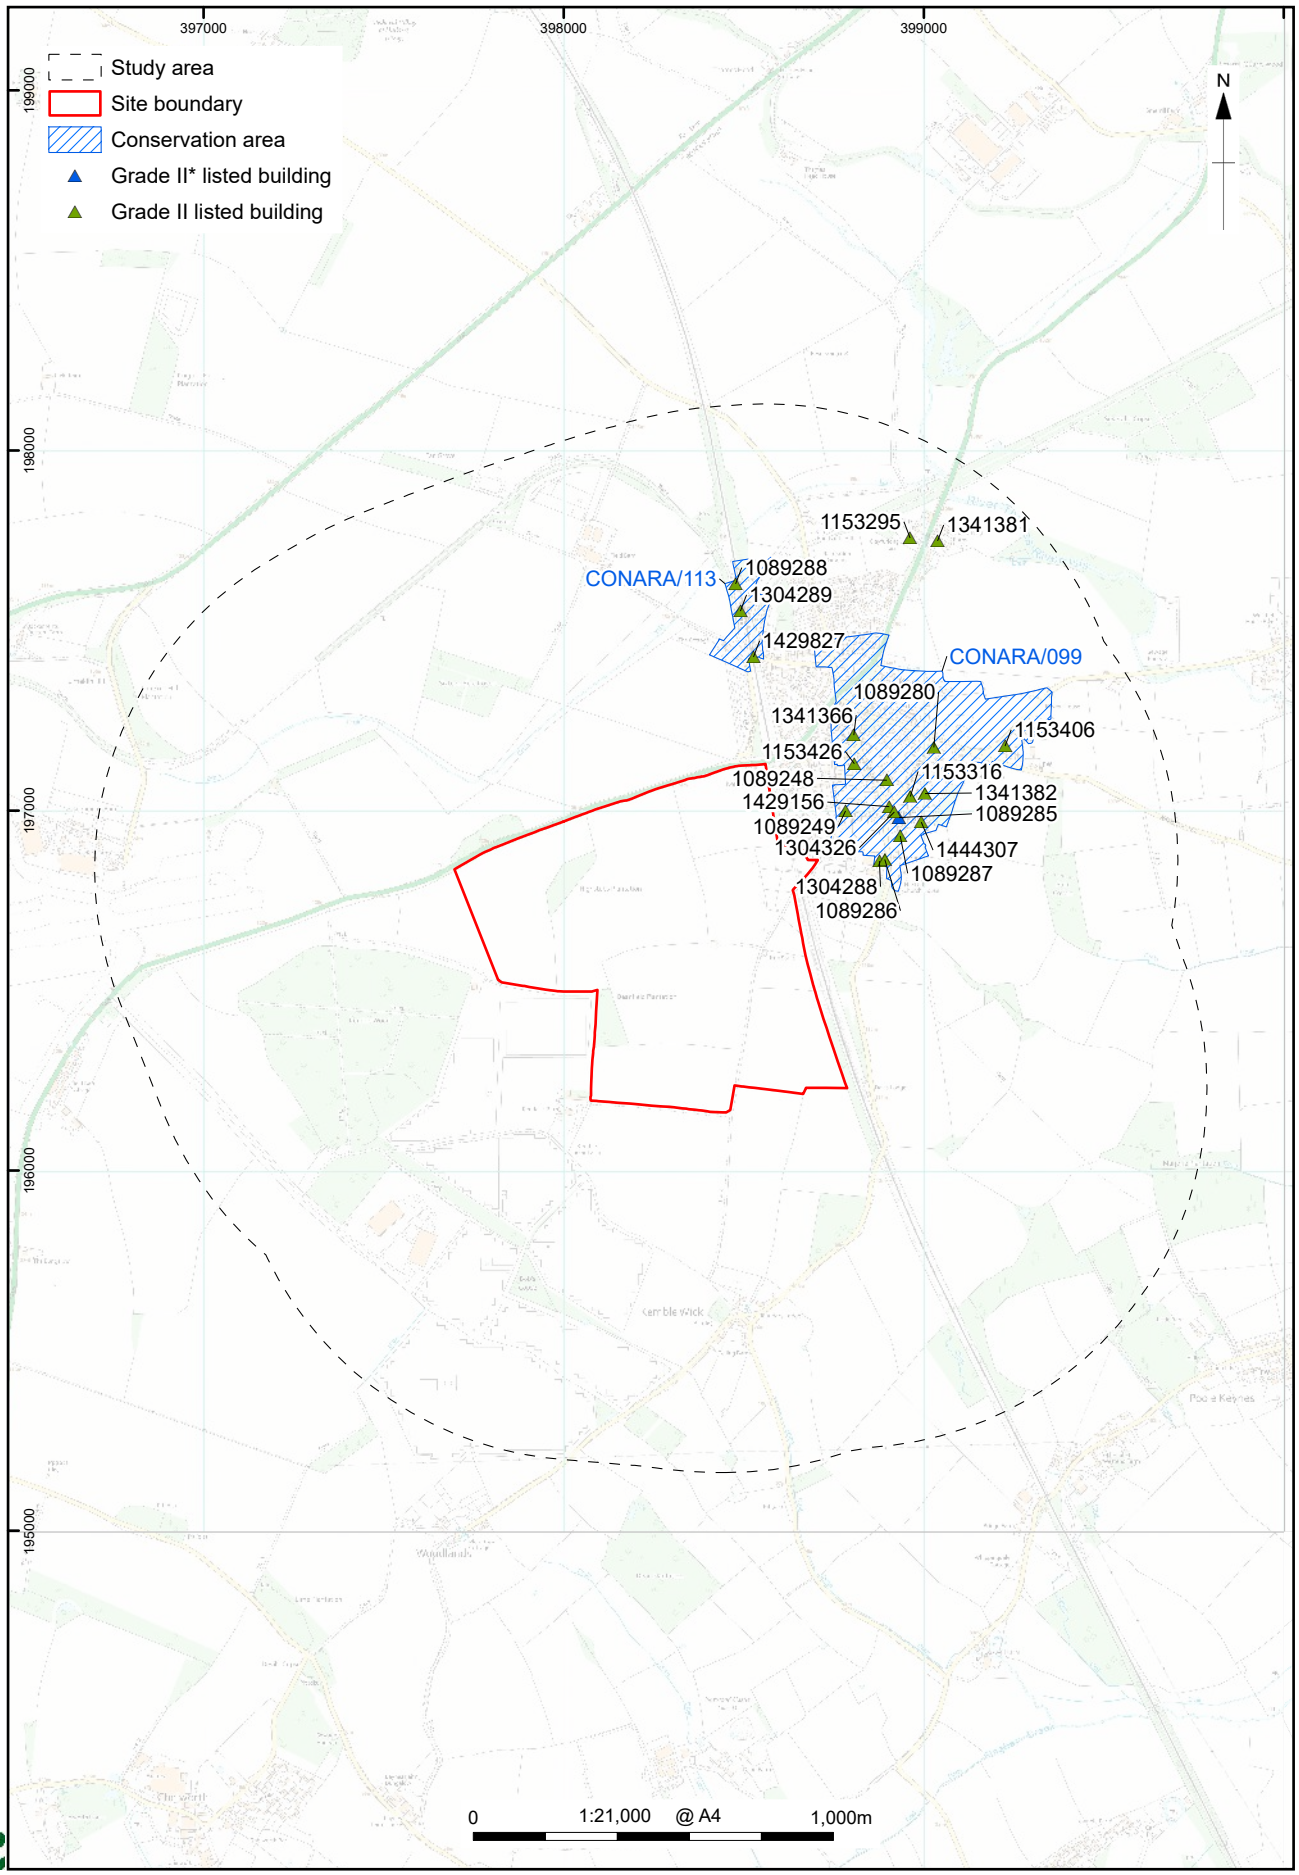
designs in the 19th century. In addition, sensitive design, respecting the local architectural vernacular, conforming to the Cotswold Design Code would aid the minimisation of the impact of new structures on the wider area. The retention and enhancement of existing boundary vegetation would also help to preserve the legibility of the present landscape and aim to reduce the overall anticipated level of less than substantial harm resulting from the loss of historic landscape character to the west of Kemble.



No opportunities for heritage enhancement are readily identifiable.

Conclusions and suitability:

It has been assessed that the progression of this site as a site allocation, through to final development, will result in a level of harm, equivalent to less than substantial harm, to the heritage significance of a conservation area and to historic landscape character, with considerate development design.



Heritage constraints rating: Moderate

The site is considered to have a final heritage sensitivity score of **Moderate** (i.e. suitable for development subject to recommended mitigation or design controls). Recommended design controls are for the retention and enhancement of existing boundary vegetation, and the consideration of less dense development within the north-eastern part of the site to allow a buffer to the conservation area. This does not consider below ground impacts to sub-surface archaeological remains, which would require full consideration if the site is progressed.

Gloucestershire County Council (2013) Gloucestershire Historic Landscape Characterisation (HLC) including the Cotswolds and the Wye Valley Areas of Outstanding Natural Beauty [data-set]. York: Archaeology Data Service [distributor] https://doi.org/10.5284/1020235

Figure K12.8: Historic landscape characterisation of the study area

Site Ref	L19
Town	Lechlade
Site Name	Land south of Butler's Court
Related policies	
Proposed allocation use	Residential development
Number of dwellings	9

Brief description of site:

The site lies on the western edge of the historic market town of Lechlade-on-Thames and extends across approximately 0.95 hectares (Fig. L19.1). It occupies part of a single field, currently in use as grassland, bounded to the north and west by The Wern and to the south by the A417. Residential properties and gardens adjoin the site to the east, where part of the boundary also abuts the Lechlade-on-Thames Conservation Area (CONARA/130). The northern, western and southern boundaries are generally open or defined by intermittent hedgerows, allowing clear views across the site from the adjacent roads. Views to the east are dominated by hedgerows and garden vegetation, with the rooftops of the adjacent properties visible in places above this planting. A small watercourse follows the western and southern boundaries of the field.

The site is located within the Thames Valley, to the north of the River Coln and close to its confluence with the River Thames. It is low-lying, at approximately 75m aOD. From the site, the landscape rises gently to the north, and to the east in the direction of Lechlade, while to the south it continues as low-lying agricultural land forming part of the River Coln floodplain. To the north, the landscape comprises grassland and arable farmland.

Significance of designated heritage assets in the site:

There are no designated heritage assets within the site.

Significance of designated heritage assets in the environs of the site which could be affected by the allocation of the site:

Conservation areas and associated designated heritage assets

The Lechlade Conservation Area adjoins part of the eastern boundary of the site (Fig. L19.2). The conservation area has been designated as a result of its high levels of historic and architectural interest. The conservation area contains the Grade I listed Church of St Lawrence (1155874) and seventy-two Grade II listed buildings. The closest of these to the site include:

- Butlers Court cottages (1303188): A pair of 17th century rubble stone cottages, with quoins and a stone slate roof. The building forms a long two storey range with mullion windows and stone stacks, with some later additions.
- Gazebo to the south-west of Butlers Cottage (1089436): An early 18th century square gazebo featuring roughcast walls with stone detailing and a pyramidal stone slate roof.

The listed buildings within the conservation area are considered to be of **high significance** as a result of the historic and architectural interest inherent in their built form and surviving historic fabric.

The conservation area also contains the scheduled Halfpenny Bridge (1003424) and the Grade II registered gardens associated with Church House (1000769).

The architectural interest of the conservation area arises from the high density of 15th–19th-century listed and non-listed historic buildings contained within the settlement and the consistent use of Cotswold vernacular styles and materials. Buildings within the conservation area are predominantly two to three storeys and constructed using local Cotswold limestone and slate tiles, with drystone walls being the dominant boundary treatment within the town. In addition to the domestic architecture, the conservation area includes the 15th-century Church of St Lawrence and two historic bridges, Halfpenny Bridge and St Johns Bridge, which act as key gateways into the town.

The historic interest of the conservation area lies in its plan form and property boundaries, which preserve the layout of the medieval market place and the medieval burgage plot pattern. The river crossings and the town's relationship to the Thames also contribute to its historic interest, highlighting its position at the highest navigable point of the Thames and illustrating its historic prominence as a river-trading hub. The surviving listed and historic buildings within the town illustrate its development from a medieval market town through to a Georgian coaching town and river port. The limited Victorian development within the town, which is largely confined to polite stone cottages and institutional buildings, reflects the declining prominence of river- and canal-based transportation in favour of the railway.

The approach to the conservation area from the west is defined by the historic linear hamlet of Downington. The character of this area is defined by large, widely spaced houses and cottages set back from the road. Views on the approach into the town are characterised by the transition from open countryside and rural pasture into the historic built environment.

Overall, the conservation area is considered to be of **high significance.** Due to its proximity to the site the conservation area has been scoped into this assessment.

Listed buildings outside of the conservation area

Outside of the conservation area the site lies in close proximity to the following Grade II listed buildings (Fig. L19.2):

- Butlers Court with gate piers and wall to the south-east (1341300): A large, detached 17th-century farmhouse, with 18th- and 19th-century additions. The house is constructed of rubble stone with a stone slate roof and prominent ashlar chimney stacks. It is complemented by an associated boundary wall and gate piers.
- Stable immediately behind Butlers Court to north-west (1341319): A former 18th century stable and granary constructed of coursed rubble stone with quoins and a stone slate roof. It has external stone steps leading to a loft level granary.
- Green Farmhouse (1341293): An early 18th-century L-shaped farmhouse built of coursed and dressed rubble stone with quoins, a stone slate roof and prominent stone end stacks.

These buildings are considered to have a high level of architectural and historic interest inherent in their built form and surviving historic fabric. They are therefore considered to be of **high significance.**

The remaining Grade II listed buildings within the study area include the 18th-century Trouthouse (1155630) and the 17th- or 18th-century Warrens Cross Farm House (1155631), which are located between 750 and 900m west of the site. These listed buildings, together with Claydon House (1089426), a Grade II listed 17th-century country house situated just outside the study area, form a small rural hamlet located on the A417 on the approach to Lechlade from the west. They are visually and physically separated from Lechlade by distance, agricultural land, intervening planting and the existing garden centre development. These assets are considered to be of **high significance** as a result of their high levels of historic and architectural interest.

Scheduled Monuments

The site lies to the south of a partially scheduled multi-period settlement, cemetery and ceremonial complex (designated area 1003434, Fig. L19.2; non-designated area 305, Fig. L19.7). This area contains a complex archaeological landscape visible primarily as cropmarks, comprising an extensive trackway system alongside settlement and funerary features. The scheduled area

contains ring ditches, probably the remains of barrows, late Neolithic to Bronze Age ceremonial features, later prehistoric and Roman field systems, and Iron Age to medieval settlement activity. The trackways connect to wider routeways and nearby farmsteads, including links from Roughsground Farm Villa. These remains have a high level of archaeological interest and are considered to be of **high significance**.

Significance of non-designated heritage assets in the site:

Several non-designated heritage assets have been recorded within the site:

- Iron Age settlement features identified during the 1995 Lechlade Bypass Evaluation (17039; Fig. L19.7);
- Prehistoric features identified during the evaluation and excavation at Butlers court (19961; Fig. L19.7); and
- Medieval field system (20464; Fig. L19.9).

These archaeological remains were uncovered by the geophysical survey and trial trenching that has been carried out within the site. The results of these investigations suggest that the site contains complex archaeology dating to the prehistoric and medieval periods. Due to their archaeological interest these Iron Age settlement remains are likely to be of **medium significance**, while below ground evidence for medieval agricultural activity is likely to be of **low/local significance**.

Significance of non-designated heritage assets in the environs of the site:

The GHER records a further 109 non-designated heritage assets within the 1km study area (Fig. L19.7-11). The site is located within a general area of high archaeological potential, with the majority of these assets supplementing, and adding context to, those assets outlined above. Owing to their archaeological interest, assets dating from the prehistoric to later medieval periods are generally considered to be of **medium significance**, while any deposits/materials dating to the post-medieval agricultural use of the study area are of comparatively **local/low significance**. Where GHER records refer to designated heritage assets such as listed buildings, registered parks and gardens, and scheduled monuments, they are considered to be of **high significance**.

Historic landscape character of the site (and significance):

The Historic Landscape Characterisation (HLC) for Gloucestershire, the Cotswolds Area of Outstanding Natural Beauty (AONB) and the Wye Valley AONB describe the site and the surrounding agricultural land as HLC Type 'A2:

less irregular enclosure partly reflecting former unenclosed cultivation patterns' (Fig. L19.4). This HLC type is interpreted as the enclosure of areas of former unenclosed cultivation by local arrangement. The enclosure pattern demonstrates small-scale semi-organised enclosure, rather than large-scale formal enclosure of the landscape. Enclosure of this type can be medieval or post-medieval in origin and is generally made up of smaller fields with irregular boundaries. Within the site, the post-medieval enclosure pattern has been altered by the construction of The Wern and the large roundabout to the south-west reducing its legibility within the allocation. Overall, this HLC type is considered to be of **low/local significance**.

Contribution of the site to the setting of known heritage assets:

The site makes a **low positive contribution** to the setting of the Lechlade-on-Thames Conservation Area as a landscape buffer that softens the visual impact of the denser modern housing at The Wern and maintains an open, verdant frontage to the water meadows to the south of the A417. The vegetation on the eastern boundary of the site contributes to the screening of the conservation area on the approach from the west, which keeps the settlement hidden until the last possible moment. This shielding and sudden reveal contribute positively to the character of the conservation area and the rural nature of its setting.

Listed buildings within the conservation area are visually separated from the site by existing development and intervening screening, and allocation of the site is unlikely to alter this relationship. The site therefore contributes to their setting in a similar way to its contribution to the setting of the conservation area, by helping to preserve the open rural edge of the settlement and by screening the settlement on the approach from the west. This makes a **low positive contribution** to the significance of the conservation area and, to a lesser extent, to the significance of listed buildings on the western edge of the settlement (1303188, 1089463).

The site does not contribute to the setting or significance of the scheduled Halfpenny Bridge (1003424) or the Grade II registered gardens associated with Church House (1000769), both of which lie within the conservation area and are experienced principally in relation to the historic core and river crossing rather than the western edge of the settlement.

Butlers Court (1341300) lies to the north-east of the site, separated from it by grassland and existing planting. As a 17th-century farmhouse located on the western edge of Lechlade, part of its significance is derived from its rural setting. As undeveloped land that may have historically been associated with

the farm, the site makes a **low positive contribution** to this aspect of the setting of Butlers Court, allowing it to be appreciated within its wider agricultural context. Partial views of the chimney stack and roofline of Butlers Court looking across the site reinforce this connection.

The site also forms part of the wider rural landscape surrounding the stable immediately behind Butlers Court to north-west (1341319). This landscape (of which the site forms a small part) makes a **low positive contribution** to the setting of this asset. The existing buildings at Butlers Court, and intervening distance and vegetation screen views between the site and this asset.

Green Farmhouse (1341293) is physically and visually separated from the site by intervening planting along the site boundaries and the A417, and there is no direct intervisibility between the asset and the site. However, as an early 18th century farmhouse located within the agricultural landscape on the western edge of Lechlade, part of its significance is derived from its rural setting, of which the site forms a very small part. This rural setting as a whole makes a **low positive contribution** to the setting of Green Farmhouse. The site is physically separated from this asset by distance, surrounding vegetation and the A417.

Trouthouse (1155630) and Warrens Cross Farm House (1155631) are located approximately 750–900m to the west of the site. These assets are visually and physically separated from the site by intervening agricultural land, planting and the existing garden centre development. The undeveloped agricultural land between these assets and Lechlade makes a low positive contribution to their setting, allowing them to be experienced as a small rural hamlet which is distinctly separate from Lechlade. The site lies on the edge of Lechlade and forms a very small part of this wider landscape. However, due to its size and position, it does not appreciably contribute to the experience of these assets as rural farm buildings, nor does it make a significant contribution to their separation from Lechlade. It is therefore considered to make a **neutral contribution** to their setting.

The non-designated archaeological remains, particularly those relating to the Iron Age settlement, make **a low positive contribution** to the setting of the scheduled multi-period settlement, cemetery and ceremonial complex (designated area 1003434; non-designated area 305) to the north, providing insight into the development and use of the wider prehistoric landscape surrounding the monument. The site is not currently visible from the scheduled monument due to existing boundary planting.

Impact assessment:

Having identified the surrounding designated heritage assets and assessed the site and its context, this assessment concludes that the site does not contain any overriding heritage constraints that would prevent its allocation. It does, however, sit within the setting of the Lechlade-on-Thames Conservation Area and several Grade II listed buildings (1303188, 1089463), situated on the western edge of the conservation area. Without suitable design mitigation, development within the allocation has the potential to adversely affect the setting of these assets. The scale of any impact would be dependent upon the detailed design, layout, scale and materials of the development.

These impacts would primarily arise from the introduction of new residential development into former agricultural land on the edge of Lechlade. This would extend the settlement beyond its existing limits and could, without suitable design mitigation, negatively affect elements of the conservation area's setting by introducing a harder suburban edge into the currently rural approach to the town from the west. This would result in **less than substantial harm** to the conservation area and to a lesser degree the listed buildings (1303188, 1089463) on its western edge. Recommendations to reduce the impact of any development upon the setting of the conservation area and the listed buildings within it are set out in the sections below.

The site makes a low positive contribution to Butlers Court (1341300) as part of its wider rural landscape and by preserving partial views of the listed building looking across the agricultural land within the site. These views allow Butlers Court to be appreciated as a former farm building. Without suitable design mitigation, development within the site could negatively affect the rural setting of this building, making it less appreciable as a historic farm building. This would result in **less than substantial harm** to this asset.

Additionally, the site forms a small part of the wider rural landscape of Green Farmhouse (1341293) and the stable immediately behind Butlers Court to the north-west (1341319). This wider landscape as a whole is considered to make a low positive contribution to the setting of these assets. Development within the site would result in the change of a small part of this landscape but would not be visible from these assets. Due to the small scale of the allocation and the lack of intervisibility, it is unlikely to affect the setting of these assets, resulting in **no harm** to them.

The site makes a neutral contribution to Trouthouse (1155630) and Warrens Cross Farm House (1155631). Development within the site would be unlikely to affect the setting of these assets and would result in **no harm** to them.

The development of the allocation would change the historic landscape character within the site from 'A2: less irregular enclosure partly reflecting former unenclosed cultivation patterns' to modern residential development. This would reduce the extent of this historic landscape character type on the western edge of Lechlade. The historic field pattern within the allocation has been altered by the creation of The Wern, lessening the legibility of this historic landscape type within the allocation. Despite these changes the site does retain its agricultural character and some of its original field boundaries. Development in the site would result in the loss of a small area of this this low/locally significant historic landscape character type, resulting in **less than substantial**.

The site has been subject to various phases of geophysical survey and evaluation which have identified surviving prehistoric and medieval remains. These are of archaeological interest and contribute to the setting of the nearby scheduled monument. Development within the site would cause **substantial harm** to any surviving archaeological remains within the site and, depending upon its height, could become visible in views looking out from the scheduled monument (1003434); which may result in **less than substantial harm** to the setting of this asset.

Cumulative impacts deriving from the allocation of the site:

No cumulative impacts are anticipated, as there are no known interacting heritage effects arising from this allocation in combination with other schemes or allocations that would give rise to additional harm beyond the impacts identified for the site itself.

Recommendations for minimising harm and maximising enhancement:

The site has previously been subject to geophysical survey and trial trenching. Any further archaeological mitigation that may be required would likely be secured as a condition of planning consent.

The following recommendations have been proposed to reduce the impact of the allocation upon the Lechlade Conservation Area and surrounding heritage assets.

Development should be set back from the A417 to retain a grassland buffer along the southern edge of the site. This buffer should incorporate generous verges and natural landscaping to preserve the rural and open character of the approach into Lechlade.

The layout should respond to the adjoining part of the Lechlade-on-Thames Conservation Area by reflecting its loose, linear and spacious settlement character. Buildings should be widely spaced and set within generous plots or grounds, avoiding a dense suburban arrangement. A loose courtyard arrangement, with a principal farmhouse-style building and ancillary structures, may be appropriate where this would reinforce the rural edge-of-settlement character and soften views towards Butlers Court (1341300).

Existing hedgerows and boundary vegetation, particularly along the eastern boundary, should be retained and strengthened to preserve the screened approach from the west and the sudden reveal of the historic settlement on the approach. Additional planting along the western edge of any development would also help to filter views of any new development from The Wern and the A417 on the approach into Lechlade.

The scale, form and materials of new development should be sympathetic to the conservation area, the rural setting of Butlers Court and the local vernacular. Traditional building forms and the use of Cotswold limestone, natural slate or other locally characteristic materials would help integrate development into this sensitive historic and landscape setting.

Building height should be in keeping with nearby development within the conservation area to prevent visual impacts upon the setting of the scheduled monument (1003434). Additionally, a programme of archaeological mitigation and recording may be required as a condition of any planning application to mitigate any archaeological effects.

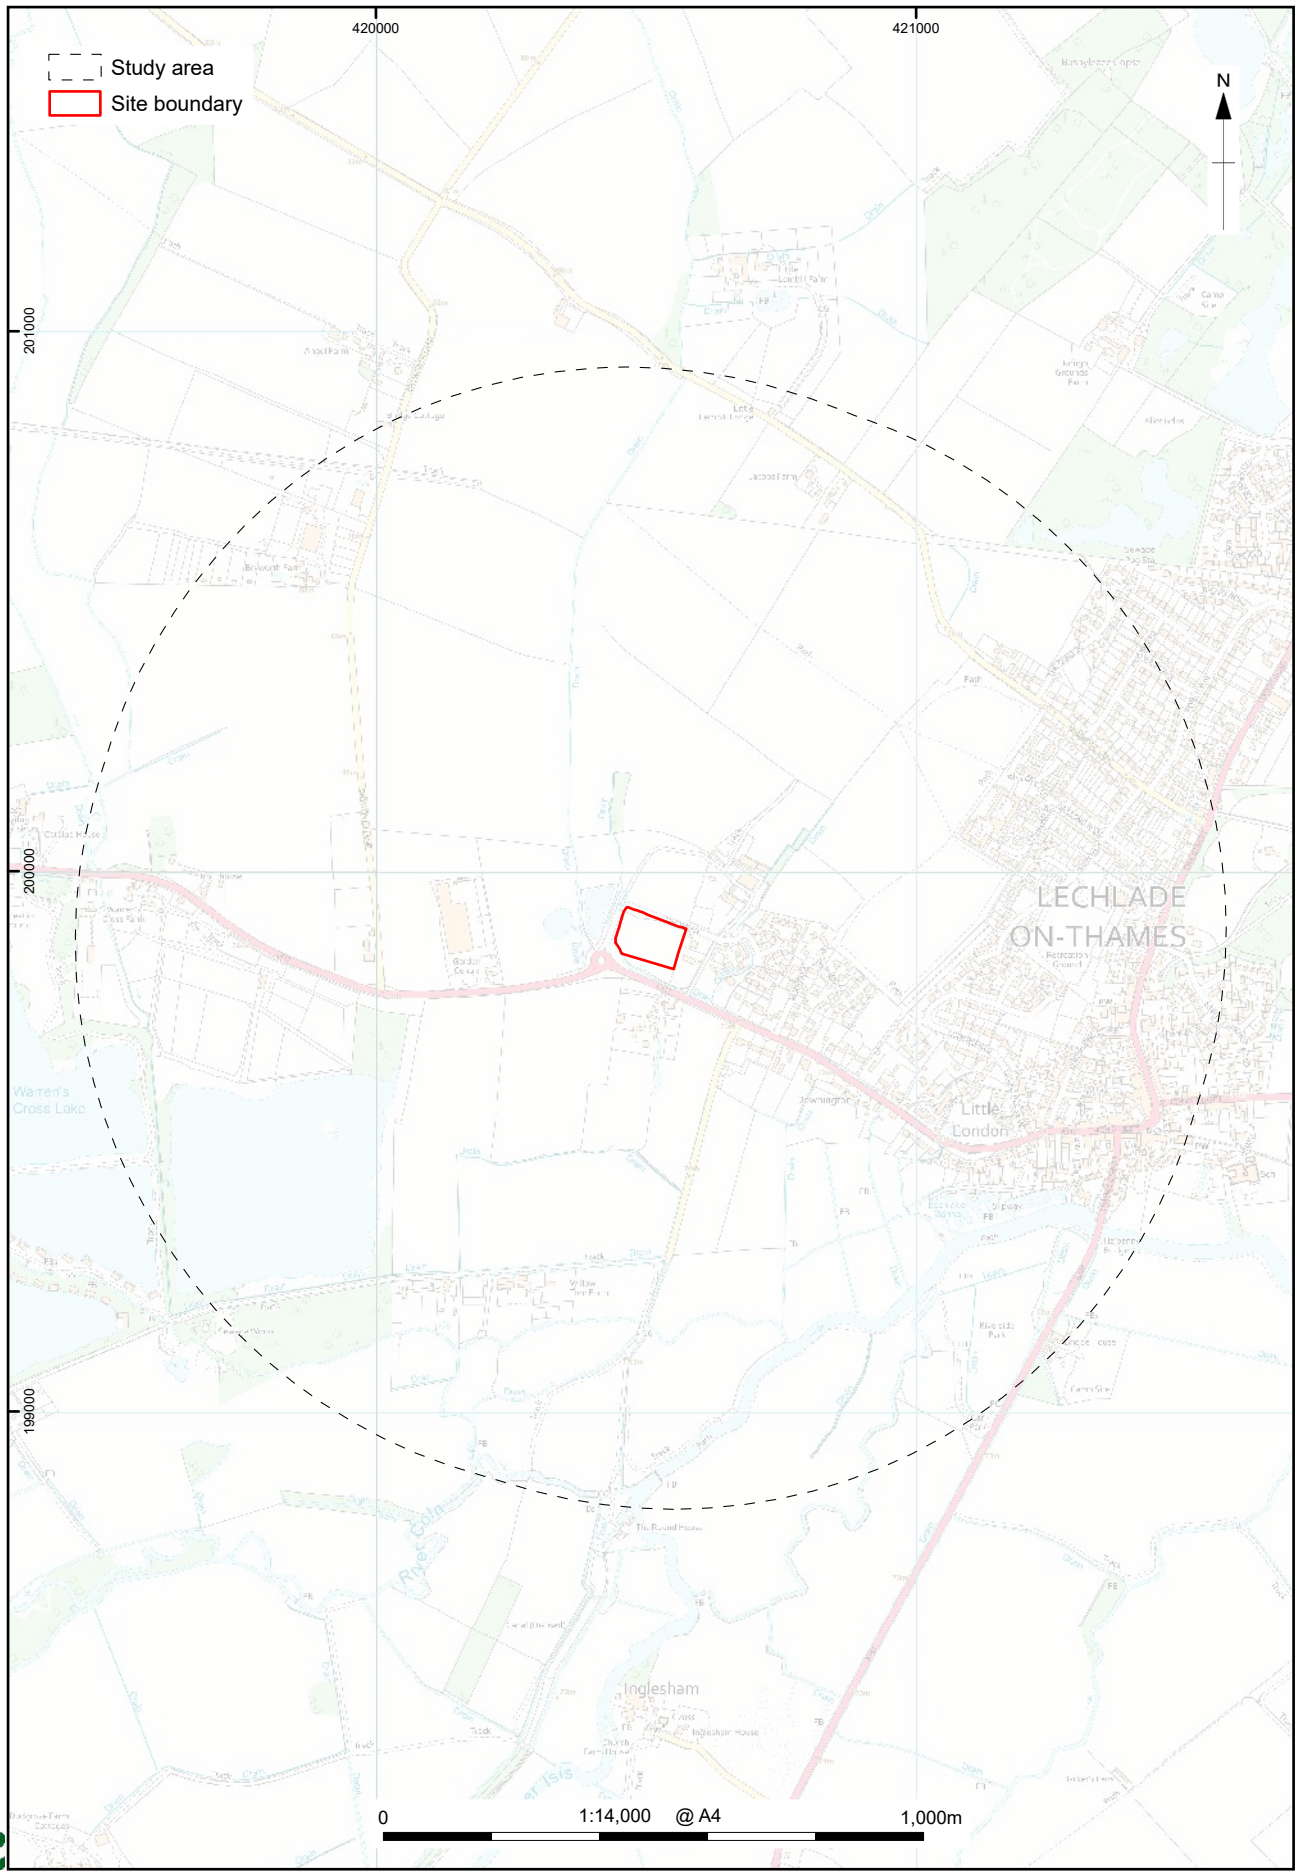
Conclusions and suitability:

The key heritage sensitivities associated with the site relate to its position on the western edge of Lechlade, adjoining part of the Lechlade-on-Thames Conservation Area, and its location within the wider setting of a number of Grade II listed buildings, including Butlers Court (1341300), the stable immediately behind Butlers Court to the north-west (1341319) and Green Farmhouse (1341293). The site also contains known non-designated archaeological remains, including Iron Age settlement evidence and medieval field systems, and forms part of a wider archaeological landscape which may provide context for the scheduled multi-period settlement, cemetery and ceremonial complex to the north.

The site makes a low positive contribution to the setting of the conservation area and to listed buildings (1303188, 1089463) on the western edge of the conservation area by preserving an open, verdant edge to the settlement and contributing to the rural approach into Lechlade from the west. It also makes a

low positive contribution to the setting of Butlers Court and forms part of the wider rural landscape associated with the stable immediately behind Butlers Court and Green Farmhouse. The site makes a neutral contribution to the more distant listed buildings at Trouthouse (1155630) and Warrens Cross Farm House (1155631), which are separated from the site by distance, intervening land, planting and existing development.

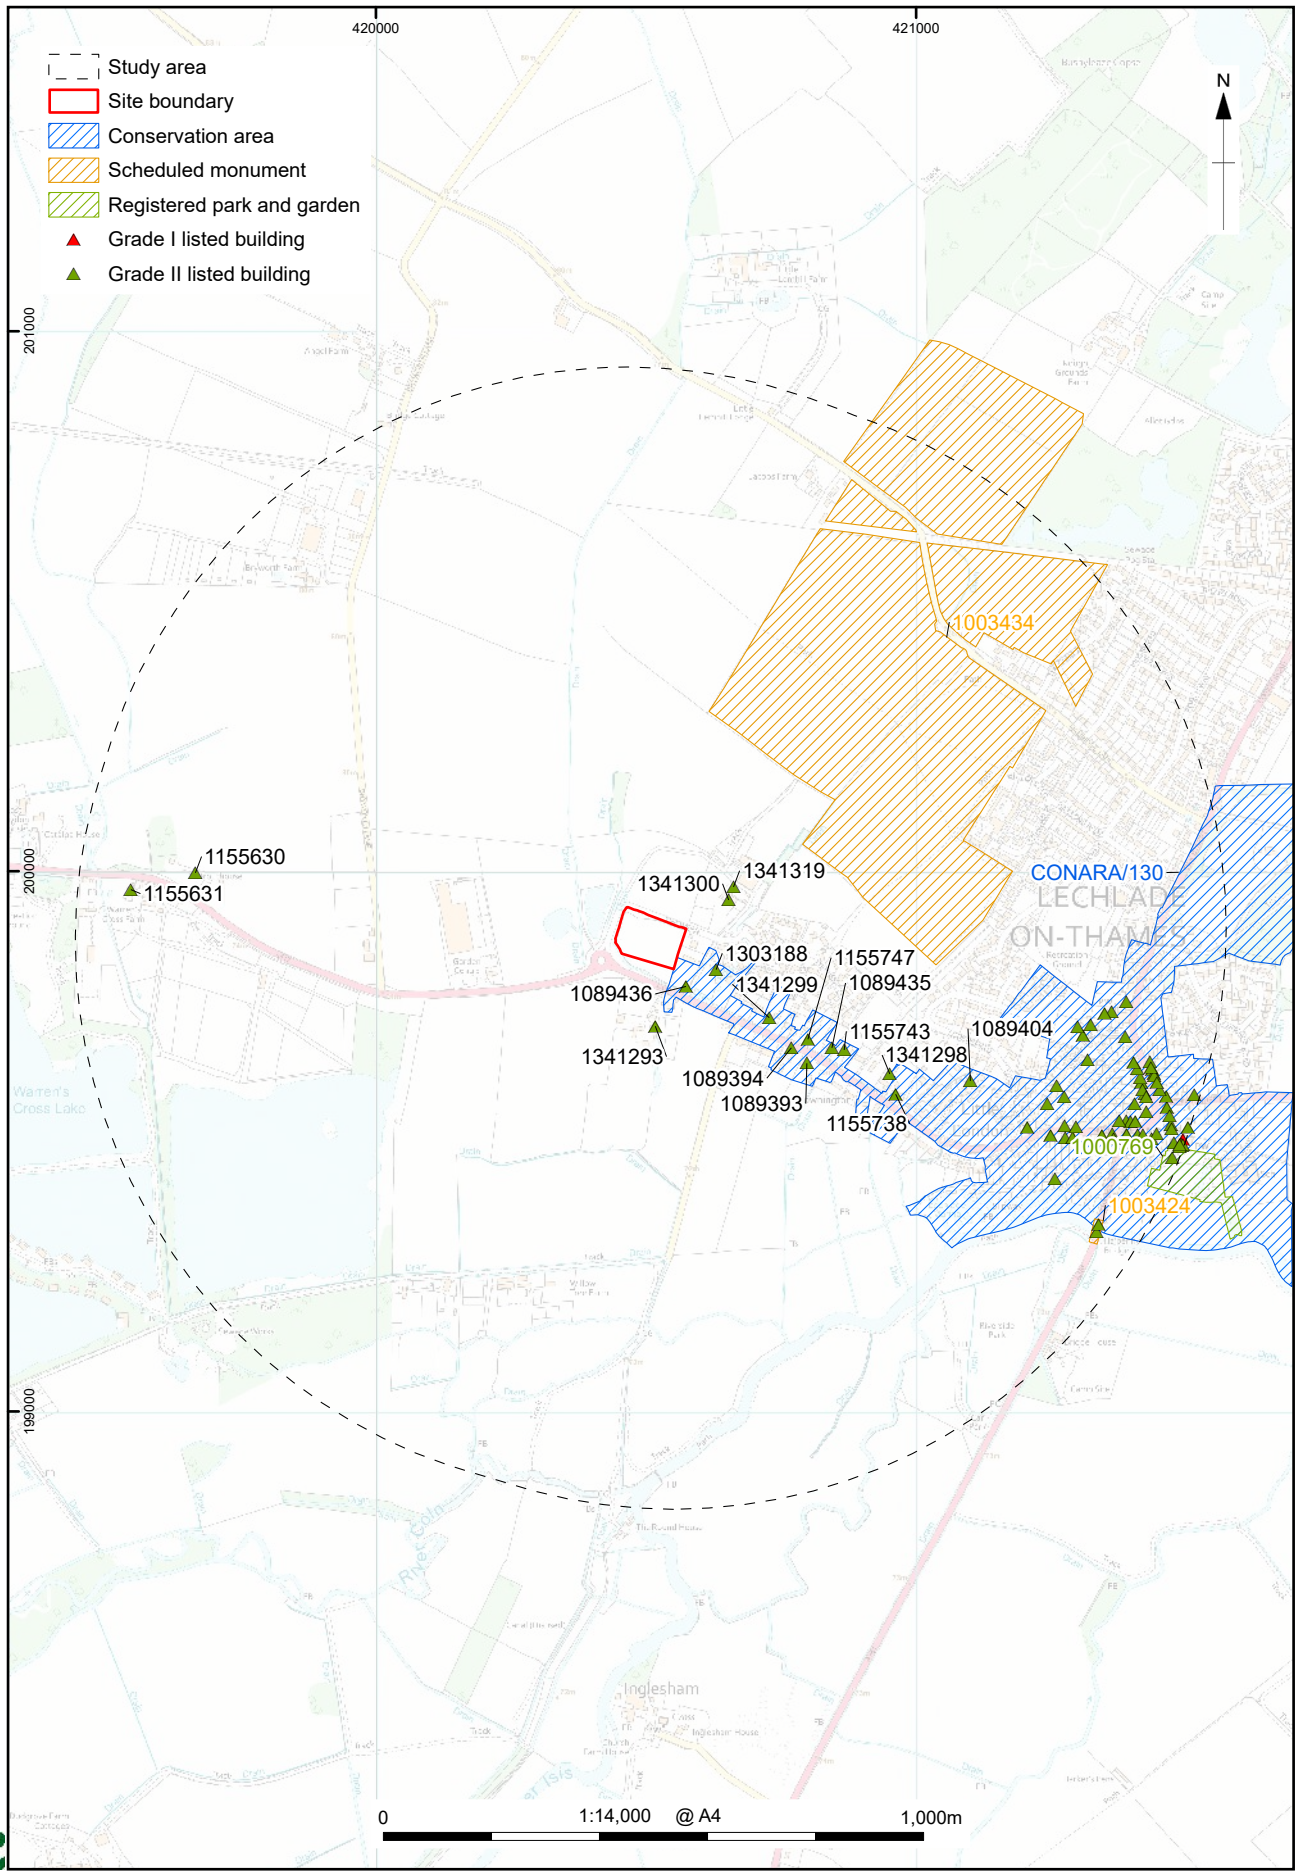
Without suitable design mitigation, development within the allocation has the potential to result in **less than substantial harm** to the setting and significance of the Lechlade-on-Thames Conservation Area and listed buildings (1303188, 1089463) on the western edge of the conservation area. It could also result in **less than substantial harm** to the setting of Grade II listed Butlers Court (1341300) and, depending on building height and visibility, to the setting of the scheduled monument (1003434) to the north. Due to the scale and position of the allocation it would result in **no harm** to the setting of the other designated assets identified within the study area.



These impacts resulting from the allocation would primarily arise from the introduction of residential development into a parcel of undeveloped historic agricultural land. This has the potential to introduce a hard suburban edge into views of the conservation on the rural approach into to the town and could reduce the ability to appreciate Butlers Court as a historic former farm building within a wider rural landscape. Depending upon building height, the allocation could also introduce development into views looking south from the scheduled monument. The level of impact would depend on the detailed design, layout, scale, density, materials and landscape treatment of the development.

In addition, development within the site has the potential to result in **substantial harm** to any surviving archaeological remains within the site. However, this could be addressed through an appropriate programme of archaeological mitigation and recording secured through the planning process.

Subject to the incorporation of the design recommendations such as setting development back from the A417; retaining and strengthening of boundary vegetation; use of a widely spaced, traditional layout containing locally appropriate building forms; restriction of building height; and use of locally characteristic materials, the heritage effects of the allocation could be reduced. On this basis, the site is considered potentially suitable for allocation from a heritage perspective, provided that any future scheme is carefully designed to respond to the conservation area, the setting of nearby designated heritage assets and the known archaeological sensitivity of the site.



Heritage Constraint Rating: Moderate

The site is considered to have an overall heritage constraint rating of **Moderate** (i.e. suitable for development subject to recommended mitigation or design controls). This reflects the presence of high-significance designated heritage assets within and around the site's setting, the potential for less than substantial harm if development is not sensitively designed, and the known archaeological interest within the site. The allocation is not precluded on heritage grounds but would require robust design and archaeological mitigation to minimise harm.

Site Reference	M19C
Settlement	Moreton-in-Marsh
Location	Dunstall Farm, Fosseway
Proposed allocation use	Residential
Number of dwellings	360

Brief description of site:

The site is situated to the south of Moreton-in-Marsh, to the immediate south of modern residential development, some of which is undergoing construction (Fig. M19C.1). It comprises an area of *c.* 27.5 hectares; four fields of arable agricultural land and one of pasture at the south-eastern extent, subdivided by mature hedgerows. A public right of way leads from Fosseway Avenue through the site. This has been temporarily diverted around the perimeter of the residential development being constructed immediately to the north-east of the site. The public right of way traverses the eastern part of the site on an approximate north to south orientation, passing an agricultural shed, after which it forks, continuing to the east as a farm access track, and to the south-east as a public right of way. The site lies at an average elevation of approximately 128m aOD, highest at its northern extent, and gradually sloping southwards.

To the north, the site is bounded by adjacent modern residential development. To the east, the site is bounded by the Great Western Railway. To the south, the site is bounded by a watercourse, with adjacent agricultural land, presumably associated with Frogmore Farm, to the south. To the west, the site is bounded by the A429, which respects the alignment of a Roman Road, the Fosse Way. The River Evenlode runs approximately 165m to the east of the site, roughly parallel with the railway line.

Significance of designated heritage assets in the site:

There are no designated heritage assets within the site.

Significance of designated heritage assets in the environs of the site which could be affected by the allocation of the site:

There are 78 listed buildings, and one scheduled monument, within a 1km radius of the site, all but two of which are situated within Moreton-in-Marsh Conservation Area, which lies 114m to the north of the site. The two assets not within the conservation area include a Grade II listed former tollhouse (1341697), and the Grade II listed Wellington Inn (1171044), both located to the east of the conservation area on London Road, also to the north of the site (Fig. MK2B.2). The majority of the listed buildings within the conservation area

are Grade II listed buildings, except for two Grade II* listed buildings, the premises of Horne and Sons (1088654), a regional Palladian townhouse, and Lemington House and boundary wall and railings (1341717). Lemington House is of 17th century origin. These assets are separated from the site by distance and large areas of modern housing, which along with the mature hedgerows and trees along the northern boundary of the site, prevents views between the majority of these assets and the site.

The spire of the Grade II listed Church of St David (1088677) can be observed in views from the site looking north towards the town. This is partially visible between trees and above the modern rooftops from the public right of way at the far southern extent of the site – elsewhere the hedgerow to the west of the track/public right of way obscures this. The significance of the church is derived from its architectural interest as a Victorian Gothic Revival Church with surviving architectural detailing, layout and internal features; and its historic interest which relates to its association with the development of the 19th century town. The height of the tower and spire allow it to be appreciated from the landscape surrounding the town contributing to understanding of the church as an important local building.

In addition, from the far south-eastern extent of the site, views north-north-westward include the possible historic rooftops of Batsford Park, on elevated land, though with modern residential buildings and telegraph poles, as well as mature trees in the foreground. Batsford Park is a Grade II* listed building (1089576), within Batsford Park, which is a Grade II* registered park and garden (1000431) in which ten additional Grade II listed buildings and features are also located. The view permits a limited appreciation of Batsford Park's position in the wider landscape, but does not reveal the designed parkland, gardens or historic estate composition that underpin its significance. Consequently, its contribution to the asset's setting and the appreciation of its significance is limited

Batsford Park, the manor house (1089576), is situated approximately 2.75km from the site, and its principal elevation faces south-east, overlooking the landscape towards the River Evenlode. It derives its significance from its late 19th century design, by the prominent architects Sir Ernest George and Harold Peto; this is expressed through its Cotswold Elizabethan style, craftsmanship and high-quality detailing. Its significance is enhanced by its association with Lord Redesdale and as a notable country estate of the Victorian period, reflecting the social status and aspirations of its owners.

Batsford Park, the registered park and garden (1000431) derives significance from its historic development as a country estate, its 18th century landscaped

park, and the distinguished late 19th century arboretum and Japanese-inspired gardens created by A.B. Freeman-Mitford. Its designed landscapes, ornamental structures, specimen planting, surviving historic earthworks and the listed buildings contained within it collectively contribute to its historic, architectural and artistic interest.

All three of these designated heritage assets, the Grade II listed Church of St David (1088677), Batsford Park Grade II* listed building (1089576), and Batsford Park Grade II* registered park and garden (1000431) are considered of **high significance**.

Significance of non-designated heritage assets in the site:

Five known non-designated heritage assets are mapped as extending to within the site itself. One of these is part of a large swathe of Iron Age to Roman period rectilinear enclosures, field boundaries and trackways, visible as cropmarks to the southeast of Dunstall Farm (2742; Fig. M19C.5), included in the HER dataset and also mapped as part of the National Mapping Programme (Fig. M19C.9). A geophysical survey covering the northern extent of the allocation (EGC6474; Fig. M19C.8) revealed probable archaeological features within the eastern part of the site as well as ridge and furrow. Subsequent, associated trial trenching (EGC6651; Fig. M19C.8) along the perimeter of the geophysical survey area, including a linear stretch of trenching across the centre of the site, encountered a ring ditch which produced a single pottery sherd of Late Bronze Age to Middle Iron Age date, as well as part of an enclosure system. This would appear to match the cropmark evidence. No surface traces were identifiable during the June 2026 site visit to support this assessment.

Other known heritage assets within the site are areas of medieval ridge and furrow, visible as cropmarks from aerial photographs across the western (51483; Fig. M19C.6), and southern (51484; Fig. M19C.6) extents of the site, and a complex series of medieval to post medieval water meadows and drainage ditches, noted within the HER dataset to be visible as earthworks, at the eastern extent of the site (4006; Fig. M19C.6). These medieval features were also mapped as part of the National Mapping Programme (M19C.9). The final known non-designated heritage assets within the site are the mapped extent of 5-6 curvilinear enclosures of unknown date, towards the eastern extent of the site (38897; Fig. M19C.7) and the mapped extent of 17 curvilinear enclosures of unknown date, visible as cropmarks, covering a larger area, also within the eastern part of the site (38898; Fig. M19C.7), features also mapped by the National Mapping Programme (Fig. M19C.9). None of these heritage

assets were identifiable at surface level during the June 2026 site visit to support this assessment.

A former farm called Dunstall has also been recorded within the site, (the upstanding agricultural building within the northern extent of the site formed part of its main complex; Fig. M19C.7). Historic Ordnance Survey mapping shows that this was accessed by the present public right of way from the north, as well as a track from the west, which extended from the main road. This western track passed an additional range of agricultural outbuildings, which formed a broad c-shape plan (Fig. M19C.7). These buildings may have been associated with Dunstall, although the enclosure map suggests they were within a separate landholding in 1821.

Owing to their archaeological interest, assets dating from the prehistoric to later medieval periods, including the Iron Age to Roman features within the site, are generally considered to be of **medium significance**. This may also be applicable to features relating to medieval agricultural practices, dependent on survival and rarity levels. It is likely that sub-surface remains of the two former agricultural complexes identified towards the northern extent of the site are of **low significance**, the evidential potential of surviving sub surface remains likely restricted to confirmation of their extent as shown on 19th century mapping. There are multiple, upstanding surviving examples of agricultural buildings of this period within the wider landscape.

Significance of non-designated heritage assets in the environs of the site:

The HER records an additional 76 non-designated heritage assets beyond the site boundary but within a 1km radius of the site (Fig. M19C.5-7), some of which are known also from previous archaeological investigations (Fig. M19C.8) and/or the National Mapping Programme (Fig. M19C.9). Many share similar characteristics with the heritage assets within the site itself, including curvilinear enclosures of unknown date identified from cropmarks in aerial photographs, prehistoric to Roman period enclosures and possible settlements, also visible as cropmarks, and extensive evidence for medieval agricultural activity, in the form of ridge and furrow, enclosures and field boundaries, and drainage ditches and water meadows. Medieval activity is not surprising given the proximity of Moreton-in-Marsh (15387 and 15388; Fig. M19C.4), which has medieval origins, 550m to the north of the site, and the deserted medieval village of Coldicote (9671) approximately 250m to the east of the site (Fig. M19C.8).

Evidence for past activity of the prehistoric, Roman and medieval periods in a wider 1km radius not reflecting that known within the site includes a possible Bronze Age barrow (38910), a Romano-British farmstead (25518), the Roman Road of the Fosse(e) Way, between Exeter and Lincoln (6491), which is respected by the present A429 to the immediate west of the site (Fig. M19C.5), and a well (2726) and a spearhead find (7237) of the medieval period (Fig. M19C.6). Post medieval period activity is largely concentrated to the north of the site, representing the continued occupation and extension of settlement at Moreton-in-Marsh (Figs. M19C.3, M19C.4 and M19C.7). The road to the west of the site, in use since at least the Roman period, was upgraded to a turnpike in 1755 (2653), and the Oxford, Worcester and Wolverhampton Railway, subsequently part of the West Midland Railway and the GWR, was established to the immediate east of the site in the 19th century (26154880). Activity of the modern period is dominated by temporary installations associated with World War II, all mapped to the north of the site (Fig. M19C.7), and there are a number of undated features in the 1km study area (Fig. M19C.7).

Owing to their evidential value, assets dating from the prehistoric to later medieval periods are generally considered to be of **low** to **medium significance**, while any deposits/ materials dating to the post-medieval agricultural use of the study area are of comparatively **low significance**. Where HER records include designated heritage assets such as listed buildings, registered parks and gardens, or scheduled monuments, they are considered to be of **high significance**.

No Neighbourhood plan has yet been approved for Moreton-in-Marsh, but there is a draft version under consultation, which identifies a number of non-designated historic structures as requiring consideration in planning proposals within a 1km radius of the site. These predominantly lie within the historic core of Moreton-in-Marsh, and so are not visible from the site. The assets within the core of the town are unlikely to be affected by the allocation of the site. Two non-designated heritage assets are identified in the draft Neighbourhood Plan to the south of the main settlement. These include the cider press on Fosseway Avenue, approximately 250m north of the site (Fig. M19C.3). This is located on a grass verge, north of a pumping station and modern houses, and these, as well as those residences under construction to the north of the site, restrict intervisibility. The other is Coldicote Farm, which is situated *c.* 400m to the east of the site (Fig. M19C.3). This is also not visible from within the site, due to mature vegetation at the eastern boundary, and beyond. These assets are unlikely to be affected by the allocation of the site.

The draft neighbourhood plan identifies a potential 43 important views in the vicinity of Moreton-in-Marsh which should be preserved in future planning proposals. One of these, View 17, is from the public right of way within the eastern half of the site, north-north-westwards (Fig. M19C.3). The cited reason appears to be based on its rural character: '*as Moreton is approached from the south, along the route shared by the Diamond Way and Moreton 8, the open arable farmland, bordered by natural hedgerows, and an old corrugated barn in the corner of the field, there is little that indicates it is within 700m of entering Fosseway Avenue*'. There is some discrepancy between descriptions and mapped locations, but three others, two potentially at the southern extent of the site, and one towards the south-western extent, all facing north or north-east, include the note 'probably remove' so presumably are of less concern. There is, however, the potential for the allocation of this site to have an effect on at least one important view. This viewpoint does not appear to be significant based on heritage, or archaeological, value so does not require further consideration in this assessment.

Historic landscape character of the site (and significance):

The site lies just beyond the Cotswolds National Landscape (CNL), designated as an Area of Natural Beauty (AONB), the boundary of which is the watercourse approximately 220m to the north of the site and the western extent of the A429, just to the west of the site. This nearest part is mapped within Pastoral Lowland Vale characterisation area. The site also lies within the Moreton-in-Marsh Special Landscape Area (Fig. M19C.3). For areas within Cotswold District Council's remit, the Special Landscape Area (SLA) designation provides protection for locally significant and attractive landscapes that are of comparable quality to AONBs. These are identified as worthy of protection and enhancement, particularly through the planning process.

The Gloucestershire Historic Landscape Characterisation (HLC; Gloucestershire County Council 2013) maps the majority of the site within character type A2m 'less irregular enclosure partly reflecting former unenclosed cultivation patterns', which is interpreted as enclosure of former un-enclosed cultivation. The south central and south-western extents lie within character type D1r 'riverine pasture, probable meadows now largely enclosed', with the subtype 'r' representing the enclosure of straight 'doles' within meadows. This character area relates to enclosed land adjacent to major streams or rivers, typically thought to be medieval or post medieval in date, perhaps the earliest surviving boundaries within a landscape (Fig. M19C.10).

The Gloucestershire Landscape Character Assessment of 2006 (LDA Design 2006) includes the site within the Undulating Lowland Vale character type,

within VM2A: Upper Stour Hills and Valleys. The landscape is intensively farmed with both arable and pastoral land. A network of generally well-maintained hedgerows border the fields, although in areas poor maintenance regimes have resulted in reinforcing post and wire and post and rail fences. Medium scale regular shaped fields emphasise the broad undulating landscape, often creating a strong pattern throughout the landscape. Small pastures and contrasting wide floodplain pastures frequently align watercourses, with the valley bottoms also supporting a denser area of indigenous vegetation including scattered trees aligning watercourses. Hedgerow trees are frequent, with occasional field trees. Despite the limited settlement pattern evident today, the landscape type has a long history of settlement, in particular since improved farming techniques allowed more marginal land to become workable in the Romano-British and Saxon periods. This landscape character type is considered to be of **low significance**, based on its lack of rarity within the wider landscape.

Contribution of the site to the significance and setting of known heritage assets:

The site comprises four fields of arable agricultural land and one of pasture at the south-eastern extent, subdivided by mature hedgerows, and including a public right of way within its eastern half. Modern residential development borders the site to the north, with adjacent agricultural land to the south and, beyond the railway line, to the east. To the west is the A429, on the west side of which, in the vicinity of the site and to the north, are large amenity buildings associated with Moreton-in-Marsh (North Cotswold Hospital and a garden centre).

Almost all of the designated heritage assets and upstanding non-designated heritage assets within a 1km radius of the site are not visible from the site, and have no historical or other associations, and thus the site provides a **neutral** contribution to their heritage significance and setting. However, the spire of the Grade II Church of St David (1088677) is partially visible through mature vegetation and over the modern rooftops of the residential developments to the north of the site. The immediate setting of the church is defined by the associated churchyard (within which are four Grade II listed tombs) with boundary wall which surrounds it, and the historic buildings along Church Street to the south and east. The wider conservation area and historic buildings within it also make a positive contribution its setting allowing the church to be understood as a focal point for the historic town. The site forms part of the historic agricultural landscape that surrounded the town. Views of the spire along the historic approaches into the town, make a low positive contribution to the setting of the church allowing its prominence and role as a local landmark

to be appreciated. Views of spire from within the site are not located along any of these historic approaches and are framed by significant modern development. These views are considered to make a **low positive** contribution to the understanding or appreciation of the heritage interest of the church, because they are from a public right of way which is shown on historic Ordnance Survey mapping.

In addition, in longer views from the site, the rooftop of the Grade II* listed manor house of Batsford Park (1089576) is also just identifiable to the north-west, again through and around mature vegetation, from the south-eastern part of the site. The key component in the setting of the manor house is the surrounding Grade II* registered park and garden (1000431), a landscape deliberately designed to frame it. The location of these heritage assets, on the south-eastern slope of a hill, has resulted in the house being designed to face south-eastwards, to allow and appreciate wide, long-reaching views across the landscape towards the River Evenlode. These wider views looking across the Evenlode valley from the house/garden cumulatively make a low positivise contribution to its setting. The site sits within this landscape and may form a small part these views. However, adjacent development, both to the north-west in terms of the built form of large, detached structures including the North Cotswold Hospital and the garden centre, and more densely developed modern residences to the immediate north, have introduced modern built form into this part of the landscape view. The site therefore provides a maximum contribution of **low positive** to the setting of this heritage asset. Return views of the house and gardens from the site allow the topographic position of the house and garden to be understood but don't directly contribute to its heritage interests or ability to appreciate these interests. The return views therefore make a **neutral contribution** to the setting of this asset.

Impact assessment:

The site has been identified as providing a maximum contribution of low positive to known heritage assets. Its inclusion as a site allocation would result in indirect harm to the setting of the Grade II listed church and a Grade II* listed building within a Grade II*listed park and garden (Batsford Park) through the introduction of new built form into the agricultural landscape, from which the spire of the church is visible from a public right of way, and over which the Grade II* listed Batsford Park house overlooks. As it is likely to result in a small change to a panoramic landscape view, this would equate to a negligible change to setting. Adjacent development to the north of the site has eroded the significance of this part of the landscape area, and proves that it is not an outright barrier to development. At a maximum, it is anticipated that the site's

inclusion as an allocation site is likely to result in an overall impact level of **less than substantial harm**, and potentially, **no harm**.

The allocation includes a large area of cropmarks identified from aerial photographs, interpreted as resulting from Iron Age to Roman period activity. Geophysical survey and trial trench evaluation covering part of the site appear to corroborate this. Further curvilinear enclosures of unknown date, as well as areas of medieval to post medieval ridge and furrow and water meadows are also known within the site, as are two former, probable nineteenth century, farm complexes, at the northern extent of the site. Development within the site would have a **permanent negative impact** on any surviving archaeological remains resulting in **substantial harm** to these heritage assets. Without appropriate investigation and mitigation measures, any development that disturbs archaeological heritage assets is unlikely to satisfy relevant national and local planning policy objectives.

The development of the allocation would change the historic landscape character of the site from irregular enclosure and riverine pasture to modern residential development, reducing the extent of these historic landscape types and eroding the post-medieval rural character of the landscape to the south of Moreton-in-Marsh. Given the size and scale of the site, this would have a negative impact upon a large area of land, but, given the significance of the historic landscape character type is low, this would result in an overall level of **less than substantial harm**.

Cumulative impacts deriving from the allocation of the site:

No cumulative impacts are anticipated, as there are no known interacting heritage effects arising from this allocation in combination with other schemes or allocations that would give rise to additional harm beyond the impacts identified for the site itself.

Recommendations for minimising harm and maximising enhancement:

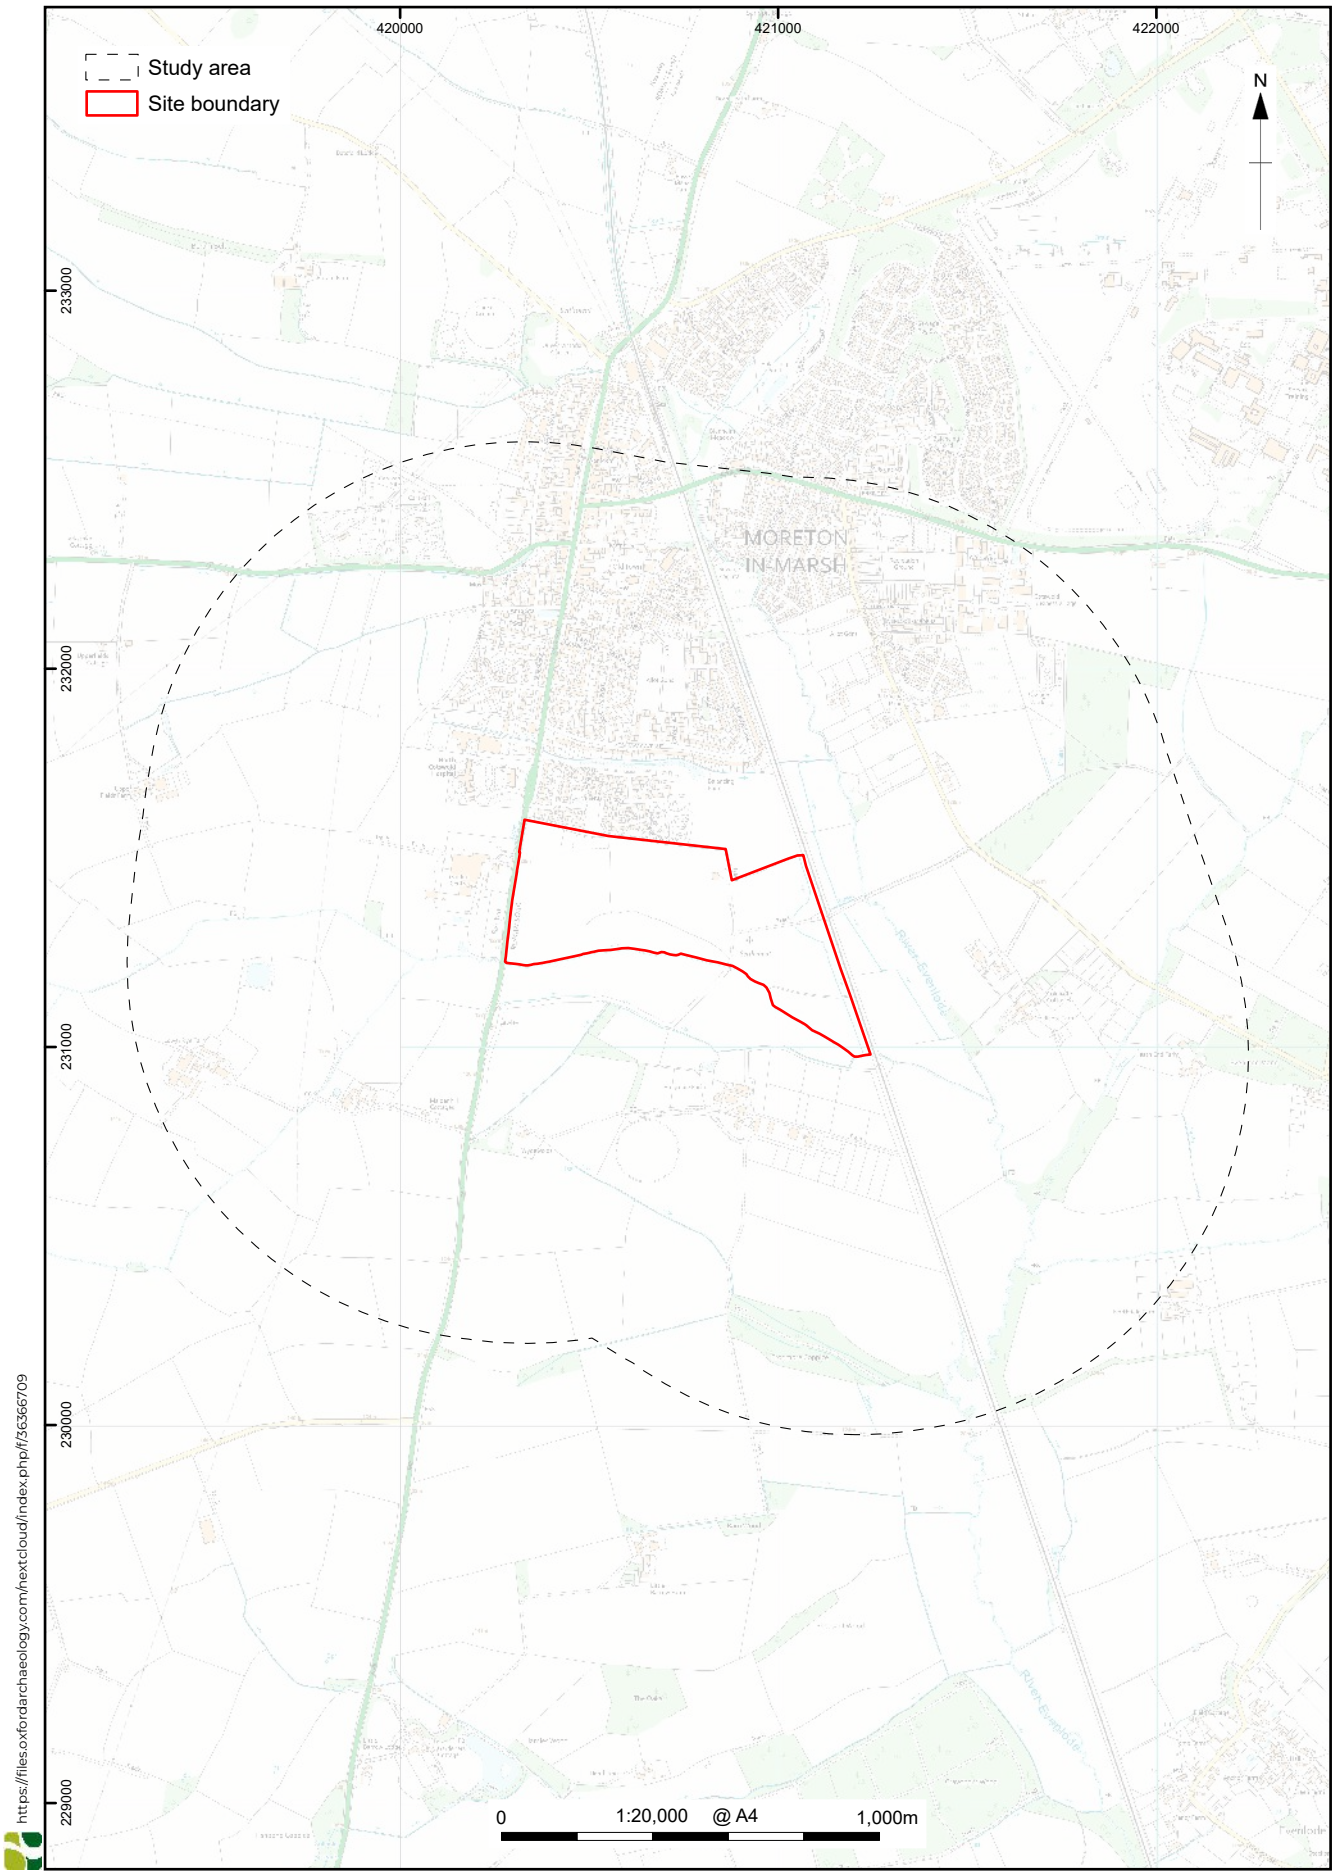
The northern part of the site has been subjected to geophysical survey and trial trench evaluation, confirming the high potential for archaeological remains of prehistoric to Roman periods, and of agricultural activity, including medieval field systems and ridge and furrow and the remains of former post medieval agricultural buildings, within the site. It seems highly likely, therefore, that a programme of targeted archaeological evaluation trenching, will be required. This would help to understand the extent and character of surviving archaeological assets and would inform a strategy to mitigate the impact of any subsequent development upon them. Development should only occur after

appropriate archaeological investigation has taken place, the full extent of impact is understood, and a strategy of mitigation is agreed with the Gloucestershire Planning Archaeologist.

For the Church of St David, the spire of which is visible to the north of the site from the public right of way within the site, it would be difficult to prevent the allocation from having some impact upon setting, but this would not result in significant visual change, and this could be reduced through the retention and enhancement of existing boundary vegetation and retention of a public right of way through the site.

Similarly, for Batsford Park, visible to the north-west from the site, it would be difficult to prevent the allocation from having some impact upon setting, but this would not result in significant visual change. The introduction of a small change to a panoramic landscape view is likely to result in a negligible change to setting which could be reduced, to a degree, through the retention and enhancement of existing boundary vegetation, and could result in an overall level of harm, of no harm.

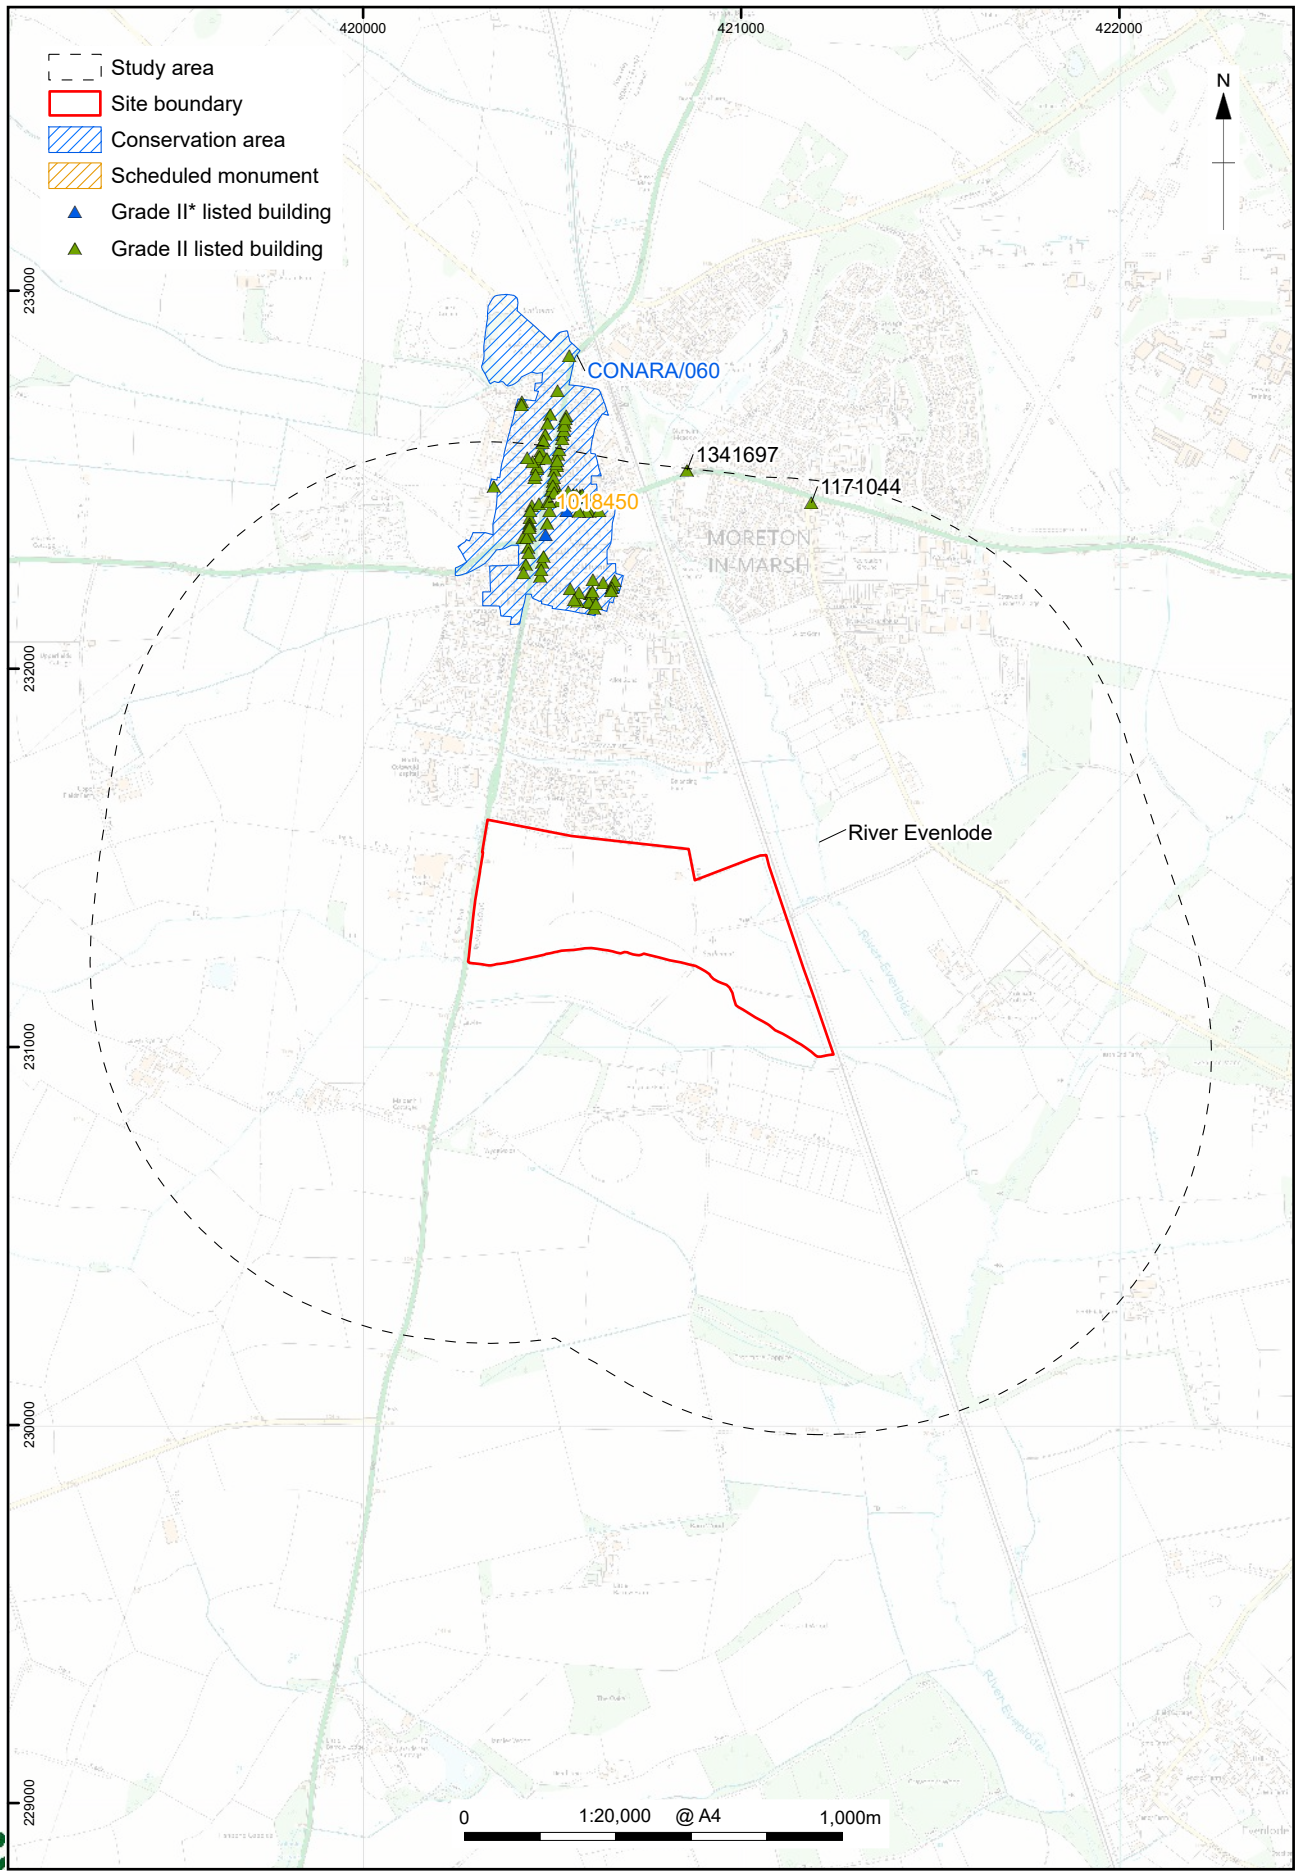
The allocation of the site has been identified to result in **less than substantial harm** to the historic landscape of the area by replacing an area of low significant irregular enclosure and riverine pasture with modern residential development. Given the size and scale of the area to be affected, some impact is inevitable. Design considerations, such as the preservation of existing field boundaries within the site's green infrastructure provision, or, where this is not possible, preservation of their alignment within the development layout, would help to preserve the legibility of the present landscape and reduce the overall level of harm.



No opportunities for heritage enhancement are readily identifiable.

Conclusions and suitability:

It has been assessed that the progression of this site as a site allocation, through to final development, could result in a level of harm, equivalent to less than substantial harm to the heritage significance of a Grade II listed church, a Grade II* listed building within a Grade II*listed park and garden and on historic landscape character. The development of land to the north, also with intervisibility with the church spire, and within the wider setting of Batsford Park, indicates that this does not preclude development. However, the incorporation of sensitive, considerate design of the final development proposals should aim to minimise harm.



Heritage constraints rating: Moderate

These could result in a final heritage sensitivity score of **Moderate** (i.e. suitable for development subject to recommended mitigation or design controls). Recommended design controls are for the retention, and perhaps enhancement, of existing mature planting, and consideration of a gradual buffer zone at the southern extent of the site, to allow for the sensitive introduction of newly built form into the character of the special landscape area in which the allocation lies. This does not consider below ground impacts to sub-surface archaeological remains, which would require full consideration if the site is progressed.

Figure M19C.10: Historic landscape characterisation of the study area

Site Reference	MK2B/C
Settlement	Mickleton
Location	Land north-east of Mickleton
Proposed allocation use	Residential
Number of dwellings	40

Brief description of site:

The site is situated to the north-east of Mickleton, to the immediate east and north of modern residential developments (Fig. MK2B/C.1). It comprises an area of *c.* 5.3 hectares, of arable agricultural land, subdivided across the centre by the west-south-west to east-north-east alignment of Canada Lane, which extends from the residential development to the west, to access large agricultural sheds to the east. The site lies at an elevation of approximately 80m aOD.

The site is bounded by farm access tracks along its north-western, and part of its north-eastern, boundaries with agricultural land beyond. To the south-west and south-east, it is bordered by modern residential developments, while along the southern boundary and remaining part of the north-eastern boundary it is bordered by agricultural fields. The trackway crossing the site (an extension of Canada Lane) is lined on either side by avenues of trees, which are protected by a tree preservation order (TPO25/00005). This trackway is also a public right of way, and forms part of the Heart of England Way. The remains of a mature hedgerow runs parallel to the track across the field to the north, and a small copse of trees and vegetation, potentially disguising rubble, is situated at the north-eastern extent of the site. A second pile of rubble is present towards the eastern extent of the mature hedgerow within the northern part of the site. Otherwise, the land within the site is arable, and is relatively flat and level, although the wider landscape is rolling, and there are longer views to the north and east.

Significance of designated heritage assets in the site:

There are no designated heritage assets within the site.

Significance of designated heritage assets in the environs of the site which could be affected by the allocation of the site:

There are 35 listed buildings within a 1km radius of the site, 34 of these are situated within Mickleton Conservation Area, which, at its nearest point to the site, lies 114m to the south of the access route (Fig. MK2B.2). No conservation area appraisal has yet been produced for Mickleton but the significance of the conservation area can be seen to arise from the historic and architectural

interest inherent in its compact, linear settlement form, rural character, and the concentration of historic and listed buildings within its well-preserved historic core. The majority of the listed buildings within the conservation area are Grade II listed and date to between the 16th and 19th centuries, illustrating the post-medieval development of the village. The Church of St Lawrence (1305720) is Grade I listed and has medieval origins, although it was extended multiple times between the 13th and 17th centuries and was subject to major restoration in the Victorian period. Both the conservation area and the listed buildings contained within it are considered to be of **high significance.**

One Grade II listed building is situated to the south of the site, outside the conservation area. This asset is Mickleton Wood Farmhouse (1088521) which dates to the 18th or early 19th century. The farmhouse has architectural interest arising from its Flemish bond brick construction with limestone detailing, including rusticated quoins, sash windows with stone lintels and a pedimented central bay. It also has historic interest arising from its age and well-preserved character as a rural farmhouse. It is considered to be of **high significance**.

A registered park and garden, Kiftsgate Court is also present (1000456) approximately 780m to the south of the site. Kiftsgate Court is a Grade II registered late 19th and early 20th century garden laid out around a country house on the crest of the Cotswold escarpment. The gardens comprise a series of distinctive formal compartments, including the Four Squares, Rose Border and White Garden, set within a wider framework of lawns, terraces, woodland planting and ornamental borders. The design evolved principally during the 1920s and 1930s under Heather Muir, with influences from nearby Hidcote Manor, and is renowned for its rich horticultural interest and plantsmanship. Beyond the formal gardens, the site extends into a small pastoral park focused on a wooded combe and scattered specimen trees. The escarpment-edge location affords extensive outward views across Mickleton and the Vale of Evesham, with particularly notable panoramas from the terrace, garden walks and lower lawns towards Bredon Hill and the Malvern Hills.

Due to modern housing developments to the south and south-west of the site, either side of Granbrook Lane, as well as the more recent development to the immediate west of the site, along Furrow Way which is proposed as the access route into the site, north of Canada Lane, none of these heritage assets are visible from the site itself. Even from the western extent of Furrow Way, dense hedgerows either side of Stratford Road, and vegetation and mature trees at the property boundaries to the north of the village, mean that there is also no intervisibility. As a result, these listed buildings and the conservation area are unlikely to be affected by the allocation of the site.

Beyond a 1km radius, considered of particular significance to the site given the local topography, is the multivallate hillfort on Meon Hill, a scheduled monument (1011372). This heritage asset is also included on Historic England's Heritage at Risk Register. It is situated on a natural hill, 1.3km to the north-east of the site, and is a particularly rare example of a multivallate hillfort in this part of the country, and only around 50 examples are known nationally. Previous archaeological investigations have revealed a large hoard of currency bars, demonstrating the high status and importance of the site in the Iron Age as well as evidencing early endeavours in the standardisation of currency, and an Anglo-Saxon inhumation burial, complete with shield boss, spearhead and ferrule, indicative of the continued importance of the monument across multiple generations. As a scheduled monument of national importance, the multivallate hillfort on Meon Hill is considered of **high significance**.

Significance of non-designated heritage assets in the site:

Three known non-designated heritage assets are mapped within the site itself, when also considering the access route. These include part of a large swathe of late medieval to post medieval ridge and furrow, identifiable through earthworks and cropmarks (51156), included in the HER dataset (Fig. MK2B/C.3), though not mapped as part of the National Mapping Programme (Fig. MK2B/C.5). No traces are visible within the site on LiDAR imagery or were identifiable in the June 2026 site visit.

The other known non-designated heritage assets are mapped to the west of the main site, traversed by the access route, and comprise a multi-phased Iron Age to Romano-British settlement (46381) and a large pit containing Mesolithic or Neolithic worked flint (53455). These were both revealed during archaeological work undertaken ahead of the residential development through which Furrow Way runs, and thus no longer survive at this location. It is possible that associated archaeological remains extend to within the site, however, no upstanding remains are visible within the site on LiDAR imagery or were identifiable in the June 2026 site visit.

Owing to their archaeological interest, assets dating from the prehistoric to later medieval periods, applicable to settlement remains, are generally considered to be of **medium significance**, and those relating to past agricultural activity of the medieval or post medieval periods, likely applicable to the mapped area of ridge and furrow, are considered to be of **low significance**.

Significance of non-designated heritage assets in the environs of the site:

The HER records an additional seven non-designated heritage assets beyond the site boundary but within a 1km radius of the site (Fig. MK2B/C.3), some of which are known also from previous archaeological investigations (Fig. MK2B/C.4) and/or the National Mapping Programme (Fig. MK2B/C.5). Some share similar characteristics with the heritage assets within the site itself, cited above. These include an additional multi-period settlement site of the prehistoric, Romano-British and medieval periods revealed by an archaeological investigation approximately 960m to the south-west of the site (MGC128658), and further evidence for agricultural arable activity in the later medieval or post medieval period across a large swathe of land to the immediate south-east of the site (51161). They also represent medieval activity in the historic core of Mickleton itself, in the form of ditches (26895 and 30477). Post medieval activity is represented by the discovery of walls at St Lawrence's Church (30476) and the known route of the 1818 Chipping Campden and Clifford turnpike road (48833), which is respected by the present Stafford Road to the west of the site and from which the access route begins, and an associated toll point (2789), to the south-west of the site.

Owing to their evidential value, assets dating from the prehistoric to later medieval periods are generally considered to be of **low** to **medium significance**, while any deposits/ materials dating to the post-medieval agricultural use of the study area are of comparatively **low significance**. Where HER records include designated heritage assets such as listed buildings, registered parks and gardens, or scheduled monuments, they are considered to be of **high significance**.

There are no non-designated heritage assets with upstanding remains within a 1km radius of the site with the potential to be affected by the allocation of the site. No Neighbourhood plan has yet been produced for Mickleton, which may identify such structures, although it is likely they will not be visible from the site.

Historic landscape character of the site (and significance):

The site lies just beyond the Cotswolds National Landscape (CNL), designated as an Area of Natural Beauty (AONB), the boundary of which is Gran Brook approximately 190m to the east of the site.

The Gloucestershire Historic Landscape Characterisation (HLC; Gloucestershire County Council 2013) maps the central part of the site within character type G4 'existing settlement - present extent', which defines settlement beyond areas

settled in the 19th century and includes areas of land interpreted as an integral part of the settlement (i.e. either side of the extension of Canada Lane). The north-western and south-eastern extents of the site lie within character type A6m 'regular fields partly echoing former open field boundaries', assumed to represent a form of parliamentary enclosure (Fig. MK2B.6).

The Gloucestershire Landscape Character Assessment of 2006 (LDA Design 2006) includes the site within the Unwooded Vale character type, within VE 1C: Mickleton Vale Fringe. This states that the character area retains areas of remnant ridge and furrow, indicating that pastoral land use has been dominant since the time the open fields were enclosed. While the majority of the field boundaries are defined by low, well maintained and regularly trimmed hedgerows, a number are gappy and reinforced with post and wire fences. Prominent hedgerow trees scattered along hedgerow boundary lines also punctuate the landscape. Mickleton is the largest settlement within the landscape, likely to have been a linear village that has since expanded, with old stone, rendered and red brick properties adjacent to the main road and newer stone properties evident as infill development. Beyond the main settled areas are a number of scattered farmsteads and dwellings.

Based on lack of rarity, time depth, and distinctiveness, this landscape character type is considered to be of **low significance**.

Contribution of the site to the significance and setting of known heritage assets:

The site comprises two small areas of agricultural arable land either side of a central track, which extends from the west through modern residential developments, eastwards to agricultural outbuildings beyond the eastern extent of the site. Modern residential development bound the site to the south-east and south-west, with adjacent agricultural land to the north-west and north-east.

For all but one of the designated heritage assets and all upstanding non-designated heritage assets within a 1km radius of the site, none are visible from the site, and thus the site provides a **neutral** contribution to their heritage significance.

The one designated heritage asset which is visible from the site is the scheduled monument of the multivallate hillfort on Meon Hill (1011372). The hillfort is also included on Historic England's Heritage at Risk Register, though this appears to be as a result of direct impacts, rather than indirect, setting impacts. The site forms a small part of the wider landscape surrounding the multivallate hillfort on Meon Hill and is visible from the monument, while the

monument is also readily visible from within the site. These reciprocal views, together with many others across the surrounding countryside, contribute to an appreciation of the hillfort's prominent topographic position and help to illustrate why this location was selected for occupation and defence. However, the site represents only a limited part of this wider setting. Views towards the hillfort from within the site form part of a much broader range of viewpoints from which its elevated position can be understood and appreciated, and do not make a unique contribution to that understanding. Equally, views outward from the monument encompass a large expanse of surrounding landscape, of which the site forms only a small component. In these views, the site is experienced in the context of the existing settlement edge of Mickleton and adjacent modern development. The site therefore is not considered to make a particularly important contribution to the setting or significance of the multivallate hillfort on Meon Hill. Overall it is considered to provide, at most, a **low positive** contribution to the setting of this asset.

Impact assessment:

Development of the site would introduce new built form into views from the scheduled multivallate hillfort on Meon Hill and could partially interrupt existing views of the hillfort from within the site and along the public right of way. However, the site forms only a small part of the wider landscape surrounding the monument and represents a limited component of its setting. Views to and from the hillfort would remain available from many other locations across the surrounding countryside, continuing to allow appreciation of its prominent topographic position and the reasons for its siting. Equally, in views from the monument, the development would comprise only a small change within a broad landscape context and would be experienced alongside the existing settlement edge of Mickleton and adjacent modern development. As a result, the effect on the setting and significance of the multivallate hillfort is likely to be no more than negligible and would, at most, result in a very low level of **less than substantial harm**.

The allocation includes an area of ridge and furrow mapped across much of the site, though not identified by the NMP. Prehistoric activity has also been revealed by archaeological investigations immediately adjacent to the site. Development within the site would have a **permanent negative impact** on any surviving archaeological remains resulting in **substantial harm** to these heritage assets. Without appropriate investigation and mitigation measures, any development that disturbs archaeological heritage assets is unlikely to satisfy relevant national and local planning policy objectives.

The development of the allocation would change the present historic landscape character of the site to modern residential development, reducing the extent of three elements of historic landscape type represented within the site, and eroding the post-medieval rural character of the landscape to the north-east of Mickleton. This would have a negative impact upon low-significance historic landscape character within this area, however, give the small size and scale of the site, and low significance of the historic landscape character area type, this would result in a maximum overall level of **less than substantial harm**.

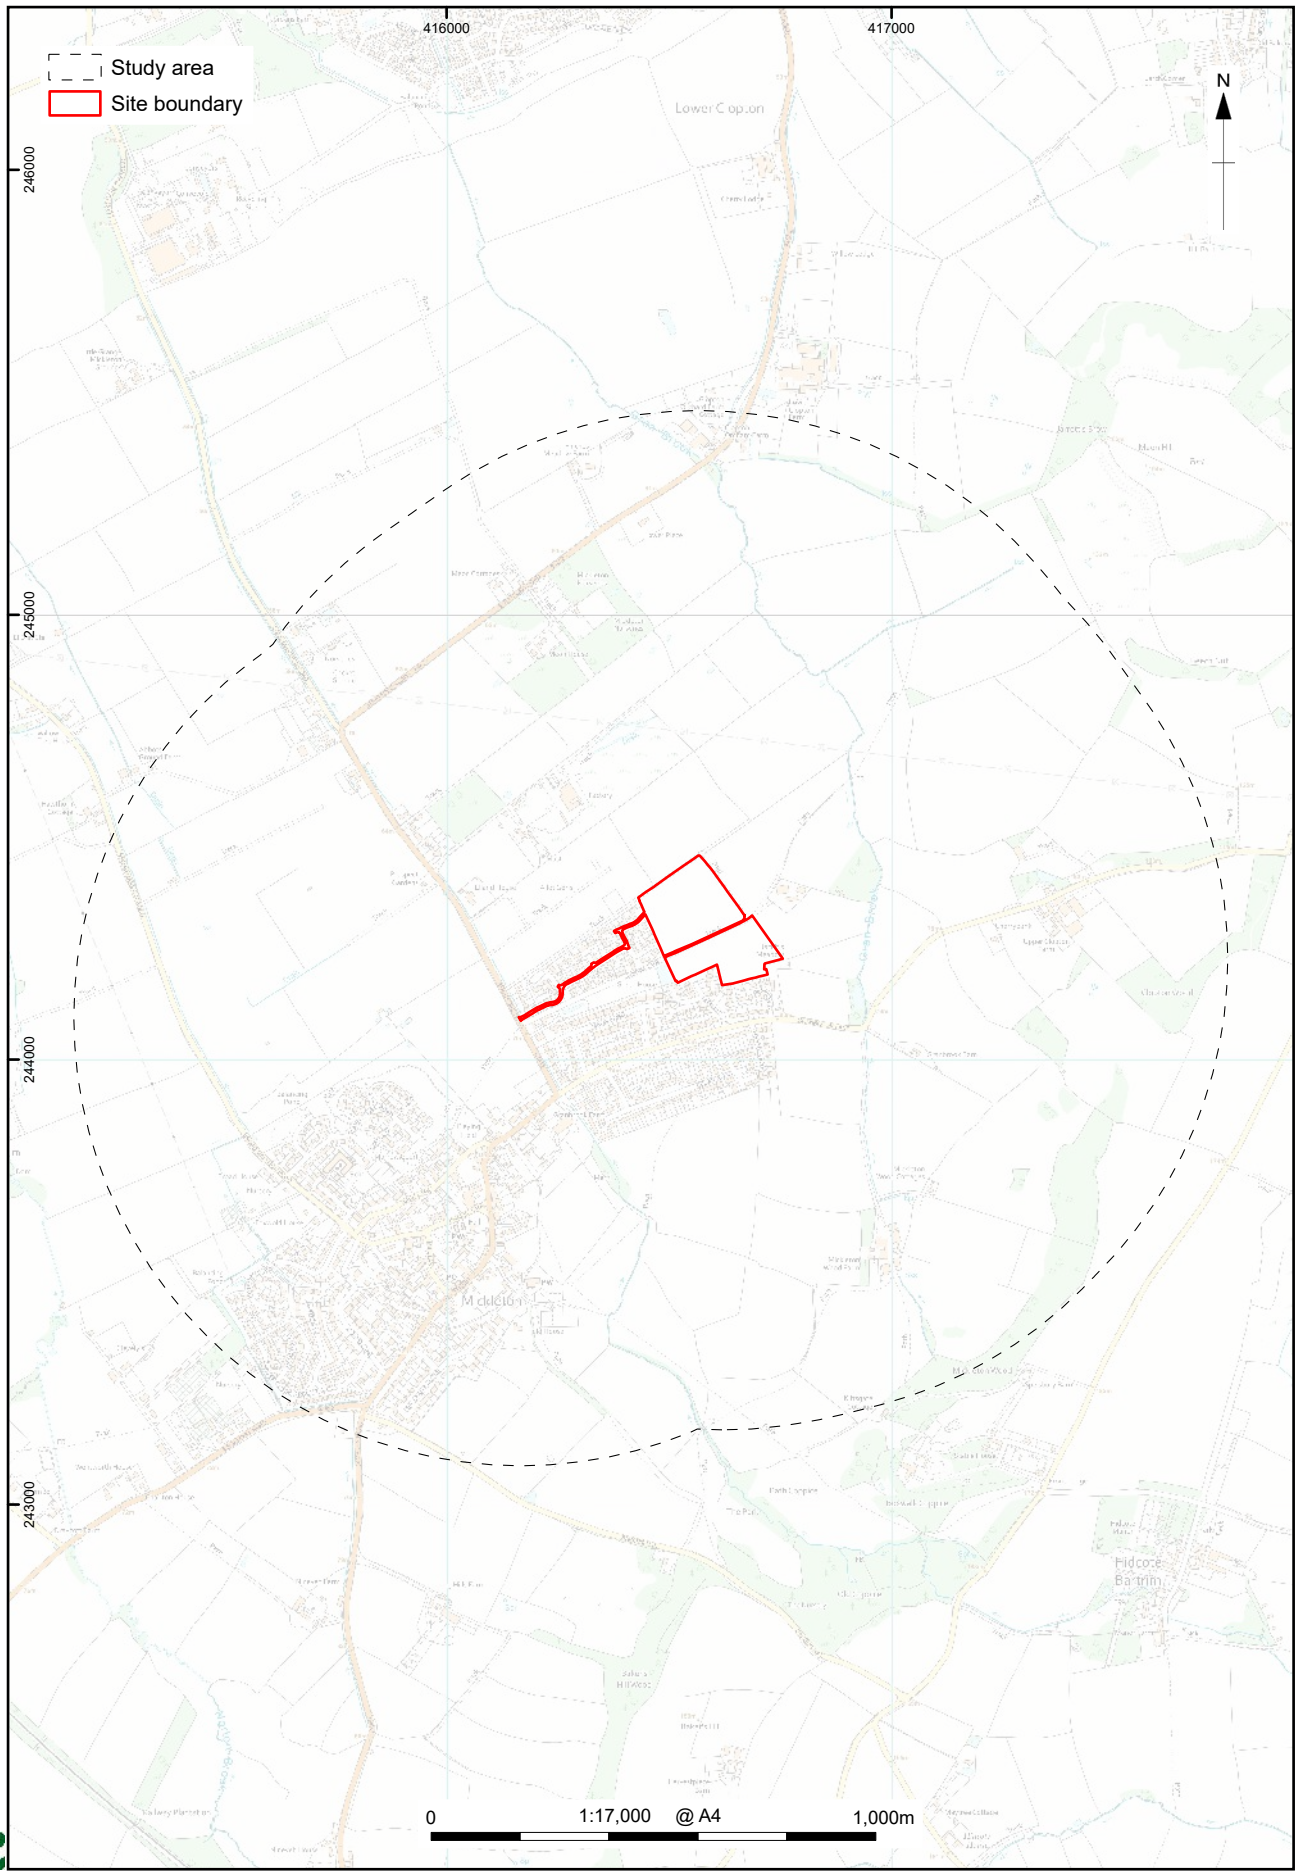
Cumulative impacts deriving from the allocation of the site:

No cumulative impacts are anticipated, as there are no known interacting heritage effects arising from this allocation in combination with other schemes or allocations that would give rise to additional harm beyond the impacts identified for the site itself.

Recommendations for minimising harm and maximising enhancement:

A desk-based assessment and geophysical survey of the site were undertaken in 2025. These concluded that there was a high potential for archaeological remains of prehistoric to Roman periods. It seems highly likely, therefore, that a programme of targeted archaeological evaluation trenching, will be required. This would help to understand the extent and character of surviving archaeological assets and would inform a strategy to mitigate the impact of any subsequent development upon them. Development should only occur after appropriate archaeological investigation has taken place, the full extent of impact is understood, and a strategy of mitigation is agreed with the Gloucestershire Planning Archaeologist.

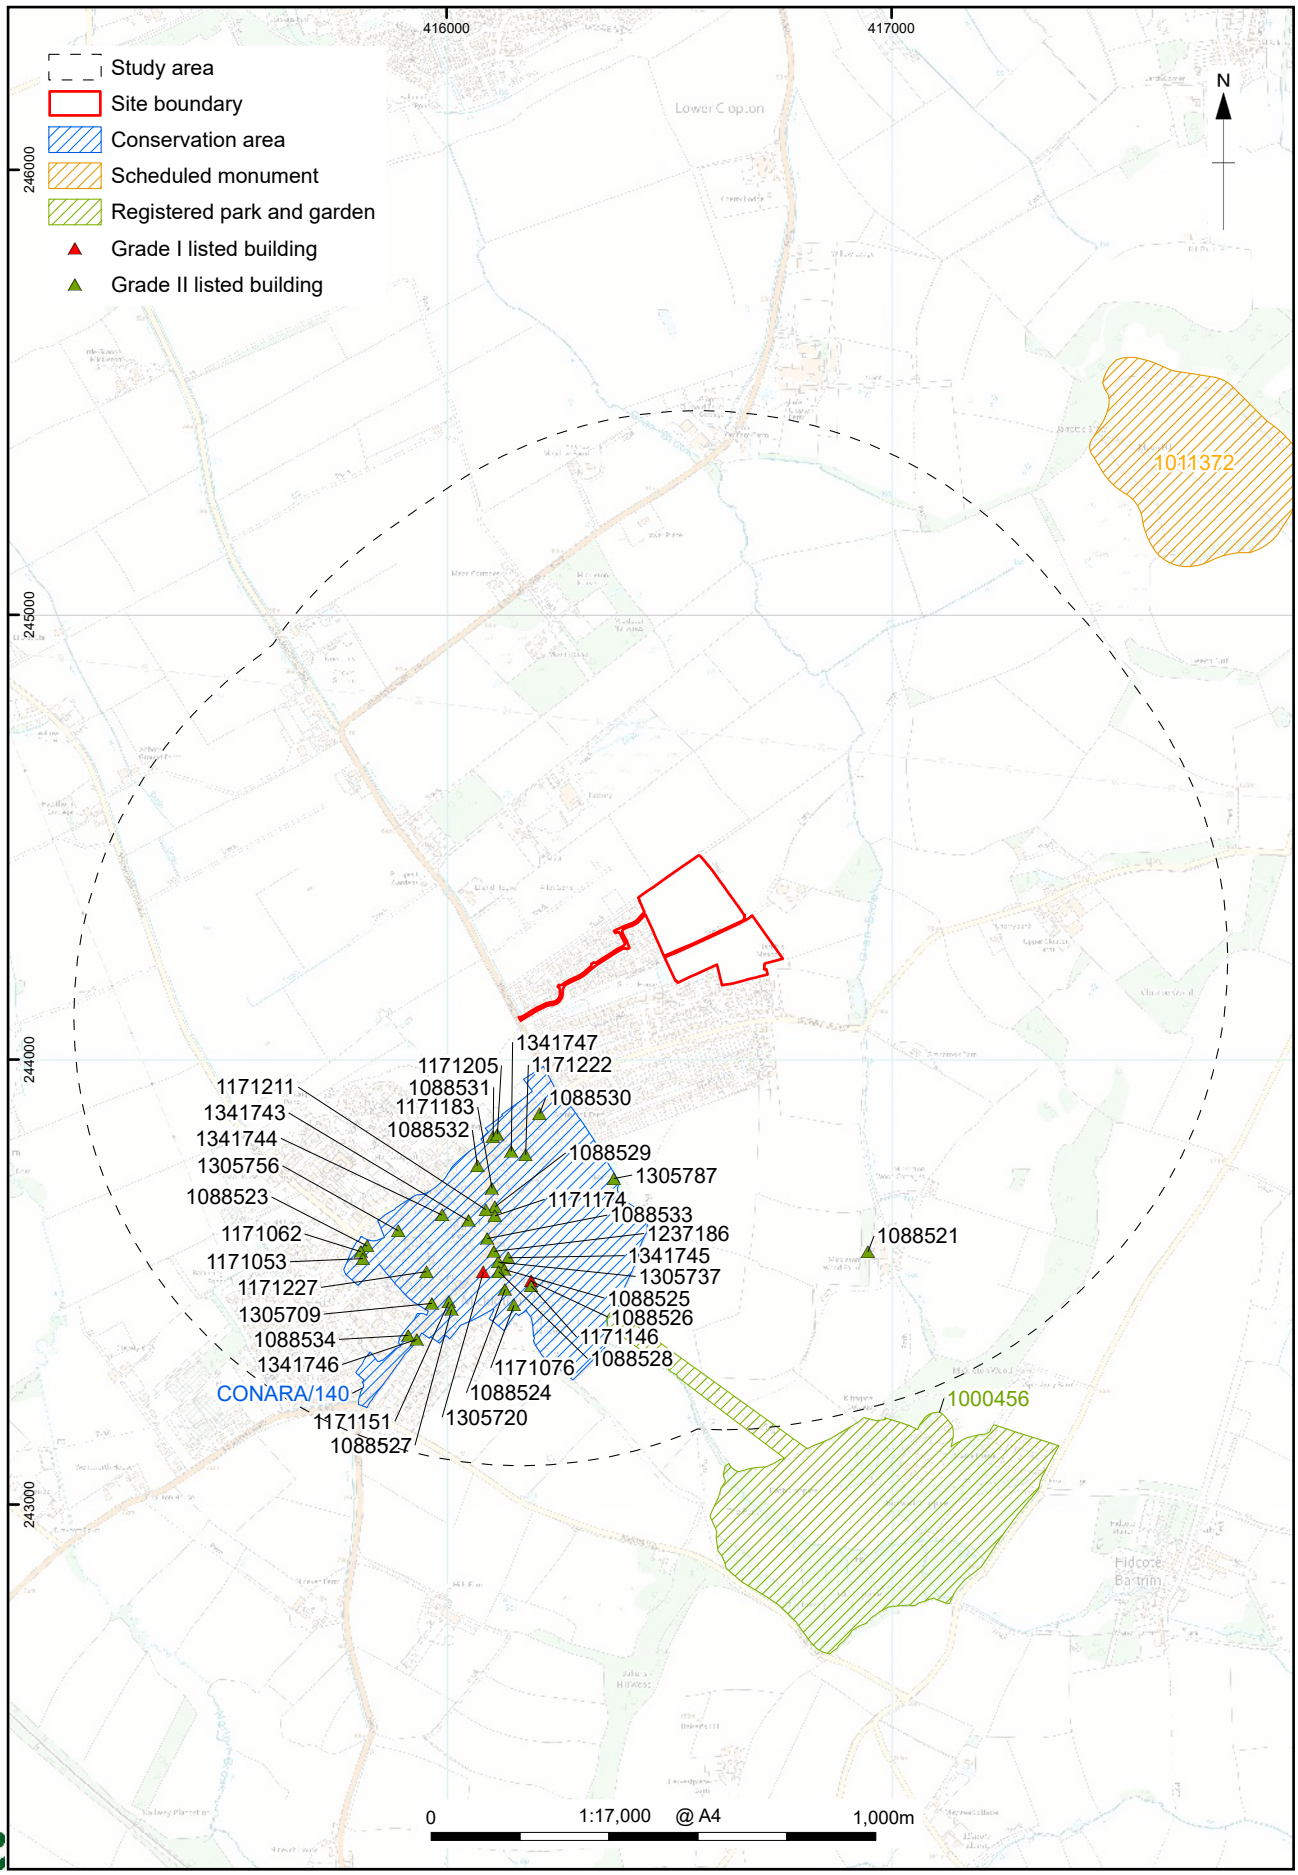
Due to the topography of the site in relation to Meon's Hill to the north-east, the allocation will result in a small degree of change to the setting of the scheduled multivallate hillfort. This impact is likely to be negligible and would at most result in a very low level of less than substantial harm. Measures to reduce this harm could include the retention and enhancement of existing boundary vegetation to soften the development edge, and the preservation of open, undeveloped, green space either side of the existing trackway to allow a continued appreciation of Meon's Hill from the site from the public right of way. In addition to sensitive design, respecting the local architectural vernacular and conforming to the Cotswold Design Code, could help to integrate the development with the existing settlement at Mickleton. These would also help to minimise levels of harm to historic landscape character, by allowing legibility of the historic layout of the site.



No opportunities for heritage enhancement are readily identifiable.

Conclusions and suitability:

It has been assessed that the progression of this site as a site allocation through to final development could result in a level of harm equivalent to less than substantial harm to the heritage significance of a scheduled monument, and on historic landscape character. However, sensitive, considerate design of the final development proposals have the potential to minimise this.



Heritage constraints rating: Moderate

The site is considered to have a final heritage sensitivity score of **Moderate** (i.e. suitable for development subject to recommended mitigation or design controls).

Figure MK2B/C.6: Historic landscape characterisation within the study area

Site Reference	R519/650
Town	Preston
Site Name	Strategic extension to the south of Preston
Related policies	-
Proposed allocation use	Mixed use: residential development and employment area
Number of dwellings	1,085
Employment area	6.7ha

Brief description of site:

The site covers an area of *c.* 100.3ha between the A417 and A419, *c.* 320m from the southern edge of Cirencester and *c.* 830m from its historic core. It is located within the agricultural fields extending to the south of the village of Preston and extends to the southern boundaries of the parish, adjacent to Siddington and South Cerney (to the south-west) and Driffield (to the south-east), in the Cotswolds District of Gloucestershire (Fig. R519/650.1).

The site comprises agricultural fields and dispersed areas of woodland, with ponds and a stream within some of the woodland, and a springhead in the east. The site is bounded to the north by fields/ paddocks and gardens that form the southern edge of the village of Preston and by roads to the east (A417), west (A419) and south (unnamed). The historic farmstead of Ermin Farm also sits adjacent to the western edge of the site. Beyond these, the site is largely surrounded by further agricultural land. Boundaries within the site comprise hedges.

The site sits within an undulating landscape, with the site itself, rising gently from *c.* 106m aOD in the north-west to *c.* 111m aOD in the south-east and *c.* 119m aOD in the north-east. The River Churn lies *c.* 90m to the west of the site at its closest point and drains cross parts of the site.

Significance of designated heritage assets in the site:

There are no designated heritage assets within the site.

Significance of designated heritage assets in the environs of the site which could be affected by the allocation of the site:

A number of designated heritage assets have been identified across the study area, comprising two conservation areas, two scheduled monuments and 23 listed buildings (Fig. R519/650.2).

Conservation areas and their associated listed buildings

The Preston Conservation Area (CONARA/067) is situated *c*. 60m to the north of the site and covers the historical elements of the village. Preston is a small historic Cotswold village of loose linear form aligned on a single road. The historic settlement is centred on All Saints Church and made up of a collection of historic farmhouses and cottages. Despite some post 1950s infill development, the settlement retains its historic linear layout and open grain. The conservation area contains a number of listed buildings constructed from traditional local limestone which contribute to the classic Cotswold identity of the settlement. A defining feature of the village is the open countryside that surrounds it and is visible in gaps between the buildings which offer views out to the surrounding countryside and maintain a strong visual link between the settlement and its rural setting. No conservation appraisal has yet been produced for Preston. Analysis would suggest that the village principally derives its significance from its intrinsic character and appearance, as well as the architectural and historic interest of its layout, linear development along the main road, historic spaces, buildings and boundary treatments. Within the conservation area, the village of Preston includes nine listed buildings, including one of Grade II* status and eight of Grade II status, all of which form part of, and contribute to, its significance. These include the Grade II* Church of All Saints (1089268) as well as the Grade II listed:

- 1089227 - Group of five monuments in line to south of south porch in churchyard of Church of All Saints
- 1089228 - Letterbox Cottage and Pear Tree Cottage
- 1089229 - 90 And 91, Preston Village
- 1089230 - Village Farm Cottage Village Farm House
- 1153591 - Church Farmhouse
- 1153596 - Group of three monuments to south of west tower in churchyard of Church of All Saints
- 1341394 - Preston Place
- 1341395 - The Old Farmhouse

These listed buildings form part of the conservation area and contribute to its significance. The church (1089268) relates to historic settlement dating from the 13th and 14th centuries, although it was restored during the 19th century, and is also associated with the 18th- and 19th-century tombs (1089227 and 1153596) and the 19th-century former vicarage (1341394). Beyond these, the farmhouses (1089230, 1153591 and 1341395) indicate the prominence of rural and agricultural buildings in the village and the surrounding area. The other listed buildings (1089228 and 1089229) relate to post-medieval settlement in

the area. Due to their architectural, historic and group interest, the conservation area and associated listed buildings are considered to be of **high significance**. The site is separated from the conservation area by a field, allotment gardens, tree belts, an area of woodland, and a line of modern residential development and modern farm buildings. These provide some visual separation between the conservation area and the site, except for where the parapet of the church (1089268) is visible above the modern buildings and trees in views from the south-western edge of the site.

The Cirencester South conservation area (CONARA/144) is located *c.* 820m to the north-west of the site and covers the southern extent of the historical town, representing its 18th century and later expansion southwards, almost filling the entire area of low-lying and boggy common land and waste ground that had been defined by the walls and ramparts of the Roman town (*Corinium*). The conservation area incorporates three Grade II* and 29 Grade II listed buildings that contribute to its character and significance. Although there have been alterations and additions to many of the listed buildings, these retain and form part of their historical character within the conservation area. Within the study area, these listed buildings comprise only the 18th century former public house of the Cotswold Club and attached railings (1298663), which forms part of its post-medieval development and the historical route into Cirencester. The conservation area appraisal identifies that its significance lies in its context of mostly 19th and 20th century development on relatively flat land with a mixture of residential, community and industrial uses. This includes the informal grid pattern of its layout, the form and character of the buildings, open spaces and mature trees that form a green backdrop enclosing and compartmentalising the area. Views within the Cirencester South conservation area are concentrated within its area but also include longer range views to its north-west. None of these incorporate views of the site. A number of issues face the conservation area as a result of demolition and redevelopment, including inadequate enclosure and the loss of boundary features; poorly maintained buildings; poorly proportioned and sited 20th century commercial buildings; visual clutter; and inadequate interpretation of the area's archaeology, architecture and history. Due to the architectural and historic interest of these assets, as well as their group value, the conservation area and its associated listed buildings are considered to be of **high significance**. Modern built development to the south-east of the conservation area (and north-west of the site), separates the conservation area from the surrounding rural landscape. This development along with the settlement at Preston, and the agricultural land to the north-west separates the site from the conservation area and blocks any views between the conservation area and the site. The conservation area (and its

listed buildings) is unlikely to be affected by the proposed allocation and has been scoped out from further assessment.

Scheduled monuments

To the north-west of the site, the scheduled monument of *Corinium* Roman town (1003426) lies *c*. 950m from the site at its closest point. The scheduled monument relates to some of the above- and below-ground remains associated with the Roman town that developed here from the 1st century AD and became the capital of the Cotswold region and second-largest town in Britain. While remains of the Roman town were defined by its walls, associated remains, including the Ermin Street Roman road (7542) and an unnamed Roman road (5963) extend past the north-west corner of the site. Remains within the area of the scheduled monument include those of the town (forum, basilica and residential districts), its walls and the amphitheatre. Due to its archaeological and historic interests, which relate to its ability to provide information about the Roman settlement, the scheduled monument is considered to be of **high significance**. The site is separated from the scheduled moment by modern development on the edge of Cirencester.

To the west, the scheduled Tithe Barn (1003445) lies *c*. 650m from the site. This monument comprises a 13th century tithe barn. This structure, and the adjoining smaller 18th century barn to its west are of Grade II* listed status (1090073). The larger barn is the earlier of the two barns, with the wagon entrance suggesting it originally covered a larger area, including the site of the later, smaller barn. The remains of the scheduled Tithe barn date to the 13th century and together with the neighbouring Grade II* listed Church of St Peter (1340986 – discussed below) they help to illustrate the layout and function of the medieval settlement as well as the logistical framework of tithe collections. Due to the archaeological, architectural, historic and group interest of the scheduled barn and adjoining later barn, this is considered to be of **high significance**. The tithe barn is separated from the site by the surrounding vegetation, as well as the intervening modern development. As such, it is unlikely to be affected by development within the proposed allocation.

Listed buildings

In addition to the listed buildings that lie within the conservation areas, a further two Grade II* and 11 Grade II listed buildings are located within the study area. For the most part these relate to small rural settlements and scattered isolated farmsteads.

The Grade I listed Church of St John the Baptist (1206356) is located *c*. 2.2km to the north-west of the site. This asset is partially visible from the north-west

part of the site. This is the largest parish church within Gloucestershire and dates to the 12th century with later medieval and post-medieval alterations and additions. Due to its architectural and historic interests, the church is considered to be of **high significance**. Although the church is also separated from the site by the intervening distance, modern development and planting, there is limited visibility of the tower from the north-west of the site where it is visible behind the modern development on the edge of Cirencester. The Neighbourhood Plan for Preston also notes that there are views of the church tower from the south-east approach to the town through the parish of Preston, incorporating part of the site, although this was not identified during the site visit, possibly due to the trees along the side of the road. Due to the separation of the church from the site, and the very limited intervisibility between the asset and the site it is unlikely to be affected by development within the site.

The historical isolated settlement at Church Farm lies *c.* 570m to the west of the site. The settlement includes the scheduled tithe barn (1003445) which is discussed in the section above; two Grade II* listed buildings comprising the Church of St Peter (1340986) and barns (1090073) and four Grade II listed structures:

- The mid-19th-century Siddington Manor (1340988);
- The mid-17th-century Church Farmhouse (1340987);
- A late 18th-century-animal shelter that has been converted into stables and garage (1090074); and
- A group of four 18th-19th century tombs within the churchyard (1090072).

The Church of St Peter (1340986) had Norman foundations and was extended and restored during the 15th and 19th centuries respectively, with the tower (visible from the site) built during its restoration. The larger of the Grade II* listed barns (1090073), although being of 13th century date and post-dating the foundation of the church, is associated with the medieval tithe system which was focused on the church and its central role in the village.

The Grade II* and Grade II listed buildings at Church Farm are considered to be of **high significance** as a result of their inherent architectural and a historic interest, and also because of their group value illustrating the evolution and development of the historic rural settlement at Church Farm.

The site is separated from Church Farm by an area of intervening modern development. Due to the surrounding development and vegetation, intervisibility with this settlement area is restricted to the upper part of the church spire, which is visible from the public right of way in the north-west of

the site, above the intervening trees and seen in conjunction with modern development, streetlights and electricity pylons. As such, and with the tithe barn in the neighbouring parish to the site, settlement at Church Farm is unlikely to be affected by development within the site and has been scoped out from further assessment.

To the south-west of the site, Siddington House (1340985) is a late 19th-century country house whose grounds extend to the opposite side of the A419 which bounds the site. The original setting of the house included its immediate gardens, its historic driveway and forecourt to the north-east and elements of the wider landscaped grounds (including a ha-ha and former parkland) and the associated service complex to its. These grounds are constrained to the immediate west of the current A419, and modern development in the immediate vicinity include a garden centre on its eastern edge and residential development within the grounds to its west. Due to its high architectural and historic interest, this listed building is considered to be of **high significance**. Although the listed building does not have a visual connection with the village to the north, the driveway entrance to the grounds does.

Preston Mill (1089264) occupies a low-lying position on the River Churn, *c.* 160m to the west of the site and comprises a 17th-/ early 18th-century millhouse and late 18th-/ early 19th-century mill. The mill sits over, and was related to, the mill waters of the River Churn. Due to its architectural and historic interest, this is considered to be of **high significance**. The mill and millhouse are separated from the site by the surrounding built form and vegetation and are unlikely to be affected by development within the proposed allocation.

The Grade II listed building of Roberts House (1304080) is located *c.* 750m to the west of the site, on the northern edge of settlement at Siddington. This relates to the late 16th-/ early 17th-century house that was associated with the Quaker John Roberts during the 17th century. Due to its architectural and historic interest, this is considered to be of **high significance**. However, this building is separated from the site by the intervening vegetation and modern development, and as such, is unlikely to be affected by development within the proposed allocation.

To the north of the site, the 17th-century Forty Farmhouse (1341396) and its associated barn (1089231), lie within 60m of the site and relate to the historical farmstead at Forty Farm. Originally, this farmstead would have been one of the discrete isolated farmsteads that characterised settlement in this part of the study area. Due to the architectural and historic interest of these buildings and their group value with one another, these buildings are considered to be of

high significance. During the 20th century, the area to the immediate north of these buildings contained further agricultural buildings. The complex to the immediate north of these buildings saw minor adjustments during the 21st century, and outline planning permission has now been granted for residential development further to the north.. The northern part of the site is visible from these assets across the low hedge and gate.

The Grade II listed building of the Round House (1090069) lies *c*. 575m to the south-west of the site. This comprises an 18th-century round tower that is recorded as having been a windmill or possibly a folly. It is shown on the 1828 one-inch OS map as a windmill, and it was historically located within an enclosure linked to a farmstead (Worm's Farm) by a trackway.. This asset has been converted into a house with much of the living space below ground. Due to its architectural and historic interest, this is considered to be of **high significance**. Despite the distance, it shares intervisibility with the site through gaps in the intervening vegetation.

A single listed building lies to the east of the proposed allocation, the late 18th-century barn associated with St Augustine Farm (1153530), *c*. 450m from the site. Due to its architectural and historic interest, this is considered to be of **high significance**. It is separated from the site by the modern A417, while the landscaping and planting along the edges of the trunk road preclude intervisibility.

Significance of non-designated heritage assets in the site:

Several non-designated heritage assets have been recorded within or immediately adjacent to the site (Figs R519/650.3-7):

- The site of a possible Bronze Age dispersed barrow cemetery (including a low mound) (3068) has been identified extending north-east from the site. Although these were identified as cropmarks and earthworks, any mounds have subsequently been plough levelled. Cropmarks in this area also indicate the presence of a possible Bronze Age settlement enclosure. Where these have been investigated along the line of the road to the north of the site (EGC8354), evidence included ring-ditches, a cremation burial and a possible funeral pyre. A further ring-ditch, possibly associated with a round barrow, with adjoining enclosures and pit (2126) has been identified in the west of the site. As a result of their archaeological and historic interest, if such remains survive within the site, are considered to be of **medium significance**. Further prehistoric evidence includes Iron Age enclosures and ditches (22349 and 22354) that indicated short-lived occupation along the north-east edge of, and in

the south-east of, the site, field boundaries of prehistoric or later date (4776 and 34544) along the western edge, and a scatter of flint (32903) recovered from towards the south-east. Such remains, if present, are likely to be of **low to medium significance**.

- Roman evidence includes the route of Ermin Street Roman road (7542) along the western boundary of the site, with its route now utilised by the A419. Alongside this, an area of extractive pits (34542) may date to the Roman period or later. Two Roman cremations, alongside associated ditches and pits (49659) have also been identified in the centre of the site. As a result of their archaeological and historic interest, as well as the connection of the road to the wider Roman road network, these remains are considered to be of **medium significance**.
- The medieval and/ or post-medieval agricultural landscape is reflected through the presence of ridge and furrow cultivation (25932, 51240 and 51243) that has been identified in the east and west of the site and extends into the surrounding landscape. Although much of the ridge and furrow cultivation was initially identified as earthworks in aerial photographs, it has subsequently been plough levelled. Due to the fact that they form part of the wider pattern of historic agriculture within the area, these are considered to be of **low to medium significance**. In addition to these, later medieval or post-medieval field boundaries or possible water courses (34543) have also been identified in the west of the site. These are considered to be of **low significance** due to their historic interest.
- As well as the use of the course of the Roman road as a turnpike road (48823), three post-medieval fishponds (9830) have been identified in the centre of the site. These may be associated with the Preston manorial complex (9828) which was formerly located within the settlement of Preston to the north (in the area later occupied by Preston and then Church Farm), and as such are considered to be of **low to medium significance**. The farmstead of Ermin Farm, marked on the first edition Ordnance Survey map of the area, is located adjacent to the boundary of the site. The site forms part of the agricultural land surrounding the farm. The south-eastern end of the site also lies within an area of post-medieval quarrying (9840). If associated remains are present within the site, they are likely to be of **low significance**.
- Undated cropmarks of ditches and pits (3017 and 4243) have also been identified towards the north and in the south-east of the site. If associated remains are present within the site, they are likely to be of **low significance**.

Significance of non-designated heritage assets in the environs of the site:

The GHER records a further 141 non-designated heritage assets within the 1km study area (Figs R519/650.3-7), dating to the Mesolithic period onwards. These include the presence of remains associated with a Bronze Age funerary landscape, prehistoric settlement and enclosures; Roman field systems, enclosures and cemeteries; and medieval and post-medieval settlement; as well as further medieval and later agriculture, historical farmsteads and South Cerney airfield (21120) which includes built structures (B hangers, the station control tower, support and ancillary buildings and air raid shelters) that are of historic interest. Overall, these indicate that the site lies within a landscape that is known for both its prehistoric and Roman activity, with historical scattered isolated farmsteads and settlement and wide areas of medieval and post-medieval agricultural practices, across the area. Owing to their archaeological interest, assets dating from the prehistoric to later medieval periods are generally considered to be of **low to medium significance**, while any deposits/ materials dating to the post-medieval agricultural use of the study area are of comparatively **low significance**. Where the GHER refers to designated heritage assets such as listed buildings, scheduled monuments these remains are considered to be of **high significance**.

Historic landscape character of the site (and significance):

The site is located in the southern end of the parish of Preston, bounded to the west by its parish boundary with Siddington and South-Cerney, and the south by its boundary with Driffield. It is also crossed by historic footpaths that continue in use as public rights of way (PRoW).

The Preston Neighbourhood Plan identifies that most of the parish consists of undulating arable fields that are typical of the Cotswold landscape, with hedges and walls forming their boundaries and that incorporates copses that break-up the skyline. The arable nature of the land is recognised as helping to maintain the rural feel of the parish, something that is noticeable on the site with the area being quiet other than road noise and the occasional aircraft. The village of Preston was also identified as being separated from other settlement in the area, something that the local population felt needs to be retained. The Landscape Character Assessment (LCA) associated with the neighbourhood plan identified that this landscape included uniformity in the defining features such as rectilinear woodland copses and hedgerows along field boundaries, and that while there is a historic road network across the area, the modern roads split the landscape into smaller parcels that can be experienced, with the site forming most of the area experienced to the south of the Preston. This includes

views looking across the site of the A417, with the rural landscape beyond altered by the former airfield site and modern development. Views towards the north-west from within the north-west of the site, however, potentially incorporate the tower of the Church of St John the Baptist (1206356), although these were not visible during the site visit. The South Cerney Neighbourhood Plan also identified an important view that looks across the former airfield (21120) with the A417 along its eastern edge. However, the trees lining the road prevent the site being visible within this.

The Historic Landscape Characterisation (HLC) for Gloucestershire, the Cotswolds Area of Outstanding Natural Beauty (AONB) and Wye Valley AONB describes the historic landscape character of the site as 'less irregular enclosure partly reflecting former unenclosed cultivation patterns' (A2; Fig. R519/650.8). This covered all of the site and extended to the east, with further enclosed land (A3, A4p) to the north and east, as well as large modern fields derived from the former enclosure (N1) to the east. The northern part of this is incorporates the historic and modern settlement extents of Preston (G3 and G4), while D3 provides a buffer to the modern extent of Cirencester. To the west, the landscape is more variable and incorporates further enclosed land (A2m, A3), riverine pasture (D1r), woodland (C1) a designed ornamental post-medieval landscape (F1) and the former airfield (I2). Within the site, the historic enclosure partially reflects the earlier cultivation seen through the ridge and furrow evidence of the wider landscape and within the site (25932, 51240 and 51243).

These areas of enclosure are representative of rural landscapes used for agriculture which began to be enclosed from the 16th century in a piecemeal fashion but that became more regularly enclosed during the 18th century. However, the boundaries within the site may date to the medieval or early post-medieval period and be amongst the earliest surviving boundaries within the landscape. Within this landscape, the site sits within an area of discrete farmsteads, including Ermin Farm, Forty Farm, Preston Farm, St Augustine Farm and Village Farm. As a result, the historic landscape character within the site is considered to be of **low significance**, with the site forming part of the agricultural land that separates these farmsteads.

Contribution of the site to the significance and setting of known heritage assets:

The agricultural landscape surrounding Preston, of which the site forms part, forms the rural setting of the conservation area (CONARA/067). This setting allows the village to be understood as a small rural community. The landscape character assessment for the village highlights the importance of the connection

between the settlement and the surrounding agricultural landscape which is preserved by the open green space visible in gaps between the houses within the settlement. Additionally, the undeveloped rural landscape surrounding the village plays a role in preserving its historic linear form and retaining its separation from surrounding settlements. The site forms part of the agricultural land to the south of Preston. It comprises an open rural landscape, field boundaries and pockets of woodland. Views looking across the site towards the conservation area allow the conservation area to be appreciated within its original rural setting, allowing it to be understood as a distinct rural community.

The PRoWs that cross the site are historic routes that connected to the settlement core. Intervisibility with the conservation area from the PRoW within the site is limited to the top of the Grade II* listed church tower (1089268), which can be seen rising above the intervening modern dwellings. Additionally, the rural landscape within the site can be seen in glimpses between trees on the western approach to the conservation area. As a result, the site makes a **low positive** contribution to the setting of the conservation area, contributing to understanding of the village as a small agricultural community with surrounding dispersed farmsteads. The intervisibility between the site and conservation area, although limited, reinforces the rural association.

The site is also considered to contribute towards the setting of the listed buildings within the conservation area. The immediate setting of All Saints Church (1089268) includes the historic churchyard plot, as well as the monuments within the churchyard (1089227 and 1153596), which is defined by its wall and the surrounding settlement. The site forms part of the wider setting of the church and the church parapet can be seen rising above the intervening modern dwellings in views towards the conservation area from the PRoW within the site. As such, it makes a **low positive** contribution to the setting of the church.

While intervisibility with the other buildings within the conservation area (1089228, 1089229, 1089230, 1153591, 1341394 and 1341395) is more restricted due to the presence of trees and other buildings, the agricultural nature of the site contributes to their rural setting, especially of the farmhouses (1153591 and 1341395), helping them to be appreciated as part of a small rural village. As such, the site makes a **low positive** contribution to their setting.
